1. **The SDT has made clarifying changes to the core definition in response to industry comments. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.**

Summary Consideration: After consideration of the comments below, the SDT has decided against making any changes to the draft core definition as the changes suggested do not provide additional clarity. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

No changes were made to the core definition.

Organization	Yes or No	Question 1 Comment
NERC Staff Technical Review	No	The sentence, “This does not include facilities used in the local distribution of electricity,” is a commentary or statement of objective rather than a definition of what facilities comprise the BES. Including such information that does not define the facilities to be included or excluded will be a source of confusion in applying the definition. The BES definition as proposed by the SDT may in fact include such facilities and as stated in paragraph 37 of Order 743: “Determining where the line between “transmission” and “local distribution” lies, which includes an inquiry into which lower voltage “transmission” facilities are necessary to operate the interconnected transmission system, should be part of the exemption process the ERO develops.”If the drafting team believes that Exclusions E1 through E4 in the

Organization	Yes or No	Question 1 Comment
		definition are sufficient to not include any facilities used in the local distribution of electricity then those exclusions, and not the aforementioned sentence in the "core definition," define the facilities that are not included (i.e., the sentence is unnecessary).
Response: The SDT discussed your comment and decided against deletion of the sentence in the core definition that refers to facilities used in the local distribution of electricity. There were many commenters who were in favor of the inclusion of the sentence in the core definition. Additionally, the SDT does not agree with the premise that the exclusions are fully sufficient to not include any facilities used in the local distribution of electricity in the definition. No change made.		
Southwest Power Pool Standards Review Team	No	The last sentence of the core states that no distribution facilities will be included, but some of these facilities could be included due to blackstart resources. We don't disagree with the idea of removing distribution facilities, but would like to see some clarification or qualifier.
Westar Energy	No	The last sentence of the core part of the definition states that no distribution facilities will be included, but we feel that some of these facilities could be included due to also being blackstart resources. We agree with the idea of removing distribution facilities, but would like to see some clarification or a qualifier with regards to blackstart resources.
Response: The inclusion of Blackstart Resources in Inclusion I3 is meant to include the blackstart generators but is not meant to include any local distribution facilities at voltage levels < 100 kV that may connect the Blackstart Resources to the BES. No change made.		
Southern Company Generation	No	We have two concerns with the changes that are proposed. First, the use of "effective dates" and "compliance obilgations ... shall begin" in the implementation plan of the definition change is confusing. Effective date is usually used to indicate the mandatory and enforceable date of a new item. Second, a radial circuit from 100kV to a generating facility with two (2) 20 MVA generators seems to meet both the inclusion criteria (I2) and the

Organization	Yes or No	Question 1 Comment
		exculsion criteria (E1). Which criteria is dominant, inclusion or exclusion?

Response: See the responses addressing the Effective Dates and the C compliance Obligations in Question 11.

As to the second part of your question, the two generators would be included in the BES by virtue of their gross individual nameplate ratings. However, the radial circuit itself would be excluded since the gross generation was not equal to or greater than 75 MVA.

The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.

Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2.

Organization	Yes or No	Question 1 Comment
Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
National Grid	No	While we agree that the BES should not include facilities used in the local distribution of energy, we feel that this is already captured in Exclusion E3. Stating it in the core definition is confusing, and should be eliminated. We suggest removing "This does not include facilities used in the distribution of electric energy" from the core definition.
IRC Standards Review Committee	No	While we agree with the changes to the definition, we do not understand the purpose of the final sentence "This does not include facilities used in the local distribution of electric energy." Since the issue of local (distribution) networks is addressed under Exclusion E3, we do not see the added benefit of the referenced text.
Response: The SDT discussed your comment and decided against deletion of the sentence in the core definition that refers to facilities used in the local distribution of electricity. There were many commenters who were in favor of the inclusion of the sentence in the core definition. Furthermore, Exclusion E3 does not by itself define the entire population of facilities used in the local distribution of electricity.		
Hydro One Networks Inc.	No	Although we agree with the concept and commend the SDT for developing explicit inclusions and exclusions as part of the definition, we believe there are several outstanding issues and concerns listed as our response to Q11 that need to be addressed by the SDT and by NERC as the ERO.
Response: Please see the detailed response to Q11.		

Organization	Yes or No	Question 1 Comment
Massachusetts Department of Public Utilities	No	The Massachusetts Department of Public Utilities ("MA DPU") appreciates the opportunity to provide comments on the second draft definition of the Bulk Electric System ("BES"). Massachusetts is the largest state by population and load in New England. It comprises 46% of both the region's population and electricity consumption. Generating plants located in Massachusetts represent 42% of New England's capacity and our capitol city, Boston, is the largest load center in the region. Some of the revisions since the last posting of the draft BES definition have improved the proposed language. However, the MA DPU has a number of concerns regarding both the substance of the definition and the process for developing this standard: 1) Phased Approach. While well-intentioned, separating the BES definition project into two separate phases is problematic from both a procedural and substantive perspective. While we recognize that the filing due date is rapidly approaching, the BES definition cannot be considered in a vacuum, divorced from the concerns raised by a number of parties in response to past postings of the BES definition. The issues NERC has identified for consideration during the proposed "Phase 2" are inseparable from the development of the BES definition (e.g., generation thresholds, technical justification for the 100 kV threshold) and should be squarely addressed before a definition is adopted and ratepayers incur costs related to compliance with mandates that may or may not be revised through the second phase of the project. The importance of considering concerns before adopting a definition is heightened by the proposed two-year implementation requirement. This short implementation period almost guarantees that entities will commit resources shortly after adoption of the definition to ensure compliance within the mandated period. In other words, ratepayers will bear costs related to compliance irrespective of any change resulting from the Phase 2 process or the exception process. Expediency, while understandable given the filing deadline, must be balanced against the risk that a multi-phased approach could lead to

Organization	Yes or No	Question 1 Comment
		significant consumer costs without attendant meaningful reliability benefits. 2) Cost-Benefit Analysis. A cost impact analysis should be performed as part of developing any reliability standard. However, the development of the BES definition has failed to consider the cost impacts of the definition (and its inclusions and exclusions) and has not weighed these impacts against identified benefits that the definition would achieve. The MA DPU supported the May 21, 2011 comments from the New England States Committee on Electricity ("NESCOE") on the last posting of the BES definition. In these comments, NESCOE stated that "any new costs a revised definition imposes - which fall ultimately on consumers - should provide meaningful reliability benefits." A cost-benefit analysis should be integral to the development of a BES definition and, indeed, any reliability standard. This analysis should include a probabilistic risk assessment examining the likelihood of an event and the costs and risks resulting from such event, which should be weighed against the costs of complying with the proposed reliability measures. 3) Technical Justification. In addition to performing a cost-benefit analysis, a technical basis must be provided to justify a proposed reliability standard. However, the proposed BES definition does not provide a technical justification for the 100 kV threshold, the threshold for generation resources, or other elements of the definition. As stated above, while well-intentioned and understandable, deferring this technical justification to a later and separate phase of the project is a flawed and potentially costly approach. Providing a technical justification for a reliability standard is a core function of standards development and should be addressed at the forefront of the process rather than relegated to a separate phase largely undertaken after a standard is filed. In Order 743, the Federal Energy Regulatory Commission ("FERC" or "the Commission") directed NERC to revise the BES definition. Revision to Electric Reliability Organization Definition of Bulk Electric System, Order No. 743A, 134 FERC Â¶ 61,210

Organization	Yes or No	Question 1 Comment
		(Mar. 17, 2011) at P 8, citing to Revision to Electric Reliability Organization Definition of Bulk Electric System, Order No. 743, 133 FERC Â¶ 61,150 (2010). The Commission stated that one way NERC could address the technical and policy concerns FERC had identified would be to institute a "bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities, and establish an exemption process and criteria for excluding facilities [NERC] determines are not necessary for operating the interconnected transmission network." Id. at P 8. However, the Commission made clear in Order 743 that NERC may propose an alternative proposal and that the 100 kV threshold is an "initial line of demarcation" to be refined through exclusions and exemptions. Id. at PP 8, 40. Accordingly, unless and until NERC provides a technical justification for its approach, the Standard should use the 100 kV threshold concept in a way that is consistent with the Commission's guidance. Specifically, the two criteria that bound the BES definition are (1) the statutory exclusion of facilities used in local distribution, and (2) the requirement that the facilities included be "necessary for reliable operation" of the interconnected transmission system. A definition that recognizes these limits, coupled with an efficient and transparent exception process, would appear to meet the Commission's expectations. For these reasons, absent a technical justification for imposing a 100 kV threshold, the MA DPU supports the revised core definition offered by NESCOE in comments filed on this 2nd Draft: "All Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher that are necessary for the reliable operation of the interconnected transmission network, including but not limited to the facilities listed below as Inclusions, and excluding (1) facilities that are used in the local distribution of electric energy, and (2) the facilities and systems listed below as Exclusions. Other Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process." The definition of the BES is

Organization	Yes or No	Question 1 Comment
		critical to NERC's role as ERO and will have a significant impact on system reliability and cost to consumers. While FERC had concerns that the existing definitions for the bulk power system were under-inclusive, the proposed Standard, as drafted, risks erring in the opposite direction and appears inconsistent with the Commission's guidance in this area.
NESCOE	No	The New England States Committee on Electricity ("NESCOE") appreciates the opportunity to provide comments on the revised BES definition. NESCOE is New England's Regional State Committee and represents the collective views of the six New England states. Please consider this submission to reflect the views of the States of Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island and Vermont. Some of these states may submit separate comments in addition to this joint filing. NESCOE does not believe that the proposed changes address our fundamental concerns. As NESCOE pointed out in its comments on the previous draft, the definition's reliance on a 100 kV "bright line" threshold may impose substantial costs on New England ratepayers without achieving meaningful reliability benefits. NERC and the drafting team have not provided any technical justification for imposing the 100 kV test, despite its potential for over-inclusiveness and significant costs. NESCOE believes that the Federal Energy Regulatory Commission ("FERC" or "the Commission") recognizes the need to avoid this result. As the Commission pointed out in Order 743A, Order 743 does not mandate the application of a 100 kV threshold, and NERC is free to propose alternatives. Unless and until NERC provides a technical justification for its approach, the Standard should use the 100 kV threshold concept in a way that is consistent with the Commission's guidance. Specifically, the Standard should make clear that the 100 kV threshold is an "initial line of demarcation," and not the end of the analysis. According to Order 743A, the two criteria that bound the BES definition are (1) the statutory exclusion of facilities used in local

Organization	Yes or No	Question 1 Comment
		distribution, and (2) the requirement that the facilities included be "necessary for reliable operation" of the interconnected transmission system. A definition that recognizes these limits, coupled with an efficient and transparent exceptions process, would meet FERC's expectations. The proposed definition does not meet this standard. For these reasons, absent a technical justification for imposing a 100 kV threshold, NESCOE suggests the following revised core definition: "All Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher that are necessary for the reliable operation of the interconnected transmission network, including but not limited to the facilities listed below as Inclusions, and excluding (1) facilities that are used in the local distribution of electric energy, and (2) the facilities and systems listed below as Exclusions. Other Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process." Where FERC had concerns that the existing definitions for the bulk power system were under-inclusive, the proposed Standard risks erring in the opposite direction. Because the definition of the BES is critical to NERC's role as ERO and will have a significant impact on ratepayers, NESCOE believes the drafting team should track FERC's guidelines as closely as possible, or provide a specific technical justification for relying on the 100 kV bright line threshold.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition		

Organization	Yes or No	Question 1 Comment
coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that the best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
ReliabilityFirst	No	This seems very confusing, but should be clear and easy enough for anyone to pickup, read, understand, apply and arrive at the same conclusion. The term local distribution needs to be either defined or have some guidance provided on what it is intended to cover. A suggestion for defining distribution would be that radials and local networks makeup distribution facilities. Radials usually terminate at distribution or customer substations and local networks are primarily used for distribution also. The Commission granted NERC the ability to define distribution in Order 743-A, paragraphs 67-71. It is not clear if the BES is meant to be a contiguous system or not from the language in the revised definition. ReliabilityFirst Staff believes that the BES should be contiguous, and therefore, any facilities needed to connect real and reactive resources to the BES need to be included. To maintain reliability, the BES cannot have pockets of generation that are not connected

Organization	Yes or No	Question 1 Comment
		to the BES via BES facilities. ReliabilityFirst Staff believes that without including the paths from BES generators in the BES, the reliable operation of the system could be jeopardized if the paths are unavailable due to non-compliance to Reliability Standards. For example, wind farm collector systems at voltages operated at less than 100 kV should be included in the BES for the above reason.
Response: The SDT discussed your comment and decided against deletion of the sentence in the core definition that refers to facilities used in the local distribution of electricity. There were many commenters who were in favor of the inclusion of the sentence in the core definition. Additionally, the SDT does not agree that Exclusions E1 and E3 are fully sufficient to not include any facilities used in the local distribution of electricity in the definition. No change made. The SDT has previously stated the existing BES definition does not mandate contiguity of the BES and the proposed definition is carrying that principle forward. Simply making a blanket statement the BES must be contiguous could have unintended consequences. However, the BES understands the importance of the concept and has agreed to discuss contiguity issues in Phase 2 of this project.		
Ontario Power Generation Inc.	No	OPG continues to question the need for the changes required (and costs imposed) as a result of this new definition. This is particularly true in the NPCC region where an impact based methodology is being used to determine the set of BES elements. A very clear 100kV bright line, as proposed in this draft, will dramatically increase the list of generation elements that must meet reliability standards, without a corresponding increase in wide-area reliability. OPG recommends that the work planned for phase II, technical justification of the generation and voltage thresholds, should be completed before implementing the new definition of BES.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or		

Organization	Yes or No	Question 1 Comment
contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.		
Kansas City Power and Light Company	No	There is no established basis for the generation thresholds referenced through the ERO Statement of Compliance Registry Criteria in Appendix 5B and the specificity of 75 MVA in the proposed BES definition. The objectives identified in the Phase 2 SAR for the definition of the Bulk Electric System include establishing an engineering basis for the generation thresholds. Phase 2 will be critical in refining and improving the Bulk Electric System definition and bringing additional clarity to the definition.
New York State Dept of Public Service	No	The core definition is still deficient due to a lack of technical support for basing the BES definition on 100 kV and for lack of any cost/benefit analysis.
City of Anaheim	No	The City of Anaheim recommends either changing the E1 (b) language back to that of the previous BES definition draft, i.e. 75 MVA or above connected at 100 kV or above, or limit the amount of generation allowed within a Radial Element or Local Network to 300 MVA or less, which is the amount of uncontrolled load loss that constitutes a reportable "disturbance" pursuant to EOP-004 and DOE Form OE-417. If DOE and NERC do not consider a 300 MW uncontrolled loss of load a reportable event, then why would the potential loss of a 75 MVA of non-critical generator connected at 69 kV make a Radial Element or Local Network critical to the reliability of the BES? The current ERO Statement of Compliance Criteria does not require GO/GOP

Organization	Yes or No	Question 1 Comment
		registration for generation connected below 100 kV as long as it's not critical to the reliability of the BES, i.e. black start, etc., even if the amount of generation is greater than 75 MVA. There is good reason for this because the mere loss of 75 MVA generator would not affect the reliability of a system as big as the Western Interconnection, at all, and a fault at say 69 kV would have sufficient impedance not to affect the BES from an electrical perspective.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
Consolidated Edison Co. of NY, Inc.	No	o Please clarify the phrase “facilities used in local distribution” as used in the ‘core’ BES Definition. What is the purpose of this phrase in the BES Definition? How does the SDT propose that an entity demonstrate that a facility is used in local distribution? o Does this phrase “facilities used in local distribution” establish a jurisdictional boundary which takes precedence over all other parts of the BES Definition and Designations? o If this phrase does not take precedence over the remainder of the BES Definition and Designations, i.e., perhaps only over some parts BES Definition and Designations, or over none of the BES Definition and Designations, then what was the drafting teams understanding of and intent

Organization	Yes or No	Question 1 Comment
		with regard to “facilities used in local distribution?” o What are Entities supposed to do with respect to “facilities used in local distribution” identified by State and Provincial regulators? o How has NERC assured that the posted BES Definition and Designations meet the intent of the Commission to establish an exemption process that avoids identifying “facilities used in local distribution” as part of the BES (Â¶37 and Â¶39 below)? Recommendations: If “facilities used in local distribution” are to be excluded on jurisdictional grounds, then o The last sentence in the Core definition should be revised as follows: “This does not include facilities used in the local distribution of electric energy, as identified by a jurisdictional governmental authority.” o We strongly recommend that the BES SDT adopt the FERC Seven Factor test as a proven basis for establishing the boundary between jurisdictional Transmission and non-jurisdictional “facilities used in local distribution.” Supporting Discussion: In FERC Order 743-A the Commission stated69. We agree ... that the Seven Factor Test could be relevant and possibly is a logical starting point for determining which facilities are local distribution for reliability purposes” By adopting this FERC Seven Factor test, the BES SDT will have fulfilled its obligation to respond to these FERC mandates relating to “local distribution” as stated in FERC Order 743: “Determining where the line between ‘transmission’ and ‘local distribution’ lies,” (Â¶37),”To the extent that any individual line would be considered to be local distribution, that line would not be considered part of the bulk electric system” (Â¶39), to establish “[A] means to track and review facilities that are classified as local distribution to ensure accuracy and consistent application of the definition” (Â¶119).Supporting References: FERC Order 743 observed some believe that “the Commission’s [and by extension NERC’s] proposal exceeds its jurisdiction by encompassing local distribution facilities that are not necessary for operating the interconnected transmission network.” [FERC

Organization	Yes or No	Question 1 Comment
		Order 743, Â¶27.]In this regard FERC Order 743 states: At Â¶37, Congress specifically exempted “facilities used in the local distribution of electric energy” from the definition. ... Determining where the line between “transmission” and “local distribution” lies, which includes an inquiry into which lower voltage “transmission” facilities are necessary to operate the interconnected transmission system, should be part of the exemption process the ERO develops. And at Â¶39, To the extent that any individual line would be considered to be local distribution, that line would not be considered part of the bulk electric system. And at Â¶119, ... [W]e believe that it would be beneficial for the ERO in maintaining a list of exempted facilities, to consider including a means to track and review facilities that are classified as local distribution to ensure accuracy and consistent application of the definition. Similarly, the ERO could track exemptions for radial facilities. [Emphasis added]Note that in Â¶119 the Commission clearly distinguishes between “radial facilities” and “local distribution” just as it differentiates between jurisdictional radials and non-jurisdictional local distribution facilities in footnote 82:82 As discussed further below, the Commission uses the term “exclusion” herein when discussing facilities expressly excluded by the statute (i.e., local distribution) and the term “exemption” when referring to the exemption process NERC will develop for use with facilities other than local distribution that may be exempted from compliance with the mandatory Reliability Standards for other reasons. FERC Order 743-A suggests:69. We agree with Consumers Energy, Portland General and others that the Seven Factor Test could be relevant and possibly is a logical starting point for determining which facilities are local distribution for reliability purposes ...”
Response: The SDT discussed your comments and decided not to make changes to the core definition. The SDT included the last sentence in the draft BES core definition as a reference to Section 215 of the Energy Power Act that excludes these facilities from the bulk power system. In addition, FERC specifically excluded these facilities in Orders No. 743 and 743-A. By asking if this sentence defines a jurisdictional boundary, you are asking the SDT for a legal conclusion that is beyond the scope of the project.		

Organization	Yes or No	Question 1 Comment
The SDT expects that most of the facilities used in the local distribution of energy will be covered by the 100 kV voltage level as well as Exclusions E1 through E4. In the event the BES definition does not provide a definitive determination on whether an Element is classified as BES or non-BES, the Rules of Procedure Exception Process may be utilized on a case-by-case basis to either include or exclude an Element. While the SDT does not agree with the premise that Exclusions E1 through E4 are fully sufficient to not include any facilities used in the local distribution of electricity in the definition, the SDT declined to use the FERC Seven Factor Test to define the dividing line between transmission and distribution as this is not an applicable test in all areas of North America which includes the Canadian Provinces. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
Hydro-Quebec TransEnergie	No	The proposed revision to the definition maintaining this bright line of 100 kV would expand significantly what is considered to be BES in HQT's case (the amount of added facilities could be ten times more). Since the main structure of Quebec system is included in the BES where the best norms and standards apply, the inclusion in the BES of sub-systems at lower voltage and including generation will not bring significant impact on the reliable operation of the interconnected system, because of the nature of the Quebec Interconnection. Furthermore for HQT's system, the proposed BES definition combined with the exception procedure are presently incompatible or at least inconsistent

Organization	Yes or No	Question 1 Comment
		with the regulatory framework applicable in Quebec. The proposed changes have not address this concern, neither the SDT's responses to our previous comments last May (Q.1 and 12).We reiterate that the definition and the exception procedure shall be determined by Quebec's regulator, the RÃ©gie de l'Ã‰nergie du QuÃ©bec, (Quebec Energy Board) which has the responsibility to ensure that electric power transmission in Quebec is carried out according to the reliability standards it adopts. Per se, it would be necessary that E1 and E3 grant exclusions with much higher level of generation. It would also be necessary to allow for several levels of application for the Reliability Standards, in accordance with the RÃ©gie de l'Ã©nergie du QuÃ©bec approach: the Bulk Power System (BPS) as determined using an impact-based methodology, the Main Transmission System (MTS), and other parts of Regional System. Standards related to the protection system (PRC-004-1 and PRC-005-1) and those related to the design of the transmission system (TPL 001-0 to TPL-004-0) shall be applicable to the first level, but all other reliability standards shall be applied to the second level, the MTS. The MTS definition is somewhat different than the Bulk Electric System definition, and it includes elements that impact the reliability of the grid, supply-demand balance and interchanges. We argue that it would be necessary for NERC to address the regulatory issues outside ot the present context of the SDT and ROP team.
Response: While the SDT appreciates the differences within the North American continent, it attempted to craft a BES definition that can be applied within the ERO footprint. It is neither within the scope of the SDT nor is it appropriate for the SDT to provide any regulatory resolution within the definition. As previously stated in our responses, the SDT believes that Acts and Regulations supersede the requirements of any Standard setting body. As such, we agree that NERC along with relevant Regions will have to address these types of non-jurisdictional situations directly or explicitly through the Exception Process.		
Rochester Gas and Electric and New York State Electric and Gas	No	The second sentence, "This does not include facilities used in the local distribution of electric energy," is vague and not sufficiently clear for northeast industry expert colleagues to be certain of what is "not included."

Organization	Yes or No	Question 1 Comment
		This sentence seems to apply only to distribution facilities that have already been classified based on the FERC "Seven Factor Test" in Order 888. If so, this sentence be re-written as follows for clarity: "This does not include facilities classified as distribution facilities." For US entities, this classification is clearly delineated in our annual FERC Form 1 filing.
Central Maine Power Company	No	The second sentence, "This does not include facilities used in the local distribution of electric energy," is vague and not sufficiently clear for northeast industry expert colleagues to be certain of what is "not included." This sentence seems to apply only to distribution facilities that have already been classified based on the FERC "Seven Factor Test" in Order 888. If so, this sentence should be restated as follows for clarity: "This does not include facilities classified as distribution facilities." For US entities, this classification is clearly delineated in our annual FERC Form 1 filing.
Response: The SDT discussed your comment and decided against revision of the sentence in the core definition that refers to facilities used in the local distribution of electricity. There were many commenters who were in favor of the inclusion of the sentence as written in the core definition.		
South Houston Green Power, LLC	No	South Houston Green Power, LLC [SHGP], a registered generator owner in ERCOT, submits the following comments: Cogeneration facilities, some of which are well over 75 MW in size, are located at a number of industrial sites owned by SHGP and its affiliates. Some of these cogeneration facilities generate power that is distributed within the industrial site and used for manufacturing plant operations. In some instances, excess power not required for plant operations is delivered back into the electric transmission grid through the tie line(s) connecting the industrial site to the grid. While the tie lines and some of the internal lines at these industrial sites operate at 100kV or higher, they do not perform anything that resembles a transmission function. Rather than transmit power long distances from generation to load centers, the tie lines and internal lines perform primarily

Organization	Yes or No	Question 1 Comment
		an end user distribution function consisting of the distribution of power brought in from the grid or generated internally to different plants within each industrial site. In some cases, the facilities also perform an interconnection function to the extent they enable power from cogeneration facilities to be delivered into the grid. The voltage of the tie lines and internal lines at these industrial sites is dictated by the load and basic configuration of each site. Higher voltage lines are used when necessary to meet applicable load requirements or to reduce line losses. That does not mean that such lines perform a transmission function. SHGP would oppose any BES definition that would by default subject either the tie lines or the internal lines at such industrial sites to the mandatory reliability standards applicable to Transmission Owners and Transmission Operators when they more readily fit the Generation Owner / Generation Operator standards. Such an expanded BES definition would subject registered entities to substantial compliance costs and create potential exposure to penalties, but would not likely substantially enhance the reliability of the BES. Perhaps such costs and exposure could be justified in exceptional circumstances, if subjecting these facilities to compliance with reliability standards were to result in a material increase in reliability of the BES. There is reason to believe, however, that in many cases the additional reliability benefit would be minimal at best. The tie lines and internal lines at industrial sites owned by SHGP and its affiliates have been operated for years as end user distribution and interconnection facilities, and practices and procedures have developed over the years that have enabled such operations to achieve a high degree of reliability for such sites. Requiring these facilities to now operate in a different manner as transmission facilities may well result in a degradation of the reliability of the manufacturing plants located at such sites. For example, outages would have to be coordinated with the RTO, which may not be interested in coordinating such outages with scheduled manufacturing plant outages. In

Organization	Yes or No	Question 1 Comment
		light of these considerations, SHGP agrees with the proposed revisions to the core definition, particularly the proposal to include a sentence expressly excluding facilities used in the local distribution of electric energy, provided it is understood that end user-owned delivery facilities located "behind-the-meter" are, regardless of voltage level, by default outside the scope of this definition.
Response: See the detailed comments on this issue in the responses to the comments on the Exception Process as well as the Detailed Information to Support an Exception Request Form.		
Indeck Energy Services	No	As acknowledged in the response to Question 12 comments on the previous BES definition, the BES definition is expansive compared to the definition of the BPS in the FPA Section 215. The inclusion of the limited Exclusions is an attempt to remedy the situation. However, the Exclusions need to include a fifth one that if, based on studies or other assessments, it can be shown that any tranmission or generator element otherwise identified as part of the BES is not important to the reliability of the BPS, then that element should be excluded from the mandatory standards program. There has never been a study to show that elements, such as a 20 MW wind farm, 60 MW merchant generator (which operates infrequently in the depressed market) in a large BA (eg NYISO) or a radial transmission line connecting a small generator are important to the reliability of the BPS. They are covered by the mandatory standards program through the registration criteria. The BES Definition is the opportunity to permit an entity to demonstrate that an element is unimportant to reliability of the BPS. The SDT has identified a small subset of elements that it is willing to exclude. By their very nature, these exclusions dim the bright line that is the stated goal of this project. However, the SDT's foresight seems limited in its selections. Analytical studies are used to evaluate contingencies that could lead to the Big Three (cascading outages, instability or voltage collapse). Such a study showing that a transmission or generation element is bounded by the N-1 or N-2

Organization	Yes or No	Question 1 Comment
		contingency would exclude it from the BES definition. For example, in a BA with a NERC definition Reportable Disturbance of approximately 400 MW (eg NYISO), a 20 MW wind farm, 60 MW merchant generator or numerous other smaller facilities would be bounded by larger contingencies. It would take more than six 60 MW merchant generators with close location and common mode failure to even be a Reportable Disturbance, much less become the N-1 contingency for the Big Three. Exclusion E5 should be "E5 - Any facility that can be demonstrated to the Regional Entity by analytical study or other assessment to be unimportant to the reliability of the BPS (with periodic reports by the Regional Entity to NERC of any such assessments)."
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. In the event that the BES definition does not provide a definitive determination on whether an Element is classified as BES or non-BES, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
Snohomish County PUD Kootenai Electric Cooperative	Yes	The Public Utility District No. 1 of Snohomish County ("SNPD") believes the SDT continues to make substantial progress towards a clear and workable definition of the Bulk Electric System ("BES") that markedly improves both the existing definition and the SDT's previous proposal. SNPD therefore strongly supports the new definition, although our support is conditioned on: (1) a workable Exceptions process being developed in conjunction with

Organization	Yes or No	Question 1 Comment
		the BES definition; and, (2) the SDT moving forward expeditiously on Phase 2 of the standards development process in accordance with the SAR recently put forward by the SDT, which would address a number of important technical issues that have been identified in the standards development process to date. SNPD strongly supports the following elements of the revised BES definition: (1) Clarification of how lists of Inclusions and Exclusions applies: The revised core definition moves the phrase "Unless modified by the lists shown below" to the beginning of the definition. This change makes clear that the Inclusions and Exclusions apply to all Elements that would otherwise be included in or excluded from the core definition (i.e., "all Transmission Elements operated at 100 kV or higher and Real Time and Reactive Power resources connected at 100 kV or higher") and eliminates a latent ambiguity in the first draft of the definition, discussed further in our comments on the first draft. (2) The exclusion for Local Distribution Facilities. As the starting point for the BES definition, SNPD supports use of the phrase "all Transmission Elements" and the qualifying sentence: "This does not include facilities used in the local distribution of electric energy." This language helps ensure that FERC, NERC, and the Regional Entities ("REs") will act within the jurisdictional constrains Congress placed in Section 215 of the Federal Power Act ("FPA"). In Section 215(a)(1), Congress unequivocally excluded "facilities used in the local distribution of electric energy" from the keystone "bulk-power system" definition. 16 U.S.C. Â§ 824o(a)(1). Including the same language in the definition helps ensure that entities involved in enforcement of reliability standards will act within their statutory limits. In addition, as a practical matter, inclusion of the language will help focus both the industry and responsible agencies on the high-voltage interstate transmission system, where the reliability problems Congress intended to regulate - "instability, uncontrolled separation, [and] cascading failures," 16 U.S.C. Â§

Organization	Yes or No	Question 1 Comment
		824o(a)(4) - will originate. At the same time, level-of-service issues arising in local distribution systems will be left to the authority of state and local regulatory agencies and governing bodies, just as Congress intended. 16 U.S.C. Â§ 824o(i)(2) (reserving to state and local authorities enforcement of standards for adequacy of service). For similar reasons, Snohomish believes use of the phrase "Transmission Elements" as the starting point for the base definition is desirable because both "Transmission" and "Elements" are already defined in the NERC Glossary of Terms Used, and the term "Transmission" makes clear that the BES includes only Elements used in Transmission and therefore excludes Elements used in local distribution of electric power. (3) Appropriate Generator Thresholds. In the standards development process, it has become apparent that the thresholds for classifying generators as BES in the current NERC Statement of Compliance Registry Criteria ("SCRC") (20 MVA for individual generators, 75 MVA for multiple generators aggregated at a single site), which predate the adoption of FPA Section 215, were never the product of a careful analysis to determine whether generators of that size are necessary for operation of the interconnected bulk transmission system. Ideally, such an analysis would be conducted as part of the current standards development process. Snohomish recognizes that, given the deadlines imposed by FERC in Order No. 743, it will not be possible for the SDT to conduct such an analysis within the time available. Accordingly, Snohomish agrees with the approach taken by the SDT, which is to propose a Phase 2 of the standards development process that would address the generator threshold issue and several other technical issues that have arisen during the current process. As long as Phase 2 proceeds expeditiously, Snohomish is prepared to support the BES definition as proposed by the SDT. While Snohomish strongly supports the overall approach adopted by the SDT and much of the specific language incorporated into the second draft of the BES definition, we believe the

Organization	Yes or No	Question 1 Comment
		second draft would benefit from further clarification or modification in a number of respects, most of which are detailed in our subsequent answers. Our support for the definition is not contingent upon these changes being adopted. Further, we believe a workable Exclusion Process is essential for a BES Definition that will meet the legal requirements of FPA Section 215, especially for systems operating in the Western Interconnection. As detailed in our previous comments, Snohomish believes a 200-kV threshold would be more appropriate for WECC than a 100-kV threshold. In addition, a 200-kV threshold for the West is backed by solid technical analysis conducted by the WECC Bulk Electric System Definition Task Force, and repeated claims that there is no technical analysis to support this view is therefore incorrect. That being said, we raise the issue here to emphasize the importance of the Exclusions for Local Networks and Radial Systems and the Exceptions process. These Exclusions and the Exceptions are essential for a definition that works in the Western Interconnection because the core definition will be over-inclusive in our region. As long as those Exclusions and the Exceptions Process are retained in a form substantially equivalent to those produced by the SDT at this juncture, Snohomish will support the SDT's proposal and will not further pursue its claims regarding the 200-kV threshold. Finally, we suggest that the SDT address the circumstance when an Element is covered by both an Inclusion and an Exclusion. We note that some of the inclusions already contain language addressing this question. For example, Inclusion 1 indicates that transformers falling within the specified parameters are part of the BES ". . . unless excluded under Exclusions E1 or E3." Where it is not already included, similar language should be included in the other Inclusions and/or Exclusions to explain whether the SDT intends the Inclusions or the Exclusions to predominate in situations where facilities might be covered by both.

Organization	Yes or No	Question 1 Comment
		We suggest clarifying language in our responses to Questions 2 and 5.
Response: The exception process will be filed concurrently with the definition. Phase 2 of this project will begin immediately following the conclusion of Phase 1 as SDT resources free up. The goal of the SDT and the Rules of Procedure Team is to have the Exception Process begin concurrently with the implementation of the revised BES Definition. Please see responses to Q2 and Q5.		
Metropolitan Water District of Southern California	Yes	Metropolitan Water District of Southern California ("MWDSC") generally supports the core definition of the Bulk Electric System as proposed. However, some of the proposed Inclusions and Exclusions need to be clarified as identified in questionnaires #6 and #10 below.
Response: Please see the detailed responses in Q6 and Q11 below.		
Clallam County PUD No.1 Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative (CCEC) Central Electric Cooperatve (CEC) Clearwater Power Company (CPC) Consumer's Power Inc. Douglas Electric Cooperative (DEC) Fall River Rural Electric Cooperative (FALL)	Yes	The Public Utility District No. 1 of Clallam County ("CLPD") believes the SDT continues to make substantial progress towards a clear and workable definition of the Bulk Electric System ("BES") that markedly improves both the existing definition and the SDT's previous proposal. CLPD therefore strongly supports the new definition, although our support is conditioned on: (1) a workable Exceptions process being developed in conjunction with the BES definition; and, (2) the SDT moving forward expeditiously on Phase 2 of the standards development process in accordance with the SAR recently put forward by the SDT, which would address a number of important technical issues that have been identified in the standards development process to date. CLPD strongly supports the following elements of the revised BES definition: (1) Clarification of how lists of Inclusions and Exclusions applies: The revised core definition moves the phrase "Unless modified by the lists shown below"

Organization	Yes or No	Question 1 Comment
Lane Electric Cooperative (LEC) Lincoln Electric Cooperative (LEC) Northern Lights Inc. (NLI) Okanogan County Electric Cooperative (OCEC) Pacific Northwest Generating Cooperative (PNGC) Raft River Rural Electric Cooperative (RAFT) West Oregon Electric Cooperative Umatilla Electric Cooperative (UEC)		to the beginning of the definition. This change makes clear that the Inclusions and Exclusions apply to all Elements that would otherwise be included in or excluded from the core definition (i.e., "all Transmission Elements operated at 100 kV or higher and Real Time and Reactive Power resources connected at 100 kV or higher") and eliminates a latent ambiguity in the first draft of the definition, discussed further in our comments on the first draft. (2) The exclusion for Local Distribution Facilities. As the starting point for the BES definition, CLPD supports use of the phrase "all Transmission Elements" and the qualifying sentence: "This does not include facilities used in the local distribution of electric energy." This language helps ensure that FERC, NERC, and the Regional Entities ("REs") will act within the jurisdictional constrains Congress placed in Section 215 of the Federal Power Act ("FPA"). In Section 215(a)(1), Congress unequivocally excluded "facilities used in the local distribution of electric energy" from the keystone "bulk-power system" definition. 16 U.S.C. Â§ 824o(a)(1). Including the same language in the definition helps ensure that entities involved in enforcement of reliability standards will act within their statutory limits. In addition, as a practical matter, inclusion of the language will help focus both the industry and responsible agencies on the high-voltage interstate transmission system, where the reliability problems Congress intended to regulate - "instability, uncontrolled separation, [and] cascading failures," 16 U.S.C. Â§ 824o(a)(4) - will originate. At the same time, level-of-service issues arising in local distribution systems will be left to the authority of state and local regulatory agencies and governing bodies, just as Congress intended. 16 U.S.C. Â§ 824o(i)(2) (reserving to state and local authorities enforcement of standards for adequacy of service).For similar reasons, Clallam believes use of the phrase "Transmission Elements" as the starting point for the base definition is desirable because both "Transmission" and "Elements" are already defined in the NERC Glossary of Terms Used, and the term

Organization	Yes or No	Question 1 Comment
		"Transmission" makes clear that the BES includes only Elements used in Transmission and therefore excludes Elements used in local distribution of electric power. (3) Appropriate Generator Thresholds. In the standards development process, it has become apparent that the thresholds for classifying generators as BES in the current NERC Statement of Compliance Registry Criteria ("SCRC") (20 MVA for individual generators, 75 MVA for multiple generators aggregated at a single site), which predate the adoption of FPA Section 215, were never the product of a careful analysis to determine whether generators of that size are necessary for operation of the interconnected bulk transmission system. Ideally, such an analysis would be conducted as part of the current standards development process. Clallam recognizes that, given the deadlines imposed by FERC in Order No. 743, it will not be possible for the SDT to conduct such an analysis within the time available. Accordingly, Clallam agrees with the approach taken by the SDT, which is to propose a Phase 2 of the standards development process that would address the generator threshold issue and several other technical issues that have arisen during the current process. As long as Phase 2 proceeds expeditiously, Clallam is prepared to support the BES definition as proposed by the SDT. While Clallam strongly supports the overall approach adopted by the SDT and much of the specific language incorporated into the second draft of the BES definition, we believe the second draft would benefit from further clarification or modification in a number of respects, most of which are detailed in our subsequent answers. Our support for the definition is not contingent upon these changes being adopted. Further, we believe a workable Exclusion Process is essential for a BES Definition that will meet the legal requirements of FPA Section 215, especially for systems operating in the Western Interconnection. As detailed in our II proceeds expeditiously, Clallam is prepared to support the BES definition as proposed by the SDT. While Clallam strongly supports the overall approach adopted

Organization	Yes or No	Question 1 Comment
		by the SDT and much of the specific language incorporated into the second draft of the BES definition, we believe the second draft would benefit from further clarification or modification in a number of respects, most of which are detailed in our subsequent answers. Our support for the definition is not contingent upon these changes being adopted. Further, we believe a workable Exclusion Process is essential for a BES Definition that will meet the legal requirements of FPA Section 215, especially for systems operating in the Western Interconnection. As detailed in our previous comments, Clallam believes a 200-kV threshold would be more appropriate for WECC than a 100-kV threshold. In addition, a 200-kV threshold for the West is backed by solid technical analysis conducted by the WECC Bulk Electric System Definition Task Force, and repeated claims that there is no technical analysis to support this view is therefore incorrect. That being said, we raise the issue here to emphasize the importance of the Exclusions for Local Networks and Radial Systems and the Exceptions process. These Exclusions and the Exceptions are essential for a definition that works in the Western Interconnection because the core definition will be over-inclusive in our region. As long as those Exclusions and the Exceptions Process are retained in a form substantially equivalent to those produced by the SDT at this juncture, Clallam will support the SDT's proposal and will not further pursue its claims regarding the 200-kV threshold.
Response: The exception process will be filed concurrently with the definition. Phase 2 of this project will begin immediately following the conclusion of Phase 1 as SDT resources free up. The goal of the SDT and the Rules of Procedure Team is to have the Exception Process begin concurrently with the implementation of the revised BES Definition.		
Michigan Public Power Agency	Yes	The Michigan Public Power Agency (MPPA) believes the SDT continues to make substantial progress towards a clear and workable definition of the

Organization	Yes or No	Question 1 Comment
		Bulk Electric System (“BES”) that markedly improves both the existing definition and the SDT’s previous proposal. MPPA therefore strongly supports the new definition, although our support is conditioned on: (1) A workable Exceptions process being developed in conjunction with the BES definition; and, (2) the SDT moving forward expeditiously on Phase 2 of the standards development process in accordance with the SAR recently put forward by the SDT, which would address a number of important technical issues that have been identified in the standards development process to date. MPPA strongly supports the following elements of the revised BES definition: (1) Clarification of how lists of Inclusions and Exclusions applies: The revised core definition moves the phrase “Unless modified by the lists shown below” to the beginning of the definition. This change makes clear that the Inclusions and Exclusions apply to all Elements that would otherwise be included in or excluded from the core definition (i.e., “all Transmission Elements operated at 100 kV or higher and Real Time and Reactive Power resources connected at 100 kV or higher”). (2) The exclusion for Local Distribution Facilities. As the starting point for the BES definition, MPPA supports use of the phrase “all Transmission Elements” and the qualifying sentence: “This does not include facilities used in the local distribution of electric energy.” This language helps ensure that FERC, NERC, and the Regional Entities (“REs”) will act within the jurisdictional constrains Congress placed in Section 215 of the Federal Power Act (“FPA”). In Section 215(a)(1), Congress unequivocally excluded “facilities used in the local distribution of electric energy” from the keystone “bulk-power system” definition. 16 U.S.C. Â§ 824o(a)(1). Including the same language in the definition helps ensure that entities involved in enforcement of reliability standards will act within their statutory limits. In addition, as a practical matter, inclusion of the language will help focus both the industry and responsible agencies on the high-voltage interstate transmission

Organization	Yes or No	Question 1 Comment
		system, where the reliability problems Congress intended to regulate - "instability, uncontrolled separation, [and] cascading failures," 16 U.S.C. Â§ 824o(a)(4) - will originate. At the same time, level-of-service issues arising in local distribution systems will be left to the authority of state and local regulatory agencies and governing bodies, just as Congress intended. 16 U.S.C. Â§ 824o(i)(2) (reserving to state and local authorities enforcement of standards for adequacy of service). MPPA also believes the use of the phrase "Transmission Elements" as the starting point for the base definition is desirable because both "Transmission" and "Elements" are already defined in the NERC Glossary of Terms Used, and the term "Transmission" makes clear that the BES includes only Elements used in Transmission and therefore excludes Elements used in local distribution of electric power. MPPA believes this was one of the many key elements addressed by FERC in Order No. 743 and reinforced by FERC Order No. 743A and has been missing from the previous definition as well as the original definition being used since Compliance efforts commenced in June, 2007 . Because of this lack of clarity MPPA has had numerous discussions with the region regarding all 17 of our member's connection to the TO/TOP in Michigan. Our discussions have resulted in defending 6 of our members specifically from the "Bright Line definition" path while having no tools in our tool box to substantiate our exclusion. When a small municipality with a peak load of 12.6 MW and no generation must be defended from a TO and/or TOP registration just because of its connection to it's TO/TOP the process requires needed adjustment for clarity. This was too small to even qualify as a DP under the Statement of Compliance Registry Criteria but must have to defend itself from a TO/TOP registration issue. (3) Appropriate Generator Thresholds. In the standards development process, it has become apparent that the thresholds for classifying generators as BES in the current NERC Statement of Compliance Registry

Organization	Yes or No	Question 1 Comment
		Criteria ("SCRC") (20 MVA for individual generators, 75 MVA for multiple generators aggregated at a single site), which predate the adoption of FPA Section 215, were never the product of a careful analysis to determine whether generators of that size are necessary for operation of the interconnected bulk transmission system. Ideally, such an analysis would be conducted as part of the current standards development process. A member of MPPA has been involved in a registration issue and it has a 3rd party study conducted by a nation consulting firm showing for the MISO area, generation levels of 100 MVA and 300 MVA aggregate or above are below the standard calculation mathematical significant impact criteria for static and dynamic planning protocol. MPPA recognizes that, given the deadlines imposed by FERC in Order No. 743, it will not be possible for the SDT to conduct such an analysis within the time available. Accordingly, MPPA agrees with the approach taken by the SDT, which is to propose a Phase 2 of the standards development process that would address the generator threshold issue and several other technical issues that have arisen during the current process. As long as Phase 2 proceeds expeditiously, MPPA is prepared to support the BES definition as proposed by the SDT. While MPPA strongly supports the overall approach adopted by the SDT and much of the specific language incorporated into the second draft of the BES definition, we believe the second draft would benefit from further clarification or modification in a number of respects, most of which are detailed in our subsequent answers. Our support for the definition is not contingent upon these changes being adopted. Further, we believe a workable Exclusion Process is essential for a BES Definition that will meet the legal requirements of FPA Section 215, especially for systems operating in the Eastern Interconnection. That being said, we raise the issue here to emphasize the importance of the Exclusions for Local Networks and Radial Systems and the Exceptions process. These Exclusions and the Exceptions are essential for a definition

Organization	Yes or No	Question 1 Comment
		that works in the Eastern Interconnection because the core definition will be over-inclusive in our region. As long as those Exclusions and the Exceptions Process are retained in a form substantially equivalent to those produced by the SDT at this juncture, MPPA will support the SDT's proposal. Finally, we suggest that the SDT address the circumstances when a facility is covered by both an Inclusion and an Exclusion. We note that some of the inclusions already contain language addressing this question. For example, Inclusion 1 indicates that transformers falling within the specified parameters are part of the BES ". . . unless excluded under Exclusions E1 or E3." Where it is not already included, similar language should be included in the other Inclusions and/or Exclusions to explain whether the SDT intends the Inclusions or the Exclusions to predominate in situations where facilities might be covered by both. We suggest clarifying language in our comments to I1 and I4 below.
Response: The exception process will be filed concurrently with the definition. Phase 2 of this project will begin immediately following the conclusion of Phase 1 as SDT resources free up. The goal of the SDT and the Rules of Procedure Team is to have the Exception Process begin concurrently with the implementation of the revised BES Definition. See the detailed response to your comments regarding Inclusion I1 and I4 in the specific questions and responses below.		
FirstEnergy Corp.	Yes	However, consider changing the last sentence to read "This does not include facilities operated at less than 100kV, unless modified below, which are are used in the local sub-transmission and distribution of electric energy."
Response: The SDT discussed your comments and decided not to change the core definition. The BES definition does not include facilities operated at less than 100 kV.		
Industrial Customers of Northwest	Yes	The Industrial Customers of Northwest Utilities ("ICNU") submits the

Organization	Yes or No	Question 1 Comment
Utilities		following comments regarding the North American Electric Reliability Corporation's ("NERC") proposal for defining the Bulk Electric System ("BES"). ICNU is an incorporated, non-profit association of large end-use electric customers in the Pacific Northwest, with offices in Portland, Oregon. ICNU previously submitted comments in the Western Electricity Coordinating Council's ("WECC") process for defining the BES. ICNU's members are not electric utilities, but some ICNU members own substations that are interconnected to utility transmission systems and utility distribution systems. In addition, in some cases, ICNU members operate local distribution facilities behind their substations to serve their end-use loads. In some cases, the ICNU member's interconnection to the utility-owned transmission system or distribution system is via a utility-owned radial line; and, in others, the ICNU member's distribution system is looped into the utility's transmission system for reliability purposes. Finally, some ICNU members have local distribution systems that include the ICNU member's backup generating facilities. ICNU is submitting comments, because these facilities arguably could fall within NERC's proposed definition of BES. ICNU appreciates the work that NERC has done to date, and encourages NERC to develop a rule that recognizes the unique aspects of the Pacific Northwest transmission system and the particular needs of end-use customers. Given the arbitrary requirements and limitations imposed by the Federal Energy Regulatory Commission, ICNU supports NERC's overall approach to defining the BES. NERC has proposed a bright line rule in which all transmission elements operated 100 kV or higher will be included in the definition, subject to certain inclusions and exclusions. ICNU supports NERC's goal of excluding facilities in the local distribution of electric energy. NERC proposes three general classes of exclusions, which includes certain radial systems, generating units that serve all or part of retail customer's load, and local networks. Specifically, NERC proposes that: 1) radial systems 100 kV and higher shall be excluded if they only serve load, or only include

Organization	Yes or No	Question 1 Comment
		certain generation resources less than 75 MVA; 2) generating units that serve customer load on the customer meter are excluded if the net capacity provided to the BES does not exceed 75 MVA and standby, back up and maintenance power services are provided; 3) local networks operated less than 300 kV that distribute power to load rather than transfer bulk power across the interconnected system; and 4) reactive power owned and operated by a retail customer solely for its own benefit. ICNU supports these exclusions; however, ICNU is concerned that certain end-use retail customer facilities that do not impact the BES may still be inappropriately included. NERC appears to recognize this possibility and includes an exception process to include or exclude facilities on a case-by-case basis. ICNU urges NERC to develop this exception process, and to review the work by WECC regarding how to structure an appropriate exception. At a minimum, the exception process should not require end-use customers to perform costly and complex studies, but should instead require utilities or regional organizations that have the relevant expertise to conduct the necessary studies to determine if a specific facility should be removed or included in the BES. ICNU is also concerned about the term "non-retail generation," which does not appear to have a corresponding definition. ICNU understands that non-retail generation is intended to apply to generation behind the retail customer's meter. ICNU recommends that net metered systems should not count towards the generation limits for radial and local network systems.
Response: See the detailed comments on this issue in the responses to the comments on the Rules of Procedure Exception Process as well as the Detailed Information to Support an Exception Request Form. To address your second comment, the SDT declined to change the term "non-retail generation". Non-retail generation is the generation on the system (supply) side of the retail meter.		

Organization	Yes or No	Question 1 Comment
PacifiCorp	Yes	PacifiCorp believes the SDT continues to make substantial progress towards a clear and workable definition of the Bulk Electric System ("BES") that markedly improves both the existing definition and the SDT's previous proposal. PacifiCorp strongly supports the new definition, conditioned on: (1) a workable Exceptions process being developed in conjunction with the BES definition; and, (2) the SDT moving forward expeditiously on Phase 2 of the standards development process in accordance with the SAR recently put forward by the SDT.
Response: The SDT appreciates your support for the clarifying changes made to the core definition. The goal of the SDT and the Rules of Procedure Team is to have the Exception Process begin concurrently with the implementation of the revised BES Definition. Phase 2 of this project will begin immediately following the conclusion of Phase 1 as SDT resources free up.		
Holland Board of Public Works	Yes	Holland BPW believes that the proposed definition is an improvement to the status quo, but requires additional work. The thresholds for classifying generators as Bulk Electric System (BES) must be revised. There was little technical support for proposing the current thresholds. No greater evidence than that which was proffered for the initial thresholds should be required to modify those standards. Four years of compliance experience and industry feedback support increasing these thresholds. Holland BPW supports increasing the generation thresholds from 20 MVA (individual gross nameplate) and 75 MVA (aggregate gross nameplate) to not less than 100 MVA (individual gross nameplate) and 300 MVA (aggregate gross nameplate). Holland BPW recognizes that the SDT and NERC have committed to making these revisions as part of "Phase 2", and are asking the industry to trust that such an initiative will not succumb to work on other initiatives. However, even if work on this initiative commences

Organization	Yes or No	Question 1 Comment
		immediately, entities that should be removed from the Compliance Registry face costs of compliance or the risk of non-compliance penalties even though their facilities are not necessary for the reliable operation of the interconnected transmission system. That said, there are two significant improvements in the revised draft. First, it is essential to make clear that the "Inclusions" and "Exclusions" apply only to the first sentence of the core definition (i.e., "Transmission Elements"). The revised definition appears to address this. By placing "Unless modified by the lists shown below" at the beginning of the first sentence of the definition clarifies that the lists of Inclusions and Exclusions pertain only to "Transmission Elements" that would otherwise be included or excluded from the core definition. The revised definition and the lists of Inclusions and Exclusions do not and cannot be applied in a manner to pull in facilities used in the local distribution of electric energy as BES facilities because Congress, by statute, has already determined that such facilities are outside of NERC's reach, as recognized by the second sentence of the definition. Second, Holland BPW supports the addition of the second sentence of the core definition that states, "This does not include facilities used in the local distribution of electric energy." This language provides necessary recognition to the jurisdictional limitation provided for in Section 215 of the Federal Power Act, and as recognized by the FERC in Orders 743 and 743-A (see, e.g., Â¶Â¶ 58-59 in 743-A). Finally, if the revised definition goes forward, it is imperative that the rules of procedure providing for an exception process be adopted at the same time.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing		

Organization	Yes or No	Question 1 Comment
deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. As for your second group of comments, the SDT appreciates your support for the clarifying changes made to the core definition. The goal of the SDT and the Rules of Procedure Team is to have the Exception Process begin concurrently with the implementation of the revised BES Definition.		
Dominion	Yes	Dominion agrees with the clarifying changes provided that the use of the capitalized terms “Transmission” and “Elements” mean that an Element that is radial is not part of the BES regardless of whether it is specifically included in the Exclusions (E1 through E4).
Response: To the extent that a radial facility that is >100 kV does not meet the exclusion criteria as specified in Exclusions E1 through E4, the Exception Process can be used to provide a final decision on whether the facility is or is not a BES Element.		
Sacramento Municipal Utility District	Yes	In an effort to avoid potential confusion and provide clarity we believe the following sentence “This does not include facilities used in the local distribution of electric energy” more appropriately fits under the “exclusions,” rather than “inclusions,” section.
ISO New England Inc	Yes	The second sentence is unclear with respect to its intent. If it’s intended to cover the exclusion described in E3, the sentence is not needed. If it’s intended to mean something else, it is unclear as to what is intended and likely should be deleted.
Manitoba Hydro	Yes	Manitoba Hydro agrees in general with the changes made to the core definition but the sentence ‘This does not include facilities used in the local

Organization	Yes or No	Question 1 Comment
		distribution of electric energy' should be removed as it is covered under Exclusion E3 and reduces the clarity of the core definition.
City of Austin dba Austin Energy	Yes	In an effort to avoid potential confusion and provide clarity we believe the sentence, "This does not include facilities used in the local distribution of electric energy," more appropriately fits under the "exclusions" (rather "inclusions") section.
Balancing Authority Northern California	Yes	In an effort to avoid potential confusion and provide clarity we believe the following sentence "This does not include facilities used in the local distribution of electric energy" more appropriately fits under the "exclusions," rather than "inclusions," section.
Response: The SDT discussed your comment and decided against moving the sentence in the core definition that refers to facilities used in the local distribution of electricity to the Exclusions section. There were many commenters who were in favor of the inclusion of the sentence in the core definition.		
ExxonMobil Research and Engineering	Yes	However, in Order 743, FERC directed NERC to further delineate the differences between transmission systems (used to transfer electric power between regions) and distribution systems (used to deliver electric power locally). The inclusions and exclusions defined in the draft BES definition are a step in the right direction, but further work is necessary during Phase 2 to meet the intention of the order. Additionally, the SDT should consider defining terms, such as non-retail generation, or providing references (footnotes) that elaborate on the referenced concept.
Response: Thank you for your support of Phase 2. Non-retail generation is the generation on the system (supply) side of the retail meter.		

Organization	Yes or No	Question 1 Comment
Transmission Access Policy Study Group	Yes	TAPS appreciates the SDT's work on this project. For the most part, TAPS supports what it believes to be the intent of the proposed language. The proposed specific exclusion of facilities used in the local distribution of electric energy is appropriate and consistent with Section 215 of the Federal Power Act. However, we have one suggestion to better carry out what we believe to be the SDT's intent. The SDT proposes to change the core generation definition from the prior version's "...Real Power resources as described below, and Reactive Power resources connected at 100 kV or higher unless such designation is modified by the list shown below," to "Unless modified by the lists shown below, ... Real Power and Reactive Power resources connected at 100 kV or higher...." Because of this change from "as described below... unless... modified by the list shown below" to simply "unless modified by the lists shown below," the proposed core definition now has the effect of including all generation, regardless of size, that is connected at over 100kV. We do not think this is the SDT's intent. For the same reason, the core definition now has the effect of including all Reactive Power resources connected at over 100kV, including generators; Inclusion I5, which includes "[s]tatic or dynamic devices dedicated to supplying or absorbing Reactive Power," does not alter the core definition's inclusion of all Reactive Power resources connected at over 100kV (whether "dedicated" or not). The most straightforward solution to this problem is to simply delete Real and Reactive Power resources from the core definition, so that such resources are instead handled entirely in the Inclusions. The core definition would thus read: "Unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher. This does not include facilities used in the local distribution of electric energy."
Florida Municipal Power Agency	Yes	FMPA appreciates the SDT's work on this project. For the most part, FMPA supports what it believes to be the intent of the proposed language. The proposed specific exclusion of facilities used in the local distribution of

Organization	Yes or No	Question 1 Comment
		electric energy is appropriate and consistent with Section 215 of the Federal Power Act. However, we have suggestions to better carry out what we believe to be the SDT's intent. The first sentence can be read as: "... all ... Real Power and Reactive Power resources connected at 100 kV or higher", which is surely not what the SDT intends. The basic problem is that Inclusions I2 and I4 do not modify the first sentence, e.g., from a set theory perspective, the set described by the first sentence includes the sets described in inclusions I2 and I4; hence, I2 and I4 do not modify the first sentence. From a literal reading, this would cause any size generator connected at 100 kV to be included, which is surely not the intent of the SDT. For similar reasons, the core definition and Inclusion I5 now has the effect of including all generators connected at 100 kV since a generator is a "dynamic device ... supplying or absorbing Reactive Power". The word "dedicated" in I5 is not sufficient in FMPA's mind to unambiguously exclude generators from this statement. FMPA suggests the following wording to address these issues:"Transmission Elements (not including elements used in the local distribution of electric energy) and Real Power and Reactive Power resources as described in the list below, unless excluded by Exclusion or Exception: a. Transmission Elements other than transformers and reactive resources operated at 100 kV or higher. b. Transformers with primary and secondary terminals operated at 100 kV or higher. c. Generating resource(s) (with gross individual or gross aggregate nameplate rating per the ERO Statement of Compliance Registry Criteria) including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above. d. Blackstart Resources identified in the Transmission Operator's restoration plan. e. Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a

Organization	Yes or No	Question 1 Comment
		voltage of 100 kV or above, but not including generation on the retail side of the retail meter. f. Non-generator static or dynamic devices dedicated to supplying or absorbing more than 6 MVAr of Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in bullet 2 above."
Response: The SDT discussed your comments and declined to make changes to the core definition. However, clarifying changes were made to Inclusion I2 to specify the generation thresholds to be included in the BES. In addition, the SDT added a clarifying phrase to Inclusion I5 to emphasize that the item is not meant to apply to generators.		
MEAG Power	Yes	MEAG agrees to the clarifying changes to the core definition in general, however, we maintain that 200kV and above is the correct bright line for the BES.
Electricity Consumers Resource Council (ELCON)	Yes	However, one of the FERC directives in Order 743 charged NERC with delineating the difference between transmission and distribution. The Inclusions and Exclusions are a step in that direction, but this subject will need more consideration in Phase 2.
Texas RE NERC Standards Subcommittee	Yes	However, one of the FERC directives in Order 743 charged NERC with delineating the difference between transmission and distribution. The Inclusions and Exclusions are a step in that direction, but this subject will need more consideration in Phase 2.
SERC OC Standards Review Group	Yes	The SERC OC Standards Review Group agrees to the clarifying changes to the core definition in general; however, we maintain that 200kV and above is the correct bright line for the Bulk Electric System.
AECI and member GandTs, Central Electric Power Cooperative, KAMO	Yes	In general, we agree with this revision. We however believe the correct voltage thresholds to be, transformer primary voltage of 200 kV or higher and

Organization	Yes or No	Question 1 Comment
Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative		secondary voltage of 100 kV or higher.
Tennessee Valley Authority	Yes	TVA agrees to the clarifying changes to the core definition in general; however, we maintain that 200kV and above is the correct bright line for the Bulk Electric System, and requests that the Phase 2 for the project use 200kV and above or develop a transmission voltage and/or an MVA threshold that is technically based.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Puget Sound Energy	Yes	This draft of the defintion is very much improved. We appreciate the work of the Standard Development Team and its efforts to increase the clarity of this important definition. For additional clarity, the first paragraph should read "Unless specifically excluded under the list of exclusions below or included or excluded through the Procedure for Requesting and Receiving an Exception from the Application of the NERC Definition of Bulk Electric System, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher,

Organization	Yes or No	Question 1 Comment
		including those Transmission Elements described in the list of inclusions below." The sentence "This does not include facilities used in the local distribution of electric energy." should be removed from the first paragraph. Because this issue is specifically addressed in exclusions E1 and E3, the inclusion of this general sentence here is unnecessary and could even be ambiguous (raising the question of whether additional Transmission Elements might be excluded even if not described in E1 or E2).
Response: The SDT discussed your comment and decided against deletion of the sentence in the core definition that refers to facilities used in the local distribution of electricity. There were many commenters who were in favor of the inclusion of the sentence in the core definition. Additionally, the SDT does not agree with the premise that the exclusions are fully sufficient to not include any facilities used in the local distribution of electricity in the definition. No change made.		
Z Global Engineering and Energy Solutions	Yes	We support these changes however feel that further clarification needs to be made regarding the E1 Note. This note currently states "Note - A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion" This note is not clear. We recommend that the note is rewritten to be clear that a normally open switching device should not be viewed as normally closed as the regions are currently doing. Possible language: "Note: A normally open switching device between radial systems, as depicted on prints or oneline diagrams, for example, does not classify the two or more radial lines as a loop line. The exclusion will still apply.”}"
Response: The SDT discussed your comment and declined to make the suggested change. It is the intent of the SDT that a switch that is marked normally open as depicted on prints or one-lines be treated as normally open when deciding whether a facility is or is not a BES Element.		
Northern Wasco County PUD	Yes	We agree with the changes. We must point out that the overall flow, or how one proceeds through the inclusions and exclusions is not clear. Can an item

Organization	Yes or No	Question 1 Comment
		that meets an inclusion be subsequently excluded? If so, this needs to be explicitly stated. So far, we only have the flow chart produced by the ROP team that indicates otherwise (http://www.nerc.com/docs/standards/sar/20110428_BES_Flowcharts.pdf). This was made evident by the question at the 9/28 webinar regarding an I5 capacitor on an E3 local network. The questioner thought the capacitor was BES per I5, but the answer was that it was excluded per E3. We can find no support for the answer given. The listing of specific exclusions within I1 (exception proves the rule) argues for questioner's stance that the capacitor is BES as written. Also, if included items could subsequently be excluded, they would be no different from any other item that met the voltage threshold of 100kV. There would be no need for any of the inclusions if all possible outputs from the inclusion tests go to the same exclusion test inputs. We strongly support the addition of the language regarding local distribution facilities, as it matches congressional intent to leave the regulation of these facilities to state and local authorities.
Harney Electric Cooperative, Inc.	Yes	HEC agrees with the changes by the SDT. Although HEC believes that there needs to be explicit language stating whether or not an item that meets inclusion can be overridden by an exclusion. An example of this was given during the Webinar on 9/28 regarding a Capacitor included under I5 yet excluded under E3 according to the NERC representative.
Central Lincoln	Yes	We agree with the changes. We must point out that the overall flow, or how one proceeds through the inclusions and exclusions is not clear. Can an item that meets an inclusion be subsequently excluded? If so, this needs to be explicitly stated. So far, we only have the flow chart produced by the ROP team that indicates otherwise (http://www.nerc.com/docs/standards/sar/20110428_BES_Flowcharts.pdf). This was made evident by the question at the 9/28 webinar regarding an I5 capacitor on an E3 local network. The questioner thought the capacitor was

Organization	Yes or No	Question 1 Comment
		BES per I5, but the answer was that it was excluded per E3. We can find no support for the answer given. The listing of specific exclusions within I1 (exception proves the rule) argues for questioner's stance that the capacitor is BES as written. Also, if included items could subsequently be excluded, they would be no different from any other item that met the voltage threshold of 100kV. There would be no need for any of the inclusions if all possible outputs from the inclusion tests go to the same exclusion test inputs.We strongly support the addition of the language regarding local distribution facilities, as it matches congressional intent to leave the regulation of these facilities to state and local authorities.
Mission Valley Power	Yes	Mission Valley Power - We agree with the changes. We must point out that the overall flow, or how one proceeds through the inclusions and exclusions is not clear. Can an item that meets an inclusion be subsequently excluded? If so, this needs to be explicitly stated. So far, we only have the flow chart produced by the ROP team that indicates otherwise (http://www.nerc.com/docs/standards/sar/20110428_BES_Flowcharts.pdf). This was made evident by the question at the 9/28 webinar regarding an I5 capacitor on an E3 local network. The questioner thought the capacitor was BES per I5, but the answer was that it was excluded per E3. We can find no support for the answer given. The listing of specific exclusions within I1 (exception proves the rule) argues for questioner's stance that the capacitor is BES as written. Also, if included items could subsequently be excluded, they would be no different from any other item that met the voltage threshold of 100kV. There would be no need for any of the inclusions if all possible outputs from the inclusion tests go to the same exclusion test inputs. We strongly support the addition of the language regarding local distribution facilities, as it matches congressional intent to leave the regulation of these facilities to state and local authorities.
Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will		

Organization	Yes or No	Question 1 Comment
identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		

Organization	Yes or No	Question 1 Comment
Long Island Power Authority	Yes	Need to define the term "local distribution"
Response: The SDT believes that with the last sentence in the core definition and Exclusions E1 and E3 that the term has been sufficiently distinguished with regard to the BES. No change made.		
Utility Services, Inc.	Yes	Upon reflection of the core definition and BES Inclusion Designations, Utility Services believes that there is an unintended redundancy between the two. Utility Services would like to suggest that the portion of the core definition that refers to the Real and Reactive Power resources be removed from the core and to leave the Inclusions as is.
Response: The SDT discussed your comment and decided against making a change to the core definition. However, a new parenthetical was added in Inclusion I5 to clarify that the item is meant to exclude generators.		
Cowlitz County PUD	Yes	Cowlitz County PUD No. 1 (Cowlitz) commends the SDT for the simplified concise core definition. However, Cowlitz believes that only Real and Reactive Power resources necessary for the support of the BES should be included. Therefore, Cowlitz suggests the core definition or the Inclusions section state this. This will allow basis for demonstrating resource Elements should be excluded from the BES through the Rules of Procedure exception process. This is not to say that owners of non-BES resource Elements should not be registered, as such entities may still have an obligation to contribute BES Reliability functions. Cowlitz votes affirmative and believes the above concern can be addressed in Phase 2.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of		

Organization	Yes or No	Question 1 Comment
industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
Ameren	Yes	a)The general concept is sound, but the Inclusion and Exclusion sections create so many circular references it is virtually impossible to take a definitive stance on whether an asset is included or excluded to the BES definition. Please revise the inclusion and exclusion criteria to give pinpointed statements that are final and do not reference other criteria, that then again reference other criteria. b)We believe that 200kV and above is the appropriate bright line for the Bulk Electric System. c)In I5, only those Reactive Power devices applied for the purpose of BES support or BES voltage control should be included. A Reactive Power device connected at >100kV but used for the purpose of voltage support to local load should not be included. d)The core definition uses "Transmission Elements" while E1 uses "transmission Elements". What is the difference? If one or both terms are applicable, their definition should be included.
Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit		

Organization	Yes or No	Question 1 Comment
breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the		

Organization	Yes or No	Question 1 Comment
definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. The SDT points the commenter to Exclusion E4 for the handling of such a situation. The SDT considered the disposition of the word "transmission" in the context of Exclusion E1, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element".		
The Dow Chemical Company	Yes	The Dow Chemical Company ("Dow) is an international chemical and plastics manufacturing firm and a leader in science and technology, providing chemical, plastic, and agricultural products and services to many essential consumer markets throughout the world. Dow and certain of its worldwide affiliates and subsidiaries, including Union Carbide Corporation, own and operate electrical facilities at a number of industrial sites within the U.S., principally, in Texas and Louisiana. The electrical facilities at these various industrial sites are configured similarly and perform similar functions. In most cases, a tie line or lines connect the industrial site to the electric transmission grid. Power is delivered from the electric transmission grid to the industrial site through the tie line(s). Lines "behind-the-meter" within the industrial site then deliver power to individual manufacturing plants within the site. Additionally, cogeneration facilities, some of which are well over 75 MW in size, are located at a number of industrial sites owned by Dow and its subsidiaries. These cogeneration facilities generate power that is distributed within the industrial site and used for manufacturing plant operations. In some instances, excess power not required for plant operations is delivered back into the electric transmission grid through the tie line(s) connecting the industrial site to the grid. While the tie lines and some of the internal lines at these industrial sites operate at 100kV or higher, they do not perform anything that resembles a transmission

Organization	Yes or No	Question 1 Comment
		function. Rather than transmit power long distances from generation to load centers, the tie lines and internal lines perform primarily an end user distribution function consisting of the distribution of power brought in from the grid or generated internally to different plants within each industrial site. In some cases, the facilities also perform an interconnection function to the extent they enable power from cogeneration facilities to be delivered into the grid. The voltage of the tie lines and internal lines at these industrial sites is dictated by the load and basic configuration of each site. Higher voltage lines are used when necessary to meet applicable load requirements or to reduce line losses. That does not mean that such lines perform a transmission function. At some sites, Dow is registered as a Generation Owner and Generation Operator. At other sites, the applicable Regional Entity has found that such registration is not required because of the relatively small amount of power supplied to the grid from the applicable cogeneration resources, even though those cogeneration resources have an aggregate capacity greater than 75 MVA (gross aggregate nameplate rating). Tie lines (to the grid) and internal lines at an industrial site that operate at 100kV or higher should be excluded from the BES definition if, due to the relatively small amount of power supplied to the grid from the generation resources at the site, the owner of those generation resources is not required to be registered as a Generation Owner and the operator of those generation resources is not required to be registered as a Generation Operator. At sites where the owner of the generation resources is registered as a Generation Owner and the operator of those generation resources is registered as a Generation Operator, the internal lines (between the generation resources and the manufacturing plants) that operate at 100kV or higher should be excluded from the BES definition, because they are distribution and not transmission facilities. The lines interconnecting the generation resources at such sites to the transmission grid should be included in the BES definition, but the owner and operator of such

Organization	Yes or No	Question 1 Comment
		interconnection lines should not be registered as a Transmission Owner or Transmission Operator. In no instance has a Regional Entity determined that Dow or any subsidiary should be registered as a Transmission Owner or Transmission Operator. Instead, such interconnection lines should be considered as part of the generation resource and Generation Owners and Generation Operators should be subject to reliability standards specifically developed for such interconnection lines. Dow is strongly opposed to any BES definition that would result in either the tie lines or the internal lines at industrial sites being subject to the mandatory reliability standards applicable to Transmission Owners and Transmission Operators. Complying with reliability standards would cause Dow and its subsidiaries to incur substantial compliance costs and create potential exposure to penalties in the future for noncompliance. Perhaps such costs and exposure could be justified if subjecting these facilities to compliance with reliability standards resulted in a material increase in reliability of the BES, but there is no reason to believe that will be the case. In fact, the opposite might be true. The tie lines and internal lines at industrial sites owned by Dow and its subsidiaries have been operated for decades as end user distribution and interconnection facilities, and practices and procedures have developed over the years that have enabled such operations to achieve a high degree of reliability for such sites. Requiring these facilities to now operate in a different manner as transmission facilities may well result in a degradation of the reliability of the manufacturing plants located at such sites. For example, outages would have to be coordinated with the RTO, which may not be interested in coordinating such outages with scheduled manufacturing plant outages. In light of these considerations, Dow agrees with the proposed revisions to the core definition, particularly the proposal to include a sentence expressly excluding facilities used in the local distribution of electric energy, provided it is understood that end user-owned delivery facilities located “behind-the-meter” are, regardless of

Organization	Yes or No	Question 1 Comment
		voltage level, presumptively outside the scope of this definition.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration.		
City of Redding	Yes	Redding is concerned that NERC has a predetermined definition of Distribution Facilities and will not evaluate networked distribution facilities fairly. NERC stated their predetermined position in their "MOTION TO INTERVENE AND COMMENTS OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION" filed in the case of the City of Holland, Michigan (Docket No. RC11-5-000). On page 10 and 11 of this motion, under the section labeled "A. Holland's 138 kV lines are transmission rather that local distribution facilities" NERC states "Distribution facilities generally are characterized as elements that are designed and can carry electric energy (Watts/MW) in one direction only at any given time from a single source point (distribution substation) to final load centers." NERC is clearly states that only radial facilities are considered distribution facilities and are unwilling to consider that network facilities over 100Kv could be classified as Distribution Facilities. Holland's claim of NERC over reaching their authority appears to have credibility. In conclusion, Redding supports the addition of Distribution Facilities as an exclusion but believes that the BES Definition phase 2 needs to clearly define the difference between Distribution and Transmission Facilities by identifying the equipment "necessary for the Reliable Operation of the interconnected bulk power transmission system".
Response: See the detailed comments on this issue in the Responses to the comments to the Question 2 of the Exception Process		

Organization	Yes or No	Question 1 Comment
as well as the Detailed Information to Support an Exception Request Form. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
Xcel Energy		In general, Xcel Energy supports the changes to the core definition of Bulk Electric System. Some additional clarification may be required as suggested below under the individual Inclusions or Exclusions.
Tacoma Power	Yes	Tacoma Power supports the core definition as currently written.
Redding Electric Utility	Yes	
ATC LLC	Yes	
Portland General Electric Company	Yes	
Farmington Electric Utility System	Yes	
Georgia System Operations Corporation	Yes	
Nebraska Public Power District	Yes	The drafting team has done a great job of adding clarity and to improving the BES definition. Although more work is needed as noted in comments

Organization	Yes or No	Question 1 Comment
		below, overall the drafting team is on the right track with the BES defintion.
Oncor Electric Delivery Company LLC	Yes	
LCRA Transmission Services Corporation	Yes	
Memphis Light, Gas and Water Division	Yes	
Independent Electricity System Operator	Yes	
PSEG Services Corp	Yes	
Orange and Rockland Utilities, Inc.	Yes	
City of St. George	Yes	The core definition is acceptable as long as the concerns for inclusion and exclusion are addressed as outlined in the other comments.
American Electric Power	Yes	
Tillamook PUD	Yes	We strongly support the addition of the language regarding local distribution facilities, as it matches congressional intent to leave the regulation of these facilities to state and local authorities.
Consumers Energy	Yes	
Springfield Utility Board	Yes	SUB particularly agrees with the addition of, “This does not include facilities used in the local distribution of electric energy.” to the BES draft definition.

Organization	Yes or No	Question 1 Comment
NV Energy	Yes	The core definition is simpler than the prior version. We support the addition of the last sentence regarding the exclusion of facilities used in the local distribution of electric energy.
Duke Energy	Yes	
Chevron U.S.A. Inc.	Yes	Yes. Very good progress was made in the process. The initial overly broad language was inadvertently including parties that are not necessary to meet the NERC and FERC goals. The current language has clarified some of the ambiguities.
Central Hudson Gas and Electric Corporation	Yes	
Idaho Falls Power	Yes	We generally support the changes made.
Exelon	Yes	
Southern Company	Yes	
Texas Industrial Energy Consumers	Yes	
Tri-State GandT	Yes	We believe that the new definition is a good clarification.
Western Area Power Administration	Yes	
Tri-State Generation and Transmission Assn., Inc. Energy Management	Yes	We believe that the new definiation is a good clarification.
MRO NERC Standards Review Forum	Yes	

Organization	Yes or No	Question 1 Comment
(NSRF)		
Pepco Holdings Inc and Affiliates	Yes	
ACES Power Marketing Standards Collaborators	Yes	
WECC Staff	Yes	
Bonneville Power Administration	Yes	
Northeast Power Coordinating Council	Yes	
SERC Planning Standards Subcommittee	Yes	
BGE	Yes	No comment.
Response: Thank you for your support.		

2. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I1 (transformers)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: Several commenters asked for additional clarity in the description of the types of transformers covered by Inclusion I1 and in response the SDT has slightly revised the language in Inclusion I1 based upon comments received and to provide additional clarity as shown below.

Several commenters suggested that Inclusion I1 contain a statement to identify the subset of transformers that are not covered by Inclusion I1 and the SDT declined to make this revision. The SDT believes the use of language in the definition to state what is also excluded is redundant and not needed in the definition.

Some comments were received suggesting modifying to Inclusion I1 to add a 200 kV threshold. Using a 200 kV voltage threshold and/or an MVA threshold for inclusion of transformers in the BES and the addition of demarcation points will be considered in Phase 2 of this effort. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

Several commenters asked for additional clarity on the hierarchy of inclusions and exclusions. The SDT provides the following guidance on this topic.

The application of the draft ‘bright-line’ BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES ‘core’ definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the ‘core’ definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the ‘core’ definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.

Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2.

Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.

In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.

I1 - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.

Organization	Yes or No	Question 2 Comment

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	More specific description is needed for the equipment intended to be included in I1. For example, is it intended to include autotransformers, PARs, primary, secondary, tertiary windings, etc.? There will be difficulty applying the definition to facilities without this detail. Suggest rewording to: All transformers (including auto-transformers, voltage regulators, and phase angle regulators and all windings) with primary and secondary terminals operated at or above 100kV, and generator step-up (GSU) transformers with one terminal operated at or above 100KV, unless excluded by E1 or E3.
NESCOE	No	NESCOE supports the revised Inclusion I1 language that treats Exclusions E1 and E3 as alternative exclusions, either of which may qualify as an exclusion. However, specificity is needed regarding what equipment is included in I1 (e.g., autotransformers, PARs, primary, secondary, tertiary windings).
Massachusetts Department of Public Utilities	No	The MA DPU supports the revised Inclusion I1 language that treats Exclusions E1 and E3 as alternative exclusions, either of which may qualify as an exclusion. However, specificity is needed regarding what equipment is included in I1 (e.g., autotransformers, PARs, primary, secondary, tertiary windings).

Response: Several commenters indicated that additional specificity is needed to describe the transformers in Inclusion I1 and the SDT added the word, "terminal" and the phrase, "at least one" to Inclusion I1 for additional clarity. The revised Inclusion I1 now reads:

> **I1** - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.

The SDT provides the following guidance with respect to inclusions and exclusions to provide clarity on how to use the definition and in response to your comment:

The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between

Organization	Yes or No	Question 2 Comment
BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
AECI and member GandTs,	No	"100 kV or above" should be modified to "200 kV or above with a registered

Organization	Yes or No	Question 2 Comment
Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative		rating of 150 MVA or greater."
Response: The issue of transformer voltage level and possibly an MVA threshold level will be discussed in Phase 2 of this project. No change made.		
Duke Energy	No	For clarity regarding 3 and 4 winding transformers, it should say "primary and at least one secondary terminal operated at 100 kV or higher.
Response: The SDT has revised the language to provide the clarity suggested in the comment. **I1** - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.		
New York State Dept of Public Service	No	o I1 lacks specificity that can lead to confusion and required clarifications. Suggested wording change: All transformers (including auto-transformers, voltage regulators, and phase angle regulators and all windings) with primary and secondary terminals operated at or above 100 kV, and generator step-up (GSU) transformers with one terminal operated at or above 100 kV, unless excluded by E1 or E3.
ISO New England Inc	No	I1 needs to be clarified such that it is clear on whether this includes autotransformers, phase angle regulators, and devices which have a tertiary winding. Using the tertiary winding as an example, it is not clear whether the tertiary winding itself is considered BES, especially if it is serving a radial system

Organization	Yes or No	Question 2 Comment
		as described in E1.
Response: The SDT has slightly revised the language in Inclusion I1 based upon comments received and to provide clarity. Since a transformer is one Element, any additional tertiary windings would be included in the BES if a transformer meets this criterion for inclusion. **I1** - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.		
Rochester Gas and Electric and New York State Electric and Gas	No	We generally agree, but suggest modification to the language of Inclusion I1 to clarify its application for transformers with more than two windings: "Transformers with two or more terminals operated at 100 kV or higher, unless excluded under Exclusion E1 and E3." Based on this wording, transformer tertiary windings would also be BES - is that the intent?
Central Maine Power Company	Yes	We generally agree, but suggest modification to the language of Inclusion I1 to clarify its application for transformers with more than two windings: "Transformers with two or more terminals operated at 100 kV or higher, unless excluded under Exclusion E1 or E3." Based on this wording, transformer tertiary windings would also be BES - is that the intent?
Response: It is correct that associated tertiary windings are included in the BES if the transformer is based upon the language in Inclusion I1. Also, the SDT has slightly revised the language in Inclusion I1 based upon comments received and to provide clarity. Since a transformer is one Element, any additional tertiary windings would be included in the BES if a transformer meets this criterion for inclusion. **I1** - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.		
LCRA Transmission Services Corporation	No	LCRA TSC supports the inclusion of transformers (with both the primary and secondary windings operated at 100-kV or higher) in the BES definition; however, additional clarification is suggested. The term transformers needs to

Organization	Yes or No	Question 2 Comment
		be further defined with respect to function (auto transformers, phase angle regulators, generator step-up transformers, etc.). Similarly, a separate definition for "Transformer" could be developed and included in the NERC Glossary of Terms.
Response: The SDT believes the existing language is clear and the proposed additional language would be redundant. However, in response to comments from others, the SDT has made clarifying changes to Inclusion I1 that should address your concerns and obviate the need for a separate definition for transformers. **I1** - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.		
ExxonMobil Research and Engineering	Yes	The Inclusion I1 contains the phrase "unless excluded under Exclusion E1 or E3". While recognizing that this is a welcomed clarification on how I1 interacts with the Exclusion section, it is inconsistent with Inclusions I2 through I5. The BES SDT team should consider how to standardize the language around the interactions between the Inclusions and Exclusions (perhaps add an "unless" qualifier for each Inclusion).
Response: The SDT provides the following guidance with respect to inclusions and exclusions to provide clarity on how to use the definition and in response to your comment: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of		

Organization	Yes or No	Question 2 Comment
electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
Ameren	Yes	Agree in general, but have the following comments: a) We agree in general with the revisions to the specific inclusions for transformers in I1; however, we believe the transformer voltage level should be 200kV or above. b) The inclusion is unclear since it includes a certain voltage transformers, but excludes those that have E1 or E3 Exclusion criteria. Each exclusion criteria has multiple stipulations to its applicability, and then has a final inclusive reference to I3. Please make the wording exact and not dependent on clausal statements.

Organization	Yes or No	Question 2 Comment
Response: The issue of transformer voltage level and possibly an MVA threshold level will be discussed in Phase 2 of this project. The SDT provides the following guidance with respect to inclusions and exclusions to provide clarity on how to use the definition and in response to your comment: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2.		

Organization	Yes or No	Question 2 Comment
Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
Memphis Light, Gas and Water Division	Yes	We believe further clarification is needed to limit BES transformers only to those serving the transmission system and not distribution loads, such as excluding transformers with one or both terminals operating below 100 kV.
Response: Transformers are excluded from the BES if the secondary terminal operates below 100 kV. No change made.		
Puget Sound Energy	Yes	Inclusion I1 references primary and secondary terminals of transformers, while Inclusions I2 and I5 reference the high-side of transformers. The SDT should consider using consistent terminology throughout the definition for this concept.
Response: The SDT has reviewed the entire document for consistency in phrasing but in this particular situation finds no problem in the terminology employed. No change made.		
Michigan Public Power Agency Clallam County PUD No.1 Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative (CCEC) Central Electric Cooperatve (CEC)	Yes	MPPA supports the SDT's changes to the first Inclusion because it is more clear and simple than the initial approach. That being said, we suggest that an additional sentence of clarification would help avoid future controversy about the meaning of Inclusion 1. As MPPA understands it, the BES intends to include transformers only if both the primary and secondary terminals operate at 100 kV or above, which is why the definition uses the word "and" ("the primary and secondary terminals"). We support this approach since it would exclude transformers where the secondary terminals serve distribution loads, and which therefore function as distribution rather than transmission facilities. MPPA believes the SDT's intent would be clarified by adding a sentence at the end of

Organization	Yes or No	Question 2 Comment
Clearwater Power Company (CPC) Snohomish County PUD Consumer's Power Inc. Douglas Electric Cooperative (DEC) Fall River Rural Electric Cooperative (FALL) Lane Electric Cooperative (LEC) Lincoln Electric Cooperative (LEC) Northern Lights Inc. (NLI) Okanogan County Electric Cooperative (OCEC) Pacific Northwest Generating Cooperative (PNGC) Raft River Rural Electric Cooperative (RAFT) West Oregon Electric Cooperative Umatilla Electric Cooperative (UEC) Kootenai Electric Cooperative		Inclusion 1 that reads: "Transformers with either primary or secondary terminals, or both, that operate at or below 100 kV are not part of the BES." This language will help ensure that there is no controversy over whether the SDT's use of the word "and" in the phrase "the primary and secondary terminals" was intentional. We also support the SDT's proposal to develop detailed guidance concerning the point of demarcation between BES and non-BES elements in the Phase 2 SAR. In this regard, we note that, while Inclusion 1 at least implicitly suggests that the dividing line between BES and non-BES Elements should be at the transformer where transmission-level voltages are stepped down to distribution-level voltages, we believe further clarification of this point of demarcation between the BES and non-BES Elements is necessary. There are many different configurations of transformers and other equipment that may lie at the juncture between the BES and non-BES systems. If the point of demarcation is designated at the transformer without further elaboration, many entities that own equipment on the high side of a transformer will be swept into the BES, and thereby exposed to inappropriately stringent regulations and undue costs. For example, distribution-only utilities commonly own the switches, bus and transformer protection devices on the high side of transformers where they take delivery from their transmission provider. Ownership of these protective devices and high-voltage bus on the high side of the transformer should not cause these entities to be classified as BES owners. MPPA has some members who have been forced to sell of such assets in the hopes of remove the necessity for a TO/TOP registration path in this region. We also support the incorporation of language (". . . unless excluded under Exclusions E1 or E3") making it clear that transformers that are operated as an integral part of a Radial System or Local Network should not be considered BES facilities, regardless of their operating voltage. Further clarification might be achieved by using the phrase ". . . unless the transformer is operated as part of a Radial System meeting the requirements of Exclusion E1 or a Local Network

Organization	Yes or No	Question 2 Comment
		meeting the requirements of Exclusion E2."

Response: The SDT has slightly revised Inclusion I1 to provide additional clarity. The SDT believes it is not necessary to state what transformers are not included in the BES, which would be redundant.

> **I1** - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.

The development of demarcation points will be included in Phase 2 of this project.

The SDT provides the following guidance with respect to inclusions and exclusions to provide clarity on how to use the definition and in response to your comment:

The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3

Organization	Yes or No	Question 2 Comment
(local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
Cowlitz County PUD	Yes	Cowlitz supports the SDT's efforts to simplify this inclusion. However, Cowlitz suggests the following change to clarify the inclusive nature of the use of "and:" Transformers with primary and secondary terminals both operated at 100 kV or high**er…**
City of Austin dba Austin Energy	Yes	We believe additional clarification of transformers to be included may be achieved with respect to auto transformers, phase angle regulators and generator step-up transformers by adding the following sentence: All transformers (including autotransformers, voltage regulators, and phase angle regulators) with primary and secondary terminals operated at or above 100kV, unless excluded by E1 or E3.
Sacramento Municipal Utility District	Yes	We believe additional clarification of transformers that are to be included may be achieved with respect to auto transformers, phase angle regulators and generator step-up transformers by adding the following recommended sentence: "All transformers (including autotransformers, voltage regulators, and phase angle regulators) with primary and secondary terminals operated at or above 100kV, unless excluded by E1 or E3."

Organization	Yes or No	Question 2 Comment
Utility Services, Inc.	Yes	Utility Services supports the comments offered by other commenters who suggest that transformers and other related devices be mentioned in the inclusion.
PacifiCorp	Yes	PacifiCorp suggests a clarification to I1 to provide as follows: "Transformers with either primary or secondary terminals, or both, that operate at or below 100 kV are not part of the BES."
Balancing Authority Northern California	Yes	We believe additional clarification of transformers that are to be included may be achieved with respect to auto transformers, phase angle regulators and generator step-up transformers by adding the following recommended sentence: "All transformers (including autotransformers, voltage regulators, and phase angle regulators) with primary and secondary terminals operated at or above 100kV, unless excluded by E1 or E3."
Response: The SDT has slightly revised the language in Inclusion I1 based upon comments received and to provide clarity. **I1** - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.		
PacifiCorp	Yes	PacifiCorp suggests a clarification to I1 to provide as follows: "Transformers with either primary or secondary terminals, or both, that operate at or below 100 kV are not part of the BES."
Response: The SDT believes it is not necessary to state what transformers are not included in the BES, which would be redundant. No change made.		
Florida Municipal Power Agency	Yes	Please see comments to Question 1
Response: Please see response to Q1.		

Organization	Yes or No	Question 2 Comment
MEAG Power	Yes	We agree in general with the revisions to the specific inclusions for transformers in I1; however, we believe the transformer voltage level should be 200kV or above.
Tennessee Valley Authority	Yes	TVA agrees in general with the revisions to the specific inclusions for transformers in I1; however, we believe the low side transformer voltage level should be 200kV or above, and requests that the Phase 2 for the project use 200kV and above or develop a transmission voltage and/or an MVA threshold that is technically based.
SERC OC Standards Review Group	Yes	We agree in general with the revisions to the specific inclusions for transformers in I1; however, we believe the transformer voltage level should be 200kV or above.
Response: The issue of transformer voltage level and possibly an MVA threshold level will be discussed in Phase 2 of this project. No change made.

Response: Thank you for your support. Due to comments received from others the SDT has made clarifying changes as follows:

I1 - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.

3. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I2 (generation) including the reference to the ERO Statement of Compliance Registry Criteria? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: Comments received regarding the threshold level for generators, the relationship between the NERC Compliance Registry and the BES Definition and the need for contiguous BES elements will be considered in the Phase 2 review.

In response to comments regarding the reference to the ERO Statement of Compliance Registry Criteria (SCRC) the SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2, instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project.

The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

Inclusion I2 was clarified as follows:

I2 - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.

Organization	Yes or No	Question 3 Comment

Organization	Yes or No	Question 3 Comment
Northeast Power Coordinating Council	No	In deference to direction given to the Drafting Team, Inclusion I2 should remove the reference to the Statement of Compliance Registry Criteria. The current language induces circular arguments without a true governing document. The definition should drive what appears in the registration criteria. I2 should be revised to read: "Generating resources with a gross nameplate rating of 20MVA or greater, or generating plant/facility connected at a common bus, with an aggregate nameplate rating of 75MVA or greater and is directly connected to a BES Element." This is consistent with the proposed I2 and the current Compliance Registry Criteria. Ultimately the definition should be the governing document and provide the details of what generation should be included. It is understood that Phase 2 of this project will address this.
Balancing Authority Northern California	No	We recommend removing the reference of the ERO Statement of Compliance Registry Criteria (Registry Criteria). The BES Definition should be the governing document and independent of ERO registration requirements. The definition should drive what appears in the Registry Criteria. Additionally, we support using the BES Phase 2 technical analysis to identify and provide technical support for determining the appropriate minimum MVA rating that a single unit, or the aggregation of multiple units, must meet to be considered part of the BES.
Oregon Public Utility Commission Staff	No	Reference to NERC Statement of Compliance Registry Criteria (SCRC) needs to be eliminated from the BES Definition. This circularity must be eliminated. Proposed revised language is:"I2 - Generating resource(s) with a gross individual nameplate rating greater than 20 MVA or with a gross aggregate nameplate rating greater than 75 MVA including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above."
American Electric Power	No	AEP is a proponent of cross-referencing related documents to avoid elements from becoming out of sync, however, rather than having the BES Definition document reference the ERO Statement of Compliance Registry Criteria, perhaps it should be

Organization	Yes or No	Question 3 Comment
		the other way around. This definition document undergoes a more thorough industry development and review process. The ERO Statement of Compliance Registry Criteria does not get specific in regards to device types. The BES Definition document is a more appropriate place to designate inclusion criteria.
New York State Dept of Public Service	No	In I2, there is a reference to the Statement of Compliance Registry Criteria. However, the Statement references the BES definition. This circular logic results in a fatally flawed definition. The statement reference should be replaced with the actual intended words.
Rochester Gas and Electric and New York State Electric and Gas	No	Inclusion I2 should remove the reference to the Statement of Compliance Registry Criteria. The definition should stand on its own. I2 should be revised to read: "Generators with a gross nameplate rating of 20 MVA or greater, or a generating plant/facility connected at a common bus, with a gross aggregate nameplate rating of 75 MVA or greater and is directly connected at a voltage of 100 kV or above. BES includes the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above." This is consistent with the proposed I2 and the current Compliance Registry Criteria.
Sacramento Municipal Utility District	No	We recommend removing the reference of the ERO Statement of Compliance Registry Criteria (Registry Criteria). The BES Definition should be the governing document and independent of ERO registration requirements. The definition should drive what appears in the Registry Criteria. Additionally, we support using the BES Phase 2 technical analysis to identify and provide technical support for determining the appropriate minimum MVA rating that a single unit, or the aggregation of multiple units, must meet to be considered part of the BES.
Central Maine Power Company	No	Inclusion I2 should remove the reference to the Statement of Compliance Registry Criteria. The definition should stand on its own. I2 should be revised to read: "Generators with a gross nameplate rating of 20 MVA or greater, or a generating plant/facility connected at a common bus, with a gross aggregate nameplate rating of

Organization	Yes or No	Question 3 Comment
		75 MVA or greater; and is directly connected at a voltage of 100 kV or above. BES includes the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above." This is consistent with the proposed I2 and the current Compliance Registry Criteria.
Farmington Electric Utility System	No	FEUS is concerned I2 is dependent on the Statement of Compliance Registry Criteria (SCRC). Modification of the SCRC is not required to go through the same process of modification of a Standard but section 1400 of the NERC Rules of Procedure. Section 1400 does allow for industry comment and requires multiple tiers of approval. However, it seems by changing the SCRC generating resources may be included or excluded from the BES - without requiring modification to the definition of the BES through the Standards Development Process. In addition, Page 4 Section I of the SCRC is dependent on the NERC definition of the BES. Logically, the SCRC should be dependent on the definition of the BES not the inverse.
Response: The SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2, instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project. **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.		
Electricity Consumers Resource Council (ELCON)	No	Since an aggregate of 75 MVA is allowed at a single site, there is no basis for maintaining the 20 MVA for a single generator. The proposed MOD-026 assigns thresholds by region that are much higher than 20 MVA for modeling purposes. Since modeling generally would require more granularity than what is necessary for the reliable operation of the interconnected transmission system (BES), the SDT might want to review the threshold basis for NERC Project 2007-09 (Generator Verification). It is understood that the threshold will be reconsidered in Phase 2 of the BES Definition Project; however, a modest change from 20 to 75 MVA seems

Organization	Yes or No	Question 3 Comment
		appropriate on an interim basis justified by the current 75 MVA aggregate per site. The following phrase should be added at the end "unless excluded under Exclusion E2."
Texas RE NERC Standards Subcommittee	No	Since an aggregate of 75 MVA is allowed at a single site, there is no basis for maintaining the 20 MVA for a single generator. The proposed MOD-026 assigns thresholds by region that are much higher than 20 MVA for modeling purposes. Since modeling generally would require more granularity than what is necessary for the reliable operation of the interconnected transmission system (BES), the SDT might want to review the threshold basis for NERC Project 2007-09 (Generator Verification).
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. Coordination between the BES Definition and the MOD Standards will be addressed in Phase 2.		
Tri-State GandT	No	1. The parenthetical phrase regarding the ERO SCRC is not clear. Is the intent that the inclusion applies to any generating resource that is required to register as a Generator or Generator Operator per the ERO SCRC? Or was a reference to the 75 MVA threshold inadvertently omitted? It also seems that it wouldn't need to be in parentheses, just make it a phrase in the sentence. 2. The wording of the sentence after the parenthetical phrase is also worded

Organization	Yes or No	Question 3 Comment
		awkwardly. Suggest changing it to "including the generator terminals and all electrical equipment up to and including the high side of generator step up transformers, if they are connected at a voltage of 100 kV or higher.
Tri-State Generation and Transmission Assn., Inc. Energy Management	No	1. The parenthetical phrase regarding the ERO SCRC is not clear. Is the intent that the inclusion applies to any generating resource that is required to register as a Generator or Generator Operator per the ERO SCRC? Or was a reference to the 75 MVA threshold inadvertently omitted? It also seems that it wouldn't need to be in parentheses, just make it a phrase in the sentence. 2. The wording of the sentence after the parenthetical phrase is also worded awkwardly. Suggest changing it to "including the generator terminals and all electrical equipment up to and including the high side of generator step up transformers, if they are connected at a voltage of 100 kV or higher.
Pepco Holdings Inc and Affiliates	No	The definition should not reference the ERO Statement of Compliance Registry Criteria; rather the actual generation threshold criteria should be listed in the definition itself. This way the definition can stand on it's own without having to refer to another document for applicability. Also, the wording should be changed to read "including the generator terminals through the high side of any dedicated generator step-up transformer(s), connected at a voltage of 100kV or above." Otherwise, the present wording could ensnare distribution facilities (similar to the cranking path argument in I3) if a 21 MVA generator was connected on a distribution line with no dedicated generator step-up transformer. In that case the distribution line and substation feeder transformer might be construed to be in scope.

Response: The SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2, instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project.

I2 - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate

Organization	Yes or No	Question 3 Comment
nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above. The I2 inclusion refers only to generation " … through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above." No change made.		
ExxonMobil Research and Engineering	No	The Inclusion I1 contains the phrase "unless excluded under Exclusion E1 or E3". While recognizing that this is a welcomed clarification on how I1 interacts with the Exclusion section, it is inconsistent with Inclusions I2 through I5. The BES SDT team should consider how to standardize the language around the interactions between the Inclusions and Exclusions (perhaps add an "unless" qualifier for each Inclusion).
South Houston Green Power, LLC	No	SHGP agrees with the proposed revisions to Inclusion I2, but requests the following phrase added at the end "unless excluded under Exclusion E2".
Nebraska Public Power District	No	Inclusion 2 does not take into consideration a later exclusion (Exclusion 3). At the end of Inclusion 2 after the words "..100 kV or above." Add the words ", unless excluded under Exclusion 3".
MRO NERC Standards Review Forum (NSRF)	No	Unless excluded under E2.
Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. *Element is defined* in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "		

Organization	Yes or No	Question 3 Comment
Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
Harney Electric Cooperative, Inc.	No	HEC would like to see the inclusion of specific thresholds that are technically justified.
City of St. George	No	The basis for the Compliance Registry Criteria generation levels for inclusion seems to be arbitrary with little or no justification. As currently proposed, a small 20 MVA

Organization	Yes or No	Question 3 Comment
		generator must comply with same requirements as large units of several hundred MVA of generation capacity. Phase 2 of the BES project may help address the issue but in the meantime many facilities must comply with numerous standards with little or no benefit to the reliability of the actual BES. No timeline for Phase 2 is indicated. Finding a bright line number for the generation levels on a per unit or overall plant basis will be a difficult task, but the present MVA levels of the Registration Criteria are very low for automatic inclusion. The compliance requirements of an entity should match the impact to the system.
NV Energy	No	While we do not agree with making specific reference and linkage to the generator thresholds of the SCRC, it is understood that a timely justification of any alternative threshold was not possible. It is of paramount importance that the subject of generation thresholds be addressed in subsequent development of this Definition. We are of the opinion that generation ought to be considered as a "user" of the BES, not necessarily a part of the BES, similar in concept to the way Load uses the BES. Using this concept, the BES would be restricted to the "wires" type facilities. Standards would nevertheless be applicable to generators that use the BES, so no gap in reliability would exist.
Idaho Falls Power	No	Reliance upon the Registry Criteria falls back to the 20MVA threshold. We believe this threshold is very low and unnecessarily draws in small entities for which there is no impact to the BES. We understand the barriers and the volume of tenchnical evidence required for any change and we therefore have no alternative language to suggest.
PacifiCorp	No	Requiring owners of single generators (20 MVA - 75 MVA) to meet reliability standards that owners of distributed power producing resources (See I4) do not have to meet is discriminatory. The limit for a single unit should be set to 75 MVA until such time as a technical review can determine the appropriate levels for all generation resources. However, even with this concern, PacifiCorp supports the entire BES definition in its current form based on the timeframe under which the SDT

Organization	Yes or No	Question 3 Comment
		is operating and with an emphasis based on a phase II SAR to address PacifiCorp's objections regarding generation levels.
Holland Board of Public Works	No	It is essential that regional entities and NERC recognize that "facilities used in the local distribution of electric energy" are not included in the definition of BES, regardless of the gross individual or gross aggregate nameplate rating of generation resources. While the addition of the second sentence in the core definition makes this clarification, Holland BPW believes it is necessary that regional entities and NERC recognize that neither this Inclusion nor any of the Inclusions may be used as a basis to compel registration and compliance in such instances, regardless of the size of the generators. The statutory exemption of facilities used in the local distribution of electric energy is not limited by generator number or capability. NERC's definitions cannot impose limitations that are not set forth in the statute. For purposes of the exclusion of facilities that might otherwise meet the definition of BES, the thresholds for determining what generating resources constitute BES facilities should be modified from the current levels (gross individual nameplate capacity of 20 MVA or gross aggregate nameplate rating of 75 MVA). Holland BPW supports modification of the thresholds to not less than 100 MVA (gross individual nameplate capacity) and 300 MVA (gross aggregate nameplate).
Hydro One Networks Inc.	No	We do not agree with the thresholds of 20 MVA for a single unit and 75 MVA aggregate at a plant, carried forward from the compliance registry. We understand the suggested phased approach and expect that the issue will be dealt with at that future time. With the exception of units that are must runs for reliability reasons, we suggest that the SDT should consider units smaller than 75 MVA or x MVA is designated as BES support element and not BES element. These units should only be required to comply with a handful of relevant NERC Standards. For example, o Voltage and frequency ride through capability o Voltage control (AVR, etc.) o Underfrequency trip setting o Protection relay setting coordination o Data submission for modeling; verification of capability and model These smaller and geographically dispersed generating resources should neither be designated as BES

Organization	Yes or No	Question 3 Comment
		element nor be required to have its connection path be designated as BES. We suggest removing the parentheses enclosing the text “with gross individual...” since their inclusion may lead to an erroneous reading of provision to include generators that do not meet ERO Statement of Compliance Registry Criteria.
Response: The SDT acknowledges and appreciates your comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Ontario Power Generation Inc.	No	OPG does not agree that the question of the 20 MVA (single) versus 75 MVA (aggregate) threshold should be deferred until a subsequent phase of the standard development process ("Phase 2"). This question should be resolved now. In general, key elements of the development process should not be parsed out into multiple phases, in hopes that "Standard Development Fatigue" will eliminate critics of the approach. Further, selecting the generator terminals as the boundary for BES within the generating station means that the Isolated Phase Bus (IPB), which connects the generator terminals to the Low Voltage (LV) terminals of the generator step-up (GSU) transformer, is now included as a BES element. The IPB is operated at low voltage, no more than 22kV, so including it as a BES element is going beyond the FERC order 743 and 743a. OPG strongly recommends that the BES boundary be moved to the LV terminals of the GSU transformer.

Organization	Yes or No	Question 3 Comment
Response: The SDT acknowledges and appreciates your perspective and frustration. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made. The I2 inclusion refers to generation"… including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above. Comments received regarding the threshold level for generators, the relationship between the NERC Compliance Registry and the BES Definition and the need for contiguous BES elements will be considered in the Phase 2 review.		
Chevron U.S.A. Inc.	No	It is not logical to allow an aggregate of 75 MVA at a single site for multiple generators while maintaining 20 MVA for a single generator. Further, if a party exceeds export of 75 MVA to meet an emergency condition on the grid, it should not be a triggering event for BES definition. Parties should be concerned with keeping the grid operational rather than the adverse effect of exceeding 75 MVA.
Response: The SDT acknowledges and appreciates your comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made. Please see the detailed responses to Q9.		
Massachusetts Department of Public Utilities	No	Failing to establish a known MVA rating at this stage is problematic. The BES definition cannot be considered in a vacuum, and adjusting or establishing thresholds such as MVA ratings will create regulatory uncertainty and may result in additional costs and unnecessary system upgrades. Additionally, Inclusion I2 should remove the reference to the Statement of Compliance Registry Criteria. The definition should be the governing document regarding generation that is included in the BES.
NESCOE	No	Failing to establish a known MVA rating at this stage is problematic. The BES definition cannot be considered in a vacuum, and adjusting or establishing thresholds such as MVA ratings will create regulatory uncertainty and may result in additional costs and unnecessary system upgrades. Additionally, Inclusion I2 should remove the reference to the Statement of Compliance Registry Criteria. The definition should be the governing document regarding generation that is included in the BES.
Northern Wasco County PUD	No	Referencing the Criteria which in turn references the BES definition creates a circular definition. Northern Wasco County PUD encourages the adoption of specific thresholds that are technically justified. We also note that the Criteria and its revisions do not go through the standards development process, so that thresholds may change with little warning and without triggering an implementation plan for facilities that may be swept into the BES as a result.
Central Lincoln	No	Referencing the Criteria which in turn references the BES definition creates a circular definition. Central Lincoln encourages the adoption of specific thresholds that are

City of Austin dba Austin Energy	No	We recommend removing the reference of the ERO Statement of Compliance Registry Criteria (Registry Criteria). The BES Definition should be the governing document and independent of ERO registration requirements. The definition should drive what appears in the Registry Criteria. Additionally, we support using the BES Phase 2 technical analysis to identify and provide technical support for determining the appropriate minimum MVA rating that a single unit, or the aggregation of multiple units, must meet to be part of the BES.
The Dow Chemical Company	No	Comments: Dow agrees with the proposed revisions to Inclusion I2, particularly the proposal to expressly reference the ERO Statement of Compliance Registry Criteria, but the following phrase should be added at the end "unless excluded under Exclusion E2".

Response: The SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2, instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project due to numerous comments received.

> **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.

The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Organization	Yes or No	Question 3 Comment
Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. *Element is defined* in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either		

Organization	Yes or No	Question 3 Comment
include or exclude an Element.		
LCRA Transmission Services Corporation	No	
Response: Without a specific comment the SDT is unable to respond.		
Kansas City Power and Light Company	No	Nameplate rating of the generator is not a reflection of what can be actually injected into the transmission system with resulting electrical impacts on transmission loading and behavior. Recommend the BES definition be based on a generators established net accredited generating capacity instead of what it could do by nameplate rating. In addition, many generators do not achieve their nameplate rating due to limitations imposed by the limitations and capabilities of their turbine/boiler capabilities. Using the nameplate rating will not allow the exclusion of some generators that should be excluded. Recommend the following language: Generating resource(s) with a net accredited capability per the ERO Statement of Compliance Registry Criteria and including the generator terminals through the high-side of the step-up transformer(s), connected at a voltage of 100 kV or above.
Response: For Phase 1, the SDT has used nameplate rating in order to maintain consistency with the ERO Statement of Compliance Registry Criteria. No change made. The SDT acknowledges and appreciates your comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values		

Organization	Yes or No	Question 3 Comment
and provide compelling justification for modifications to the existing values.		
Ameren	No	a) This definition becomes dependent on a document that can be changed without direct correlation to the BES definition. Remove the reference to the ERO Statement of Compliance Registry Criteria, and simply state the criteria as currently used. There is no need to look up another definition in another document to identify what is included in the BES definition. b) All MOD Standards' requirements for generators should also follow this definition.
Response: The SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2, instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project. **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above. b) Coordination between the BES Definition and the MOD Standards will be addressed in Phase 2.		
Tacoma Power	Yes	Tacoma Power generally supports Inclusion I2 and deferring the appropriate quantitative thresholds to those that will be determined in Phase 2. However, the term “gross individual” and “gross aggregate” nameplate rating, although industry used terms, are not industry defined or uniformly understood and applied. Nameplate ratings are determined from discussions and negotiations between the designer, supplier and the owner and it is the owner that makes the final determination of the generating station equipment nameplate ratings. Nameplate ratings for thermal or hydro plants may be based on such things as: fuel mix (best, worst and average), fuel delivery capacity, reservoir level, best efficiency point, normal operating point, ancillary equipment capacities, emissions and discharge restrictions, continuous versus peak output and designed versus installed and tested capacities. It would be more uniform to establish new or use existing criteria to

Organization	Yes or No	Question 3 Comment
		define “gross individual” and “gross aggregate” nameplate ratings, such as that used in the Code of Federal Regulations CFR 18, Part 11.1, “Authorized Installed Capacity” for hydraulic units and CFR 18, Part 287.101, “Determination of Powerplant Design Capacity” for steam electric, combustion turbine and combined cycle units.
Response: For Phase 1, the SDT has used nameplate rating in order to maintain consistency with the ERO Statement of Compliance Registry Criteria. No change made. The SDT acknowledges and appreciates your comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
Hydro-Quebec TransEnergie		We believe that automatic inclusion of such generation and the path to connect them to the BES would bring a great amount of facilities in the BES. Generation should be considered on a different level such as "BES Support Elements" and provisions should be made so that some specific reliability standards would apply to them.
Response: The SDT acknowledges and appreciates your comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Snohomish County PUD Kootenai Electric Cooperative	Yes	SNPD supports the changes made in Inclusion 2 and believe that the definition in its current form adds clarity. In particular, we support the SDT's decision to collapse Inclusions 2 and 3 from the previous draft definition into a single Inclusion that addresses the treatment of generation for purposes of the BES definition. We also support the SDT's proposal for a Phase 2 of the BES Definition process to examine the technical justification for these thresholds and to establish new thresholds based on a careful technical analysis. It is our understanding that the generator threshold issue will be vetted through the complete standards development process. We agree with this approach because if the generator threshold is treated as merely an element of NERC's Rules of Procedure, it can be changed with considerably less due process and industry input than the Standards Development Process. Compare NERC Rules of Procedure Â§ 1400 (providing for changes to Rules of Procedure upon approval of the NERC board and FERC) with NERC Standards Process Manual (Sept. 3, 2010) (providing for, e.g., posting of SDT proposals for comment, successive balloting, and super-majority approval requirements). See also Order No. 743-A, 134 FERC Â¶ 61,210 at P 4 (2011) ("Order No. 743 directed the ERO to revise the definition of 'bulk electric system' through the NERC Standards Development Process" (emph. added)). Addressing all aspects of Phase 2 through the Standards Development Process will improve the content of the definition by bringing to bear industry expertise on all aspects of the definition and will ensure that, once firm guidelines are established, they can be relied upon by both industry and regulators without threat that they will be changed with little notice and little due process. SNPD also believes further clarification of the proposed language would be appropriate. The SDT proposes continued reliance upon the thresholds that are used in the NERC Statement of Compliance Registry Criteria for registration of Generation Owners and Generation Operators, which is currently 20 MVA for an individual generation unit and 75 MVA for multiple units on a single site. Conceptually, we are concerned about this

Organization	Yes or No	Question 3 Comment
		approach because, as we understand it, the purpose of the Compliance Registry is to sweep in all generators that might be material to the reliable operation of the BES, and not to definitively determine whether a given generator is, in fact, material to the reliable operation of the BES. As the SCRC itself states, the SCRC is intended only to identify “candidates for registration.” SCRC at p.3, Â§ 1 (emph. added). Accordingly, we believe that the generator threshold determined in Phase 2 should be incorporated directly into the BES Definition rather than being incorporated by reference from the SCRC.We also believe that the specific language proposed by the SDT could be further clarified. The SDT proposes to include generation in the BES if the “Generation resource(s)” has a “nameplate rating per the ERO Statement of Compliance Registry.” We understand this language is intended to be a placeholder for the results of the technical analysis that would occur in Phase 2 but we believe simply stating that the threshold will be “per the ERO Statement of Compliance Registry” is ambiguous. Further, for the reasons noted above, we believe the threshold should be part of the BES Definition, and should not simply be a cross-reference to the SCRC (and, given the different purposes of the BES Definition and the SCRC, it is not clear that the same threshold should be used in both). We therefore propose that Inclusion 2 be rewritten to state: “Qualifying Individual Generation Resources or Qualifying Aggregate Resources connected at a voltage of 100 kV or above.” Two definitions would then be added to the note at the end of the definition to read as follows:"For purposes of this BES Definition, Qualifying Individual Generation Resources means an individual generating unit that meets the materiality threshold to be included in this definition or, in the absence of such a materiality threshold, that meets the gross nameplate capacity voltage threshold requiring registration of the owner of such a resource as a Generation Owner under the ERO Statement of Compliance Registry Criteria.""For purposes of this BES Definition, Qualifying Aggregate Generation Resources means any facility consisting of one or more generating units that are connected at a common bus that meets the materiality threshold to be included in this definition, or, in the absence of such a threshold, that meets the gross nameplate capacity voltage threshold requiring

Organization	Yes or No	Question 3 Comment
		registration of the owner of multiple-unit generator as a Generation Owner under the ERO Statement of Compliance Registry Criteria."The “materiality threshold” is intended to refer to the generator threshold developed in Phase 2. We suggest using definitions in this fashion for several reasons. First, we believe the language we suggest more clearly states the intention of the SDT, which we understand is to classify generation units as part of the BES if they are necessary for operation of the BES, but to exclude smaller generating units because they are not material to the operation of the interconnected transmission grid. Second, we believe use of the defined terms better reflects the intention of the SDT to reserve the specific question about generator thresholds to the technical analysis that will occur in Phase 2 without having to revise the BES Definition at the end of that process. That is, the definitions are designed to allow the SDT to include revised thresholds in the definition at the conclusion of the Phase 2 process based upon the technical analysis planned for Phase 2, and the revised thresholds will be automatically incorporated into the BES Definition if the language we suggest is used. The thresholds used in the SCRC would only be a fall-back, to be used only until Phase 2 is completed.Third, the definitions can be incorporated into other parts of the BES Definition, which will add consistency and clarity. As noted in our answers to several of the questions below, the specific 75 MVA threshold is retained in several of the Exclusions and Inclusions, and we believe the industry would be better served if the revised thresholds arrived at after technical analysis in Phase 2 are automatically incorporated into all relevant provisions of the BES Definition. There is no reason for the SDT to continue to rely on the 75 MVA threshold once the analysis planned for Phase 2 on the threshold issue is completed. Fourth, the phrase “or that meets the materiality threshold to be included in this definition” is intended to preserve the SDT’s flexibility to make a determination that generators below a specific threshold are not “necessary to” maintain the reliability of the interconnected transmission system, and to incorporate that finding as part of the definition itself, even if a different threshold is used in the SCRC to identify potential candidates for registration. Accordingly, our proposed language makes clear that a specific threshold in the definition controls over any

Organization	Yes or No	Question 3 Comment
		threshold that might be included in the SCRC. For the reasons stated above, we believe is it highly desirable to include any material threshold in the BES Definition itself rather than relegating the threshold to the SCRC, which is merely a procedural rule rather than a full-fledged Reliability Standard. Hence, we agree with the SDT's decision to examine the question of where the line between BES and non-BES Elements should be drawn more closely in Phase 2 under the rubric of "contiguous vs. non-contiguous BES," and commend the work of the Project 2010-07 Standards Drafting Team and the GO-TO Team as a good starting point for the SDT's analysis on this issue. We understand Inclusion 2 would classify generators exceeding specific thresholds as part of the BES, but would not necessarily require facilities interconnecting such generators to be part of the BES. As discussed more fully in our answer to Question 9, based on extensive technical analysis that has already been performed by the NERC Project 2010-07 Standards Drafting Team and its predecessor, the NERC "GO-TO Team," regulating as part of the BES a dedicated interconnection facility connecting a BES generator to the interconnected bulk transmission grid will result in an unnecessary regulatory burden that produces considerable expense for the owner of the interconnection facility with little or no improvement in bulk system reliability. We also believe the clauses at the end of Inclusion 2 are somewhat confusing and that greater clarity would be achieved by changing ". . . including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above" so that the Inclusion covers transformers with terminals "connected at a voltage of 100 kV or above, including the generator terminal(s) on the high side of the step-up transformer(s) if operated at a voltage of 100 kV or above." Finally, as discussed further in our answer to Questions 5 and 6, SNPD believes more clarity may be achieved by collapsing Inclusion 5, addressing Reactive Power resources, and Inclusion 4, which addresses dispersed renewable resources, into a single Inclusion that addresses "power producing resources" (the language used in current Inclusion 4).

Organization	Yes or No	Question 3 Comment
Response: Thank you – the SDT acknowledges and appreciates your comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. The SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2, instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project. **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above. Please see detailed responses to Q5 and Q6.		
Independent Electricity System Operator	Yes	While we agree with Inclusion I2, we suggest removing the parentheses enclosing the text “with gross individual...” since their inclusion may lead to an erroneous reading of provision to include generators that do not meet ERO Statement of Compliance Registry Criteria.
Puget Sound Energy	Yes	The term "per" should be replaced by "greater than the levels specified for a Generator Owner/Operator in". For a definition of this importance, the term "per" is too vague.
Response: The SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2,		

Organization	Yes or No	Question 3 Comment
instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project. **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.		
Clallam County PUD No.1 Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative (CCEC) Central Electric Cooperatve (CEC) Clearwater Power Company (CPC) Consumer's Power Inc. Douglas Electric Cooperative (DEC) Fall River Rural Electric Cooperative (FALL) Lane Electric Cooperative (LEC) Lincoln Electric Cooperative (LEC) Northern Lights Inc. (NLI) Okanogan County Electric	Yes	CLPD supports the changes made in Inclusion 2 and believe that the definition in its current form adds clarity. In particular, we support the SDT's decision to collapse Inclusions 2 and 3 from the previous draft definition into a single Inclusion that addresses the treatment of generation for purposes of the BES definition. We also support that aspect of the SDT's proposal for a Phase 2 of the BES Definition process that would examine the technical justification for these thresholds and that would establish new thresholds based on a careful technical analysis. It is our understanding that the generator threshold issue will be vetted through the complete standards development process. We agree with this approach becauseif the generator threshold is treated as merely an element of NERC's Rules of Procedure, it can be changed with considerably less due process and industry input than the Standards Development Process. Compare NERC Rules of Procedure Â§ 1400 (providing for changes to Rules of Procedure upon approval of the NERC board and FERC) with NERC Standards Process Manual (Sept. 3, 2010) (providing for, e.g., posting of SDT proposals for comment, successive balloting, and super-majority approval requirements). See also Order No. 743-A, 134 FERC Â¶ 61,210 at P 4 (2011) ("Order No. 743 directed the ERO to revise the definition of 'bulk electric system' through the NERC Standards Development Process" (emph. added)). Addressing all aspects of Phase 2 through the Standards Development Process will improve the content of the definition by bringing to bear industry expertise on all aspects of the definition and will ensure that, once firm guidelines are established, they can be relied upon by both industry and regulators without threat that they will be changed with little notice and little due process.CLPD believes further clarification of the proposed language would be appropriate. The SDT proposes continued reliance

Organization	Yes or No	Question 3 Comment
Cooperative (OCEC) Pacific Northwest Generating Cooperative (PNGC) Raft River Rural Electric Cooperative (RAFT) West Oregon Electric Cooperative Umatilla Electric Cooperative (UEC)		upon the thresholds that are used in the NERC Statement of Compliance Registry Criteria for registration of Generation Owners and Generation Operators, which is currently 20 MVA for an individual generation unit and 75 MVA for multiple units on a single site. as we understand it, the purpose of the Compliance Registry is to sweep in all generators that might be material to the reliable operation of the BES, and not to definitively determine whether a given generator is, in fact, material to the reliable operation of the BES. As the SCRC itself states, the SCRC is intended only to identify "candidates for registration." SCRC at p.3, Â§ 1 (emph. added). Accordingly, we believe that the generator threshold determined in Phase 2 should be incorporated directly into the BES Definition rather than being incorporated by reference from the SCRC.We also believe that the specific language proposed by the SDT could be further clarified. The SDT proposes that generation be included in the BES if the "Generation resource(s)" has a "nameplate rating per the ERO Statement of Compliance Registry." Southern Company Generation	Yes	Yes, provided that the minimum gross individual nameplate rating threshold is the same as the gross aggregate nameplate rating (currently > 75MVA). The MVA ratings are specified in many places in the BES definition, where a reference is made in I2 to using the Statement of Compliance Registry Criteria. We believe that the BES definition should point to the Statement of Compliance Registry Criteria and not include MVA values. We also believe individual units < 75MVA should be excluded unless they have been shown to be critical to BES reliability through a technical justification study performed by the transmission planning authority.
Michigan Public Power Agency	Yes	MPPA supports the changes made in Inclusion 2 and believe that the definition in its current form adds clarity. In particular, we support the SDT's decision to collapse Inclusions 2 and 3 from the previous draft definition into a single Inclusion that addresses the treatment of generation for purposes of the BES definition. MPPA also supports the SDT's proposal for a Phase 2 of the BES Definition process that would

Organization	Yes or No	Question 3 Comment
		examine the technical justification for these thresholds and that would establish new thresholds based on a careful technical analysis. It is our understanding that the generator threshold issue will be vetted through the complete standards development process. We agree with this approach because if the generator threshold is treated as merely an element of NERC's Rules of Procedure, it can be changed with considerably less due process and industry input than the Standards Development Process. Compare NERC Rules of Procedure Â§ 1400 (providing for changes to Rules of Procedure upon approval of the NERC board and FERC) with NERC Standards Process Manual (Sept. 3, 2010) (providing for, e.g., posting of SDT proposals for comment, successive balloting, and super-majority approval requirements). Finally, we agree with the SDT's decision to examine the question of where the line between BES and non-BES Elements should be drawn more closely in Phase 2 under

Organization	Yes or No	Question 3 Comment
		the rubric of "contiguous vs. non-contiguous BES," and commend the work of the Project 2010-07 Standards Drafting Team and the GO-TO Team as a good starting point for the SDT's analysis on this issue. We understand Inclusion 2 would classify generators exceeding specific thresholds as part of the BES, but would not necessarily require facilities interconnecting such generators to be part of the BES. As discussed more fully in our answer to Question 9, based on extensive technical analysis that has already been performed by the NERC Project 2010-07 Standards Drafting Team and its predecessor, the NERC "GO-TO Team," regulating as part of the BES a dedicated interconnection facility connecting a BES generator to the interconnected bulk transmission grid will result in an unnecessary regulatory burden that produces considerable expense for the owner of the interconnection facility with little or no improvement in bulk system reliability. We also believe the clauses at the end of Inclusion 2 are somewhat confusing and that greater clarity would be achieved by changing ". . . including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above" so that the Inclusion covers transformers with terminals "connected at a voltage of 100 kV or above, including the generator terminal(s) on the high side of the step-up transformer(s) if operated at a voltage of 100 kV or above." MPPA and its members believe it is essential that regional entities and NERC recognize that "facilities used in the local distribution of electric energy" are not included in the definition of BES, regardless of the gross individual or gross aggregate nameplate rating of generation resources. While the addition of the second sentence in the core definition makes this clarification, MPPA and its members believes it is necessary that regional entities and NERC recognize that neither this Inclusion nor any of the Inclusions may be used as a basis to compel registration and compliance in such instances, regardless of the size of the generators. The statutory exemption of facilities used in the local distribution of electric energy is not limited by generator number or capacity. NERC's definitions cannot impose limitations that are not set forth in the statute. For purposes of the exclusion of facilities that might otherwise meet the definition of BES, the thresholds for determining what generating resources

Organization	Yes or No	Question 3 Comment
		constitute BES facilities should be modified from the current levels (gross individual nameplate capacity of 20 MVA or gross aggregate nameplate rating of 75 MVA). MPPA and its members would support modification of the thresholds to not less than 100 MVA (gross individual capacity) and 300 MVA (gross aggregate nameplate).

Response: The SDT acknowledges and appreciates your comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

The SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2, instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project.

> **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.

Texas Industrial Energy Consumers	Yes	The interplay between Inclusion I2, which references the Statement of Registry Compliance, and Exclusions E1-E3 is unclear. Under the Registry criteria, "a customer-owned or operated generator/generation that serves all or part of retail load with electric energy on the customer's side of the retail meter may be excluded as a candidate for registration ... if (i) the net capacity provided to the bulk power system does not exceed the criteria above." It appears that the SDT intended to invoke this provision by referencing the Statement of Registry Compliance, which counts only the "net" capacity provided, by referencing the Statement of Compliance

Organization	Yes or No	Question 3 Comment
		Registry Criteria. However, Exclusions E1 and E3 exclude generation on the basis of "gross nameplate ratings." For customer-owned facilities, this treatment is inconsistent with netting treatment provided in the Statement of Registry Compliance. Exclusions E1-E3 should be revised to reference the Statement of Compliance Registry Criteria as well so that customer-owned generation is included or excluded based on its net capacity to the grid rather than its gross nameplate capacity. TIEC also supports revisiting and potentially raising the thresholds that trigger registration as a Generation Owner or Operator. TIEC understands that the SDT has decided to maintain the status quo as reflected in NERC's Registry Criteria at this time. TIEC looks forward to addressing potential modifications to the thresholds in the appropriate context.

Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. *Element is defined* in the NERC Glossary of Terms as:

> "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Organization	Yes or No	Question 3 Comment
Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power,	Yes	The word "identified" should be replaced with "designated".

Organization	Yes or No	Question 3 Comment
MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative		
Response: The SDT believes this comment was intended for Q4 and directs you to the detailed response provided there.		
Dominion	Yes	Dominion interprets the revised language to exclude generating resources connected at less than 100 kV. If this interpretation is not accurate, then Dominion does not support the revised language.
Response: The I2 inclusion refers only to generation " … through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above."		
Transmission Access Policy Study Group	Yes	TAPS supports the intent of proposed Inclusion I2. For the sake of clarity, we suggest revising "per the ERO Statement of Compliance Registry Criteria" to "as described in the ERO Statement of Compliance Registry Criteria."
ACES Power Marketing Standards Collaborators	Yes	We'd prefer to see the language from the ERO Statement of Compliance Registry Criteria repeated within the BES Definition itself instead of referencing an outside document. As it stands right now, the Compliance Registry Criteria needs to stay intact for Phase 1 of this project. That makes the Compliance Registry Criteria reliant on the BES Definition and vice versa. We understand that the Statement of Compliance Registry Criteria may be reviewed/revised at the same time Phase 2 of this project is being developed, therefore we agree with Inclusion I2 of this draft.
Response: The SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2, instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed		

Organization	Yes or No	Question 3 Comment
and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project. **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.		
Florida Municipal Power Agency	Yes	Please see comments to Question 1
Response: Please see response to Q1.		
Redding Electric Utility	Yes	Redding believes that the definition should drive what appears in the Registry Criteria, therefore we only support this on a temporary basis based on the premise that the BES Phase 2 technical analysis will identify and provide technical support for determining the appropriate minimum MVA rating for a single unit or the aggregation of multiple units.
City of Redding	Yes	Redding believes that the definition should drive what appears in the Registry Criteria, therefore we only support this on a temporary basis based on the premise that the BES Phase 2 technical analysis will identify and provide technical support for determining the appropriate minimum MVA rating for a single unit or the aggregation of multiple units.
MEAG Power	Yes	We agree in general with the revisions to I2 for generation; however, we maintain that 200kV and above is the correct bright line for the Bulk Electric System.
Tennessee Valley Authority	Yes	TVA agrees in general with the revisions to I2 for generation; however, we maintain that 200kV and above is the correct bright line for generation connected to the Bulk Electric System, and requests that the Phase 2 for the project use 200kV and above or develop a transmission voltage and/or an MVA threshold that is technically based.

Organization	Yes or No	Question 3 Comment
SERC Planning Standards Subcommittee	Yes	We are concerned that the generator MVA limits are too low and strongly support addressing this issue in Phase 2 of this project.
NERC Staff Technical Review	Yes	The drafting team's proposed approach for Inclusion I2 (generation), including the reference to the ERO Statement of Compliance Registry Criteria, is generally acceptable given the scope of this project and the breaking of the project into two phases. Thresholds for generator MVA rating and interconnection voltage should be considered in the second phase of this project.
SERC OC Standards Review Group	Yes	We agree in general with the revisions to I2 for generation; however, we maintain that 200kV and above is the correct bright line for the Bulk Electric System.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project. **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.		

4. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I3 (blackstart)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: The directive by FERC to revise the definition of the BES has been interpreted by the SDT to include all Facilities necessary for reliably operating the interconnected transmission system under both normal and emergency conditions. This interpretation by the SDT includes situations related to Blackstart Resources and system restoration. Blackstart Resources have the ability to be started without the support of the interconnected transmission system in order to meet a Transmission Operators restoration plan requirements for Real and Reactive Power capability, frequency, and voltage control. The SDT maintains that Blackstart Resources must be included in the definition however their associated Cranking Paths are not included in the BES definition as they can fall within distribution class levels. Cranking Paths will be discussed further in Phase 2 of this project.

No changes were made to Inclusion I3 from the previous posting.

Organization	Yes or No	Question 4 Comment
SERC OC Standards Review Group	No	We agree with the changes but believe clarity would be added by changing the word “identified” to “designated”.
Tennessee Valley Authority	No	TVA agrees with the changes but believe clarity would be added by changing the word “identified” to “designated”.
Southern Company	No	We agree with the changes but believe clarity would be added by changing the word “identified” to “designated”.
MEAG Power	No	We agree with the changes but believe clarity would be added by changing the word “identified” to “designated”.
Response: ‘Identified’ is consistent with the wording in EOP-005-2. The SDT does not feel that this change would add any additional clarity. No change made.		

Organization	Yes or No	Question 4 Comment
Texas Reliability Entity	No	We feel that the Cranking Path should be included in the BES definition. Inclusion of the Cranking Path is vital to a functional, sustainable and reliable system restoration (and restoration plan) regardless of where the Cranking Path is located. CIP-002-4 Attachment 1 recognizes the critical nature of the Cranking Path.
NERC Staff Technical Review	No	The cranking path(s) identified in the Transmission Operator's restoration plan should be included in the BES definition.
Response: Cranking Paths identified in a Transmission Operator's restoration plans are often composed of distribution system Elements. The Transmission Operator's restoration plans identify a number of possible system restoration scenarios to address the uncertainty of the actual requirements needed to address a particular restoration event including Cranking Paths. Therefore, the SDT maintains that Cranking Paths are not required to be included in the BES definition as they are essentially a moving target and could include distribution Elements. The Cranking Paths issue will be discussed anew in Phase 2 of this project. No change made.		
NESCOE	No	While NESCOE appreciates that cranking paths were excluded in response to industry comments, as we stated in comments to the prior posting of the BES definition, blackstart units should be excluded from the BES. Such units are appropriately covered under regional restoration procedures and applicable NERC standards (see for example, Emergency Operating Procedure EOP-005-2). However, should blackstart units be included in subsequent postings of the definition, we suggest that the language be revised to state that only those units "material to" the BES are included.
Ontario Power Generation Inc.	No	To assure availability of the generation blackstart resources identified in the Transmission Operator's Power System Restoration Plan the generators are tested according to the requirements of reliability standard EOP-009. Blackstart resources are only required post LOBES (Loss of Bulk Electric System) and in many cases do not contribute to the reliability of the BES under normal operating conditions. OPG recommends that this inclusion be removed from the new definition of BES.
IRC Standards Review	No	We support the SDT's decision to exclude the cranking paths from the BES definition since testing and verification of the use of facilities in the cranking path is already

Organization	Yes or No	Question 4 Comment
Committee		covered by the appropriate EOP standards. This inclusion is extraneous given there is already a designation specific for system restoration covered by an existing standard to recognize their reliability impacts and to ensure their expected performance. NERC Standards EOP-005-2 stipulates the requirements for testing blackstart resource and cranking paths. This testing requirement suffices to ensure that the facilities critical to system restoration are functional when needed, which meets the intent of identifying their criticality to reliability. We therefore suggest removing Inclusion I3.
Hydro One Networks Inc.	No	We agree with the SDT in excluding the cranking paths from the BES definition, a point we had raised in our comments to the previous posting. We also disagree with the inclusion of blackstart resources and reiterate our view that their inclusion is superfluous given there is already a designation specific for system restoration covered by an existing standard, to recognize their reliability impacts and to ensure their expected performance. NERC Standard EOP-005-2 stipulates the requirements for testing blackstart resources and cranking paths. This testing requirement suffices to ensure that the facilities critical to system restoration are functional when needed, which meets the intent of identifying their criticality to reliability. We therefore suggest completely removing Inclusion I3.We suggest the SDT to drop I3 on the basis that: o The availability and performance expectations of blackstart resources are ensured by existing related standards; and o Unless they meet the BES definition under inclusion I2, there is no perceived reliability value in everyday operation of the BES.
Northeast Power Coordinating Council	No	Eliminating I3 should be considered based on the availability and performance expectations of black start resources being ensured by existing standards, and unless they meet the BES definition under the I2 inclusion they do not have any reliability impact on BES operation. If I3 is retained, suggest rewording Inclusion I3 to read as follows: Black start resources material to and designated as part of the Transmission

Organization	Yes or No	Question 4 Comment
		Operator's restoration plan.
Independent Electricity System Operator	No	We thank the SDT for excluding the cranking paths from the BES definition, a point we had raised in our comments to the previous posting. However, we had also disagreed with the inclusion of Blackstart Resources and reiterate our view that their inclusion is superfluous given there is already a designation specific for system restoration covered by an existing standard, to recognize their reliability impacts and to ensure their expected performance. NERC Standards EOP-005-2 stipulates the requirements for testing blackstart resource and cranking paths. This testing requirement suffices to ensure that the facilities critical to system restoration are functional when needed, which meets the intent of identifying their criticality to reliability. We therefore suggest removing Inclusion I3 entirely.
FirstEnergy Corp.	Yes	We agree with the team's conclusion to remove cranking paths from the BES definition since NERC (i.e. EOP standards) specifically address reliability matters associated with cranking paths. Although we believe item I3 (blackstart unit) is unnecessary as part of the BES Definition, we will not object to its inclusion. A blackstart unit is a facility necessary for BES restoration, but not necessarily required to be included within the BES Definition.

Response: The SDT disagrees that Blackstart Resources should not be included in the BES Definition. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all facilities necessary for operating an interconnected electric transmission network. The SDT interprets this to include operation under both normal and emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator's restoration plan requirements for Real and Reactive Power capability, frequency, and voltage control. The associated resources of the electric system that can be isolated and then energized to deliver electric power during a restoration event are essential to enable the startup of one or more other generating units as defined in the Transmission Operator's restoration plan. For these reasons, the SDT continues to include Blackstart Resources indentified in the Transmission Operator's restoration plan as BES elements. No change made.

Organization	Yes or No	Question 4 Comment
ACES Power Marketing Standards Collaborators	No	Blackstart Resources can actually be on the distribution system. There is still the question of whether the distribution system would then be subjected to the enforceable standards. If so, there would most likely be a significant cost increase associated with tracking compliance for these distribution systems without a commensurate increase in reliability since Blackstart Resources are rarely used. This could very well cause entities to un-designate Blackstart Resources on distribution systems to avoid these distribution systems from becoming part of the BES. The same rationale that was used for eliminating cranking paths could also be applied to Blackstart Resources.
Response: Cranking Paths identified in a Transmission Operator's restoration plans are often composed of distribution system Elements. The Transmission Operator's restoration plans identify a number of possible system restoration scenarios to address the uncertainty of the actual requirements needed to address a particular restoration event including Cranking Paths. Therefore, the SDT maintains that Cranking Paths are not required to be included in the BES definition as they are essentially a moving target and could include distribution Elements. The Cranking Paths issue will be discussed anew in Phase 2 of this project. The SDT feels that the situation described would fall within a minimal percentage of units and therefore would be subject to the Exception Process as applicable. No change made.		
ReliabilityFirst	No	Blackstart Resource is a defined NERC term, but as outlined in the definition, it could be read to include the transmission assets that also make up the resource as part of the TOP plan. Is that the intent? ReliabilityFirst Staff also feels that without including the Cranking Paths, the reliable operation of the system could be jeopardized if a restoration is required and the Cranking Paths are unavailable due to non-compliance to Reliability Standards.
Response: The SDT does not agree that the definition of Blackstart Resource necessarily encompasses transmission assets. No change made. Cranking Paths identified in a Transmission Operator's restoration plans are often composed of distribution system Elements. The Transmission Operator's restoration plans identify a number of possible system restoration scenarios to address the uncertainty of the actual requirements needed to address a particular restoration event including Cranking Paths. Therefore,		

Organization	Yes or No	Question 4 Comment
the SDT maintains that Cranking Paths are not required to be included in the BES definition as they are essentially a moving target and could include distribution Elements. The Cranking Paths issue will be discussed anew in Phase 2 of this project. No change made.		
Central Maine Power Company	No	Inclusion I3 should be changed to include the phrase, “material to,” currently in the Statement of Compliance Registry Criteria (Section 3C3). Based on the definition wording, the Generator Step-Up transformer (GSU) would not be BES if the generator would not otherwise already be included as BES under another definition provision.
Rochester Gas and Electric and New York State Electric and Gas	No	Inclusion I3 should be changed to include the phrase, “material to,” currently in the Statement of Compliance Registry Criteria (Section 3C3). Based on the definition wording, the Generator Step-Up transformer (GSU) would not be BES if the generator would not otherwise already be included as BES under another definition provision.
Orange and Rockland Utilities, Inc.		Minimum Power system and material? NERC registry criteria for generation section "3C3"
Massachusetts Department of Public Utilities	No	The inclusion should be revised to specify that only those blackstart units that are “material to” the BES are included in the definition.
Consolidated Edison Co. of NY, Inc.	No	We suggest using wording from the Statement of Compliance Registry Criteria:Any generator regardless of size which is material to ... [Ref: Statement of Compliance Registry Criteria, III.c.3-Blackstart]Define “material to” as a generator listed as a necessary part of the TOP-defined minimum system to restore the BES. This term “material to” should exclude Blackstart-capable generators not necessary for BES restoration or only used for local distribution system restoration. Wording Recommendation: Following the words “identified in” add the words “and material to” so that the new Inclusion reads:I3 - Blackstart Resources identified in and material to the Transmission Operator’s restoration plan.
Response: The SDT believes that adding language such as “material to” does not provide clarity and remains immeasurable. No		

Organization	Yes or No	Question 4 Comment
change made.		
Manitoba Hydro	No	Inclusion I3 should specifically state that only the Blackstart Resources specified through EOP-005-2 R1.4 are included in the BES since "Transmission Operator restoration plan' is not a NERC defined term. Suggested wording:"I3 - Blackstart Resources identified through EOP-005-2 R1.4"
Response: The SDT appreciates your concern but does not believe it is appropriate to reference a standard in the definition. Any modification to the standard including an interpretation or a simple re-versioning for errata would change the standard number and thus require that the definition be updated. No change made.		
ISO New England Inc	No	The SDT has interpreted the FERC Directive to revise the BES definition in a manner that goes beyond the mandate of ensuring that the definition encompasses all facilities necessary for operating an interconnected electric transmission network. The SDT states that operation is interpreted as being under both normal and emergency conditions. However, loss of all electric power is the end state condition when all normal and emergency remediating actions have failed to prevent a collapse of the grid. System restoration involves the use of blackstart generators that are not resources necessary for operating the electrical grid but rather a means to recover following (not part of the emergency itself) an extreme emergency. The SDT should simply refer to the current Compliance Registry, which, for now, appears to adequately deal with the issue of how to treat Blackstart resources. I3 states "Blackstart Resources identified in the Transmission Operator's restoration plan". This is contrary to the preferred language that is part of the approved ERO Statement of Compliance Registry, III.C.3 that states, "Any generator, regardless of size, that is a blackstart unit material to (emphasis added) and designated as part of a transmission operator entity's restoration plan". This language is necessary to distinguish between those Blackstart Resources that are depended upon to restore the BES following an emergency ("Key Facilities") as compared to those Blackstart Resources that are used to restore power to customer load.

Organization	Yes or No	Question 4 Comment
		Additionally, discussions with others during the preparation of comments have revealed that some interpret this requirement to include the GSU. We do not interpret this in this manner, but this should be clarified to avoid confusion.
Response: The SDT disagrees that Blackstart Resources should not be included in the BES Definition. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all facilities necessary for operating an interconnected electric transmission network. The SDT interprets this to include operation under both normal and emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator's restoration plan requirements for Real and Reactive Power capability, frequency, and voltage control. The associated resources of the electric system that can be isolated and then energized to deliver electric power during a restoration event are essential to enable the startup of one or more other generating units as defined in the Transmission Operator's restoration plan. For these reasons, the SDT continues to include Blackstart Resources indentified in the Transmission Operator's restoration plan as BES elements. No change made. The SDT does not agree that the definition of Blackstart Resource necessarily encompasses transmission assets such as GSUs.		
SRP	No	The Blackstart 'Cranking Path' has been deleted from Inclusion 3 of the BES definition. However, NERC Standards EOP-005 and CIP-002, R1.2.4, require documenting the Cranking Path. In addition, CIP-002—4 identifies the Cranking Path as a Critical Asset in Attachment 1. Compliance to the NERC Standards needs to be an exact science whenever possible. SRP does not argue the inclusion or exclusion of Cranking Path. However, if it is excluded, guidance must be provided on whether or not a Cranking Path is subject to the previously mentioned Standards.
Response: Cranking Paths are subject to any standard in which they are specifically spelled out.		
Tacoma Power	Yes	Tacoma Power generally support Inclusion I3 as written. We continue to believe the BES should only include the Blackstart Resources that support a regional recovery. We propose changing Inclusion I3 to read,"Blackstart Resources identified in the Transmission Operator's restoration plan and included in a regional restoration plan."

Organization	Yes or No	Question 4 Comment
Response: The SDT does not agree that the definition should specify Blackstart Resources included in regional restoration plans as those regional systems may not be included in the BES nor have any impact on the BES. No change made.		
Ameren	Yes	a)The definition should include only those black start generators connected 100 kV and above and included in the restoration plan. b)We agree with the changes but believe clarity would be added by changing the word "identified" to "designated".
Response: Blackstart Resources are required to be registered regardless of connected voltage level. The SDT is remaining consistent with its earlier position on that point. No change made. 'Identified' is consistent with the wording in EOP-005-2. The SDT does not feel that this change would add any additional clarity at this time. No change made.		
Utility Services, Inc.	Yes	Utility Services supports suggestions by others that request that the language of the Inclusion use the exact language of the SCRC III.3.c. Leaving the language as is will likely increase the number of black start facilities beyond those currently applicable.
Response: Adding language such as "material to" found in the ERO Statement of Compliance Registry Criteria does not provide clarity and remains immeasurable. No change made.		
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power	Yes	In general, we agree with this revision. However, the aggregate MVA threshold should be 150 MVA or greater, and threshold voltage level should be 200kV or higher.

Organization	Yes or No	Question 4 Comment
Cooperative		
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
City of Redding	Yes	Redding recommends the following rewording: "The Primary Blackstart resources designated in the Transmission Operator's restoration plan." We believe it reduces reliability if all Blackstart generation either primary or secondary are required to be BES. Requiring all Blackstart capable units to be BES creates an incentive to leave certain blacstart units out of restoration plans in order to avoid BES inclusion. By making only the primary Blackstart unit a BES element then Transmission Operators will be more willing to include ALL Blackstart units in their plan thus creating a complete procedure for the Transmission Operator to restore the system.
Redding Electric Utility	Yes	Redding recommends the following rewording: "The Primary Blackstart resources designated in the Transmission Operator's restoration plan." We believe it reduces reliability if all Blackstart generation either primary or secondary are required to be BES. Requiring all Blackstart capable units to be BES creates an incentive to leave certain blacstart units out of restoration plans in order to avoid BES inclusion. By making only the primary Blackstart unit a BES element then Transmission Operators will be more willing to include ALL Blackstart units in their plan thus creating a complete procedure for the Transmission Operator to restore the system.

Organization	Yes or No	Question 4 Comment
City of Austin dba Austin Energy	Yes	We recommend rewording Inclusion I3 as follows: "Only Primary Blackstart resources designated as part of the Transmission Operator's restoration plan." We have concerns that making all Blackstart generation either primary or secondary BES elements creates an incentive to remove those secondary Blackstart capable units in an effort to avoid BES inclusion. We believe that making the primary Blackstart unit the only BES element will remove this incentive. In so doing, this will allow the secondary Blackstart units to remain in the Transmission Operator's plan and training program as an alternate tool for the Transmission Operator to restore the system.
Sacramento Municipal Utility District	Yes	We recommend rewording Inclusion I3 as follows: "Only Primary Blackstart resources designated as part of the Transmission Operator's restoration plan." We have concerns that making all Blackstart generation either primary or secondary BES elements will create an incentive to remove those secondary Blackstart capable units in order to avoid BES inclusion. Making the primary Blackstart unit the only BES element will remove this incentive. In so doing, this will allow the secondary Blackstart units to remain in the Transmission Operator's plan and training program as an alternate tool for the Transmission Operator to restore the system.
Balancing Authority Northern California	Yes	We recommend rewording Inclusion I3 as follows: "Only Primary Blackstart resources designated as part of the Transmission Operator's restoration plan." We have concerns that making all Blackstart generation either primary or secondary BES elements will create an incentive to remove those secondary Blackstart capable units in order to avoid BES inclusion. Making the primary Blackstart unit the only BES element will remove this incentive. In so doing, this will allow the secondary Blackstart units to remain in the Transmission Operator's plan and training program as an alternate tool for the Transmission Operator to restore the system.
Response: The SDT discussed the recommended wording and determined that it did not provide further clarity to the definition. Utilizing "primary" and "secondary" as a deterministic method for inclusion would create regional inconsistencies with application of the definition which is contrary to the intent to create a consistent continent-wide definition. No change made.		

Organization	Yes or No	Question 4 Comment
WECC Staff	Yes	WECC agrees with the inclusion of the blackstart units, but does not agree with the deletion of the cranking path from the I3. The cranking path should be included in the definition since the NERC standards EOP-005 and CIP-002 R1.2.4 require documenting the cranking path. The revised CIP-002-4 Standard identifies the cranking path as a critical asset in Attachment 1 (1.5).
Response: Cranking Paths identified in a Transmission Operator's restoration plans are often composed of distribution system Elements. The Transmission Operator's restoration plans identify a number of possible system restoration scenarios to address the uncertainty of the actual requirements needed to address a particular restoration event including Cranking Paths. Therefore, the SDT maintains that Cranking Paths are not required to be included in the BES definition as they are essentially a moving target and could include distribution Elements. The Cranking Paths issue will be discussed anew in Phase 2 of this project. No change made.

Inc.		
Cowlitz County PUD	Yes	
PSEG Services Corp	Yes	
Hydro-Quebec TransEnergie	Yes	
Pacific Northwest Generating Cooperative (PNGC)	Yes	PNGC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Raft River Rural Electric Cooperative (RAFT)	Yes	RAFT supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
West Oregon Electric Cooperative	Yes	WOEC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Lincoln Electric Cooperative (LEC)	Yes	LEC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Northern Lights Inc. (NLI)	Yes	NLI supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is

Organization	Yes or No	Question 4 Comment
		simply a specific type of such an interconnection facility.
Okanogan County Electric Cooperative (OCEC)	Yes	OCEC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Douglas Electric Cooperative (DEC)	Yes	DEC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Fall River Rural Electric Cooperative (FALL)	Yes	FALL supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Lane Electric Cooperative (LEC)	Yes	LEC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Clearwater Power Company (CPC)	Yes	CPC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Snohomish County PUD	Yes	SNPD supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.

Organization	Yes or No	Question 4 Comment
Consumer's Power Inc.	Yes	CPI supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Central Electric Cooperatve (CEC)	Yes	CEC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Coos-Curry Electric Cooperative (CCEC)	Yes	CCEC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Blachly-Lane Electric Cooperative (BLEC)	Yes	BLEC supports the removal of the Cranking Path language in I3. As noted in our response to Question 9, there is no reason to classify as BES the facilities interconnecting a BES generator to the bulk interstate system. A Cranking Path is simply a specific type of such an interconnection facility.
Long Island Power Authority	Yes	
The Dow Chemical Company	Yes	
City of St. George	Yes	
American Electric Power	Yes	
Tillamook PUD	Yes	Tillamook PUD agrees with the removal of the voltage language since the inclusions and exclusions only apply to equipment over 100 kV.

Response: Thank you for your support.		

5. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I4 (dispersed power)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: Several comments sought clarification that Inclusion I4 was directed at including resources such as wind and solar farms and sought a distinction between Inclusions I2 and I4. The SDT believes this is presently clear in the definition. Inclusion I4 specifically addresses wind and solar farms being dispersed power producing resources that "utilize[e] a system designed primarily for aggregating capacity." The essential distinction between Inclusion I2 and I4 is that Inclusion I2 may not include generating resources that use lower voltage collection systems while Inclusion I4 is specifically designed to accomplish this purpose.

The SDT also clarifies that Inclusion I4 speaks towards the inclusion of the generation resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2.

There were a number of comments seeking clarification on the location of the common point of connection. While the SDT does not believe additional clarification of the term "common point" is needed in the BES definition, the following guidance is provided. The common point of connection, which is the point from where generation is aggregated to determine if the 75 MVA threshold is met, is the point where the individual transmission Element(s) of a collector system ultimately meet the 100 kV transmission system.

Some stakeholders asked for clarity on the issue of units on the customer's side of the retail meter. Generating units on the customer's side of the retail meter are not included under Inclusion I4 since customer-side retail generation typically does not "utilize[e] a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above."

Several comments sough clarification of the definitional difference between "dispersed power" and "distributed generation" as used in the BES definition. While the SDT does not believe that further clarity of these terms is needed in the BES definition, it clarifies that distributed generation is generally defined as: a generator that is located close to the particular Load that it is intended to serve and is interconnected to the utility distribution system. The U.S Energy Information Administration (EIA) and FERC generally use this as a basic definition. The language of Inclusion I4 stating "Dispersed power producing resources . . . utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above" was selected so as not to confuse what is traditionally considered distributed generation with the types of systems to be included in Inclusion I4.

The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

No changes were made to Inclusion I4 based on comments provided in response to this question.

Organization	Yes or No	Question 5 Comment
Northeast Power Coordinating Council	No	Suggest the term “common point” needs clarification and/or definition (is risk of single mode failure intended, i.e. where all the resources could be lost for a single event?). Suggest the following wording: “connected at a common point through a dedicated step-up transformer with a high-side voltage of 100 KV or above.” Dispersed power producing sources such as wind and solar should not be included as BES elements because of the variable and intermittent nature of these resources. If these dispersed power producing resources had dedicated energy storage facilities only then that could make them BES elements. Generally the collector systems for these resources (from the bulk transmission system reliability perspective) do not differ from distribution systems which are excluded from the BES.
Response: While the SDT does not believe that additional clarification of the term “common point” is needed in the BES definition, the following guidance is provided. The common point of connection, which is the point from where generation is aggregated to determine if the 75 MVA threshold is met, is the point where the		

Organization	Yes or No	Question 5 Comment
individual transmission Element(s) of a collector system ultimately meet the 100 kV transmission system. No change made. The SDT disagrees with excluding dispersed power producing sources such as wind and solar from the BES definition. These resources comprise a significant share of the North American resource mix. No change made. The SDT does not believe further clarification of Dispersed Power Resources is needed. Inclusion I4 is directed at including resources such as wind and solar farms. This is denoted by the requirement that the dispersed power producing resources "utilize[e] a system designed primarily for aggregating capacity." Furthermore, Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made.		
Southwest Power Pool Standards Review Team	No	We believe that the removal of the wording "single site" in I2 would remove the need to cover dispersed power producing resources in I4. What is the reason for keeping I4 in this version? Also we understand that 75MVA is held in I4 because of no direct link to the registry criteria, but feel that this number could change in phase two of the project which would create unnecessary work in the future.
Response: The essential distinction between Inclusions I2 and I4 is that Inclusion I2 may not include generating resources that use lower voltage collection systems while Inclusion I4 is specifically designed to accomplish this purpose. Inclusion I4 is directed at including resources such as wind and solar farms. This is denoted by the requirement that the dispersed power producing resources "utilize[e] a system designed primarily for aggregating capacity." No change made. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry		

Organization	Yes or No	Question 5 Comment
stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Pepco Holdings Inc and Affiliates	No	The SDT reworded Inclusion I4 to use the phrase "utilizing a system designed primarily for aggregating capacity". This was to address a concern that the previous definition could ensnare distributed generation or small generators in a distribution system. We agree with the intent of this modification. I4 was intended solely to address wind and solar farms that use a collector system to aggregate their capacity. Therefore, to provide better clarity on the intent of this Inclusion, perhaps it would be better to specifically mention these examples in the wording: "Dispersed power producing resources (such as wind and solar farms, etc.) which utilize a system designed primarily for aggregating capacity, where the capacity is greater than 75MVA (gross aggregate nameplate rating) and the facility is connected at a common point at a voltage of 100kV or above."
Response: Use of the term 'etc.' is not suitable for a definition as it is completely open ended. Inclusion of a list is problematic as it may not be complete especially with regard to future technology enhancements which could force a revision of the definition. The SDT does not believe the suggested change provides any additional clarity. The SDT does not believe further clarification of Dispersed Power Resources is needed. Inclusion I4 is directed at including resources such as wind and solar farms. This is denoted by the requirement that the dispersed power producing resources "utilize[e] a system designed primarily for aggregating capacity." No change made.		
Hydro One Networks Inc.	No	Although we agree with the I4 concept, we suggest that the SDT should consider that this category primarily includes wind and solar farms and their collector system. We believe these facilities should not be included

Organization	Yes or No	Question 5 Comment
		as BES elements but rather as supporting elements (see comments under I2) for the following reasons: a) Any additional benefit of classifying these resources as BES is insignificant for the reliability of supply (capacity and energy), considering the intermittent and widely variable nature of these resources. The planning and operational standards and practices make sure that their unavailability or unexpected (sudden) loss, which are significantly more likely due to the natural elements than those due to mechanical or electrical causes, will not jeopardize the reliability of the supply; and b) The reliability of the aspects of the collector system of these resources (their impact on reliability of the bulk transmission system) is not different from that of distribution systems (load serving feeders) which are excluded from the BES. We agree with the revised portion of Inclusion I4 which does indeed clarify that there is no requirement for a contiguous BES path from the dispersed generation resources to the point of interconnection to the BES.
Response: The SDT disagrees with excluding dispersed power producing sources such as wind and solar from the BES definition. These resources comprise a significant share of the North American resource base. No change made. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made.		
Western Area Power Administration	No	Need to clarify the systems associated with this inclusion. The phrase "dispersed power producing resources" in inclusion (I4) is confusing and does not clearly communicate the focus of this inclusion. Without reviewing the reference information provided in the 1st draft comment form, it's not clear that dispersed power producing resources refer to wind and solar resources. Recommendation: Include examples after phrase "dispersed power producing resources" for clarification to this

Organization	Yes or No	Question 5 Comment
		inclusion. Change I4 to read - Dispersed power producing resources (i.e. wind and solar resources) with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above.
Response: The SDT does not believe that the suggestion provides any additional clarity. No change made.		
PacifiCorp	No	Setting a dispersed power producing resource limit to 75 MVA at a common point discriminates against single generator owners who own generators between 20 MVA and 75 MVA (inclusion I1), typically connected at a common point and requires such owners to be subject to additional standards that dispersed power producing owners are not required. However, even with this concern, PacifiCorp supports the entire BES definition in its current form based on the timeframe under which the SDT is operating and with an emphasis based on a phase II SAR to address PacifiCorp's objections regarding generation levels. Under the attached scenario, please identify which elements would be considered BES: This response included a drawing. This format will not allow the submission of the drawing. The drawing will be sent separately in an email. Reference "Proj 2010-17 PAC Drawing".
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. All recommendations for modifications to the technical		

Organization	Yes or No	Question 5 Comment
aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System will be considered. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made. The examples provided will be reviewed as part of Phase 2.		
Massachusetts Department of Public Utilities	No	The aggregate 75 MVA of connected generation does not appear to be adequately supported by technical analysis and appears, on its face, as too low. Among our concerns is that such a low level will have a potential adverse impact on the development of renewable generation resources. In addition, the inclusion needs to be clarified in order that entities have clear guidance on what is meant by "common point of interconnection."
NESCOE	No	NESCOE continues to disagree with this proposed inclusion. NESCOE is concerned with the potential adverse impact this may have on the development of renewable generation resources. In addition, NESCOE suggests that the aggregate 75 MVA of connected generation is too low and is not adequately supported by technical analysis. The threshold value should be related to the largest contingency the applicable control area is designed to operate to. A level of 300 MVA would be appropriate. Finally, the inclusion needs to be clarified in order that entities have clear guidance on what is meant by "common point of interconnection."
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded		

Organization	Yes or No	Question 5 Comment
the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. The SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made. While the SDT does not believe that additional clarification of the term "common point" is needed in the BES definition, the following guidance is provided. The SDT believes the common point of connection, which is the point from where generation is aggregated to determine if the 75 MVA threshold is met, is the point where the individual transmission Element(s) of a collector system ultimately meet the 100 kV transmission system. No change made.		
Idaho Falls Power	No	As drafted, it appears to draw in all generation resources that sum to 75 MVA or higher. We question then if there is value of categorizing every wind turbine on a >75MVA wind farm as a BES asset and, what would be the unintended consequences. Perhaps language delineating the point of aggregation as the demarcation point of a BES asset would better serve.
Response: Inclusion I4 denotes an aggregate threshold. This is clear from the requirement inclusion threshold of "aggregate capacity greater than 75 MVA (gross aggregate nameplate rating)." Once this aggregate threshold is met, all generation resources that comprise the facility would be included. No change made. While the SDT does not believe that additional clarification of the term "common point" is needed in the BES definition, the following guidance is provided. The SDT believes the common point of connection, which is the point from where generation is aggregated to determine if the 75 MVA threshold is met, is the point where the individual transmission Element(s) of a collector system ultimately meet the 100 kV transmission system. No change made.		

Organization	Yes or No	Question 5 Comment
ReliabilityFirst	No	The term "Dispersed Power Producing Resource" is not a defined term and needs further clarification. However, I4 is not needed and is already included in I2. I4 does not add any additional facilities that are not already included in I2. How are "dispersed power producing resources" different from "generating resources" described in I2? If the intent of I4 is to include wind generators but exclude wind farm collector systems in the BES, ReliabilityFirst Staff disagrees. To maintain reliability, the BES cannot have pockets of generation that are not connected to the BES via BES facilities. ReliabilityFirst Staff believes that without including the paths from BES generators in the BES, the reliable operation of the system could be jeopardized if the paths are unavailable due to non-compliance to Reliability Standards. For example, wind farm collector systems at voltages operated at less than 100 kV should be included in the BES for the above reason. I4 could be deleted.
Response: The SDT does not believe further clarification of Dispersed Power Resources is needed. Inclusion I4 is directed at including resources such as wind and solar farms. This is denoted by the requirement that the dispersed power producing resources "utilize[e] a system designed primarily for aggregating capacity." No change made. The essential distinction between Inclusions I2 and I4 is that Inclusion I2 may not include generating resources that use lower voltage collection systems while Inclusion I4 is specifically designed to accomplish this purpose. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made. The contiguous nature of the BES will be discussed as part of Phase 2 of the project. No change made.		
Xcel Energy	No	Xcel Energy believes that this inclusion is still a little vague and could use some clarification. For instance, if a wind farm has an aggregated capacity greater than 75 MVA (and therefore meets Inclusion I4) exactly

Organization	Yes or No	Question 5 Comment
		what facilities are included as part of the BES, every turbine, all distribution transformers and cables, etc. If all equipment is included, what level of detail is required of this BES facility for modeling purposes, and who is responsible for modeling this system. Or, is the intent to only include the facilities at the common point of connection, whereby the facility could be modeled as 1 large facility?
Response: Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made.		
Central Maine Power Company	No	The term "common point" needs clarification and/or definition. (e.g., is it intended to apply to the risk of single mode failure, where all the resources could be lost for a single event?) Some northeast industry expert colleagues interpret I2 to mean the collector system itself needs to be 100 kV or above in order to be BES. I2 seems to not include the collector system itself in BES. I4 should be restated as follows: "Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system connected at a common point. BES includes the interconnecting substation with the step-up transformer(s) connected at a voltage of 100 kV or above."[alternatively, replace "interconnecting substation with" with, "generator terminals through the high-side of" if the entire collector system is intended to be BES]Also note that some wind collector systems require supplemental dynamic reactive resources or special control system to met reliability standards. As written, these reactive resources or controls may not be considered to be BES.
New York State Dept of Public Service	No	I4 reference to a "common point" lacks clarity that can lead to confusion and required clarifications. Suggested wording change: ... connected at a common point through a dedicated step-up transformer with a high-

Organization	Yes or No	Question 5 Comment
		side voltage of 100 kV or above."
American Electric Power	No	We believe more clarity is needed as to where exactly the "common point" is, for example in the case of a wind farm. This first common point could be interpreted as the output voltage of the wind generator, would be less than the 100kv threshold and thereby could (unintentionally?) exclude the facility as a whole. If this was unintentional, we recommend rewording I4 in a manner similar to I2.
Response: While the SDT does not believe that additional clarification of the term "common point" is needed in the BES definition, the following guidance is provided. The SDT believes the common point of connection, which is the point from where generation is aggregated to determine if the 75 MVA threshold is met, is the point where the individual transmission Element(s) of a collector system ultimately meet the 100 kV transmission system. No change made.		
The Dow Chemical Company	No	It is not clear how "Dispersed power producing resources" differ from "Generating Resource (s)" in I2. Inclusion I4 should clarify this. We suggest that the phrase "Variable Energy Resources" be used instead of "Dispersed power producing resources". Variable Energy Resources should be defined as "Resources producing electricity using wind or solar energy." The following phrase should be added at the end "unless excluded under Exclusion E2".
Response: The essential distinction between Inclusion I2 and I4 is that Inclusion I2 may not include generating resources that use lower voltage collection systems while Inclusion I4 is specifically designed to accomplish this purpose. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made. The SDT does not believe that the suggestion provides any additional clarity. No change made.		

Organization	Yes or No	Question 5 Comment
The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " An Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2.		

Organization	Yes or No	Question 5 Comment
Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition does not provide a definitive determination on whether an Element is classified as BES or non-BES, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. No change made.		
City of St. George	No	This language follows the 75 MVA plant requirements from the Registration Criteria. See comments to question 3 (for I2) above. Additional detail is needed to clarify exactly at what point in the dispersed system the BES starts and what is not BES.
Response: Please see response to Q3. While the SDT does not believe that additional clarification of the term "common point" is needed in the BES definition, the following guidance is provided. The SDT believes the common point of connection, which is the point from where generation is aggregated to determine if the 75 MVA threshold is met, is the point where the individual transmission Element(s) of a collector system ultimately meet the 100 kV transmission system. No change made.		
ISO New England Inc	No	I4 is unclear as to whether or not the collector system (or system designed primarily for aggregating capacity) itself is BES or just the resource."Utilizing a system designed primarily for aggregating capacity" needs to be more clearly defined to account for multiple systems that may exist out of one common point. A suggestion would be to modify the end of the sentence to say "connected at any common point." I4 will allow for significant amounts of dispersed power producing resources to be excluded from the BES. This includes wind resources which are increasing in numbers and having a significant impact on system operations. It does not seem appropriate that having ten 70 MVA (total of 700 MVA) installations each with their own connection to a 115

Organization	Yes or No	Question 5 Comment
		kV bus should fall outside of the BES. As currently written, they would fall outside of the inclusion if they do not utilize the same collector system. It is unclear whether or not supplemental equipment associated with the dispersed power producing resources is included in the BES. As an example, many wind resources are being interconnected utilizing supplemental dynamic and static reactive devices which are crucial to the operation of these resources. The dynamic devices are often controlling themselves and static reactive devices, which may or may not be connected above 100 kV. Leaving these devices out of the BES definition seems to be a potential gap.
Response: The essential distinction between Inclusion I2 and I4 is that Inclusion I2 may not include generating resources that use lower voltage collection systems while Inclusion I4 is specifically designed to accomplish this purpose. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made. The clustering of dispersed power producing resources and supplemental equipment will be discussed as part of Phase 2 of the project. No change made.		
Rochester Gas and Electric and New York State Electric and Gas	No	The term “common point” needs clarification and/or definition. (e.g., is it intended to apply to the risk of single mode failure, where all the resources could be lost for a single event?) Some northeast industry expert colleagues interpret I2 to mean the collector system itself needs to be 100 kV or above in order to be BES. I2 seems to not include the collector system itself in BES. I4 be restated as follows:”Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system connected at a common point. BES includes the interconnecting substation with the step-up transformer(s) connected at a voltage of 100 kV or above.”[alternatively, replace the bold italics with,

Organization	Yes or No	Question 5 Comment
		"generator terminals through the high-side of"] Also note that some wind collector systems require supplemental dynamic reactive resources or special control system to met reliability standards. As written, these reactive resources or controls may not be considered to be BES.
Response: While the SDT does not believe that additional clarification of the term "common point" is needed in the BES definition, the following guidance is provided. The SDT believes the common point of connection, which is the point from where generation is aggregated to determine if the 75 MVA threshold is met, is the point where the individual transmission Element(s) of a collector system ultimately meet the 100 kV transmission system. No change made. The essential distinction between Inclusion I2 and I4 is that Inclusion I2 may not include generating resources that use lower voltage collection systems while Inclusion I4 is specifically designed to accomplish this purpose. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made. The inclusion of supplemental equipment will be discussed as part of Phase 2 of the project. No change made.		
LCRA Transmission Services Corporation	No	LCRA TSC suggests consistency between this inclusion criteria and the criteria used in I2 for "generation".
Response: The essential distinction between Inclusion I2 and I4 is that Inclusion I2 may not include generating resources that use lower voltage collection systems while Inclusion I4 is specifically designed to accomplish this purpose. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made.		
Kansas City Power and Light Company	No	It is not clear that it is the injection at the collection point that is the defining point for the injection. Nameplate rating of the generator is not a reflection of what can be actually injected into the transmission system with resulting electrical impacts on transmission loading and behavior. Recommend the BES definition be based on a generating resource(s)

Organization	Yes or No	Question 5 Comment
		established net accredited generating capacity at the common point instead of what it could do by nameplate rating that may not be achievable. Recommend the following language: Dispersed power producing resources utilizing a system designed primarily for aggregating capacity connected through a common point at a voltage of 100 kV or above with aggregate net accredited capacity at the common point of greater than 75 MVA.
Response: For Phase 1, the SDT has used nameplate rating in order to maintain consistency with the ERO Statement of Compliance Registry Criteria. No change made. This can be discussed in Phase 2 of the project. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Farmington Electric Utility System	No	FEUS feels additional clarity should be added to I4. It appears I4 is not intended to include each individual wind turbine generating unit in a wind farm as a BES element, but rather to include the point at which the aggregation becomes large enough to meet the aggregate capacity threshold of 75MVA.
Response: inclusion I4 denotes an aggregate threshold. This is clear from the requirement inclusion threshold		

Organization	Yes or No	Question 5 Comment
of "aggregate capacity greater than 75 MVA (gross aggregate nameplate rating)." Once this aggregate threshold is met, all generation resources that comprise the facility would be included. No change made.		
South Houston Green Power, LLC	No	Further clarification of "Dispersed power producing resources" is needed. Multiple small resources should not be included. The following phrase should be added at the end of Inclusion I4 "unless excluded under Exclusion E2".
Response: The SDT does not believe that additional clarification is needed. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made. The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " An Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.		

Organization	Yes or No	Question 5 Comment
Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition does not provide a definitive determination on whether an Element is classified as BES or non-BES, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. No change made.		
Westar Energy	No	We believe that the removal of the wording "single site" in I2 would eliminate the need to include dispersed power producing resources in I4. We feel that I4 should be removed to reduce redundancy in the definition, unless there is some other reason to include it. Also, we understand that 75 MVA is retained in I4 because there is no direct link to the ERO Statement of Compliance Registry Criteria, but we have concerns that this number could change in phase two of the project, creating unnecessary work in the future.
Response: The essential distinction between Inclusion I2 and I4 is that I2 may not include generating resources that use lower voltage collection systems while I4 is specifically designed to accomplish this purpose, therefore I4 is needed. No change made.		

Organization	Yes or No	Question 5 Comment
The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. The SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Hydro-Quebec TransEnergie		Same comment than Q. 3. Also, since the path to connect the dispersed generation is often done at distribution voltage, that lower voltage path should not be included in BES.
Response: Please see response to Q3. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made.		
Tacoma Power	Yes	Tacoma Power generally supports the Inclusion I4 as currently written. However, we support further refinement of the aggregate nameplate rating definition and support deferring the appropriate quantitative thresholds to those that will be determined in Phase 2.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders		

Organization	Yes or No	Question 5 Comment
No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. The SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Ameren	Yes	a)For a consistent application, we suggest that the definition of the terms "Dispersed power producing resources" is included. Consider including some examples also.
Response: The SDT does not believe further clarification of Dispersed Power Resources is needed. Inclusion I4 is directed at including resources such as wind and solar farms. This is denoted by the requirement that the dispersed power producing resources "utilize[e] a system designed primarily for aggregating capacity." No change made.		
Cowlitz County PUD	Yes	However, Cowlitz suggests Inclusion 4 be made parallel with Inclusion 2: ...(greater than the gross aggregate name plate rating per the ERO Statement of Compliance Registry Criteria) utilizing...
Response: The SDT believes that Inclusions I2 and I4 do use consistent language and this point has been clarified with the clarifying language changes to Inclusion I2. No change made.		
Long Island Power Authority	Yes	Need to define the term "common point"
Response: While the SDT does not believe that additional clarification of the term "common point" is needed in the BES definition, the following guidance is provided. The SDT believes the common point of connection,		

Organization	Yes or No	Question 5 Comment
which is the point from where generation is aggregated to determine if the 75 MVA threshold is met, is the point where the individual transmission Element(s) of a collector system ultimately meet the 100 kV transmission system.		
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative	Yes	This inclusion should be limited to reactive devices 150 MVAR or greater (gross aggregate nameplate rating) connected through a common point at the 200 kV level or higher level.
Manitoba Hydro	Yes	Manitoba Hydro agrees with I4 but it does create a discrepancy between the BES Definition and the Registration Criteria Document. The Registration Criteria document should be updated and I2 and I4 should be combined into a single Inclusion.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. The SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for		

Organization	Yes or No	Question 5 Comment
modifications to the existing values. Possible revisions to the ERO Statement of Compliance Registry Criteria will be discussed as part of Phase 2 of the project. No change made.		
Consumers Energy	Yes	We agree, but would like further clarification on what wind farm equipment (e.g., collector systems or other equipment) would be considered a part of the BES. Is the system designed for aggregating capacity considered to be part of the dispersed plant or part of the BES.
Response: Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made.		
Michigan Public Power Agency Clallam County PUD No.1 Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative (CCEC) Central Electric Cooperatve (CEC) Clearwater Power Company (CPC) Snohomish County PUD Consumer's Power Inc. Douglas Electric Cooperative (DEC) Fall River Rural Electric	Yes	MPPA supports the revised language generally, but believes additional changes would make the language clearer. Specifically, we believe Inclusion 4 should not incorporate a hard 75 MVA generation threshold (i.e, "resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating)"). Instead, we urge the SDT to replace this language with the defined term "Qualifying Aggregate Generation Resources," which is discussed in more detail in our response to Question 3. This language, or some equivalent, will preserve the SDT's ability to revise the 75 MVA threshold in Phase 2, with the result of Phase 2 included in the BES Definition by operation rather than requiring further revision of the Definition. More generally, we are not certain what is accomplished by Inclusion 4 that is not already accomplished by Inclusion 2, which also addresses whether generation should be defined as BES. The SDT's stated concern is with variable generation units such as wind and solar plants. It is not clear to us why this concern is not fully addressed in Inclusion 2, which addresses multiple generation units connected at a common bus, the configuration of most variable generation plants with multiple units. We are also concerned that the language, as proposed, could have

Organization	Yes or No	Question 5 Comment
Cooperative (FALL) Lane Electric Cooperative (LEC) Lincoln Electric Cooperative (LEC) Northern Lights Inc. (NLI) Okanogan County Electric Cooperative (OCEC) Pacific Northwest Generating Cooperative (PNGC) Raft River Rural Electric Cooperative (RAFT) West Oregon Electric Cooperative Umatilla Electric Cooperative (UEC) Kootenai Electric Cooperative		unintended consequences and improperly classify local distribution systems as BES in certain circumstances. This is because multiple distributed generation units could render a local distribution system a "collector system" and the entire system the equivalent of an aggregated generation unit, causing the local distribution system to be improperly denied status as a LN. If many different distributed generation units are connected to a local distribution system, it is very unlikely that more than a few of those units would fail simultaneously, and it is therefore unlikely that multiple generation units would produce a measureable impact on the interconnected bulk transmission system, especially if the units individually do not otherwise exceed the materiality threshold to be established by the SDT in Phase 2. Further, we are concerned that, if small distributed generation units become the industry norm, Inclusion 4 could unintentionally sweep in local distribution systems, especially where local policies favor the growth of small solar or other renewable generation systems for public policy reasons. Finally, we suggest that the SDT add the phrase ". . . unless the dispersed power producing resources operate within a Radial System meeting the requirements of Exclusion E1 or a Local Network meeting the requirements of Exclusion E2." This language, which parallels the language included at the end of Inclusion I1, would make clear that dispersed small-scale generators scattered throughout a Radial System or Local Network serving retail load would not convert the Radial System or Local Network into a BES system, even if the aggregate capacity of those small generators exceeds the relevant threshold.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders		

Organization	Yes or No	Question 5 Comment
No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. The SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made. The essential distinction between Inclusions I2 and I4 is that Inclusion I2 may not include generating resources that use lower voltage collection systems while Inclusion I4 is specifically designed to accomplish this purpose. No change made. Inclusion I4 is directed at including resources such as wind and solar farms. This is denoted by the requirement that the dispersed power producing resources "utilize[e] a system designed primarily for aggregating capacity." Furthermore, Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. Therefore distribution systems would not be inadvertently included. No change made.		
National Grid	Yes	We agree with Inclusion I4, however we feel that the inclusion could be interpreted in some different ways. This inclusion could be interpreted to exclude dispersed generation greater than 75 MVA if the first common point is less than 100 kV. To eliminate any confusion in the interpretation of this inclusion, we suggest this wording: Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) connected to a Transmission Element at 100 kV or above, utilizing a system designed primarily for aggregating capacity which includes all transformers between the generator(s) and the Transmission Element.

Organization	Yes or No	Question 5 Comment
MRO NERC Standards Review Forum (NSRF)	Yes	I4 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above starting at the point of aggregation to 75 MVA or more through to the point of interconnection at 100 kV or above."
Response: The SDT does not believe that the suggested change provides additional clarity. No change made.		
Electricity Consumers Resource Council (ELCON)	Yes	The term "dispersed power" and "dispersed generation" are often synonymous with distributed generation, which includes behind-the-meter generation (CHP). The Inclusion should be clarified by specifically referencing wind and solar, or adopt the FERC term "Variable Energy Resources." Also, to distinguish this Inclusion from Inclusion I2, the SDT might want to clarify that the collection system (usually at voltage below 100 KV anyway) is not part of the BES-just the resources and any transformers included by I1, if this is indeed the intent of this Inclusion. The following phrase should be added at the end "unless excluded under Exclusion E2."
Response: The SDT believes that inclusion of a list is problematic as it may not be complete especially with regard to future technology enhancements which could force a revision of the definition. Furthermore, the SDT does not believe further clarification of Dispersed Power Resources is needed. Inclusion I4 is directed at including resources such as wind and solar farms. This is denoted by the requirement that the dispersed power producing resources "utilize[e] a system designed primarily for aggregating capacity." No change made. The SDT does not believe that additional clarification is needed. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made.		

Organization	Yes or No	Question 5 Comment
ACES Power Marketing Standards Collaborators	Yes	Further clarification on what "dispersed power" means would be helpful. How does it compare to distributed generation?
Response: While the SDT believes that further clarity of the terms "dispersed power" and "distributed generation" is not needed, it notes that distributed generation is generally defined as: a generator that is located close to the particular load that it is intended to serve and is interconnected to the utility distribution system. The U.S EIA and FERC generally use this as a basic definition. The language of Inclusion I4 stating "Dispersed power producing resources . . . utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above" was selected so as not to confuse what is traditionally considered distributed generation with the types of systems to be included in Inclusion I4. No change made.		
Texas RE NERC Standards Subcommittee	Yes	To distinguish this Inclusion from Inclusion I2, the SDT might want to clarify that the collection system (usually at voltage below 100 KV anyway) is not part of the BES-just the resources and any transformers included by I1, if this is indeed the intent of this Inclusion.
Response: The SDT does not believe that additional clarification is needed. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2. No change made.		
ExxonMobil Research and Engineering	Yes	The BES SDT should clarify the difference between "dispersed power producing resources" and "generation resources" in such a manner that it is clear that an industrial plant containing providing the BES with power from ten 7.5MVA machines connected at a common point at a voltage of 100 kV or higher meets the qualifications for generation resources and does not meet the qualifications for a "dispersed power producing resource".
Portland General Electric	Yes	PGE requests additional clarity in the wording of Inclusion 4. Inclusion 4 is not intended to include each individual wind turbine generating unit in a

Organization	Yes or No	Question 5 Comment
Company		wind farm as a BES element, but rather to include the point at which the aggregation becomes large enough to meet the aggregate capacity threshold of 75 MVA. However, the response to comments from the last comment posting and the current wording of Inclusion 4 does not provide sufficient clarity to answer this question.
Bonneville Power Administration	Yes	BPA suggests adding, "Including generating terminals of the high side" as clarifying language to the end of the sentence. (Specifically where the 100kV is to be measured as clarified in I2). BPA believes that Inclusion 4 is not intended to include each individual wind turbine/generator unit in a wind farm as a BES element, but rather to include the point at which the aggregation becomes large enough to meet the aggregate capacity threshold of 75 MVA.
WECC Staff	Yes	WECC seeks further clarification on Inclusion 4. Several comments were submitted in the last round of comments whether each individual wind turbine in a wind farm, will be included in the BES. WECC believes the language change to I4 by the SDT did not address this issue. The current language in I4 could be interpreted as each individual turbine (example 1MW) would be part of the BES. WECC believes that I4 is not intended to include each individual wind turbine in a wind farm as a BES element but rather to include the point at which the aggregation becomes large enough to meet the aggregate capacity threshold of 75 MVA. WECC recommends the SDT modify the language in I4 to clarify this issue.
Response: The SDT does not believe that additional clarification is needed. Inclusion I4 denotes an aggregate threshold. This is clear from the requirement wording of "aggregate capacity greater than 75 MVA (gross aggregate nameplate rating)." Once this aggregate threshold is met, all generation resources that comprise the facility would be included. No change made.		
Transmission Access Policy	Yes	We recommend clarifying that the dispersed power resources covered by

Organization	Yes or No	Question 5 Comment
Study Group		this inclusion do not include generators on the retail side of the retail meter. Specifically, we recommend that the Inclusion read: "Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100kV or above, but not including generation on the retail side of the retail meter."
Florida Municipal Power Agency	Yes	We recommend clarifying that the dispersed power resources covered by this inclusion do not include generators on the retail side of the retail meter. Specifically, we recommend that the Inclusion read: "Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100kV or above, but not including generation on the retail side of the retail meter."
Response: The SDT does not believe that additional clarification is needed. The SDT further clarifies that generating units on the customer's side of the retail meter are not included under Inclusion I4 since customer-side retail generation typically does not "utilize[e] a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above." No change made.

Response: Thank you for your support.		

6. The SDT has added specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I5 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: In response to comments, the SDT added further clarification to Inclusion I5 to exclude small generators that would be improperly brought into the BES.

The SDT believes Inclusion I5 incorporates the necessary resources for the reliable operation of the BES, without unintentionally including any distribution devices, or including any of the dedicated transformers which are not identified in the core definition or Inclusion I1.

Additionally, Exclusion E4 will further exclude those non-generator Reactive Power resource devices that were identified through the core definition or through Inclusion I5 which are on the load side of the customer meter solely for the customer's own use.

Using a threshold for inclusion of non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

I5 –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

Organization	Yes or No	Question 6 Comment

Organization	Yes or No	Question 6 Comment
SERC OC Standards Review Group	No	We feel that this inclusion should be limited to dynamic devices with an aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) connected through a common point.
Tennessee Valley Authority	No	TVA feels that this inclusion should be limited to dynamic devices with an aggregate capacity greater than 75 MVAR (gross aggregate nameplate rating) connected through a common point at a voltage of 200kV or above, and requests that the Phase 2 for the project use 75 MVAR connected at 200kV or above or develop a transmission voltage and/or an MVAR threshold that is technically based.
Tri-State GandT	No	There should be a limitation on what reactive components needs to be included. The limits could be based on capacity of the units or on the voltage step that occurs upon switching of the device.
Western Area Power Administration	No	This inclusion should be worded to only include static or dynamic reactive devices which are necessary to meet the NERC Planning Criteria in terms of normal and post-disturbance voltage profiles. We shouldn't have to include smaller shunt cap banks and reactors which are used primarily for voltage support (not voltage collapse). Recommendation: Change I5 to read - Static or dynamic devices dedicated to supplying or absorbing Reactive Power which are necessary to meet the NERC Planning Criteria in terms of normal and post-disturbance voltage profiles that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1
Southern Company	No	We believe that the size of the reactive power resource should be considered as a key factor to be part of BES. When considering generating resources, the size, e.g., greater than 75 MVA, was a key part of criteria to be included or excluded as BES. A similar approach should be applied when considering reactive power resources. We also suggest the removal of static reactive resources from this inclusion.
Response: Using a threshold for inclusion of non-generator Reactive Power resource devices in the BES will be considered in		

Organization	Yes or No	Question 6 Comment
Phase 2 of this effort. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
New York State Dept of Public Service	No	I5 - which has been newly added and significantly expands the BES definition - should be dropped due to lack of technical justification.
Northeast Power Coordinating Council	No	Technical studies need to be conducted to confirm reactive resource impacts on the reliability of the BES. The inclusion of reactive resources is a significant expansion of the current BES definition and therefore requires technical justification for inclusion. Inclusion I5 as written is confusing with a reference to Inclusion I1 in the definition. Suggest removing references to reactive resources from Phase 1 until technical justification can be demonstrated (as part of Phase 2).
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects of the definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will provide compelling justification.		

Organization	Yes or No	Question 6 Comment
No change made.		
Southwest Power Pool Standards Review Team	No	We understand that this inclusion is used to capture those devices other than generation resources, but the language leads us to believe that it could include all generators used to supply or absorb reactive power. We would suggest that I5 be changed to read "-Static or dynamic devices specifically used for supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.
Consumers Energy	No	This inclusion appears to pull small generators that have an AVR that are connected to 138 kV into the BES. These generators are primarily intended to provide real power.
Response: The SDT added further clarifications to Inclusion I5 to specifically exclude generators. **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.		
Dominion	No	The language in the last part of Inclusion I5 "....or through a transformer that is designated in Inclusion I1" introduces ambiguity. Specifically, it is not clear how implememtation of this language would result in the inclusion of any Static or dynamic device that is not already included. Dominion suggests that the language in I5 be revised to read "Static or dynamic devices dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or connected through a dedicated transformer with at least one terminal voltage of 100 kV or higher." Dominion understands that the SDT intended for this Inclusion to not address generators or power producing resources because they are covered elsewhere (I2 and I4) and requests that the SDT confirm this understanding.
Response: The SDT believes these qualifications on non-generator Reactive Power resource devices in Inclusion I5 do include the		

Organization	Yes or No	Question 6 Comment
necessary resources for the reliable operation of the BES, without unintentionally including any distribution devices, or including any of the dedicated transformers which are not identified in the core definition or Inclusion I1. No change made. The SDT confirms that Dominion's understanding of the intent of this inclusion is correct. In response to comments, the SDT added further clarifications to Inclusion I5. **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.		
Pepco Holdings Inc and Affiliates	No	Agree in principle. However, the last phrase "or through a transformer that is designated in Inclusion I1" is unnecessary, since if the resource were connected through a transformer meeting Inclusion I1 it would by nature be connected at 100kV or higher.
Response: The SDT believes the Inclusion I1 wording is necessary to capture those devices dedicated to supplying or absorbing Reactive Power. No change made.		
MRO NERC Standards Review Forum (NSRF)	No	NSRF recommends the following proposed language for I5 to address the concern:"I5 - Static or dynamic devices which 1) are dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1 and 2) are pertinent to meeting the NERC Planning Criteria in terms of normal and post-disturbance voltage profiles."
Response: The SDT does not believe this change provides additional clarity as it diverts from the bright-line concept. No change made.		
PacifiCorp	No	PacifiCorp recommends the addition of the phrase "...unless excluded under E1 or E3." Otherwise, PacifiCorp believes that I5 is currently acceptable. However, phase II should identify limits and technically justify the appropriate limit(s).

Organization	Yes or No	Question 6 Comment
Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		

Organization	Yes or No	Question 6 Comment
Using a threshold for inclusion of non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
Massachusetts Department of Public Utilities	No	The inclusion of all devices that supply reactive power to the BES is unnecessary and will result in unjustified costs to the ratepayer. Static devices (fixed capacitors) should remain excluded from the BES as they are dispatched by operations personnel, and if one fixed capacitor bank fails, the operator can replace its impact by switching in another fixed bank. This represents routine operation of the system. On the other hand, dynamic devices may be important to maintaining voltage stability of the system. These installations typically are rated to supply or absorb 75 MVA or more to or from the BES. Therefore, the MA DPU suggests that dynamic reactive power devices rated at 75 MVA or more could be included in the BES. Further, revised inclusion I5 is a new inclusion that lacks definition (and appears to be redundant with the general BES definition). NERC should provide technical justification for the additional language under Inclusion I5.
NESCOE	No	NESCOE believes that inclusion of all devices that supply reactive power to the BES is unnecessary and will result in transferring unjustified costs to the ratepayer. Static devices (fixed capacitors) should remain excluded from the BES as they are dispatched by operations personnel, and if one fixed capacitor bank fails, the operator can replace its impact by switching in another fixed bank. This represents routine operation of the

Organization	Yes or No	Question 6 Comment
		system. On the other hand, dynamic devices may be important to maintaining voltage stability of the system. These installations typically are rated to supply or absorb 75 MVA or more to or from the BES. Therefore, NESCOE suggests that dynamic reactive power devices rated at 75 MVA or more be included in the BES. Further, revised inclusion I5 is a new inclusion that lacks definition (and appears to be redundant with the general BES definition). NERC should provide additional technical justification for the additional language under Inclusion I5.
Response: The SDT believes these qualifications on non-generator Reactive Power resource devices in Inclusion I5 do include the necessary resources for the reliable operation of the BES, without unintentionally including any distribution devices, or including any of the dedicated transformers which are not identified in the core definition or Inclusion I1. No change made. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will provide compelling justifications.		
Clallam County PUD No.1 Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative (CCEC) Central Electric Cooperatve (CEC) Clearwater Power Company	No	CLPD has several concerns about the new language in Inclusion 5. First, because Reactive Power devices produce power, they are “power producing resources” and we therefore believe Inclusion 5 is duplicative of Inclusion 4, which addresses “power producing devices.” Second, there is no capacity threshold specified in Inclusion 5 for Reactive Power devices that would be considered part of the BES. This is inconsistent with the approach taken in the balance of the definition, where thresholds are specified for generators and other types of power producing devices. Finally, CLPD believes the appropriate threshold for inclusion or exclusion of Reactive

(CPC) Snohomish County PUD Consumer's Power Inc Douglas Electric Cooperative (DEC) Fall River Rural Electric Cooperative (FALL) Lane Electric Cooperative (LEC) Lincoln Electric Cooperative (LEC) Northern Lights Inc. (NLI) Okanogan County Electric Cooperative (OCEC) Pacific Northwest Generating Cooperative (PNGC) Raft River Rural Electric Cooperative (RAFT) West Oregon Electric Cooperative Umatilla Electric Cooperative (UEC) Kootenai Electric Cooperative Cowlitz County PUD		Power devices from the BES should be subject to the same technical analysis that will cover generators in the Phase 2 process.

Organization	Yes or No	Question 6 Comment
Michigan Public Power Agency	No	MPPA has several concerns about the new language in Inclusion 5. First, because Reactive Power devices produce power, they are "power producing resources" and we therefore believe Inclusion 5 is duplicative of Inclusion 4, which addresses "power producing devices." Second, there is no capacity threshold specified in Inclusion 5 for Reactive Power devices that would be considered part of the BES. This is inconsistent with the approach taken in the balance of the definition, where thresholds are specified for generators and other types of power producing devices. Finally, MPPA believes the appropriate threshold for inclusion or exclusion of Reactive Power devices from the BES should be subject to the same technical analysis that will cover generators in the Phase 2 process. Without such analysis either: 1) no threshold except for those connected at 100kV, or: 2) of .95 power factor of a 20 MVA generator, or 6 MVAr and use the fact that most Facility Connection Requirements require a power factor in the range of between 0.85 - 0.9 lagging to 0.9 - 0.95 leading for a generator. Hence, a 20 MVA generator (the smallest to meet the registry criteria) will need to absorb a minimum of 6 MVAr and use that as the technical justification.

Response: The SDT added further clarifications to Inclusion I5 to address your concerns and those of others.

> **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. Therefore, the SDT will consider all recommendations for modifications to the technical

Organization	Yes or No	Question 6 Comment
aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made. .		
Ontario Power Generation Inc.	No	OPG recommends that the wording of this inclusion be made clear that the BES boundary extends to the Low Voltage terminals of the transformer, used in the interface connection, and does not include the static or dynamic reactive power source itself unless it is directly connected to the BES.
Response: The SDT refers the commenter to Inclusion I1 which addresses the situation presented here when used in conjunction with Inclusion I5. No change made.		
Metropolitan Water District of Southern California	No	Inclusion 5 should be changed to be consistent with the core definition and to clarify Reactive Power devices. Under I5, the additional phrase "or through a dedicated transformer with a high side voltage of 100 kV or higher," appears to conflict with the core definition's phrase "and Real Power and Reactive Power resources connected at 100 kV or higher". For example, if you have a device connected to a 69Kv system which is used solely for an end-user's load, but the 69kv system is transformed up to a 115kV system, such device could be included as BES or you would have to define what is meant by "dedicated. If Reactive Power is meant to agree with the definition under NERC's Glossary of Terms, there should be consistency and less verbiage. MWDSC also agrees with WECC's comment that there should be some minimum threshold for Reactive Power devices similar to that identified for generating resources in Inclusion 2. MWDSC recommends that Inclusion 5 be changed as follows: I5 - "Reactive Power devices dedicated to support the BES that are connected at 100kV or higher, or through a transformer that is designated in Inclusion I1."
Response: The SDT does not believe that a contradiction exists. Proper application of the definition and inclusions (see explanation of process immediately following) would seem to preclude the situation described by the commenter. No change		

Organization	Yes or No	Question 6 Comment
made. The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element as defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of		

Organization	Yes or No	Question 6 Comment
the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made. The SDT does not believe this change provides additional clarity. No change made.		
LCRA Transmission Services Corporation	No	This inclusion conflicts with exclusion E4. Which one takes priority?
Duke Energy	No	Need to add the exception for exclusions under E1 or E3, and also reword to exclude devices connected to a transformer winding less than 100 kV unless that is the only connection to that winding. Suggested rewording of I5 : “Unless excluded under Exclusions E1 or E3, static or dynamic devices dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage or 100 kV or higher, or through a transformer winding less than 100 kV that is designated in Inclusion I1 if the winding does not have any circuits or load connected to it.” This would eliminate having to include a capacitor connected to the 69 kV winding of a three winding BES transformer such as 230/138/69 kV if that winding had other connections such as 69 kV circuits. The voltage threshold of 100 kV and above should capture devices connected to 100 kV or

Organization	Yes or No	Question 6 Comment
		higher windings of transformers designated in Inclusion I1.

Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.

Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2.

Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.

In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either

Organization	Yes or No	Question 6 Comment
include or exclude an Element.		
Tacoma Power	No	Tacoma Power generally supports the intent of Inclusion I5 as currently written. However, we believe the definition of the MVAr threshold level must be included in the Phase 2 evaluation and should be determined in a similar manner to the generator threshold that will be determined for I2.
Farmington Electric Utility System	No	I5 should be modified to identify a minimum Reactive Power threshold for static or dynamic devices. As drafted a 1 MVA device supplying or absorbing Reactive Power that is connected at 100 kV or higher would be included in the BES.
MEAG Power	No	We feel that this inclusion should be limited to dynamic devices with an aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) connected through a common point.
Harney Electric Cooperative, Inc.	No	HEC believes this inclusion should include a technically justified capacity limit on reactive resources to warrant inclusion.
City of St. George	No	A reasonable minimum value for inclusion should be added. As presently written all static or dynamic devices would be included in the BES regardless of size.
Tillamook PUD	No	While we agree that reactive devices of sizable capacity connected at 100 kV or higher are needed for BES reliability, Tillamook PUD fails to see why this inclusion is needed as they are already captured by the 100 kV threshold. We would propose instead to eliminate this inclusion and substitute an exclusion for smaller capacity devices. If the SDT really believes an inclusion for reactive devices is needed, we suggest the SDT provide a technically justified capacity limit within the inclusion. In addition we suggest also including the phrase "...unless excluded under Exclusion E1, E2 or E4" similar to that in I1.

Organization	Yes or No	Question 6 Comment
Mission Valley Power	No	Mission Valley Power - While we agree that reactive devices of sizable capacity connected at 100 kV or higher are needed for BES reliability, Mission Valley Power fails to see why this inclusion is needed as they are already captured by the 100 kV threshold. We would propose instead to eliminate this inclusion and substitute an exclusion for smaller capacity devices. If the SDT really believes an inclusion for reactive devices is needed, we suggest the SDT provide a technically justified capacity limit within the inclusion. In addition we suggest also including the phrase "...unless excluded under Exclusion E1, E2 or E4" similar to that in I1. Please see the answer to Q1 above Q10 below.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Consolidated Edison Co. of NY, Inc.	No	Normally, static and dynamic devices supply Reactive Power (VARs) to or absorb VARs from the surrounding system. By their nature, VARs do not travel far, e.g., miles. So, VARs by their nature only produce local impacts. Please explain the meaning of the phrase "dedicated to supplying or absorbing Reactive Power," with emphasis on explaining why the term "dedicated" was employed? How does an Entity determine if a particular static or dynamic device is "dedicated" to the BES? What Guidance documents can the BES SDT provide describing "dedicated"

Organization	Yes or No	Question 6 Comment
		static and dynamic devices?
Response: The word 'dedicated' was used to identify those Elements whose sole purpose is supplying or absorbing Reactive Power. The language limits those devices dedicated to voltages at 100 kV and higher (via the core definition or through Inclusion I5), unless it can be excluded via Exclusion E4.		
American Electric Power	No	I5 only specifies voltage limits, and makes no mention of reactive limits. We suggest that the drafting team consider adding reactive capacity to these criteria as well.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
South Houston Green Power, LLC	No	The phrase should be added at the end “unless excluded under Exclusion E4”.
National Grid	No	We see some potential conflicts between this inclusion and the exclusions. Without some additional wording, it seems like some devices that are in a Local Distribution Network would be considered BES. In addition, reference to a transformer in Inclusion I1 is not necessary since the definition includes “all Transmission Elements operated at 100 kV”, thus by definition and I5, those connected to 100 kV and higher are already included. We suggest: Static or dynamic devices dedicated to supplying or absorbing Reactive Power that are connected at 100kV or higher unless the device is in an area

Organization	Yes or No	Question 6 Comment
		excluded from BES by Exclusion E1 or E3, or through a dedicated transformer with a high-side voltage of 100kV or higher, unless excluded by Exclusion E4.
Orange and Rockland Utilities, Inc.	No	Should also mention "unless excluded under Exclusion E1 or E3".
The Dow Chemical Company	No	The phrase “or through a dedicated transformer with a high-side voltage of 100 kV or higher” is inconsistent with I1 and would bring Reactive Power Equipment that is lower than 100Kv into the BES definition. This phrase should be deleted. The following phrase should be added at the end “unless excluded under Exclusion E4”.

Response: The application of the draft ‘bright-line’ BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES ‘core’ definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the ‘core’ definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the ‘core’ definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

“Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. “

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the ‘core’ definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the

Organization	Yes or No	Question 6 Comment
exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. No change made.		
Hydro-Quebec TransEnergie	No	
Response: Without specific comments the SDT is unable to respond.		
Northern Wasco County PUD	No	While we agree that reactive devices of sizable capacity connected at 100 kV or higher are needed for BES reliability, Northern Wasco County PUD fails to see why this inclusion is needed as they are already captured by the 100 kV threshold. We would propose instead to eliminate this inclusion and substitute an exclusion for smaller capacity devices. If the SDT really believes an inclusion for reactive devices is needed, we suggest the SDT provide a technically justified capacity limit within the inclusion. In addition we suggest also including the phrase "…unless excluded under Exclusion E1, E2 or E4" similar to that in I1. Please see the answer to Q1 above Q10 below.
Central Lincoln	No	While we agree that reactive devices of sizable capacity connected at 100 kV or higher are needed for BES reliability, Central Lincoln fails to see why this inclusion is needed as they are already captured by the 100 kV threshold. We would propose instead to eliminate this inclusion and substitute an exclusion for smaller capacity devices.If the

Organization	Yes or No	Question 6 Comment
		SDT really believes an inclusion for reactive devices is needed, we suggest the SDT provide a technically justified capacity limit within the inclusion. In addition we suggest also including the phrase "...unless excluded under Exclusion E1, E2 or E4" similar to that in I1. Please see the answer to Q1 above Q10 below.

Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.

The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with

Organization	Yes or No	Question 6 Comment
specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. No change made. Please see detailed responses to Q1 and Q10.		
Ameren	No	a)Only those Reactive Power devices applied for the purpose of BES support or BES voltage control should be included. A Reactive Power device connected at >100kV but used for the purpose of voltage support to local load and/or needed to support local networks should be excluded. b)We believe that this inclusion should be limited to dynamic devices with an aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) connected through a common point. c)See the response to question 2: The inclusion is unclear since it includes a certain voltage transformers, but excludes those that have E1 or E3 Exclusion criteria. Each exclusion criteria has multiple stipulations to its applicability, and then has a final inclusive reference to I3. Please make the wording exact and not dependent on

Organization	Yes or No	Question 6 Comment
		clausal statements.

Response: a) The SDT believes that the proper application of the core definition with Inclusion i1 and I5 plus the application of Exclusions E1, E3, and E4 will cover the situation described in most applications. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. No change made.

b) The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

c) The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the

Organization	Yes or No	Question 6 Comment
application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. No change made.		
ExxonMobil Research and Engineering	No	The BES SDT should work on clarifying the differences between Inclusion I5 and Exclusion E4. The phrase "solely for its own use" in Exclusion E4 is vague and open to interpretation. It is unclear whether equipment, such as power factor correction facilities, surge capacitors located in motor terminal boxes and excitation capacitors installed for use by a motor located on the low side of a 138 kV primary transformer would be excluded from the BES. Is the intent of this requirement to capture "reactive resources" that provide VARs to the BES in regions that exhibit voltage stability issues?
Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and		

Organization	Yes or No	Question 6 Comment
non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. No change made. The BES definition is predicated on operations at 100 kV or higher. In the example cited, the equipment in question appears to be below that threshold and thus is not included in the BES. No change made.		
ATC LLC	No	ATC agrees with the inclusion provided the last clause is removed, as noted below.

Organization	Yes or No	Question 6 Comment
		The BES definition is intended to establish a bright line BES definition. The clause "dedicated transformer" is undefined and unclear. Inclusion I5 -Static or dynamic devices dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher (deletion of remainder of clause).
Response: The SDT considered the disposition of the word "dedicated" and determined that retention of this word is necessary to show the SDT's intent that the conditions described by the inclusion are for configurations where the intended device is only going through one transformation. No change made.		
Westar Energy	No	We understand that I5 is being used to capture those devices other than generation resources, but the language used leads us to believe that it could include all generators that supply or absorb reactive power. We also believe the language should be changed to be consistent with I1. We suggest that I5 be changed to read: "Static or dynamic devices specifically used for supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side terminal operated at 100 kV or higher, or through a transformer that is designated in Inclusion I1."
Response: The SDT has clarified the wording of Inclusion I5 to address your concern. **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1. The SDT does not believe your suggested wording provides additional clarity. No change made.		
Florida Municipal Power Agency		To help clarify and to avoid inclusion of de minimis reactive resources, we propose a size threshold of 6 MVAr consistent with the smallest size generator included in the BES at a 0.95 power factor, which is a common leading power factor used in Facility Connection Requirements for generators. In other words, 6 MVAr is consistent with typically the least amount of MVAr required to be absorbed by the smallest generator

Organization	Yes or No	Question 6 Comment
		meeting the registry criteria.
Redding Electric Utility	Yes	Redding believes that an appropriate MVAr level should be established during Phase 2.
City of Redding	Yes	Redding believes that an appropriate MVAr level should be established in during Phase 2.
City of Austin dba Austin Energy	Yes	Appropriate MVAr level should be established. Reactive resources should be treated similar to generation criteria and included in the technical studies associated with the Phase 2 technical analysis in order to establish the appropriate MVAr level included as BES.
Sacramento Municipal Utility District	Yes	However, appropriate MVAr level should be established. Reactive resources should be treated similar to generation criteria and included in the technical studies associated with the Phase 2 technical analysis in order to establish the appropriate MVAr level included as BES.
Tri-State Generation and Transmission Assn., Inc. Energy Management	No	There should be a limitation on what reactive components needs to be included. The limits could be based on capacity of the units or on the voltage step that occurs upon switching of the device
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power	Yes	This inclusion should be limited to reactive devices 150 MVAR or greater (gross aggregate nameplate rating) connected through a common point at the 200 kV level or higher level.

Organization	Yes or No	Question 6 Comment
Cooperative		
Memphis Light, Gas and Water Division	Yes	We are in general agreement with this inclusion, except that there is no threshold for reactive resources as there is for generators and transformers. We recommend that a minimum level be established for this equipment, such as 100 MVAr, or that studies be conducted to determine an appropriate threshold.
Southern Company Generation	Yes	We believe that the size of the reactive power resource should be considered as a key factor to be part of BES. When considering generating resources, the size, e.g., greater than 75 MVA, was a key part of criteria to be included or excluded as BES. A similar approach should be applied when considering reactive power resources. Moreover, the language at the end of I5, "or through a transformer that is designated in Inclusion I1," appears to be redundant since the reactive power resources are connected to 100 kV or higher already without this additional language. The following language is suggested: I5 - Static or dynamic devices dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, and with an aggregate continuous nameplate rating greater than 30 MVA.
ACES Power Marketing Standards Collaborators	Yes	We understand the SDT's logic behind not setting any threshold values for reactive resources during Phase 1 of this project. Ample time and effort should be given to developing the technical justification behind such values. However, we encourage the SDT to consider adding threshold values in Phase 2 of the project to provide even more clarity to this inclusion.
Balancing Authority Northern California	Yes	However, appropriate MVAr level should be established. Reactive resources should be treated similar to generation criteria and included in the technical studies associated with the Phase 2 technical analysis in order to establish the appropriate MVAr level included as BES.
WECC Staff	Yes	WECC believes I5 should be modified to identify a minimum Reactive Power threshold

Organization	Yes or No	Question 6 Comment
		for static or dynamic devices similar to the threshold identified for generating resources in I2. As worded, any size device dedicated to supplying or absorbing Reactive Power that is conected at 100 kV or higher, no matter how small, would be included in the BES.
Response: Using a threshold for inclusion of non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Springfield Utility Board	Yes	SUB agrees in general, but does not agree that ALL reactive resources should be automatically included in the BES Definition. For example, is a local network (100 kV or above), which is otherwise excluded, but has a reactive device used for power factor correction (100 kV or above), still excluded? There are a significant number of reactive resources that are used to serve systems that provide service primarily to load, with either no or a minimal amount of generation. If this section is included, the Exclusion language needs to be modified to exclude those reactive resources from the BES that are radial serving only load or local networks that serve load (with less than 75MVa of generation). SUB does not agree with the language referring to only those “retail customer” reactive power devices for Exclusion E.4. This is too narrow and does not accurately reflect the use of reactive power devices installed by registered entities when retail customers do not “fix” their reactive power issues on their own. SUB recommends

Organization	Yes or No	Question 6 Comment
		that the language in I5 and E4 be consistent, and that "retail customer" should include Registered Entities as well as end users. This present language is overly broad and, absent modifications to the BES definition, will generate a significant amount of paperwork. SUB suggests the following language change:I5 -Static or dynamic devices dedicated to supplying or absorbing Reactive Power that:a)are connected at 100 kV or higher and are not part of a radial system or area network that are excluded from the BES, or;b)are connected through a dedicated transformer with a high-side voltage of 100 kV or higher and are not part of a radial system or area network that are excluded from the BES, or;c)are connected through a transformer that is designated in Inclusion I1 and are not part of a radial system or area network that are excluded from the BES .

Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5.

Organization	Yes or No	Question 6 Comment
The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. No change made. The SDT team considered the disposition of the word "retail" in the context of Inclusion I5, and determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter). No change made.		
FirstEnergy Corp.	Yes	While we do not object to I5, we question its need based on item I2 and believe I2 also covers this item
Response: The SDT added further clarifications to Inclusion I5 to address your concern. **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.		
Central Maine Power Company	Yes	There is no such thing as "supplying or absorbing Reactive Power" but the intended meaning is sufficiently clear since it is industry 'shorthand'. We suggest an alternative wording of: "Static or dynamic Reactive Power resources that are connected at 100 kV or higher, or..."
Rochester Gas and Electric and New York State Electric and Gas	Yes	There is no such thing as "supplying or absorbing Reactive Power" but the intended meaning is sufficiently clear since it is industry 'shorthand'. Suggest alternative wording:"Static or dynamic Reactive Power resources that are connected at 100 kV or

Organization	Yes or No	Question 6 Comment
		higher, or…"
Response: The SDT elected to also include the word 'dedicated' in front of the quotation listed to identify those Elements whose sole purpose is supplying or absorbing Reactive Power. Re-arranging the words as suggested would not capture the same effect. No change made.		
Portland General Electric Company	Yes	
Georgia System Operations Corporation	Yes	
Kansas City Power and Light Company	Yes	
Oncor Electric Delivery Company LLC	Yes	
Utility Services, Inc.	Yes

Response: Thank you for your support.		

7. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E1 (radial system)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: Exclusion E1 is an exclusion for the contiguous transmission Elements connected at or above 100 kV. Generation resources connected within the radial system are qualifiers for this exclusion.

The "single point of connection of 100 kV or higher" is where the radial system will begin if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation.

Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify for exclusion under Exclusion E3. The owner always has the option to seek exclusion through the exception process.

The SDT considered the disposition of the word "transmission" in the context of Exclusion E1, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element".

The SDT has determined that it should be conservative with regard to allowing exclusion for radial systems that are depended upon for blackstart functionality, as these will arguably be more important to the reliable operation of the transmission system than equivalent radial systems without blackstart resources.

Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion.

Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing

threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 development of the BES definition.

Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator's responsibility to indicate how a switch is used in the normal operating environment.

No changes were made to Exclusion E1 due to received comments.

Organization	Yes or No	Question 7 Comment
NERC Staff Technical Review	No	While we appreciate the improvement in the text for Exclusion E1, but we continue to believe that E1 should require (i) the normally open switch must not be used to make a parallel connection if the normally switch is operated at 100 kV or higher and (ii) an automatic interrupting device that is part of the BES must be provided at the point of interconnection between the radial system and the BES.
American Electric Power	No	AEP supports the concept of the exclusion of radial systems, however further clarification is needed regarding whether or not the source equipment is included as part of the radial system (for example, ring bus or breaker and a half bus configurations). Regarding the following text: "Note - A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion." We interpret this as not including two radial lines which could be tied together through a normally open switch, are we correct? Additional clarity may be needed regarding this note.
Response: Radial systems should be assessed with the normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator's responsibility to indicate how a switch is used in the normal operating environment. No change made.		

Organization	Yes or No	Question 7 Comment
The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial and the owner of the bus would need to insure the reliability of the substation. No change made.		
Northeast Power Coordinating Council	No	E1 can be simplified by not dividing in three subsets of a, b and c. The end result is that a Radial system is excluded if it does not have more than 75 MVA aggregate non-retail generation. There seems to be an error with reference to I3. Black start unit paths are not designated as BES and were taken out in this version under I3 so E1 and E3 should not reference I3. This contradicts the radial or LN exclusion from I3. Suggest deleting the reference to I3 in E1 and E3 because this reference is in contradiction to I3. I3 does not require a path to be BES, but it implied that a radial cannot be excluded if there is a black start unit on the radial. Further clarification is needed to the language in the Note referring to the "Normally Open switch". The E1 reference Note should be re-worded to state "Radial systems shall be assessed with all normally open switching devices in their open positions." Explanatory figures should be included to illustrate the system configurations addressed. Black start unit paths must be considered in the construction of E1. In E1c, what is meant by "non-retail"?
Response: The SDT believes that the distinction between Load only, generation only, and Load with generation provides a bright-line exclusion for radial systems that is needed to cover all of the possible scenarios. No change made. The SDT appreciates the suggestion that there could be an appearance of an inconsistency between Inclusion I3 and Exclusions E1 and E3. The SDT has determined that it should be conservative with regard to allowing exclusion for radial systems that are depended upon for blackstart functionality, as these will arguably be more important to the reliable operation of the transmission system than equivalent radial systems without Blackstart Resources. No change made.		

Organization	Yes or No	Question 7 Comment
The SDT agrees that the radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator's responsibility to indicate how a switch is used in the normal operating environment. Non-retail generation is the generation on the system (supply) side of the meter.		
Consumers Energy	No	In general we agree, but believe the word "transmission" should be removed from "A group of contiguous transmission Elements..."
Southwest Power Pool Standards Review Team	No	Why was the defined term for "T"ransmission dropped in this version of the definition? This should be kept in this version of the definition as well.
Response: The SDT team considered the disposition of the word "transmission" in the context of Exclusion E1, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element". No change made.		
Bonneville Power Administration	No	BPA believes that a system left connected in a network configuration, via use of a normally open switch for temporary network connection, without the protections afforded through the standards that apply to BES should be limited to less than 24 hours. BPA believes that the term "non-retail generation" in E1(c) should be clearly defined. In addition, BPA believes that there needs to be a means to isolate the radial system from the BES during a fault on the radial system by means of a automatic fault interrupting device. Automatic fault interrupting device should be a defined term.
Response: The exclusion for radial systems does not provide requirements in the operating environment. Any attempt to hard code time duration into the exclusion language will create any number of one off situations when applied on a continent-wide basis. It is the owner and operator's responsibility to indicate how a switch is used in the normal operating environment. No change made. Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-		

Organization	Yes or No	Question 7 Comment
retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made. The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. No change made.		
Dominion	No	Dominion does not agree that exclusion of a radial should be based upon the aggregate capacity of generation. A radial serving only generation should be excluded just as it is for load (as proposed by the SDT in 1a). No reliability gaps exist since the owner and/or operator of generation (with an individual with gross individual or gross aggregate nameplate rating per the ERO Statement of Compliance Registry Criteria) must comply with applicable reliability standards. Dominion requests that the SDT provide technical justification for E1a and E1b as it did for E3, and explain the intent of the footnote in E1.
Response: The SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the NERC Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made. Exclusion E1.a is a retained exclusion form the existing definition and as such requires no technical justification at this time. As for Exclusion E1.b, the SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical		

Organization	Yes or No	Question 7 Comment
justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. The SDT believe that the radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator's responsibility to indicate how a switch is used in the normal operating environment.		
Pepco Holdings Inc and Affiliates	No	1) Additional clarification is needed on whether certain bus sections supplying radial systems would be considered part of the BES. It is critical that the BES definition address this issue, since it will define what transmission Protection Systems fall in scope for PRC-004 and 005. One way to address this issue would be to add a qualifier to Exclusion E1 that states, "if a radial system is supplied from a bus section in a substation, then this bus section is considered part of the radial system and is not considered part of the BES if the tripping of this bus section does not result in an interruption to any BES facilities when the station is operating in its normal configuration." 2) Since the SDT deleted the inclusion of Black Start Cranking Paths in I3 then reference to I3 in criteria E1b and E1c should also be removed. Limits on connected generation should only be constrained by the 75MVA limit. In summary, delete the phrase "not identified in Inclusion I3" from both Exclusions E1b and E1c.
Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial and the owner of the bus would need to insure

the reliability of the substation. No change made. The SDT appreciates the suggestion that there could be an appearance of an inconsistency between Inclusion I3 and Exclusions E1 and E3. The SDT has determined that it should be conservative with regard to allowing exclusion for radial systems that are depended upon for blackstart functionality, as these will arguably be more important to the reliable operation of the transmission system than equivalent radial systems without Blackstart Resources. No change made.		
Southern Company Generation	No	Subpart (b) uses the term "generation resources" while subpart (c) uses the term "non-retail generation", why are these different terms used? Further, why is it important that the term "non-retail generation" is used in subpart (c)? In addition, the SDT needs to clarify what the term "non-retail generation" means. Is this what is commonly referred to as "customer owned" or "behind-the-meter" generation? The change in version 2 that removed the requirement that an excluded radial system have an automatic interruption device at the single point of connection to the rest of the BES creates a problem. Three-terminal circuits are common below 230 kV. The "tapped portion" should not be left out of the BES since a fault on that portion takes out the whole line. We propose this revised language in the first sentence on E1: "E1 - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher, where the connection has an automatic interruption device,..." Exclusion E1, subpart (c) uses the phrase "an aggregate capacity of ... less than or equal to 75 MVA ...". Exclusion E3. subpart (a) provides that the local networks "do not have an aggregate capacity of ... greater than 75 MVA ...". Why are these phrases stated differently even though they appear to address the same resources?
Response: Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion.		

Organization	Yes or No	Question 7 Comment
The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial and the owner of the bus would need to insure the reliability of the substation. No change made. The SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
IRC Standards Review Committee	No	While we support the provisions of E1 in principle, we are seeking clarification to the following issues. Does the connection voltage of generation referred to in E1.b affect whether a radial system could be excluded under E1? Please clarify the meaning of "non-retail" generation used in E1.c.
Response: Exclusion E1 is an exclusion for the contiguous transmission Elements connected at or above 100 kV. Generation resources connected within the radial system are qualifiers for this exclusion. No change made. Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.		
Hydro One Networks Inc.	No	Although we agree with the exclusion of radial systems, we believe that the reliability of the interconnected transmission network should not be determined by the amount of installed generation on the radial system. We believe that the generation limit is restrictive and has little or no technical basis. It is not the size of a unit on the radial system that should determine the reliability impact on the BES but more importantly its location, configuration and system characteristics such as reliability must run unit.

Organization	Yes or No	Question 7 Comment
		We believe that there is no reason to divide E1 in three subsets of a, b and c. The end result is that a radial system is excluded if it does not have more than 75 MW of aggregate non-retail generation. However, consistent with E2 we suggest replacing "an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating)" with "a maximum net capacity of non-retail generation provided to the BES of 75 MVA." We suggest deleting the references to I3 in E1 and E3 because we believe that this reference is in contradiction to I3 and probably an oversight and should be corrected. I3 does not require path to be BES but it implies here that a radial system cannot be excluded if there is a Blackstart unit on it.
Response: The SDT believes that the distinction between Load only, generation only, and Load with generation provides a bright-line exclusion for radial systems that is needed to cover all of the possible scenarios. No change made. Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made. The SDT appreciates the suggestion that there could be an appearance of an inconsistency between Inclusion I3 and Exclusions E1 and E3. The SDT has determined that it should be conservative with regard to allowing exclusion for radial systems that are depended upon for blackstart functionality, as these will arguably be more important to the reliable operation of the transmission system than equivalent radial systems without Blackstart Resources. No change made.

ReliabilityFirst	No	The term radial must be specifically defined in this application. ReliabilityFirst Staff believes this to mean a true radial in the sense that an adverse impact by the radial

Organization	Yes or No	Question 7 Comment
		facilities does NOT affect or impact BES facilities. In the first sentence the word "Element" is capitalized but "transmission" is not, we believe both terms should be capitalized. The phrase "single point of connection" should have guidance so that everyone reading this definition reads the single point of interconnection the same. Some have read this phrase to be a single substation, while others have read this phrase to be one and only one line or supply (i.e. interconnection point), which is it? The "Note" we disagree with. In any and all cases if there is any operation or use of the BES, the facilities should be included. By the wording of this exclusion, one cannot determine if taps (sections of line from a BES transmission line to a single substation) are intended to be included in the BES or not. More specifically, where does the radial facility begin and the BES end? This determination was clearer in the previous version of the definition with the use of the language "...originating with an automatic interruption device...".
Response: The SDT team considered the disposition of the word "transmission" in the context of Exclusion E1, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element". No change made. The "single point of connection of 100 kV or higher" is where the radial will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used		

Organization	Yes or No	Question 7 Comment
in the normal operating environment. No change made.		
Ontario Power Generation Inc.	No	Non-retail generation needs to be properly defined in the text of the exclusion.
Response: Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion.		
City of St. George	No	Radial systems should be excluded as generally outlined in E1, however the generation levels (of 75 MVA) are too restrictive. The primary criteria should be, does power flow into the radial system? If there is always flow into the radial system, generation levels should not prevent exclusion from the BES.
City of Anaheim	No	The City of Anaheim recommends either changing the E1 (b) language back to that of the previous BES definition draft, i.e. 75 MVA or above connected at 100 kV or above, or limit the amount of generation allowed within a Radial Element or Local Network to 300 MVA or less, which is the amount of uncontrolled load loss that constitutes a reportable "disturbance" pursuant to EOP-004 and DOE Form OE-417. If DOE and NERC do not consider a 300 MW uncontrolled loss of load a reportable event, then why would the potential loss of a 75 MVA of non-critical generator connected at 69 kV make a Radial Element or Local Network critical to the reliability of the BES? The current ERO Statement of Compliance Criteria does not require GO/GOP registration for generation connected below 100 kV as long as it's not critical to the reliability of the BES, i.e. black start, etc., even if the amount of generation is greater than 75 MVA. There is good reason for this because the mere loss of 75 MVA generator would not affect the reliability of a system as big as the Western Interconnection, at all, and a fault at say 69 kV would have sufficient impedance not to affect the BES from an electrical perspective.
Response: Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate		

Organization	Yes or No	Question 7 Comment
amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the NERC Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
Xcel Energy	No	Xcel Energy believes that some more definition is required to clarify the intent of the note under Exclusion E1 related to normal open switching device. A direct statement would remove any ambiguity, such as "a normally open switch in a system that could be interconnected or experience loop flows will be considered (BES/non BES)".
Response: Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made.		
Northern Wasco County PUD	No	Northern Wasco County PUD notes that a new term has been introduced, "non-retail generation," with no definition provided. The answer to the question on this during the 9/28 webinar indicated that non-retail generation was behind the retail customer's meter. We can see no reason why the net-metered PV systems should count toward the aggregate limit (exceeding the limit means no exclusion) while a non-blackstart thermal plant doesn't (the radial system is excluded if any amount of load is present). We have also heard the SDT meant just the opposite of what was stated in the webinar. We ask that a reasonable definition for non-retail be provided within the BES definition document. We strongly agree that radial systems should be excluded and that the presence of normally open switching devices between radial systems should not cause them to be considered non-radial. Such a result would cause the removal of these devices to the detriment of the local level of service. We note that the singular "A normally open switching device" is used and suggest that an allowance be made for the possibility of multiple devices. "Normally open switching devices..."

Organization	Yes or No	Question 7 Comment
LCRA Transmission Services Corporation	No	The current wording is unclear with respect to the treatment of normally open switching devices. LCRA TSC suggests the following language to replace the existing language on the note to E1: “Two radial systems connected by a normally open, manually operated switching device, as depicted on prints or one-line diagrams for example, may be considered as radial systems under this exclusion.” The current wording is unclear with respect to “non-retail generation”. The sudden loss of large, radial-supplied load may result in reliability deficiencies. LCRA TSC suggests stating a load level or a load capacity in the exclusion.
Tillamook PUD	No	Tillamook PUD notes that a new term has been introduced, “non-retail generation,” with no definition provided. The answer to the question on this during the 9/28 webinar indicated that non-retail generation was behind the retail customer’s meter. We can see no reason why the net-metered PV systems should count toward the aggregate limit (exceeding the limit means no exclusion) while a non-blackstart thermal plant doesn’t (the radial system is excluded if any amount of load is present). We have also heard the SDT meant just the opposite of what was stated in the webinar. We ask that a reasonable definition for non-retail be provided within the BES definition document.We strongly agree that radial systems should be excluded and that the presence of normally open switching devices between radial systems should not cause them to be considered non-radial. 		load is present). We have also heard the SDT meant just the opposite of what was stated in the webinar. We ask that a reasonable definition for non-retail be provided within the BES definition document. We strongly agree that radial systems should be excluded and that the presence of normally open switching devices between radial systems should not cause them to be considered non-radial. Such a result would cause the removal of these devices to the detriment of the local level of service. We note that the singular "A normally open switching device" is used and suggest that an allowance be made for the possibility of multiple devices. "Normally open switching devices..."
Central Lincoln	No	Central Lincoln notes that a new term has been introduced, "non-retail generation," with no definition provided. The answer to the question on this during the 9/28 webinar indicated that non-retail generation was behind the retail customer's meter. We can see no reason why the net-metered PV systems should count toward the aggregate limit (exceeding the limit means no exclusion) while a non-blackstart thermal plant doesn't (the radial system is excluded if any amount of load is present). We have also heard the SDT meant just the opposite of what was stated in the webinar. We ask that a reasonable definition for non-retail be provided within the BES definition document. We strongly agree that radial systems should be excluded and that the presence of normally open switching devices between radial systems should not cause them to be considered non-radial. Such a result would cause the removal of these devices to the detriment of the local level of service. We note that the singular "A normally open switching device" is used and suggest that an allowance be made for the possibility of multiple devices. "Normally open switching devices..."
Response: Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.		

Organization	Yes or No	Question 7 Comment
Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator's responsibility to indicate how a switch is used in the normal operating environment. No change made.		
BGE	No	During the previous comment period, BGE asked for clarification regarding the exclusion of "radial facilities". The particular example configuration in question involved two 115 kV lines emanating from two different points of connection and "tied" on the "low side" at 34.5 kV. The SDT responded that this was not a radial facility but would be excluded under the E3-Local Network exclusion. BGE believes that this particular configuration should be excluded under the E1-Radial Systems exclusion. BGE does not beleive that two otherwise radial lines are made "non-radial" because they are tied at a voltage lower than 100 kV.
Orange and Rockland Utilities, Inc.	No	Please clarify on "single point of connection". It seems like less confusion if "single source" is used here instead of "single point of connection".
Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made.		
ISO New England Inc	No	The term "single point" is not clear. A better explanation is necessary. For example, the same bus in a bus/branch model should suffice as a "single point". There should not be a requirement to be at the same node as found in a nodal model. The term "a group of contiguous transmission elements" is ambiguous and needs to

Organization	Yes or No	Question 7 Comment
		be clarified. The "Non-retail" qualifier in E1.c) should be deleted. It adds confusion to the exclusion and is not defined.
Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made. The SDT team considered the disposition of the word "transmission" in the context of Exclusion E1, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element". No change made. Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.		
Kansas City Power and Light Company	No	Nameplate rating of the generator is not a reflection of what can be actually injected into the transmission system with resulting electrical impacts on transmission loading and behavior. Recommend the BES definition be based on a generating resource(s) established net accredited generating capacity instead of what it could do by nameplate rating that may not be achievable. Recommend the following change to the b) and c) parts of E1:b) Only includes generation resources not identified in Inclusion I3 with an aggregate net accredited capacity less than or equal to 75 MVA. Or, c) Where the radial system serves Load and includes generation resources not identified in Inclusion I3 with an aggregate net accredited capacity of non-retail

Organization	Yes or No	Question 7 Comment
		generation less than or equal to 75 MVA.
Hydro-Quebec TransEnergie	No	Even with the modification proposed, it is too much restrictive to refuse exclusion of radial system when they have generator or multiple generating units of aggregate capacity greater than 75 MVA, especially when a system is able to function reliably with the loss of generation much higher than this amount. To count on the exception procedure to exclude radial system with greater generation is risky since no specific criteria have been given to guide such exclusion. In most cases for radial or local system including generation, the path that connects the generation should not be included in the BES. Generators should be allowed to be considered "BES support elements" and reliability standards should apply to them in specific.
Response: Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
Independent Electricity System Operator	No	We support the provisions of E1 in principle but require clarification of some issues and suggest alternative wording in some cases. It is unclear if the connection voltage of generation referred to in E1.b affects whether a radial system could be excluded under E1 although from the context it appears that it would. For clarity we suggest appending “connected at 100 kV or higher.” Please provide in the BES definition document an explanation of “non-retail” and “retail” generation used in E1.c. Additionally, despite the fact the revisions to Inclusion I3 (Blackstart Resources) removed any reference to Cranking Paths, Exclusion 1 (b) and (c) both indicate that the exclusion of a radial system would not be allowed if generation identified in I3 were connected to it. This implies that the Cranking Path for this Blackstart Resource would have to be BES. This appears to be an inconsistency. We suggest removing the

Organization	Yes or No	Question 7 Comment
		phrase “not identified in Inclusion I3” in both instances. We disagree with notion that the capacity of generation connected to a radial system ought to determine whether that radial system should be classified as BES. Firstly, it is a given that the generation connected to the subject radial that meets the registry criteria would already be captured within the core BES definition and Inclusion I2. The function served by a radial that is of importance in the current context is that of delivering surplus power to the rest of the bulk power system and so, the impact on the BES of loss of the radial system or its connected generation needs to be considered. In our view, the “BES-status” of the radial itself is immaterial and so too is the aggregate capacity of generation resources connected to it. Detailed arguments regarding impact on the BES can be made in support of an application for an exclusion under the Exception Process, but it would be beneficial to avoid unnecessarily including a radial merely because it has more than 75 MVA of qualifying generation connected to it, without equal consideration of the connected load. To put a “bright line” on the consideration of impact referred to above, we suggest: In E1 (b): Replace "an aggregate capacity less than or equal to 75 MVA (gross nameplate rating)" with "a net capacity provided to the BES of less than or equal to 75 MVA." In E1 (c): Replace "an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating)" with "a net capacity of non-retail generation provided to the BES of 75 MVA."This wording would be consistent with E2 (i). Finally the word “affect” stated in the note accompanying E1 lends itself to mis-interpretation. We therefore suggest the following revision to achieve greater clarity:”This exclusion applies to radial systems connected by a normally open switch.”
Response: Exclusion E1 is an exclusion for the contiguous transmission Elements connected at or above 100 kV. Generation resources connected within the radial system are qualifiers for this exclusion. No change made. Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term “non-retail generation” in ExclusionE1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier “non-retail” would cause candidate local networks with retail generation to		

Organization	Yes or No	Question 7 Comment
be unfairly biased against obtaining this exclusion. No change made. The SDT appreciates the suggestion that there could be an appearance of an inconsistency between Inclusion I3 and Exclusions E1 and E3. The SDT has determined that it should be conservative with regard to allowing exclusion for radial systems that are depended upon for blackstart functionality, as these will arguably be more important to the reliable operation of the transmission system than equivalent radial systems without Blackstart Resources. No change made. Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made.		
Central Maine Power Company	No	E1 needs to be revised to make it less confusing. “Radial systems” leaves the impression that E1 is not simply a “radial line exclusion”, because of the plural and the word “systems.” Northeast industry expert colleagues are not clear what this sentence specifies: “A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher.” o Does E1 apply only to a single radial transmission line (and its associated “group of Elements”)? o Alternatively, does E1 apply to multiple radial lines “emanating from” the same substation regardless of the bus configuration - would a ring bus or a two-bus system that is connected with a tie breaker be considered as “a single point of connection”? o If the radial line is simply tapped off a BES line without any automatic interruption device, should not the radial line be included as part of the BES since a permanent fault on this radial line will take out the BES line it is tapping off of? If the radial line is defined as part of the BES, it could be subject to certain requirements such as vegetation management for overhead lines. o Should not the exclusion include some description of the

Organization	Yes or No	Question 7 Comment
		operational requirements to help resolve the ambiguity? As it is, the exclusion is scenarios-based. When a specific scenario is overlooked, the oversight becomes a source of ambiguity.This definition is not clear. Clarity is imperative.E1(c) should define or replace the term “non-retail”. Industry needs clarity on exactly what generation this clause applies to, in order to properly apply this definition. The Note referring to the “Normally Open switch” needs further clarification. As written, it seems to conflict with FERC order 743, paragraph 55:”While commenters would like to expand the scope of the term “radial” to exclude certain transmission facilities such as tap lines and secondary feeds via a normally open line, we are not persuaded that such categorical exemption is warranted.” E1 should be restated as follows: “Radial systems: A single transmission line or transformer not otherwise identified in the Inclusions above, with a single point of connection of 100 kV or higher and: a) Only serves Load. Or, b) Only includes generation resources, not identified in the Inclusions above. Or, c) Both serves Load and only includes generation resources not identified in the Inclusions above."
Rochester Gas and Electric and New York State Electric and Gas	No	E1 needs to be revised to make it less confusing. “Radial systems” leaves the impression that E1 is not simply a “radial line exclusion”, because of the plural and the word “systems.” Northeast industry expert colleagues are not clear at all what this sentence specifies: “A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher.” o Does E1 apply only to a single radial transmission line (and its associated “group of Elements”)? o Alternatively, does E1 apply to multiple radial lines “emanating from” the same substation regardless of the bus configuration - would a ring bus or a two-bus system that is connected with a tie breaker be considered as “a single point of connection”? This definition is not clear. Clarity is imperative. E1(c) should define or replace the term “non-retail”. Industry needs clarity on exactly what generation this applies to, in order to properly apply this definition. The Note referring to the “Normally Open switch” needs further clarification. As written, it seems to conflict with FERC order 743, paragraph 55:”While commenters

Organization	Yes or No	Question 7 Comment
		would like to expand the scope of the term "radial" to exclude certain transmission facilities such as tap lines and secondary feeds via a normally open line, we are not persuaded that such categorical exemption is warranted." E1 should be restated as follows:"Radial systems: A single transmission line or transformer not otherwise identified in the Inclusions above, with a single point of connection of 100 kV or higher and: a) Only serves Load. Or, b) Only includes generation resources, not identified in the Inclusions above. Or, c) Both serves Load and only includes generation resources, not identified in the Inclusions above.
Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made. Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made. The SDT does not believe that the suggested wording provides any additional clarity. No change made.		
South Houston Green Power, LLC	No	SHGP generally supports with the proposed revisions to Exclusion E1, but suggests several additional clarifying revisions should be made. First, the phrase "a single point

Organization	Yes or No	Question 7 Comment
		of connection" in the introductory sentence should be revised to read "a single point of connection (including multiple connections to the same ring bus or substation where the energy normally flows in the same direction)". This revision is intended to ensure that radial systems which involve multiple parallel lines and are designed to operate as a single radial system, but that nevertheless connect to the grid through more than line for reliability. Second, for this same reason, an additional (i.e., second) note should be added to the end of Exclusion E1 that reads as follows: "Note, a normally closed switching device that enables multiple lines emanating from the same grid ring bus or different grid buses to operate as a single radial system does not affect this exclusion." Third, the phrase "with an aggregate capacity of non-retail generation less than or equal to 75 MVA should be eliminated.
Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made. Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of		

Organization	Yes or No	Question 7 Comment
further review under Phase 2 of the BES definition. No change made.		
Tacoma Power	Yes	Tacoma Power generally supports the Exclusion E1 as currently written. However, the "note" at the end of E1 is confusing and can be interpreted inconsistently. We recommend moving the language from the "note" to part of the exclusion as its own section, as follows:(d) Normally-open switching devices between radial elements as depicted and properly identified on system one-line diagrams should not be used to deny this exclusion. Additionally, we believe it is not appropriate for E1 to state an MVA threshold in Section b) when determining such thresholds is the purpose for Phase 2. We urge the SDT to defer the determination of a MVA threshold in E1 to Phase 2.
Response: Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made. Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
City of Austin dba Austin Energy	Yes	For the E1 reference "Note," we would benefit from additional clarification identifying the treatment of a normally open switch and offer the following: "Radial systems shall be assessed with all normally open switching devices in their open positions." The wording in Exclusion 1-c should more clearly reflect what is intended by using the term "non-retail generation." Also, as with the technical justification for Inclusions I2 and I4, we recommend that the generation threshold, i.e. gross nameplate values, be deferred to Phase 2.

Organization	Yes or No	Question 7 Comment
Response: Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made. Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made. Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
Ameren	Yes	a)We suggest the wording "non-retail generation' should be clarified with an explanation of why it is used in this exclusion. b)This exclusion criterion has multiple stipulations to its applicability, and also has a final inclusive reference to I3. Please make the wording exact and not dependent on clausal statements.
Response: Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made. The SDT believes that the distinction between Load only, generation only, and Load with generation provides a bright-line exclusion for radial systems that is needed to cover all of the possible scenarios. In addition, the SDT has determined that it should be conservative with regard to allowing exclusion for radial systems that are depended upon for blackstart functionality, as these will arguably be more important to the reliable operation of the transmission system than equivalent radial systems		

Organization	Yes or No	Question 7 Comment
without blackstart resources. No change made.		
Utility Services, Inc.	Yes	Utility Services is very concerned that the "single point of connection" lacks clarity and applications need to be identified. Utility Services suggests that the SDT publish illustrative one-line diagrams to aid the industry in determining when the designations are best applied.
Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made. Publishing diagrams will be considered in Phase 2.		
PSEG Services Corp	Yes	1. If a 50 MVA generator that is included per I2 is connected to an excluded radial system, would the generator be excluded or included per E1b)? If yes, then the language "unless excluded under Exclusion E1 and E3" in I1 needs to be added to I2, I4, and I5. 2. Non-retail generation in E1c) was described behind-the-meter generation in the Webinar. The term "non-retail generation" should be defined because one could infer that generation defined by E2 is "retail generation." Also, is the 75 MVA limit intended apply to the generator (as stated) or its net capacity as defined in E2? If it means the generator MVA, does that mean that generation excluded in E2 cannot exceed 75 MVA when connected to an excluded radial system?3. In general, the definition needs to better define the impact that "exclusion" has on a different "inclusion" or "exclusion."

Organization	Yes or No	Question 7 Comment
Response: Exclusion E1 is an exclusion for the contiguous transmission Elements connected at or above 100 kV. Generation resources connected within the radial system are qualifiers for this exclusion. No change made. Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made. Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
Massachusetts Department of Public Utilities	Yes	The aggregate 75 MVA of connected generation appears too low and would benefit from additional technical justification.
Response: Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
The Dow Chemical Company	Yes	Dow generally agrees with the proposed revisions to Exclusion E1, but believes that several additional clarifying revisions should be made. First, the phrase "a single point of connection" in the introductory sentence should be revised to read "a single point of connection (including multiple connections to the same ring bus or different buses where the energy normally flows in the same direction)". This revision is intended to ensure that radial systems include arrangements involving multiple parallel lines that are designed to operate as a single radial system, but that nevertheless connect at the grid ring bus or different buses on the grid for reliability.

Organization	Yes or No	Question 7 Comment
		Second, for this same reason, an additional (i.e., second) note should be added to the end of Exclusion E1 that reads as follows: "Note, a normally closed switching device that enables multiple lines emanating from the same grid ring bus or different grid buses to operate as a single radial system does not affect this exclusion." Third, in "c)," the phrase "with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating)" is confusing and potentially inconsistent to the extent that "non-retail generation" may be different from "gross nameplate rating." The apparent intent of the clause is to exclude radial systems that serve both load and generation, provided the generation capacity made available to the transmission grid does not exceed 75 MVA. Dow would recommend that the phrase be revised to read "where the net capacity provided to the transmission grid does not exceed 75 MVA." This revision would provide greater clarity and is consistent with the language used in Exclusion E2.

Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made.

Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made.

Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail

Organization	Yes or No	Question 7 Comment
generation to be unfairly biased against obtaining this exclusion. No change made.		
ExxonMobil Research and Engineering	Yes	The removal of the requirement for an automatic fault interrupting device from this requirement is a welcomed change from the first posting. This Exclusion helps preserve the current NERC Registry and explicitly excludes many facilities used in the distribution of electric power.
Long Island Power Authority	Yes	Need to clarify what is a "single point of interconnection" e.g. is it a bus section or a substation
Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made.		
Manitoba Hydro	Yes	Manitoba Hydro agrees with E1 but the wording of the note regarding 'normally open switching devices' is unclear. In the Industry Webinar on September 28th, the Drafting Team made it clear that the note means that if an element can be connected to the BES from multiple points but under normal operating conditions it is only connected to the BES at a single point by means of normally open switches, then the element is still excluded from the BES provided it meets either the E1 a, b, or c criteria. The team also noted that the discretion to operate the normally open switching devices in the best interests of reliability rests with the operating entity. Suggested wording:"Note: The ability to connect a group of contiguous transmission Elements from multiple connection points of 100kV or higher through normally open switching devices does not negate this Exclusion. "

Organization	Yes or No	Question 7 Comment
		As well, part c) of E1 should be changed to “c) Only serves Load and includes...”
Response: The “single point of connection of 100 kV or higher” is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made.		
ATC LLC	Yes	Unless there is a specific reason to the contrary, ATC suggests that Exclusion E1b include the qualification of “aggregate capacity of non-retail generation less than or equal to 75 MVA” to be consistent with the wording in E1c.
Puget Sound Energy	Yes	The language addressing generation resources in sections b and c of E1 could be more clear (an example of clearer language is section a of E3). At the least, the language in these two sections should be revised to read "... includes generation resources that are not identified in Inclusion I3 and that do not have an aggregate capacity exceeding 75 MVA ...".
Response: Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		

Organization	Yes or No	Question 7 Comment
NV Energy	Yes	There may be an opportunity to consolidate the sub-items of E1 into a single inclusion statement in order to simplify this exclusion designation. We propose the following replacement option: "E1 - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and serves any combination of load and/or generation, provided that the generation resources are not identified in Inclusion I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating)."
Response: The SDT believes that the distinction between Load only, generation only, and Load with generation provides a bright-line exclusion for radial systems that is needed to cover all of the possible scenarios. No change made.		
Clallam County PUD No.1 Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative (CCEC) Central Electric Cooperatve (CEC) Clearwater Power Company (CPC) Snohomish County PUD Consumer's Power Inc. Douglas Electric Cooperative (DEC) Fall River Rural Electric Cooperative (FALL) Lane Electric Cooperative	Yes	CLPD continues to support the radial system exclusion, which is necessary as a legal matter, because, for example, FERC in Orders No. 743 and 743-A has required that the existing radial exemption in the NERC Statement of Compliance Registry Criteria be maintained. As a practical matter, radial systems are used for service to retail loads, usually in remote or rural areas, and not for the transmission of bulk power. Hence, operation of the radials has little or nothing to do with the reliable operation of the interconnected bulk transmission network. We also support the inclusion of the note discussing normally open switches because this language provides needed clarity for a common radial system configuration. We also agree with the substantive thrust of this language, which is that a radial system should not be considered part of the BES if it is interconnected at a single point, even if there is an alternative point of delivery that is normally open. While we support the Exclusion for Radial Systems, we believe several clarifications and refinements are necessary. (1) The term "transmission Elements" in the initial paragraph should be changed to "Elements." Radial systems are not transmission systems and including the word "transmission" in the Radial System exclusion is therefore unnecessary and confusing. (2) Subparagraph (b) of Exclusion 1 refers to"generation resources . . . with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating)"). We urge the SDT to replace this language with the defined term "Qualifying Aggregate Generation

Organization	Yes or No	Question 7 Comment
(LEC) Lincoln Electric Cooperative (LEC) Northern Lights Inc. (NLI) Okanogan County Electric Cooperative (OCEC) Pacific Northwest Generating Cooperative (PNGC) Raft River Rural Electric Cooperative (RAFT) West Oregon Electric Cooperative Umatilla Electric Cooperative (UEC) Kootenai Electric Cooperative		Resources," discussed in more detail in our response to Question 3. This language, or some equivalent, will preserve the SDT's ability to revise the 75 MVA threshhold in Phase 2, with the result of Phase 2 included in the BES Definition by operation rather than requiring further revision of the Definition. (3) Subparagraph (b) also seems to assume that if a Radial System contains a generator exceeding the 75 MVA threshhold, the Radial System itself must be included in the BES because it links the generator to the interconnected bulk transmission system. As discussed more fully in our response to Question 9, below, NERC's Project 2010-17 Standards Drafting Team and GO-TO Task Force have both concluded that this assumption is unwarranted. (4) The "Note" as drafted by the SDT indicates that "a normally open switching device between radial systems" will not serve to disqualify the Radial from exclusion under Exclusion 1. As noted above, CLPD strongly supports the note conceptually. However, we believe this language should be included in a separate subparagraph (d), rather than a note, because treatment as a "note" suggests it is less important than other portions of the Exclusion. We also suggest the language be changed to read: (d) Normally-open switching devices between radial elements as depicted and properly identified on system one-line diagrams does not affect this exclusion.This will make clear that a radial with more than one normally-open switch connecting it to another radial is still a radial. From the perspective of the BES Definition, the key question is whether switches operating between Radials are normally open, not whether there is more than one normally-open switch.
Response: 1) The SDT team considered the disposition of the word "transmission" in the context of Exclusion E1, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element". No change made. 2) Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent		

Organization	Yes or No	Question 7 Comment
with the existing threshold in the NERC Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made. 3) See response to Q9. 4) Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made.		
Michigan Public Power Agency	Yes	MPPA and its members continue to support the radial system exclusion, which is necessary as a legal matter, because, for example, FERC in Orders No. 743 and 743-A has required that the existing radial exemption in the NERC Statement of Compliance Registry Criteria be maintained. As a practical matter, radial systems are used for service to retail loads, usually in remote or rural areas, and not for the transmission of bulk power. Hence, operation of the radials has little or nothing to do with the reliable operation of the interconnected bulk transmission network. But we believe that further clarification is necessary. First, the deletion of "originating with an automatic interruption device" is a step in the right direction. However, "emanates from a single point of connection" could be too narrowly interpreted (i.e., multiple buses within a single substation could be viewed as multiple points of connection). MPPA and its members proposes the following modification: "emanates from a single substation connected to the BES at 100 kV or higher ...". Entities whose only connection emanates from a single substation and otherwise meet the BES definition should not be denied exclusion under E1 solely because they connect to multiple buses within a single substation. Additionally, adoption of "E3- Local Networks" renders specious any argument that clams that connecting to multiple buses within a single suvstation makes a material difference for reliability purposes since local networks would have multiple connections anyway. Additionally, it is not clear why it is necessary to include the note at the end of the revised definition. ("A normally open switching device between radial systems, as

Organization	Yes or No	Question 7 Comment
		depicted on prints or one-line diagrams for example, does not affect this exclusion.") This rasies questions as to what "normally open" means, and wheither the only evidence demonstrating what "normally open" means will be prints or one-line diagrams. Further, it is not entirely clear what is meant by the language "does not affect this exclusion". If the note remains, it should be modified to read something like, "a normally open switching device between radial systems does not prevent application of this exclusion." Finally, the generation threshold limit in E1(b) and E1(c) should be revised as discussed in response to Q1. Specifically, the proposed threshold of 75 MVA for this exclusion should be raised to not lessd than 300 MVA in both E1(b) and E1 (c).

Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made.

Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made.

Exclusion E1.b refers to a radial system that contains only generation and the SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.

Organization	Yes or No	Question 7 Comment
NESCOE	Yes	NESCOE suggests that the aggregate 75 MVA of connected generation is too low and would benefit from additional technical justification. The threshold value should be related to the largest contingency to which the applicable control area is designed to operate. A level of 300 MVA would be appropriate. This 300 MVA limit represents 25% of the 1200 MVA loss of source that is typically assumed for operation of the Northeast portion of the Eastern Interconnection. Depending on system conditions, this number may be as high as 1500 MVA. Therefore, the suggested value of 300 MVA has a technical basis and falls well within typical loss of source expectations for the Northeast.
Response: The SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
Z Global Engineering and Energy Solutions	Yes	As stated in comment one. I recommend the Note is rewritten: "Note - A normally open switching device between radial systems, as depicted on prints or oneline diagrams, for example, does not classify the two or more radial lines as a loop line. The exclusion will still apply."
Harney Electric Cooperative, Inc.	Yes	HEC strongly agrees that radial systems should be excluded from the BES and that the presence of a normally open switching device between radial systems should not cause them to be considered non-radial
PacifiCorp	Yes	: The note in E1 as written is ambiguous and requires clarification. PacifiCorp assumes the note means that two radial systems separated by a normally open switching device allows for the exclusion of both radial systems. PacifiCorp recommends that the SDT revise the note to serve as a paragraph clarifying E1 that, “Radial systems separated by normally open switching device(s) as depicted on prints or one-line diagrams for example, and operated in the normally open position, except during

Organization	Yes or No	Question 7 Comment
		abnormal operating conditions, qualifies both radial systems under this exclusion."
Response: Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made.		
Texas Industrial Energy Consumers	Yes	As noted in response to Question 3, above, Exclusion E1 would only allow exclude radial systems with "aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating)." The reference to "non-retail" generation in subsection (c) indicates that the SDT may have intended to preserve the "netting" approach set forth in the Statement of Registry Compliance, but this should be made clearer. The description in subsection (c) should be revised to exclude "Where the radial system serves Load and includes generation resources not identified in Inclusions I2 or I3," and the remainder of that sentence referencing a 75 MVA gross nameplate rating should be removed. This will provide a reference back to the Statement of Registry Compliance and clarify that only net capacity is considered for customer-owned facilities.
Response: Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. The SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
Holland Board of Public Works	Yes	Holland BPW supports the exclusion of radial systems from the BES definition, but believes that further clarification is necessary. First, the deletion of "originating with an automatic interruption device" is a step in the right direction. However,

Organization	Yes or No	Question 7 Comment
		"emanates from a single point of connection" could be too narrowly interpreted (i.e., multiple buses within a single substation could be viewed as multiple points of connection). Holland BPW proposes the following modification: "emanates from a single substation connected to the BES at 100 kV or higher..." Entities whose only connection emanates from a single substation and otherwise meet the BES definition should not be denied exclusion under E1 solely because they connect to multiple buses at that single substation. Additionally, adoption of "E3 - Local Networks" renders specious any argument that claims that connecting to multiple buses within a single substation makes a material difference for reliability purposes since local networks would have multiple connections anyway. Additionally, it is not clear why it is necessary to include the note at the end of the revised definition. ("A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.") This raises questions as to what "normally open" means, and whether the only evidence demonstrating what "normally open" means will be prints or one-line diagrams. Further, it is not entirely clear what is meant by the language "does not affect this exclusion". If the note remains, it should be modified to read something like, "a normally open switching device between radial systems does not prevent application of this exclusion." Finally, the generation threshold limit in E1(b) and E1(c) should be revised as discussed in response to Q1. Specifically, the proposed threshold of 75 MVA for this exclusion should be raised to not less than 300 MVA in both E1(b) and E1(c).
Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100 kV or higher. Networks that have multiple connections at 100 kV or higher may qualify under Exclusion E3. The owner		

Organization	Yes or No	Question 7 Comment
always has the option to seek exclusion through the exception process. No change made. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made. The threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative	Yes	Remove “non-retail” because it is irrelevant to reliability. In general, we agree with the remaining concepts. However transformer voltage threshold should be 200 kV or higher, the power thresholds should be 150 MVA or greater.
Response: Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term “non-retail generation” in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier “non-retail” would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made. The SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the NERC Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.		
Electricity Consumers	Yes	ELCON supports the changes made from the first posting for both E1 and E3 (which complements E1), as this will help maintain the status quo referred to in the

Organization	Yes or No	Question 7 Comment
Resource Council (ELCON)		introductory text. We seek one clarification: Some large industrial customers that operate in remote, rural locations provide distribution services to third parties (usually on a pro bono basis) where the local utility (LSE) is unable or unwilling to serve. These transactions, which are akin to "border-line sales" in utility parlance, are typically de minimis relative to the Load of the entity that delivers the power. While the distribution is at low voltages (less than 100 kV), the power may have been received by the entity at a higher voltage. We seek affirmation by the SDT that such situations are not precluded by Exclusion E1.
Response: This is a bright-line definition for the BES and Exclusion E1 can be used to exclude radial systems for the contiguous transmission Elements connected at or above 100 kV and lower voltage systems are already excluded from the BES. The definition does not draw a distinction between ownership or connection arrangements. Without an exact configuration it is impossible for the SDT to comment further but if this situation somehow slips through the cracks, there is always the option to seek an exception. No change made.		
ACES Power Marketing Standards Collaborators	Yes	The term "non-retail generation" used in Exclusion E1 (item c) and again in E3 (item a) should be clarified (see comments for question 8 below). The Note after item c should also be clarified to indicate that closing a normally open switch doesn't affect this exclusion.
Response: Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made. Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.		
Sacramento Municipal Utility	Yes	For the E1 reference "Note," we would benefit from additional clarification identifying

Organization	Yes or No	Question 7 Comment
District		the treatment of a normally open switch and offer the following: "Radial systems shall be assessed with all normally open switching devices in their open positions." The wording in Exclusion 1-c should more clearly reflect what is intended by using the term "non-retail generation." Also, as with the technical justification for Inclusions I2 and I4, it is recommended that the generation threshold, i.e. gross nameplate values, be deferred to Phase 2.
Balancing Authority Northern California	Yes	For the E1 reference "Note," we would benefit from additional clarification identifying the treatment of a normally open switch and offer the following: "Radial systems shall be assessed with all normally open switching devices in their open positions." The wording in Exclusion 1-c should more clearly reflect what is intended by using the term "non-retail generation." Also, as with the technical justification for Inclusions I2 and I4, it is recommended that the generation threshold, i.e. gross nameplate values, be deferred to Phase 2.

Response: Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operators responsibility to indicate how a switch is used in the normal operating environment. No change made.

Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.

The SDT believes that a limit on the aggregate amount of connected (non-retail) generation within the radial system is necessary to ensure that there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the ERO Statement of Compliance Registry Criteria, and this threshold is a subject of further review under Phase 2 of the BES definition. No change made.

Organization	Yes or No	Question 7 Comment
Florida Municipal Power Agency Transmission Access Policy Study Group	Yes	FMPA supports the exclusion of radial systems from the BES Definition. Such systems are generally not "necessary for operating an interconnected electric transmission network," the standard in Orders 743 and 743-A. We have several suggestions to clarify the proposed language for this Exclusion. Proposed Exclusion E1 refers to "[a] group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher." We appreciate the SDT's clarification of the point of connection requirement, but the term "a single point of connection" should be further defined (more clearly than just by voltage), and should be generic enough to encompass the various bus configurations. It is not the case, for example, that each individual breaker position in a ring bus is a separate point of connection for this purpose; in that situation, a bus at one voltage level at one substation should be considered "a single point of connection." Some examples of configurations that should be considered a single point of connection for this purpose are at https://www.frcc.com/Standards/StandardDocs/BES/BESAppendixA_V4_clean.pdf, Examples 1-6. Although the core definition (appropriately) refers to "Transmission Elements" (with a capital "T"), proposed Exclusion E1 refers to "transmission Elements" (with a lowercase "t"). To avoid confusion, either "Transmission" should be capitalized in both locations, or the word "transmission" should simply be deleted from Exclusion E1, leaving a "group of contiguous Elements." We understand that the lack of capitalization may have been a deliberate choice by the SDT in an attempt to avoid confusion that SDT members believe exists in the Glossary definition. If the Glossary definition of Transmission is unclear-which FMPA does not necessarily believe is the case-the answer is not to simply abandon the Glossary definition in favor of an entirely undefined term; it is to submit a SAR to improve the Glossary definition. Exclusion E1(c) refers to "an aggregate capacity of non-retail generation less than or equal to 75 MVA." "Non-retail generation" is potentially ambiguous, because it could be read as distinguishing between generation that will be sold at wholesale and generation that is used by the retail provider to meet retail load. On the

Organization	Yes or No	Question 7 Comment
		understanding that the intent is in fact to describe generation behind the end-user meter, sometimes referred to as "behind-the-second-meter generation," we suggest the following revision: "an aggregate generation capacity less than or equal to 75 MVA, not including generation on the retail customer's side of the retail meter." Exclusion E1 concludes with a "Note": "A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion." The Note should not specify the types of evidence required to prove a normally open switch, and the phrase "as depicted on prints or one-line diagrams" should be deleted. This phrase is equivalent to a "Measure" in a standard and should not be embedded in the equivalent of a "Requirement." Since the phrase only gives an "example," it does not in fact add anything to the Note, but may lead to confusion over what sort of evidence is required.

Response: The "single point of connection of 100 kV or higher" is where the radial system will begin, if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Furthermore, the SDT believes that radial systems cannot have multiple connections at 100kV or higher. Networks that have multiple connections at 100kV or higher may qualify under Exclusion E3. The owner always has the option to seek exclusion through the exception process. No change made.

The SDT team considered the disposition of the word "transmission" in the context of Exclusion E1, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element". No change made.

Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.

Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent

Organization	Yes or No	Question 7 Comment
the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator's responsibility to indicate how a switch is used in the normal operating environment. No change made.		
MRO NERC Standards Review Forum (NSRF)	Yes	Unless there is a specific reason to the contrary the NSRF suggests that E1b include the qualification of "aggregate capacity of non-retail generation less thatn or equal to 75 MVA" be added to be consistent with the wording in E1c.
MEAG Power	Yes	We suggest the wording "non-retail generation' should be clarified with an explanation of why it is used in this exclusion.
SERC OC Standards Review Group	Yes	We suggest the wording "non-retail generation' should be clarified with an explanation of why it is used in this exclusion.
Consolidated Edison Co. of NY, Inc.	Yes	Please define the term "non-retail generation."
Tennessee Valley Authority	Yes	TVA suggests the wording "non-retail generation' should be clarified with an explanation of why it is used in this exclusion.
SERC Planning Standards Subcommittee	Yes	The SDT needs to clarify what is meant by "non-retail generation." Is this what is commonly referred to as "customer owned" or "behind-the-meter" generation?
Response: Non-retail generation is the generation on the system (supply) side of the meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E1.c in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.		
WECC Staff	Yes	The use of the word "affect" in the note may cause problems with interpretation by users. WECC suggests replacing the term "affect" with "alter".
Response: The SDT considered your comments and chose to leave the existing wording unchanged as it does not provide any		

Organization	Yes or No	Question 7 Comment
additional clarity. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator's responsibility to indicate how a switch is used in the normal operating environment. No change made.

Response: Thank you for your support.		

8. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E2 (behind-the-meter generation)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: The majority of commenters are in agreement with Exclusion E2 but there were some requests for additional clarification and the SDT responded by clarifying the language as shown below.

There were also questions raised about threshold levels in the exclusion. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

Some commenters have questioned the reasoning behind Exclusion E2 (ii). Condition (ii) in Exclusion E2 is derived from FERC or provincial regulations applicable to qualifying cogeneration and small power production facilities. For example, see 18 CFR §292.101 and §292.305(b) for the requirements specific to the US. The SDT believes that condition (ii), which requires that the generation serving the retail customer load self provide reserves, is essential for the integrity of the exclusion. This is not new ground and is simply clarifying language that has been present in the ERO Statement of Compliance Registry Criteria for quite some time. The SDT believes that the meaning of the definition will be understood in Balancing Authority Areas where it is applicable as it reflects existing practice. Therefore, the SDT has declined to delete condition (ii).

E2 - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail ~~customer~~ Load with electric energy ~~on the customer's side of the retail meter~~ if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.

Organization	Yes or No	Question 8 Comment
MEAG Power	No	Clarification needs to be provided for what is meant by E2 (ii), regarding generation on the customer's side of the retail meter; otherwise we have trouble developing a position on this question.
SERC OC Standards Review Group	No	Clarification needs to be provided for what is meant by E2 (ii), regarding generation on the customer's side of the retail meter; otherwise we have trouble developing a position on this question.
Tennessee Valley Authority	No	Clarification needs to be provided for what is meant by E2 (ii), regarding generation on the customer's side of the retail meter; otherwise we have trouble developing a position on this question.
ReliabilityFirst	No	It is not clear why "ii" is needed. If the net generation exceeds 75 MVA, then it is included in the BES whether or not there are ancillary services provided for that generation. Would customer owned generation less than a net of 75 MVA but greater than 20 MVA be included in the BES if item ii was not met?
FirstEnergy Corp.	No	We suggest striking item "ii"
Dominion	No	Dominion supports exclusion for behind-the-meter generation, (if connected at >100 kV) if the load behind the meter (to which that generation is intended to support) does not rely on generation outside that metered point for purposes of back-up energy or any type of ancillary services at any time. The proposed language appears to suggest that standby, back-up, and maintenance power services are always required. There are alternative means to provide these services, such as reducing load to match 'reliability services' provided by the available behind-the-meter generation. Further, even if standby, back-up, and maintenance power services are always required, the exclusion criteria obligation should be placed on the retail load, not the generation outside the metered point
Response: Condition (ii) in Exclusion E2 is derived from FERC or provincial regulations applicable to qualifying cogeneration and		

Organization	Yes or No	Question 8 Comment
small power production facilities. For example, see 18 CFR §292.101 and §292.305(b) for the requirements specific to the US. The SDT believes that condition (ii), which requires that the generation serving the retail customer load self provide reserves, is essential for the integrity of the exclusion. This is not new ground and is simply clarifying language that has been present in the ERO Statement of Compliance Registry Criteria for quite some time. The SDT believes that the meaning of the definition will be understood in Balancing Authority Areas where it is applicable. No change made.		
Northeast Power Coordinating Council	No	Why are references to Balancing Authority, Generator Owner, and Generator Operator included in E2 which is part of the BES definition? The wording of Exclusion E2 should be consistent with the Statement of Compliance Registry Criteria in Section III.c.4.
Response: The roles of the Balancing Authority, Generator Owner, and Generator Operator are implied in the ERO Statement of Compliance Registry Criteria and the terms were added as the result of industry requests for clarification. No change made.		
Southern Company	No	We suggest that clarification is needed for what is meant by E2 (ii), regarding generation on the customer's side of the retail meter. Also, we would like for a clarification of the difference between the terms "retail load" and "retail customer load" as used in exclusions E2 and E3.
Response: Condition (ii) in Exclusion E2 is derived from FERC or provincial regulations applicable to qualifying cogeneration and small power production facilities. For example, see 18 CFR §292.101 and §292.305(b) for the requirements specific to the US. The SDT believes that condition (ii), which requires that the generation serving the retail customer load self provide reserves, is essential for the integrity of the exclusion. This is not new ground and is simply clarifying language that has been present in the ERO Statement of Compliance Registry Criteria for quite some time. The SDT believes that the meaning of the definition will be understood in Balancing Authority Areas where it is applicable. No change made. The SDT accepts your recommendation regarding "retail Load" and has clarified Exclusion E2 to read: **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail ~~customer~~ Load with electric energy ~~on the customer's side of the retail meter~~ if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator		

Organization	Yes or No	Question 8 Comment
Owner or Generator Operator, or under terms approved by the applicable regulatory authority.		
Southwest Power Pool Standards Review Team	No	This number could change in phase two of the project which would create unnecessary work in the future.
Farmington Electric Utility System	No	E2 should be modified to include a size and threshold for individual generating units, similar to that identified in I2. As currently worded E2 places the same threshold (75 MVA) on a single generating unit as is placed on multiple generating units.
Westar Energy	No	As expressed in our comment to question 5, we have concerns that the 75 MVA number could change in phase two of the project, creating unnecessary work in the future.
American Electric Power	No	It appears an entity with less than 75 MVA would not have been included as part of the earlier inclusions. Is it necessary to note this threshold once again in the exclusion section? Might it be possible to add some of the "behind the meter load" to the inclusion section to reduce the amount of both the inclusions and exclusions? Doing so would likely provide more clarity to the standard.
City of Anaheim	No	Again, 75 MVA should be increased to 300 MVA in E2 for the reasons stated in response to Question 7.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values		

Organization	Yes or No	Question 8 Comment
and provide compelling justification for modifications to the existing values. No change made.		
City of St. George	No	Same basic comments and concerns as question #7.
Response: See response to Q7.		
ISO New England Inc	No	Exclusion E2 is confusing as written and seems counter intuitive. As an example, a 400 MW generator which is behind the meter with a 400 MW load could be excluded. This generator could have a significant impact on the performance of the system and yet it is excluded. As a simple example, loss of the 400 MW generator would require that the 400 MW load be supplied from the system, possibly leading to low voltages and thermal overloads. Additionally, a machine of this size could adversely impact the dynamic response of the system, leading to damping concerns or unit instability. If E2 is to be retained, it is not clear under what load conditions should the load at the facility be measured. Load levels, and resulting net flows to the system, can be significantly different between seasons, time of day, and the status of end user equipment at large industrial/manufacturing sites. The term "Retail Customer Load" needs to be defined. The Balancing Authority should not be included as an entity providing this service. In general the Statement of Compliance Registry has provided the preferred language to use here (Page 9, [Exclusions: second paragraph).
Response: The SDT believes that Exclusion E2 should be dedicated to the situation faced by behind-the-meter (i.e., retail customer owned) generation that are PURPA qualifying facilities (in the US) (e.g., see 18 CFR Part 292 for the regulations that are applicable in the US), and similarly situated generators in Canada. Condition (ii) in Exclusion E2 is derived from FERC or provincial regulations applicable to qualifying facilities. The SDT believes that condition (ii), which requires that the generation serving the retail customer load self provide reserves, is essential for the integrity of the exclusion. No change made. The roles of the Balancing Authority, Generator Owner, and Generator Operator are implied in the ERO Statement of Compliance Registry Criteria and the terms were added to Exclusion E2 as the result of industry requests for clarification.		

Organization	Yes or No	Question 8 Comment
The SDT has clarified Exclusion E2 to read: **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail ~~customer~~ Load with electric energy ~~on the customer's side of the retail meter~~ if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.		
Central Maine Power Company	No	E2 should be consistent with the Statement of Compliance Registry Criteria. References to Balancing Authority, Generator Owner, and Generator Operator should not be included in the BES definition. "Net capacity" is unclear - must flow never exceed 75 MVA on an instantaneous or integrated hourly energy basis per either design or operating experience? There is a potential for hundreds of MW to be interconnected at a customer facility, with the "net capacity" (= flow into the transmission system? Instantaneous? Annual average? On an integrated hourly basis at any hour?) being less than 75 MVA - are hundreds of MW of generation "not material" to BES reliability? The conditions under which direction of flow (i.e., "net capacity") is assessed are critical, but E2(i) is silent on this.In E2(ii), the "and", "or", and "or" are not clear - what are the necessary terms of the referenced "binding obligation" and what is an "applicable regulatory authority"? Are "standby" and "back-up" and "maintenance" power services independently defined and provided by a GOP, GO, or BA? Northeast industry expert colleagues do not understand the relevance of E2(ii) to BES reliability.E2 should be restated as follows:"A generating unit or multiple generating units that serve all or part of retail customer Load with electric energy on the customer's side of the meter if the flow to or from the BES can never exceeds 75 MVA."
Rochester Gas and Electric and New York State Electric and Gas	No	E2 should be consistent with the Statement of Compliance Registry Criteria. References to Balancing Authority, Generator Owner, and Generator Operator should not be included in the BES definition.

Organization	Yes or No	Question 8 Comment
		"Net capacity" is unclear - must flow never exceed 75 MVA on an instantaneous or integrated hourly energy basis per either design or operating experience? There is a potential for hundreds of MW to be interconnected at a customer facility, with the "net capacity" (= flow into the transmission system? Instantaneous? Annual average? On an integrated hourly basis at any hour?) being less than 75 MVA - are hundreds of MW of generation "not material" to BES reliability? The conditions under which direction of flow (i.e., "net capacity") is assessed are critical, but E2(i) is silent on this. In E2(ii), the "and", "or", and "or" are not clear - what are the necessary terms of the referenced "binding obligation" and what is an "applicable regulatory authority"? Are "standby" and "back-up" and "maintenance" power services independently defined and provided by a GOP, GO, or BA? Northeast industry expert colleagues do not understand the relevance of E2(ii) to BES reliability.E2 should be restated as follows:"A generating unit or multiple generating units that serve all or part of retail customer Load with electric energy on the customer's side of the meter if the flow to or from the BES never exceeds 75 MVA"

Response: The wording of (ii) is essentially the same as the wording on this topic in the ERO Statement of Registry Criteria which has been in existence for several years and is well understood in the industry. Qualifying for Exclusion E2 will be determined the same as every other inclusion or exclusion; there is nothing special about Exclusion E2 that separates it from the rest of the definition. The roles of the Balancing Authority, Generator Owner, and Generator Operator are implied in the ERO Statement of Compliance Registry Criteria and the terms were added to Exclusion E2 as the result of industry requests for clarification.

The SDT believes that Exclusion E2 should be dedicated to the situation faced by behind-the-meter (i.e., retail customer owned) generation that are PURPA qualifying facilities (in the US) (e.g., see 18 CFR Part 292 for the regulations that are applicable in the US), and similarly situated generators in Canada. Condition (ii) in Exclusion E2 is derived from FERC or provincial regulations applicable to qualifying facilities. The primary purpose of retail customer owned generation in the context of Exclusion E2 is the integrity of steam production that supports a manufacturing process. The electrical load of that process does not exist without steam.

The SDT believes that condition (ii), which requires that the generation serving the retail customer load self provide reserves (i.e., standby, backup and maintenance power), is essential for the integrity of the exclusion. These reserves maintain steam generation

Organization	Yes or No	Question 8 Comment
and the load to sustain the manufacturing process. In the US, the terms and conditions of standby, backup and maintenance services are defined and administered by State PSCs (i.e., the "applicable regulatory authority" in the US) subject to FERC oversight. These services are provided under contract or tariff with GOs, GOPs or BAs in regions that do not have ISOs or RTOs, and provided by ISOs and RTOs where so-called "organized markets" operate. The first condition (i) in Exclusion E2 had to reference the net generation (in MWs) since it was how the generation was operated, and the residual ("net") amount exported to the BES that was deemed relevant to the exclusion and reliability, not the nameplate rating. The export is subject to the 75 MVA threshold; the requirement for reserves under a "binding obligation" (standby, backup and maintenance power) matches part or all of the on-site load and is not subject to the threshold. No change made.		
LCRA Transmission Services Corporation	No	
Response: Without any specific comment, the SDT is unable to respond.		
Kansas City Power and Light Company	No	Any facilities that are customer owned regardless of size or configuration are not under the jurisdiction or responsibility of the Registered Entity and should not be considered as included with a Registered Entity.
Response: Exclusion E2 was based on the ERO Statement of Compliance Registry Criteria. No change made.		
Ameren	No	a)If retail generation fails to meet (i) or (ii) it appears that the retail generation would be included. The wording of (ii) is complex. Who will police this with retail behind-the-meter generators? b)Clarification needs to be provided for what is meant by E2 (ii), regarding generation on the customer's side of the retail meter; otherwise we have trouble developing a position on this question.
Response: The wording of (ii) is essentially the same as the wording on this topic in the ERO Statement of Registry Criteria which has been in existence for several years and is well understood in the industry. Qualifying for the E2 Exclusion will be determined the same		

Organization	Yes or No	Question 8 Comment
as every other inclusion or exclusion; there is nothing special about Exclusion E2 that separates it from the rest of the definition. Condition (ii) in Exclusion E2 is derived from FERC or provincial regulations applicable to qualifying facilities. The SDT believes that condition (ii), which requires that the generation serving the retail customer load self provide reserves, is essential for the integrity of the exclusion. The first condition (i) in Exclusion E2 had to reference the net generation (in MWs) since it was how the generation was operated that was deemed relevant to the exclusion, not the nameplate rating. No change made.		
Nebraska Public Power District	Yes	However the exclusion needs to be noted in I2, so as to non conflict with I2. (See comment on #2 above.)
Response: Any retail generation that meets the criteria in Exclusion E2 is not in the BES so there is no conflict. No change made.		
National Grid	Yes	We agree with this exclusion, but the intention of point (i), the net capacity provided to the BES does not exceed 75 MVA, is not clear. We suggest this wording:"the net capacity provided to the BES for 90% of the hours of the year does not exceed 75 MVA".
Response: The first condition (i) in Exclusion E2 had to reference the net generation (in MWs) since it was how the generation was operated that was deemed relevant to the exclusion, not the nameplate rating. The threshold level for generators will be considered in the Phase 2 review. No change made.		
Utility Services, Inc.	Yes	Utility Services supports the comments offered by others suggesting that the language be revised to be identical to the language in the SCRC.
Response: The SDT modified the language in response to industry requests for clarification. For example, the terms Balancing Authority, Generator Owner, and Generator Operator are implied in the ERO Statement of Compliance Registry Criteria. No change made.		
South Houston Green Power, LLC	Yes	SHGP generally agrees with the proposed revisions to Exclusion E2, but believes that a clarifying revision should be made. Substitute "transmission grid" for "BES" in the phrase "provided to the BES" to insure that the metering is to the grid.

Organization	Yes or No	Question 8 Comment
The Dow Chemical Company	Yes	Dow generally agrees with the proposed revisions to Exclusion E2, but believes that a clarifying revision should be made. Substitute “transmission grid” for “BES” in the phrase “provided to the BES” to insure that the measurement is to the grid.
Response: The SDT believes that BES is the appropriate point of measurement because Exclusion E2 is defined in relation to the BES. No change made.		
Manitoba Hydro	Yes	Manitoba Hydro agrees with E2 but suggests that the phrase ‘A generating unit or multiple generating units’ be replaced with ‘Generating resource(s)’ for clarity and consistency.
Response: The SDT does not see where the suggested change will add any additional clarity. No change made.		
Michigan Public Power Agency Clallam County PUD No.1 Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative (CCEC) Central Electric Cooperatve (CEC) Clearwater Power Company (CPC) Snohomish County PUD Consumer's Power Inc. Douglas Electric Cooperative (DEC)	Yes	MPPA and its members support the revised language. The language provides clarity regarding the BES status of customer-owned cogeneration facilities. However, MPPA and its members urge the SDT to remove the reference to the 75 MVA threshhold and replace it with the defined term “Qualifying Aggregate Generation Resources” or some equivalent language for the reasons stated in our responses to Questions 3, 5, and 7. In addition, we are concerned that Exclusion 2 will place local distribution utilities in a difficult position because, under Exclusion 1 or Exclusion 3 as drafted, they could lose their status as a Radial System or a Local Network through the actions of a customer constructing behind-the-meter generation, With respect to Radial Systems, the appearance of behind-the-meter generators could cause the Radial System to exceed the thresholds specified in subparagraphs (b) and (c) of Exclusion 1 through no fault of the Radial System owner. Similar, a Local Network could lose its status because behind-the-meter generation could be of sufficient size that power moves into the interconnected grid in certain hours or under certain contingencies, rather than moving purely onto the Local Network, as required in subparagraph (b) of Exclusion 3. The Exclusions for Radial Systems and Local Networks should be made consistent with the Exclusion for behind-the-meter generation. There is no technical reason to believe

Organization	Yes or No	Question 8 Comment
Fall River Rural Electric Cooperative (FALL) Lane Electric Cooperative (LEC) Lincoln Electric Cooperative (LEC) Northern Lights Inc. (NLI) Okanogan County Electric Cooperative (OCEC) Pacific Northwest Generating Cooperative (PNGC) Raft River Rural Electric Cooperative (RAFT) West Oregon Electric Cooperative Umatilla Electric Cooperative (UEC) Cowlitz County PUD Kootenai Electric Cooperative		the power flowing from a behind-the-meter customer-owned generator will have less impact on the bulk system than an equivalent-sized generator owned by a utility operating a Radial System or LN.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the		

Organization	Yes or No	Question 8 Comment
technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. The thresholds in Exclusions E1 and E3 apply only to non-retail generators (i.e., generation on the system (supply) side of the retail meter) and are not affected by presence of retail generation. No change made.		
Massachusetts Department of Public Utilities	Yes	While the MA DPU generally supports Exclusion E2, no information has been provided by NERC demonstrating that the 75 MVA rating is based on any sound technical analysis.
NESCOE	Yes	While NESCOE generally supports Exclusion E2, no information has been provided by NERC demonstrating that the 75 MVA rating is based on any sound technical analysis.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
Texas Industrial Energy Consumers	Yes	Please see the response to Question 3, above. Unlike exclusions E1 and E3, this exclusion refers specifically to the “net capacity” provided, which is consistent with existing treatment for generation that is netted against internal load under the Statement of Registry Compliance.
Response: See response to Q3.		

Organization	Yes or No	Question 8 Comment
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative	Yes	E2 "retail meter" should read "retail meter(s)". (i) Should be reworded as "the maximum net impact to the BES does not exceed 150 MVA, connected at 200 kV or higher." (ii) if we understand this clause correctly, we believe our proposed (i) wording will handle the issue. Also, all load's inclusion, within a BA, is dictated within the BAL standards and so remove entirely or additional clarification is needed.

Response: It is accepted use in NERC Reliability Standards that singular words and terms apply to plural conditions as well. No change made.

The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

Condition (ii) in Exclusion E2 is derived from FERC or provincial regulations applicable to qualifying cogeneration and small power production facilities. For example, see 18 CFR §292.101 and §292.305(b) for the requirements specific to the US. The SDT believes that condition (ii), which requires that the generation serving the retail customer load self provide reserves, is essential for the integrity of the exclusion. This is not new ground and is simply clarifying language that has been present in the ERO Statement of Compliance Registry Criteria for quite some time. The SDT believes that the meaning of the definition will be understood in Balancing Authority Areas where it is applicable. No change made.

Organization	Yes or No	Question 8 Comment
Southern Company Generation	Yes	Some editing is needed. The second part, (ii), of the and logic provided for the exclusion criteria E2 is confusing. The initial criteria, (i), seems to be adequate regarding impact to the BES. The criteria listed after "(ii)" does not seem to be relevant to the impact on the BES. What does it mean to provide standby, back-up, and maintenance power services to a generating unit or multiple generating units? It is unclear who is providing the power service. If this is needed, the statement needs to be simplified so it can be understood. What is the difference between the terms "retail Load" and "retail customer Load" as used in Exclusions E2 and E3?
Response: Condition (ii) in Exclusion E2 is derived from FERC or provincial regulations applicable to qualifying cogeneration and small power production facilities. For example, see 18 CFR §292.101 and §292.305(b) for the requirements specific to the US. The SDT believes that condition (ii), which requires that the generation serving the retail customer load self provide reserves, is essential for the integrity of the exclusion. This is not new ground and is simply clarifying language that has been present in the ERO Statement of Compliance Registry Criteria for quite some time. The SDT believes that the meaning of the definition will be understood in Balancing Authority Areas where it is applicable. The SDT accepts your recommendation regarding "retail Load" and hasl clarified Exclusion E2 to read: **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail ~~customer~~ Load with electric energy ~~on the customer's side of the retail meter~~ if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.		
ACES Power Marketing Standards Collaborators	Yes	"A generating unit or multiple generating units that serve all or part of retail customer Load with electric energy on the customer's side of the retail meter" sounds a lot like "non-retail generation" that is used in E1 and E3 which was described in the webinar as generation that resides on the customer side of the retail meter and is used to supply energy to that customer's load and is owned by the customer. Is E2 assuming that this generation is not owned by the customer?

Organization	Yes or No	Question 8 Comment
		Also, part ii) adds to the confusion. Conceptually we agree with this exclusion but further clarification is preferred.
Response: Exclusion E2 does not apply to non-retail generation, which the SDT defines as generation on the system (supply) side of the retail meter. Condition (ii) in Exclusion E2 is derived from FERC or provincial regulations applicable to qualifying cogeneration and small power production facilities. For example, see 18 CFR §292.101 and §292.305(b) for the requirements specific to the US. The SDT believes that condition (ii), which requires that the generation serving the retail customer load self provide reserves, is essential for the integrity of the exclusion. This is not new ground and is simply clarifying language that has been present in the ERO Statement of Compliance Registry Criteria for quite some time. The SDT believes that the meaning of the definition will be understood in Balancing Authority Areas where it is applicable. No change made.		
Bonneville Power Administration	Yes	BPA believes that if E2 is intended to exclude behind-the-meter generation, the phrase "on the customer's side of the retail meter" should immediately follow "generating units" in the first line. Otherwise, the phrase could be seen as modifying "retail customer Load."
Response: The SDT has clarified Exclusion E2 as suggested. **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail ~~customer~~ Load with electric energy ~~on the customer's side of the retail meter~~ if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.		
WECC Staff	Yes	E2 is inconsistent with Section III.c. of the NERC Statement of Compliance Registry Criteria and is in conflict with I2. As written, E2 uses a net capacity threshold of 75MVA, which does not distinguish between a single generating unit and multiple generating units. The threshold in the NERC Statement of Compliance Registry Criteria for a single generating unit is 20MVA. As a result, E2 would appear to exclude generators from 20MVA to 75MVA that serve any amount of retail load behind the

Organization	Yes or No	Question 8 Comment
		meter. WECC recommends replacing "(i) the net capacity provided to the BES does not exceed 75 MVA" with "(i) the net capacity provided to the BES does not exceed the individual or gross nameplate ratings provided in the NERC Statement of Compliance Registry Criteria." WECC's recommended change makes E2 consistent with I2 and the SDT's plan to address generator thresholds in Phase 2.
Response: Comments received on Inclusion I2 made it clear that industry did not want circular references in the definition so the SDT has refrained from using the wording suggested here both in Inclusion I2 and Exclusion E2. The threshold levels of generators and the relationship between the ERO Statement of Compliance Registry Criteria and the BES definition will be considered in the Phase 2 review. However, the SDT believes that a value was needed for Phase 1 and decided to proceed with the single 75 MVA threshold. No change made.

Organization	Yes or No	Question 8 Comment
Response: Thank you for your support. Due to other comments received, the SDT has made a slight clarifying change to Exclusion E2 as shown: **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail ~~customer~~ Load with electric energy ~~on the customer's side of the retail meter~~ if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.		

9. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E3 (local network)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: Commenters were generally supportive of the concept of the local network Exclusion E3 as proposed in the second posting of the BES definition. The most prevalent comments, and the SDT's response to those comments, were as follows:

Several commenters suggested that the requirement under Exclusion E3.b should apply only during normal operating conditions. In other words, commenters felt that some power flow should be allowed to flow from the candidate local network back into the BES as long as it only occurred under abnormal conditions. To address this suggestion, the SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, but determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. . However, the SDT believes that, in circumstances where a local network is unable to utilize the local network exclusion solely because, under abnormal system conditions power flows out of the network, the same network could be a suitable candidate for exclusion under the Exception Process.

Numerous comments were received that either challenged the generator thresholds in Exclusion E3.a or suggested that the Exclusion for local networks should be silent on generator thresholds until the question of appropriate generation thresholds is addressed in Phase 2 of Project 2010-17. The SDT agrees that the threshold(s) for generation throughout the BES definition should be addressed in Phase 2 of this effort. However, to satisfy to the Commission's directives in Orders 743 and 743-A743-A in a timely fashion, the SDT believes it is necessary to use a generation threshold that is consistent with the in-force ERO Statement of Compliance Registry Criteria.

The SDT introduced the term "non-retail generation" in the E3 Exclusion, and a number of commenters questioned the SDT's understanding of the term. For the purpose of Exclusion E3 (and Exclusion E1), the SDT intends "non-retail generation" to mean generation that is on the system (supply) side of the retail meter.

Numerous commenters suggested that the word "transmission" be removed from the phrase in the first paragraph of Exclusion E3. The SDT considered the disposition of the word "transmission" in Exclusion E3, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element".

Several commenters expressed some confusion about Exclusion E3.b. Commenters felt that two separate and distinct ideas were being addressed in Exclusion E3.b, and that the expression following the colon is expected to clarify the expression preceding the colon. The SDT agrees that these two ideas are separate, but related. The SDT decided to revise Exclusion E3.b to provide this clarity, as follows:

> **E3.b**: Power flows only into the LN~~:~~ and ~~T~~the LN does not transfer energy originating outside the LN for delivery through the LN;

This minor revision is clarifying only, and does not represent any material change to the Exclusion provision.

Organization	Yes or No	Question 9 Comment
SERC OC Standards Review Group	No	We would agree with the exclusion if the wording of the exclusion includes the following phrase (in quotation marks) added at the end of E3 b): Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN "under normal operating conditions".
Tennessee Valley Authority	No	TVA would agree with the exclusion if the wording of the exclusion includes the following phrase (in italics) added at the end of E3 b): "Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN under normal operating conditions; and"
MEAG Power	No	We would agree with the exclusion if the wording of the exclusion includes the following phrase (in italics) added at the end of E3 b): Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN "under normal operating conditions".
Response: The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made.		
NERC Staff Technical Review	No	While we appreciate the improvement in the text of Exclusion E3, but we continue to believe that E3 should require automatic interrupting devices that are part of the BES must be provided at the points of interconnection between the Local Network and the BES.
Response: The SDT considered the suggested requirement for separation of the LN via automatic fault interrupting devices during the		

Organization	Yes or No	Question 9 Comment
development of the language for the second posting, and determined that such a qualifier could not be enforced for facilities that are not essential for the reliable operation of an interconnected transmission network. No change made.		
Northeast Power Coordinating Council	No	What is the technical justification for 300kv and higher? Local Network is capitalized (network not capitalized at the beginning of E3) throughout E3, yet it is not defined in the NERC Glossary. The installed generation limit in a Local Network should be addressed in Phase 2. Any studies supporting E3 should be made available.
Response: The threshold of 300 kV is used as a cap, not a minimum. Please refer to the companion document in the second posting of the BES Definition under Project 2010-17 for a description of the technical justification for local network exclusion. The term "local network" is not capitalized anywhere in the Exclusion E3 section of the definition except where it is placed as a section title, and when abbreviated. The SDT understands that "local network" is not a NERC Glossary term. The SDT agrees that the threshold(s) for generation throughout the BES definition should be addressed in Phase 2 of this effort; however, to satisfy the Commission's directives in Order 743 and 743-A in a timely fashion, it is necessary to use a generation threshold that is consistent with the in-force Statement of Compliance Registry Criteria. No change made. Please refer to the companion document in the second posting of the BES Definition under Project 2010-17 for a description of the technical justification for local network exclusion.		
Bonneville Power Administration	No	BPA has several concerns regarding Exclusion E3. First, BPA strongly believes that Exclusion E3 must retain the requirement that the local network (LN) be separable from the BES by an automatic fault interrupting device wherever the LN interconnects with the BES. BPA believes that this is necessary in order to protect both the BES and the LN during faults, especially if there is any possibility that backfeed could occur. BPA recommends retaining the original language: Separable by automatic fault interrupting devices: Wherever connected to the BES, the LN must be connected through automatic fault interrupting devices. In addition, as stated in our comments in May, 2011, "automatic fault interrupting device" should be a defined term.

Organization	Yes or No	Question 9 Comment
		BPA strongly believes that Exclusion E3 should not be allowed for any facilities above 200kV instead of the 300kV limit in shown in the current proposal. Networks operated above 200kV have significant fault duties, carry much more power, and have a greater potential for cascading if something does not operate properly than networks operated below 200kV. Therefore, BPA believes that these networks should be part of the BES. BPA believes the term "non-retail generation" in E3(a) should also be defined.
Response: The SDT considered the suggested requirement for separation of the LN via automatic fault interrupting devices during the development of the language of the second posting, and determined that such a qualifier could not be enforced for facilities that are not essential for the reliable operation of an interconnected transmission network. No change made. As the SDT does not propose the inclusion of the requirement for an automatic fault interrupting device, the definition of the term is not necessary. The threshold cap of 300 kV was a modification added for the second posting of the definition. The prior version of the definition had no upper bound on operating voltage for the local network, and the SDT has now adopted a 300 kV upper limit pursuant to comments received. Please refer to the technical justification document for local networks that accompanied the second posting under Project 2010-17 for details about the selection of 300kV as the cap for local networks. No change made. Non-retail generation is meant to be the generation on the system (supply) side of the retail meter. This is a well understood interpretation which the SDT took from official literature and does not need to be officially defined.		
ACES Power Marketing Standards Collaborators	No	The term "non-retail generation" used in Exclusion E1 (item c) and again in E3 (item a) should be clarified. The following applies to E3 (item c): A flowgate should not be used to limit applicability of E3. First, there is no definition for what constitutes a permanent flowgate. Second, flowgates are often created for a myriad of reasons that have nothing to do with them being necessary to operate the BES. While section c) in E3 attempts to limit the applicability to permanent flowgates, there is no definition for what constitutes a permanent flowgate particularly since no flowgate is truly permanent. The NERC Glossary of Terms definition of flowgate includes flowgates in the IDC. This is a problem because flowgates are included in the IDC for many reasons not just because reliability issues are identified. Flowgates could be included to simply study the impact of schedules on a particular interface as an

Organization	Yes or No	Question 9 Comment
		example. It does not mean the interface is critical. As an example, it could be used to generate evidence that there are no transactional impacts to support exclusion from the BES. Furthermore, the list of flowgates in the IDC is dynamic. The master list of IDC flowgates is updated monthly and IDC users can add temporary flowgates at anytime. While the "permanent" adjective applied to flowgates probably limits the applicability from the “temporary” flowgates, it is not clear which of the monthly flowgates would be included from the IDC since they might be added one month and removed another. Flowgates are created for many reasons that have nothing to do with them being necessary to operate the BES. First, flowgates are created to manage congestion. The IDC is more of a congestion management tool than a reliability tool. FERC recognized this in Order 693, when they directed NERC to make clear in IRO-006 that the IDC should not be relied upon to relieve IROLs that have been violated. Rather, other actions such as re-dispatch must be used in conjunction. Second, flowgates are used as a convenient point to calculate flows to sell transmission service. The characteristics of the flowgate make it a good proxy for estimating how much contractual use has been sold not necessarily how much flow will actually occur. While some flowgates definitely are created for reliability issues such as IROLs, many simply are not.
Response: Non-retail generation is meant to be the generation on the system (supply) side of the retail meter. The SDT believes that the language in Exclusion E3.c prohibiting “Flowgates” from qualifying for definitional exclusion is appropriate and necessary. As a definitional exclusion characteristic, Exclusion E3.c must follow the principle of being a bright-line and easily identifiable, and as such, the SDT feels that the definition cannot allow some types of Flowgates and disallow others. Flowgates must continue to be a prohibiting characteristic under Exclusion E3, since these facilities are more likely to be used in the transfer of bulk power than not. An entity who wishes to make a case for exclusion of a unique type of Flowgate facility can do so through the exception process. The SDT believes that the continued qualifier of “permanent” associated with the term “Flowgate” addresses the majority of the concern in this comment. No change made.		
Dominion	No	Dominion could support if E3a were eliminated.
Response: The SDT continues to believe that it is necessary to establish a limit on the allowable quantity of generation that may be significant to the reliable operation of the surrounding interconnected transmission system. Please note that the issues surrounding the appropriate generation threshold, among other topics, will be taken up in Phase 2 of this BES definition effort. No change made.		

Organization	Yes or No	Question 9 Comment
Pepco Holdings Inc and Affiliates	No	1) In the Drafting Teams Consideration of Comments on the previous version, it was stated, "....It is not the SDT's intent to specifically exclude any facilities in major metropolitan areas; it expects that the specific examples mentioned (NYC, Washington DC) would not qualify for exclusion under the revised Exclusion E3." The currently proposed E3 will result in specific exclusion of major local networks in major metropolitan areas. These major LNs qualify for exclusion under proposed E3, and its qualifiers, in that they distribute power to the local load rather than act as facilities to transfer bulk power across the interconnected system. However, the LNs that supply large amounts of load in very dense load areas should have some transmission reliability considerations. To capture the appropriate LNs in question, consideration should be given to limiting the amount of load supplied by a LN to some load level. For example if an LN has a peak load level of less than 1,000MVA it would qualify for LN exclusion and if it exceeds 1,000MVA it would not qualify for exclusion. There are certainly many LNs that supply relatively small amounts of load, just as radial facilities. They should be excluded. It is important to develop a load level that would provide the proper balance between the small LNs and the major LNs. 2) Since the SDT deleted the inclusion of Black Start Cranking Paths in I3 then reference to I3 in criteria E3a should also be removed. Limits on connected generation should only be constrained by the 75MVA limit. Therefore E3a should then read "Limits on connected generation: The LN and its underlying Elements do not include generation resources with an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);"
Response: The SDT appreciates your concern about the possible exclusion of large metropolitan load centers through the exclusion for local networks in Exclusion E3. However, the SDT feels that it has accurately captured the characteristics of facilities that are used in the local distribution of electric energy within Exclusion E3 (and Exclusion E1), which the Commission's Order specifically targeted for exclusion. To the suggestion of a 1,000 MW demand cap on the exclusion for local networks, the SDT sees no technical basis upon which to make such a change. Also, the SDT is unaware of any situations of a network of facilities serving a load of that size that would not be precluded in some way under at least one of the three characteristics of Exclusion E3. Finally, an Exception Process will exist in the event that an entity seeks an inclusion of such facilities. No change made. The SDT appreciates the suggestion that the elimination of the inclusion for Cranking Paths, while maintaining the qualifier prohibiting blackstart resources from existing in a qualifying local network could be viewed as an inconsistency. Given that the concept of		

Organization	Yes or No	Question 9 Comment
exclusion of 'local networks' is already an issue requiring careful technical justification, the SDT has determined that it should be conservative with regard to allowing such an exclusion for facilities that are depended upon for blackstart functionality, as these will arguably be more important to the reliable operation of the transmission system than equivalent networks without blackstart resources. It is nevertheless possible to achieve exclusion through the Exception Process. No change made.		
Tri-State Generation and Transmission Assn., Inc. Energy Management	No	1. b) should be reworded to "Normally there is power flow only into the LN: The LN is not normally used to transfer power originating outside of the LN for delivery through the LN." There could be conditions inside the LN, such as large loads shut down for maintenance, which would allow the parallel transmission Elements to allow power to flow through the LN. Those conditions would have no negative or adverse effect on the BES. 2. Capitalize "Network" at the beginning of the Exclusion
Tri-State GandT	No	1. b) should be reworded to "Normally there is power flow only into the LN: The LN is not normally used to transfer power originating outside of the LN for delivery through the LN." There could be conditions inside the LN, such as large loads shut down for maintenance, which would allow the parallel transmission Elements to allow power to flow through the LN. Those conditions would have no negative or adverse effect on the BES.2. Capitalize "Network" at the beginning of the Exclusion.
Response: The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made. The word "network" as used in "local network" is not intended as a defined term; therefore, it is not capitalized. When expressed in abbreviation, "LN" is properly capitalized. No change made.		
MRO NERC Standards Review Forum (NSRF)	No	THE NSRF suggestion considering a different approach for the power flow criteria in [E]3b. [E]3b: No [Firm] Power Transfers are scheduled out of, or [through], the LN in the operating horizon [for BES designations applicable to the operating horizon] and [no] Firm Power Transfers are reserved to flow out of, or through, the LN in the planning horizon [for BES designations applicable to the planning horizon].

Organization	Yes or No	Question 9 Comment
Response: The SDT believes it is vital to ensure both that power flow is always in the direction from the BES toward the LN at all points of connection, and that the LN facilities not be used for "wheeling" type transactions. The SDT believes the existing language accomplishes this. The suggested language in this comment touches on an important aspect, the scheduled use of the facilities, but the SDT believes that the existing language is more appropriate to express this point. No change made.		
Hydro One Networks Inc.	No	We agree with the exclusion concept of LN. However, the reliability of the interconnected transmission network should not be determined by the amount of installed generation in the local network. We believe that the generation limit is restrictive and has little or no technical basis. It is not the size of a unit in the LN that will determine the reliability impact on the BES but more importantly its location, configuration and system characteristics such as reliability must run unit. We suggest that the SDT should address this in phase 2 to increase the installed generation limit in a LN. We suggest deleting the references to I3 in E1 and E3 because we believe that this reference is in contradiction to I3 and probably an oversight and should be corrected. I3 does not require a path to be BES but it implies here that a radial system cannot be excluded if there is a Blackstart unit on it.
Response: The SDT agrees that the threshold(s) for generation throughout the BES definition should be addressed in Phase 2 of this effort; however, to satisfy the Commission's directives in Order 743 and 743-A in a timely fashion, it is necessary to use a generation threshold that is consistent with the in-force Statement of Compliance Registry Criteria. No change made. The SDT appreciates the suggestion that the elimination of the inclusion for Cranking Paths, while maintaining the qualifier prohibiting blackstart resources from existing in a qualifying local network could be viewed as an inconsistency. Given that the concept of exclusion of 'local networks' is already an issue requiring careful technical justification, the SDT has determined that it should be conservative with regard to allowing such an exclusion for facilities that are depended upon for blackstart functionality, as these will arguably be more important to the reliable operation of the transmission system than equivalent networks without blackstart resources. It is nevertheless possible to achieve exclusion through the Exception Process. No change made.		
Holland Board of Public Works	Yes	Holland BPW supports the exclusion of Local Networks (LN) from the definition of BES. Such systems are generally not necessary for the reliable operation of the interconnected transmission network. However, some revisions are necessary. Holland BPW believes that E3(a) and E3(b) can and should be eliminated, provided E3(c) remains. E3(c) provides that an LN is BES if it is classified as a Flow Gate or Transfer Path. The bases for removing E3(a) and E3(b) are as follows: (1) Provision E3(a) establishes a

Organization	Yes or No	Question 9 Comment
		75 MVA limit on connected generation. This is inconsistent with the concept of a LN and should be removed. If not removed, it should be increased to not less than 300 MVA, consistent with the discussion in response to Q1. If an LN does not accommodate bulk power transfer across the interconnected system, the amount of generation that exists and is distributed within that system is immaterial for purposes of the reliable operation of the interconnected transmission system. During the NERC Webinar, NERC representatives suggested that placing an upper limit on generation within a LN might be desirable based upon an assumption that if that entity's internal generation is lost, then replacement generation would have to come from the BES, and could therefore affect reliability. This assumption has not been substantiated. In most instances, generation resources are dispersed throughout the LN - it is unlikely an event would result in the loss in the amount of the aggregate generation. Additionally, LNs have local load shedding and system restoration plans for such contingencies. (2) E3(b) is unnecessary and should be removed. The proposed language in E3(b) appears to be concerned with flows originating from outside of the LN, coming into the LN, and then exiting the LN to loads outside of the LN. As noted above, E3(c) appears to address this concern. If E3(b) is maintained, then the introductory clause ("Power flows only into the LN:") should be deleted, because it is inconsistent with the second clause ("The LN does not transfer energy originating outside the LN for delivery through then LN.") If E3(b) is retained, Holland BPW supports the second clause ("The LN does not transfer energy originating outside the LN for delivery through then LN") because it appears to be the portion of the provision that addresses the concern about flows into, through, and then out of, the LN. (3) E3(b) should also be removed or modified because it fails to recognize typical municipal system operations. An LN may have internal generation that is less than its peak load but in excess of off-peak or holiday load levels. The language "Load flows only into the LN" does not recognize this situation and prevents an LN from making the most economic use of surplus generation. There are no reliability reasons to discourage such sales since with or without such transactions, this generation is not necessary for the reliable operation of the interconnected transmission system.
Response: The SDT believes that a limit on the amount of connected (non-retail) generation within the LN is necessary to ensure that		

Organization	Yes or No	Question 9 Comment
there is no reliability impact on the interconnected transmission system; however, the threshold of the allowable generation – 75 MVA – was chosen to be consistent with the existing threshold in the NERC Statement of Compliance Registry Criteria, and this threshold is a subject of further review under the Phase 2 development of the BES definition. The SDT believes that Exclusion E3.b continues to be necessary to ensure that qualifying LN's do not participate in "wheel-through" transactions, and that power always flows in a direction from the BES toward the LN. The SDT has clarified Exclusion E3.b as follows due to your comments and those of others. **E3.b**: Power flows only into the LN~~:~~ and ~~T~~the LN does not transfer energy originating outside the LN for delivery through the LN;		
Texas Industrial Energy Consumers	Yes	As noted in response to Question 3, above, subsection (a) of Exclusion E3 would only exclude Local Networks with "aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating)." The reference to "non-retail" generation in subsection (a) indicates that the SDT may have intended to preserve the "netting" approach set forth in the Statement of Registry Compliance, but this should be made clearer. The description in subsection (a) should be revised to exclude "Where the radial system serves Load and includes generation resources not identified in Inclusions I2 or I3," and the remainder of that sentence referencing a 75 MVA gross nameplate rating should be removed. This will provide a reference back to the Statement of Registry Compliance and clarify that only net capacity is considered for customer-owned facilities. TIEC also disagrees with the 300 kV upper limitation on transmission elements within a Local Network. Consistent with TIEC's comments to FERC, if these facilities are serving a distribution function, their voltage level is irrelevant. The transmission versus distribution distinction should be based on function, not voltage level. The remainder of this exclusion clarifies what constitutes a distribution function, so the 300 kV limit is unnecessary and should be removed.
Response: The SDT evaluated this comment and has concluded that the exclusion must necessarily be based on the gross aggregate nameplate of the generation connected within the candidate systems. The approach that is suggested in your comment could result in significant amounts of generation existing within the excluded area. No change made. The SDT does not agree with the removal of the 300 kV cap that limits the qualification of a group of facilities for local network exclusion. The SDT feels that an upper bound is essential to prevent inappropriate exclusions of facilities that may be important to the reliable operation of the interconnected transmission system. The Exception Process is available for specific circumstances where a 300 kV cap is problematic. No change made.		

Organization	Yes or No	Question 9 Comment
PacifiCorp	Yes	PacifiCorp strongly supports the categorical exclusion of Local Networks ("LNs") from the BES. PacifiCorp believes the exclusion is necessary to ensure that the BES definition complies with FERC's statutory jurisdictional requirements. PacifiCorp recommends the following modifications: o Change "contiguous transmission Elements" to "contiguous Elements". o Modify item b to state, "Power flows only into the LN during normal operating conditions: The LN does not transfer energy originating outside the LN for delivery to loads located outside the LN..." o Add an item (may be included in item b) to provide as follows: "The LN is not critical (or is not relied upon) to maintain the reliability of the interconnected system during abnormal operating conditions."
Response: The SDT considered the disposition of the word "transmission" in Exclusion E3, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element". No change made. The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made. The SDT does not believe that the statement "The LN is not critical (or is not relied upon) to maintain the reliability of the interconnected system during abnormal operating conditions" lends itself to determination by inspection; hence, it is not an appropriate "bright-line" characteristic for ExclusionE3. No change made.		
Southern Company	No	We would agree with the exclusion if the wording of the exclusion includes the following phrase (in italics) added at the end of E3 b): "Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN "under normal operating conditions". What does the term "non-retail generation" mean? Can the term "non-retail generation in E3a be changed to simply "generation"?
Response: The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition.		

Organization	Yes or No	Question 9 Comment
For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made. Non-retail generation is meant to be the generation on the system (supply) side of the retail meter. The SDT has intentionally utilized the term "non-retail generation" in Exclusion E3.a in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.		
ReliabilityFirst	No	ReliabilityFirst Staff proposes to use the LN exclusion as part of the definition of what elements make up the facilities used in the local "distribution" of electric energy and could be included in the Exception Process as a criterion for exclusion.
Response: The SDT believes that Exclusion E3 has sufficient clarity and that its provisions can be readily demonstrated without the need to be handled through the Exception Process. Therefore, it is more appropriately handled within the definition. No change made.		
Ontario Power Generation Inc.	No	Non-retail generation needs to be properly defined in the text of the exclusion.
Mission Valley Power	No	Mission Valley Power - : We strongly agree that local networks should be excluded, since they act much like the radial systems excluded in E1 while providing a higher level of service to customers. These networks should not be discouraged in the name of reliability. We again object to the introduction of the new confusing term "non-retail generation" with no definition provided.
Tillamook PUD	No	We strongly agree that local networks should be excluded, since they act much like the radial systems excluded in E1 while providing a higher level of service to customers. These networks should not be discouraged in the name of reliability.

Organization	Yes or No	Question 9 Comment
		We again object to the introduction of the new confusing term "non-retail generation" with no definition provided.
Central Lincoln	No	We strongly agree that local networks should be excluded, since they act much like the radial systems excluded in E1 while providing a higher level of service to customers. These networks should not be discouraged in the name of reliability. We again object to the introduction of the new confusing term "non-retail generation" with no definition provided.
Northern Wasco County PUD	No	We strongly agree that local networks should be excluded, since they act much like the radial systems excluded in E1 while providing a higher level of service to customers. These networks should not be discouraged in the name of reliability. We again object to the introduction of the new confusing term "non-retail generation" with no definition provided.
Response: Non-retail generation is meant to be the generation on the system (supply) side of the retail meter.		
Central Hudson Gas and Electric Corporation	No	Under the proposed definition, clause E3.b. stipulates that 'power only flows into the Local Network (LN): The LN does not transfer energy originating outside the LN for delivery through the LN.' Clearly, this is a bright line. The Local Network Exclusion document, however, describes that 'power flow "shifts"' of 'negligible fraction' are acceptable. Further, the document acknowledges that parallel flows through the LN, 'as governed by the fundamentals of parallel circuits' will occur. Finally, the document goes on to exhibit that flows through the LN, however minimal, will result from both power transfer distribution factor (PTDF) and line outage distribution factor (LODF) analysis. If this is the case, what bright line criterion should be applied for this Exclusion Principal if no maximum PTDF and/or LODF are specified?
Response: Exclusion E3.b does in fact prohibit power flow at the BES interface points of the LN from entering the BES. The accompanying technical justification document merely addresses the insignificance of the power flow shifts that will occur in an example system. Clearly, in the example system of the technical justification document, power flow is shown to always be in a direction from the BES toward the LN, albeit with only a slight magnitude shift in the PTDF and LODF analyses. The technical justification document does not attempt to set any threshold on the magnitude of this shift; it merely is a demonstration on a sample		

Organization	Yes or No	Question 9 Comment
system. The only bright-line criterion that is applicable to this question is that power flow shall always be from the BES toward the LN.		
City of Anaheim	No	Again, 75 MVA should be increased to 300 MVA in E2 for the reasons stated in response to Question 7.
Response: The SDT has determined that it must retain the 75 MVA threshold on generation allowed within a qualifying LN in order to remain consistent with the existing ERO Statement of Compliance Registry Criteria. There has not been sufficient technical justification to this point that would support a change from this threshold; however, such threshold will be considered in Phase 2 of this Project 2010-17. No change made.		
Consumers Energy	No	In general we agree, but believe the word "transmission" should be removed from "A group of contiguous transmission Elements..."
Response: The SDT considered the disposition of the word “transmission” in Exclusion E3, and determined that retention of this word – in lower-case – is necessary to modify the word “Element”. This is meant to eliminate the generation that would otherwise be included in the term “Element”. No change made.		
Manitoba Hydro	No	Manitoba Hydro agrees with the Local Network Exclusion but disagrees with the drafting team’s removal of the requirement to have protective devices protecting the BES from the LN. We suggest that the following requirement is re-inserted into E3 to meet the LN Exclusion:”a) Wherever connected to the BES, the LN must be connected with a Protection System.”
Response: The SDT considered the suggested requirement for separation of the LN via automatic fault interrupting devices during the development of the language of the second posting, and determined that, consistent with Order 743 and 743a, such a qualifier could not be enforced for facilities that are not essential for the reliable operation of an interconnected transmission network. No change made.		
Long Island Power Authority	No	Main paragraph and items E3b and E3c adequately define a Local Network. It seems like the intent to exclude non bulk distribution systems would still be included because of E3a. E3a should be eliminated. If not eliminated, need to define the term "underlying Elements".

Organization	Yes or No	Question 9 Comment
Response: The SDT continues to believe that it is necessary to establish a limit on the allowable quantity of generation that may be significant to the reliable operation of the surrounding interconnected transmission system. Please note that the issues surrounding the appropriate generation threshold, among other topics, will be taken up in Phase 2 of this BES definition effort. No change made. The SDT believes that the existing phrase in ExclusionE3.a "and its underlying Elements" has sufficient clarity and meets the intent of the exclusion with brevity. No change made.		
City of St. George	No	The exclusion of Local Networks should be provided, however the generation level limits are too restrictive. As long as the power flow is into the system the generation level of the local network shouldn't matter as long as it is being used to serve local load. E3a should be deleted from the definition, or at least some higher level of allowed generation should be included. Another possibility would be a ratio of local load to local generation. Areas with local generation serving local load will have similar characteristics or affects to the BES system as were used in the Local Network justification paper (Appendix 1) included with the documents. If some reasonable level of local generation was added to the example system it is unlikely that the affects to the BES flows would change from what was presented in the example.
Response: The SDT has determined that it must retain the 75 MVA threshold on generation allowed within a qualifying LN in order to remain consistent with the existing ERO Statement of Compliance Registry Criteria. There has not been sufficient technical justification to this point that would support a change from this threshold; however, such threshold will be considered in Phase 2 of this Project 2010-17. The SDT continues to believe that it is necessary to establish an upper limit on the allowable quantity of generation that may be included in the local network since generation in a local network may be significant to the reliable operation of the surrounding interconnected transmission system. Please note that the issues surrounding the appropriate generation threshold, among other topics, will be taken up in Phase 2 of this BES definition effort.		
Orange and Rockland Utilities, Inc.	No	We know that N-1 is assumed when power-flow study is performed, however, N-1 should be mentioned here for clarification.

Organization	Yes or No	Question 9 Comment
Response: The SDT understands this comment to be in reference to the technical justification document that accompanied the definition in its second posting. This technical justification document was merely intended to be illustrative of the insignificance of the interaction of a sample local network on its surrounding interconnected transmission system. The "LODF" values were for a single element taken out of service. No change made.		
ISO New England Inc	No	E3 could result in many large load pockets being excluded from the BES definition and should be deleted. Assuming that it is retained, we offer the following additional comments. The term "a group of contiguous transmission elements" is ambiguous and needs to be clarified. Please clarify in the exclusion if the flows into the LN as described in E3.b) are pre-contingency flows only. Please clarify the system conditions (time of year, peak or off-peak) that should be considered in determining of flow is only into the LN. The "Non-retail" qualifier in E3.a) should be deleted.
Response: The SDT appreciates your concern about the possible exclusion of large metropolitan load centers through the exclusion for local networks in Exclusion E3. However, the SDT feels that it has accurately captured the characteristics of facilities that are used in the local distribution of electric energy within Exclusion E3 (and Exclusion E1), which the Commission's Order specifically targeted for exclusion. No change made. The SDT considered the disposition of the word "transmission" in Exclusion E3, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element". No change made. The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made. There are no specified conditions applicable to item Exclusion E3.b. In order to qualify for exclusion under this item, this characteristic must be demonstrated under all conditions. This exclusion has been re-stated as follows for additional clarity:		

Organization	Yes or No	Question 9 Comment
E3.b: Power flows only into the LN~~:~~ and ~~T~~the LN does not transfer energy originating outside the LN for delivery through the LN; The SDT has intentionally utilized the term "non-retail generation" in Exclusion E3.a in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.		
Texas Reliability Entity	No	There should be language that includes UFLS, UVLS, or load fully removable for Reserves even in a local network to avoid a lapse in reliability in operation of the BES. Even if it is to be included in any Phase 2 work, it should be mentioned here to avoid gaps.
Response: The SDT is uncertain whether this comment suggests that facilities used in UFLS, UVLS, or as interruptible load for reserve, should be prohibited from exclusion from the BES under Exclusion E3. At any rate, even a facility that is excluded under Exclusion E3 may continue to have obligations under the reliability standards for UFLS, UVLS or other load shedding requirements.		
Independent Electricity System Operator	No	Consistent with our comments in response to Q7, we propose removing E3 (a) since, as explicitly described in E3 (b), one of the characteristic of the LN is that power flows only into the LN. The level of generation contained within the LN is therefore immaterial, particularly where the most onerous contingency or system operating condition occurring within the LN, results in acceptable BES performance as defined by the applicable criteria of the NERC transmission planning standards. The generation connected within the LN that meets the registry criteria would already be captured within the definition of the BES as provided for in Inclusion I2.
Response: The SDT continues to believe that it is necessary to establish a limit on the allowable quantity of generation that may be significant to the reliable operation of the surrounding interconnected transmission system. Please note that the issues surrounding the appropriate generation threshold, among other topics, will be taken up in Phase 2 of this BES definition effort. No change made.		
Rochester Gas and Electric and New York State Electric and Gas	No	"Local Network" is capitalized (network not capitalized at the beginning of E3) throughout E3, yet it is not defined in the NERC Glossary. This exclusion is vague. This exclusion applies to a network with "multiple points of connection" with the purpose "to improve the level of service to retail customer load" - this phrase is intent-based and not reliability-based - most/all transmission "improves service" compared to it not being there. In

Organization	Yes or No	Question 9 Comment
Central Maine Power Company		essence, this exclusion can be obtained if a portion of the network:1. Doesn't have significant generation (again, "non-retail" phrase is unclear)2. Power only flows "into" this portion of the network, and not (ever? Even under any TPL design contingencies?) "out." Is this considering only pre-contingency steady state conditions? During contingency conditions and for the period following a contingency the LN could supply power to other parts of the network depending on the nature of the contingency. The conditions under which direction of flow is assessed are critical, but E3(b) is silent on this.3. This portion of the network is not part of a monitored transmission interfaceThis "Local Network Exclusion" is supported by a technical analysis which relied on transfer distribution factors (see http://www.nerc.com/docs/standards/sar/bes_definition_technical_justification_local_network_20110819.pdf on the NERC BES Definition standard page http://www.nerc.com/filez/standards/Project2010-17_BES.html). This transfer distribution factor (TDF) method was rejected by FERC in Order 743. Paragraph 85 of the Order states: "Given the questionable and inconsistent exclusions of facilities from the bulk electric system by the material impact assessment and the variable results of the Transmission Distribution Factor test proposed in NPCC's compliance filing in Docket No. RC09-3, there are no grounds on which to reasonably assume that the results of the material impact assessment are accurate, consistent, and comprehensive.93 Additionally, we have noted how the results of multiple material impact tests can vary depending on how the test is implemented."Unless E3 is made more specific and clear, it should be stricken.

Response: The term "local network" is not capitalized anywhere in the Exclusion E3 section of the definition except where it is placed as a section title, and when abbreviated. The SDT understands that "local network" is not a NERC Glossary term. No change made.

The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made.

The SDT recognizes that the TDF methodology suggested by various entities as a threshold for determining inclusion in the BES was not favored by the Commission. However, as used in the technical justification document, the transfer distribution factors for power flow transfer as well as line outage factors are merely illustrative of the de minimis impact that a sample local network has on its

Organization	Yes or No	Question 9 Comment
surrounding interconnected transmission system. The SDT does not propose the use of TDF as a threshold for determination of BES.		
Kansas City Power and Light Company	No	Although the Technical Justification Local Network guidance document is helpful in explaining the principles and concepts involved with determination of what constitutes a Local Network, criteria needs to be established regarding the impacts of LODF and PTDF that will clearly define what constitutes a Local Network to avoid debate and controversy.
Response: As used in the technical justification document, the transfer distribution factors for power flow transfer as well as line outage factors are merely illustrative of the de minimis impact that a sample local network has on its surrounding interconnected transmission system. The SDT does not propose the use of TDF as a threshold for determination of BES. No change made.		
Nebraska Public Power District	No	In E3 (a): please define "non-retail generation" as usued in E3(a). Also, what is the criterion that makes this genertion BES generation? The MVA rating only, or is there other criteria? A generator may have a 75 MVA gross nameplate rating, but may be limited physically or electrically to below the 75 MVA. Is this a basis for exclusion for this generator?
Response: Non-retail generation is meant to be the generation on the system (supply) side of the retail meter. Consistent with the ERO Statement of Compliance Registry Criteria, the SDT has used language in describing generation thresholds in Exclusion E3.a as being gross aggregate nameplate ratings.		
Ameren	No	a) The exclusion should also be extended to reactive resources needed to support the local area network (see response to Q10). It is also suggested that "local network" be renamed to "local area network" to better describe or distinguish itself from a wide-area network such as the BES. b) We would agree with the exclusion if the wording of the exclusion includes the following phrase (in italics) added at the end of E3 b): Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN "under normal operating conditions".

Organization	Yes or No	Question 9 Comment
Response: If a candidate local network is granted exclusion under Exclusion E3, the exclusion would apply to the reactive resources within that network as well. No change made. The SDT believes that renaming the local network to "local area network" (LAN) will lead to industry confusion with the identical term used to refer to communications infrastructure. No change made. The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made.		
Georgia System Operations Corporation	No	Item (b) is unclear: Although the first sentence says "Power flows only into the LN," which suggests there will be no exports, the second sentence says "The LN does not transfer energy originating outside the LN for delivery through the LN," which suggests it could deliver power originating within the LN. This would seem to be reasonable by comparison to E-2, so long as no more than 75 MVA is exported (which is indeed the limitation on the quantity of "non-retail generation" in the LN). On a related point, if the limit on connected generation is not intended to be a limit on possible exports, and therefore any power from interconnected non-retail generation must be sold within the LN, why does the limit need to be so low; why should the aggregate quantity of such internally-consumed generation be an issue? Also, is the "non-retail" designation intended to exclude customer-owned generation from the 75 MVA calculation?
Response: The SDT has re-stated item Exclusion E3.b for additional clarity. **E3.b**: Power flows only into the LN~~.~~ and ~~T~~the LN does not transfer energy originating outside the LN for delivery through the LN; The limit placed on the aggregate generation within the local network only applies to non-retail generation. To clarify, in order to qualify under Exclusion E3, exports are not permissible from the local network. Non-retail generation is meant to be the generation on the system (supply) side of the retail meter.		

Organization	Yes or No	Question 9 Comment
ATC LLC	No	ATC agrees in general with the exclusions for E3 pending the following changes: Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN under normal operating conditions (n-0 contingency); and ATC suggests considering a different approach for the power flow criteria in Exclusion E3b:Inclusion E3b - No Firm Power Transfers are scheduled to flow out of, or through, the LN in the operating horizon [for BES designations applicable to the operating horizon] and no Firm Power Transfers are reserved to flow out of, or through, the LN in the planning horizon [for BES designations applicable to the planning horizon).
Response: The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made. The SDT believes it is vital to ensure both that power flow is always in the direction from the BES toward the LN at all points of connection, and that the LN facilities not be used for "wheeling" type transactions. The SDT believes the existing language accomplishes this. This suggested language in this comment touches on an important aspect, the scheduled use of the facilities, but the SDT believes that the existing language is more appropriate to express this point. No change made.		
Tacoma Power	No	Tacoma Power does not support the Exclusion E3 as currently written. We strongly believe that Section c) of E3 must replace the term "transfer path" with "Major Transfer Path" to distinguish these paths from any common ATC path. This revision is consistent with the existing language used in the form, Detailed Information to Support an Exception Request. Additionally, we believe it is not appropriate for E3 to state an MVA threshold in Section a) when determining such thresholds is the purpose for Phase 2. We urge the SDT to defer the determination of a MVA threshold in E3 to Phase 2. Finally, the term "non-retail generation" is not a universally understood term in the industry. We suggest that the SDT replace the phrase "non-retail generation" with "generation located on the retail

Organization	Yes or No	Question 9 Comment
		customer's side of the meter."
Response: The existing language posted in the second draft of the BES definition does include the word "major" as a modifier of transfer paths in the Western Interconnection. The definition cannot have this word "major" capitalized, as it is not part of the NERC Glossary of Terms. Accordingly, the SDT believes that there is no need to make the suggested change to Exclusion E3.c. The SDT agrees that the threshold(s) for generation throughout the BES definition should be addressed in Phase 2 of this effort; however, to satisfy the Commission's directives in Order 743 and 743-A in a timely fashion, it is necessary to use a generation threshold that is consistent with the in-force Statement of Compliance Registry Criteria. No change made. Non-retail generation is meant to be the generation on the system (supply) side of the retail meter. The exclusion language of Exclusion E3.a intends to consider only the non-retail (supply side) generation; whereas your comment suggests that the generation to be counted is on the retail side of the meter. With the clarification of the use of the term "non-retail generation", the SDT believes that Exclusion E3.c is appropriate. No change made.		
MEAN	No	MEAN does not agree with the language of E3, b). This language is arbitrary and could be represented in several ways, dependent on the entity making their case. As we all know, electricity doesn't always take the shortest path. MEAN would recommend eliminating E3, b) due to its subjective language and rely on the current E3, c) to evaluate reliability and system impacts. If the language does not change, MEAN would argue to any applicable RE that the language intent was to address facilities that have documentation stating that the facilities are used for transferring energy across (e.g. joint ownership, contribution in aid of construction, etc.) and have an E3 exception denied based on power flow models or other transmission modeling.
Response: The SDT has reviewed the language of Exclusion E3.b, and does not find it to be subjective or arbitrary. However, the SDT does propose a minor revision to re-state E3.b for additional clarity: **E3.b**: Power flows only into the LN~~:~~ and ~~T~~the LN does not transfer energy originating outside the LN for delivery through the LN;		
South Houston Green Power, LLC		SHGP would like to broaden the scope of Local Networks. If a Local Network does not allow transfer of Bulk Power across the Interconnected System, then the Local Network should be excluded regardless of the amount of generation behind the meter. Often, large industrial sites install large combined Heat and Power cogeneration units due to a hefty steam load. Subjecting industrial facilities to additional reporting and coordination efforts [other than those already required by the TO

Organization	Yes or No	Question 9 Comment
		and RTO] may have little, if any, increase in grid reliability. The 75 MVA (gross nameplate rating) needs to be eliminated. To date, none of the Regional Entities has suggested that SHGP or its affiliates register as a Transmission Owner or Transmission Operator with respect to any SHGP or affiliated delivery facilities.
Response: The SDT has determined that it must retain the 75 MVA threshold on generation allowed within a qualifying LN in order to remain consistent with the existing ERO Statement of Compliance Registry Criteria. There has not been sufficient technical justification to this point that would support a change from this threshold; however, such threshold will be considered in Phase 2 of this Project 2010-17. No change made.		
Hydro-Quebec TransEnergie		Same comment than Q7.
Response: See response to Q7.		
ExxonMobil Research and Engineering	Yes	Exclusion E1 and E3 aid in the delineation of distribution and transmission facilities. However, we request that the BES SDT review paragraphs 108 and 109 of FERC Order 743. In order to meet reliability target requirements to safely and economically operate manufacturing and production facilities, many industrial facilities are fed by two or more utility transmission lines that originate at independently fed utility substations. Due to the magnitude of an industrial site's load, these transmission lines are typically designed to operate at levels in excess of 100 kV at the request of the utility company. These transmission lines typically terminate into an interconnection facility, owned by the industrial facility, that spot networks the transmission lines via a ring buss or breaker and a half substation within the industrial facility's private use network in order to serve the load of the facility's private use network. These private use networks typically satisfy the requirements set forth in the definition of a Local Network (power flows in, not a flowgate, etc.); however, the term "non-retail generation" is not a term that is implicitly defined or consistent with this documents use of "net capacity provided..." phrasing in similar exclusions.
Response: Non-retail generation is meant to be the generation on the system (supply) side of the retail meter.		

Organization	Yes or No	Question 9 Comment
Sacramento Municipal Utility District	Yes	It is preferred to hold reference to gross nameplate rating/threshold values until generation technical justification is completed as part of Phase 2; these studies should apply to any real or reactive power threshold reference. For Exclusion E3-b using the phrase "[p]ower flows only into the LN" is too restrictive. An allowable MW threshold of LN power producing resources should be deferred to the Phase 2 BES technical analysis. Where no generation is present in the LN, it is recommended that an allowance for residual flow through the LN.
City of Austin dba Austin Energy	Yes	We prefer to hold reference to gross nameplate rating/threshold values until generation technical justification is completed as part of Phase 2; these studies should apply to any real or reactive power threshold reference. For Exclusion E3-b using the phrase "[p]ower flows only into the Local Network" is too restrictive. An allowable MW threshold of Local Network power producing resources should be deferred to the Phase 2 BES technical analysis. Where no generation is present in the Local Network, it is recommended that an allowance for residual flow through the Local Network.
Response: The SDT agrees that the threshold(s) for generation throughout the BES definition should be addressed in Phase 2 of this effort; however, to satisfy the Commission's directives in Order 743 and 743-A in a timely fashion, it is necessary to use a generation threshold that is consistent with the in-force Statement of Compliance Registry Criteria. No change made. The SDT feels strongly that in order for a network to qualify for exclusion under the Exclusion E3 section of the definition, there must be strict bounds and limits placed on the characteristics of the candidate facilities. Allowances for minor "out-flow" from the local network, or "minimal" flow, as suggested in this comment, will lead to an inconsistent application of the definition and therefore, a lack of bright-line quality in the definition. Situations such as what is proposed in this comment can be referred to the Exception Process for possible exclusion from the BES. No change made.		
Portland General Electric Company	Yes	PGE agrees with Exclusion E3, but believes additional clarification is necessary to facilitate a complete understanding and application of the exclusion criteria. First, there is no specific definition of "non-retail" generation provided. Additionally, E3 b) states "Power flows only into the LN: The LN does not transfer energy originating

Organization	Yes or No	Question 9 Comment
		outside the LN for delivery through the LN." PGE believes that a local network should still qualify for the LN exclusion if power may flow out of the LN at a discrete point or certain discrete points during abnormal operating conditions, but power still flows into the LN on an aggregate basis during all operating conditions, and power flows only into the LN at all discrete points during normal operating conditions.
Response: Non-retail generation is meant to be the generation on the system (supply) side of the retail meter. The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made.		
Cowlitz County PUD	Yes	Cowlitz strongly supports the categorical exclusion of Local Networks ("LNs") from the BES. This exclusion will allow conversion of radial systems to LNs without compliance impact, and should be encouraged rather than discouraged as networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. The decision of whether to network radial systems should be made on the basis of costs and benefits to the retail customers served by those radials, and not on the basis of disparate regulatory treatment. Consumers will ultimately benefit from the path chosen by the SDT. Cowlitz believes that the word "transmission" does not add clarity to the Exclusion; simply stating "Elements" is sufficient. This will allow for a gradual acceptance that transmission is not defined by a certain voltage, but more a medium in which electrical power is efficiently transported from power resources to load centers where it is distributed. The old convention of transmission versus distribution no longer fits in the current regulatory environment, and as such should be retired. Cowlitz also believes that subparagraphs (a) and (b) are redundant; subparagraph (a) is duplicated by the limit in subparagraph (b) requiring no flow out of the LN. However, Cowlitz also believes that removing (a) will complicate FERC's acceptance of this exclusion. Therefore this should be addressed in Phase 2. Cowlitz is confused by the use of the term "non-retail generation" in subparagraph (a). From context,

Organization	Yes or No	Question 9 Comment
		we believe the SDT considers "non-retail generation" to mean generation that is not connected through a dedicated step-up transformer to voltages at or above 100 kV, is consumed by the retail customer's load, or consumed within the LN rather than being physically exported and sold to markets outside the LN. Cowlitz suggests that the SDT rewrite subparagraph (a) to read "Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3 and does not have any generation net power flow greater than 75 MVA across any single retail revenue metering point into an Element operated at or greater than 100 kV."
Response: The SDT considered the disposition of the word "transmission" in Exclusion E3, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element". The SDT agrees that the threshold(s) for generation throughout the BES definition should be addressed in Phase 2 of this effort; however, to satisfy the Commission's directives in Order 743 and 743-A in a timely fashion, it is necessary to use a generation threshold that is consistent with the in-force Statement of Compliance Registry Criteria. No change made. Non-retail generation is meant to be the generation on the system (supply) side of the retail meter. The SDT appreciates the suggested language change for item Exclusion E3.a. The SDT considered this language, and has determined that retention of the existing (non-retail) generation limit of 75 MVA is essential to meet the Commission's order in the first phase of Project 2010-17. No change made.		
National Grid	Yes	We agree with Exclusion E3 on local networks, however we suggest this clarification to the first sentence: A group of contiguous transmission Elements operated at or above 100kV but less than 300kV that distribute power to Load rather than transfer bulk power across the interconnected system under normal ("all-lines-in") configuration and conditions. We also suggest the following clarification to part c, so that the IROLs don't get overlooked: Not part of Flowgate, transfer path, or an Interconnected Reliability Operating Limit (IROL). The LN does not contain a monitored Facility of a permanent Flowgate in the Easter Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec

Organization	Yes or No	Question 9 Comment
		Interconnection, and is not a monitored Facility included in an IROL.
Response: The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made. The SDT believes it has adequately and concisely addressed the IROL characteristic with Exclusion E3.c. No change made.		
Pacific Northwest Generating Cooperative (PNGC) Raft River Rural Electric Cooperative (RAFT) West Oregon Electric Cooperative Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative	Yes	PNGC strongly supports the exclusion of Local Networks ("LNs") from the BES. The conversion of radial systems to local networks should be encouraged because networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. If the BES definition were to provide an exclusion for radials without providing a similar exclusion for LNs, however, it would discourage networking local distribution systems because of the significantly increased regulatory burdens faced by the local distribution utility if it elected to network its radial facilities. By placing radial systems and LNs on the same regulatory footing, the proposed definition will ensure that decisions about whether to network radial systems are made on the basis of costs and benefits to the retail customers served by those radials, and not on the basis of disparate regulatory treatment. Consumers would ultimately benefit.PNGC also supports specific refinements made to the LN exclusion by the SDT in the current draft of the BES definition. In particular, PNGC supports the clarification of the purposes of a LN. The current draft states that LNs connect at multiple points to "improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system." PNGC supports this change in language because it reflects the fundamental purposes of a LN and emphasizes one of the key distinctions between LNs and bulk transmission facilities, namely, that LNs are designed primarily to serve local retail load while bulk transmission facilities are designed primarily to move bulk power from a bulk source (generally either the point of interconnection of a wholesale generator or a the point of interconnection with another bulk transmission system) to one or more wholesale purchasers. PNGC believes further improvement of the language could be achieved with additional modifications and clarifications. With respect to the core language of Exclusion 3, we believe the language making

Organization	Yes or No	Question 9 Comment
(CCEC) Central Electric Cooperatve (CEC) Clearwater Power Company (CPC) Consumer's Power Inc. Douglas Electric Cooperative (DEC) Fall River Rural Electric Cooperative (FALL) Lane Electric Cooperative (LEC) Lincoln Electric Cooperative (LEC) Northern		a "group of contiguous transmission Elements operated at or above 100kV" the starting point for identifying a LN would be improved by deleting the term "transmission" from this phrase. This is so because LNs are not used for transmission and the use of the term "transmission Elements" is therefore both confusing and unnecessary. There would be no room for argument about what the SDT intended by including the word "transmission" if the word is deleted and the Exclusion applies to any "group of Elements operated at 100kV or above" that meets the remaining requirement of the Exclusion. Further, any definitional value that is added by using the term "transmission Elements" is accomplished by using that term in the core definition, and there is no reason to carry the term through in the Exclusions. PNGC also believes that subparagraphs (a) and (b) are redundant, because whatever protection is offered by the generation limit in subparagraph (a) is duplicated by the limit in subparagraph (b) requiring no flow out of the LN. We believe the SDT can eliminate subparagraph (a) of Exclusion 3 and simply rely on subparagraph (b) because if power only flows into the LN even if it interconnects more than 75 MVA of generation, the interconnected generation interconnected will have no significant interaction with the interconnected bulk transmission system. It will only interact with the LN. And, with the advent of distributed generation, it is easy to foresee a situation in which a large number of very small distributed generators are interconnected into a LN, so that the aggregate capacity of these generators exceeds 75 MVA. However, because the generators are small and dispersed and, under the criterion in subparagraph (b), would be wholly absorbed within the LN rather than transmitting power onto the interconnected grid, those generators would not have a material impact on the grid. We also suggest that subparagraph (b) of Exclusion 3 could be more clearly drafted. Subparagraph (b), as part of the requirement that power flow into a LN rather than out of it, includes this description: "The LN does not transfer energy originating outside the LN for delivery through the LN." We understand this language is intended to distinguish a LN from a link in the transmission system - power on a transmission link passes through the transmission link to a load located elsewhere, while power in a LN enters the LN and is consumed by retail load within the LN. While we agree with the concept proposed by the SDT, we believe the language would be clearer if it read: "The LN does not transfer energy originating outside the LN for delivery through the LN to loads located outside the LN." We believe the italicized language is necessary to distinguish between a transmission system, where power that originates outside a system is delivered through the system and passes through the

Organization	Yes or No	Question 9 Comment
Lights Inc. (NLI) Okanogan County Electric Cooperative (OCEC) Umatilla Electric Cooperative (UEC)		system to a sink located somewhere outside the system, from a LN, in which power originating outside the LN passes through the LN and is delivered to retail load within the LN. To put it another way, the italicized language helps distinguish a transmission system from an LN, in which the LN "transfers energy originating outside the LN for delivery through the LN to loads located within the LN." We also believe the language of subparagraph (a) of Exclusion 3 could be improved. Subparagraph (d) would make LNs part of the BES if they interconnect "non-retail generation greater than 75 MVA (gross nameplate rating)." For the reasons stated in our responses to Questions 3, 5 and 7, we urge the SDT to replace the reference to a hard 75 MVA threshold with the defined term "Qualifying Aggregate Generation Resources" or some equivalent. We are also uncertain what is meant by the use of the term "non-retail generation" in subparagraph (a). From context, we believe the SDT considers "non-retail generation" to be the equivalent of generation that is located behind the retail meter, usually but not always owned by the customer and used to serve the customer's own load. We therefore suggest that the SDT replace the term "non-retail generation" with "generation located behind the retail customer's meter." Similarly, we are unsure what is meant by the phrase "the LN and its underlying Elements." We believe the phrase "and its underlying Elements" could simply be deleted from the definition without loss of meaning. In the alternative, the SDT might consider using the phrase "the LN, including all Elements located on the distribution side of any Automatic Fault Interrupting Devices (or other points of demarcation) separating the LN from the bulk interstate transmission system." We believe this phrase more accurately reflects the SDT's intent, which appears to be that generation exceeding 75 MVA in aggregate capacity interconnected anywhere within the LN disqualifies that LN from being excluded from the BES under Exclusion 3. PNGC also believes that both subparagraphs (a) and (b) of Exclusion 3 could be safely eliminated as long as subparagraph (c) is retained. Subparagraph (c) makes a LN part of the BES if it is classified as a Flow Gate or Transfer Path. Flow Gates and Transfer Paths are, by definition, the key facilities that allow reliable transmission of bulk electric power on the interconnected grid. If a LN has not been identified as either a Flow Gate or a Transfer Path, it is unlikely the LN is necessary for the reliable

Organization	Yes or No	Question 9 Comment
		transmission of electricity on the interconnected bulk system. Apart from these specific improvements that we believe could be achieved by modifying the language of Exclusion 3, we believe the SDT may need to re-examine certain assumptions that appear to underlie the current draft. Specifically, subparagraph (a) suggests that if BES generation is embedded within a LN, the LN itself must also be BES. But two NERC bodies have already addressed similar questions and concluded there is no technical basis for such concerns. NERC's Standards Drafting Team for Project 2010-07 and its predecessor, the "GO-TO Task Force" were formed to address how the dedicated interconnection facilities linking a BES generator to high-voltage transmission facilities should be treated under the NERC standards. The GO-TO Team concluded that by complying with a handful of reliability standards, primarily related to vegetation management, reliable operation of the bulk interconnected system could be protected without unduly burdening the owners of such interconnection systems. Therefore, there is no reason, according to the GO-TO Team, that dedicated high-voltage interconnection facilities must be treated as "Transmission" and classified as part of the BES in order to make reliability standards effective. See Final Report from the NERC Ad Hoc Group for Generator Requirements at the Transmission Interface (Nov. 16, 2009) (paper written by the GO-TO Task Force). Similarly, the Project 2010-07 Team observed that interconnection facilities "are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system." White Paper Proposal for Information Comment, NERC Project 2010-07: Generator Requirements at the Transmission Interface, at 3 (March 2011). Requiring Generation Owners and Operators to comply with the same standards as BES Transmission Owners and Operators "would do little, if anything, to improve the reliability of the Bulk Electric System," especially "when compared to the operation of the equipment that actually produces electricity - the generation equipment itself." Id. We believe that interconnection of BES generators within a LN is analogous and that, based on the findings of the Project 2010-07 and GO-TO Teams, automatically classifying a LN as "BES" simply because a large generator is embedded in the LN will result in substantial overregulation and unnecessary expense with little gain for bulk system reliability. If anything, generation interconnected through a LN is less likely to produce material impacts on the interconnected bulk transmission system than the equivalent generator interconnected through a single dedicated line because an LN is

Organization	Yes or No	Question 9 Comment
		interconnected to the bulk system at several points, so that if one interconnection goes down, power can still flow from the BES generator to the bulk system on other interconnection points. Where a dedicated interconnection facility is involved, by contrast, if the interconnection line fails, the generator is unavailable to the interconnected bulk system. Similarly, we suggest that the SDT re-examine the assumptions underlying subparagraph (b), which seems to suggest that a local distribution system cannot be classified as a Local Network if power flows out of that system at any time, even if the amount is de minimis, the outward flow is only for a few hours, a year, or the outward flow occurs only in an extreme contingency. Accordingly, we suggest that the initial clause of subparagraph (b) be revised to read: "Except in unusual circumstances, power flows only into the LN." Finally, we note that the LN exclusion must not operate in any way as a substitution for the statutory prohibition on including "facilities used in the local distribution of electric energy" in the BES. Therefore, even with the LN exclusion, the SDT must retain this statutory language in the core definition of the BES, as discussed in our answer to Question One. If a certain piece of equipment is a "facility used in the local distribution of electric energy," then it is not part of the BES in the first instance, and so consideration of the LN Exclusion, or of any other Exclusion, any Inclusion, or any Exception, would be both unnecessary and uncalled for.
Response: The SDT considered the disposition of the word "transmission" in Exclusion E3, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element". The SDT continues to believe that it is necessary to establish a limit on the allowable quantity of generation that may be significant to the reliable operation of the surrounding interconnected transmission system. Please note that the issues surrounding the appropriate generation threshold, among other topics, will be taken up in Phase 2 of this BES definition effort. No change made. The intent of the SDT in structuring the language of Exclusion E3.b was to ensure two things: first that power flow is always in the direction from the BES toward the LN, and second that the LN is not used for "wheel-through" transactions. The suggestion in your comment places an unnecessary qualifier on the "wheel-through" whereby it would only apply if the transaction were serving "loads". The SDT believes this qualifier would inadvertently allow a wholesale transaction to be scheduled through the subject facilities, and this is contrary to the intent of the exclusion provision of Exclusion E3.b. Given the high degree of certainty and assurances regarding the high priority of the Phase 2 efforts on this Project 2010-17, for the purpose of completing the posting of the definition in the first		

Organization	Yes or No	Question 9 Comment
phase of the Project, the SDT believes that it is preferable to continue to use the specific value of 75 MVA within item Exclusion E3.a. No change made. Non-retail generation is meant to be the generation on the system (supply) side of the retail meter. The SDT believes that the existing phrase in Exclusion E3.a "and its underlying Elements" has sufficient clarity and meets the intent of the exclusion with brevity. No change made. The SDT acknowledges the work of Project 2010-07 "GO-TO" task force in identification of various NERC Standard requirements that would promote reliability of the generator-to-transmission interface. This Project 2010-17 SDT believes that the body of work in Project 2010-07 is most pertinent to generator lead-line facilities, rather than the looped and parallel-operated facilities contemplated in Exclusion E3, and therefore, the SDT finds it necessary to continue to require all of the characteristics of Exclusion E3 to be met in order to qualify for exclusion from the BES. No change made. The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made. The SDT has retained the statutory language "facilities used in the local distribution of electric energy" in the core definition section.		
Massachusetts Department of Public Utilities	Yes	The MA DPU generally supports this exclusion but believes it is too narrow. As noted in the response to question 7, Exclusion E3 should likely allow a higher level of aggregate generation MVA on a Local Network. In addition, local networks should not necessarily be ineligible for Exclusion E3 simply because an amount of power may transfer out of the network at times. NERC's draft technical network exclusions document should be amended such that local networks would be permitted to qualify for network exclusions under E3 if power flowing out of the network is minimal and would not likely adversely impact the BES.
Response: The SDT has determined that it must retain the 75 MVA threshold on generation allowed within a qualifying LN in order to remain consistent with the existing ERO Statement of Compliance Registry Criteria. There has not been sufficient technical justification to this point that would support a change from this threshold; however, such threshold will be considered in Phase 2 of		

Organization	Yes or No	Question 9 Comment
this Project 2010-17. No change made. The SDT feels strongly that in order for a network to qualify for exclusion under the Exclusion E3 section of the definition, there must be strict bounds and limits placed on the characteristics of the candidate facilities. Allowances for minor "out-flow" from the local network, or "minimal" flow, as suggested in this comment, will lead to an inconsistent application of the definition and therefore, a lack of bright-line quality in the definition. Situations such as what is proposed in this comment can be referred to the Exception Process for possible exclusion from the BES. No change made.		
The Dow Chemical Company	Yes	Dow is uncertain whether end user-owned, behind-the-meter delivery facilities of the sort it has described above would fall within the scope of the core BES definition proposed by NERC. To date, none of the Regional Entities has suggested that Dow should register as a Transmission Owner or Transmission Operator with respect to any of these Dow-owned delivery facilities. If a literal application of the proposed BES Definition would, because of their voltage level or for any other reason, include such facilities, then Dow has an interest in assuring that the E3 exclusion for "local network" facilities is structured to embrace them. To that end, Dow would propose, first, the elimination of the 300 Kv cap for these facilities. Dow has systems that operate above 300 Kv due solely to the capacity of the lines to supply power over the distance required at our large manufacturing sites. Second, for the same reasons discussed above (in response to question #7), the phrase "do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating)" in "a)" should be changed to "the net capacity provided to the transmission grid does not exceed 75 MVA." Third, the introductory phrase in "b)" -- "Power flows only into the LN" -- is inconsistent with the recognition in "a)" (as amended pursuant to Dow's above suggestion) that power may flow out of an LN and into the transmission grid if there is generation connected to the LN and the 75 MVA limit is observed. Dow recommends either deleting the introductory clause or correcting it to read "Power is not transferred through the LN."
Response: The SDT does not agree with the removal of the 300 kV cap that limits the qualification of a group of facilities for local network exclusion. The SDT feels that an upper bound is essential to prevent inappropriate exclusions of facilities that may be important to the reliable operation of the interconnected transmission system. The Exception Process is available for specific		

Organization	Yes or No	Question 9 Comment
circumstances where a 300kV cap is problematic. The SDT evaluated your comment in regard to Question 7 (Radial) as well as to the local network exclusion, and has concluded that both exclusions must necessarily be based on the gross aggregate nameplate of the generation connected within the candidate systems. The approach that is suggested in your comment could result in significant amounts of generation existing within the excluded area. It remains the intent of the SDT to uphold a 75 MVA limit on the connected (non-retail) generation within a qualifying LN and, at the same time, reinforcing that power flow is always from the BES toward the LN at all points of connection. We believe these characteristics are essential in order to ensure that qualifying LN facilities are not being relied upon for reliable operation of the interconnected transmission system.		
Springfield Utility Board	Yes	SUB strongly supports the exclusion of Local Networks from the BES. SUB particularly agrees with the addition of, "LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to customer Load and not to accommodate bulk power transfer across the interconnected system." language to the draft E3 Exclusion, as well as the LN characterization being more clearly defined.SUB is concerned that the E3 Exclusion does not specify that these power flows would be "under normal operating conditions" and specify if all power flow is considered. SUB recommends that unscheduled power flow should not be considered, but that it is applicable only to scheduled power flow. While SUB supports the exclusion of LNs from the BES, we believe there is additional work that needs to done regarding the Local Network Exclusion Technical Justification. Without specific parameters, determining inclusions and exclusions will be left to the discretion of too many. This will create ambiguity and inconsistency of application.
Response: The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made. The suggestion that only the "scheduled" portion of flow be considered under Exclusion E3.b would ignore the physical impact that the		

Organization	Yes or No	Question 9 Comment
candidate network has on the surrounding interconnected transmission system; therefore, the SDT must retain the provisions of Exclusion E3.b. However, the SDT has made a clarifying change to the exclusion language to address various comments that were received. **E3.b**: Power flows only into the LN~~:~~ and ~~T~~the LN does not transfer energy originating outside the LN for delivery through the LN; The SDT does not intend to perform additional work on the technical justification document at this time. It was not intended to have any specific thresholds or parameters from which exclusions would be granted; it merely illustrates the negligible effects that a sample local network has upon the flows in the surrounding transmission network. No change made.		
Michigan Public Power Agency Clallam County PUD No.1 Snohomish County PUD Kootenai Electric Cooperative	Yes	MPPA and its members strongly supports the categorical exclusion of Local Networks ("LNs") from the BES. We believe the exclusion is necessary to ensure that the BES definition complies with the statutory requirement, discussed in our response to Question 1, to exclude all facilities used in the local distribution of electric power. LNs are, of course, probably the most common form of local distribution facility. Further, the conversion of radial systems to local distribution networks should be encouraged because networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. If the BES definition were to provide an exclusion for radials without providing a similar exclusion for LNs, however, it would discourage networking local distribution systems because of the significantly increased regulatory burdens faced by the local distribution utility if it elected to network its radial facilities. By placing radial systems and LNs on the same regulatory footing, the proposed definition will ensure that decisions about whether to network radial systems are made on the basis of costs and benefits to the retail customers served by those radials, and not on the basis of disparate regulatory treatment. Consumers will ultimately benefit from the path chosen by the SDT.MPPA and its members also support specific refinements made to the LN exclusion by the SDT in the current draft of the BES definition. In particular, MPPA supports the clarification of the purposes of a LN. The current draft states that LNs connect at multiple points to "improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system." Snohomish supports this change in language because it reflects the fundamental purposes of a LN and emphasizes one of the key distinctions between LNs and bulk transmission facilities, namely, that LNs are designed primarily to serve local retail load while bulk transmission facilities are designed primarily to move bulk power from a bulk source (generally either

Organization	Yes or No	Question 9 Comment
		the point of interconnection of a wholesale generator or a the point of interconnection with another bulk transmission system) to one or more wholesale purchasers. MPPA believes further improvement of the language could be achieved with additional modifications and clarifications. With respect to the core language of Exclusion 3, we believe the language making a "group of contiguous transmission Elements operated at or above 100 kV" the starting point for identifying a LN would be improved by deleting the term "transmission" from this phrase. This is so because LNs are not used for transmission and the use of the term "transmission Elements" is therefore both confusing and unnecessary. There would be no room for argument about what the SDT intended by including the word "transmission" if the word is deleted and the Exclusion applies to any "group of Elements operated at 100 kV or above" that meets the remaining requirement of the Exclusion. Further, any definitional value that is added by using the term "transmission Elements" is accomplished by using that term in the core definition, and there is no reason to carry the term through in the Exclusions. MPPA also believes that subparagraphs (a) and (b) are redundant in the sense that whatever protection is offered by the generation limit in subparagraph (a) is duplicated by the limit in subparagraph (b) requiring no flow out of the LN. We believe the SDT can eliminate subparagraph (a) of Exclusion 3 and simply rely on subparagraph (b) because if power only flows into the LN even if it interconnects more than 75 MVA of generation, the interconnected generation interconnected will have no significant interaction with the interconnected bulk transmission system. It will only interact with the LN. And, with the advent of distributed generation, it is easy to foresee a situation in which a large number of very small distributed generators are interconnected into a LDN, so that the aggregate capacity of these generators exceeds 75 MVA. However, because the generators are small and dispersed and, under the criterion in subparagraph (b), would be wholly absorbed within the LN rather than transmitting power onto the interconnected grid, those generators would not have a material impact on the grid. We also suggest that subparagraph (b) of Exclusion 3 could be more clearly drafted. Subparagraph (b), as part of the requirement that power flow into a LN rather than out of it, includes this description: "The LN does not transfer energy originating outside the LN for delivery through the LN." We understand this language is intended to distinguish a LN from a link in the transmission system - power on a transmission link passes through the transmission link to a load located elsewhere, while power in a LN enters the LN and is consumed by retail load within the LN.

Organization	Yes or No	Question 9 Comment
		While we agree with the concept proposed by the SDT, we believe the language would be clearer if it read: "The LN does not transfer energy originating outside the LN for delivery through the LN to loads located outside the LN." We believe the italicized language is necessary to distinguish between a transmission system, where power that originates outside a system is delivered through the system and passes through the system to a sink located somewhere outside the system, from a LN, in which power originating outside the LN passes through the LN and is delivered to retail load within the LN. To put it another way, the italicized language helps distinguish a transmission system from an LN, in which the LN "transfers energy originating outside the LN for delivery through the LN to loads located within the LN." We also believe the language of subparagraph (a) of Exclusion 3 could be improved. Subparagraph (d) would make LNs part of the BES if they interconnect "non-retail generation greater than 75 MVA (gross nameplate rating)." For the reasons stated in our responses to Questions 3, 5 and 7, we urge the SDT to replace the reference to a hard 75 MVA threshold with the defined term "Qualifying Aggregate Generation Resources" or some equivalent. We are also uncertain what is meant by the use of the term "non-retail generation" in subparagraph (a). From context, we believe the SDT considers "non-retail generation" to mean generation that is used by retail customers located within a LN rather than being exported and sold on wholesale markets outside the LN. We therefore suggest that the SDT replace the phrase "non-retail generation" with the phrase "generation sold in wholesale markets and transmitted outside the LN." Similarly, we are unsure what is meant by the phrase "the LN and its underlying Elements." We believe the phrase "and its underlying Elements" could simply be deleted from the definition without loss of meaning. In the alternative, the SDT might consider using the phrase "the LN, including all Elements located on the distribution side of any Automatic Fault Interrupting Devices (or other points of demarcation) separating the LN from the bulk interstate transmission system." We believe this phrase more accurately reflects the SDT's intent, which appears to be that generation exceeding 75 MVA in aggregate capacity interconnected anywhere within the LN disqualifies that LN from being excluded from the BES under Exclusion 3. Finally, MPPA believes that both subparagraphs (a) and (b) of Exclusion 3 could be safely eliminated as long as subparagraph (c) is retained. Subparagraph (c) makes a LN part of the BES if it is classified as a Flow Gate or Transfer Path. Flow Gates and Transfer

Organization	Yes or No	Question 9 Comment
		Paths are, by definition, the key facilities that allow reliable transmission of bulk electric power on the interconnected grid. If a LN has not been identified as either a Flow Gate or a Transfer Path, it is unlikely the LN is necessary for the reliable transmission of electricity on the interconnected bulk system. Apart from these specific improvements that we believe could be achieved by modifying the language of Exclusion 3, we believe the SDT may need to re-examine certain assumptions that appear to underlie the current draft. Specifically, subparagraph (a) suggests that if BES generation is embedded within a LN, the LN itself must also be BES. But two NERC bodies have already addressed similar questions and concluded there is no technical basis for such concerns. NERC's Standards Drafting Team for Project 2010-07 and its predecessor, the "GO-TO Task Force" were formed to address how the dedicated interconnection facilities linking a BES generator to high-voltage transmission facilities should be treated under the NERC standards. The GO-TO Team concluded that by complying with a handful of reliability standards, primarily related to vegetation management, reliable operation of the bulk interconnected system could be protected without unduly burdening the owners of such interconnection systems. Therefore, there is no reason, according to the GO-TO Team, that dedicated high-voltage interconnection facilities must be treated as "Transmission" and classified as part of the BES in order to make reliability standards effective. See Final Report from the NERC Ad Hoc Group for Generator Requirements at the Transmission Interface (Nov. 16, 2009) (paper written by the GO-TO Task Force). Similarly, the Project 2010-07 Team observed that interconnection facilities "are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system." White Paper Proposal for Information Comment, NERC Project 2010-07: Generator Requirements at the Transmission Interface, at 3 (March 2011). Requiring Generation Owners and Operators to comply with the same standards as BES Transmission Owners and Operators "would do little, if anything, to improve the reliability of the Bulk Electric System," especially "when compared to the operation of the equipment that actually produces electricity - the generation equipment itself." Id. We believe that interconnection of BES generators within a LN is analogous and that, based on the findings of the Project 2010-07 and GO-TO Teams, automatically classifying a LN as "BES" simply because a large generator is embedded in the LN will result in substantial overregulation and

Organization	Yes or No	Question 9 Comment
		unnecessary expense with little gain for bulk system reliability. If anything, generation interconnected through a LN is less likely to produce material impacts on the interconnected bulk transmission system than the equivalent generator interconnected through a single dedicated line because an LN is interconnected to the bulk system at several points, so that if one interconnection goes down, power can still flow from the BES generator to the bulk system on other interconnection points. Where a dedicated interconnection facility is involved, by contrast, if the interconnection line fails, the generator is unavailable to the interconnected bulk system. Similarly, we suggest that the SDT re-examine the assumptions underlying subparagraph (b), which seems to suggest that a local distribution system cannot be classified as a Local Network if power flows out of that system at any time, even if the amount is de minimis, the outward flow is only for a few hours a year, or the outward flow occurs only in an extreme contingency. Accordingly, we suggest that the initial clause of subparagraph (b) be revised to read: "Except in unusual circumstances, power flows only into the LN."

Response: The SDT considered the disposition of the word "transmission" in Exclusion E3, and determined that retention of this word – in lower-case – is necessary to modify the word "Element". This is meant to eliminate the generation that would otherwise be included in the term "Element".

The SDT continues to believe that it is necessary to establish a limit on the allowable quantity of generation that may be significant to the reliable operation of the surrounding interconnected transmission system. Please note that the issues surrounding the appropriate generation threshold, among other topics, will be taken up in Phase 2 of this BES definition effort. No change made.

The intent of the SDT in structuring the language of Exclusion E3.b was to ensure two things: first that power flow is always in the direction from the BES toward the LN, and second that the LN is not used for "wheel-through" transactions. The suggestion in your comment places an unnecessary qualifier on the "wheel-through" whereby it would only apply if the transaction were serving "loads". The SDT believes this qualifier would inadvertently allow a wholesale transaction to be scheduled through the subject facilities, and this is contrary to the intent of Exclusion E3.b. Given the high degree of certainty and assurances regarding the high priority of the Phase 2 efforts on Project 2010-17, for the purpose of completing the posting of the definition in the first phase of the Project, the SDT believes that it is preferable to continue to use the specific value of 75 MVA within ExclusionE3.a. No change made.

Non-retail generation is meant to be the generation on the system (supply) side of the retail meter.

The SDT believes that the existing phrase in ExclusionE3.a "and its underlying Elements" has sufficient clarity and meets the intent of

Organization	Yes or No	Question 9 Comment
the exclusion with brevity. No change made. The SDT acknowledges the work of the Project 2010-07 "GO-TO" task force in identification of various NERC Reliability Standard requirements that would promote reliability of the generator-to-transmission interface. The Project 2010-17 SDT believes that the body of work in Project 2010-07 is most pertinent to generator lead-line facilities, rather than the looped and parallel-operated facilities contemplated in the Exclusion E3, and therefore, the SDT finds it necessary to continue to require all of the characteristics of Exclusion E3 to be met in order to qualify for exclusion from the BES. No change made. The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made.		
NESCOE	Yes	NESCOE generally supports this exclusion but believes it is too narrow. As noted in the response to question 7, Exclusion E3 should allow a higher level of aggregate generation MVA on a Local Network (at least 300 MVA). In addition, NESCOE believes that local networks should not necessarily be ineligible for Exclusion E3 simply because an amount of power may transfer out of the network at times. NERC's draft technical network exclusions document should be amended such that local networks would be permitted to qualify for network exclusions under E3 if power flowing out of the network is minimal and would not likely adversely impact the BES. For example, transfers of less than or equal to 100 MVA should not have any adverse impact on the BES. The draft technical network exclusions document should be amended to state that transfers of 100 MVA MVA into the BES from the local distribution network are acceptable. The 100 MVA limit suggested here represents 25% of the rated value of a typical 345/115 substation (typically on the order of 400 MVA). Rarely does more than a fraction of the rated MVA flow from the low voltage side to the high voltage side. An allowance of 100 MVA represents a flow level will have no significant impact to the interconnected bulk power network.
Response: The SDT feels strongly that in order for a network to qualify for exclusion under the Exclusion E3 section of the definition, there must be strict bounds and limits placed on the characteristics of the candidate facilities. Allowances for minor "out-flow" from the local network, or "minimal" flow, as suggested in this comment, will lead to an inconsistent application of the definition and therefore, a lack of bright-line quality in the definition. Situations such as what is proposed in this comment can be referred to the		

Organization	Yes or No	Question 9 Comment
Exception Process for possible exclusion from the BES. No change made.		
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative	Yes	We would agree in principle with the LN exclusion if the wording of the exclusion includes the following phrase (in italics) added at the end of E3 b): Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN "under normal operating conditions". Also, the correct BES threshold level should be 200 kV rather than 100 kV. Finally, the nomenclature of Flowgate (FG) components appears to be confused. AECI believes E3 c) should be changed to read "contingent Facility" rather than "monitored Facility". Although unspecified within the NERC Glossary, we believe FG monitored Facilities are typically the impacted facilities in danger of overload, while the contingent facilities are those which, if lost, would cause the monitored Facility to become overloaded. As currently written, a formerly qualified LN could later become disqualified due to an external entity's ill-designing a parallel EHV line, thereby causing one or more potential (N-1) overloaded Facility within that LN. Further, operational FG loading conditions are often relieved by opening-up LN elements near the monitored Facility, with little impact upon BES reliability, yet with lesser reliability to the underlying LN loads. This implies that the monitored elements of Flowgates are typically non-essential to the BES reliability. AECI can support "contingent" FG Facilities disqualifying a LN claim, but it cannot support "monitored" Facilities as disqualifying factors for rejecting a LN claim.
Response: The SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made. The SDT appreciates the suggestion of an alternate BES threshold level of 200 kV rather than 100 kV; however, in the absence of a strong technical justification, the SDT must retain the 100 kV threshold in the core definition. No change is being made at this time		

Organization	Yes or No	Question 9 Comment
but all threshold values will be examined in Phase 2. The SDT continues to believe that “monitored” is the most appropriate modifier of “Flowgate” in the text of Exclusion E3.c. Exclusion E3.c is intended to identify the elements that are part of these Flowgates, not necessarily those whose contingency can affect the Flowgate. The elements comprising Flowgates (and major transfer paths in the West) must continue to be prohibited from exclusion via Exclusion E3.c, since these facilities are more likely to be used in the transfer of bulk power than not; therefore, they are more characteristic of serving an interconnected transmission function than distribution. No change made.		
Southern Company Generation	Yes	What does the term "non-retail generation" mean? Can the term "non-retail generation" in E3a be changed to simply "generation."
Response: Non-retail generation is meant to be the generation on the system (supply) side of the retail meter. The SDT has intentionally utilized the term “non-retail generation” in Exclusion E3.a in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier “non-retail” would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.		
Electricity Consumers Resource Council (ELCON)	Yes	This Exclusion and Exclusion E1 aid in the delineation of local distribution versus transmission. We suggest three clarifying revisions. First, the phase “but less than 300 kV” should be deleted. Many large industrial facilities have on-site distribution systems that operate above 300 kV due solely to the capacity of the lines to supply power over the distance required at the manufacturing sites. Second, for the same reasons discussed above (in response to question #7), the phrase “do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating)” in “a)” should be changed to “the net capacity provided to the transmission grid does not exceed 75 MVA.” Third, the introductory phrase in “b)” -- “Power flows only into the LN” -- is inconsistent with the recognition in “a)” that power may flow out of an LN and into the transmission grid if there is generation connected to the LN and the 75 MVA limit is observed. We recommend either deleting the introductory clause or correcting it to read “Power is not transferred through the LN.”
Response: The SDT does not agree with the removal of the 300 kV cap that limits the qualification of a group of facilities for local		

Organization	Yes or No	Question 9 Comment
		network exclusion. The SDT feels that an upper bound is essential to prevent inappropriate exclusions of facilities that may be important to the reliable operation of the interconnected transmission system. The Exception Process is available for specific circumstances where a 300 kV cap is problematic. No change made. The SDT evaluated your comment in regard to Question 7 as well as to the local network exclusion, and has concluded that both exclusions must necessarily be based on the gross aggregate nameplate of the generation connected within the candidate systems. The approach that is suggested in your comment could result in significant amounts of generation existing within the excluded area. No change made. It remains the intent of the SDT to uphold a 75 MVA limit on the connected (non-retail) generation within a qualifying LN and, at the same time, reinforcing that power flow is always from the BES toward the LN at all points of connection. The SDT believes these characteristics are essential in order to ensure that qualifying LN facilities are not being relied upon for reliable operation of the interconnected transmission system. However, the SDT has clarified Exclusion E3.b in response to industry comments: **E3.b**: Power flows only into the LN~~:~~ and ~~T~~the LN does not transfer energy originating outside the LN for delivery through the LN;
Transmission Access Policy Study Group	Yes	TAPS supports the exclusion of Local Networks from the BES. Such systems are generally not "necessary for operating an interconnected electric transmission network," the standard in Orders 743 and 743-A. We have several suggestions to clarify the proposed language for this Exclusion. TAPS' comments in response to Question 7 above regarding "points of connection at 100kV or higher" and "non-retail generation" are applicable to Exclusion E3 as well. The term "bulk power," which occurs twice in Exclusion E3, is vague and could be read incorrectly as a reference to the statutorily-defined "bulk-power system," which is not, we think, the SDT's intent. The word "bulk" should be deleted, so that the Exclusion simply refers to transferring "power" across the interconnected system. TAPS raised this concern in response to the last posting of the BES Definition. In response, the SDT removed some instances of "bulk power" but left the remaining two, stating that "the SDT believes it provides conceptual value to the exclusion principle." The SDT does not state what conceptual value the term is intended to provide; on the assumption that it relates to a distinction between transferring power from local generation to serve local load, and transferring power over longer distances, TAPS suggests, as an alternative to simply deleting the word "bulk," that the Exclusion be revised to refer to "transfers of power from non-LN generation to non-LN load."Exclusion E3(c) states: "Power flows only into the LN: The LN does not transfer energy

Organization	Yes or No	Question 9 Comment
		originating outside the LN for delivery through the LN." This statement is unclear because the two parts mean different things. TAPS proposes rewriting this sentence to state: "Power flows only into the LN, that is, at each individual connection at 100 kV or higher, the pre-contingency flow of power is from outside the LN into the LN for all hours of the previous 2 years" to help clarify the intent. Two years is suggested because it is the time period set out in the draft exception application form for which an applicant should state whether power flows through an Element to the BES.
Response: See response to Q7. The SDT prefers to continue the use of the word "bulk" in the core paragraph of Exclusion E3. The SDT believes this clarifies an important conceptual idea to the industry, and the term "bulk" is not intended to be definitional in this context. This paragraph merely provides an introduction to the concept of the local network, and retaining the term "bulk" conveys the concept effectively. The lettered sub-items under the core paragraph are the prescriptive and precise characteristics that the industry will use to determine qualification for exclusion under Exclusion E3. No change made. The SDT prefers not to add demonstration criteria, such as the suggestion to provide a minimum of 2 years worth of data, within the text of the BES definition. The SDT believes the language, particularly the word "always" adds sufficient clarity. No change made.		
Florida Municipal Power Agency	Yes	: FMPA supports the exclusion of Local Networks from the BES. Such systems are generally not "necessary for operating an interconnected electric transmission network," the standard in Orders 743 and 743-A. However, we have several suggestions to clarify the proposed language for this Exclusion. Exclusion E3(c) states: "Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN." This statement is unclear because the two parts mean different things. FMPA proposes rewriting this sentence to state: "Power flows only into the LN, that is, at each individual connection at 100 kV or higher, the pre-contingency flow of power is from outside the LN into the LN for all hours of the previous 2 years" to help clarify the intent. Two years is suggested because it is the time period set out in the draft exception application form for which an applicant should state whether power flows through an Element to the BES. FMPA' comments in response to Question 7 above regarding "points of connection at 100kV or higher" and "non-retail generation" are applicable to Exclusion E3 as well. The term "bulk power," which occurs twice in Exclusion E3, is vague and could be read incorrectly as a

Organization	Yes or No	Question 9 Comment
		reference to the statutorily-defined "bulk-power system," which is not, we think, the SDT's intent. The word "bulk" should be deleted, so that the Exclusion simply refers to transferring "power" across the interconnected system. FMPA raised this concern in response to the last posting of the BES Definition. In response, the SDT removed some instances of "bulk power" but left the remaining two, stating that "the SDT believes it provides conceptual value to the exclusion principle." The SDT does not state what conceptual value the term is intended to provide; on the assumption that it relates to a distinction between transferring power from local generation to serve local load, and transferring power over longer distances, FMPA suggests, as an alternative to simply deleting the word "bulk," that the Exclusion be revised to refer to "transfers of power from non-LN generation to non-LN load."
Response: Exclusion E3.b was intended to be a combination of two similar properties when it was drafted for the second posting of the BES definition. The SDT has received a number of comments indicating that these are two separate and distinct concepts, and has revised Exclusion E3.b to provide more clarity. **E3.b**: Power flows only into the LN~~:~~ and ~~T~~the LN does not transfer energy originating outside the LN for delivery through the LN; The SDT prefers not to add demonstration criteria, such as the suggestion to provide a minimum of 2 years worth of data, within the text of the BES definition. The SDT believes the language, particularly the word "always" adds sufficient clarity. No change made. See response to Q7. The SDT prefers to continue the use of the word "bulk" in the core paragraph of Exclusion E3. The SDT believes this clarifies an important conceptual idea to the industry, and the term "bulk" is not intended to be definitional in this context. This paragraph merely provides an introduction to the concept of the local network, and retaining the term "bulk" conveys the concept effectively. The lettered sub-items under the core paragraph are the prescriptive and precise characteristics that the industry will use to determine qualification for exclusion under Exclusion E3. No change made.		
SERC Planning Standards Subcommittee	Yes	The term "non-retail generation" in E3a should be changed to simply "generation."
Response: The SDT has intentionally utilized the term "non-retail generation" in Exclusion E3.a in order to specifically isolate that		

Organization	Yes or No	Question 9 Comment
generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier "non-retail" would cause candidate local networks with retail generation from obtaining this exclusion. No change made.		
Balancing Authority Northern California	Yes	It is preferred to hold reference to gross nameplate rating/threshold values until generation technical justification is completed as part of Phase 2; these studies should apply to any real or reactive power threshold reference. For Exclusion E3-b using the phrase "[p]ower flows only into the LN" is too restrictive. An allowable MW threshold of LN power producing resources should be deferred to the Phase 2 BES technical analysis. Where no generation is present in the LN, it is recommended that an allowance for residual flow through the LN.
Response: The SDT agrees that the threshold(s) for generation throughout the BES definition should be addressed in Phase 2 of this effort; however, to satisfy the Commission's directives in Order 743 and 743-A in a timely fashion, it is necessary to use a generation threshold that is consistent with the in-force Statement of Compliance Registry Criteria. No change made. The SDT feels strongly that in order for a local network to qualify for exclusion under the Exclusion E3 section of the definition, there must be strict bounds and limits placed on the characteristics of the candidate facilities. Allowances for minor "out-flow" from the local network, or "minimal" flow, as suggested in this comment, will lead to an inconsistent application of the definition and therefore, a lack of bright-line quality in the definition. Situations such as what is proposed in this comment can be referred to the Exception Process for possible exclusion from the BES. No change made.

10. The SDT has added specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E4 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices. The comments received identified overwhelming support of Exclusion E4 as written.

Some commenters questioned the use of the word 'retail' in Exclusion E4. The SDT determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the Load side of a customer meter) and would otherwise be included via the core definition and/or Inclusion I5.

Other commenters proposed adding the same threshold qualification language contained in other exclusions. Using a threshold for inclusion of non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

No changes were made to the definition as a result of these comments.

Organization	Yes or No	Question 10 Comment
Westar Energy	No	This particular Exclusion doesn't address the qualifier as to the impact to the BES. We believe the qualification language in E2, in regards to behind the meter generation, should also be included in Exclusion E4 for clarification purposes.

Organization	Yes or No	Question 10 Comment
Southwest Power Pool Standards Review Team	No	This particular Exclusion doesn't address the qualifier as to the impact to the BES. We request that it emulate the language provided for E2 (behind the meter gen) and classified for this specific exclusion.
Response: Using a threshold for inclusion of non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
ISO New England Inc	No	The term "retail customer" is unclear and will lead to confusion. This exclusion should be removed as there are many instances where a generator may be using the reactive power device to meet other interconnection requirements and the reactive device should be held to the same BES requirements as the generator.
Response: The SDT team considered the disposition of the word "retail" in the context of E4, and determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter). No change made. Exclusion E4 is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter) and would otherwise be included via the core definition and/or Inclusion I5. No change made.		
Central Maine Power Company	No	Consider using other wording to replace "retail"

Organization	Yes or No	Question 10 Comment
Response: The SDT team considered the disposition of the word “retail” in the context of E4, and determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter). No change made.		
Metropolitan Water District of Southern California	No	Exclusion 4 appears to limit the devices just to retail customers. However, any end-user load, including wholesale or retail, should be included. NERC's Glossary of Terms uses the phrase "end-use customer", not retail customers to describe loads. MWDSC recommends that Exclusion 4 be changed as follows: E4 - Reactive Power devices owned and operated by an end-use customer solely for its own use.
Response: The SDT team considered the disposition of the word “retail” in the context of E4, and determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter). No change made.		
The Dow Chemical Company	No	The term “solely” should be replaced by the term “primarily”. All devices to control Reactive power behind-the-meter arguably provide some benefit to the transmission grid.
Response: The SDT does not believe these changes provide additional clarity. No change made.		
LCRA Transmission Services Corporation	No	This exclusion conflicts with inclusion item I5. Which one takes priority?
Response: The application of the draft ‘bright-line’ BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES ‘core’ definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the ‘core’ definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the ‘core’ definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: “Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit		

Organization	Yes or No	Question 10 Comment
breaker, bus section, or transmission line. An element may be comprised of one or more components. “ Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the ‘core’ definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer’s side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
Ameren	No	a)Reactive Power devices connected 100 kV and above applied for the purpose of voltage support to local load and/or local area network should also be excluded.
Response: Reactive Power devices connected at 100kV and above are included in the core definition. Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner.		

Organization	Yes or No	Question 10 Comment
The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element as defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind-the-retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		

Organization	Yes or No	Question 10 Comment
An entity can always request an exception through the Exception Process. No change made.		
Tillamook PUD	No	Any device that might be excluded under E4 has already been included per I5. Unless I5 is removed, or rewritten as suggested above; this exclusion will exclude nothing.
Central Lincoln	No	Please see Central Lincoln's answers to Q1 and Q6. Any device that might be excluded under E4 has already been included per I5. Unless I5 is removed, or rewritten as suggested above; this exclusion will exclude nothing.
Northern Wasco County PUD	No	Please see Northern Wasco County PUD's answers to Q1 and Q6. Any device that might be excluded under E4 has already been included per I5. Unless I5 is removed, or rewritten as suggested above; this exclusion will exclude nothing.

Response: Please see responses to Q1 and Q6.

The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element as defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion

Organization	Yes or No	Question 10 Comment
language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind-the-retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices. No change made.		
Northeast Power Coordinating Council	No	Consider using other wording to replace "retail". The statement "owned or operated by the retail customer" is confusing and arguably inaccurate and should be revised. Refer to comments related to reactive resources for Question 6 regarding Inclusion I5. Retail and non-retail generation should be defined.
Response: The SDT team considered the disposition of the word "retail" in the context of E4, and determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter). No change made. Non-retail generation is meant to be the generation on the system (supply) side of the retail meter.		
American Electric Power	No	Does this refer to distribution level or reactive power resources? If so, it would appear these are not included as part of I5. Or instead, does this refer to customer equipment at BES voltages? If it is the latter, we recommend E4 be reworded to state "Reactive

Organization	Yes or No	Question 10 Comment
		Power devices that meet the Inclusion criteria of I5 that are owned and operated by the retail customer solely for its own use..."

Response: Distribution devices are not included.

The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.

Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2.

Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.

In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the

Organization	Yes or No	Question 10 Comment
interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative	Yes	Ownership is irrelevant, so "owned and operated by the retail customer solely for its own use", should be replaced by "owned and operated solely in conjunction with specific industrial customer loads."
Response: The SDT does not believe this change provides additional clarity. No change made.		
NESCOE	Yes	While we are generally supportive of this exclusion, the term "retail" needs to be clarified (i.e., are retail customers of all sizes intended to be excluded?).
Massachusetts Department of Public Utilities	Yes	While we are generally supportive of this exclusion, the term "retail" needs to be clarified (i.e., are retail customers of all sizes intended to be excluded?).
Response: The SDT reviewed your comment and believes that 'retail' is the correct terminology. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter. No change made. Using a threshold for non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort.		
Long Island Power Authority	Yes	Exclusion should identify a maximum value.
Response: Using a threshold for non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort. No change made.		

Organization	Yes or No	Question 10 Comment
ExxonMobil Research and Engineering	Yes	The BES SDT should work on clarifying the differences between Inclusion I5 and Exclusion E4. The phrase "solely for its own use" in Exclusion E4 is vague and open to interpretation. It is unclear whether equipment, such as power factor correction facilities, surge capacitors located in motor terminal boxes and excitation capacitors installed for use by a motor located on the low side of a 138 kV primary transformer would be excluded from the BES.

Response: It is the intent of the SDT that distribution devises are not included in the BES.

The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element as defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion

Organization	Yes or No	Question 10 Comment
I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind-the-retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. No change made.		
Springfield Utility Board	Yes	Reactive power devices used to serve radial networks or Local Networks are often owned and operated by the registered entity (not the "retail customer") to address Area Network - wide reactive power issues. This language should read:"E4. Reactive power devices that are within a radial system excluded under E1 or within a local network excluded under E3" If the current draft language is left as it is, there will likely be a lot of unnecessary paperwork to exclude reactive power devices within radial system or local networks from the BES through the exclusion process. SUB suggests that the language in the E4 Exclusion be consistent with that in the I5 Inclusion.
Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "		

Organization	Yes or No	Question 10 Comment
Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.

11. Are there any other concerns with this definition that haven't been covered in previous questions and comments remembering that the exception criteria are posted separately for comment?

Summary Consideration: Comments received for Question 11 were mostly re-statements of comments expressed in the previous questions. No changes were made to the core definition or Inclusions or Exclusions based solely on question 11 comments. However, changes were made to the Implementation Plan to clarify the compliance obligation date of the revised definition as shown below.

Some commenters have expressed frustration over the lack of high level guidance for the exception process. The SDT understands the concerns raised by the commenters in not receiving hard and fast guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments.

There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn't been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel, not to make the final determination. The Regional Entity plays no role in actually approving or rejecting the submittal. It simply acts as an intermediary. One can counter that this places the Regional Entity in a position to effectively block a submittal by being arbitrary as to what information needs to be supplied. In addition, the SDT believes that the visibility of the process would belie such an action by the Regional Entity and also believes that one has to have faith in the integrity of the Regional Entity in such a process. Moreover, Appendix 5C of the proposed NERC Rules of Procedure, Sections 5.1.5, 5.3, and 5.2.4, provide an added level of protection requiring an independent Technical Review Panel assessment where a Regional Entity decides to reject or disapprove an exception request. This panel's findings become part of the exception request record submitted to NERC. Appendix 5C of the proposed NERC Rules of Procedure, Section 7.0, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request. On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that the explicit types of studies to be provided and how to interpret the information aren't shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn't been handled before by

either party and there is a great deal of professional experience involved on both the submitter's and the Regional Entity's side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication.

Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result ofa sudden disturbance, including a cyber security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal.

Some commenters have asked whether a single 'yes' or 'no' response to an item on the exception request form will mandate a negative response to the request. To that item, the SDT refers commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.2 of the proposed Rules of Procedure that states "No single piece of evidence provided as part of an Exception Request or response to a question will be solely dispositive in the determination of whether an Exception Request shall be approved or disapproved."

The SDT would like to point out several changes made to the specific items in the form that were made in response to industry comments. The SDT believes that these clarifications will make the process tighter and easier to follow and improve the quality of the submittals.

Finally, the SDT would point to the draft SAR for Phase 2 of this project that calls for a review of the process after 12 months of experience. The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase 1 of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem. The SDT asks the commenter to consider all of these facts in making your decision and casting your ballot and hopes that these changes will result in a favorable outcome.

Some comments were received about the lack of a cost benefit analysis with regard to revision to the definition. The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.

Several comments were received questioning how to apply the definition with the inclusions and exclusions. The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.

Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2.

Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.

In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.

Finally, there were comments on the lack of a technical basis for the threshold values employed in the definition. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

Implementation Plan - Compliance obligations for all newly identified Elements included by the definition shall begin 24 months after the applicable effective date of the definition.

Organization	Yes or No	Question 11 Comment
SERC OC Standards Review Group	Yes	The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. The SERC OC standards Review Group is concerned how this revised definition will impact entity registration, i.e., how will the revised definition be integrated into the Compliance Registry Criteria. The implementation plan should include how the integration is going to occur. The Rules of Procedure exception process should be further defined or referenced in this definition."The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review Group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."
Southern Company	Yes	The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. Southern Companies are concerned how this revised definition will impact entity registration, i.e., how will the revised definition be integrated into the Compliance Registry Criteria. The implementation plan should include how the integration is going to occur. The Rules of Procedure exception process should be further defined or referenced in this definition.

Response: The revised definition of Bulk Electric System will be applied in the same manner as it is today. This is based on language contained in FERC Order No. 693, which states: "…the Commission will rely on the NERC definition of bulk electric system and NERC's registration process to provide as much certainty as possible regarding the applicability to and the responsibility of specific entities to comply with the Reliability Standards in the start-up phase of a mandatory Reliability Standard regime". As the SDT progresses through Phase 2 of the project, it is envisioned that the technical aspects contained in the definition and in the ERO Statement of Compliance Registry will be merged and ultimately incorporated into the definition of the Bulk Electric System. At that time the ERO Statement of Compliance Registry Criteria will be revised to point to the BES definition for the technical aspects in regards to BES Elements. No change made.

The Rules of Procedure exception process is referenced in the current draft version of the BES definition in a note which states: "Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process". No change made.

Organization	Yes or No	Question 11 Comment
Northeast Power Coordinating Council	Yes	Technical bases have not been provided for the proposed definition of the BES. Additionally, the cost impacts have not been assessed and weighed against thepotential benefits of this proposal. There is confusion arising from the construction and interactions of the Inclusion, and Exclusion sections. System diagrams, put in a separate guidance document, would help in understanding. The situation of using Exceptions to understand Exclusions must be avoided. Suggest consider incorporating Inclusions directly, and leave the Exclusions as is format wise. The Implementation period discusses a 24 month timeframe (the Order suggests 18) from when the standard becomes effective to begin Compliance obligations. If construction is required to become compliant or meet performance requirements with standards, or CIP Version 5 standards increase the amount of BES assets this will be insufficient when considering budgeting, designing, siting requirements, and permitting. Concern exists over the paradigm that the definition should “mirror” the NERC Compliance Registry Criteria regarding who is registered. Some RSC members believe the definition should drive any changes to the registry criteria and not the criteria perpetuating the thresholds in the definition. However, there is a need to confirm that Phase 2 of this project will address this. The Inclusions and Exclusions listed need clarifications and perhaps diagrams and accompanying guidelines to clarify and explain the intent.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These		

Organization	Yes or No	Question 11 Comment
		and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The technical aspects of the definition have remained identical to the current definition and identical to the application of the ERO Statement of Compliance Registry Criteria and therefore do not require a technical justification to support maintaining the status-quo. The SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission. The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit

Organization	Yes or No	Question 11 Comment
		breaker, bus section, or transmission line. An element may be comprised of one or more components. “ Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the ‘core’ definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer’s side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. The development of a guidance document which contains generic diagrams is a portion of the overall project that the SDT feels is necessary to ensure the consistent application of the BES definition going forward. Therefore the SDT has determined that such a document will be developed during Phase 2 of the project. The SDT agrees that a potential reformatting of the definition (core, Inclusions and Exclusions) would improve the understanding of the application of the definition. However, these types of changes would require a significant amount of revisions to the current draft and could be seen as substantive in nature and prevent the SDT from moving forward with a recirculation ballot. This scenario would require a successive ballot which would place the project schedule in jeopardy of achieving a successful filing by January 25, 2012. The

Organization	Yes or No	Question 11 Comment
SDT will be exploring the reformatting of the definition (core, Inclusions and Exclusions) during Phase 2 of the project. In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity. Phase 1 of the project, as explained above, is addressing Commission directives established in Order No. 743 within a relatively short time period. The SDT has decided to maintain the status quo with respect to applicability and the technical aspects contained in the ERO Statement of Compliance Registry Criteria as the prudent path to take to ensure a successful conclusion to Phase 1 of the project. The status quo was established in FERC Order No. 693, which states: "…the Commission will rely on the NERC definition of bulk electric system and NERC's registration process to provide as much certainty as possible regarding the applicability to and the responsibility of specific entities to comply with the Reliability Standards in the start-up phase of a mandatory Reliability Standard regime". As the SDT progresses through Phase 2 of the project, it is envisioned that the technical aspects contained in the definition and in the ERO Statement of Compliance Registry will be merged and ultimately incorporated into the definition of the Bulk Electric System. At which time the ERO Statement of Compliance Registry Criteria will be revised to point to the BES definition for the technical aspects in regards to BES Elements.		
Westar Energy	Yes	We believe a reference should be made to the ROP changes which also provide a mechanism whereby Elements may be excluded or included in the BES. Without that reference, the proposed definition is not all inclusive of all means for exclusions or inclusions. We would suggest the definition be expanded to say "Unless modified by the lists shown below or as provided by Appendix 5C of the NERC Rules of Procedure, all Transmission..." This comment was submitted in response to the original posting and the response received was that it was inadvertently left out and that it would be placed back in, but we don't see the reference in this draft of the definition.
Southwest Power Pool Standards Review Team	Yes	A reference needs to be made to the ROP changes which also provide a mechanism whereby Elements may be excluded/included in the BES. Without that reference the proposed definition does not completely include all means for exceptions/inclusions.

Organization	Yes or No	Question 11 Comment
		We would suggest the definition be expanded to say '...modified by the list shown below or as provided by Appendix 5C of the NERC Rules of Procedure. We submitted this in the original posting and the response received was that it was inadvertently left out and that it would be placed back in. We don't see the reference in this draft of the definition.
Response: The Rules of Procedure exception process is referenced in the current draft version of the BES definition in a note which states: "Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process". No change made.		
WECC Staff	Yes	Following are additional comments not covered in previous questions: o Under the section "Effective Dates": There may be confusion with the statement "Compliance Obligations for Elements included by definition shall begin 24 months after the applicable effective data of the definition." The phrase "included by definition" can be interpreted broadly. o WECC notes that a generation threshold of 75MVA is specified in Exclusions E1, E2, and E3. WECC believes that generation thresholds for Exclusions should be addressed in Phase 2 when generation thresholds for Inclusions are being considered.
Response: The complete statement from the Implementation Plan states: "Compliance obligations for all newly identified Elements included by the definition shall begin 24 months after the applicable effective date of the definition." The SDT's intent with this language is to identify newly identified BES Elements based on the revised definition. In other words, Elements that were not considered to be BES Elements based on the exiting definition of BES in the NERC Glossary of Terms, but are now included as a result of revising the exiting definition. The Implementation Plan has been clarified as shown: **Implementation Plan** - Compliance obligations for all newly identified Elements included by the definition shall begin 24 months after the applicable effective date of the definition. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a		

Organization	Yes or No	Question 11 Comment
change from the current values that exist through the application of the definition today. Phase 1 of the project is addressing Commission directives established in Order No. 743 within a relatively short time period. Therefore the decision to maintain the status quo as far as application of the definition and the technical aspects contained in the ERO Statement of Compliance Registry Criteria is the prudent path to take to ensure a successful conclusion to Phase 1 of the project. The status quo was established in FERC Order No. 693, which states: "…the Commission will rely on the NERC definition of bulk electric system and NERC's registration process to provide as much certainty as possible regarding the applicability to and the responsibility of specific entities to comply with the Reliability Standards in the start-up phase of a mandatory Reliability Standard regime". These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
ExxonMobil Research and Engineering	Yes	It would be worthwhile to explain the relationship (timeline) between the BES Definition implementation plan and the compliance implementation plan proposed in the BES RoP team's new Appendix 5C for the NERC Rules of Procedure.
Texas RE NERC Standards Subcommittee	Yes	It might be worthwhile to explain the relationship (timeline) between the BES Definition implementation plan and the compliance implementation plan proposed in the BES RoP team's new Appendix 5C for the NERC Rules of Procedure.
Response: For a newly identified Element(s) under the revised BES definition, the time period to be in full compliance with all applicable Reliability Standards is 24 months from the effective date of the definition. If the entity wishes to file for an exception of a newly identified Element(s) under the revised BES definition through the Rules of Procedure Exception Process, the entity will have 12 months from the effective date of the revised BES definition in which to file such a request. If the exception request is rejected or disapproved and the classification of the Element(s) remains as a BES Element, the Regional Entity and the owner of such a BES Element(s) shall agree to an Implementation Plan for full compliance obligations, which will establish an implementation date no earlier than the date established by the definition Implementation Plan (24 months from the effective date of the definition).		
Dominion	Yes	As a general policy, Dominion believes that attempting to precisely refine the definition of the BES may not be the best way to insure BES reliability. Instead,

Organization	Yes or No	Question 11 Comment
		industry effort should be focused on developing specific reliability standard requirements targeted toward solving problems that need to be addressed. Stated differently, every Element that could have an impact on the BES does not need to be included in the definition of the BES. NERC's Functional Model addresses the broad range of functions performed by the electric utility industry. When reliability concerns are identified and can best be addressed via a standard, modifying the requirements in that standard as applicable to that functional model should occur rather than attempting to modify the BES definition. Effort spent on developing specific reliability standard requirements mentioned above is superior to the industry engaging in definitional debates that do not address to the underlying reliability drivers. It is not essential that each reliability standard explicitly apply to each registered entity. The existing reliability requirements, as applied to the various functional entities require communication of information necessary to insure there are no reliability gaps, either directly or indirectly among the various entities. The existing standards typically have a hierarchy wherein: o Planners (PA, TP) receive information predominately from the owners (GO, DP, TO) and those that represent end-use customers (LSE and PSE); o Reliability entities (BA, RC and TOP) receive information predominately from operating entities (GOP, TOP) and those that represent end-use customers (LSE and PSE); o Planners provide reliability assessments to Reliability entities (BA, RC and TOP) and receive feedback on these reliability assessments (including validity of assumptions and result); and o Reliability entities (BA, RC and TOP) give instructions (including when necessary directives) to operating entities (GOP, TOP) and those that represent end-use customers (LSE and PSE). This is how the industry has historically operated, how it operates today and why the standards in place today are structured as they are. Reliability is best served when the standards themselves contain the appropriate requirements and are applied to either an Element or Facility or to the appropriate functional entity (DP, GO, GOP, LSE, TO, TOP, etc.). Definitional boundaries can create the potential for false positives in reliability and, in fact, may be detrimental to reliability in the longer term if they impose additional compliance burdens without closing a reliability gap.

Organization	Yes or No	Question 11 Comment
Response: The SDT acknowledges and appreciates the comments and recommendations associated with concepts for alternatives to the revision of the exiting definition of BES. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, and is bound to answering those directives in a manner that achieves industry consensus while remaining responsive to the language contained in the Orders. No change made.		
Pepco Holdings Inc and Affiliates	Yes	1) From the proposed BES definition and Exclusion E1 it is very clear that a 138-12kV distribution transformer serving radial load would not be considered part of the BES. However, suppose this transformer was connected to a position in a ring-bus or a breaker-and-a-half arrangement. Would the physical bus between the transformer high side terminals and the two breakers in the ring-bus, or breaker-and-a-half-bus, be considered part of the BES? They would be contiguous transmission elements (bus) operating at 138kV and supplying a radial distribution transformer. Also, tripping of this "radial" bus section would not interrupt any BES facilities, due to the station bus arrangement. As such, by definition and Exclusion E1 this 138kV bus section (element) would not be part of the BES, and no special exclusion filing would be required. Is this correct? However, take the same 138-12kV transformer but this time connected in a typical line-bus arrangement. The transformer by definition is not a BES element. As was the case above, the bus section between the transformer and the two breakers in the line-bus would be contiguous elements (bus) operating at 138kV and supplying a radial distribution transformer. Again, by definition and Exclusion E1 this bus section (element) would not be part of the BES. However, in this case tripping of the "radial" bus section would result in an interruption to the through path of the station, and could therefore interrupt the through flow on BES facilities. Does this make either the transformer, or its associated bus section, or both part of the BES? Based on the above examples, if the type of bus connection could influence whether an element is included in the BES or not, then additional language needs to be added to the definition (either as an Inclusion or Exclusion) to make this point clear. The BES definition needs to be specific enough to eliminate any confusion as to what is included, and what is not included, and thereby greatly minimize, if not eliminate, the need to request interpretations. A sample FAQ document, with examples, would be

Organization	Yes or No	Question 11 Comment
		extremely helpful, but should not be a substitute for a BES description which leaves little room for interpretation. 2) As seen from the above attempt to describe issues that need clarification, without a diagram to show specific situations, it is difficult to fully explain the concerns on ensuring that the BES definition stands on its own. Since the commenting process does not accommodate diagrams, PHI is sending separately a white paper with diagrams in an attempt to clarify the definition and make it as unambiguous as possible, leaving little room for interpretation. This paper may be helpful in developing a FAQ document. 3) The definition should state that it applies to a system "normal" configuration. It does not include maintenance or N-1 or any abnormal configurations. 4) There was no place on the comment forms to comment on the proposed Implementation Plan for the BES definition. So comments are included here. The proposed plan states "compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition." This is fine for most applications; however, there is an effect with PRC-005 compliance. PRC-005 (Protection System Maintenance Standard) requires that evidence for the last two maintenance intervals, in order to demonstrate that you are following the prescribed intervals in your maintenance plan. If additional facilities are brought into scope by the new BES definition, and the protection systems associated with these facilities were not previously maintained on the same interval as other BES facilities, then it may not be possible within the allotted 24 months to demonstrate the facilities were maintained within the prescribed intervals for BES facilities. An implementation plan at least as long as one full maintenance cycle would be required to assure compliance. This issue needs to be addressed or coordinated with PRC-005.
Response: 1) Exclusion E1 identifies a Radial system as "a group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher" (with additional criteria identified in parts E1a, b and c). The SDT interprets the language 'single point of connection' as a tapped point where the radial system originates. Therefore in a ring-bus, a breaker-and-a-half or a		

Organization	Yes or No	Question 11 Comment
typical line bus arrangement, the bus between the breakers and the breakers themselves are considered to be BES Elements. Under these circumstances the bus position is the 'single point of connection', not a contiguous group of Elements as suggested in the comment. 2) The development of a guidance document which contains generic diagrams is a portion of the overall project that the SDT feels is necessary to ensure the consistent application of the BES definition going forward. Therefore the SDT has determined that such a document will developed during Phase 2 of the project. 3) The SDT does not believe that system state affects the definition and therefore there is no need to declare that the definition only applies to normal state. No change made. 4) The BES definition Implementation Plan addresses the implementation of the revised definition. The SDT is not in a position to comment on compliance obligations associated with the Reliability Standards. However, in circumstances where data may not be available due to the revised definition requirements, the SDT expects an entity to work with its Regional Entity to come up with a plan to satisfy the obligation.		
Southern Company Generation	Yes	1) On page 1, the year of the anticipated date for the BOT adoption is correctly 2012. 2) We believe that the last two sentences of the first paragraph of the Background Information section of the 2nd draft of the definition document is incorrect. The statements read: " It should be noted that the revised definition does not address functional entity registration or standards requirements applicability. Those are separate issues." The definition of the BES that is approved will govern the scope of the equipment that is relevant to many of the reliability standards. This issue cannot be separated from the applicability of the requirements of the reliability standards. What is the purpose of creating a continent wide definition of the BES if is is not to provide instruction the enetties subject to the requirements of the standards? Refer to these sample standard requirements to see that this definition already plays a major part in the applicability of the requirements: EOP-005-2 R1, R4; EOP-006-2 R1; EOP-008-1 R1; FAC-008-1 R1.2; and PRC-005-1a for example - there are many others.
Response: 1) The SDT has made the revision to the BOT adoption date to correctly identify the year as 2012.		

Organization	Yes or No	Question 11 Comment
2) The SDT acknowledges that the linkage between the BES definition and the Reliability Standards may have been understated in the *Background Information* contained in the comment form. However, the goal of the SDT in addressing the Commission directives is to develop modifications to the definition in response to the directives without significantly expanding or contracting the scope of the BES and not drive registration changes in the industry. The SDT believes that they have met these goals, as evidenced by a detailed review of the NERC Reliability Standards. The SDT determined that potentially the scope of applicability of certain requirements may change due to the establishment of a bright-line definition. However, this potential change did not dictate a need for modification of the language contained in the requirements.		
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative	Yes	: AECI supports the bright-line concept, but believes the SDT should adopt a core voltage threshold of "200 kV or higher", and MVA capacity of "150 MVA or greater". A proper threshold is critical, because an inappropriately low threshold will divert significant industry attention and resource away from what truly benefits the BES reliability. (The number of facilities tend to rise more geometrically than linearly as the voltage threshold drops.)We believe that an evaluation of the transmission-line Surge Impedance Loading (SIL), at various kV levels, could provide technical insight as to why many industry planning engineers believe sub-230kV Facilities, in general do not belong within the BES. AECI suggests that the SDT consider a more consistent bright-line facility threshold of 150 MVA capability for all equipment. This would include transmission lines as well, where an Surge Impedance Loading analysis demonstrates that lines below 230 kV, can support 150 MVA flow up to 280 miles (applying 1.1 p.u. line-loadability of SIL, IEEE Transactions on Power Apparatus and Systems, Vol.PAS-98, No.2 March/April 1979, p 609, Figure 7),without additional reactive compensation. In comparison, single-conductor 138 kV lines, in same table, can support 150 MVA transfers no more than 50 miles, while 345 kV lines are capable of supporting 150 MVA transfers well over 600 miles.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These		

Organization	Yes or No	Question 11 Comment
and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.		
MRO NERC Standards Review Forum (NSRF)	Yes	NSRF recommends that the following statement be added after I5. If an element is not included based upon the core definition or I1 - I5, the elements is not consider to be a part of the BES.
Response: The SDT is attempting through the BES definition to identify facilities that should be classified as BES Elements. Adding a statement that emphasizes the opposite of what the definition is intending to accomplish would be redundant and would negate the efforts of the SDT to improve clarity and remove the ambiguity that currently exists the definition today. No change made.		
IRC Standards Review Committee	Yes	(1) We support a phased approach proposed in the draft supplemental SAR. Development of the revised BES definition is an important and complex undertaking. The product of this work is fundamental to establishing the applicability of NERC Reliability Standards. The issues identified for attention in Phase 2 of this project warrant careful investigation and as such allowing additional time to properly research and provide for stakeholders to vett them is justified. Specific to the assessment of raising the generator rating threshold from 20 MVA to 75 MVA per unit, we would point out that this needs to be looked at from a different perspective. Industry debates so far have been on the apparent lack of reliability contribution and economic benefits for keeping the threshold at 20 MVA. The former point implies that any negative reliability impact that could be contributed by a generator higher than 20 MVA but lower than 75 MVA could be negligible. Some examples of the standards that the 20-75 MVA units may need to comply with to ensure reliability are: o Voltage and frequency ride through capability o Voltage control (AVR, etc.) o Underfrequency trip setting o Protection relay setting coordination o Data submission for modeling; verification of capability and model A Venn diagram developed by an industry group shows that generators at 20 to 74.99 MVA account for about 13.8% of the total

Organization	Yes or No	Question 11 Comment
		installed capacity in the US. Out of this, 3.0% are currently deemed non-BES whereas the other 10.8% are BES. We do not know how the BES reliability may be affected if these 10.8% generators are no longer deemed BES facilities (after an increase of threshold to 75 MVA) and subject to compliance with NERC standards, including those mentioned above. An assessment from both a positive contribution and a negative impact viewpoints are thus required to aid the determination of the merit of raising the rating threshold. (2) The draft Implementation Plan for the BES definition states "Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition." We are concerned that the stated implementation period may be insufficient time to complete transition plans for newly identified BES Elements and Facilities, where those plans require procurement, installation and commissioning of additional equipment. We believe a period of 24 months may be more appropriate.
Response: 1) The SDT agrees with the commenter that the best opportunity to address the industry concerns associated with the technical aspects of the definition is through Phase 2 of the project. The SDT also agrees with the commenter in that any assessment utilized to determine the correct threshold for generating resources should be accomplished without any preconceived threshold value as a target for justification. The full scope of the assessments will be determined through a joint effort between the SDT and the appropriate NERC Technical Committee. 2) In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.		
Tennessee Valley Authority	Yes	The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. TVA is concerned with this revised definition's impact on entity registrations, i.e., how will the revised definition be integrated into the

Organization	Yes or No	Question 11 Comment
		Compliance Registry Criteria. The implementation plan should include how the integration is going to occur. The 24 month period for new facilities that are to become BES elements as a result of this definition is very important to successful implementation of the definition. An period shorter that 24 months would be very problematic for the industry.
Response: Phase 1 of the project, as explained above, is addressing Commission directives established in Order No. 743 within a relatively short time period. The SDT has decided to maintain the status quo with respect to applicability and the technical aspects contained in the ERO Statement of Compliance Registry Criteria as the prudent path to take to ensure a successful conclusion to Phase 1 of the project. The status quo was established in FERC Order No. 693, which states: "…the Commission will rely on the NERC definition of bulk electric system and NERC's registration process to provide as much certainty as possible regarding the applicability to and the responsibility of specific entities to comply with the Reliability Standards in the start-up phase of a mandatory Reliability Standard regime". As the SDT progresses through Phase 2 of the project, it is envisioned that the technical aspects contained in the definition and in the ERO Statement of Compliance Registry will be merged and ultimately incorporated into the definition of the Bulk Electric System. At which time the ERO Statement of Compliance Registry Criteria will be revised to point to the BES definition for the technical aspects in regards to BES Elements. The SDT agrees with the commenter in regards to the implementation time period of 24 months. In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.		
Hydro One Networks Inc.	Yes	o The definition of the Bulk Electric System (BES) is a foundational construct for the North American Electric Reliability Corporation (NERC). FERC Orders 743 and 743-A do not mandate a 100 kV approach. Instead, it states that a 100 kV bright line threshold is one approach to defining the BES. It further states that only "some" 115/138 kV facilities are necessary for the reliable operation of the bulk system. We believe that if one subset issue (such as 20 MVA vs. 75 MVA) of the entire definition, requires more

Organization	Yes or No	Question 11 Comment
		time and resources to arrive at the correct answer, the much larger and more fundamental issue of how to define BES should not have been dismissed without the appropriate analysis before another definition is proposed to be adopted by the ERO. o The proposed definition, in combination with other new and/or modified Reliability Standards such as newly modified and approved TPL Standards will require significant system upgrades with high dollar investments. We are deeply concerned that a) no such assessment has been undertaken by the SDT and/or the ERO and b) the proposed definition of the BES is not based on a technical analysis that will enhance the reliability of the interconnected transmission network. o The NERC as the ERO should at least undertake a cost and incremental reliability benefit analysis for its proposed definition of BES. Furthermore, cost impacts and reliability benefit assessments of the BES definition coupled with other new and modified reliability standards (such as the TPL Standards) must also be undertaken and weighed against the potential benefits, if any, of this or any proposal. Not providing such an assessment but using the 100 kV level as a starting point for the BES definition, gives no assurances of benefits for any stakeholder including respective governmental and regulatory authorities and rate payers in Canada or the USA. o The proposed definition would significantly increase the population of BES elements. Many of the standards requirements for these new elements will introduce administrative burden and operating expenses. This would impose significant costs, costs that ratepayers will have to bear, with little or no gain in reliability benefits for the interconnected transmission system. We suggest that the resulting BES definition must identify incremental reliability benefits by the ERO for the interconnected transmission network based on sound technical analysis to justify the change to those who will pay for any required system upgrades - the ratepayer. o The draft Implementation Plan for the BES definition states “Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition.” We are concerned that the stated implementation period will give insufficient time to complete transition plans for newly identified BES

Organization	Yes or No	Question 11 Comment
		Elements and Facilities, where those plans require approval, procurement, installation and commissioning of additional equipment. We believe a period of 60 months at a minimum is more appropriate. Finally, we believe that the SDT proposed approach for exception criteria is reasonable recognizing that one method/criteria can not be applicable to everyone and every situation within the ERO footprint. However, we believe that there is a huge gap and lack of any transparency on how the exception application will be evaluated and processed. We strongly suggest that the SDT develop a reference or a guidance document as part of the RoP that should provide guidance to Registered Entities, Regional Entities and the ERO on how an exception application should be processed. Else, (a) it will pose a challenge for each of the entities including ERO, and (b) may introduce Regional discretion and be perceived as having no transparency for the registered entities.

Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System including the 100 kV bright-line level. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.

The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to

Organization	Yes or No	Question 11 Comment
		improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The technical aspects of the definition have remained identical to the current definition and identical to the application of the ERO Statement of Compliance Registry Criteria and therefore do not require a technical justification to support maintaining the status-quo. In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity. The SDT understands the concerns raised by the commenters in not receiving hard and fast guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments. There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn't been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel, not to make the final determination. The Regional Entity plays no role in actually approving or rejecting the submittal. It simply acts as an intermediary. One can counter that this places the Regional Entity in a position to effectively block a submittal by being arbitrary as to what information needs to be supplied. In addition, the SDT believes that the visibility of the process would belie such an action by the Regional Entity and also believes that one

Organization	Yes or No	Question 11 Comment
		has to have faith in the integrity of the Regional Entity in such a process. Moreover, Appendix 5C of the proposed NERC Rules of Procedure, Sections 5.1.5, 5.3, and 5.2.4, provide an added level of protection requiring an independent Technical Review Panel assessment where a Regional Entity decides to reject or disapprove an exception request. This panel's findings become part of the exception request record submitted to NERC. Appendix 5C of the proposed NERC Rules of Procedure, Section 7.0, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request. On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that the explicit types of studies to be provided and how to interpret the information aren't shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn't been handled before by either party and there is a great deal of professional experience involved on both the submitter's and the Regional Entity's side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication. Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result ofa sudden disturbance, including a cyber security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal. Some commenters have asked whether a single 'yes' or 'no' response to an item on the exception request form will mandate a negative response to the request. To that item, the SDT refers commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.2 of the proposed Rules of Procedure that states "No single piece of evidence provided as part of an Exception Request or response to a question will be solely dispositive in the determination of whether an Exception Request shall be approved or

Organization	Yes or No	Question 11 Comment
disapproved." The SDT would like to point out several changes made to the specific items in the form that were made in response to industry comments. The SDT believes that these clarifications will make the process tighter and easier to follow and improve the quality of the submittals. Finally, the SDT would point to the draft SAR for Phase 2 of this project that calls for a review of the process after 12 months of experience. The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase 1 of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem. The SDT asks the commenter to consider all of these facts in making your decision and casting your ballot and hopes that these changes will result in a favorable outcome.		
Western Area Power Administration	Yes	Yes, the definition should also provide clarification on mobile equipment installed to support maintenance or equipment failures. Adding mobile equipment is a common practice for our industry and should be addressed in the definition to bring a general awareness and common understanding of the practice regarding the NERC standards. Recommendation: Add the following Exclusion to BES definition for mobile equipment. Exclude all mobile equipment on stand-by that has not been placed into service as well as all components of mobile equipment that does not meet the inclusion criteria for the primary function of the device being installed (e.g. ,battery bank on mobile transformer installed on radial feed would also be excluded)
Response: The SDT acknowledges the commenter's concern and has determined that the need for an exclusion identifying mobile equipment is not appropriate. The SDT believes that the BES definition is identifying Elements that support the reliable operation of the interconnected transmission grid. This premise implies that the Element is electrically connected to the system and is performing a reliability related service. The SDT believes that the time the mobile equipment is placed in service is when the equipment would be classified as a BES Element and subject to compliance obligations. No change made.		
NESCOE	Yes	NESCOE offers the following additional comments: 1) Phased Approach. While well-intentioned, separating the BES definition project into two separate phases is

Organization	Yes or No	Question 11 Comment
		problematic from both a procedural and substantive perspective. While we recognize that the filing due date is rapidly approaching, the BES definition cannot be considered in a vacuum, divorced from the concerns raised by a number of parties in response to past postings of the BES definition. The issues NERC has identified for consideration during the proposed "Phase 2" are inseparable from the development of the BES definition and should be squarely addressed before a definition is adopted. In particular, the development of criteria for determining what facilities are "necessary for the reliable operation" of the interconnected system cannot be put off for a second phase. Contrary to FERC's direction, NERC's proposal will force ratepayers to incur costs related to compliance with mandates that may or may not be revised through the second phase of the project. The importance of considering and resolving such concerns before adopting a definition is heightened by the proposed two-year implementation requirement. This short implementation period almost guarantees that entities will commit resources shortly after adoption of the definition to ensure compliance within the mandated period. In other words, ratepayers will bear costs related to compliance irrespective of any change resulting from the Phase 2 process or the exception process. Expediency, while understandable given the filing deadline, must be balanced against the risk that a multi-phased approach could lead to significant consumer costs without attendant meaningful reliability benefits. 2) Cost-Benefit Analysis. A cost impact analysis should be performed as part of developing any reliability standard. However, the development of the BES definition has failed to consider the cost impacts of the definition (and its inclusions and exclusions) and weigh these impacts against identified benefits that the definition would achieve. NESCOE stated in its May 21, 2011 comments on the last posting of the BES definition that "any new costs a revised definition imposes - which fall ultimately on consumers - should provide meaningful reliability benefits." A cost-benefit analysis should be integral to the development of a BES definition and, indeed, any reliability standard. This analysis should include a probabilistic risk assessment examining the likelihood of an event and the costs and risks resulting from such event, which should be weighed against the costs of complying with the proposed reliability

Organization	Yes or No	Question 11 Comment
		measures. 3) Technical Justification. In addition to performing a cost-benefit analysis, a technical basis must be provided to justify a proposed reliability standard. However, as we state above, the proposed BES definition does not provide a technical justification for the 100 kV threshold. Nor does it provide a technical justification for the threshold for generation resources or other elements of the definition. As stated above, while well-intentioned and understandable, deferring this technical justification to a later and separate phase of the project is a flawed and potentially costly approach. Providing a technical justification for a reliability standard is a core function of standards development and should be addressed at the forefront of the process rather than relegated to a separate phase largely undertaken after a standard is filed.

Response: 1) The SDT acknowledges the commenter's concerns; however the SDT (and the ERO) has an obligation to respond to the Commission directives established in Order No. 743 within the time frame allotted by the Order. The narrow scope of the directives and the limited timeframe for project completion has prevented the SDT from fully vetting the concerns of the industry as expressed through the development process. To best address the Commission directives and stakeholder concerns, the SDT has opted to separate the project into phases. The revised project plan has been fully endorsed by the NERC Members Representative Committee and the Board of Trustees. Additionally the NERC Standards Committee has committed to the continued development of a revised definition by retaining the project as a high priority project and by dedicating the resources necessary to fully vet the issues raised by stakeholders.

2) The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition

Organization	Yes or No	Question 11 Comment
any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission. 3) The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The technical aspects of the definition have remained identical to the current definition and identical to the application of the ERO Statement of Compliance Registry Criteria and therefore do not require a technical justification to support maintaining the status-quo.		
ReliabilityFirst	Yes	This definition needs to be clear and easy enough for anyone to pickup, read, understand, apply and arrive at the same conclusion on whether the facility or element is included or excluded. This definition leaves room for continued debate and interpretation. To help make this definition clearer, ReliabilityFirst Staff has provided a redline version of the core definition under a separate cover (file titled "Bulk Electric System definition by RFC Staff 10-4-2011").
Response: The SDT believes that the revised definition of the BES has provided the necessary clarity to allow for consistent application on a continent-wide basis. The issues identified in the commenter's redline (provided following the responses to question 11) have been fully vetted by the SDT and addressed in the responses to the comments for the applicable question related to the specific issue.		
Ontario Power Generation Inc.	Yes	Further to comments submitted in Question #1, OPG disagrees in general with proceeding to implement a 100 kV brightline definition in the absence of a properly quantified cost/benefit analysis. Entities are being asked to incur a high cost for no demonstrated benefit in wide-area reliability.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has		

Organization	Yes or No	Question 11 Comment
pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.		
Central Hudson Gas and Electric Corporation	Yes	Due to the movement to a phased BES definition development process and assuming the definition is approved as proposed, there is an urgent need for NERC to provide clear guidance to Registered Entities regarding how to proceed with facilities and address changes to the NERC Compliance Registry registration obligations brought in/on by the application of the new definition. The problem stems from a likely scenario whereby the affected Registered Entities may be faced with an Implementation Plan and an Exception Request Procedure which must be completed prior to the completion of the Phase 2 definition development process. If that is the case, many Registered Entities will be confronted with either (1) spending large amounts of human and financial resources, not yet acquired, to address facilities/procedures necessary to address possible new compliance obligations only to find their efforts rendered unnecessary by the results produced in Phase 2 or, (2) waiting until the results of Phase 2 are provided and risking being found non-compliant and subject to substantial penalties in the future. Neither option can be viewed as a desirable, or for that matter, an acceptable position to be placed in.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has		

Organization	Yes or No	Question 11 Comment
pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Therefore, the SDT believes that best opportunity to address cost and resources issues will be through the development of Regional transition plans once the definition has been approved by the Commission. The SDT recommends that the commenter pursue achieving full compliance with the revised definition in the appropriate time period (see Implementation Plan) while utilizing the Rules of Procedure exception process to specific exceptions from the BES definition.		
Springfield Utility Board	Yes	When submitting BES Definition comments, SUB would suggest a “not-applicable”, “no-impact” or “abstain” option in addition to “yes” or “no”. In some cases, the draft language has no impact on an entity’s system, yet that entity’s selection of “yes” or “no” may imply agreement or disagreement rather than expressing lack of applicability. This could skew the perception of agreement or disagreement, and create a potential issue for those who are directly impacted by the changes.
Response: The SDT understands the commenter’s concern; however the formatting of the comment form (including the electronic version) is governed by the ERO and beyond the control of the SDT. Your comment will be forwarded to the NERC Standards staff for consideration.		
Mission Valley Power	Yes	Mission Valley Power - In order to help meet the fast approaching target date, Mission Valley Power will be voting affirmative in this ballot, with the hope these comments will be addressed in Phase 2. If the ballot should fail, please address these comments in this phase. Thanks to the team for their good work.
Response: The SDT acknowledges and appreciates the continued support of the project. The SDT will consider all recommendations for modifications to the technical aspects of the definition for project inclusion at the appropriate time during Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing		

Organization	Yes or No	Question 11 Comment
values.		
Consolidated Edison Co. of NY, Inc.	Yes	Con Edison shares the concerns raised by the State of New York Department of Public Service (NYPSC) in its September 12, 2011 letter to NERC Chairman Anderson. The NYPSC expressed concern that the proposed BES Definition "would impose significant costs, costs that New York ratepayers will be expected to bear, with little or no increase in reliability benefits." The BES definition is being revised without an assessment of costs or benefits. The SDT is encouraged to work with NERC Staff to perform such an assessment prior to providing the revised BES definition to the NERC Board. Regional Entities share this concern with cost effectiveness. In NPCC, the Board of Directors directed NPCC Staff to develop a methodology to assess the cost and benefit of Standards. This NPCC Cost Effectiveness Analysis Procedure (CEAP) establishes a process to address those concerns. The CEAP introduces two assessments of the estimated industry-wide costs of requirements into that Standard's development process. The procedure adds supporting information and background for the NPCC stakeholders, ballot body and the NPCC Board of Directors. Moreover, during a 2010 FERC technical conference the Commission recognized that "reliability does not come without cost." As a result, significant interest was expressed in development of a process to identify the costs for draft reliability Standards and the ability of the proposed standards to achieve the reliability objective(s) sought in a cost effective manner. We understand that it is a NERC priority to define adequate level of reliability and use it as the basis for determining the cost effectiveness of a proposed rule. While this has not yet been finalized, NERC could use this proposed standard as a test case for determining the relationship between costs and benefits.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES		

Organization	Yes or No	Question 11 Comment
definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.		
Northern Wasco County PUD	Yes	In order to help meet the fast approaching target date, Northern Wasco County PUD will be voting affirmative in this ballot, with the hope these comments will be addressed in Phase 2. If the ballot should fail, please address these comments in this phase. Thanks to the team for their good work.
Tillamook PUD	Yes	If Tillamook PUD had signed up to ballot in time, we would be voting yes with the hope that these comments would be addressed in Phase 2. If the ballot fails, please address these comments in this phase.
Response: The SDT acknowledges and appreciates the continued support of the project. The SDT will consider all recommendations for modifications to the technical aspects of the definition for project inclusion at the appropriate time during Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
American Electric Power	Yes	There needs to be some clarification regarding the default status of an asset, as well as the order and priority of the inclusion and exclusion classifications within the definition. First, prior to any evaluation by virtue of the definition, is an asset by default excluded from the BES, or rather, it is included? In addition, once the definition is used to evaluate an asset which has both inclusion attributes and exclusion attributes, which of the two classifications has greater weight? For example, if an asset is first included by the BES definition inclusion criteria can it then be excluded by BES

Organization	Yes or No	Question 11 Comment
		definition exclusion criteria? Or instead, if an asset is first excluded by BES definition exclusion criteria can it then be included by the BES definition inclusion criteria? AEP's recommendation is that an asset, by default, not be considered part of the BES. Next, the asset would be evaluated by the inclusion criteria as specified within the definition. Next, any asset explicitly included by the inclusion criteria is then evaluated using the exclusion criteria. Once the entity has made their determination based on the definition, exception requests could then be made to include or exclude assets as appropriate. We believe our interpretation is what is implied by the draft definition, however, this needs to be explicitly communicated within the definition itself.

Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be

Organization	Yes or No	Question 11 Comment
applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
City of St. George	Yes	The small utility exclusion issues discussed in the first draft of the documents are not included (draft 1 proposed E4) nor addressed in the draft 2 documentation. Under the present definition many small utilities with local generation to serve its own local load will be required to register for additional functions, or at a minimum go through a long, expensive, time consuming process to get an individual exclusion from the BES. The topics that have been postponed to Phase 2 of the project are critical to and will have a direct impact to many utilities. Phase 2 needs to have specific shorter than normal timelines established, similar to what Phase 1 has had. The present definition and standards in general makes little or no consideration for the actual impact of an entity or facility on the bulk system. As such small utilities with a few miles of 115 kV or 138 kV lines and some generation are required to meet the same requirements as large utilities with 100's or 1,000's of miles of 345 kV or 500 kV lines and that operate very large generation plants of several hundred MVA of capacity. All utilities support reliability improvement, but the requirements and associated costs need to match their actual impact to the overall system.
Response: The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., potential small utility exclusion) of the BES definition. However, it is important to emphasize the fact that the SDT is developing a definition to identify the Elements that support the reliable operation of the interconnected transmission network regardless of ownership or operational responsibility. Small utility issues are very similar to the issues raised through the GOTO project and are best addressed through the applicability of the individual reliability standards, not through the definition of the BES.		

Organization	Yes or No	Question 11 Comment
No change made.		
ISO New England Inc	Yes	There are a number of possible scenarios where an element falls under both an inclusion and exclusion. The definition is unclear as to whether or not this would have the element be BES or not. During the webinar an example was given about a static shunt device meeting the requirements of I5, but is part of a radial network. The response during the webinar was that this would be excluded. If this is correct, it means that an exclusion takes precedence over an inclusion. Is this always the case? This needs to be clarified and stated somewhere in this document. To be consistent with regard to the terms "Operated at 100 kV" and "Connected at 100 kV ", we suggest that reference to generators should state, "Connected at a transmission element operated at 100 kV". This will avoid confusion in cases where a generator is connected to a transmission element rated at 100 kV but operated at a lower voltage.
Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.		

Organization	Yes or No	Question 11 Comment
Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. The BES definition refers to operating voltage (as emphasized in FERC Order No. 743-A) and the SDT does not feel that the language "connected at a voltage of 100kV or above" creates any confusion on the intent of the Inclusion. No change made.		
NBPT	Yes	o When an exclusion and inclusion principles overlap which takes precedence? For example I5 may be excluded if in a LN (E3) o The Local Network Exclusion criterion does not appear to consider voltage support and the effects of shifting of load or impacts due to a loss of load. The 75 MW generation threshold has no technical basis. The LN exclusion should allow for studies demonstrating no through flow benefit regardless if there is. o 75 MW Generation has no technical justification. o Black Start resources should not be included in all GO/GOP standards except for those standards specific to black start units.
Response: The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will		

Organization	Yes or No	Question 11 Comment
identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis. Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. " Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy. Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES. Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES. Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1. Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2. Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element. The local network exclusion has established a bright-line with specific characteristics that must be met to be eligible for exclusion.		

Organization	Yes or No	Question 11 Comment
Exclusion E3b states: "Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN". This characteristic applies under all operating conditions including any variations in network load. It is not clear to the SDT what the commenter is referring to in regards to voltage support. Exclusion E3 addresses transmission Elements and does not exclude Real Power or Reactive Power resources from the BES. The concept of the 75 MVA threshold is based on the generation inclusion criteria for plant/facility arrangements by carrying through the concept of the reliability impact that the aggregated loss of 75 MVA or greater would have on the overall reliability of the interconnected transmission grid. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. The SDT has determined that Blackstart Resources serve a reliability benefit to the interconnected transmission grid and therefore have been included in the scope of the BES. This is consistent with current practice and specifically with the registration requirements that identify the owner, operators, and users of Blackstart Resources be registered as Generator Owner/Generator Operator. Specific concerns with the applicability of individual standards should be addressed through the Standard Development Process for the individual Reliability Standards in question.		
Texas Reliability Entity	Yes	(1) It is unclear exactly what is intended by "non-retail generation" in Exclusion E1(c). We suggest that the term be explained or defined in the BES definition or in a collateral document. This term does not have a commonly understood unambiguous meaning in our Region. (2) Phase 2 has to be completed or explicitly defined/scoped to fully capture all of the components necessary for reliable operation of the BES.

Organization	Yes or No	Question 11 Comment
Response: (1) Non-retail generation is the generation on the system (supply) side of the retail meter. (2) The supplemental SAR for Phase 2 of the project will be posted for industry comment at which time the SDT will be accepting recommendations for specific issues to be addressed by the SDT during phase 2 of the project.		
New York State Dept of Public Service	Yes	o Per NERC's obligations under the Energy Power Act of 2005 to provide FERC technical advice, no technical justification has been provided for basing the BES definition on the 100 kV and MVA thresholds. o No cost analysis on either the reliability benefits of the overall definition or on the implementation plan has been performed to determine whether the likely high cost of the definition to ratepayers is justified. o The definition of the BES should be the driver for the application of all other NERC reliability standards and criteria. The definition uses the Statement of Compliance Registry Criteria as a driver of the definition when the reverse should be taking place; contents of the Statement should be driven by the BES definition.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the definition has not been altered in regards to the bright-line or the generation thresholds and therefore does not require the development of technical justification to maintain the status quo. SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission		

Organization	Yes or No	Question 11 Comment
grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission. The SDT has revised the language in Inclusion I2 to eliminate the circular reference to the ERO Statement of Compliance Registry Criteria. Inclusion I2 has been revised to read: **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.		
Hydro-Quebec TransEnergie	Yes	In the Implementation plan, it is given only 24 months for compliance after applicable regulatory approval. Considering the possibility that a proposed transition plan may involve commissioning of long term projects, a provision for such situation should be made with longer delay.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. With that being said, the SDT believes that an implementation time period of 24 months is sufficient time to address the development of regional transition plans, address any necessary registration changes, file for exceptions through the Rules of Procedure exception process and address any required training. The SDT also acknowledges that the potential exists for extenuating circumstances that will need to be addressed through the regional transition plans.		
Independent Electricity System Operator	Yes	We wish to also express our support for phased approach proposed in the draft supplemental SAR. Development of the revised BES definition is an important and

Organization	Yes or No	Question 11 Comment
		complex undertaking. The product of this work is fundamental to establishing the applicability of NERC Reliability Standards. The issues identified for attention in Phase 2 of this project warrant careful investigation and as such allowing additional time to properly research and stakeholder them is justified. The draft Implementation Plan for the BES definition sates "Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition." We are concerned that the stated implementation period may be insufficient time to (1) prepare and file exception requests and have these assessed; and (2) in cases where these exception requests are not approved, to develop and complete transition plans for newly identified BES Elements and Facilities, particularly where those plans require major investments for the procurement, installation and commissioning of additional equipment. We therefore propose the following alternative wording for the Implementation Plan: "Compliance obligations for elements included by the definition shall be evaluated and an implementation schedule established within 24 months." Throughout the document various phrases are used to describe generating units/resource, viz. "generation resources", "generating resources", "generating unit" and "power producing resources". Please review these to identify and address any possible inconsistencies.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. With that being said, the SDT believes that an implementation time period of 24 months is sufficient time to address the development of regional transition plans,		

Organization	Yes or No	Question 11 Comment
address any necessary registration changes, file for exceptions through the Rules of Procedure exception process and address any required training. The SDT also acknowledges that the potential exists for extenuating circumstances that will need to be addressed through the regional transition plans. The SDT has reviewed the applicable documents for inconsistencies related to the terms generating units/resource, viz. “generation resources”, “generating resources”, “generating unit” and “power producing resources”. The SDT has made the appropriate modifications to address any issues resulting from the inconsistencies.		
Central Lincoln	Yes	We note that the SAR for Phase 2, like that for Phase 1, does not include all entity types. We see no reason to maintain dual definitions for the different entity types, and the resulting confusion. In order to help meet the fast approaching January target date, Central Lincoln will be voting affirmative in this ballot, with the hope these comments will be addressed in Phase 2. If the ballot should fail, please address these comments in this phase. Thanks to the team for their good work.
Response: The draft SAR developed for Phase 2 of Project 2010-17 Definition of the Bulk Electric System, similar to the SAR for Phase 1 has purposefully omitted the Interchange Authority and the Purchase Selling Entity functional entities because these entities do not own or operate BES Elements. This conclusion does not necessitate the need for dual definitions; the definition of the BES does not impact the functional responsibilities of these entities. The SDT acknowledges and appreciates the continued support of the project. The SDT will consider all recommendations for modifications to the technical aspects of the definition for project inclusion at the appropriate time during Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.		
Utility Services, Inc.	Yes	Utility Services would like to raise the question of whether SCRC III.3.d (the so-called "Generator Materiality" clause) is incorporated within the BES Inclusion Designations. One theory suggests that given that I2 is designed to deal with III.3.a and III.3.b and I3 reflects the need to incorporate black start generation; then generators under the materiality clause are not identified with the inclusion criteria. However, the second theory suggests that resources identifed through I2 reflect the entire III.c.1-4 language

Organization	Yes or No	Question 11 Comment
		of the SCRC, then the generators in the material clause are captured under I2. But if this is the case, then I3 is redundant to I2 and does not need to separately addressed.
Response: The SDT has revised the language in Inclusion I2 to clearly identify the applicability of generating resources. The revised language is as follows: **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.		
FirstEnergy Corp.	Yes	FE supports the SDT's phased project approach which was well articulated in the NERC BES Definition Fact Sheet
LCRA Transmission Services Corporation	Yes	LCRA TSC supports the direction the standards drafting team taking with this project on the BES Definition and encourages further clarification as noted in these comments for proper application.
Response: The SDT acknowledges and appreciates the continued support of the project.		
National Grid	Yes	The proposed implementation period in the draft definition is too short. The new BES definition will likely result in increased operational costs during the implementation period that will ultimately be borne by customers. Implicit in the Commission's directive to change the BES definition is the Commission's determination that the benefits of this change, including consistency among the regions, outweigh the ratepayer impacts. However, National Grid remains concerned that the ratepayer impacts have not been fully taken into account. The implementation period is a tool that can allow NERC to meet the Commission's directive while softening any resulting ratepayer impacts. Implementation can and should be staged in order to mitigate and even out rate increases. National Grid suggests that the implementation period be flexible to allow entities who anticipate that large and/or expensive upgrades to the BES will be necessary to meet compliance can submit an alternate implementation plan to spread compliance and the associated rate changes over a longer period; we

Organization	Yes or No	Question 11 Comment
		would suggest a minimum of 7 years. This time period was also recognized as a reasonable implementation time period in the recent TPL-001-2 for those portions of the standard that would also result in plans that would require siting, permitting and construction activities. This BES definition is likely to have similar impacts for some entities and allowing for an implementation timeline with the definition change enables achievement of the goals while recognizing the realities of constructing facilities in today's environment.
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. With that being said, the SDT believes that an implementation time period of 24 months is sufficient time to address the development of regional transition plans, address any necessary registration changes, file for exceptions through the Rules of Procedure exception process and address any required training. The SDT also acknowledges that the potential exists for extenuating circumstances that will need to be addressed through the regional transition plans. In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.		
Rochester Gas and Electric	Yes	If the definition and inclusions and exclusions are not sufficiently specific and clear,

Organization	Yes or No	Question 11 Comment
and New York State Electric and Gas		stakeholders will flood NERC and RROs with interpretation requests and/or apply the definition and its inclusions or exclusions incorrectly. Explanatory figures with one-line diagrams should be developed and shared to illustrate the system configurations included and excluded in this BES Definition. This would be very helpful for definition clarity. This should be done as part of an "Application Guide" for the BES Definition - this has precedence in CIP-002 version 5. Attached is a sample set of one-line diagrams with interpretations based upon the inclusions and exclusions developed by Northeast Power Coordinating Council members for discussion purposes as an example, but note that there is not a uniform agreement on these diagrams based on the BES Definition as written, due to lack of clarity.
Response: The development of a guidance document which contains generic diagrams is a portion of the overall project that the SDT feels is necessary to ensure the consistent application of the BES definition going forward. Therefore the SDT has determined that such a document will be developed during Phase 2 of the project. The SDT thanks Rochester for the appended drawings but wishes to point out that the SDT does not agree with some of the depictions shown on the drawings thus pointing out the need for an eventual guidance document.		
Central Maine Power Company	Yes	If the definition and inclusions and exclusions are not sufficiently specific and clear, stakeholders will flood NERC and RROs with interpretation requests and/or apply the definition and its inclusions or exclusions incorrectly. Explanatory figures with one-line diagrams should be developed and shared to illustrate the system configurations included and excluded in a BES Definition. This would be very helpful for definition clarity. This should be done as part of an "Application Guide" for the BES Definition - there is precedence for an "Application Guide" with graphical support in CIP-002 version 5. A sample set of one-line diagrams with interpretations based upon the inclusions and exclusions developed by Northeast Power Coordinating Council members for discussion purposes is available as an example, but note that there is not a uniform agreement on these diagrams based on the BES Definition as written, due to lack of clarity.

Organization	Yes or No	Question 11 Comment
Nebraska Public Power District	Yes	Regarding the Local Network: Can there be some additional technical documents or examples provided for the most common configurations? The LN document is a good document to provide guidance, however the supply of common configuration examples would be very helpful in determining LN applicability. Examples where technical document with examples would be helpful: 1. If a breaker and a half source substation provides two parallel 115 kV lines feeding a load only substation from separate breaker and a half legs at the source substation, would the two parallel lines feeding the load be a LN distribution network feed since they are from the same source substation? 2. if there is a radial feed from a ring bus or a breaker and a half configuration to a radial load on a single line can the portion of the ring bus or breaker and a half bus between the line breakers and the breakers themselves at the source substation be excluded from the BES? 3. Can some legs of a 115kV breaker and a half substation be disgnated BES and the other legs be non BES depending on how the BES lines and loads tie in to the breaker and half legs? 4. In determining if elements are BES is there any consideration to fault locations and if these faults would interrupt BES flow on ring bus or breaker and a half configurations to help determine what is BES? If so, how many contingencies would be considered to interrupt BES flow?
Response: The development of a guidance document which contains generic diagrams is a portion of the overall project that the SDT feels is necessary to ensure the consistent application of the BES definition going forward. Therefore the SDT has determined that such a document will be developed during Phase 2 of the project.		
Ameren	Yes	a) We believe this revised definition is an improvement over the previous posting, a step in the right direction. b) The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. Our concern is how this revised definition will impact entity registration, i.e., how will the revised definition be integrated into the Compliance Registry Criteria. The implementation plan should include how the integration is going to occur. The Rules of Procedure exception process should be further defined or referenced in this definition.

Organization	Yes or No	Question 11 Comment
		c) See Question 1 response: The general concept is sound, but the Inclusion and Exclusion sections create so many circular references it is virtually impossible to take a definitive stance on whether an asset is included or excluded to the BES definition. Please revise the inclusion and exclusion criteria to give pinpointed statements that are final and do not reference other criteria, that then again reference other criteria
Response: a) The SDT acknowledges and appreciates the continued support of the project. b) The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The BES definition will be utilized in conjunction with the ERO Statement of Compliance Registry Criteria to determine how entities will be registered. As the SDT progresses through phase 2 of the project, consideration will be given to establish a definition that will eventually be the definitive document to determine registration requirements. The Rules of Procedure exception process is referenced in the current draft version of the BES definition in a note which states: "Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process". c) The SDT has made several revisions that the address the clarity issues raised by commenter's. For a detailed response concerning the specific clarifications made by the SDT, see the individual responses for the appropriate question. The application of the bright-line definition of the BES is explained in the detail in the Summary Consideration at the beginning of this question.		
MEAG Power	Yes	The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. We are concerned how this revised definition will impact entity registration, i.e., how will the revised definition be integrated into the Compliance Registry Criteria. The implementation plan should include how the integration is going to occur.

Organization	Yes or No	Question 11 Comment
Response: The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The BES definition will be utilized in conjunction with the ERO Statement of Compliance Registry Criteria to determine how entities will be registered. As the SDT progresses through phase 2 of the project, consideration will be given to establish a definition that will eventually be the definitive document to determine registration requirements. The current Implementation Plan is determining the effective dates of the revised definition and the extended time period for meeting compliance obligations. The revised definition and the current ERO Statement of Compliance Registry Criteria will continue to be utilized in the same manner as today for registration determinations. In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.		
Redding Electric Utility	Yes	
City of Redding	Yes	Redding is concerned that phase 2 will not produce significant rules or criteria that further define the BES; the desire to dedicate adaquate resourses is currently high since FERC has a looming deadline upon NERC, however without deadlines Redding believes that NERC will find it difficult to find the expertise or desire to finish the Project.
Response: The NERC Standards Committee (SC) has approved Phase 2 of Project 2010-17 Definition of the Bulk Electric System as a 'high priority' project. Additionally, the SC has retained the existing SDT and committed to providing the necessary resources through the NERC Technical Committees in providing analysis of technical issues to be addressed in Phase 2 of the project. Furthermore, the		

Organization	Yes or No	Question 11 Comment
SDT will be developing a project schedule for Phase 2, subject to approval by the SC, which will identify the appropriate deadlines throughout the project.		
Indeck Energy Services	Yes	As acknowledged in the response to Question 12 comments on the previous BES definition, the BES definition is expansive compared to the definition of the BPS in the FPA Section 215. The inclusion of the limited Exclusions is an attempt to remedy the situation. However, the Exclusions need to include a fifth one that if, based on studies or other assessments, it can be shown that any tranmission or generator element otherwise identified as part of the BES is not important to the reliability of the BPS, then that element should be excluded from the mandatory standards program. There has never been a study to show that elements, such as a 20 MW wind farm, 60 MW merchant generator (which operates infrequently in the depressed market) in a large BA (eg NYISO) or a radial transmission line connecting a small generator are important to the reliability of the BPS. They are covered by the mandatory standards program through the registration criteria. The BES Definition is the opportunity to permit an entity to demonstrate that an element is unimportant to reliability of the BPS. The SDT has identified a small subset of elements that it is willing to exclude. By their very nature, these exclusions dim the bright line that is the stated goal of this project. However, the SDT's foresight seems limited in its selections. Analytical studies are used to evaluate contingencies that could lead to the Big Three (cascading outages, instability or voltage collapse). Such a study showing that a transmission or generation element is bounded by the N-1 or N-2 contingency would exclude it from the BES definition. For example, in a BA with a NERC definition Reportable Disturbance of approximately 400 MW (eg NYISO), a 20 MW wind farm, 60 MW merchant generator or numerous other smaller facilities would be bounded by larger contingencies. It would take more than six 60 MW merchant generators with close location and common mode failure to even be a Reportable Disturbance, much less become the N-1 contingency for the Big Three. Exclusion E5 should be "E5 - Any facility that can be demonstrated to the Regional Entity by analytical study or other assessment to be unimportant to the reliability of the BPS (with periodic reports by

Organization	Yes or No	Question 11 Comment
		the Regional Entity to NERC of any such assessments)."
Response: The concerns of the commenter are addressed by the implementation of the Rules of Procedure exception process, which establishes the exclusion methods described by the commenter. The commenter's suggested language leaves Regional discretion in the process, which is a cited concern requiring elimination by the Commission, in the Orders No. 743 and 743-A. The SDT has provided a reference to the Rules of Procedure exception process in the definition with the following language: "Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process."		
Kootenai Electric Cooperative Michigan Public Power Agency Clallam County PUD No.1 Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative (CCEC) Central Electric Cooperatve (CEC) Clearwater Power Company (CPC) Snohomish County PUD Consumer's Power Inc. Douglas Electric Cooperative (DEC) Fall River Rural Electric Cooperative (FALL) Lane Electric Cooperative	No	KEC extends its thanks to the SDT and to the many industry entities that have actively participating in the Standards Development Process. KEC strongly supports the current draft and believes, with certain refinements discussed in our comments, that the definition will serve the industry and reliability regulators well for many years to come. In addition, as noted earlier, KEC is encouraged that the 20/75 MVA generation thresholds referred to in the NERC Statement of Compliance Registry Criteria, which have been relied upon by the SDT largely as a matter of necessity, will be reviewed and a technical assessment will be performed to identify the appropriate generation unit and plant size threshold to ensure a reliable North America. Finally, we understand that the Rules of Procedure Team will continue to move forward with developing an Exceptions Process that will complement the BES Definition and ensure that, to the extent the BES Definition is over-inclusive, facilities that should not be classified as BES will be excluded from the BES. Because the Exceptions Process is integral to a workable BES Definition, we support the current process for moving forward with the Exceptions Process and the BES Definition on parallel paths. We note that KEC specifically supports the changes made by the SDT in the "Effective Date" provision of the BES Definition, which shortens the effective date of the new definition to the beginning of the first calendar quarter after regulatory approval (as opposed to the first calendar quarter twenty-four months after regulatory approval), with a 24-month transition period. KEC supports this conclusion because it will allow entities seeking deregistration under the terms of the new BES definition to obtain the benefits of the new definition without an unreasonable wait, while allowing any entities that may be newly-classified as BES owners or operators sufficient time to

RFC Suggested changes to definition:

Bulk Electric System (BES): Unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. ~~This does not include facilities used in the local distribution of electric energy.~~ The BES includes:

~~**Inclusions:**~~

- I1 - Transformers with primary and secondary terminals operated at 100 kV or higher. ~~unless excluded under Exclusion E1 or E3~~for local distribution or retail customers~~.~~
- I2 - Generating resources as described in the ERO Statement of Compliance Registry Criteria including the generator terminals through the high-side of the step-up transformer(s), connected at a voltage of 100 kV or above.
- I3 - Blackstart Resources and associated designated ~~blackstart~~ Cranking Paths operated at 100 kV or higher, identified in the Transmission Operator's restoration plan. ~~regardless of voltage level.~~
- ~~I4 - Dispersed power producing resources as described in the ERO Statement of Compliance Registry Criteria utilizing a system designed primarily for aggregating capacity, connected at common point at a voltage of 100 kV or above.~~
- **I4~~5~~** –Static or dynamic devices dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in ~~Inclusion~~ I1.

This definition does not include facilities used in the local distribution of electric energy or retail customers, which are:~~-~~

~~**Exclusions:**~~

- E1 - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher from a single transmission source originating with a single~~n~~ automatic interruption device and:
    a) Only serves Load. Or,
    b) Only includes generation resources not identified in ~~Inclusion~~ I3, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,
    c) Where the radial system serves Load and includes generation resources, not identified in ~~Inclusion~~ I3,~~-~~ with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

  Note - A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.

- E2 - A generating unit or multiple generating units that serve all or part of retail customer Load with electric energy on the customer's side of the retail meter if:
  - (i) the net capacity provided to the BES does not exceed 75 MVA, and
  - (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.
- E3 - Local Network (LN): A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:

  a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in ~~Inclusion~~ I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);
  b) Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN; and;
  c) Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).
- **E4** – Reactive Power devices owned and operated by the retail customer solely for its own use.

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

Pacificorp additional comments:

5. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I4 (dispersed power)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

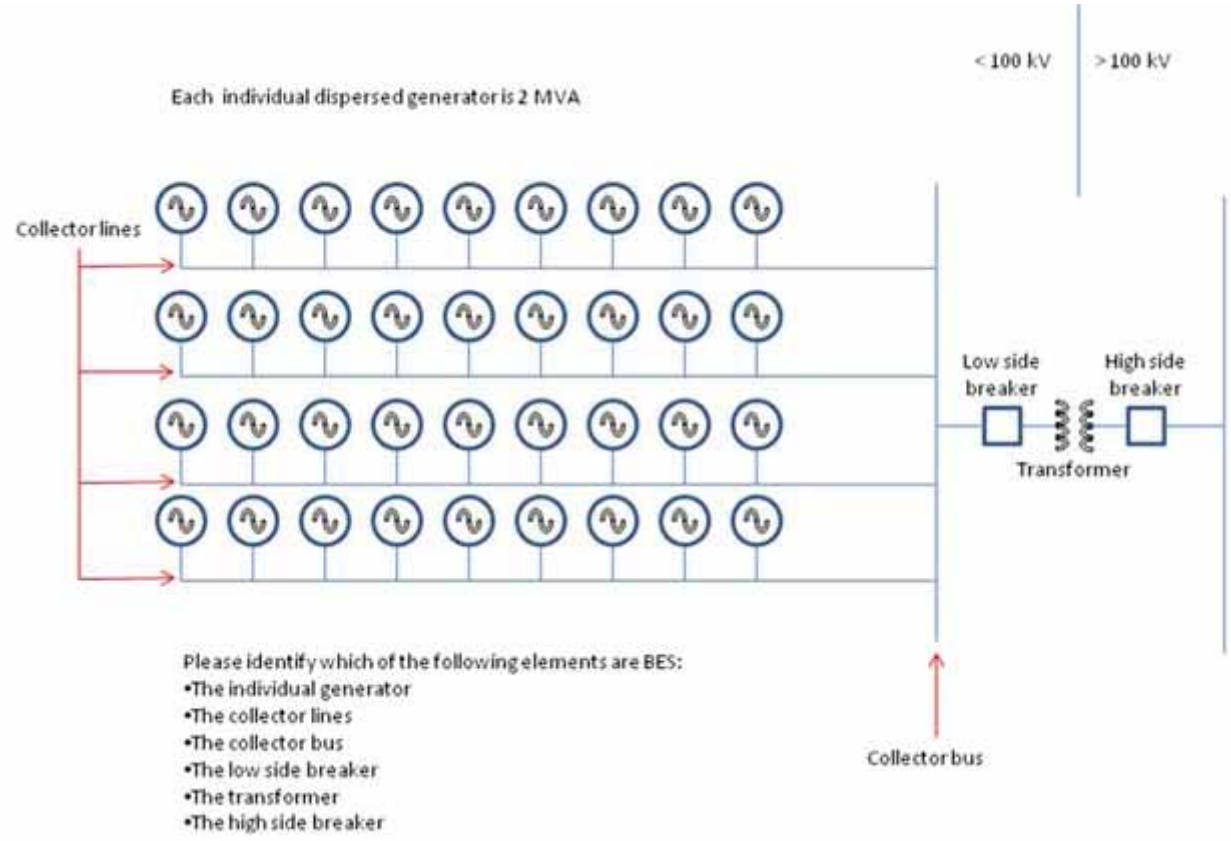
Yes:

No: X

Comments: Setting a dispersed power producing resource limit to 75 MVA at a common point discriminates against single generator owners who own generators between 20 MVA and 75 MVA (inclusion I1), typically connected at a common point and requires such owners to be subject to additional standards that dispersed power producing owners are not required.

However, even with this concern, PacifiCorp supports the entire BES definition in its current form based on the timeframe under which the SDT is operating and with an emphasis based on a phase II SAR to address PacifiCorp's objections regarding generation levels.

Under the attached scenario, please identify which elements would be considered BES:



< 100 kV
> 100 kV
Each individual dispersed generator is 2 MVA
Collector lines
Low side breaker
High side breaker
Transformer
Collector bus
Please identify which of the following elements are BES:
•The individual generator
•The collector lines
•The collector bus
•The low side breaker
•The transformer
•The high side breaker

Rochester Diagrams: These diagrams were supplied by Rochester as examples and do not reflect the SDT's opinion of what is and isn't a BES Element.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment 12/17/10 – 1/21/11
2. SC authorized moving the SAR forward to standard development 3/25/11
3. First posting of definition 4/28/11 – 5/27/11
4. First posting of criteria 5/11/11 – 6/10/11
5. Second posting of definition and criteria plus initial ballot 8/26/11 – 10/10/11

Description of Current Draft

This draft is the third posting and recirculation ballot of the revised definition of the Bulk Electric System (BES). It is for a 10-day recirculation voting period.

Anticipated Actions	Anticipated Date
30-day Formal Comment Period	4/28/11
45-day Formal Comment Period with Parallel Initial Ballot	September 2011
Recirculation ballot	November 2011
BOT adoption	January 2012

Effective Dates

This definition shall become effective on the first day of the second calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the definition will go into effect on the first day of the second calendar quarter after Board of Trustees adoption. Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition.

Version History

Version	Date	Action	Change Tracking

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bulk Electric System (BES): Unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- **I1** - Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded under Exclusion E1 or E3.
- **I2** - Generating resource(s) with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.
- **I3** - Blackstart Resources identified in the Transmission Operator's restoration plan.
- **I4** - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above.
- **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

Exclusions:

- **E1** - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:
    a) Only serves Load. Or,
    b) Only includes generation resources, not identified in Inclusion I3, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,
    c) Where the radial system serves Load and includes generation resources, not identified in Inclusion I3, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

  Note – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.

- **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.
- **E3** - Local networks (LN): A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:
    a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating) ;
    b) Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and
    c) Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).
- **E4** – Reactive Power devices owned and operated by the retail customer solely for its own use.

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment 12/17/10 – 1/21/11
2. SC authorized moving the SAR forward to standard development 3/25/11
3. First posting of definition 4/28/11 – 5/27/11
4. First posting of criteria 5/11/11 – 6/10/11
4.5. Second posting of definition and criteria plus initial ballot 8/26/11 – 10/10/11

Description of Current Draft

This draft is the ~~second~~third posting and recirculation ballot of the revised definition of the Bulk Electric System (BES). It is for a ~~45-day formal comment and parallel~~ 10-day recirculation voting period.

Anticipated Actions	Anticipated Date
30-day Formal Comment Period	4/28/11
45-day Formal Comment Period with Parallel Initial Ballot	September 2011
Recirculation ballot	~~December~~November 2011
BOT adoption	January 201~~1~~2

Effective Dates

This definition shall become effective on the first day of the second calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the definition will go into effect on the first day of the second calendar quarter after Board of Trustees adoption. Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bulk Electric System (BES): Unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- **I1** - Transformers with the primary terminal and at least one secondary terminal~~s~~ operated at 100 kV or higher unless excluded under Exclusion E1 or E3.
- **I2** - Generating resource(s) ~~(~~with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA ~~per the ERO Statement of Compliance Registry Criteria)~~ including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.
- **I3** - Blackstart Resources identified in the Transmission Operator's restoration plan.
- **I4** - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above.
- **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

Exclusions:

- **E1** - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:
  a) Only serves Load. Or,
  b) Only includes generation resources, not identified in Inclusion ~~-~~I3, ~~-~~with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,
  c) Where the radial system serves Load and includes generation resources, not identified in Inclusion ~~-~~I3, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

  Note – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.

- **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail ~~customer~~ Load with electric energy ~~on the customer's side of the retail meter~~ if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.
- **E3** - Local networks (LN): A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:
    a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating) ;
    b) Power flows only into the LN~~:~~ and ~~T~~the LN does not transfer energy originating outside the LN for delivery through the LN; and
    c) Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).
- **E4** – Reactive Power devices owned and operated by the retail customer solely for its own use.

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for Project 2010-17:
Definition of BES

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this project can be implemented. However, this definition relies heavily on the fact that an approved exception process exists in the NERC Rules of Procedure.

Effective Dates

This definition shall become effective on the first day of the second calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required the definition shall go into effect on the first day of the second calendar quarter after Board of Trustees adoption.

Compliance obligations for all newly identified Elements included by the definition shall begin 24 months after the applicable effective date of the definition.

The SDT realizes that Order 743 suggested a maximum of 18 months for implementation of a revised definition of the BES. The 24 month period cited here is based on the various rehearing requests filed by entities expected to be affected by the revised definition. Thus, the SDT believes that this is a more realistic timeframe in which to effect any changes.

The SDT believes that the timeframe shown is needed to:

- Effectively produce reasonable transition plans – As shown in Order 743, part of the overall process of revising the definition of BES is for the ERO and Regional Entities to develop transition plans on a region by region basis to accommodate any changes needed in those regions due to the revised definition. The transition plans will include any actions necessary for entities to achieve compliance on any issues brought about by the revised definition.
- Submit any necessary registration changes – While Order 743 states that a revised definition should provide clarity and not necessarily require major changes to registration; it is possible that the revised definition may cause some registration changes. Entities will need time to submit their changes and for those changes to work their way through the process.
- File for exceptions – The revised definition does not exist in a vacuum. There is a corresponding process for entities to request exceptions for specific equipment or configurations. This process will be defined in the NERC Rules of Procedure and will involve individual entities or the Regional Entities having to make a technical case to justify the exception. This process will take some time to complete and it would be expected that there will be an initial backlog of cases to process.
- Provide training – Entities will need to train their operators and personnel on changes to their operations brought about by the revised definition.

The existing definition of BES shall be retired at midnight of the day immediately prior to the effective date of the new definition of BES in the particular jurisdiction in which the new definition is becoming effective.

Implementation Plan for Project 2010-17:
Definition of BES

Prerequisite Approvals

The existing definition of BES shall be retired at midnight of the day immediately prior to the effective date of the new definition of BES in the particular jurisdiction in which the new definition is becoming effective.

Detailed Information to Support an Exception Request

Entities that have Element(s) designated as excluded, under the BES definition and designations, do not have to seek exception for those Elements under the Exception Procedure.

General Instructions:

A one-line breaker diagram identifying the Element(s) for which the exception is requested must be supplied with every request. The diagram(s) supplied should also show the Protection Systems at the interface points associated with the Elements for which the exception is being requested.

Entities are required to supply the data and studies needed to support their submittal. Studies should:

- Be based on an Interconnection-wide base case that is suitably complete and detailed to reflect the electrical characteristics and system topology
- Clearly document all assumptions used
- Address key performance measures of BES reliability through steady-state power flow, and transient stability analysis as necessary to support the entity's request, consistent with the methodologies described in the Transmission Planning (TPL) standard and commensurate with the scope of the request

Supporting statements for your position from other entities are encouraged.

List any attached supporting documents and any additional information that is included to support the request:

DRAFT

Detailed Information to Support an Exception Request

For Transmission Elements:

1. Is there generation connected to the Element(s)?

   ☐ Yes ☐ No

   If yes, what are the individual gross nameplate values of each unit?

   Description/Comments:

2. How do/does the Element(s) impact permanent Flowgates in the Eastern Interconnection, major transfer paths within the Western Interconnection, or a comparable monitored facility in the ERCOT Interconnection or the Quebec Interconnection?

   Please list the Flowgates or paths considered in your analysis along with any studies or assessments that illustrate the degree of impact:

3. Is/Are the Element(s) included in an Interconnection Reliability Operating Limit (IROL) in the Eastern Interconnection, ERCOT Interconnection, or Quebec Interconnection or a major transfer path rating in the Western Interconnection?

   ☐ Yes ☐ No

   Please provide the appropriate list for the operating area where the Element(s) is located:

4. How does an outage of the Element(s) impact the over-all reliability of the BES? Please provide study results that demonstrate the most severe system impact of the outage of the Element(s) and the rationale for your response:

DRAFT

Detailed Information to Support an Exception Request

5. Is/Are the Element(s) used for off-site power supply to a nuclear power plant as designated in a mutually agreed upon Nuclear Plant Interface Requirement (NPIR)?

   ☐ Yes ☐ No

   Description/Comments:

6. Is/Are the Element(s) part of a Cranking Path identified in a Transmission Operator's restoration plan?

   ☐ Yes ☐ No

   Description/Comments:

7. Does power flow through the Element(s) into the BES?

   ☐ Yes ☐ No

   If yes, then using metered or SCADA data for the most recent consecutive two calendar year period, what is the minimum and maximum magnitude of the power flow out of the Element(s)? Describe the conditions and the time duration when this occurs?

DRAFT

Detailed Information to Support an Exception Request

For Generation Resources:

1. What is the MW value of the host Balancing Authority's most severe single Contingency and what is the generation resources percent of this value?

   Please provide the values and a reference to supporting documents:

2. Is the generation resource used to provide reliability-related Ancillary Services?

   ☐ Yes ☐ No

   If so, what reliability-related Ancillary Services are the generation resource supplying:

3. Is the generation resource designated as a must run unit for reliability?

   ☐ Yes ☐ No

   Please provide the appropriate reference for your operating area:

4. How does an outage of the generation resource impact the over-all reliability of the BES? Please provide study results that demonstrate the most severe system impact of the outage of the generator and the rationale for your response:

5. Does the generation resource use the BES to deliver its actual or scheduled output, or a portion of its actual or scheduled output, to Load?

   ☐ Yes ☐ No

   Description/Comments:

DRAFT

Detailed Information to Support an Exception Request

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2010-17 Definition of Bulk Electric System

Two Recirculation Ballot Windows Open: Thursday, November 10 – Monday, November 21, 2011

Now Available

Two recirculation ballot windows are now open for Project 2010-17 Definition of Bulk Electric System (BES). The first is for the definition of Bulk Electric System and the associated Implementation Plan, and the second is for a draft application form titled *Detailed Information to Support an Exception Request* referenced in the proposed Rules of Procedure BES Definition Exception Process. Both recirculation ballots are open through 8 p.m. Eastern on Monday, November 21, 2011.

Since the initial ballot, the drafting team has considered all comments received during the formal comment period and initial ballots of the definition and *Detailed Information to Support an Exception Request* form, and made clarifying modifications to the Bulk Electric System Definition and Implementation Plan in the following areas:

- Clarified the wording in Inclusion I1 to indicate that at least one secondary terminal must be at 100 kV or higher to accommodate multiple terminal transformers.
- Removed the reference to the ERO Statement of Compliance Registry Criteria in Inclusion I2 so that there is no chance of the registry values being changed and affecting the definition prior to resolution of threshold values in Phase 2 of this project.
- Clarified that generators were not part of Inclusion I5 to avoid improperly pulling in small generators.
- Clarified the issue of power flow into the local network in Exclusion E3.b.
- Clarified the compliance obligation date of the revised definition in the Implementation Plan.

The drafting team made the following clarifying modifications to the *Detailed Information to Support an Exception Request form* referenced in the Rules of Procedure Exception Process:

- General – Clarified that it was the intent of the drafting team to allow an entity to submit any data or information that it feels supports the exception request.
- General – Clarified the use of facility versus Element(s).
- Generation Questions:

- Clarified several questions by consistently using 'generation resource's' vs. 'generator's' or 'generator facility's'.
- Clarified several questions by clearly identifying reliability-related purposes associated with the generation resources.

In response to industry concerns, the drafting team has provided a detailed explanation of the hierarchy of the BES definition, including the proper application of the Inclusions and Exclusions for the identification of BES Elements (See Consideration of Comments report posted on project page of the NERC website). Additionally, the drafting team explained the rationale behind the creation of the *Detailed Information to Support an Exception Request* form and the guidance it provides for evaluating a request.

A presentation made in support of the NERC Standards and Compliance Workshop held in Atlanta, GA on October 26 – 30, 2011 provides a detailed explanation of the 'phased' project approach to the revision of the BES definition as well as addressing the modifications to the BES definition, the Implementation Plan, and the application form titled *Detailed Information to Support an Exception Request*. The presentation (audio and power-point) is available on the NERC website at the following link: http://www.nerc.com/page.php?cid=2|247|326.

Documents associated with this project, including clean and redline copies of the definition, the Implementation Plan, the *Detailed Information to Support an Exception Request* form referenced in the Rules of Procedure Exception Process and the drafting team's consideration of comments submitted during the parallel formal comment period and initial ballot that ended on October 10, 2011, have been posted on the project page.

Instructions for Balloting in the Recirculation Ballots

In a recirculation ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their prior votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the recirculation ballot window. If a ballot pool member does not participate in the recirculation ballot, that member's last vote cast in the initial ballot that ended on October 10, 2011 will be carried over and will be used to determine if there are sufficient affirmative votes for approval.

Members of the two ballot pools associated with the definition and application form may log in and submit their votes in the recirculation ballots from the following page: https://standards.nerc.net/CurrentBallots.aspx.

Next Steps

If the definition and application form achieve ballot pool approval, they will be presented to the Board of Trustees for adoption and subsequently filed with regulators for approval along with the proposed Rules of Procedure additions (Sections 509 and 1703). FERC Orders 743 and 743-A require that the revised definition and an approach to determine exceptions be filed with FERC by January 25, 2012.

The Standards Committee and NERC Board of Trustees have recommended that the drafting team address issues such as generation thresholds in a second phase of this project. This approach will ensure that the drafting team has sufficient time to adequately consider and develop a sound technical basis for an approach, and will allow the drafting team to meet the regulatory deadline in FERC Orders 743 and 743A (filing by January 25, 2012). The drafting team has posted a draft Supplemental Standards Authorization Request (SAR) for information purposes only; the SAR will be posted for comment at a future time.

Additional information about the project, including a Fact Sheet and additional informational documents, has been posted on the project page.

Background

On November 18, 2010 FERC issued Order 743 (amended by Order 743A) and directed NERC to revise the definition of Bulk Electric System so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. Additional specificity will reduce ambiguity and establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

In addition, NERC was directed to develop a process for identifying any Elements or Facilities that should be excluded from the BES. NERC is working to address these directives with two activities – the definition of Bulk Electric System is being revised through the standard development process and a BES Definition Exception Process is being developed as proposed modifications to the Rules of Procedure. The proposed modifications to the Rules of Procedure were posted for a comment period through October 27, 2011.

The work of the BES Definition Exception Process (Rules of Procedure) team has been publicly posted at: http://www.nerc.com/filez/standards/Rules_of_Procedure-RF.html.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Standards Announcement

Project 2010-07 Definition of Bulk Electric System

Recirculation Ballot Results

Now Available

Two recirculation ballots, for the definition of Bulk Electric System (BES) and for the application form titled 'Detailed Information to Support a Request for a BES Exception,' closed on November 21, 2011. Both recirculation ballots achieved stakeholder approval.

Voting statistics for each ballot are listed below, and the Ballot Results Web page provides a link to the detailed results.

BES Definition	Detailed Information to Support a Request for BES Exception
Quorum: 95.92%	Quorum: 93.02%
Approval: 81.32%	Approval: 81.48%

Next Steps

The definition of Bulk Electric System, its associated implementation plan and the supporting application form titled 'Detailed Information to Support a BES Exception Request' will be presented to the NERC Board of Trustees for adoption and subsequently filed with regulatory authorities. A set of proposed changes to the Rules of Procedure to provide a process for determining exceptions to the definition of BES is near completion and will be presented to the NERC Board of trustees for approval at the same time as the BES definition. The regulatory deadline in FERC Orders 743 and 743A requires that the revised definition of BES and process for handling exceptions be filed by January 25, 2012.

Additional information about the project, including a Fact Sheet and additional informational documents, has been posted on the project page.

Background

On November 18, 2010 FERC issued Order 743 (amended by Order 743A) and directed NERC to revise the definition of Bulk Electric System so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. Additional specificity will reduce ambiguity and establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

In addition, NERC was directed to develop a process for identifying any Elements or Facilities that should be excluded from the BES. NERC addressed these directives with two activities – the definition of Bulk Electric System was revised through the standard development process and a BES Definition Exception Process has been developed as proposed modifications to the Rules of Procedure. The work of the BES Definition Exception Process has been publicly posted at: http://www.nerc.com/filez/standards/Rules_of_Procedure-RF.html.

Standards Authorization Request

Title of Proposed Standard definition	NERC Glossary of Terms - Phase 2: Revision of the Bulk Electric System
Request Date	December 2, 2011

SAR Requester Information	SAR Type (Check all that apply)	
Name: Project 2010-17 Definition of Bulk Electric System (BES) SDT	☐	New Standard
Primary Contact: Peter Heidrich (Manager of Reliability Standards, FRCC) , Project 2010-17 Definition of Bulk Electric System (BES) SDT Chair	X	Revision to existing Standard
Telephone: (813) 207-7994 Fax: (813) 289-5646	☐	Withdrawal of existing Standard
E-mail: pheidrich@frcc.com	☐	Urgent Action

SAR Information
Industry Need (What is the industry problem this request is trying to solve?)
This project supports the ERO's obligation to identify the Elements necessary for the reliable operation of the interconnected transmission network to ensure that the ERO, the Regional Entities, and the industry have the ability to properly identify the applicable entities and Elements subject to the NERC Reliability Standards.
Purpose or Goal (How does this request propose to address the problem described above?)
Research possible revisions to the definition of BES (Phase 2) to address the issues identified through Project 2010-17 Definition of Bulk Electric System (BES) (Phase 1). The definition encompasses all Elements necessary for the reliable operation of the interconnected transmission network. The definition development may include other improvements to the definition as deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing a high quality and

SAR Information
technically sound definition of the Bulk Electric System (BES).
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?)
Revise the BES definition to identify the appropriate electrical components necessary for the reliable operation of the interconnected transmission network.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
Collect and analyze information needed to support revisions to the definition of Bulk Electric System (BES) developed in Phase 1 of this project to provide a technically justifiable definition that identifies the appropriate electrical components necessary for the reliable operation of the interconnected transmission network. The definition development may include other improvements to the definition as deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing a high quality and technically sound definition of the BES.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
Collect and analyze information needed to support revisions to the definition of BES developed in Phase 1 of this project to provide a technically justifiable definition that identifies the appropriate electrical components necessary for the reliable operation of the interconnected transmission network. The definition development will include an analysis of the following issues which were identified during the development of Phase 1 of Project 2010-17 Definition of the BES. Clarification of these issues will appropriately define which Elements are necessary for the reliable operation of the interconnected transmission network. • Develop a technical justification to set the appropriate threshold for Real and Reactive Resources used in the operation of the Bulk Electric System (BES) • Determine if there is a technical justification to support the assumption that there is a reliability benefit of a contiguous BES • Determine if there is technical justification for including the equipment which "supports" the reliable operation of the BES • Determine if there is a technical justification to support an automatic interrupting device in Exclusions E1 and E3 • Determine if there is a technical justification to support the inclusion of Cranking Paths and

SAR Information
Blackstart Resources • Determine if there is a technical justification for selection of 100 kV as the bright-line voltage level • Determine if there is a technical justification to support allowing power flow out of the local network under certain conditions and if so, what the maximum allowable flow should be Provide improved clarity to the following: • The relationship between the BES definition and the ERO Statement of Compliance Registry Criteria established in FERC Order 693 • The use of the term "non-retail generation" • The language for Inclusion I4 on dispersed power resources • The appropriate 'points of demarcation' between Transmission, Generation, and Distribution Phase 2 of the definition development may include other improvements to the definition as deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing a high quality and technically justifiable definition of the BES. Based on the potential revisions to the definition of the BES and an analysis of the application of, and the results from, the exception process, the drafting team will review and if necessary propose revisions to the 'Technical Principles' associated with the Rules of Procedure Exception Process to ensure consistency in the application of the definition and the exception process.

Reliability Functions

The Standard will Apply to the Following Functions (Check box for each one that applies.)		
This section is not applicable as the SAR is for a definition which is about Elements. Elements of the BES may impact all functions, however Applicability to entities is covered in Section 4 of each Reliability Standard.		
☐	Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.

The Standard will Apply to the Following Functions (Check box for each one that applies.)		
☐	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐	Transmission Owner	Owns and maintains transmission facilities.
☐	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☐	Generator Owner	Owns and maintains generation facilities.
☐	Generator	Operates generation unit(s) to provide real and reactive power.

The Standard will Apply to the Following Functions (Check box for each one that applies.)		
	Operator	
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles (Check box for all that apply.)	
X	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
X	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
X	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
X	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
X	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
X	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

Applicable Reliability Principles (Check box for all that apply.)	
X	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
X	8. Bulk power systems shall be protected from malicious physical or cyber attacks.
Does the proposed Standard comply with all of the following Market Interface Principles? (Select 'yes' or 'no' from the drop-down box.)	
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment 12/17/10 – 1/21/11
2. SC authorized moving the SAR forward to standard development 3/25/11
3. First posting of definition 4/28/11 – 5/27/11
4. First posting of criteria 5/11/11 – 6/10/11
5. Second posting of definition and criteria plus initial ballot 8/26/11 – 10/10/11

Description of Current Draft

This draft is the third posting and recirculation ballot of the revised definition of the Bulk Electric System (BES). It is for a 10-day recirculation voting period.

Anticipated Actions	Anticipated Date
30-day Formal Comment Period	4/28/11
45-day Formal Comment Period with Parallel Initial Ballot	September 2011
Recirculation ballot	November 2011
BOT adoption	January 2012

Effective Dates

This definition shall become effective on the first day of the second calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the definition will go into effect on the first day of the second calendar quarter after Board of Trustees adoption. Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition.

Version History

Version	Date	Action	Change Tracking
1	TBD	Respond to FERC Order No. 743 to clarify the definition of the Bulk Electric System	N/A

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bulk Electric System (BES): Unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- **I1** - Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded under Exclusion E1 or E3.
- **I2** - Generating resource(s) with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.
- **I3** - Blackstart Resources identified in the Transmission Operator's restoration plan.
- **I4** - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above.
- **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

Exclusions:

- **E1** - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:
    a) Only serves Load. Or,
    b) Only includes generation resources, not identified in Inclusion I3, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,
    c) Where the radial system serves Load and includes generation resources, not identified in Inclusion I3, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

  Note – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.

- **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.
- **E3** - Local networks (LN): A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:
    a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating) ;
    b) Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and
    c) Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).
- **E4** – Reactive Power devices owned and operated by the retail customer solely for its own use.

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

Project 2010-17 Phase 2 - Definition of BES

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the SAR. The electronic comment form must be completed by **February 3, 2012.**

If you have questions please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 1.609.947.3673.

2010-17 Definition of BES project page

Background Information

This posting is for soliciting comment.

This SAR is a direct result of the industry comment periods for Project 2010-17 Definition of BES Phase 1 where the industry indicated a need for further detailed examination of the technical concepts underlying the BES definition. Due to time constraints in Phase 1 brought about by the FERC Orders driving the revised definition, any expansion of the scope of Phase 1 was deferred to Phase 2 where time deadlines would be less of an issue. The language of the SAR is such that any and all aspects of the Phase 1 definition are open to discussion and possible revision. However, the SDT outlined some of the major points that were brought up in Phase 1 by bulleting them in the SAR description. The SDT does not consider this list to be an all exclusive one – it is simply a brief listing of those issues that were identified in Phase 1.

You do not have to answer all questions. Enter all comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.

The scope of this project includes:

Collect and analyze information needed to support revisions to the definition of BES developed in Phase 1 of this project to provide a technically justifiable definition that identifies the appropriate electrical components necessary for the reliable operation of the interconnected transmission network. The definition development will include an analysis of the following issues which were identified during the development of Phase 1 of Project 2010-17 Definition of the BES. Clarification of these issues will appropriately define which Elements are necessary for the reliable operation of the interconnected transmission network.

- Develop a technical justification to set the appropriate threshold for Real and Reactive Resources used in the operation of the Bulk Electric System (BES)
- Determine if there is a technical justification to support the assumption that there is a reliability benefit of a contiguous BES
- Determine if there is a technical justification for the equipment which "supports" the reliable operation of the BES but is installed on the distribution system
- Determine if there is a technical justification to support an automatic interrupting device in Exclusions E1 and E3
- Determine if there is a technical justification to support the inclusion of Cranking Paths and Blackstart Resources
- Determine if there is a technical justification for selection of 100 kV as the bright-line voltage level
- Determine if there is a technical justification to support allowing power flow out of the local network under certain conditions and if so, what the maximum allowable flow should be

Provide improved clarity to the following:

- The relationship between the BES definition and the ERO Statement of Compliance Registry Criteria established in FERC Order 693
- The use of the term "non-retail generation"
- The language for Inclusion I4 on dispersed power resources
- The appropriate 'points of demarcation' between Transmission, Generation, and Distribution

Phase 2 of the definition development may include other improvements to the definition as deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing a high quality and technically justifiable definition of the Bulk Electric System (BES).

Based on the potential revisions to the definition of the Bulk Electric System (BES) and an analysis of the application of, and the results from, the exception process, the drafting team will review and if necessary propose revisions to the 'Technical Principles' associated with the Rules of Procedure Exception Process to ensure consistency in the application of the definition and the exception process.

1. Do you agree with this scope? If not, please explain.

   ☐ Yes

   ☐ No

   Comments:

The SDT has identified several issues that are included in the scope of Phase 2 of the project that are associated with the technical aspects of the definition and require technical justification to drive a revision to the definition. Compelling technical justification is an essential component in moving any revision forward that addresses the technical nature of the BES definition. The SDT is seeking to identify existing technical justifications (i.e., completed studies, technical papers, etc.) and requests your assistance to properly identify resources available to the SDT which will facilitate the SDT's work in prioritizing its efforts.

Note: The SDT does not intend to respond to all responses associated with an entity's knowledge of existing technical justification (i.e. analysis methodologies, completed studies, technical papers, etc.). The SDT is collecting potential resources that could assist in the development of compelling technical justification.

2. Do you agree that the SDT should pursue the development of technical justification to set thresholds for Real and Reactive Power Resources used in the reliable operation of the BES different from those presently existing in the BES definition?

   ☐ Yes

   ☐ No

   Comments:

   a. Are you aware of existing technical justification (i.e., analysis methodologies, completed studies, technical papers, etc.) that would assist the SDT in the development of technical justification for this issue? If so, please provide details in the 'Comments' field.

   ☐ Yes

   ☐ No

   Comments:

3. Do you agree that the SDT should pursue technical justification that supports the assumption that there is a reliability benefit of a contiguous BES?

   ☐ Yes

   ☐ No

   Comments:

a. Are you aware of existing technical justification (i.e., analysis methodologies, completed studies, technical papers, etc.) that would assist the SDT in the development of technical justification for this issue? If so, please provide details in the 'Comments' field.

☐ Yes

☐ No

Comments:

4. Do you agree that the SDT should pursue technical justification for including in the BES definition the equipment which "supports" the reliable operation of the BES?

☐ Yes

☐ No

Comments:

Standards Announcement

Project 2010-17 Definition of Bulk Electric System Phase 2

Comment Period Now Open: January 4 – February 3, 2012

Now Available

The Definition of Bulk Electric System Standard Drafting Team (DBES SDT) has posted a Standard Authorization Request (SAR) for Phase 2 of Project 2010-17 Definition of Bulk Electric System for comment through 8 p.m. Eastern on Friday, February 3, 2012.

During Phase 1 of this project, stakeholders identified a number of possible refinements to clarify which Elements are necessary for the reliable operation of the interconnected transmission network, but because of the regulatory deadline imposed by FERC Orders 743 and 743-A, the team was not able to develop the technical justification required to support making such refinements. The Standards Committee and NERC Board of Trustees supported initiation of Phase 2 of the project to provide an opportunity to further evaluate and develop technical justification for refinements proposed by stakeholders.

The team is seeking comments on the scope of the proposed Phase 2 project as well as specific suggestions for existing sources of data or technical input to support revisions.

Instructions for Commenting

A comment period is open through **8 p.m. Eastern on Friday, February 3, 2012**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

The drafting team will review the comments and determine whether to make changes to the SAR before proceeding with Phase 2 of the project. The drafting team is not obligated to provide individual responses to each comment on existing sources of data or technical input to support revisions but will provide a summary Consideration of Comments on those items.

Background

On November 18, 2010 FERC issued Order 743 and directed NERC to revise the definition of Bulk Electric System so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. Phase 1 of Project 2010-17 Definition of Bulk Electric System achieved stakeholder approval of a revised definition of Bulk Electric

System and application form titled 'Detailed Information to Support an Exception Request' referenced in the Rules of Procedure Exception Process, and the revised definition and exception process will be filed with FERC by the required January 25, 2012 deadline.

Phase 2 of the project is being initiated to develop and analyze technical justification for refinements to the definition that were suggested by stakeholders during Phase 1.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Name and Title	Company and Address	Contact Info	Bio
Pete Heidrich Mgr. of Reliability Standards and SDT Chair	Florida Reliability Coordinating Council 1408 N. Westshore Blvd. Suite 1002 Tampa, FL 33607-4512	1.813.207.7994 pheidrich@frcc.com	Peter Heidrich is Manager of Reliability Standards at the Florida Reliability Coordinating Council (FRCC). Peter joined FRCC in August, 2008 after 16 years at DTE Energy (Detroit Edison) and 8½ years of military service in the United States Navy Nuclear Power Program. Peter is responsible for the development of the FRCC Regional Reliability Standards and associated reliability related policies and procedures (i.e., Regional Criteria, Regional Interpretations, & FAQs, Regional Definitions, etc.) and oversight of the FRCC Reliability Standards Development Process. Additionally, Peter actively participates as the FRCC representative in NERC Reliability Standards development and on various committees, subcommittees, and working groups (i.e., NERC Standards Committee (SC), SC Process Subcommittee, ERO Regional Standards Group (Vice-Chair), Functional Model Working Group, and Results-Based Standard Initiative).
Barry Lawson Associate Director, Power Delivery & Reliability and SDT Vice Chair	National Rural Electric Cooperative Association 4301 Wilson Blvd. GR11-253 Arlington, VA 22203	1.703.907.5781 barry.lawson@nreca.coop	Barry Lawson is the Associate Director, Power Delivery & Reliability at the National Rural Electric Cooperative Association (NRECA). Barry joined NRECA in April 2001, after 18 years in positions with Dominion Virginia Power, Edison Electric Institute, Columbia Gas Transmission, and KEMA Consulting. At NRECA, Barry's current focus is on NERC reliability policy/governance issues, standards development and compliance process developments, and critical infrastructure protection policy issues. In addition, Barry actively participates in BOT, MRC, and SC activities and he is currently the Chair of NERC's Critical Infrastructure Protection Committee (CIPC).
Jennifer Dering Mgr. Operations Planning – Transmission	New York Power Authority 123 Main St. White Plains, NY 10601-3170	1.914.287.3179 Jennifer.dering@nypa.gov	Jennifer Dering is Manager of Operations Planning at the New York Power Authority. Jennifer joined the New York Power Authority 18 years ago after beginning her career at IBM. Jennifer is responsible for the short term operational planning of NYPA's transmission assets that range from 69 kV to 765 kV and span the entire state of New York. Jennifer has held a variety of positions at NYPA prior to her current role in Transmission including roles within Nuclear Licensing, Energy Efficiency, Project

			Management, and Engineering. Jennifer is also a licensed Professional Engineer in the state of New York and a Certified Energy Manager.
Brian Evans-Mongeon Pres. & CEO	Utility Services 25 Crossroad Suite 201 Waterbury, VT 05676	1.802.552.4022 brian.evans-mongeon@utilitysvcs.com	Brian Evans-Mongeon is the President and CEO of Utility Services, Inc., a service firm formed in 2007, specializing in assisting registered entities in the Electric Reliability Organization (ERO) program. As the President and CEO of Utility Services, Brian is responsible for oversight of ERO Compliance and Monitoring for client's in regions across the U.S.; ISO & NEPOOL markets; and Renewable Energy Trading and associated activities. Utility Services is a member in five of the eight NERC regions and its' staff hold a number of committee positions within those regions. Brian is a member of NPCC's Compliance and Regional Standards Committee, and is a participant in the NPCC task force for regional standards on disturbance monitoring. At NERC, Brian is a participant in the Standard Drafting Team for the Under Frequency Load Shedding program (NERC Project 2007-01), is currently a member of the Definition of Bulk Electric System (BES) team (NERC Project 2010-17), and is the current chair of the Standard Drafting Team for Disturbance and Sabotage Reporting (NERC Project 2009-01). Previously, Brian has over twenty years of experience in the electrical utility business working for both Green Mountain Power Corporation as a Power Operations & Administration Manager and Vermont Public Power Supply Authority as a Marketing Services Manager.
Phil Fedora Asst. VP, Reliability Services	Northeast Power Coordinating Council 1040 Avenue of the Americas (6th Ave.) 10th Floor New York, NY 10018-3703	1.212.840.4909 pfedora@npcc.org	Philip Fedora is the Assistant Vice President of Reliability Services, Northeast Power Coordinating Council (NPCC) where he oversees a wide range of power system reliability activities associated with the coordination of system planning, system studies and protection, the assessment of adequacy, and multi-Area Regional planning. Phil is responsible for NPCC's Reliability Assessment and Performance Analysis program area, including liaison with state, federal and provincial governmental/regulatory officials. Phil joined NPCC in July, 1999 after 15 years at ISO-New England/New England Power Planning (NEPOOL), where he was responsible for the management of the ISO-New England Power Supply Reliability activities, and 8 years at Westinghouse Electric, Advanced Systems Technology, providing consulting services for domestic

			and foreign utilities. Phil is NPCC's representative on the NERC Planning Committee, has authored several technical papers on power system modeling and assessment, and is a member of the IEEE – Power Engineering Society and CIGRE. He is a licensed Professional Engineer in the Commonwealth of Pennsylvania.
Ajay Garg Mgr. Policy and Approvals	Hydro One Networks 483 Bay St., TCT St-04 Toronto, Ontario, Canada M5G 2P5	1.416.345.5420 ajay.garg@hydroone.com	Ajay Garg is Manager, Policy & Approvals within Asset Management at Hydro One Networks Inc (formerly Ontario Hydro). Ajay joined Hydro One in 2000, after 15 years in positions with Nova Scotia Power and NPCC. At Hydro One, Ajay's current focus is on NERC reliability policy/governance issues, standards development and compliance process, along with addressing non-jurisdictional regulatory issues. Ajay has been actively involved with the development of NERC and NPCC Standards/Criteria for many years along with his participation on the 2003 NERC blackout investigation team. Ajay also represents Hydro One and/or Canada on various other committees of IEC, IEEE, NERC, NPCC, CEA, and CSA. Ajay is a Canadian representative on IEC TC8 and ACEC along with convener of TC8 HV Transmission Group, and member of NERC-CCC and NPCC -CC. Ajay is a licensed Professional Engineer in the Province of Ontario.
John P. Hughes VP, Technical Affairs	Electricity Consumers Research Council 1111 19th St. NW Washington, DC 20036	1.202.682.1390 jhughes@elcon.org	John Hughes is Vice President of Technical Affairs at the Electricity Consumers Resource Council (ELCON), the national association of large industrial consumers of electricity. John is responsible for managing ELCON's interventions before FERC, DOE, and related state regulatory bodies. John is also author of ELCON policy papers and technical documents on all facets of the electric industry. John joined ELCON in 1987 as technical director after serving as Director of Economic Research at the Niagara Mohawk Power Corporation where he was previously Associate Director of Corporate Planning. Prior to joining Niagara Mohawk in 1982, John was Chief Economist at the Massachusetts Energy Facilities Siting Council. John supervised the council's technical staff regarding the demand forecasts and supply plans of electric and natural gas utilities that operated in the state. John was also directly involved with the council's adjudication of petitions to site transmission lines, natural gas pipelines and gasification facilities, and nuclear power plants. John has been active

			with NERC since 1996, having been a member of the Commercial Practices Working Group, the Market Interface Committee, and the Compliance and Certification Committee (CCC).
Joel Mickey Director, Grid Operations	ERCOT 2705 W. Lake Drive Taylor, TX 76574	1.512.248.3925 jmickey@ercot.com	Joel Mickey is Director of Grid Operations for the Electric Reliability Council of Texas (ERCOT) Joel oversees the system operations control center, operations engineering, operations analysis, and system operations training. Joel joined ERCOT in 2000 as Manager of Market Operations with management responsibilities for wholesale market design, market analysis, demand-side resource support and testing, market clearing price validation and correction, network modeling, and market reporting. Prior to joining ERCOT, Joel worked with a computer software vendor specializing in energy utility systems for restructured markets. Joel started his career in the power industry in 1981 at Houston Lightning and Power (now Centerpoint Energy) where he worked for 15 years in various positions including underground network tester, system controller, and staff consultant. Joel has served on various committees for the North American Electric Reliability Council (NERC) including the Standards Development team for Interchange, and the Electronic Scheduling Committee. Joel currently serves as a member of the North American Energy Standards Board (NAESB) Executive Committee and on NERC's Interchange Subcommittee and on the Standards Drafting Team - Interchange. At ERCOT, he served as the co-chair of the Texas Nodal Team's market operations concept group and chaired the Nodal Transition Plan Task Force.
Jeffrey Mitchell Director, Engineering	Reliability First 320 Springside Dr. Suite 300 Akron, OH 44333	1.330.247.3043 Jeff.mitchell@rfirst.org	Jeff Mitchell is the Director of Engineering at Reliability*First* Corp. (RFC) where he oversees the reliability assessment and performance analysis activities including resource and transmission assessment reports, protection system mis-operation review, event analysis, model development, operations, and the regional standards process. Jeff joined the East Central Area Reliability Coordination Agreement (ECAR) staff in 1997 after 17 years with Ohio Edison (now FirstEnergy) and subsequently the Reliability*First* staff since its inception. Jeff facilitated the development of the Reliability*First* BES definition in 2007 and now handles the interpretation requests. Jeff is currently the chair of the NERC

			Planning Committee and was the initial chair of the Eastern Interconnection Reliability Assessment Group's (ERAG) Management Committee. He is also a licensed Professional Engineer in Ohio and Pennsylvania.
Jerome Murray Senior Electrical Engineer	Oregon Public Utility Commission 550 Capitol St. NE Suite 215 PO Box 2148 Salem, OR 97308-2148	1.503.378.6626 jerry.murray@state.or.us	Jerome Murray is a Senior Electrical Engineer with the Oregon Public Utility Commission (OPUC). Jerome joined OPUC in 1983. Previously, he was an electrical power engineering consultant. Jerome has also worked for PacifiCorp, Pacific Gas and Electric, Southern California Edison, and the Navy Civil Engineer Corps. Jerome is currently responsible for utility regulation development, industry outreach, and compliance oversight associated with OPUC's electric reliability and service quality measure programs. Additionally, Jerome actively participates as the State Government representative on the NERC Operating Committee and the WECC Operating Committee. Jerome also participates in the IEEE Distribution Reliability Working Group and is a licensed professional engineer in the states of Oregon and Washington.
Rich Salgo Director, Electric System Operations	Sierra Pacific Power PO Box 10100 Reno, NV 89520	1.775.834.5874 rsalgo@nvenergy.com	Rich Salgo is the Director of Electric System Control Operations at NV Energy, Inc., which includes the registered entities of Nevada Power Company and Sierra Pacific Power Company. In this role, Rich is responsible for the transmission, distribution, and balancing functions conducted within the NV Energy control centers, including associated operations engineering, training, and energy management system support functions. Among the duties of his present position, Rich is responsible for ensuring that policies, procedures, and processes are developed and implemented pursuant to NERC and WECC Regional Standards, as well as having responsibility for corporate initiatives in compliance with the CIP Standards. Rich holds a Bachelor's degree in Electrical Engineering, and he joined the predecessor company, Sierra Pacific Resources, in 1984. In this time, Rich has had experience in various facets of electric system design, system protection, substation and line construction, and field operations. Rich is a long-standing member of the WECC Operating Committee, participates on an advisory committee for the WECC Reliability

			Coordinator, and is a member of the WECC Unscheduled Flow Administrative Subcommittee. Rich is a licensed Professional Engineer in the state of California, and also holds a NERC Operator Certification at the RC level.
Jason Snodgrass Regulatory Compliance Mgr.	Georgia Transmission	1.770.270.7294 jason.snodgrass@gatrans.com	Jason Snodgrass is the Regulatory Compliance Manager at Georgia Transmission Corporation. Jason has been employed in this role since 2008, after 7½ years of experience as a planning engineer. Jason is primarily responsible for developing, maintaining, and training of GTC's compliance program. Additional responsibilities include policy/governance, compliance process developments, performing self-audits of applicable mandatory standards, and performing self-assessments/consultation for new and revised NERC Standards prior to the mandatory dates.
Jennifer Sterling Director, Transmission Strategy and Compliance	Exelon 2 Lincoln Center Oakbrook Terrace, IL 60181	1.630.437.2764 jennifer.sterling@exeloncorp.com	Jennifer Sterling is the Director, Transmission Strategy and Compliance for Exelon Corporation. Jennifer has been employed by Exelon and its subsidiary, Commonwealth Edison for 21 years. She has also held positions in ComEd's System Planning, Bulk Power Operations, Transmission Policy, and Regulatory & Strategic Services Departments. Jennifer is responsible for managing the Exelon NERC Reliability Standards Compliance Program across the corporation and for providing leadership for strategic and reliability initiatives for the ComEd and PECO transmission facilities. Additionally, Jennifer was a member of the NERC Violations Severity Levels Drafting Team and actively participates on Edison Electric Institute and North American Transmission Forum Committees.
Jonathan Sykes Mgr., System Protection	Pacific Gas & Electric 1919 Webster St. Room #409 Oakland, CA 94612	1.510.874.2691 jfst@pge.com	Jonathan Sykes is Manager of System Protection at Pacific Gas and Electric Company (PG&E) in California. Jonathan joined PG&E in June 2009 after 27 years at Salt River Project in Arizona where he worked as a principal engineer in System Protection and Transmission Planning. Jonathan is responsible for the oversight (application, design, and compliance) of the 40,000 protective relays at PG&E. Jonathan also serves as the Chairman

			of the NERC System Protection and Control Subcommittee and has been active in the committee for more than 5 years. Jonathan is also active on the WECC Remedial Action Reliability Subcommittee and Relay Work Group. He is also a Senior Member in IEEE and participates in the Power System Relay Committee and chairs work groups. Jonathan has authored and co-authored papers concerning reliability and advanced application.

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF A REVISED DEFINITION OF "BULK ELECTRIC SYSTEM"
IN THE NERC GLOSSARY OF TERMS USED IN RELIABILITY STANDARDS

EXHIBIT G

TECHNICAL JUSTIFICATION PAPER FOR THE

"LOCAL NETWORK EXCLUSION"

(EXCLUSION E3 OF THE BES DEFINITION)

Local Network Exclusion

Introduction

The purpose of this document is to provide the justification for the definitional exclusion of local networks (LN) from the definition of the Bulk Electric System (BES) as proposed in NERC Standards Development Project 2010-17. Presented herein are technical, logical, and practical considerations that provide such justification for exclusion of these facilities from the Bulk Electric System.

Summary of Justification

The local network exclusion proposal is shown to be justified through the following facts:

1. In accordance with Commission Orders 743 and 743a on the matter of the revision of the Definition of the Bulk Electric System, the facilities used in the local distribution of electric energy are to be excluded;
2. The exclusion for local networks, as provided in the revised definition of the BES, ensures that a candidate for local network exclusion must satisfy all of the exclusion principles thus demonstrating that the candidate facilities are not performing a transmission function;
3. The limit on connected generation within the local network is consistent with the existing threshold above which a generating plant in aggregate becomes subject to owner and operator registration in the ERO Statement of Compliance Registry Criteria;
4. The voltage cap applied to the qualifications for a local network is established at 300 kV, which is consistent with the distinction being made between Extra High Voltage and High Voltage in the NERC Board of Trustees-approved Reliability Standard on transmission planning, TPL-001-2;
5. The power flow "shifts" that would occur on the elements of a local network are but a negligible fraction of that which distributes upon the BES elements for a given power transfer and is fully eclipsed by the Load in the local network; and
6. The interaction of the local network with the BES is similar in character to that of a radial facility.

Description of Local Network

Local networks are defined in the draft BES Definition as:

A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:

a) *Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating) ;*
b) *Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN; and*
c) *Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).*

Local networks are present to provide local electrical distribution service and are not planned, designed, nor operated to benefit or support the balance of the interconnected electrical transmission network. Their purpose is to provide local distribution service, not to provide transfer capacity for the interconnected electric transmission network. Their design and operation is such that at the point of connection with the interconnected electric transmission network, their effect on that network is similar to that of a radial facility, particularly in that flow always moves in a direction that is from the BES into the facility. Any distribution of parallel flows into the local network from the BES, as governed by the fundamentals of parallel electric circuits, is negligible, and, more importantly, is overcome by the Load served by the local network, thereby ensuring that the net actual power flow direction will always be into the local network at all interface points. The presence of a local network is not for the operability of the interconnected electric transmission network; neither will the local network's separation or retirement diminish the reliability of the interconnected electric transmission network.

Commission Determination on Exclusion of Local Distribution – Relation to Local Network

In Order 743a, the Commission made it clear that facilities that are used in the local distribution of electric energy will be excluded from the Bulk Electric System. Such clarification was provided in both paragraphs 22 and 25 of the Order. The Commission agreed with certain commenters that facilities used in the local distribution of energy should be excluded from the revised Bulk Electric System definition.

In response to this facet of the Order, in developing the BES definition, the SDT has followed this guidance. Exclusion E3 was specifically designed to capture for exclusion those high voltage non-radial facilities being used for the local distribution of energy.

The exclusion characteristics in items a, b, and c above are further explained in the next section. These exclusion principles serve to ensure that facilities excluded under the local network exclusion (E3) are not necessary for the reliable operation of the interconnected electric transmission network and are instead used in the local distribution of energy.

Exclusion Principles

Of key importance is that Exclusion E3 in the draft BES definition requires the facilities of a candidate network to meet all of the characteristics listed in the exclusion. The SDT adopted this approach to ensure that none of the characteristics typical of interconnected electric transmission networks, or necessary for the operation of the interconnected electric transmission system, would be permissible in those facilities that are qualified for Exclusion E3. In the discussion below, it is shown that these characteristics successfully prevent exclusion of facilities necessary for operating an interconnected electric transmission network, and allow only facilities that are not necessary for such operation to be excluded from the BES.

A. *First Exclusion Principle: Limits on Connected Generation*

> *Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3, and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);*

This characteristic places restrictions on the type and size of generation resources that can be connected within the candidate facility. By placing this generation restriction on the local network, it is ensured that that the candidate facility will not under any circumstance act as a host to generation that exceeds the existing aggregate generation threshold in the ERO Statement of Compliance Registry Criteria (SCRC) and that the candidate facility will not contain Blackstart Resources. The SDT submits that this characteristic minimizes the contribution and influence the local network may have over the neighboring Elements of the BES by limiting both the magnitude and the function of the connected generation. The threshold of 75 MVA was chosen in a manner to provide consistency with the criteria applied in the ERO's SCRC regarding the registration for entities owning and operating generation plants in aggregate.

B. *Second Exclusion Principle: Power Flow and Function*

> *Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN;*

This characteristic ensures that the real power flow direction at all connection points to the BES is into the candidate local network, thereby ensuring that the candidate facilities behave in a manner that is radial in character. Further, the local network is restricted as to its use; i.e., it cannot be used for "wheel" transactions, or the transfer of energy originating outside the local network for delivery through the local network. By restricting the flow direction to be exclusively into the network at its connection points to the BES and precluding the network from providing transmission wheeling service, this exclusion characteristic further ensures that the local network is providing only a distribution service, and is not contributing to, nor is necessary for, the reliable operation of the interconnected electric transmission network. Regarding the location of the connection points to the BES, Exclusion E3 specifies that local networks "emanate from multiple points of connection at 100 kV or higher…" These points of emanation, where the local network begins and the BES ends, are established on a case-by-

case basis, but will necessarily be the points, below 300 kV, at which all of the qualifying exclusion principles are satisfied. As an example, see Appendix 1 to this document, which provides, among other things, a single line diagram depicting a local network and its interface with the BES.

C. *Third Exclusion Principle: Flowgates and Transfer Paths*

> *Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or the Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).*

This characteristic further ensures that the candidate local network facilities do not contain nor comprise facilities of well-established flowgates and transfer paths throughout the Interconnections of North America. These transfer paths are customarily used to provide bulk power transfers within the Interconnections, and therefore, the function and purpose of any candidate facilities included in or among such paths extends beyond the distribution function. A number of interchange coordination Reliability Standards apply to these transfer paths and flowgates. The SDT feels that such facilities are necessary for the reliable operation of an interconnected electric transmission network and would not be excluded from the definition of the BES.

The Use of a 300 kV Cap is Appropriate for Local Network Exclusion

The selection of a 300 kV cap for the applicability of an exclusion for a local network was based upon recent NERC Standards Development work in Project 2006-02 "Assess Transmission Future Needs and Develop Transmission Plans." As conveyed in its work product, TPL-001-2, the Project 2006-02 SDT sets a voltage level of 300 kV to differentiate Extra High Voltage (EHV) facilities from High Voltage facilities acting as a threshold to distinguish between expected system performance criteria.[1] The Project 2010-17 SDT seeks to establish consistency in the limitations placed on the exclusion applicability for local network facilities, and has therefore adopted this 300 kV level to ensure that EHV facilities, which under the TPL-001-2 Standard are held to a higher standard of performance, are not subject to this exclusion.

There is Minimal Effect to Flow in the Local Network due to BES Power Transfer

Similar to the character of a radial facility, and in order to qualify for exclusion from the BES under Exclusion E3.b,a local network must only have power flow into the network at all connection points to the BES. As demonstrated below, while this flow at the connection points is always into the local

[1] Per footnote #3 in TPL-001-2, "Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300 kV and high voltage (HV) Facilities defined as the 300 kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss."

network, the magnitude of the flow at these connection points will exhibit very slight shifts as bulk power transactions are implemented on neighboring BES facilities. This occurs because local network facilities are electrically parallel to Elements comprising the BES, and hence, the local network will experience a small effect due to changes in power angle across the parallel network as BES dispatch and flow patterns change. However, such flow shift is shown to be minimal, and the resultant power flow at all BES interface points is dominated by the superimposed load flow serving the distribution Load connected within the local network. Again, Exclusion E3.b ensures that flow shall always be from the BES into the local network in order to qualify for exclusion.

In order to provide a realistic example of the electrical interaction between a typical local network and the BES, an electric system in the western United States was examined from a power transfer distribution factor (PTDF) perspective. In a PTDF analysis, the branch elements of an electrical network are examined on the basis of the percentage split of a given power flow as it propagates through the network. In the simplest example of two identical lines operated at the same voltage, arranged in parallel between a given sending bus and receiving bus, the total power transfer will divide equally among the two parallel line elements, and hence, each element would be found to have a 50% PTDF. In a more complicated network, the line elements will carry a portion of the total flow in a manner that is inversely proportional to their impedance; i.e., the lower the impedance of the network branch, the higher portion of the flow that will distribute along that branch.

The electric system in question is depicted in Appendix 1. The station name identifiers and the network topology (but not electrical connectivity) have been changed to respect the confidentiality of the information. In the represented system, a bulk power transfer was simulated, with a point of receipt (injection) at BES bus T9 and a point of delivery at the other end of the system at BES bus T10. With this simulated power transfer, power flow analysis tools were used to determine the distribution of this simulated transfer as it propagates across the various parallel branches of the network. As depicted in Appendix 1, the facilities that are presumed to be excluded via the local network exclusion (E3) are shown to carry negligible flow, with the largest PTDF at a mere 0.23% of the total transfer. Note that a PTDF analysis shows only the *incremental* shift in power flow and does not imply that this 0.23% actually flows in and then back out of the network. The power flow results demonstrate that the flow measured at the interface points of the BES continues to flow into the local network, and is essentially unchanged, as it is only shifted in magnitude by a mere 0.23% of the modeled transaction amount.

In addition to the PTDF analysis, another analysis of Line Outage Distribution Factors (LODF), examines the re-distribution of flow that occurs on parallel elements after a subject element is removed from service. For example, if a BES element is carrying 500 MW, and is taken out of service, LODF describes how that flow re-distributes among all parallel paths in a given network. LODF factors are measured in percent of the pre-outage flow on the outaged element. Conducting this analysis on the example network and modeling the worst case outage, which is the loss of the line element between BES buses T9 and T10, shows that the net shift in flow for the local network is 4.0% of the pre-outage flow, and the largest shift in flow on any of the individual local network elements is 2.7%. The flow direction at the interface points between the local network and the BES continues to be into the local network.

This degree of flow shift on the local network facilities is *de minimus*, and neither diminishes or improves the reliability of the parallel BES facilities. From both a PTDF and an LODF analysis perspective, the local network exhibits qualities equivalent to radial facilities in that the power flow emanates from the point of BES connection in one direction – the only difference being that in the case of the local network, in order to provide source reliability to the distribution Load, more than one connection is provided to the BES.

Appendix 1
Local Network Technical Justification
Power Transfer Distribution Factor Analysis

This appendix provides Power Transfer Distribution Factor (PTDF) and Line Outage Distribution Factor (LODF) analyses and assessments using a relevant power flow case used in actual operating studies in the Western Interconnection to assess reliable Operating Transfer Capability on a rated path in the Western Electricity Coordinating Council ("WECC"). The electrical system representation is accurate; however, the bus names and topology have been graphically rearranged to address any Critical Energy Infrastructure Information ("CEII") concerns.

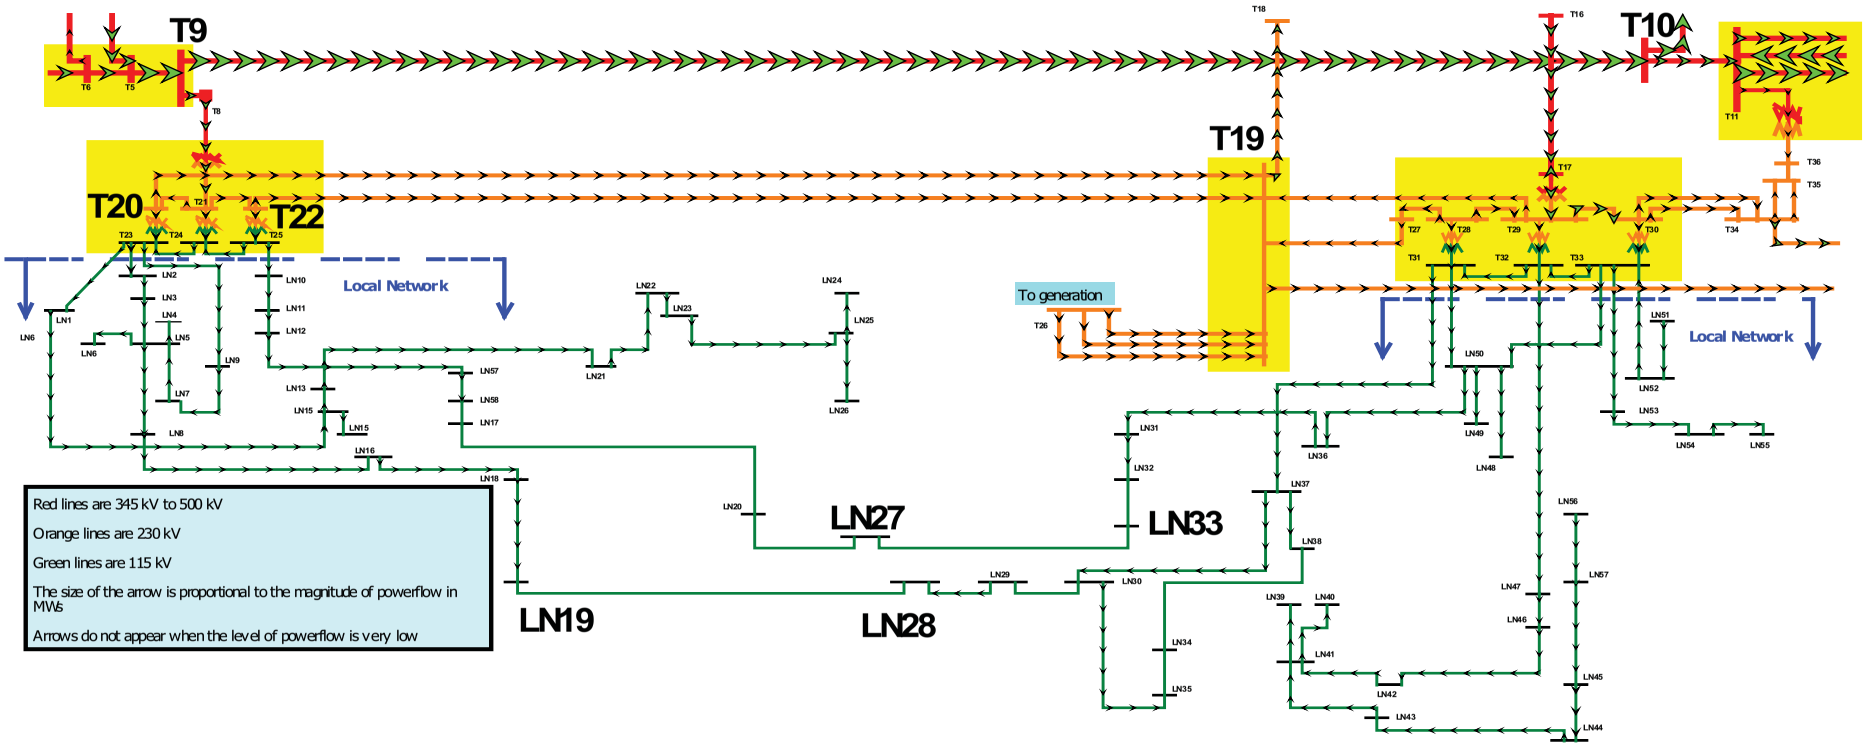
Although linear analyses, such as these, are relatively independent of actual power transfer levels, the modeled system conditions represented peak load demand and high power transfer conditions. The PTDF analyzes the injection of power from BES electrical bus T9 and delivering it to BES bus T10, which is consistent with the use of the BES transfer path. Based on the PTDF assessment, 92% of the power flow is transferred over the 500 kV line that directly connects BES buses T9 and T10. The remaining flow appears on the underlying 230 kV lines and adjacent 345 kV and 500 kV lines. The largest PTDF on any local network is 0.23 percent.

The LODF analysis considers the "worst-case" outage of the strongest (lowest impedance) transmission element, the line between BES buses T9 and T10. The LODF values that are computed represent the percentage of the pre-outage T9-T10 flow that re-distributes on each of the remaining branches. The analysis shows that the net shift in flow for the local network is 4.0% of the pre-outage flow, and the largest shift in flow on any of the individual local network elements is 2.7%. The 2.7% shift occurs on the local network branch between buses LN19 and LN28, and a 1.3% shift occurs on the branch between LN27 and LN33. The flow direction at the interface points between the local network and the BES continues to be into the local network.

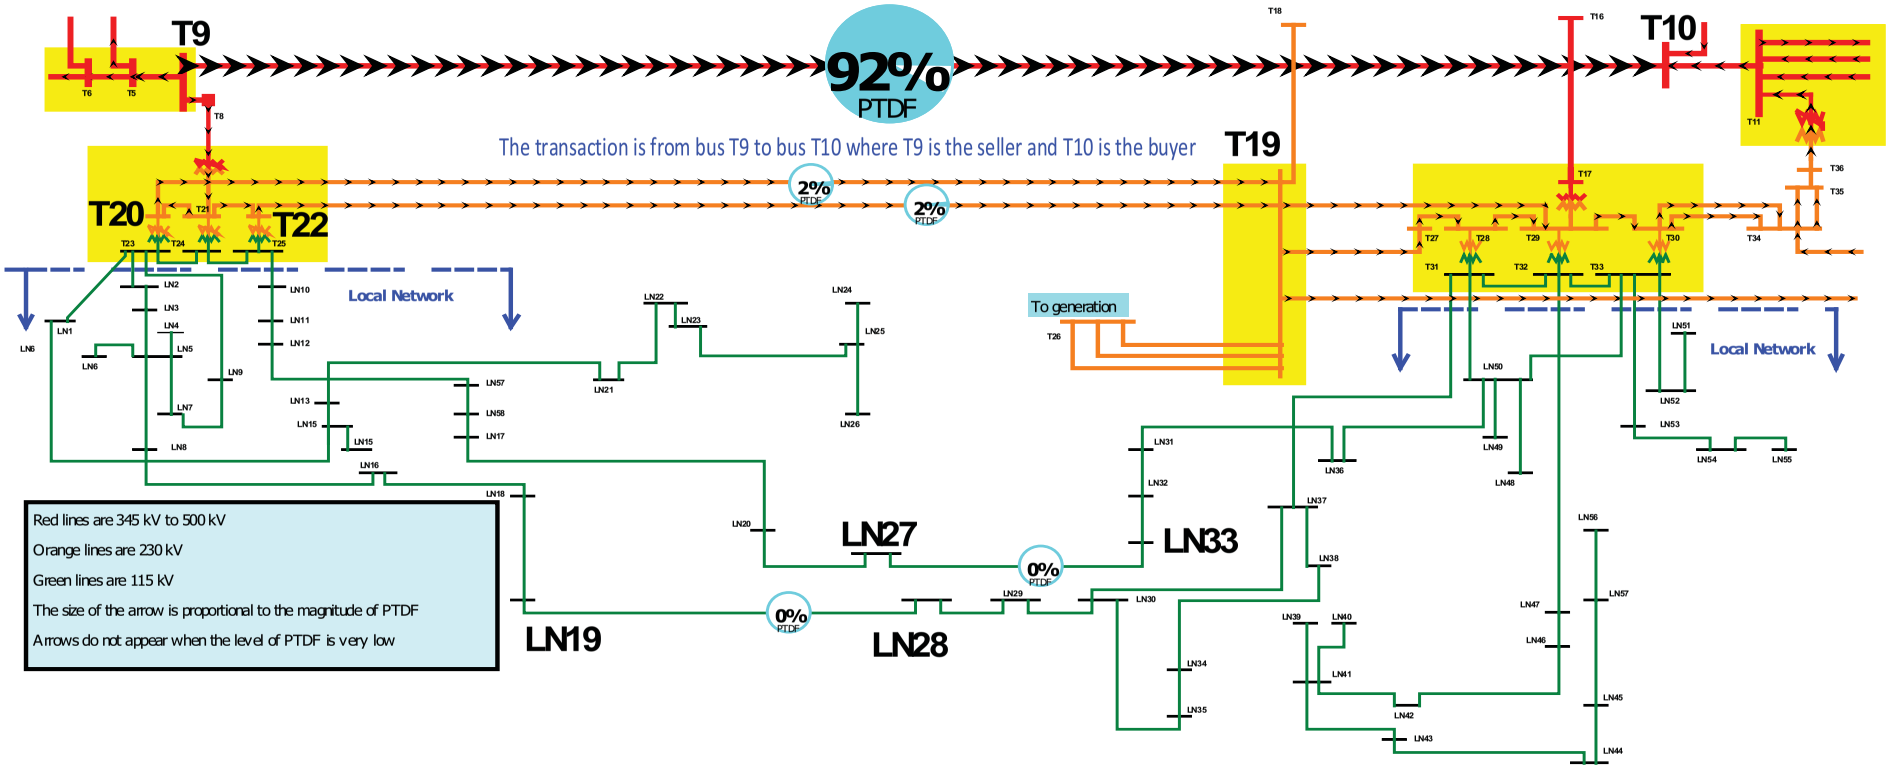
Below are three single line diagrams, which depict the 1) powerflow, 2) percentage distribution of flows for the PTDF analysis, and 3) the percent of flow distribution for the LODF analysis. In these diagrams, the local network elements are indicated by a green line color, and the local network station buses are indicated with an "LN" designation, for example, "LN23".

Following the single line diagrams are two tables: Table 1 - a tabulation of the PTDF values for the network, and Table 2 - depicting the LODF values for the T9-T10 line outage case.

The Powerflow Single Line



The Power Transfer Distribution Factors ("PTDF") Single Line



The Line Outage Distribution Factors ("LODF") Single Line identifying the revised PTDF values of the transmission line from T9 to T10 is opened

Re: North American Electric Reliability Corporation
Docket No. RR__-___-__
Petition of the North American Electric Reliability Corporation for Approval of Revisions to its Rules of Procedure to Adopt a Bulk Electric System Exception Procedure

Dear Ms. Bose:

The North American Electric Reliability Corporation (NERC) hereby submits the "Petition of the North American Electric Reliability Corporation for Approval of Revisions to its Rules of Procedure to Adopt a Bulk Electric System Exception Procedure."

NERC's filing consists of: (1) this transmittal letter, (2) the Petition, which follows this transmittal letter, and (3) Attachments 1, 2A, 2B, 3A, 3B, 4A, 4B, 5A, 5B, 6A, 6B, 7A, 7B, 8A, 8B and 9, all of which is being transmitted in a single pdf file. The Table of Contents to the Petition lists and identify the Attachments.

Please contact the undersigned if you have any questions concerning this filing.

Respectfully submitted,

/s/ Owen E. MacBride

Attachment 1: Proposed Appendix 5C to the Rules of Procedure, *Procedure for Requesting and Receiving an Exception from the NERC Definition of Bulk Electric System*

Attachments 2A and 2B: Clean and Redlined Versions of the Revised Rules of Procedure, Sections 100-1700 (including proposed new Sections 509 and 1703)

Attachments 3A and 3B: Clean and Redlined Versions of Revised Appendix 2 of the Rules of Procedure – *Definitions Used in the Rules of Procedure*

Attachments 4A and 4B: Clean and Redlined Versions of Revised Appendix 3D of the Rules of Procedure – *Registered Ballot Body Criteria*

Attachments 5A and 5B: Clean and Redlined Versions of Revised Appendix 4B of the Rules of Procedure – *Sanction Guidelines of the North American Electric Reliability Corporation*

Attachments 6A and 6B: Clean and Redlined Versions of Revised Appendix 5B of the Rules of Procedure – *Statement of Compliance Registry Criteria*

Attachments 7A and 7B: Clean and Redlined Versions of Revised Appendix 6 of the Rules of Procedure – *System Operator Certification Program Manual*

Attachments 8A and 8B: Clean and Redlined Versions of Revised Appendix 8 of the Rules of Procedure – *NERC Blackout and Disturbance Response Procedures*

Attachment 9: "The Development Process and Basis for the RoP Team's Recommended Provisions – Including How Stakeholder Comments Were Considered and Addressed," prepared by the BES Rules of Procedure Team

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC") respectfully requests the Commission to approve, in accordance with §215(f) of the Federal Power Act ("FPA")[1] and the Commission's regulations at 18 C.F.R. §39.10, revisions to NERC's Rules of Procedure ("ROP") for the purpose of adopting a procedure for requesting and receiving exceptions from the NERC definition of Bulk Electric System ("BES Exception Procedure"), as directed by the Commission in Order No. 743.[2] NERC requests approval for the following revisions and additions to the ROP:

- Proposed new Appendix 5C to the ROP, *Procedure for Requesting and Receiving an Exception to the NERC Definition of Bulk Electric System* (**Attachment 1**)
- Proposed new Sections 509 ("Exceptions to the Definition of the Bulk Electric System") and 1703 ("Challenges to NERC Determinations of BES Exception Requests Under Section 509") of the ROP (included in **Attachments 2A** (clean) and **2B** (redlined))[3]

[1] 16 U.S.C. §824o.

[2] *Revision to Electric Reliability Organization Definition of Bulk Electric System*, 133 FERC ¶ 61,150 (2011) ("Order No. 743"); *Order on Rehearing*, 134 FERC ¶ 61,210 (2011) ("Order No. 743-A").

[3] On November 29, 2011, NERC filed with the Commission, for approval, revisions to sections 100-1600 of the ROP. *Petition for Approval of Revisions to the Rules of Procedure of the North American Electric Reliability Corporation*, Docket No. RR12-3-000 ("November 29, 2011 ROP Revisions Filing"). Further, on November 7, 2011, NERC made a compliance filing with the Commission in Docket No. RR10-11-004 in response to an October 7, 2011 Order, to amend one section of the Rules of Procedure. *Compliance Filing of the North American Electric Reliability Corporation in Response to October 7, 2011 Order*. In addition, on March 18, 2011, NERC filed proposed new sections 1701 and 1702 of the ROP with the Commission for approval, in connection with the request for approval of Reliability Standard PRC-023-2. *Petition of the North American Electric Reliability Corporation for Approval of a Protection and Control (PRC) Reliability Standard*, Docket No. RM08-13-000. As of the date of this Petition, the Commission has not acted on any of these filings. **Attachments 2A** and **2B** incorporate the revisions to the ROP filed in the November 29, 2011 ROP Revisions Filing and the November 7, 2011 compliance filing, and to ROP sections 1701-1702 filed on March 18, 2011, as though all these revisions had been approved by the Commission.

- Revisions to sections 302.2.2, 501.1.4.4, 804, 1102.2 and 1701 of the ROP to reflect the adoption of the revised BES Definition and new section 1703 and Appendix 5C of the ROP (these revisions are shown in **Attachments 2A** and **2B**).

- Revisions to Appendix 2 to the ROP, *Definitions Used in the Rules of Procedure* (**Attachments 3A** (clean) and **3B** (redlined)) [4]

- Revisions to Appendix 3D to the ROP, *Registered Ballot Body Criteria* (**Attachments 4A** (clean) and **4B** (redlined).[5]

- Revisions to Appendix 4B to the ROP, *Sanction Guidelines of the North American Electric Reliability Corporation* (**Attachments 5A** (clean) and 5**B** (redlined).[6]

- Revisions to Appendix 5B to the ROP, *Statement of Compliance Registry Criteria* (**Attachments 6A** (clean) and **6B** (redlined)) [7]

- Revisions to Appendix 6 to the ROP, *System Operator Certification Program Manual* (**Attachments 7A** (clean) and **7B** (redlined).[8]

---

[4] NERC filed proposed Appendix 2, as a new appendix to the ROP, for Commission approval in the November 29, 2011 ROP Revisions Filing. As of the date of the instant filing, the Commission has not acted on NERC's request for approval of proposed Appendix 2. **Attachments 3A** and **3B** are based on Appendix 2 as filed in the November 29, 2011 ROP Revisions filing as though it were already approved.

[5] The November 29, 2011 ROP Revisions Filing included proposed revisions to Appendix 3D. As of the date of the instant filing, the Commission has not yet acted on the November 29, 2011 ROP Revisions Filing. **Attachments 4A** and **4B** incorporate the revisions to Appendix 3D submitted for approval in the November 29, 2011 ROP Revisions Filing, as though approved.

[6] The November 29, 2011 ROP Revisions Filing included proposed revisions to Appendix 4B. As of the date of the instant filing, the Commission has not yet acted on the November 29, 2011 ROP Revisions Filing. **Attachments 5A** and **5B** incorporate the revisions to Appendix 4B submitted for approval in the November 29, 2011 ROP Revisions Filing, as though approved.

[7] The November 29, 2011 ROP Revisions Filing included proposed revisions to Appendix 5B. As of the date of the instant filing, the Commission has not yet acted on the November 29, 2011 ROP Revisions Filing. **Attachments 6A** and **6B** incorporate the revisions to Appendix 5B submitted for approval in the November 29, 2011 ROP Revisions Filing, as though approved.

[8] The November 29, 2011 ROP Revisions Filing included proposed revisions to Appendix 6. As of the date of the instant filing, the Commission has not yet acted on the November 29, 2011 ROP Revisions Filing. **Attachments 7A** and **7B** incorporate the revisions to Appendix 6 submitted for approval in the November 29, 2011 ROP Revisions Filing, as though approved.

- Revisions to Appendix 8 to the ROP, *NERC Blackout and Disturbance Response Procedures* (**Attachments 8A** (clean) and **8B** (redlined).[9]

In Order No. 743, the Commission directed NERC to develop, using its Reliability Standards development process, a revised definition of the term "Bulk Electric System" ("BES Definition");[10] and to also develop, through a stakeholder process, a process to exempt facilities from inclusion in the Bulk Electric System through application of the BES Definition.[11] The Commission directed NERC to file the revised BES Definition and the exemption procedure within one year following the effective date of the final rule adopted in Order No. 743. Order No. 743 specified the effective date of the final rule to be 60 days following the date of its publication in the *Federal Register*. The final rule was published in the *Federal Register* on November 26, 2010[12]; the date 60 days following the date of publication was January 25, 2011.

As directed in Order No. 743, NERC has developed both a revised BES Definition and a proposed BES Exception Procedure.[13] NERC is submitting the revised BES Definition to the Commission for approval in a separate petition that is being filed contemporaneously with the instant Petition. The petitions for approval of the revised BES Definition and of the BES

[9] The November 29, 2011 ROP Revisions Filing included proposed revisions to Appendix 8. As of the date of the instant filing, the Commission has not yet acted on the November 29, 2011 ROP Revisions Filing. **Attachments 8A** and **8B** incorporate the revisions to Appendix 8 submitted for approval in the November 29, 2011 ROP Revisions Filing, as though approved.

[10] Order No. 743 at PP 29-33.

[11] Order No. 743 at PP 112-13.

[12] 75 FR 72910 (2010).

[13] Proposed Sections 509 and 1703 and Appendix 5C use the term "exception" rather than the term "exemption" used in Order No. 743. Use of the term "exception" is consistent with the terminology used in section 411 of the ROP and Appendix 4D pertaining to requests for Technical Feasibility Exceptions ("TFE") from NERC Critical Infrastructure Protection Standards.

Exception Procedure are being filed within one year following January 25, 2011.

The proposed BES Exception Procedure addresses the applicable concerns raised by the Commission, in Order No. 743, with respect to the current processes for determining what facilities are part of the BES and what facilities are not.[14] The BES Exception Procedure provides for decisions to approve or disapprove Exception Requests[15] to be made by NERC, rather than by the Regional Entities, thereby eliminating the potential for inconsistency and subjectivity that the Commission was concerned was created by having decisions as to what facilities are included in or excluded from the BES made at the Regional Entity level.

This filing also includes proposed conforming revisions to sections 302.2, 501.1.4.4, 804, 1102.2 and 1701 of the ROP and to Appendices 2, 3D, 4B, 5B, 6 and 8 of the ROP which are necessary in light of the revised BES Definition and the new BES Exception Procedure provisions in section 1703 and Appendix 5C. The revisions to Appendix 2, *Definitions Used in the Rules of Procedure*, add new defined terms that are used in the revised BES Definition or in proposed Appendix 5C, modify certain other definitions to distinguish their meanings as used in Appendix 5C from their meanings as used elsewhere in the ROP, and make minor revisions to other definitions resulting from adoption of the revised BES Definition. The revision to Appendix 5B, *Statement of Compliance Registry Criteria*, replaces the existing BES Definition with the revised BES Definition in the text of Appendix 5B. The revision to section 1701 of the ROP is necessary to reference the addition of new section 1703 to section 1700. The revisions to

[14] As shown in the separate petition being filed contemporaneously for approval of the revised BES Definition, the revised BES Definition fully addresses the concerns the Commission expressed in Order No. 743 with respect to the current definition of Bulk Electric System and its application to determine what facilities are included in or excluded from the BES.

[15] Capitalized terms used in this Petition, such as "Exception Requests," that are not otherwise defined herein, are defined terms in proposed Appendix 5C, or in proposed ROP Appendix 2 which is currently pending before the Commission.

sections 302.2.2, 501.1.4.4, 804 and 1102.2 of the ROP and to Appendices 3D, 4B, 6 and 8 are necessary to reflect capitalization of certain terms that become defined terms in the ROP as the result of the revised BES Definition.

The NERC Board of Trustees voted to adopt the proposed ROP revisions, including proposed new Appendix 5C and proposed new sections 509 and 1703 of the ROP, on January 18, 2012.

Attachment 1 to this Petition is the proposed Appendix 5C to the ROP, *Procedure for Requesting and Receiving an Exception from the NERC Definition of Bulk Electric System*. **Attachments 2A** and **2B** are clean and redlined versions of the ROP, Sections 100-1700, showing proposed new Sections 509 and 1703 and the revisions to other sections as enumerated above. **Attachments 3A** and **3B** are clean and redlined versions of proposed revised Appendix 2 to the ROP, *Definitions Used in the Rules of Procedure*. **Attachments 4A** and **4B** are clean and redlined versions of proposed revised Appendix 3D to the ROP, *Registered Ballot Body Criteria*. **Attachments 5A** and **5B** are clean and redlined versions of proposed revised Appendix 4B to the ROP, *Sanction Guidelines of the North American Electric Reliability Corporation.* **Attachments 6A** and **6B** are clean and redlined versions of proposed revised Appendix 5B to the ROP, *Statement of Compliance Registry Criteria*. **Attachments 7A** and **7B** are clean and redlined versions of proposed revised Appendix 6 to the ROP, *System Operator Certification Program Manual*. **Attachments 8A** and **8B** are clean and redlined versions of proposed revised Appendix 8 to the ROP, *NERC Blackout and Disturbance Response Procedures*. **Attachment 9**, captioned "The Development Process and Basis for the RoP Team's Recommended Provisions – Including How Stakeholder Comments Were Considered and Addressed," was prepared by the stakeholder-based BES Rules of Procedure Team ("BES ROP Team") that developed a proposed

Exception Procedure on which Appendix 5C and ROP sections 509 and 1703 are based. **Attachment 9** describes the process that was followed by the BES ROP Team in developing these documents, and key issues that were identified and addressed by the Team in the course of developing its proposals.

NERC requests that the Commission approve Appendix 5C and the other proposed ROP revisions with the same effective date as the proposed effective date of the revised BES Definition, as discussed in NERC's separate petition for approval of the revised BES Definition.

NERC is also filing the proposed revisions to the ROP, including proposed new Sections 509 and 1703 and Appendix 5C, with Applicable Governmental Authorities in Canada.

III. PROPOSED REVISIONS TO THE RULES OF PROCEDURE

A. Order Nos. 743 and 743-A

In Order No. 743, the Commission directed NERC to develop a process for exempting facilities from being included in the BES by the application of the BES Definition.

> [W]e direct the ERO to develop a proposed exemption process. We believe that it is appropriate that NERC develop the process in its function as the ERO. Further, allowing the ERO to develop an appropriate exemption process should provide interested stakeholders an opportunity to participate in the development of the process, as requested by some commenters.[16]

The Commission also expressed a number of concerns that it believed needed to be addressed in the development of the exemption process.

> **P 115.** "NERC should develop an exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid. The ERO should also determine any related changes to its Rules of Procedure that may be required to implement the exemption process, and file the proposed exemption process and rule changes with the Commission."
>
> **P 116.** ". . . [W]e no longer contemplate a process that requires Commission review of each request for exemption. However, in order to avoid an inconsistent application of the exemption process, NERC should oversee the facility-by-facility exemption process to ensure an objective and uniform application of the exemption criteria that it develops. NERC may consider delegating responsibilities for the exemption process to Regional Entities, so long as the process is clear and capable of being applied consistently, objectively and uniformly across all regions. However, consistent with out statements in Order No. 672 concerning the need for a strong ERO, NERC should maintain oversight of any Regional Entity activity. We believe ERO oversight is also vital in ensuring consistent application of any nation-wide exemption criteria that the ERO develops." (Footnote omitted.)
>
> **P 117. "**While the Commission will not require that we review each exemption on a facility-by-facility basis, we would maintain the authority to conduct audits to determine the appropriateness of a particular exemption. We contemplate that a Commission staff audit would review the application of the exemption criteria developed by NERC in NERC's or a Regional Entity's determination to approve an exemption for a particular facility. However, to facilitate such audits, the ERO

[16] Order No. 743 at P 112.

should maintain a list of exempted facilities that can be made available to the Commission upon request. NERC can decide how best to maintain the list, including determining whether or not to post it on the NERC website."

P 118. "Additionally, the ERO should consider developing criteria for revoking an exemption if a particular transmission facility no longer qualifies for such an exemption. This may be appropriate, for example, when a transmission system in the vicinity undergoes a significant change."

P 119. "**. . .** [T]he exemption process provides a means of ensuring that relatively high voltage distribution facilities are excluded from compliance with mandatory Reliability Standards. In this light, we believe that it would be beneficial for the ERO in maintaining a list of exempted facilities, to consider including a means to track and review facilities that are classified as local distribution to ensure accuracy and consistent application of the definition. Similarly, the ERO could track exemptions for radial facilities."

P 120. "In response to comments seeking a blanket exemption for industrial facilities, the Commission is not inclined to grant categorical exemptions of any kind. However, NERC should consider the parties' concerns regarding exemption categories in developing an exemption process and criteria. Entities can submit specific facilities for exemption through the NERC-developed exemption process . . . ."

P 121. "We agree with ERCOT's suggestion that the ERO should develop a parallel process for including as part of the bulk electric system 'critical' facilities, operated at less than 100 kV, that the Regional Entities determine are necessary for operating the interconnected transmission network. Currently, Regional Entities have the ability to include 'critical' facilities operated below 100 kV. We believe that it would be worthwhile for NERC to consider formalizing the criteria for inclusion of critical facilities operated below 100 kV in developing the exemption process. Additionally, we note that Order No. 716 creates a process to include critical facilities under NUC-001-1. Similarly, we note that Order No. 733 creates an additional 'add in' approach to sub-100 kV facilities that Regional Entities and planning coordinators have identified as critical to the reliability of the bulk electric system." (Footnotes omitted.)

P 150. "We disagree with commenters that definitions of 'integrated transmission elements' and 'material impact' are needed to implement this Final Rule. These terms are not defined by the present bulk electric system definition, and defining these terms is not necessary to revise the definition as directed herein. Whether specific facilities have a material impact is not dispositive with respect to whether they are needed for reliable operation. These questions are more appropriately addressed through development of an exemption process at NERC."

In Order No. 743-A, the Commission provided additional clarification with respect to the scope of the exemption process.

> **P 76.** "The Commission notes some confusion regarding 'exclusions' versus 'exemptions.' We understand that a facility that is *excluded* would not have to go through any process at NERC to determine applicability. On the other hand, where an entity applies to NERC to seek to *exempt* its facility from the bulk electric system, NERC would follow an *exemption* process. With that understanding, we clarify that, as discussed herein, we envision that the process for determining which facilities will be included under the bulk electric system will involve several steps. NERC will develop criteria for determining whether a facility that falls under the definition of bulk electric system may qualify for exclusion. If, for example, the application of the criteria clearly indicates that a facility is local distribution, the facility is excluded, and no process before the ERO is required. If application of the NERC criteria does not lead to a definitive result, the entity could apply for an exemption, invoking a factual inquiry before the ERO to determine the proper categorization of facilities." (Italics in original.)

> **P 84.** "In Order No. 743, . . . while the Commission stated that the ERO should develop an exemption process that includes 'clear, objective, transparent, and uniformly applicable criteria' for determining exemptions, the Commission otherwise left it to the ERO's discretion to develop an appropriate exemption process, which the Commission will review. Any exemption of radial facilities is not based on a statutory requirement, unlike exclusion of local distribution. However, the Commission believes that certain categories of radial facilities may lend themselves to an 'exclusion' process as described above (i.e., once identified as belonging to a certain radial category, the facilities could be excluded without further review). For example, should the revised bulk electric system definition maintain the exclusion of radial facilities serving only load from one transmission source, these types of facilities easily could be excluded without further analysis."

> **P 86.** "The Commission clarifies that Order No. 743 granted NERC discretion to make a determination regarding whether to exclude or exempt radial facilities. One consideration in this regard is whether an exclusion process will avoid NERC having to review thousands of exemptions for facilities outside the NPCC region that previously were excluded as radial."

> **P 88.** "With respect to Consumers' request for clarification regarding how much incidental generation a line could serve and continue to meet the bulk electric system radial line exclusion, this is an issue that should be raised with NERC as it develops criteria for determining what is considered radial."

> **P 98.** "Order No. 743 directed the ERO to develop an exemption process, and specifically declined to 'dictate the substance or content of the exemption process.' However, we provided guidance, stating that the process should include

> clear, objective, transparent and uniformly applicable criteria for exemption of facilities that are not necessary for operating the interconnected transmission system. Accordingly, the Commission grants EEI's, Consumers Energy's and Wisconsin Electric's requests for clarification that the discussion regarding which facilities should or should not be included in the bulk electric system definition was intended to provide guidance, not to prejudge what should be included in the exemption criteria. . . ."

As discussed in the balance of this §III, the proposed Exception Procedure appropriately addresses the Commission's directives and concerns expressed in Order Nos. 743 and 743-A with respect to the exemption procedure. In addition, in §V below, NERC acknowledges the need to maintain a list of facilities that have been granted Exceptions from the BES Definition, as indicated in Order No. 743.

B. Proposed Section 509 of the Rules of Procedure

Proposed new Section 509 of the ROP, "Exceptions to the Definition of the Bulk Electric System," identifies the availability of the procedure in Appendix 5C to request a determination that an Element that falls within the BES Definition should be excluded from the BES or that an Element that falls outside of the BES Definition should be included in the BES:

> An Element is considered to be (or not be) part of the Bulk Electric System by applying the BES Definition to the Element (including the inclusions and exclusions set forth therein). Appendix 5C sets forth the procedures by which (i) an entity may request a determination that an Element that falls within the definition of Bulk Electric System should be exempted from being considered a part of the Bulk Electric System, or (ii) an entity may request that an Element that falls outside the definition of the Bulk Electric System should be considered a part of the Bulk Electric System.

Section 509 specifies that the Exception Procedure in Appendix 5C is available with respect to (i) Elements that are considered to be part of the BES by applying the BES Definition, and (ii) Elements that are not considered to be part of the BES based on applying the BES Definition, but which the Submitting Entity believes should be excluded from or included in, respectively, the BES. The Exception Procedure is not intended to be used to resolve ambiguous

situations in which it cannot be determined by applying the BES Definition whether an Element is part of or not part of the BES.

C. Proposed Appendix 5C to the Rules of Procedure

1. Overview

Proposed Appendix 5C sets forth the detailed procedures for requesting and receiving an Exception from inclusion in or exclusion from the Bulk Electric System based on application of the BES Definition. As discussed in greater detail in §IV below, following the issuance of Order No. 743, NERC established a stakeholder-based BES ROP Team to develop a proposed Exception Procedure. The BES ROP Team developed a proposed Exception Procedure which the Team submitted to NERC. As also discussed in §IV, proposed Appendix 5C as approved by the NERC Board and submitted for approval in this filing incorporates several modifications to the BES ROP Team's proposal, both revisions recommended by NERC staff and revisions directed by the NERC Board of Trustees. However, the basic structure and concepts of the proposed Exception Procedure for which approval is requested herein are the same as in the BES ROP Team's proposal.

Taking into account the directives and concerns set forth in Order Nos. 743 and 743-A, the BES ROP Team considered several process attributes to be important in developing the Exception Procedure:

- The Exception Procedure should maintain the exemption for facilities used in the local distribution of electric energy and the exemption for radial facilities.
- The Exception Procedure, including the criteria for allowing Exceptions, should be clear, objective, transparent and uniformly applicable.
- The Exception Procedure should allow any Registered Entity to utilize the process to seek an Exception either for its own facilities or for the facilities of others with respect to which the Registered Entity has ERO-related reliability responsibilities.

- NERC should be the ultimate decision-maker for Exception Requests, in order to retain facility-by-facility oversight of the objective and uniform application of the Exception criteria.

- The Exception Procedure should include provisions for revoking a previously-granted Exception for a facility if the Exception is no longer warranted.

With respect to establishing criteria for Exceptions, the proposed Exception Procedure establishes specific steps to be followed in submitting, reviewing and deciding Exception Requests. It also specifies detailed Required Information that must be submitted with an Exception Request, or it will be rejected. In terms of technical criteria for allowing Exceptions, it was determined jointly by the NERC Standards Committee, NERC Reliability Standards Program management, the leaders of the BES Definition Standard Drafting Team ("SDT") and the BES ROP Team that the SDT would take responsibility for determining the technical criteria for Exceptions. As discussed in detail in §III.D of NERC's petition for approval of the proposed BES Definition, which is being filed contemporaneously with this Petition, the SDT determined that developing a single set of technical criteria that would be applicable to all Exception Requests was not feasible. The SDT determined, instead, that a common set of data and information that the Submitting Entity would be required to submit with each Exception Request should be developed (the "Detailed Information to Support an Exception Request"). The Detailed Information is intended to ensure that a consistent baseline of technical information is provided to the Regional Entity and NERC with all Exception Requests, in addition to the specific information and arguments submitted by the Submitting Entity in support of its Exception Request. The Submitting Entity remains responsible to present sufficient information and argument to justify the Exception Request.[17]

[17] *See* section 3.2 of proposed Appendix 5C.

Additionally, several significant issues were identified during development of the Exception Procedure (some of these were raised by stakeholder comments) that the BES ROP Team needed to address. These issues generally fell into the following categories:

- Who is eligible to initiate and/or participate in the process by which an Exception is granted? What is the role of state regulators?

- What should be the scope of the Elements for which an Exception can be requested in a single Exception Request?

- Should an entity that is unable to determine the status of an Element by applying the BES Definition be able to use the Exception Procedure to obtain a determination?

- What is the appropriate balance between allowing open access to the Exception process and ensuring the resources of NERC and the Regional Entities are spent processing and analyzing valid, permissible requests?

- What is the appropriate balance between allowing open access to the Exception process and an appropriate level of consistency, respecting the varied roles and proper exercise of discretion by each participant?

- How transparent should the Exception process be? In addition to the Submitting Entity (and Owner of the facility, if different), should any entities other than the Regional Entity, NERC, the Commission, and Applicable Governmental Authorities in Canada, be allowed access to facility-specific information filed with an Exception Request?

- What should be the status for compliance purposes of an Element during the pendency of the request?

These and other issues were resolved in the development of the BES Exception Procedure, and their resolution is reflected in proposed Appendix 5C.[18]

The Exception Procedure developed by the BES ROP Team – and, with relatively minor modifications, approved by the NERC Board and submitted in this Petition for the Commission's approval – provides, for most circumstances, a fairly simple and direct process of discrete steps:

[18] *See* **Attachment 9** for further discussion of how the BES ROP Team addressed these issues and other stakeholder concerns.

1. An entity applies the BES Definition to an Element, but nonetheless believes that the Element, contrary to its characterization based on the BES Definition, should either be included in or excluded from the BES. The entity therefore submits an Exception Request to the Regional Entity in which the Element is located.

2. The Regional Entity receives the Exception Request.

    a. The Regional Entity conducts an initial screening looking for three items to determine if the Exception Request is a valid request for processing:

        i. Is the Exception Request from an eligible submitter?

        ii. Is the Exception Request a request for an Exception from the BES Definition?

        iii. Is all the Required Information provided with the Exception Request?

        If the initial answer to each question is yes, the Exception Request is moved along in the process to a substantive review. If the answers to all questions are not yes, the submitter is given an opportunity to modify or supplement the Exception Request before the Regional Entity rejects it.

    b. The Regional Entity substantively evaluates the Exception Request and makes a recommendation to NERC as to whether it should be approved or disapproved.

3. NERC reviews the Exception Request and all information developed at the Regional Entity level, and either approves or disapproves the Exception Request.

4. The Submitting Entity either accepts the NERC decision, or appeals it to the NERC Board of Trustees Compliance Committee ("BOTCC").

Importantly, in response to the Commission's directives and concerns expressed in Order Nos. 743 and 743-A, the decision as to whether to approve or disapprove an Exception Request is made only by NERC. The Regional Entity performs a non-substantive initial screening of the Exception Request and, if the Exception Request passes the initial screening, conducts a substantive review and makes a recommendation to NERC as to whether the Exception Request should be approved or disapproved. However, the actual decision to approve or disapprove the Exception Request is made by the NERC President after considering the opinion provided by a three-person NERC review panel (as well as the Recommendation of the Regional Entity and

other information placed into the record at the Regional Entity and NERC levels). Further, if the Regional Entity rejects the Exception Request based on the initial screening but the Submitting Entity believes the Exception Request is proper and complete as submitted, the Exception Procedure allows the Submitting Entity to appeal the Rejection to NERC.

Placing the decision-making responsibility with NERC will provide for a consistent approach to and determination of Exception Requests coming from Submitting Entities in all Regions, thereby eliminating Regional Entity discretion in the determination of Exception Requests. Further, not only will NERC be able to provide consistent determinations on Exception Requests coming from Submitting Entities in different Regions but involving the same or similar facts and circumstances, but NERC, as the sole decision-maker, will be able to take into account the aggregate impact on the BES of approving or disapproving all the Exception Requests submitted. NERC's ability to provide for consistency and to assess aggregate impacts is enhanced by the provision added to Appendix 5C at the direction of the NERC Board (as described in §IV below) specifying that the final decision on all Exception Requests will be issued by the NERC President.

Additionally, the proposed Exception Procedure includes provisions for requesting and approving an Inclusion Exception, by which an Element that the BES Definition would not include in the BES can be included in the BES.[19] A request for an Inclusion Exception can be submitted by the Owner of an Element, or by a Regional Entity, Planning Authority ("PA"), Reliability Coordinator ("RC"), Transmission Operator ("TOP"), Transmission Planner ("TP") or Balancing Authority ("BA") that has the Element within its Scope of Responsibility.[20]

[19] *See* Order No. 743 at P 121.

[20] Scope of Responsibility is defined in section 2.26 of Appendix 5C as "The registered functions of a PA, RC, TOP, TP or BA and the geographical or electric region in which the PA, RC, TOP,

Finally, the Exception Procedure also includes provisions for monitoring that an Exception that has been granted continues to be warranted, and for revoking an Exception that is no longer warranted.[21]

In Order No. 743-A, the Commission noted that NERC would need to determine whether local distribution facilities and radial facilities would be "excluded" from the BES, or "exempted" through the exemption process.[22] The proposed BES Definition expressly excludes both "facilities used in the local distribution of electric energy," and radial systems as described in Exclusion E1 of the BES Definition, from the Bulk Electric System.[23] Therefore, it was not necessary for the BES Exception Procedure to contain detailed criteria or procedures to exempt local distribution facilities or radial facilities from inclusion in the Bulk Electric System.

In summary, the proposed Exception Procedure establishes a process that (1) balances the need for effective and efficient administration with due process and clarity of expectations; (2) promotes consistency in determinations and eliminates Regional discretion by having all decisions on Exception Requests made at NERC; (3) provides for involvement of persons with applicable technical expertise in making decisions on Exception Requests; and (4) should alleviate concerns about a "one-size-fits-all" approach.

2. Section-by-Section Summary of Proposed Exception Procedure

The following subsections provide a section-by-section summary of the Exception

---

TP or BA operates to perform its registered functions, or with respect to a Regional Entity, its Regional Entity Region."

[21] *See* Order No. 743 at P 118.

[22] Order No. 743-A at PP 76, 84, 86 and 88.

[23] *See* the discussion in §III.C of NERC's contemporaneously-filed petition for approval of the revised BES Definition.

Procedure in proposed Appendix 5C.

a. Section 1.0 – Introduction

Section 1.1, Purpose, states the purpose of Appendix 5C:

> The NERC definition of the Bulk Electric System uses specific terms and thresholds that, in most cases, should appropriately identify Elements and groups of Elements that are appropriately classified as part of the Bulk Electric System. Conversely, the BES Definition should, in most cases, exclude Elements that are not part of the Bulk Electric System. In certain cases, however, the BES Definition may classify certain Elements as part of the Bulk Electric System that are not necessary for the Reliable Operation of the interconnected bulk-power transmission system or the BES Definition may classify certain Elements as non-Bulk Electric System that are necessary for the Reliable Operation of the interconnected bulk-power transmission system.
>
> This Appendix . . . provides the procedure by which an entity may request and receive an Exception which will have the effect of either including within the BES an Element or Elements that would otherwise be excluded by application of the BES Definition or excluding from the BES an Element or Elements that would otherwise be included by application of the BES Definition.

Section 1.1 also states the status of an Element until the time that an Exception from the BES Definition has been requested and granted:

> An entity must request and obtain an Exclusion Exception pursuant to an Exception Request under this Exception Procedure before any Element that is included in the BES by application of the BES Definition shall be excluded from the BES. Likewise, an entity must request and obtain an Inclusion Exception pursuant to an Exception Request under this Exception Procedure before any Element that is excluded from the BES by application of the BES Definition shall be included in the BES.
>
> During the pendency of an Exception Request, the status of an Element(s) that is the subject of an Exception Request shall remain as it is determined based on application of the BES Definition. This status will continue until all appeals to all Applicable Governmental Authorities are completed.

Section 1.1 further provides that an entity planning the connection of a new Element for which it believes an Exception would be appropriate may request an Exception prior to commercial operation of the Element.

Finally, section 1.1 details who is entitled to file an Exception Request. The right to file an Exception Request is not limited to the Owner of the Element that is the subject of the Exception Request. Rather, the Regional Entity or a Registered Entity performing reliability functions that would have the Element within its Scope of Responsibility may submit an Exception Request with respect to the Element:

> The Owner of the Element to which the Exception Request applies or, with respect to an Element owned by another Registered Entity, any Regional Entity, Planning Authority ("PA"), Reliability Coordinator ("RC"), Transmission Operator ("TOP"), Transmission Planner ("TP") or Balancing Authority ("BA") that has (or will have upon inclusion of the Elements in the BES) the Elements covered by an Exception Request within its Scope of Responsibility may submit an Exception Request for the Element as provided in this Exception Procedure.

Section 1.2, Authority, includes a statement relating to adoption of the Exception Procedure or a comparable procedure by Applicable Governmental Authorities in Canada and Mexico: "This Exception Procedure or an equivalent procedure is to be implemented in Canada and Mexico consistent with their respective laws and agreements."

Section 1.3 states obligations of Canadian and Mexican Entities and Cross-Border Regional Entities with regard to seeking Exceptions from Applicable Governmental Authorities consistent with their respective laws and agreements.[24] This section states that a Canadian Entity or Mexican Entity "shall not be required to subject itself to United States federal or state laws not otherwise applicable to the entity in order to utilize this Exception Procedure or an equivalent procedure."

b. Section 2.0 – Definitions

Section 2.0 sets forth the definitions of defined terms that are frequently used in

[24] A Canadian Entity is defined in section 2.5 of Appendix 5C as "a Registered Entity that is organized under Canadian federal or provincial law;" and a Mexican Entity is defined in section 2.18 as "a Registered Entity that is organized under Mexican law."

Appendix 5C. The text of section 2.0 assumes that proposed Appendix 2, *Definitions Used in the Rules of Procedure*, of the ROP is approved by the Commission and in effect prior to Appendix 5C becoming effective. Therefore, section 2.0 of Appendix 5C states:[25]

> For purposes of this Appendix, capitalized terms shall have the definitions set forth in Appendix 2 to the Rules of Procedure. For ease of reference, the definitions of the following terms that are used in this Appendix are also set forth below.

This text is consistent with the modified text in a number of existing ROP Appendices (*e.g.*, Appendices 4C and 4D) as submitted in the November 29, 2011 ROP Revisions Filing. If proposed Appendix 5C is approved and becomes effective prior to the effective date of proposed Appendix 2, then the above-quoted text should be replaced by the following text, until Appendix 2 is approved and becomes effective:

> For purposes of this Appendix, the following terms shall be defined as set forth in this section 2.0. Capitalized terms used in this Appendix that are not defined in this section 2.0 shall have the meanings as defined in, as applicable, (i) the NERC *Glossary of Terms Used in Reliability Standards*, or (ii) section 1.0 of the NERC *Uniform Compliance Monitoring and Enforcement Program*, Appendix 4C to the NERC *Rules of Procedure*, or (iii) page 20 of the Organization Registration and Certification Manual, or (iv) section 1501 of the NERC *Rules of Procedure*.

A number of the defined terms and their definitions in section 2.0 are taken from existing Appendix 4D, including Canadian Entity, Classified National Security Information, Eligible Reviewer, FOIA, NRC Safeguards Information, and Protected FOIA Information.

c. Section 3.0 – Basis for Approval of an Exception

Section 3.1, Grounds for an Exception, identifies the two types of Exception Requests and their grounds – Exclusion Exceptions and Inclusion Exceptions. An Exclusion Exception may be requested and obtained "on the grounds that the Element(s) for which the Exception

[25] As noted above, Appendix 2 was filed for approval in the November 29, 2011 ROP Revisions Filing and is pending before the Commission as of the date of this Petition.

Request is filed is included within the BES based on application of the BES Definition but is not necessary for the Reliable Operation of the interconnected bulk-power transmission system as evidenced by Required Information provided pursuant to **Detailed Information to Support an Exception Request (**Section III.B of the Exception Request Form)." An Inclusion Exception may be requested and obtained "on the grounds that the Element(s) for which the Exception Request is filed is not included within the BES based on application of the BES Definition but is necessary for the Reliable Operation of the interconnected bulk-power transmission system as evidenced by Required Information provided pursuant to **Detailed Information to Support an Exception Request** (Section III.B of the Exception Request Form)."

Section 3.2, Burden, specifies that the burden to provide a sufficient basis for Approval of an Exception Request is on the Submitting Entity. This provision is consistent with the placement of the burden to justify a Technical Feasibility Exception as set forth in section 3.3 of existing Appendix 4D, the TFE Procedure. This is an important provision because it establishes that where an Element is *included* in the BES by application of the BES Definition, the entity submitting an Exception Request must prove that the Element should not be included in the BES, or else the Element will remain in the BES; and where an Element is *not included* in the BES by application of the BES Definition, the entity submitting the Exception Request must prove that the Element should be included in the BES, or else the Element will continues to be excluded from the BES. Section 3.2 also specifies that all evidence provided as part of an Exception Request or response thereto will be considered in determining whether the Exception Request shall be approved or disapproved.

d. Section 4.0 – Form, Contents, and Submission of an Exception Request

Section 4.1, Eligible Submitting Entities, details what entities may submit Exception

Requests:

- The Owner of an Element may submit an Exception Request for either an Inclusion Exception or an Exclusion Exception regarding that Element.

- A Regional Entity, PA, RC, TOP, TP, or BA that has (or will have upon inclusion in the BES) the Elements covered by an Exception Request within its Scope of Responsibility may submit an Exception Request for the inclusion in the BES of an Element or Elements owned by a Registered Entity, provided that before doing so, (i) the Submitting Entity conferred with the Owner about the reasons for an Exception, and (ii) could not reach agreement regarding the submission of such an Exception Request. (If the Owner agrees with submitting an Exception Request, the Owner should be the Submitting Entity.)

- A Regional Entity may submit an Exception Request for the inclusion in the BES of an Element or Elements owned by an Owner that is not a Registered Entity.

- An Owner or a Regional Entity may submit an Exception Request for the exclusion from the BES of an Element.

Section 4.2, Separate Submissions for Each Exception Request, specifies as general rules that (i) a separate Exception Request shall be submitted for each Element or set of connected Elements for which the Submitting Entity seeks an Exception, and (ii) a single Exception Request may not be submitted for separate Elements within the geographic boundaries of more than one Regional Entity. Additionally, where the Submitting Entity seeks Exceptions for multiple, similar Elements (all within the boundaries of a single Regional Entity) on the same basis, the Exception Requests for all the Elements may be included in one Exception Request with all the Elements or sets of connected Elements separately identified. Finally, section 4.2 specifies a procedure by which multiple Submitting Entities may jointly file Exception Requests for similar Elements on the same basis; in this situation, one of the Submitting Entities will be designated as the Lead Entity and will submit the Exception Request Form with all Required Information to support the Exception Request.

Section 4.3, Withdrawal of an Exception Request, specifies that a Submitting Entity may withdraw an Exception Request at any time prior to Approval or Disapproval of the Exception Request by NERC.

Section 4.4, Form and Format of Exception Request, specifies that the Exception Request shall consist of three sections. (The required contents of the three sections are enumerated in sections 4.5.1, 4.5.2 and 4.5.3, respectively.) This section also requires that if the Submitting Entity is not the Owner of the Element, the Submitting Entity shall provide a copy of the Exception Request to the Owner (or to the operator(s) of the Element if the Owner is unknown) when the Exception Request is submitted to the Regional Entity.

Section 4.5, Required Information to be Included in the Exception Request, details the Required Information that is to be included in each section of the Exception Request. Section 4.5.1 details the Section I Required Information, section 4.5.2 details the Section II Required Information, and section 4.5.3 describes the Section III Required Information. Each of sections 4.5.1, 4.5.2 and 4.5.3 specifies that failure to provide all of the Required Information for Section I, Section II or Section III, respectively, may result in Rejection of the Exception Request as incomplete.

Section 4.5.1 specifies the Required Information to be included in Section I of the Exception Request. The Section I Required Information is identifying information concerning the Submitting Entity (and Owner, if different), the Exception Request and the Element(s).

Section 4.5.2 specifies the Required Information to be included in Section II of the Exception Request. The Section II Required Information includes (among other things):

- Identification and location of the Element(s) for which the Exception is being requested.

- A statement of the basis on which the Submitting Entity contends the Exception Request should be approved, and if the Submitting Entity is not the Owner, a statement of the basis of the Submitting Entity's reason for submitting the Exception Request.

- A statement, signed and dated by an authorized representative of the Submitting Entity's senior management, stating that the representative has read the Exception Request on behalf of the Submitting Entity and that the Submitting Entity believes Approval of the Exception Request is warranted.

The Section II Required Information will not be publicly posted or disclosed to third parties except for persons involved in reviewing the Exception Request.

Sections 4.5.1 and 4.5.2 each specifies that at the same time the Submitting Entity submits the Exception Request Form to the Regional Entity, the Submitting Entity shall submit a copy of Section I and Section II to each PA, RC, TOP, TP and BA that has (or will have upon inclusion of the Elements in the BES) the Elements covered by the Exception Request within its Scope of Responsibility.

Section 4.5.3 specifies that Section III of the Exception Request shall contain the Detailed Information to Support an Exception Request as specified on the Exception Request Form. The Detailed Information to Support an Exception Request was developed by the SDT for the BES Definition through the NERC Reliability Standard development process.[26] The development and contents of the Detailed Information to Support an Exception Request are described in §III.D of NERC's Petition for approval of the revised BES Definition, which is being filed contemporaneously with this Petition.

[26] Because the Detailed Information to Support an Exception Request was developed and adopted through the Reliability Standard development process, it can only be modified through the Reliability Standard development process, and not through the procedure for revising the ROP.

Section 4.5.3 states that the Submitting Entity may designate all or part of the Section III Required Information as Confidential Information. It sets forth specific provisions for the handling of and access to any Classified National Security Information, NRC Safeguards Information and/or Protected FOIA Information that is submitted in support of the Exception Request.

Section 4.5.4 provides for information to be submitted by entities in addition to the Submitting Entity:

- If the Owner is different than the Submitting Entity, the Owner may file a response to supplement, correct or disagree with all or any part of the Exception Request.

- Any PA, RC, TOP, TP, and BA that has (or will have upon inclusion of the Element(s) in the BES) the Elements covered by an Exception Request within its Scope of Responsibility may also provide input to the Regional Entity regarding the request.

Section 4.5.4 also sets forth procedures by which the Owner (if different than the Submitting Entity) or a PA, RC, TOP, TP or BA, in order to enable it to evaluate the Exception Request, may request and obtain the Section III Required Information from the Regional Entity. Section 4.5.4 includes provisions to protect, in such a transaction, any Confidential Information included in the Section III Required Information.

Section 4.6, Access to Confidential Information, Classified National Security Information, NRC Safeguards Information, and Protected FOIA Information Included in Required Information, sets forth provisions by which the Regional Entity can obtain access to any Confidential Information, Classified National Security Information, NRC Safeguards Information, and Protected FOIA Information included in the Exception Request from the Submitting Entity or Owner, while protecting the confidentiality of the information.

e. Section 5.0 – Review, Acceptance or Rejection, and Recommendation Regarding Exception Requests

Section 5.0 specifies that the Regional Entity's evaluation of an Exception Request will consist of two stages:

- an initial screening to determine whether to accept or reject the Exception Request, and
- a substantive review to determine the Regional Entity's recommendation to NERC as to whether or not the Exception Request should be approved.

The details of the procedures for the Regional Entity's initial screening and substantive review of the Exception Request are set forth in sections 5.1, 5.2 and 5.3. Sections 5.1.3(a) and 5.2.2 set forth the time periods for completion of the initial screening and substantive review. However, section 5.0 also allows the Regional Entity the ability to establish an alternative time period objective and work plan:

> If the Regional Entity determines at any time that for a specified period of time, the Regional Entity will be unable to complete initial screenings of Exception Requests within the time provided by section 5.1.3(a) and/or substantive reviews of Exception Requests within the time provided in section 5.2.2, the Regional Entity, based on consultation with NERC, shall establish an alternative time period objective and work plan for completing initial screenings and substantive reviews of Exception Requests during the specified period of time. The alternative time period and work plan shall be publicized by posting on the Regional Entity's website.[27]

Section 5.0 also sets forth exceptions to the procedures for the initial screening and substantive review of an Exception Request where the Regional Entity is the Submitting Entity:

- There will be no initial screening, and no Acceptance or Rejection, of the Exception Request.
- The Regional Entity will begin substantive review of the Exception Request (and of any responses received from the Owner and other applicable entities) within sixty

[27] This provision is comparable to sections 5.1.3(b) of Appendix 4D, the TFE Procedure.

days after submitting the Exception Request to the Owner and other applicable entities, and shall complete the substantive review within six months.

- Before the Regional Entity issues a Recommendation to NERC to approve or disapprove the Exception Request in whole or in part, the Technical Review Panel shall review the proposed Recommendation and issue an opinion on it, with copies provided to the Owner and to NERC.

Section 5.1, Initial Screening of Exception Request for Acceptance or Rejection, sets forth the detailed procedures relating to the Regional Entity's initial screening of an Exception Request. Section 5.1.3 specifies that the Regional Entity is to complete the initial screening within 60 days after receiving the Exception Request or, if the Submitting Entity is not the Owner, within 30 days after receiving the Owner's response, unless (i) the Regional Entity has established an alternative time period objective and work plan (as described above), or (ii) the Regional Entity issues a notice to the Submitting Entity (and to the Owner, if different), prior to the deadline date, stating a revised deadline date.

The initial screening shall review (i) whether the Exception Request is from an eligible (in accordance with section 4.1) Submitting Entity, and (ii) whether all Required Information has been provided; the Exception Request may be rejected for failure to meet either criterion. (Sections 5.1.4 and 5.1.5.) However, the Regional Entity may not reject the Exception Request because it is missing Required Information, unless (1) it first contacts the Submitting Entity to request that the missing Required Information be provided, and (2) the Submitting Entity fails to submit the missing Required Information within 30 days or such additional period of time that the Regional Entity allows based on the circumstances. If the Submitting Entity submits supplemental Required Information in response to the Regional Entity's request, the time for the Regional Entity to complete the initial screening is extended by 15 days from the receipt of the supplemental Required Information.

Section 5.1.6 specifies that the Regional Entity may either accept the Exception Request in its entirety, reject it in its entirety, or if the Exception Request is for more than one Element, may accept it with respect to a subset of the Elements and reject it with respect to the remainder of the Elements. Section 5.1.5(b) specifies that if the Regional Entity rejects the Exception Request, its notice must explain the reason for the Rejection. Section 5.1.6 also specifies that the Submitting Entity may, within 30 days after receipt of the Rejection, appeal to NERC to reverse the Rejection and to direct the Regional Entity to proceed with a substantive review of the Exception Request.

Section 5.2, Substantive Review of Exception Request for Approval or Disapproval, sets forth the detailed procedures for the Regional Entity's substantive review of the Exception Request. Section 5.2.1 specifies that in conducting its substantive review, the Regional Entity:

- may request access to and review the Required Information, including any Confidential Information, Classified National Security Information, NRC Safeguards Information, and Protected FOIA Information;
- may conduct one or more physical inspections of the relevant Element(s) and its (their) context and surrounding Elements and Facilities;
- may request additional information from the Submitting Entity, Owner, or applicable PAs, RCs, BAs, TOPs and TPs; and
- may engage in further discussions concerning possible revisions to the Exception Request.

Section 5.2.2 specifies that at the outset of its substantive review of the Exception Request, the Regional Entity shall develop a milestone schedule pursuant to which it plans to conduct the substantive review, and shall send a copy of the milestone schedule to the Submitting Entity and the Owner (if different) for information. Section 5.2.2 further provides that the Regional Entity shall complete the substantive review and issue a notice with its Recommendation within six months following Acceptance of the Exception Request or within an

alternative time period established pursuant to section 5.0. However, the Regional Entity may extend the period for substantive review by issuing a notice stating the revised date by which it will issue its Recommendation.

Section 5.2.3 specifies that upon completion of its substantive review of the Exception Request, the Regional Entity shall issue a Recommendation to NERC (with a copy to the Submitting Entity and to the Owner if different) as to whether the Exception Request should be approved or disapproved (in whole or in part), and stating the basis for the Recommendation. The Regional Entity shall also transmit to NERC the Exception Request Form and all other information considered by the Regional Entity in arriving at its Recommendation.

Section 5.2.4 provides that the Regional Entity shall not recommend Disapproval of an Exception Request, in whole or in part, without first submitting the Exception Request to a Technical Review Panel and receiving its opinion, in accordance with section 5.3 (summarized below).

Section 5.2.5 states that NERC shall develop, and post on its web site, a reporting program and schedule pursuant to which Regional Entities will be required to submit to NERC periodic reports on the numbers, status and timing of their initial screenings and substantive reviews of Exception Requests. While NERC considered establishing specific reporting requirements, including specific content, in Appendix 5C, it was determined that (i) it would be premature to do so prior to the Commission's approval of the BES Exception Procedure, and (ii) in any event, flexibility should be maintained to change the reporting requirements and content, once developed, by not hard-wiring these requirements in Appendix 5C.[28] These reports may

[28] Candidate data items for the reporting requirements could include he number of new Exception Requests received during the quarter; the number of Exception Requests for which initial screening was completed during the quarter; the number of Exception Requests for which

also be posted on the Regional Entity and NERC websites, and would provide a basis for the development of periodic reports that NERC could submit to the Commission. Submission and posting of periodic status reports will enable NERC to maintain oversight, and stakeholders to have visibility, of the Regional Entities' success or lack thereof in processing Exception Requests within the time periods specified in Appendix 5C.

Section 5.3, Technical Review Panel, contains the provisions relating to the Regional Entity Technical Review Panels. Each Regional Entity shall have a Technical Review Panel comprised of not less than three individuals appointed by the Regional Entity senior executive. Any panel members who are industry subject matter experts or Regional Entity members shall comply with section 403.7 of the ROP (pertaining to confidentiality and to lack of conflicts of interest and financial interest in the matter), shall not have participated in the Regional Entity's review of the Exception Request that they are to evaluate, and shall have the required technical background to evaluate Exception Requests. Section 5.3 requires that if the Regional Entity intends to issue a Recommendation of Disapproval, in whole or in part, it must first submit its proposed determination to the Technical Review Panel and receive the Panel's opinion. If the Regional Entity decides to recommend Disapproval of the Exception Request, a copy of the Technical Review Panel's opinion is to be provided to the Submitting Entity (and to the Owner, if different). The Regional Entity is not bound by the Technical Review Panel's opinion, but the

---

substantive review was completed during the quarter; the number of Exceptions Requests in the process of initial screening; the number of Exception Requests for which the original deadline date as specified in section 5.1.3 has not been reached; the number of Exception Requests for which the deadline date for the initial screening has been extended pursuant to section 5.1.3; the number of Exception Requests undergoing substantive review, the number of Exception Requests undergoing substantive review that are within the six month review period pursuant to section 5.2.2; and the number of Exception Requests undergoing substantive review for which the six month review period has been extended pursuant to section 5.2.2. However, no determination has been made as to the content requirements for the periodic reports.

Panel's opinion will be part of the record associated with the Exception Request and shall be provided to NERC.

f. Section 6.0 – Supplementation of an Exception Request Prior to a Recommendation

Section 6.0 specifies that a Submitting Entity or Owner, at any time prior to the Regional Entity issuing its Recommendation, may supplement the Exception Request, either at the Regional Entity's request or at the Submitting Entity's or Owner's own initiative, for the purpose of providing additional or revised Required Information. The Submitting Entity or Owner shall submit a written explanation of what Required Information is being added or revised and the purpose of the supplementation. Section 6.0 provides that supplementing a pending Exception Request may, in the Regional Entity's discretion, reset the time period for the Regional Entity's initial screening or substantive review.

g. Section 7.0 – Appeal of Rejection of an Exception Request

Section 7.0 sets forth procedures by which a Submitting Entity may appeal to NERC the Regional Entity's Rejection of an Exception Request. The submission to NERC must demonstrate that the Submitting Entity is eligible (in accordance with section 4.1) to submit the Exception Request and that all Required Information has been provided. If NERC determines that the Submitting Entity is eligible to submit the Exception Request, that all Required Information has been provided, and that the Exception Request should proceed to substantive review, NERC shall issue a decision directing the Regional Entity to proceed to a substantive review of the Exception Request. NERC's decision to direct, or not to direct, the Regional Entity to proceed to substantive review, is to be issued within 45 days after receiving the Submitting Entity's submission, with copies to the Submitting Entity (and Owner if different).

h. Section 8.0 – Approval or Disapproval of an Exception Request

Section 8.0 sets forth the process by which NERC will review an Exception Request, following receipt of the Regional Entity's Recommendation. The Submitting Entity or Owner will have 30 days following the date of the Regional Entity's recommendation to NERC to submit a comment in support of or opposition to the Recommendation. The Exception Request will be reviewed by a team of at least three persons, appointed by the NERC President, with the required technical background to evaluate Exception Requests. The members of the review team must have no financial, contractual, employment or other interest in the Submitting Entity or Owner that would present a conflict of interest and must be free of any conflicts of interest in accordance with NERC policies.[29] NERC may ask the Regional Entity and the Submitting Entity and Owner (if different) to appear at a NERC office, or to participate in a teleconference or webinar, to discuss questions concerning the Exception Request.[30]

The NERC team's review shall be completed within 90 days after NERC receives the Regional Entity's Recommendation, at the conclusion of which the team will issue a written proposed decision to approve or disapprove the Exception Request. If the Exception Request

[29] At the present time, NERC anticipates that its review teams would be drawn from staff resources, supplemented by contractors as necessary, particularly where needed to provide specific relevant subject matter expertise. However, situations may also arise in which NERC may need to call on industry subject matter experts to participate as members of review teams.

[30] In addition to the Regional Entity's Recommendation, the materials available to the NERC review team (and to the NERC President, see below) will include the Exception Request itself (including the Detailed Information to Support an Exception Request), any opinion from the Regional Entity Technical Review Panel, and any information submitted at the Regional Entity level by a PA, RC, BA, TOP or TP concerning the Exception Request. Although it is presumed that a PA, RC, BA, TOP or TP will present a comprehensive statement of its comments and concerns, if any, at the Regional Entity review stage, NERC would have the ability to ask the PA, RC, BA, TOP or TP if it needs to supplement the information, comments or concerns that were submitted to the Regional Entity, in order to provide the NERC review team and the NERC President with the most complete information on which to base their respective decisions.

concerns more than one Element, the review team's proposed decision may approve a portion and disapprove a portion of the Exception Request. The written proposed decision shall state the basis for the decision. If the review team's proposed decision is not unanimous, the dissenting team member may, if he or she wishes to do so, issue a minority report stating the dissenting member's reasons for disagreement with the proposed decision.

Within 30 days after the date of the NERC review team's proposed decision, the NERC President will issue a final written decision on the Exception Request on behalf of NERC. The NERC President's decision may adopt the review panel's proposed decision or modify the proposed decision, and may reach a different conclusion than the proposed decision as to whether the Exception Request is approved or disapproved. The decision issued by the NERC President shall be the decision of NERC with respect to the Approval or Disapproval of the Exception Request.

Section 8.0 also specifies that NERC shall provide to the Submitting Entity and to the Owner, if different, copies of any documents considered by the NERC review team in reaching its proposed decision, and any additional documents considered by the NERC President in reaching the final decision, that were not originally provided by, or have not previously been provided to, the Submitting Entity or Owner. Finally, Section 8.0 provides that NERC shall retain the documentation used to substantiate the decision related to an Exception Request for the longer of seven years or as long as the Exception is in effect, unless a different retention period is otherwise identified.

i. Section 9.0 – Appeal of Approval or Disapproval of an Exception Request

Section 9.0 specifies that a Submitting Entity or Owner aggrieved by NERC's Approval or Disapproval of an Exception Request or termination of an Exception (pursuant to section 11.0,

described below) may, within 30 days following the date of the NERC decision, challenge the determination pursuant to ROP section 1703 (described in §III.D below). If neither the Submitting Entity nor the Owner challenges NERC's decision within the 30 day period with respect to any Element to which the Exception Request or the Exception applies, the determination becomes effective with respect to that Element on the thirty-first day following the date of the NERC decision.

j. Section 10.0 – Implementation Period for Exceptions

Section 10.1, Inclusion Exceptions, specifies that for an Element for which an Inclusion Exception is approved, the Owner must submit to the Regional Entity a proposed implementation plan detailing the schedule for the Owner to achieve compliance with any Reliability Standards that are applicable to the newly included Element. The Owner and the Regional Entity shall confer to agree upon the implementation schedule. If they are unable to agree on a schedule, the Regional Entity shall notify the NERC director of compliance operations of the disagreement and provide statements of the Regional Entity's and the Owner's positions, and NERC shall specify a reasonable implementation schedule.

Section 10.2 pertains to establishing the compliance implementation plan for an Element for which an Exclusion Exception has been denied.

-- Subsection (a) specifies that in the case of a newly-constructed or installed Element which is included in the BES by application of the BES Definition but for which an Exception Request for an Exclusion Exception was submitted at least 12 months before commercial operation of the Element, but either is still pending or has been rejected or disapproved at the time of commercial operation, the Owner shall submit an implementation plan to the Regional Entity detailing the schedule for the Owner to

achieve compliance with any Reliability Standards applicable to the newly constructed or installed Element.

-- Subsection (b) specifies that in the case of an Element that was not included in the BES under the previously effective BES Definition but is included in the BES based on application of the revised BES Definition, and for which an Exception Request for an Exclusion Exception was submitted within 12 months after the revised BES Definition became effective but either is still pending or has been rejected or disapproved at the end of the applicable BES Definition implementation plan time period,[31] the Owner shall submit a proposed implementation plan to the Regional Entity detailing the schedule for the Owner to achieve compliance with any Reliability Standards applicable to the newly included Element.

Under both subsections, the Owner and the Regional Entity shall confer to agree upon the implementation schedule. If they are unable to agree on a schedule, the Regional Entity shall notify the NERC director of compliance operations of the disagreement and provide statements of the Regional Entity's and the Owner's positions, and NERC shall specify a reasonable implementation schedule.

k. Section 11.0 – Termination of an Approved Exception

Section 11.1 specifies that an Exception Request typically will be approved without a specified date of termination but will be subject to review to verify continuing justification for the Exception. Section 11.2 requires that a Submitting Entity must notify the Regional Entity and NERC within 90 days after learning of any change of condition which would affect the basis stated by NERC in its decision approving the Exception Request. NERC will review the

[31] The proposed implementation period for the revised BES Definition is addressed in §III.E of NERC's contemporaneously-filed petition for approval of the revised BES Definition.

notification and determine whether to direct the Regional Entity to perform a substantive review pursuant to section 5.2 to verify continuing justification for the Exception and to issue a Recommendation to NERC on whether the Exception should be continued or terminated.

Section 11.3 requires a Submitting Entity that has received an Exception to certify periodically to the Regional Entity that the basis for the Exception remains valid, and in connection with each certification, shall provide any changes to the Section I Required Information or Section II Required Information. (Section 11.6 requires that upon request by the Regional Entity, the Submitting Entity or Owner (if different) shall, within 30 days, provide the most recent versions of any Section III Required Information requested.) The certification is to consider the effect on the basis for the Exception of changes such as load growth and topological changes and the effects on system limits and impacts as a result of contingencies listed in Table 1 of each applicable TPL Reliability Standard. The certifications must be provided every 36 months for as long as the Exception remains in effect. The first certification is due on the first day of the first quarter 36 months after the date on which the Exception Request was approved. If the certification is not provided, the Exception is subject to termination 90 days after the date the certification was due.

Additionally, section 11.4 specifies that if the Regional Entity obtains information through means other than those described in sections 11.2 (notification from the Submitting Entity) or 11.3 (periodic certifications submitted by the Submitting Entity) indicating an Exception may no longer be warranted, the Regional Entity shall provide the information to NERC. NERC will determine whether to direct the Regional Entity to perform a substantive review pursuant to section 5.2 to verify continuing justification for the Exception and to issue a Recommendation to NERC on whether the Exception should be continued or terminated. This

process will also provide NERC the ability to direct the Regional Entity to conduct a substantive review of the Exception, if NERC obtains information indicating the Exception may no longer be warranted.

Section 11.5 specifies that if the Regional Entity recommends that an Exception be terminated, NERC shall take the following actions:

- issue a written notice to the Submitting Entity (and the Owner, if different) that the exception is under review for possible termination;
- allow the Submitting Entity and/or Owner 30 days to submit comments or information to NERC to show that the Exception continues to be justified and should remain in effect; and
- cause the Regional Entity's Recommendation to be reviewed by a NERC review panel for purposes of issuing a proposed decision, followed by a final decision by the NEC President, in accordance with section 8.0.

If the conclusion of the NERC review is that the Exception should be terminated, NERC shall send a written notice to the Submitting Entity and/or Owner stating that the Exception is terminated and the reasons for the termination. When an Element will be included in the BES as a result of the termination of an Exclusion Exception, an implementation plan detailing the schedule for complying with any Reliability Standards applicable to the newly-included Element will be developed in accordance with section 10.1 as if it were being included by an Inclusion Exception.

D. Proposed Section 1703 of the Rules of Procedure

Proposed ROP section 1703 (included in **Attachments 2A** and **2B**) provides a procedure for a Submitting Entity or Owner to challenge the NERC decision to approve or disapprove an Exception Request pursuant to Appendix 5C. The Submitting Entity (or Owner, if different) must file the challenge within 30 days of the date of the NERC decision, by submitting it to the NERC director of compliance operations, with copies to the Regional Entity and to the

Submitting Entity or Owner (if different). The Regional Entity, and the Submitting Entity or Owner if different, may file a response within 30 days after the date the challenge is filed with NERC. The challenge will be decided by the NERC BOTCC. The BOTCC must issue its decision within 90 days after the submission of the challenge, unless the BOTCC issues a notice extending the deadline for its decision to a stated date later than the 90-day deadline, and stating the reason for the extension. The BOTCC decision will be the final NERC decision on the Exception Request.

Section 1703.4 states that the Submitting Entity, or Owner if different, may appeal the final NERC decision to, or seek review of the final NERC decision by, the Applicable Governmental Authority(ies), in accordance with the legal authority and rules and procedures of the Applicable Governmental Authority(ies). An appeal to an Applicable Governmental Authority must be filed within 30 days following the date of the BOTCC's decision or within such other time period as is provided for in the legal authority, rules or procedures of the Applicable Governmental Authority.

E. Proposed Revisions to Appendix 2 to the Rules of Procedure

In the November 29, 2011 ROP Revisions Filing, which is still pending before the Commission as of the date of this Petition, NERC submitted for approval (among other revisions to the ROP) proposed new Appendix 2, *Definitions Used in the Rules of Procedure*. Appendix 2 is intended to collect, in one appendix to the ROP, all defined terms used anywhere in the ROP and appendices.

Proposed Appendix 5C includes a number of new defined terms that are not included in proposed Appendix 2 as filed with the Commission in the November 29, 2011 ROP Revisions Filing (including, of course, the revised definition of Bulk Electric System). In addition, it is

necessary to slightly modify several other definitions in proposed Appendix 2, which are already used elsewhere in the ROP, to make them consistent with definitions in proposed Appendix 5C. Accordingly, NERC is submitting for approval, as part of this filing, proposed revisions to Appendix 2 as originally filed in the November 29, 2011 ROP Revisions Filing. **Attachment 3A** is a clean version of Appendix 2 incorporating the additional and revised definitions that are being added due to Appendix 5C, and **Attachment 3B** is a redlined version of Appendix 5C, as originally submitted in the November 29, 2011 ROP Revisions Filing, showing the additional and revised definitions that are being added due to Appendix 5C.[32]

Following is a list of the new and revised definitions in Appendix 2:

Acceptance of the Exception Request or Acceptance (new defined term from Appendix 5C)

Approval of the Exception Request or Approval (new defined term from Appendix 5C)

Balancing Authority (minor revision to reflect inclusion of new defined terms in the BES through adoption of the revised BES Definition)

Balancing Authority Area (minor revision to reflect inclusion of new defined terms in the BES through adoption of the revised BES Definition)

BES Definition (new defined term from Appendix 5C)

Blackstart Resource (minor revision to reflect inclusion of new defined terms in the BES through adoption of the revised BES Definition)

Bulk Electric System or BES (revised definition from NERC Glossary)

Canadian Entity (revised definition to distinguish the meanings of this term as used in Appendix 4D and Appendix 5C, respectively)

Disapproval of the Exception Request or Disapproval (new defined term from Appendix 5C)

[32] NERC is making the assumption that the November 29, 2011 ROP Revisions Filing will be acted upon by the Commission before the instant Petition is acted on.

Distribution Factor (defined term from the NERC Glossary being added to the defined terms in the ROP as a result of adoption of the revised BES Definition)

Exception (new defined term from Appendix 5C)

Exception Procedure (new defined term from Appendix 5C)

Exception Request (new defined term from Appendix 5C)

Exception Request Form (new defined term from Appendix 5C)

Flowgate (defined term from the NERC Glossary being added to the defined terms in the ROP due to its use in the revised BES Definition)

Inclusion Exception (new defined term from Appendix 5C)

Interchange Distribution Calculator (defined term from the NERC Glossary being added to the defined terms in the ROP as a result of adoption of the revised BES Definition)

Lead Entity (new defined term from Appendix 5C)

Load (defined term from the NERC Glossary being added to the defined terms in the ROP due to its use in the revised BES Definition)

Mexican Entity (new defined term from Appendix 5C)

Owner (new defined term from Appendix 5C)

Reactive Power (defined term from the NERC Glossary being added to the defined terms in the ROP due to its use in the revised BES Definition)

Real Power (defined term from the NERC Glossary being added to the defined terms in the ROP due to its use in the revised BES Definition)

Recommendation (new defined term from Appendix 5C)

Rejection of the Exception Request or Rejection (new defined term from Appendix 5C)

Required Information (revised definition to distinguish the meanings of this term as used in Appendix 4D and Appendix 5D, respectively)

Scope of Responsibility (new defined term from Appendix 5C)

Section I Required Information (new defined term from Appendix 5C)

Section II Required Information (new defined term from Appendix 5C)

Section III Required Information (new defined term from Appendix 5C)

Sink Balancing Authority (minor revision to reflect inclusion of new defined terms in the BES through adoption of the revised BES Definition)

Special Protection System (minor revision to reflect inclusion of new defined terms in the BES through adoption of the revised BES Definition)

Submitting Entity (revised definition to distinguish the meanings of this term as used in Appendix 5C and in section 1500 of the ROP, respectively)

Technical Review Panel (new defined term from Appendix 5C)

F. Proposed Revisions to Appendix 5B to the Rules of Procedure

Appendix 5B of the ROP, *Statement of Compliance Registry Criteria*, includes within its text the current definition of Bulk Electric System. Accordingly, and assuming the revised definition of Bulk Electric System is approved by the Commission, Appendix 5B needs to be revised to include the revised BES Definition. In addition, several other terms in Appendix 5B will now be capitalized because they become defined terms due to adoption of the revised BES Definition.

Attachment 6A to this Petition is a clean version of Appendix 5B, as filed with the Commission for approval in the November 29, 2011 ROP Revisions Filing, with the existing definition of Bulk Electric System replaced by the revised BES Definition. **Attachment 6B** is a redlined version of Appendix 5B, as filed in the November 29, 2011 ROP Revisions Filing, showing, in legislative style, the deletion of the current definition of Bulk Electric System and the insertion of the revised BES Definition, as well as the other capitalization revisions described above.[33]

[33] In **Attachments 6A** and **6B**, the proposed revisions to Appendix 5B for which approval has been sought in the November 29, 2011 ROP Revisions Filing, which is still pending before the Commission as of the date of this Petition, are assumed to have been accepted and therefore are incorporated in the existing text.

G. Proposed Revisions to Other Sections of the Rules of Procedure and to Appendices 3D, 4B, 6 and 8

NERC also requests approval of minor revisions to sections 302.2.2, 501.1.4.4, 804, 1102.2 and 1701 of the ROP and Appendices 3D, 4B, 6 and 8. The revisions to section 1701 are necessary to reflect the addition of new section 1703 to section 1700 of the ROP. The revisions to the other sections of the ROP and to Appendices 3D, 4B, 6 and 8 are all necessary to capitalize (consistent with the capitalization convention adopted in the November 29, 2011 ROP Revisions Filing) terms that become defined terms as the result of adoption of the revised BES Definition and several defined terms from the NERC Glossary that are used within the revised BES Definition. The revisions to these ROP sections and Appendices are shown in the redlined versions in **Attachments 2B, 4B, 5B, 7B** and **8B**, respectively.[34]

IV. NERC APPROVALS FOR THE PROPOSED REVISION

Following the issuance of Order No. 743 on November 28, 2010, a SDT was formed charged with the responsibility to develop a revised BES Definition, technical criteria for Exception Requests, and an implementation plan (Standards Project 2010-17*)*; and the BES ROP Team was formed to develop a proposed BES Exception Procedure to be added to the NERC ROP. The BES ROP Team members were selected, from stakeholder names that were submitted for participation on the Standards Project 2010-17 SDT, to provide a good mixture of technical, policy and industry view. The Team included Canadian representatives.[35]

During the course of the BES ROP Team's work, interested stakeholders were provided multiple opportunities to participate in the development of a BES Exception Procedure, through

[34] Each of these Attachments was prepared assuming that the proposed revisions submitted to the Commission in the November 29, 2011 ROP Revisions Filing will be approved.

[35] The BES ROP Team roster is available at: http://www.nerc.com/docs/standards/dt/BESROP_ROSTER_08312011.pdf.

open meetings of the Team as well as through extensive use of e-mail, web postings, and informational and question-and-answer sessions held jointly with the BES Definition SDT. An extensive stakeholder e-mail list (the same list used for the BES Definition SDT's work) was compiled and used to distribute status information about the Team's work as well as draft documents. The use of a common e-mail list kept the BES Definition SDT and the BES ROP Team aware of each other's work. As an additional source of information for stakeholders, a BES ROP Team web page was created and hyperlinked to the "Standards Under Development" page on the NERC web site. Further, the NERC Member Representatives Committee was briefed on the BES ROP Team's progress on several occasions during 2011; two joint (with the SDT) NERC webinars with questions and answers were presented; and there was one joint presentation at a NERC Standards workshop.

Through two separate postings and comment periods, stakeholders were provided the opportunity to provide feedback on draft amendments to the ROP for the BES Exception Procedure. A 30-day posting for comment was held from May 10, 2011 through June 10, 2011, in conjunction with the first posting of the draft revised BES Definition. Seventy sets of comments were received on this draft posting, including comments from more than 176 different people from approximately 131 organizations representing all ten Registered Ballot Body Segments. A special electronic comment form was utilized to facilitate the submission and review of stakeholder comments.

After considering the comments received in the first posting, the BES ROP Team made substantial revisions to the proposed ROP amendments. A second posting for a 45-day comment period was conducted from September 13, 2011 through October 27, 2011, in conjunction with the second posting and initial ballot of the revised BES Definition. There were 72 sets of

comments received on the second posting, including comments from more than 134 different people from approximately 86 organizations representing nine of the ten Segments. An electronic comment form was again used which included specific questions that stakeholders were asked to respond to, as well as providing the ability to comment generally on the proposed text.[36]

After reviewing the second set of comments, the BES ROP Team made additional revisions to the draft ROP provisions, and submitted the Team's proposed versions of Appendix 5C and ROP sections 509 and 1703 to NERC.

A more detailed discussion of the development process followed by the BES ROP Team and how the Team considered and addressed a number of issues it identified, including issues raised in stakeholder comments, in arriving at its final proposed ROP provisions, is provided in **Attachment 9**, which was prepared by the BES ROP Team.

The provisions proposed by the BES ROP Team were reviewed and discussed by NERC Reliability Standards, Compliance Operations, Reliability Assessment and Performance Analysis, and Legal staffs to identify any revisions to the Team's documents that NERC staff should recommend to the Board. Although generally accepting the structure and process embodied in the ROP provisions proposed by the BES ROP Team, NERC staff did make a number of specific revisions to the Team's proposed documents for the versions that were submitted to the NERC Board for approval. A number of these revisions were non-substantive revisions for purposes of internal consistency within Appendix 5C and/or for consistency

[36] The NERC Bylaws (Article XI, section 2) only require that one, 45-day comment period be provided for proposed additions or revisions to the ROP, before the additions or revisions are submitted to the Board for approval. By providing for two postings and stakeholder comment periods, the BES ROP Team exceeded the requirements of the Bylaws.

(including format consistency) with other ROP provisions. Substantive revisions that were made to proposed Appendix 5C include the following items:

- Sections 5.0 item (iii), 5.1.5 and 5.3 – The Team's proposal included a requirement for a review by the Regional Entity Technical Review Panel if the Regional Entity proposes to reject an Exception Request. This provision has been deleted. In deleting this provision, NERC staff considered both this specific provision and the overall amount of process and resource requirements that Appendix 5C and ROP section 1703 would require of the Regional Entities and NERC, as well as the time potentially required to complete the overall Exception Request process, and concluded that the amount of process steps, resources and time required needed to be reduced. NERC Staff also noted that sections 5.1.5(b) and 7.0 give the Submitting Entity the right to appeal a Rejection of an Exception Request by the Regional Entity to NERC, thereby providing an opportunity for review of the Rejection decision.

- Section 5.1.3. The time periods for the Regional Entity to complete initial screening of Exception Requests, described in the Team's proposal as "typical," were changed to deadlines, with a provision added whereby the Regional Entity can extend the deadline to a new date by issuing a notice.[37]

- Section 5.0 item (ii) and 5.2.2. The Team's version included a requirement for the Regional Entity to confer with the Submitting Entity (and Owner, if different) to establish milestones for the Regional Entity to complete its substantive review of the Exception Request within six months. This requirement for such consultations has been deleted. The necessity to engage in such conferences and negotiations in connection with every substantive review of an Exception Request was viewed as an excessive time and resource requirement for the Regional Entities. However, in its place, a provision was added in section 5.2.2 requiring the Regional Entity, at the outset of its substantive review, to develop a milestone schedule pursuant to which it plans to conduct the substantive review, and to send a copy of the milestone schedule to the Submitting Entity and the Owner (if different) for information.

- A new section 5.2.5 was added stating that NERC shall develop, and post on its web site, a reporting program and schedule pursuant to which Regional Entities will be required to submit to NERC periodic reports on the numbers, status and timing of their initial screenings and substantive reviews of Exception Requests.

[37] In addition, section 5.0 allows a Regional Entity to establish an alternative time period objective and work plan for completing initial screenings and substantive reviews of Exception Requests, for a period of time, if the Regional Entity determines it will be unable to complete these activities within the time periods specified in section 5.0.

- Section 8.0. The Team's proposed version included a requirement that if the decision of the three-person NERC team reviewing an Exception Request is not unanimous, its decision must note that fact and state the basis on which the minority disagreed. This provision has been eliminated and replaced with a provision that the dissenting team member may, if he or she wishes, submit a minority report stating the dissenting member's reasons for disagreement with the decision. NERC staff did not see a need to require a statement of the minority position if the dissenting member did not feel sufficiently strongly to provide one.

- Section 8.0. The minimum time period for NERC to retain documentation of the NERC decision was increased from six years (in the Team's proposal) to seven years, to be more consistent with other NERC document retention policies.

- Section 8.0. A provision in the Team's version that "The Submitting Entity and/or Owner if different shall be given access to this record upon request, subject to applicable confidentiality provisions" was deleted. Entities should be responsible to maintain their own copies of the record of the Exception Request process; further, responding to requests for documents from the record (including ensuring that confidentiality requirements are maintained when access or copies are provided) would be an unnecessary resource requirement for NERC. However, this provision was replaced with a requirement that NERC shall provide to the Submitting Entity and to the Owner (if different), copies of any documents considered by the NERC review team in reaching its proposed decision, and any additional documents considered by the NERC President in reaching the final decision, that were not originally provided by, or have not previously been provided to, the Submitting Entity or Owner. (The references to the review team's "proposed decision" and to the NERC President's "final decision" were added as the result of the additional changes made to Section 8.0 at the direction of the NERC Board, as discussed below.)

- Sections 10.1, 10.2(a) and 10.2(b). In the Team's version, the three cited sections each provided that if the Regional Entity and the Owner are unable to agree on an implementation plan for compliance with Reliability Standards applicable to an Element that is included in the BES due to Approval or Disapproval of an Exception Request, "the Regional Entity Board or a Board-appointed committee shall specify a reasonable implementation schedule." NERC staff concluded that designating Regional Entity boards to make these determinations was inappropriate for a number of reasons, including lack of expertise and the fact that some Regional Entity boards meet infrequently so that the determination of the implementation plan schedule could be unduly delayed. These provisions were deleted and replaced with provisions specifying that if the Regional Entity and the Owner are unable to agree on an implementation plan, the matter shall be brought to NERC and NERC will determine an appropriate implementation schedule.

- Section 11.3. The frequency with which the Submitting Entity must certify that the basis for the Exception remains valid was changed from 24 months (in the Team's version) to 36 months. NERC staff noted that (i) the underlying system conditions

and configurations on which the Exception was based are not likely to change frequently, (ii) Regional Entity resources will be required to track the certification due dates and process and review the certifications, and (iii) section 11.2 imposes a separate requirement on Submitting Entities to notify the Regional Entity and NERC within 90 days after learning of any change in condition which would affect the basis stated in the NERC decision approving the Exception Request.

Substantive revisions that NERC staff made to the BES ROP Team's proposed ROP section 1703 (providing the procedures for a challenge of the NERC decision on an Exception Request to the NERC Board) are the following items:

- The Team's proposed version of ROP section 1703 provided for two levels of review: review by a separate standing technical panel appointed by the NERC Board, followed by review (if requested by the appellant) by the NERC BOTCC. NERC Staff concluded that providing for two levels of review at the appeal stage, including review by another panel of technical experts, was unnecessary in light of the review steps in the process leading up to the "initial" NERC decision on the Exception Request, which already will have included review by two separate panels of technical experts. Therefore, section 1703 was revised to eliminate review by the standing panel of experts, and instead to provide for only one step in the challenge process, *i.e.*, consideration of the challenge by the BOTCC.

- The Team's version also provided that the BOTCC, when asked to review the decision of the standing panel, could simply allow the 90-day period for BOTCC review to expire with no action, thereby making the standing panel's decision the final NERC decision. However, because the review by the standing panel was eliminated, section 1703 was also revised to specify that the BOTCC must render a decision on each challenge. A provision was also added to allow the BOTCC to extend its decision deadline date beyond 90 days by issuing a notice to the parties stating the extended deadline date. This "extension" provision gives the BOTCC flexibility in scheduling and to ensure it has sufficient time to consider the challenge.

During the course of consideration of the BES ROP Team's proposed Exception Procedure, there was also consideration of whether provisions should be added to Appendix 5C to provide for coordination among Regional Entities concerning Exception Requests. Section 4.1 of proposed Appendix 5C specifies that:

> With respect to an Element that crosses a boundary between Regional Entities, (1) the Submitting Entity will submit the Exception Request to both (or all) Regional Entities, which will cooperate to process the Exception Request pursuant to section 5.1 below, or (2) the Regional Entities must jointly submit an

Exception Request to NERC (neither Regional Entity shall be allowed to submit such Exception Request unilaterally).

However, consideration was also given to whether to include procedures by which neighboring Regional Entities in an Interconnection to the Region in which the Element is located would be sent notification of, and could submit comments on, an Exception Request concerning how the Exception Request could impact reliability in the neighboring Region, even where the Element(s) that are the subject of the Exception Request are located solely within a single Region. It was the near-unanimous conclusion of the Regional Entities and NERC that such additional procedures were not needed and would, in fact, create additional prescriptive administrative requirements that could burden efficient implementation of the Exception Procedure. Rather, the Regional Entities can work cooperatively together to keep each other apprised of Exception Requests that could, if granted, have impacts on the Reliable Operation of the interconnected bulk-power transmission system in a neighboring Region within the Interconnection, and seek input from the neighboring Regional Entity where appropriate. Additionally, NERC, in its role under the Exception Procedure as the entity deciding whether Exception Requests should be approved or disapproved, can consider and evaluate the potential impacts of an Exception Request on the Reliable Operation of the interconnected bulk-power transmission system in neighboring Regional Entities.

The NERC Board accepted the revisions to the Exception Procedure recommended by NERC staff and directed that two additional revisions be made to the BES ROP Team's proposed version of Appendix 5C. Both of the revisions directed by the Board have been implemented in section 8.0.

- The Board determined that the three-person NERC review team should not make the decision on behalf of NERC to approve or disapprove the Exception Request, but rather that the decision should be made by the NERC President. Accordingly, section

8.0 was revised to specify that the review team is to issue a proposed decision within 90 days after the Regional Entity's Recommendation is received, and that within 30 days thereafter, the NERC President will issue a final decision to approve or disapprove the Exception Request, which shall be the NERC decision.

- The Board directed that a provision be added to specify that the NERC review team members shall be free of any conflicts of interest with respect to the Submitting Entity or Owner. Based on this direction, the following sentence was added in section 8.0: "The members of the review team shall have no financial, contractual, employment or other interest in the Submitting Entity or Owner that would present a conflict of interest and shall be free of any conflicts of interest in accordance with NERC policies."

On January 18, 2012, the NERC Board approved proposed Appendix 5C, as modified by NERC staff and subject to revisions as directed by the Board (as described above), proposed ROP section 509, and proposed ROP section 1703 (also as modified by NERC staff). The Board also approved the proposed revisions to ROP sections 302.2.2, 501.1.4.4, 804, 1102.2 and 1701 and to Appendices 2, 3D, 4B, 5B, 6 and 8 that are submitted with this Petition.

V. NERC LIST OF FACILITIES THAT HAVE RECEIVED EXCEPTIONS

In Order No. 743, the Commission indicated that NERC should maintain a list of facilities that are granted exemptions from the BES Definition pursuant to the exemption process that NERC was directed to develop:

> While the Commission will not require that we review each exemption on a facility-by-facility basis, we would maintain the authority to conduct audits to determine the appropriateness of a particular exemption. We contemplate that a Commission staff audit would review the application of the exemption criteria developed by NERC in NERC's or a Regional Entity's determination to approve an exemption for a particular facility. However, to facilitate such audits, the ERO should maintain a list of exempted facilities that can be made available to the Commission on request. NERC can decide how best to maintain the list, including determining whether or not to post it on the NERC website.[38]
>
> **. . .** [T]he exemption process provides a means of ensuring that relatively high voltage distribution facilities are excluded from compliance with mandatory Reliability Standards. In this light, we believe that it would be beneficial for the

[38] Order No. 743 at P 117.

> ERO in maintaining a list of exempted facilities, to consider including a means to track and review facilities that are classified as local distribution to ensure accuracy and consistent application of the definition. Similarly, the ERO could track exemptions for radial facilities.[39]

The proposed BES Exemption Procedure and the other new ROP provisions submitted in this Petition do not include provisions for NERC to maintain a list of facilities that have received Exceptions, as this is an internal administrative matter for NERC to implement that does not need to be embedded in the ROP. However, NERC recognizes the Commission's statement that NERC should maintain such a list, and plans to do so. NERC will develop a specific internal plan and procedures for maintaining a list of facilities for which Exceptions have been granted, in order to be prepared to initiate the list when the BES Definition and the BES Exception Procedure go into effect and Exception Requests begin to be received and processed. NERC has not yet determined specifically how the list will be organized and structured, nor whether or under what conditions the list will be made available on the NERC web site or otherwise made available to any entities other than the Commission (and other Applicable Governmental Authorities) and the Regional Entities. One overriding issue will be the extent of Confidential Information (including Critical Energy Infrastructure Information) that will be included in Exception Requests and in decisions on Exception Requests, and how to make the list of facilities with Exceptions available (if at all) to other stakeholders while continuing to protect Confidential Information.

In addition to the list that NERC will maintain, it will be necessary for Regional Entities to maintain lists of facilities within their Regions for which Exceptions have been granted, in order to monitor compliance with the requirement to submit periodic certifications pursuant to section 11.3 of Appendix 5C.

[39] Order No. 743 at P 119.

VI. CONCLUSION

NERC respectfully requests that the Commission approve (1) proposed new Appendix 5C to the NERC Rules of Procedure, *Procedure for Requesting and Receiving Exceptions from the NERC Definition of the Bulk Electric System*, (2) proposed new Sections 509 and 1703 of the ROP, and (3) the proposed revisions to sections 302.2.2, 501.1.4.4, 804, 1102.2 and 1701 of the ROP and to Appendices 2, 3D, 4B, 5A, 6 and 8 submitted with and described in this Petition, and that the Commission find this filing and the proposed new provisions of the ROP to constitute full compliance with the Commission's directives in Order Nos. 743 and 743-A concerning development of a procedure for exemptions from application of the BES Definition. NERC requests that the Commission approve the proposed ROP revisions with the same effective date as the proposed effective date of the revised BES Definition.

Respectfully submitted,

Gerald W. Cauley President and Chief Executive Officer North American Electric Reliability Corporation 3353 Peachtree Road N.E. Suite 600, North Tower Atlanta, GA 30326-1001 (404) 446-2560 David N. 1.0 INTRODUCTION

1.1. Purpose

The NERC definition of the Bulk Electric System uses specific terms and thresholds that, in most cases, should appropriately identify Elements and groups of Elements that are appropriately classified as part of the Bulk Electric System. Conversely, the BES Definition should, in most cases, exclude Elements that are not part of the Bulk Electric System. In certain cases, however, the BES Definition may classify certain Elements as part of the Bulk Electric System that are not necessary for the Reliable Operation of the interconnected bulk-power transmission system or the BES Definition may classify certain Elements as non-Bulk Electric System that are necessary for the Reliable Operation of the interconnected bulk-power transmission system.

This Appendix to the Rules of Procedure of the North American Electric Reliability Corporation provides the procedure by which an entity may request and receive an Exception which will have the effect of either including within the BES an Element or Elements that would otherwise be excluded by application of the BES Definition or excluding from the BES an Element or Elements that would otherwise be included by application of the BES Definition. This Appendix is intended to implement authorization granted by FERC to allow such Exceptions from the BES Definition.[1]

An entity must request and obtain an Exclusion Exception pursuant to an Exception Request under this Exception Procedure before any Element that is included in the BES by application of the BES Definition shall be excluded from the BES. Likewise, an entity must request and obtain an Inclusion Exception pursuant to an Exception Request under this Exception Procedure before any Element that is excluded from the BES by application of the BES Definition shall be included in the BES.

During the pendency of an Exception Request, the status of an Element(s) that is the subject of an Exception Request shall remain as it is determined based on application of the BES Definition. This status will continue until all appeals to all Applicable Governmental Authorities are completed. An entity that is planning a connection of a new Element for which it believes an Exception would be appropriate may request an Exception prior to commercial operation of the Element.

The Owner of the Element to which the Exception Request applies or, with respect to an Element owned by another Registered Entity, any Regional Entity, Planning Authority ("PA"), Reliability Coordinator ("RC"), Transmission Operator ("TOP"), Transmission Planner ("TP") or Balancing Authority ("BA") that has (or will have upon inclusion of the Elements in the BES) the Elements covered by an Exception Request within its Scope of Responsibility may submit an Exception Request for the Element as provided in this Exception Procedure.

[1] *Revision to Electric Reliability Organization Definition of Bulk Electric System*, 133 FERC ¶ 61,150 ("Order No. 743") (2010), *Order on Reh'g, Revision to Electric Reliability Organization Definition of Bulk Electric System*, 134 FERC ¶61,210 ("Order No. 743-A") (2011).

1.2. Authority

This Appendix is a NERC Rule of Procedure and an Electric Reliability Organization Rule. This Appendix has been approved by (i) the NERC Board of Trustees and (ii) FERC. Any future revisions to this Appendix must be adopted in accordance with Article XI, section 2 of the NERC *Bylaws* and Section 1400 of the NERC *Rules of Procedure*, including approval by the NERC Board of Trustees and by FERC, in order to become effective. This Exception Procedure or an equivalent procedure is to be implemented in Canada and Mexico consistent with their respective laws and agreements.

1.3 Canadian and Mexican Entities and Cross-Border Regional Entities

A Registered Entity that is a Canadian Entity or a Mexican Entity seeking an Exception will be expected to work with the Regional Entity, NERC, and Applicable Governmental Authorities in Canada or Mexico, as appropriate, consistent with their respective laws and agreements, and without being obligated to authorize the disclosure of information prohibited by applicable federal, state or provincial law from disclosure to FERC or other governmental authorities in the U.S., in order to implement this Exception Procedure or an equivalent procedure. A Canadian Entity or a Mexican Entity shall not be required to subject itself to United States federal or state laws not otherwise applicable to the entity in order to utilize this Exception Procedure or an equivalent procedure.

2.0. DEFINITIONS

For purposes of this Appendix, capitalized terms shall have the definitions set forth in Appendix 2 to the Rules of Procedure. For ease of reference, the definitions of the following terms that are used in this Appendix are also set forth below.

2.1 Acceptance of the Exception Request (or Acceptance): The determination that an eligible Exception Request (i.e., an Exception Request permitted by section 4.1) contains all the Required Information so that it can undergo substantive review.

2.2 Approval of the Exception Request (or Approval): The determination by NERC that an Exception Request meets the criteria to receive the requested Exception.

2.3 BES: Bulk Electric System.

2.4 BES Definition: The NERC definition of the Bulk Electric System as set forth in the NERC *Glossary of Terms Used in Reliability Standards.*

2.5 Canadian Entity: A Registered Entity that is organized under Canadian federal or provincial law.

2.6 Classified National Security Information: Required Information that has been determined to be protected from unauthorized disclosure pursuant to Executive Order No. 12958,

as amended, and/or the regulations of the NRC at 10 C.F.R. §95.35; or pursuant to any comparable provision of Canadian or Mexican federal or provincial law.

2.7 Disapproval of the Exception Request (or Disapproval): The determination by NERC that an Exception Request does not meet the criteria to receive the requested Exception.

2.8 Eligible Reviewer: A person who has the required security clearances or other qualifications, or who otherwise meets the applicable criteria, to have access to Confidential Information, Classified National Security Information, NRC Safeguards Information or Protected FOIA Information, as applicable to the particular information to be reviewed.

2.9 Exception: Either an Inclusion Exception or an Exclusion Exception.

2.10 Exception Procedure: The procedure set forth in this Appendix.

2.11 Exception Request: A request made by a Submitting Entity in accordance with this Appendix for an Exception.

2.12 Exception Request Form: The form adopted by each Regional Entity, in accordance with a template provided by NERC, for use by Submitting Entities in submitting Exception Requests; provided, that the Exception Request Form must include Section III.B as adopted by NERC.

2.13 Exclusion Exception: A determination that an Element that falls within the BES Definition should be excluded from the BES.

2.14 FERC: The United States Federal Energy Regulatory Commission.

2.15 FOIA: The U.S. Freedom of Information Act, 5 U.S.C. §552.

2.16 Inclusion Exception: A determination that an Element that falls outside the BES Definition should be included in the BES.

2.17 Lead Entity: The entity that submits Exception Request information that is common to a group of Submitting Entities that are submitting Exception Requests jointly.

2.18 Mexican Entity: A Registered Entity that is organized under Mexican law.

2.19 NRC: The United States Nuclear Regulatory Commission.

2.20 NRC Safeguards Information: Required Information that is subject to restrictions on disclosure pursuant to 42 U.S.C. §2167 and the regulations of the NRC at 10 C.F.R. §73.21-73.23; or pursuant to comparable provisions of Canadian or Mexican federal or provincial law.

2.21 Owner: The owner(s) of an Element or Elements that is or may be determined to be part of the BES as a result of either the application of the BES Definition or an Exception, or another entity, such as an operator, authorized to act on behalf of the owner of the Element or Elements in the context of an Exception Request.

2.22 Protected FOIA Information: Required Information, held by a governmental entity, that is subject to an exemption from disclosure under FOIA [5 U.S.C. §552(e)], under any similar state or local statutory provision, or under any comparable provision of Canadian or Mexican federal or provincial law, which would be lost were the Required Information to be placed into the public domain.

2.23 Recommendation: The report to NERC containing the evaluation prepared in accordance with section 5.2 concerning whether or to what extent an Exception Request should be approved.

2.24 Rejection of the Exception Request (or Rejection): The determination that an Exception Request is not an eligible Exception Request (i.e., an Exception Request permitted by section 4.1) or does not contain all the Required Information in accordance with section 4.5 in order to be reviewed for substance.

2.25 Required Information: Information required to be provided in an Exception Request, as specified in section 4.0.

2.26 Scope of Responsibility: The registered functions of a PA, RC, TOP, TP or BA and the geographical or electric region in which the PA, RC, TOP, TP or BA operates to perform its registered functions, or with respect to a Regional Entity, its Regional Entity Region.

2.27 Section I Required Information: Required Information that is to be provided in Section I of a Submitting Entity's Exception Request.

2.28 Section II Required Information: Required Information that is to be provided in Section II of a Submitting Entity's Exception Request.

2.29 Section III Required Information: Required Information that is to be provided in Section III of a Submitting Entity's Exception Request.

2.30 Submitting Entity: The entity that submits an Exception Request in accordance with section 4.0.

2.31 Technical Review Panel: A panel established pursuant to section 5.3 of this Appendix.

3.0. BASIS FOR APPROVAL OF AN EXCEPTION

3.1. Grounds for an Exception

(a) Exclusion Exception

An entity may request and obtain Approval from NERC for an Exclusion Exception on the grounds that the Element(s) for which the Exception Request is filed is included within the BES based on application of the BES Definition but is not necessary for the Reliable Operation of the interconnected bulk-power transmission system as evidenced by Required Information provided pursuant to **Detailed Information to Support an Exception Request (**Section III.B of the Exception Request Form).

(b) Inclusion Exception

An entity may request and obtain Approval from NERC for an Inclusion Exception on the grounds that the Element(s) for which the Exception Request is filed is not included within the BES based on application of the BES Definition but is necessary for the Reliable Operation of the interconnected bulk-power transmission system as evidenced by Required Information provided pursuant to **Detailed Information to Support an Exception Request (**Section III.B of the Exception Request Form).

3.2. Burden

The burden to provide a sufficient basis for Approval of an Exception Request in accordance with the provisions of this Exception Procedure is on the Submitting Entity. It is the responsibility of the Regional Entity, subject to oversight by NERC as provided in this Exception Procedure, to evaluate the request and make a Recommendation to NERC regarding its Approval. All evidence provided as part of an Exception Request or response will be considered in determining whether an Exception Request shall be approved or disapproved.

4.0. FORM, CONTENTS, AND SUBMISSION OF AN EXCEPTION REQUEST

4.1. Eligible Submitting Entities

The Owner of an Element may submit an Exception Request for either an Inclusion Exception or an Exclusion Exception regarding that Element. A Regional Entity, PA, RC, TOP, TP, or BA that has (or will have upon inclusion in the BES) the Elements covered by an Exception Request within its Scope of Responsibility may submit an Exception Request for the inclusion in the BES of an Element or Elements owned by a Registered Entity, provided that before doing so, (i) the Submitting Entity conferred with the Owner about the reasons for an Exception, and (ii) could not reach agreement regarding the submission of such an Exception Request. (If the Owner agrees with submitting an Exception Request, the Owner should be the Submitting Entity.) Only a Regional Entity may submit an Exception Request for the inclusion in the BES of an Element or Elements owned by an Owner that is not a Registered Entity. Only an

Owner or a Regional Entity may submit an Exception Request for the exclusion from the BES of an Element.

When a Regional Entity requests an Exception, the Regional Entity shall be the Submitting Entity and shall prepare and submit copies of its Exception Request (or portions thereof) to all applicable entities in accordance to this section 4.0.

With respect to an Element that crosses a boundary between Regional Entities, (1) the Submitting Entity will submit the Exception Request to both (or all) Regional Entities, which will cooperate to process the Exception Request pursuant to section 5.1 below, or (2) the Regional Entities must jointly submit an Exception Request to NERC (neither Regional Entity shall be allowed to submit such Exception Request unilaterally).

4.2. Separate Submissions for Each Exception Request

A separate Exception Request shall be submitted for each Element or set of connected Elements for which the Submitting Entity seeks an Exception. The scope of an Exception Request shall cover the terminal connections of the Element or set of Elements as identified in the Exception Request. Where the Submitting Entity seeks Exceptions from the BES Definition for multiple, similar Elements (either at the same location or at different locations within the geographic boundaries of a Regional Entity) on the same basis, the Exception Requests for all such Elements may be included in one Exception Request with all such Elements or sets of connected Elements separately identified. A single Exception Request may not be submitted for separate Elements within the geographic boundaries of more than one Regional Entity.

Multiple Submitting Entities may jointly file Exception Requests for similar Elements for which they are requesting Exceptions on the same basis. In such a situation, the Submitting Entities will submit a package comprised of a complete Exception Request Form for a Lead Entity, and an Exception Request Form for each other Submitting Entity that (1) provides the Submitting Entity's differing individual information to the extent such is required (e.g., contact information, identification, and location of Element(s), etc.), and (2) otherwise references the pertinent portions of the complete Exception Request Form filed by the Lead Entity (e.g., status under application of the BES Definition, basis for an Exception under section 3.1, etc.). For any Exception Request filed by multiple Submitting Entities as provided in this section, the Lead Entity shall be considered the "Submitting Entity" for purposes of the Regional Entity's and NERC's notices and actions in accordance with the remainder of this Exception Procedure. However, any Owner nonetheless may take any action otherwise appropriate for a Submitting Entity (e.g., respond to a Recommendation, submit an appeal, etc.).

4.3. Withdrawal of an Exception Request

A Submitting Entity may withdraw an Exception Request at any time prior to NERC Approval or Disapproval of the Exception Request.

4.4. Form and Format of Exception Request

An Exception Request shall consist of three sections, all of which must be submitted to the applicable Regional Entity. If the Submitting Entity is not the Owner [i.e., is a Regional Entity, PA, RC, TOP, TP, or BA that has (or will have upon inclusion of the Element in the BES) the Elements covered by an Exception Request within its Scope of Responsibility], it shall at the same time provide a copy of the Exception Request to the Owner (or if the Owner is unknown, to the operator of the Element(s)) to which the Exception Request applies.

4.5. Required Information to be Included in the Exception Request

4.5.1. Section I of an Exception Request shall contain the Required Information specified in this section 4.5.1. At the same time the Submitting Entity submits the Exception Request Form to the Regional Entity, the Submitting Entity shall submit a copy of Section I to each PA, RC, TOP, TP, and BA that has (or will have upon inclusion in the BES) the Elements covered by an Exception Request within its Scope of Responsibility. Failure to provide all Section I Required Information may result in Rejection of the Exception Request as incomplete.

1. Name and address of Submitting Entity.

2. Submitting Entity NERC Compliance Registry ID (if yet assigned).

3. Name of the Owner, if different than the Submitting Entity,

4. Owner's NERC Compliance Registry ID (if yet assigned).

5. Exception Request submittal date.

6. Whether the Exception Request is an original Exception Request or an amended Exception Request; and if it is an amended Exception Request, the identification number(s) of the original Exception Request and any previous amendments.

7. Whether the Exception Request is being submitted in conjunction with Exception Requests by other Submitting Entities. If so, the names of the other Submitting Entities.

8. Whether the Submitting Entity is filing a similar Exception Request(s) with one or more other Regional Entities, and if yes, the name(s) of the other Regional Entity(ies).

9. The type(s) of Element(s) for which the Exception is being requested.

10. Status, based on application of the BES Definition, of the Element(s) for which the Exception is being requested.

4.5.2. Section II of an Exception Request shall contain the Required Information specified in this section 4.5.2. At the same time the Submitting Entity submits the Exception Request Form to the Regional Entity, the Submitting Entity shall submit a copy of Section II to each PA, RC, TOP, TP, and BA that has (or will have upon inclusion of the Element(s) in the BES) the Elements covered by an Exception Request within its Scope of Responsibility. Failure to provide all Section II Required Information may result in Rejection of the Exception Request as incomplete.

Section II Required Information will not be publicly posted or disclosed to third parties except for persons involved in reviewing the Exception Request.

1. Identification and location(s) of Element(s) for which the Exception is being requested.

2. Name, title, phone number, facsimile number, and E-mail address of the Submitting Entity's technical contact person for the Exception Request.

3. Certification by the Submitting Entity (if other than Owner) that it conferred with the Owner regarding the reason for the requested Exception, but could not reach agreement regarding the submission of an Exception Request.

4. To the extent known by the Submitting Entity, name, mailing address, phone number, facsimile number, and E-mail address of the Owner's technical contact person for the Exception Request, if the Owner is different from the Submitting Entity.

5. Identification of PA, RC, TOP, TP, and BA that has (or will have upon inclusion in the BES) the Elements covered by the Exception Request within its Scope of Responsibility, and certification by the Submitting Entity that it has sent copies of Sections I and II to each such entity.

6. A statement of the basis on which the Submitting Entity contends the Exception Request should be approved, and if the Submitting Entity is not the Owner, a statement of the basis of the Submitting Entity's reason for submitting the Exception Request.

7. A statement, signed and dated by an authorized representative of the Submitting Entity's senior management stating that the representative has read the Exception Request on behalf of the Submitting Entity and that the Submitting Entity believes Approval of the Exception Request is warranted.

4.5.3 Section III of an Exception Request shall contain the **Detailed Information to Support an Exception Request** as specified on the Exception Request Form. Failure to include all Section III Required Information may result in Rejection of the Exception Request. The Submitting Entity may designate all or part of the Section III Required Information as Confidential Information.

1. If the Exception Request is supported, in whole or in part, by Classified National Security Information, NRC Safeguards Information, and/or Protected FOIA Information, Section III shall include a statement identifying which of these categories each such item of information falls into and explaining why each such item of information is Classified National Security Information, NRC Safeguards Information, and/or Protected FOIA Information.

2. If the Submitting Entity is prohibited by law from disclosing any Classified National Security Information, NRC Safeguards Information and/or Protected FOIA Information to any person who is not an Eligible Reviewer (such as, for example, the restriction on access to Classified National Security Information specified in section 4.1 of Executive Order No. 12958, as amended), Section III shall identify the Classified National Security Information, NRC Safeguards Information and/or Protected FOIA Information that is subject to such restrictions on disclosure and shall identify the criteria which a person must meet in order to be an Eligible Reviewer of the Classified National Security Information, NRC Safeguards Information and/or Protected FOIA Information.

4.5.4 The Owner of the Element(s) to which the Exception Request applies, if different than the Submitting Entity, may file a response to supplement, correct or disagree with all or any part of an Exception Request. Any PA, RC, TOP, TP, and BA that has (or will have upon inclusion of the Element(s) in the BES) the Elements covered by an Exception Request within its Scope of Responsibility may also provide input to the Regional Entity regarding the Exception Request. If in order to evaluate an Exception Request, the Owner, PA, RC, TOP, TP or BA wishes to obtain any Required Information in Section III of the Exception Request, the Owner, PA, RC, TOP, TP or BA may submit to the Regional Entity that received the Exception Request a request stating its reason for wanting to review such information, and the Regional Entity may provide such information to the Owner, PA, RC, TOP, TP or BA if the Regional Entity believes such review may assist the Regional Entity's review; if any of such Section III Required Information has been designated Confidential Information, prior to being provided the Confidential Information, the Owner, PA, RC, TOP, TP or BA shall execute a confidentiality agreement in a form established by the Regional Entity. Any response provided pursuant to this section 4.5.4 must be submitted to the Regional Entity with copies to the Submitting Entity and the Owner, if different from the Submitting Entity, within forty-five (45) days after the date the Exception Request Form was submitted to the Regional Entity.

4.6 Access to Confidential Information, Classified National Security Information, NRC Safeguards Information, and Protected FOIA Information Included in Required Information

4.6.1. Upon reasonable advance notice from a Regional Entity, and subject to section 4.6.2, a Submitting Entity or Owner must provide the Regional Entity (a) with access to Confidential Information, Classified National Security Information, NRC Safeguards Information, and Protected FOIA Information included in the Exception Request, and (b) with

access for purposes of making a physical review and inspection of the Element or Elements for which an Exception Request has been submitted.

4.6.2. If the Submitting Entity or Owner is prohibited by law from disclosing any Confidential Information, Classified National Security Information, NRC Safeguards Information, or Protected FOIA Information to any person who is not an Eligible Reviewer (such as, for example, the restriction on access to Classified National Security Information specified in section 4.1 of Executive Order No. 12958, as amended), then such Confidential Information, Classified National Security Information, NRC Safeguards Information, or Protected FOIA Information shall only be reviewed by a representative or representatives of the Regional Entity which may include contractors, who are Eligible Reviewers.

4.6.3. The Regional Entity, as applicable, will work cooperatively with the Submitting Entity and/or Owner to provide necessary levels of protection for information identified in Section 1500 of the NERC Rules of Procedure and to access Protected FOIA Information in a way that does not waive or extinguish the exemption of the Protected FOIA Information from disclosure. If the Regional Entity shares any Confidential Information with a third party it shall do so subject to restrictions in applicable law under appropriate confidentiality agreements.

5.0 REVIEW, ACCEPTANCE OR REJECTION, AND RECOMMENDATION REGARDING EXCEPTION REQUESTS

The Regional Entity's evaluation of the Exception Request will consist of two stages:

(a) During the first stage, the Regional Entity shall conduct an initial screening to determine whether to accept or reject the Exception Request; and

(b) During the second stage, the Regional Entity shall conduct a substantive review to determine its Recommendation to NERC as to whether or not the Exception Request should be approved.

If the Regional Entity determines at any time that for a specified period of time, the Regional Entity will be unable to complete initial screenings of Exception Requests within the time provided by section 5.1.3(a) and/or substantive reviews of Exception Requests within the time provided in section 5.2.2, the Regional Entity, based on consultation with NERC, shall establish an alternative time period objective and work plan for completing initial screenings and substantive reviews of Exception Requests during the specified period of time. The alternative time period and work plan shall be publicized by posting on the Regional Entity's website.

When a Regional Entity is the Submitting Entity of an Exception Request, it nonetheless shall process such Request in accordance with this section 5.0, with the following exceptions:

i. There will be no initial screening, Acceptance, or Rejection, and therefore sections 5.1.3 through 5.1.6 will not apply;

ii. No later than sixty (60) days after the submission of the Exception Request to the Owner and other applicable entities, the Regional Entity shall commence its substantive review of the Exception Request (and of any responses received from the Owner and other applicable entities) in accordance with section 5.2 and shall complete such substantive review within six (6) months; and

iii. Before the Regional Entity issues a Recommendation to NERC to approve or disapprove the Exception Request in whole or in part, the Technical Review Panel shall review the proposed determination and issue an opinion with copies provided to the Owner and to NERC, in accordance with section 5.3.

5.1. Initial Screening of Exception Request for Acceptance or Rejection

5.1.1. Upon receipt of an Exception Request, the Regional Entity will assign a unique identifier to the Exception Request, and will review the Exception Request to determine that the Exception Request is from an eligible (in accordance with section 4.1) Submitting Entity for an Exception from the application of the BES Definition and that all Required Information has been provided. If the Exception Request indicates that the Submitting Entity has submitted a similar Exception Request to one or more other Regional Entities, the Regional Entities shall coordinate their actions undertaken pursuant to this section 5.0. If the Exception Request is for an Element that crosses boundaries between or among Regional Entities, the Regional Entities shall cooperatively determine a lead Regional Entity to assess the request in a single process yielding a single Recommendation to NERC.

5.1.2. The unique identifier assigned to the Exception Request will be in the form of XXXX-YYYY-NERCID-ExceptionZZZZZ, where "XXXX" is the year in which the Exception Request is received by the Regional Entity (*e.g.*, "2012"); "YYYY" is the acronym for the Regional Entity within whose geographic boundaries the relevant Element or Elements are located[2]; NERCID is the Submitting Entity's NERC Compliance Registry ID (or an abbreviation of its name if an ID is not yet assigned); and "ZZZZZ" is the sequential number of the Exception Requests received by the Regional Entity in that year. If the Exception Request is amended or resubmitted, "-AZ" will be added to the end of the identifier, where "Z" is the number of the amendment to the Exception Request. If the Exception Request is for an Element that crosses boundaries between or among Regional Entities, the YYYY identifier shall be that of the lead Regional Entity assessing the request.

5.1.3. The Regional Entity will complete its initial screening of the Exception Request Form and any Owner's response submitted pursuant to section 4.5.4 no later than either sixty (60) days after receiving the Exception Request or, if the Submitting Entity is not the Owner, thirty (30) days after receiving any Owner's response, whichever is later, unless (i) the

[2] The acronyms to be used are: FRCC (Florida Reliability Coordinating Council); MRO (Midwest Reliability Organization); NPCC (Northeast Power Coordinating Council); RFC (Reliability*First* Corporation); SERC (SERC Reliability Corporation); SPP (Southwest Power Pool Regional Entity); TRE (Texas Reliability Entity); and WECC (Western Electricity Coordinating Council), and NERC in cases where the Exception Request is submitted to NERC.

Regional Entity has established an alternative time period objective and work plan for completing initial screenings pursuant to this section 5.0 that provides for a different time period(s) for completing initial screenings, or (ii) the Regional Entity issues a notice to the Submitting Entity, and to the Owner if different, prior to the deadline date for completing the initial screening, stating that the Regional Entity will not be able to complete the initial screening by the deadline date and stating a revised deadline date.

5.1.4. If, based on its initial screening, the Regional Entity determines the Exception Request is from an eligible (in accordance with section 4.1) Submitting Entity for an Exception from the BES Definition, and that all Required Information has been provided, the Regional Entity shall accept the Exception Request as complete and send a notice of such Acceptance to the Submitting Entity, with a copy to the Owner, if different than the Submitting Entity, and to NERC.

5.1.5. (a) If the Regional Entity determines, based on its review of the Exception Request, that the Exception Request (i) is not from an eligible (in accordance with section 4.1) Submitting Entity for an Exception from application of the BES Definition, and/or (ii) does not contain all Required Information, the Regional Entity shall reject the Exception Request as incomplete and send a notice of such Rejection to the Submitting Entity, with a copy to the Owner, if different than the Submitting Entity, and to NERC. To the extent feasible, if an Exception Request Form is missing Required Information, the Regional Entity shall not reject the Exception Request until (1) it has contacted the Submitting Entity to request that the Exception Request Form be supplemented with the missing Required Information, and (2) the Submitting Entity has failed to submit such Required Information within thirty (30) days or such additional period of time as the Regional Entity may allow at its discretion based on the circumstances. Under appropriate confidentiality/security agreements, the Regional Entity shall facilitate the access to data and information from other entities required by the Submitting Entity to accurately supply the **Detailed Information to Support an Exception Request** (e.g., interconnection base case power flow studies) and/or by the Owner to accurately respond. When a Submitting Entity submits supplemental Required Information in response to a request under this section 5.1.5(a), the time for the Regional Entity to perform its initial screening will be extended for fifteen (15) days after receipt of the supplemental Required Information.

(b) If the Regional Entity rejects the Exception Request in accordance with section 5.1.5 (a), the Regional Entity's notice shall explain the reason for the Rejection. The Submitting Entity may, within thirty (30) days after receipt of the Rejection, appeal to NERC in accordance with section 7.0 of this Exception Procedure to reverse the Rejection and to direct the Regional Entity to proceed with a substantive review of the Exception Request.

5.1.6. The Regional Entity may either accept the Exception Request in its entirety, reject the Exception Request in its entirety, or if the Exception Request is for more than one Element, may accept it with respect to a subset of the Elements and reject it with respect to the remainder based on the similarity of the evidence presented for the Exception Request.

5.2 Substantive Review of Exception Request for Approval or Disapproval

5.2.1 After Acceptance of an Exception Request, the Regional Entity shall conduct a substantive review of all evidence provided as part of an Exception Request or response to evaluate whether or to what extent the Exception Request should be approved. As part of its substantive review, depending on the circumstances of the Exception Request, the Regional Entity may request access to and review the Required Information, including any Confidential Information, Classified National Security Information, NRC Safeguards Information, and Protected FOIA Information that is necessary to support the Exception Request; may conduct one or more physical inspections of the relevant Element(s) and its (their) context and surrounding Elements and Facilities; may request additional information from the Submitting Entity, Owner, or applicable PAs, RCs, BAs, TOPs and TPs; and may engage in further discussions concerning possible revisions to the Exception Request.

5.2.2. At the outset of its substantive review of the Exception Request, the Regional Entity shall develop a milestone schedule pursuant to which it plans to conduct the substantive review, and shall send a copy of the milestone schedule to the Submitting Entity and the Owner, if different, for information. The Regional Entity shall complete the substantive review of the Exception Request within six months after Acceptance of the Exception Request or within an alternative time period under section 5.0, at the conclusion of which the Regional Entity shall issue a notice (in accordance with section 5.2.3) stating its Recommendation that the Exception Request be approved or disapproved. The Regional Entity may extend the period of substantive review for individual Exception Requests; the revised date by which the Regional Entity will issue its Recommendation concerning the Exception Request shall be stated in a notice issued by the Regional Entity.

5.2.3. Upon completion of its substantive review of the Exception Request, the Regional Entity shall issue a Recommendation to NERC, with a copy to the Submitting Entity and to the Owner if different than the Submitting Entity, including the Regional Entity's evaluation of whether and to what extent the Exception Request qualifies to be approved in its entirety or be disapproved in its entirety, or if the Exception Request is for more than one Element, to be approved with respect to a subset of the Elements and disapproved with respect to the remainder of the Elements. The Recommendation shall set forth the basis on which the Regional Entity arrived at its Recommendation. With the Recommendation, the Regional Entity will also send NERC copies of the Exception Request Form and all other information considered by the Regional Entity in arriving at its Recommendation.

5.2.4 The Regional Entity shall not recommend Disapproval of the Exception Request in whole or in part without first submitting the Exception Request for review to a Technical Review Panel and receiving its opinion, in accordance with section 5.3.

5.2.5 NERC shall develop, and post on its web site, a reporting program and schedule pursuant to which Regional Entities will be required to submit to NERC periodic reports on the numbers, status and timing of their initial screenings and substantive reviews of Exception Requests.

5.3 Technical Review Panel

Each Regional Entity shall establish provisions for a Technical Review Panel consisting of not less than three (3) individuals appointed by the Regional Entity senior executive (CEO, President, General Manager, etc.). Panel members shall comply with Subsection 7 of Section 403 of the NERC Rules of Procedure, shall not have participated in the review of the Exception Request, and shall have the required technical background to evaluate Exception Requests. When the Regional Entity intends pursuant to section 5.2.2 to issue a Recommendation of Disapproval, in whole or in part, the Technical Review Panel must first review the Regional Entity's proposed determinations and provide an opinion, a copy of which shall be provided to the Submitting Entity (and Owner if different) in the event the Regional Entity decides to disapprove the Exception Request. The Regional Entity will not be bound by the opinion of the Technical Review Panel, but such evaluation shall become part of the record associated with the Exception Request and shall be provided to NERC.

6.0 SUPPLEMENTATION OF AN EXCEPTION REQUEST PRIOR TO A RECOMMENDATION

A Submitting Entity or Owner at any time prior to the Regional Entity issuing its Recommendation may supplement a pending Exception Request that is under review by a Regional Entity, either at the request of the Regional Entity or at the Submitting Entity's or Owner's own initiative, for the purpose of providing additional or revised Required Information. The Submitting Entity or Owner shall submit a written explanation of what Required Information is being added or revised and the purpose of the supplementation. Supplementing a pending Exception Request may, in the Regional Entity's discretion, reset the time period for the Regional Entity's initial screening or substantive review, as applicable, of the Exception Request.

7.0 APPEAL OF REJECTION OF AN EXCEPTION REQUEST

The Submitting Entity may submit to the NERC Director of Compliance Operations, with a copy to the Regional Entity and Owner if different, information that demonstrates that the insufficiencies in an Exception Request Form identified in the notice of Rejection by the Regional Entity pursuant to section 5.1.5 are incorrect or otherwise do not warrant Rejection of the Exception Request, and that the Exception Request should be accepted and proceed to substantive review. A Submitting Entity's submission to NERC under this section 7.0 shall be in writing, shall provide the Exception Request which received the Rejection (using the identifier assigned to the Exception Request pursuant to section 5.1.2), and shall set forth a description of the errors that the Submitting Entity believes are in the notice of Rejection. The Submitting Entity's submission must demonstrate that it is eligible (in accordance with section 4.1) to submit the Exception Request and that all Required Information for the Exception Request has been provided. NERC will review the Submitting Entity's submission and the reports submitted by the Regional Entity or Regional Entities pursuant to section 5.1.5 with respect to the Exception Request, and if NERC determines that the Submitting Entity is eligible (in accordance with section 4.1) to submit the Exception Request, that all Required Information has been provided, and that the Exception Request should proceed to substantive review, NERC shall,

within forty-five (45) days after receiving the submission, issue a decision directing the Regional Entity to proceed to a substantive review of the Exception Request in accordance with section 5.2. NERC will send a written notice to the Submitting Entity, the Owner if different, and the Regional Entity stating that NERC either directs the Regional Entity to proceed to a substantive review or that NERC does not direct such a review.

8.0 APPROVAL OR DISAPPROVAL OF AN EXCEPTION REQUEST

Following the date of the Regional Entity's Recommendation to NERC, a Submitting Entity or Owner, will have thirty (30) days to submit a comment in support of or opposition to the Recommendation. The NERC President shall appoint a team of no less than (3) three persons with the required technical background to evaluate Exception Requests to review the Recommendation and accompanying materials provided by the Regional Entity pursuant to section 5.2.3, the Technical Review Panel opinion (if any), and any comment submitted by the Submitting Entity or Owner. The members of the review team shall have no financial, contractual, employment or other interest in the Submitting Entity or Owner that would present a conflict of interest and shall be free of any conflicts of interest in accordance with NERC policies. This review shall be completed within ninety (90) days after NERC receives the Recommendation. NERC may choose to ask the Regional Entity, Submitting Entity and Owner, if different than the Submitting Entity, to appear at a NERC office for interviews or discussion regarding any questions. In lieu of appearing in person at a NERC office, appearances may be, upon the mutual agreement of NERC, the Regional Entity, the Submitting Entity and/or Owner, conducted by a conference call, teleconferencing, or webinar. By the end of the ninety-day review period, the team shall issue a proposed decision either to approve or to disapprove the Exception Request. If the Exception Request concerns more than one Element, the review team's proposed decision may approve the Exception Request in its entirety, disapprove the Exception Request in its entirety, or approve some portion of the Exception Request and disapprove the remaining portion. The proposed decision shall be in writing, shall be based on the team's independent consideration of the full record, and state the basis for the decision. If the proposed decision of the team was not unanimous, the dissenting team member may, if he or she wishes to do so, issue a minority report stating the dissenting member's reasons for disagreement with the proposed decision. Within thirty (30) days after the date of the review team's proposed decision, the NERC President shall issue a final written decision on the Exception Request on behalf of NERC. The final decision may adopt the proposed decision or modify the proposed decision, and may reach a different conclusion than the proposed decision as to whether the Exception Request is approved or disapproved. The final decision issued by the NERC President shall be the decision of NERC with respect to Approval or Disapproval of the Exception Request.

NERC shall provide to the Submitting Entity and to the Owner, if different, copies of any documents considered by the NERC review team in reaching its proposed decision, and any additional documents considered by the NERC President in reaching the final decision, that were not originally provided by, or have not previously been provided to, the Submitting Entity or Owner.

Documentation used to substantiate the decision related to an Exception Request shall be retained by NERC for a minimum of seven (7) years or as long as the Exception is in effect, whichever is longer, unless a different retention period is otherwise identified

9.0 CHALLENGES TO APPROVAL OR DISAPPROVAL OF EXCEPTION REQUESTS

A Submitting Entity or Owner aggrieved by NERC's Approval or Disapproval of an Exception Request or termination of an Exception may, within thirty (30) days following the date of NERC's decision, challenge such determination pursuant to Section 1703 of the NERC Rules of Procedure. If neither a Submitting Entity nor Owner challenges, within such period, NERC's determination with respect to any Element to which the Exception Request or the Exception applies, such determination shall become effective with respect to such Element on the thirty-first day following the date of the NERC decision.

10.0 IMPLEMENTATION PERIOD FOR EXCEPTIONS

10.1 Inclusion Exceptions

In the case of an Element not included in the BES by application of the BES Definition but for which an Inclusion Exception is approved, the Owner shall submit a proposed implementation plan to the Regional Entity detailing the schedule for complying with any Reliability Standards applicable to the newly included Element. The Regional Entity and Owner shall confer to agree upon such schedule. If the Regional Entity and Owner are unable to agree on the implementation plan, the Regional Entity shall notify the NERC Director of Compliance Operations of the disagreement, and shall provide statements of the Regional Entity's and the Owner's positions, and NERC shall specify a reasonable implementation schedule.

10.2 Denials of Exception Requests for Exclusion

(a) In the case of a newly-constructed or installed Element which is included in the BES by application of the BES Definition but for which an Exception Request for an Exclusion Exception was submitted at least twelve (12) months before commercial operation of the Element, but which Exception Request either is still pending or has been rejected or disapproved at the time of commercial operation, the Owner shall submit a proposed implementation plan to the Regional Entity detailing the schedule for complying with any Reliability Standards applicable to the newly constructed or installed Element. The Regional Entity and Owner shall confer to agree upon such schedule. If the Regional Entity and Owner are unable to agree on the implementation plan, the Regional Entity shall notify the NERC Director of Compliance Operations of the disagreement, and shall provide statements of the Regional Entity's and the Owner's positions, and NERC shall specify a reasonable implementation schedule.

(b) In the case of an Element which is included in the BES based on application of the current BES Definition but was not included in the BES under the BES Definition in effect immediately prior to the current BES Definition, and for which an Exception Request for an Exclusion Exception was submitted no more than twelve (12) months after the current BES

Definition became effective, but which Exception Request either is still pending or has been rejected or disapproved at the end of any applicable BES Definition implementation plan time period, the Owner shall submit a proposed implementation plan to the Regional Entity detailing the schedule for complying with any Reliability Standards applicable to the newly included Element. The Regional Entity and Owner shall confer to agree upon such schedule. If the Regional Entity and Owner are unable to agree on the implementation plan, the Regional Entity shall notify the NERC Director of Compliance Operations of the disagreement, and shall provide statements of the Regional Entity's and the Owner's positions, and NERC shall specify a reasonable implementation schedule.

11.0 TERMINATION OF AN APPROVED EXCEPTION

11.1 An Exception Request typically will be approved without a specified date of termination but will be subject to review to verify continuing justification for the Exception.

11.2 Submitting Entity(ies) shall notify the appropriate Regional Entity, with a copy to NERC, within ninety (90) days after learning of any change of condition which would affect the basis stated by NERC in its decision pursuant to section 8.0 approving the Exception Request. NERC shall review such notification and determine whether to direct the Regional Entity to perform a substantive review (pursuant to section 5.2) to verify continuing justification for the Exception and to issue a Recommendation to NERC.

11.3 Submitting Entity(ies) shall certify[3] periodically to the appropriate Regional Entity that the basis for an Element being included or excluded in the BES through the Exception remains valid and in connection with each certification, shall provide the Regional Entity with any changes to Section I Required Information or Section II Required Information. The certification shall be due on the first day of the first quarter thirty-six (36) months after the date on which the Exception Request was approved and every thirty-six (36) months thereafter, as long as the Exception remains in effect. If such certification is not provided, the Exception is subject to termination ninety (90) days after the date the certification was due, and the Regional Entity shall send the Submitting Entity and NERC written notice of such termination.

11.4 If the Regional Entity obtains information through means other than those described in sections 11.2 and 11.3 that indicates an Exception may no longer be warranted, the Regional Entity shall provide such information to NERC. NERC shall review the information and determine whether to direct the Regional Entity to perform a substantive review (pursuant to section 5.2) to verify continuing justification for the Exception and to issue a Recommendation to NERC.

11.5 If the Regional Entity's Recommendation following a substantive review pursuant to section 11.2 or 11.4 is that the Exception shall be terminated, NERC shall (i) issue a written notice to the Submitting Entity and Owner, if different, that the Exception is under review for possible termination, (ii) allow the Submitting Entity and/or Owner, as applicable, thirty (30)

[3] The certification shall consider the effect on the basis for the Exception of changes such as Load growth and topological changes, as well as the effect on system limits and impacts as a result of the contingencies listed in Table 1 of each applicable NERC TPL Reliability Standard.

days from the date of the notice to submit comments or information to NERC to show that the Exception continues to be justified and should remain in effect, and (iii) cause the Recommendation to be reviewed in accordance with section 8.0 of this Appendix. If the conclusion of the review is that the Exception should be terminated, NERC shall send a written notice to the Submitting Entity and Owner, if different, stating that the Exception is terminated and the reasons for the termination. When an Element will be included in the BES as a result of the termination of an Exclusion Exception under this section, an implementation plan detailing the schedule for complying with any Reliability Standards applicable to the newly included Element will be developed in accordance with section 10.1 as if it were an Inclusion Exception.

11.6 Upon request by the Regional Entity, the Submitting Entity(ies) and/or Owner if different shall provide within thirty (30) days the most recent versions of any Section III Required Information so requested.

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF REVISIONS TO ITS RULES OF PROCEDURE
TO ADOPT A BULK ELECTRIC SYSTEM EXCEPTION PROCEDURE

ATTACHMENT 2A

REVISED RULES OF PROCEDURE, SECTIONS 100-1700

(INCLUDING PROPOSED NEW SECTIONS 509 AND 1703)

CLEAN VERSION

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Proposed Revisions 1-9-2012
[Incorporates proposed revisions filed with FERC on March 18, November 7 and November 29, 2011]

Rules of Procedure

Effective: January 10, 2012

Rules of Procedure Section 400 is subject to further revisions to comply with directives in a FERC Order issued October 7, 2011 (137 FERC ¶ 61,028).

1702 Challenges to Determinations by Planning Coordinators Under Reliability Standard PRC-023 92
1703 Challenges to NERC Determinations of BES Exception Requests under Section 509 94

SECTION 100 — APPLICABILITY OF RULES OF PROCEDURE

NERC and NERC Members shall comply with these Rules of Procedure. Each Regional Entity shall comply with these Rules of Procedure as applicable to functions delegated to the Regional Entity by NERC or as required by an Applicable Governmental Authority or as otherwise provided.

Each Bulk Power System owner, operator, and user shall comply with all Rules of Procedure of NERC that are made applicable to such entities by approval pursuant to applicable legislation or regulation, or pursuant to agreement.

Any entity that is unable to comply or that is not in compliance with a NERC Rule of Procedure shall immediately notify NERC in writing, stating the Rule of Procedure of concern and the reason for not being able to comply with the Rule of Procedure.

NERC shall evaluate each case and inform the entity of the results of the evaluation. If NERC determines that a Rule of Procedure has been violated, or cannot practically be complied with, NERC shall notify the Applicable Governmental Authorities and take such other actions as NERC deems appropriate to address the situation.

NERC shall comply with each approved Reliability Standard that identifies NERC or the Electric Reliability Organization as a responsible entity. Regional Entities shall comply with each approved Reliability Standard that identifies Regional Entities as responsible entities. A violation by NERC or a Regional Entity of such a Reliability Standard shall constitute a violation of these Rules of Procedure.

SECTION 200 — DEFINITIONS OF TERMS

Definitions of terms used in the NERC Rules of Procedure are set forth in **Appendix 2**, *Definitions Used in the Rules of Procedure*.

SECTION 300 — RELIABILITY STANDARDS DEVELOPMENT

301. General

NERC shall develop and maintain Reliability Standards that apply to Bulk Power System owners, operators, and users and that enable NERC and Regional Entities to measure the reliability performance of Bulk Power System owners, operators, and users; and to hold them accountable for Reliable Operation of the Bulk Power Systems. The Reliability Standards shall be technically excellent, timely, just, reasonable, not unduly discriminatory or preferential, in the public interest, and consistent with other applicable standards of governmental authorities.

302. Essential Attributes for Technically Excellent Reliability Standards

1. **Applicability** — Each Reliability Standard shall clearly identify the functional classes of entities responsible for complying with the Reliability Standard, with any specific additions or exceptions noted. Such functional classes[1] include: Reliability Coordinators, Balancing Authorities, Transmission Operators, Transmission Owners, Generator Operators, Generator Owners, Interchange Authorities, Transmission Service Providers, market operators, Planning Authorities, Transmission Planners, Resource Planners, Load-Serving Entities, Purchasing-Selling Entities, and Distribution Providers. Each Reliability Standard shall also identify the geographic applicability of the Reliability Standard, such as the entire North American Bulk Power System, an Interconnection, or within a Region. A Reliability Standard may also identify any limitations on the applicability of the Reliability Standard based on electric Facility characteristics.

2. **Reliability Objectives** — Each Reliability Standard shall have a clear statement of purpose that shall describe how the Reliability Standard contributes to the reliability of the Bulk Power System. The following general objectives for the Bulk Power System provide a foundation for determining the specific objective(s) of each Reliability Standard:

    2.1 **Reliability Planning and Operating Performance**— Bulk Power Systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions.

    2.2 **Frequency and Voltage Performance**— The frequency and voltage of Bulk Power Systems shall be controlled within defined limits through the balancing of Real and Reactive Power supply and demand.

[1] These functional classes of entities are derived from NERC's Reliability Functional Model. When a Reliability Standard identifies a class of entities to which it applies, that class must be defined in the Glossary of Terms Used in NERC Reliability Standards.

2.3 **Reliability Information** — Information necessary for the planning and operation of reliable Bulk Power Systems shall be made available to those entities responsible for planning and operating Bulk Power Systems.

2.4 **Emergency Preparation** — Plans for emergency operation and system restoration of Bulk Power Systems shall be developed, coordinated, maintained, and implemented.

2.5 **Communications and Control** — Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of Bulk Power Systems.

2.6 **Personnel** — Personnel responsible for planning and operating Bulk Power Systems shall be trained and qualified, and shall have the responsibility and authority to implement actions.

2.7 **Wide-Area View** — The reliability of the Bulk Power Systems shall be assessed, monitored, and maintained on a Wide-Area basis.

2.8 **Security** —Bulk Power Systems shall be protected from malicious physical or cyber attacks.

3. **Performance Requirement or Outcome**— Each Reliability Standard shall state one or more performance Requirements, which if achieved by the applicable entities, will provide for a reliable Bulk Power System, consistent with good utility practices and the public interest. Each Requirement is not a "lowest common denominator" compromise, but instead achieves an objective that is the best approach for Bulk Power System reliability, taking account of the costs and benefits of implementing the proposal.

4. **Measurability** — Each performance Requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that Requirement. Each performance Requirement shall have one or more associated measures used to objectively evaluate compliance with the Requirement. If performance can be practically measured quantitatively, metrics shall be provided to determine satisfactory performance.

5. **Technical Basis in Engineering and Operations**— Each Reliability Standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.

6. **Completeness** — Reliability Standards shall be complete and self-contained. The Reliability Standards shall not depend on external information to determine the required level of performance.

7. **Consequences for Noncompliance** — In combination with guidelines for Penalties and sanctions, as well as other ERO and Regional Entity compliance documents, the consequences of violating a Reliability Standard are clearly presented to the entities responsible for complying with the Reliability Standards.

8. **Clear Language** — Each Reliability Standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.

9. **Practicality** — Each Reliability Standard shall establish Requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.

10. **Consistent Terminology** — To the extent possible, Reliability Standards shall use a set of standard terms and definitions that are approved through the NERC Reliability Standards development process.

303. Relationship between Reliability Standards and Competition

To ensure Reliability Standards are developed with due consideration of impacts on competition, to ensure Reliability Standards are not unduly discriminatory or preferential, and recognizing that reliability is an essential requirement of a robust North American economy, each Reliability Standard shall meet all of these market-related objectives:

1. **Competition** — A Reliability Standard shall not give any market participant an unfair competitive advantage.

2. **Market Structures** — A Reliability Standard shall neither mandate nor prohibit any specific market structure.

3. **Market Solutions** — A Reliability Standard shall not preclude market solutions to achieving compliance with that Reliability Standard.

4. **Commercially Sensitive Information** — A Reliability Standard shall not require the public disclosure of commercially sensitive information or other Confidential Information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with Reliability Standards.

5. **Adequacy** — NERC shall not set Reliability Standards defining an adequate amount of, or requiring expansion of, Bulk Power System resources or delivery capability.

304. Essential Principles for the Development of Reliability Standards

NERC shall develop Reliability Standards in accordance with the NERC *Standard Processes Manual*, which is incorporated into these Rules of Procedure as **Appendix 3A**. Appeals in connection with the development of a Reliability Standard shall also be conducted in accordance with the NERC *Standard Processes Manual*. Any amendments or revisions to the *Standard Processes Manual* shall be consistent with the following essential principles:

1. **Openness** — Participation shall be open to all Persons who are directly and materially affected by the reliability of the North American Bulk Power System. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in NERC or any other organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

2. **Transparency** — The process shall be transparent to the public.

3. **Consensus-building** —The process shall build and document consensus for each Reliability Standard, both with regard to the need and justification for the Reliability Standard and the content of the Reliability Standard.

4. **Fair Balance of Interests** — The process shall fairly balance interests of all stakeholders and shall not be dominated by any single interest category.

5. **Due Process** — Development of Reliability Standards shall provide reasonable notice and opportunity for any Person with a direct and material interest to express views on a proposed Reliability Standard and the basis for those views, and to have that position considered in the development of the Reliability Standards.

6. **Timeliness** — Development of Reliability Standards shall be timely and responsive to new and changing priorities for reliability of the Bulk Power System.

305. Registered Ballot Body

NERC Reliability Standards shall be approved by a Registered Ballot Body prior to submittal to the Board and then to Applicable Governmental Authorities for their approval, where authorized by applicable legislation or agreement. This Section 305 sets forth the rules pertaining to the composition of, and eligibility to participate in, the Registered Ballot Body.

1. **Eligibility to Vote on Reliability Standards** — Any person or entity may join the Registered Ballot Body to vote on Reliability Standards, whether or not such person or entity is a Member of NERC.

2. **Inclusive Participation** — The Segment qualification guidelines are inclusive; i.e., any entity with a legitimate interest in the reliability of the Bulk Power System that can meet any one of the eligibility criteria for a Segment is entitled to belong to and vote in each Segment for which it qualifies, subject to limitations defined in Sections 305.3 and 305.5.

3. **General Criteria for Registered Ballot Body Membership** — The general criteria for membership in the Segments are:

    3.1 **Multiple Segments** — A corporation or other organization with integrated operations or with affiliates that qualifies to belong to more than one Segment (e.g., Transmission Owners and Load-Serving Entities) may join once in each Segment for which it qualifies, provided that each Segment constitutes a separate membership and the organization is represented in each Segment by a different representative. Affiliated entities are collectively limited to one membership in each Segment for which they are qualified.

    3.2 **Withdrawing from a Segment or Changing Segments** — After its initial registration in a Segment, each registered participant may elect to withdraw from a Segment or apply to change Segments at any time.

    3.3 **Review of Segment Criteria** — The Board shall review the qualification guidelines and rules for joining Segments at least every three years to ensure that the process continues to be fair, open, balanced, and inclusive. Public input will be solicited in the review of these guidelines.

4. **Proxies for Voting on Reliability Standards** — Any registered participant may designate an agent or proxy to vote on its behalf. There are no limits on how many proxies an agent may hold. However, for the proxy to be valid, NERC must have in its possession written documentation signed by the representative of the registered participant that the voting right by proxy has been transferred from the registered participant to the agent.

5. **Segments** — The specific criteria for membership in each Registered Ballot Body Segment are defined in the *Standard Processes Manual* in **Appendix 3A.**

6. **Review of Segment Entries** — NERC shall review all applications for joining the Registered Ballot Body, and shall make a determination of whether the applicant's self-selection of a Segment satisfies at least one of the guidelines to belong to that Segment. The entity shall then become eligible to participate as a voting member of that Segment. The Standards Committee shall resolve disputes

regarding eligibility for membership in a Segment, with the applicant having the right of appeal to the Board.

306. Standards Committee

The Standards Committee shall provide oversight of the Reliability Standards development process to ensure stakeholder interests are fairly represented. The Standards Committee shall not under any circumstance change the substance of a draft or approved Reliability Standard.

1. **Membership** — The Standards Committee is a representative committee comprising representatives of two members of each of the Segments in the Registered Ballot Body.

2. **Elections** — Standards Committee members are elected for staggered (one per Segment per year) two-year terms by the respective Segments in accordance with the *Procedure for the Election of Members of the NERC Standards Committee*, which is incorporated into these Rules of Procedure as **Appendix 3B**. Segments may use their own election procedure if such a procedure is ratified by two-thirds of the members of a Segment and approved by the Board.

3. **Canadian Representation**

   3.1 **Provision for Sufficient Canadian Representation —** If any regular election of Standards Committee members does not result in at least two Canadian members on the Standards Committee, the Canadian nominees who were not elected but who received the next highest percentage of votes within their respective Segment(s) will be designated as additional members of the Standards Committee, as needed to achieve a total of two Canadian members.

   3.2 **Terms of Specially Designated Canadian Members** — Each specially designated Canadian member of the Standards Committee shall have a term ending with the next annual election.

   3.3 **Segment Preference** — If any Segment has an unfilled representative position on the Standards Committee following the annual election, the first preference is to assign each specially designated Canadian representative to a Segment with an unfilled representative position for which his or her organization qualifies.

   3.4 **Rights of Specially Designated Canadian Members** — Any specially designated Canadian members of the Standards Committee shall have the same rights and obligations as all other members of the Standards Committee.

4. **Open Meetings** — All meetings of the Standards Committee shall be open and publicly noticed on the NERC website.

307. Standards Process Manager

NERC shall assign a standards process manager to administer the development of Reliability Standards. The standards process manager shall be responsible for ensuring that the development and revision of Reliability Standards are in accordance with the NERC *Standard Processes Manual*. The standards process manager shall work to achieve the highest degree of integrity and consistency of quality and completeness of the Reliability Standards. The standards process manager shall coordinate with any Regional Entities that develop Regional Reliability Standards to ensure those Regional Reliability Standards are effectively integrated with the NERC Reliability Standards.

308. Steps in the Development of Reliability Standards

1. **Procedure** — NERC shall develop Reliability Standards through the process set forth in the NERC *Standard Processes Manual* (**Appendix 3A**). The procedure includes a provision for approval of urgent action Reliability Standards that can be completed within 60 days and emergency actions that may be further expedited.

2. **Board Approval** — Reliability Standards or revisions to Reliability Standards approved by the ballot pool in accordance with the *Standard Processes Manual* shall be submitted for approval by the Board. No Reliability Standard or revision to a Reliability Standard shall be effective unless approved by the Board.

3. **Governmental Approval** — After receiving Board approval, a Reliability Standard or revision to a Reliability Standard shall be submitted to all Applicable Governmental Authorities in accordance with Section 309. No Reliability Standard or revision to a Reliability Standard shall be effective within a geographic area over which an Applicable Governmental Authority has jurisdiction unless approved by such Applicable Governmental Authority or is otherwise made effective pursuant to the laws applicable to such Applicable Governmental Authority.

309. Filing of Reliability Standards for Approval by Applicable Governmental Authorities

1. **Filing of Reliability Standards for Approval** — Where authorized by applicable legislation or agreement, NERC shall file with the Applicable Governmental Authorities each Reliability Standard, modification to a Reliability Standard, or withdrawal of a Reliability Standard that is approved by the Board. Each filing shall be in the format required by the Applicable Governmental Authority and

shall include: a concise statement of the basis and purpose of the Reliability Standard; the text of the Reliability Standard; the implementation plan for the Reliability Standard; a demonstration that the Reliability Standard meets the essential attributes of Reliability Standards as stated in Section 302; the drafting team roster; the ballot pool and final ballot results; and a discussion of public comments received during the development of the Reliability Standard and the consideration of those comments.

2. **Remanded Reliability Standards and Directives to Develop Standards** — If an Applicable Governmental Authority remands a Reliability Standard to NERC or directs NERC to develop a Reliability Standard, NERC shall within five (5) business days notify all other Applicable Governmental Authorities, and shall within thirty (30) calendar days report to all Applicable Governmental Authorities a plan and timetable for modification or development of the Reliability Standard. Reliability Standards that are remanded or directed by an Applicable Governmental Authority shall be modified or developed using the *Standard Processes Manual*. NERC shall, during the development of a modification for the remanded Reliability Standard or directed Reliability Standard, consult with other Applicable Governmental Authorities to coordinate any impacts of the proposed Reliability Standards in those other jurisdictions. The expedited action procedure may be applied if necessary to meet a timetable for action required by the Applicable Governmental Authorities, respecting to the extent possible the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interest in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental Authority, then Rule 321 of these Rules of Procedure shall apply.

3. **Directives to Develop Reliability Standards under Extraordinary Circumstances** — An Applicable Governmental Authority may, on its own initiative, determine that extraordinary circumstances exist requiring expedited development of a Reliability Standard. In such a case, the Applicable Governmental Authority may direct the development of a Reliability Standard within a certain deadline. NERC staff shall prepare the Standards Authorization Request and seek a stakeholder sponsor for the request. If NERC is unable to find a sponsor for the proposed Reliability Standard, NERC will be designated as the requestor. The proposed Reliability Standard will then proceed through the Reliability Standards development process, using the expedited action procedures described in the *Standard Processes Manual* as necessary to meet the specified deadline. The timeline will be developed to respect, to the extent possible, the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental

Authority, then Rule 321 of these Rules of Procedure shall apply, with appropriate modification of the timeline.

3.1 Consistent with all Reliability Standards developed under the expedited action process, each of the three possible follow-up actions as documented in the *Standard Processes Manual* are to be completed through the Reliability Standards development process and are subject to approval by the Applicable Governmental Authorities in the U.S. and Canada.

310. Annual Reliability Standards Development Plan

NERC shall develop and provide an annual Reliability Standards Development Plan for development of Reliability Standards to the Applicable Governmental Authorities. NERC shall consider the comments and priorities of the Applicable Governmental Authorities in developing and updating the annual Reliability Standards Development Plan. Each annual Reliability Standards Development Plan shall include a progress report comparing results achieved to the prior year's Reliability Standards Development Plan.

311. Regional Entity Standards Development Procedures

1. **NERC Approval of Regional Entity Reliability Standards Development Procedure** — To enable a Regional Entity to develop Regional Reliability Standards that are to be recognized and made part of NERC Reliability Standards, a Regional Entity may request NERC to approve a Regional Reliability Standards development procedure.

2. **Public Notice and Comment on Regional Reliability Standards Development Procedure** — Upon receipt of such a request, NERC shall publicly notice and request comment on the proposed Regional Reliability Standards development procedure, allowing a minimum of 45 days for comment. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the Regional Reliability Standards development procedure and request another posting for comment, or submit the Regional Reliability Standards development procedure, along with its consideration of any objections received, for approval by NERC.

3. **Evaluation of Regional Reliability Standards Development Procedure** — NERC shall evaluate whether a Regional Reliability Standards development procedure meets the criteria listed below and shall consider stakeholder comments, any unresolved stakeholder objections, and the consideration of comments provided by the Regional Entity, in making that determination. If NERC determines the Regional Reliability Standards development procedure meets these requirements, the Regional Reliability Standards development procedure shall be submitted to the Board for approval. The Board shall consider the recommended action, stakeholder comments, any unresolved stakeholder

comments, and the Regional Entity consideration of comments in determining whether to approve the Regional Reliability Standards development procedure.

3.1 **Evaluation Criteria** — The Regional Reliability Standards development procedure shall be:

3.1.1 **Open** — The Regional Reliability Standards development procedure shall provide that any person or entity who is directly and materially affected by the reliability of the Bulk Power Systems within the Regional Entity shall be able to participate in the development and approval of Reliability Standards. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in the Regional Entity, a Regional Entity or any organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

3.1.2 **Inclusive** — The Regional Reliability Standards development procedure shall provide that any Person with a direct and material interest has a right to participate by expressing an opinion and its basis, having that position considered, and appealing through an established appeals process if adversely affected.

3.1.3 **Balanced** — The Regional Reliability Standards development procedure shall have a balance of interests and shall not permit any two interest categories to control the vote on a matter or any single interest category to defeat a matter.

3.1.4 **Due Process** — The Regional Reliability Standards development procedure shall provide for reasonable notice and opportunity for public comment. At a minimum, the Regional Reliability Standards development procedure shall include public notice of the intent to develop a Regional Reliability Standard, a public comment period on the proposed Regional Reliability Standard, due consideration of those public comments, and a ballot of interested stakeholders.

3.1.5 **Transparent** — All actions material to the development of Regional Reliability Standards shall be transparent. All Regional Reliability Standards development meetings shall be open and publicly noticed on the Regional Entity's website.

3.1.6 **Accreditation of Regional Standards Development Procedure** — A Regional Entity's Regional Reliability Standards development procedure that is accredited by the American National Standards Institute or the Standards Council of Canada

shall be deemed to meet the criteria listed in this Section 311.3.1, although such accreditation is not a prerequisite for approval by NERC.

3.1.7 **Use of NERC Procedure** — A Regional Entity may adopt the NERC *Standard Processes Manual* as the Regional Reliability Standards development procedure, in which case the Regional Entity's Regional Reliability Standards development procedure shall be deemed to meet the criteria listed in this Section 311.3.1.

4. **Revisions of Regional Reliability Standards Development Procedures** — Any revision to a Regional Reliability Standards development procedure shall be subject to the same approval requirements set forth in Sections 311.1 through 311.3.

5. **Duration of Regional Reliability Standards Development Procedures** — The Regional Reliability Standards development procedure shall remain in effect until such time as it is replaced with a new version approved by NERC or it is withdrawn by the Regional Entity. The Regional Entity may, at its discretion, withdraw its Regional Reliability Standards development procedure at any time.

312. Regional Reliability Standards

1. **Basis for Regional Reliability Standards** — Regional Entities may propose Regional Reliability Standards that set more stringent reliability requirements than the NERC Reliability Standard or cover matters not covered by an existing NERC Reliability Standard. Such Regional Reliability Standards shall in all cases be approved by NERC and made part of the NERC Reliability Standards and shall be enforceable in accordance with the delegation agreement between NERC and the Regional Entity or other instrument granting authority over enforcement to the Regional Entity. No entities other than NERC and the Regional Entity shall be permitted to develop Regional Reliability Standards that are enforceable under statutory authority delegated to NERC and the Regional Entity.

2. **Regional Reliability Standards That are Directed by a NERC Reliability Standard** — Although it is the intent of NERC to promote uniform Reliability Standards across North America, in some cases it may not be feasible to achieve a reliability objective with a Reliability Standard that is uniformly applicable across North America. In such cases, NERC may direct Regional Entities to develop Regional Reliability Standards necessary to implement a NERC Reliability Standard. Such Regional Reliability Standards that are developed pursuant to a direction by NERC shall be made part of the NERC Reliability Standards.

3. **Procedure for Developing an Interconnection-wide Regional Standard** — A Regional Entity organized on an Interconnection-wide basis may propose a

Regional Reliability Standard for approval as a NERC Reliability Standard to be made mandatory for all applicable Bulk Power System owners, operators, and users within that Interconnection.

3.1 **Presumption of Validity** — An Interconnection-wide Regional Reliability Standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities, shall be adopted as a NERC Reliability Standard. NERC shall rebuttably presume that a Regional Reliability Standard developed, in accordance with a Regional Reliability Standards development process approved by NERC, by a Regional Entity organized on an Interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities.

3.2 **Notice and Comment Procedure for Interconnection-wide Regional Reliability Standard** — NERC shall publicly notice and request comment on the proposed Interconnection-wide Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to comment on or withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for approval by NERC.

3.3 **Approval of Interconnection-wide Regional Reliability Standard by NERC** — NERC shall evaluate and recommend whether a proposed Interconnection-wide Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections that could serve as a basis for rebutting the presumption of validity of the Regional Reliability Standard. The Regional Entity, having been notified of the results of the evaluation and recommendation concerning NERC proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for approval as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, NERC's recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether to approve the Regional Reliability Standard as a NERC Reliability Standard.

3.4 **Applicable Governmental Authority Approval** — An Interconnection-wide Regional Reliability Standard that has been approved by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

3.5 **Enforcement of Interconnection-wide Regional Reliability Standard** — An Interconnection-wide Regional Reliability Standard that has been approved by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

4. **Procedure for Developing Non-Interconnection-Wide Regional Reliability Standards** — Regional Entities that are not organized on an Interconnection-wide basis may propose Regional Reliability Standards to apply within their respective Regions. Such Regional Reliability Standards may be developed through the NERC Reliability Standards development procedure, or alternatively, through a Regional Reliability Standards development procedure that has been approved by NERC.

4.1 **No Presumption of Validity** — Regional Reliability Standards that are not proposed to be applied on an Interconnection-wide basis are not presumed to be valid but may be demonstrated by the proponent to be valid.

4.2 **Notice and Comment Procedure for Non-Interconnection-wide Regional Reliability Standards** — NERC shall publicly notice and request comment on the proposed Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to comment on or resolve any objections identified in the comments and may choose to withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for approval by NERC.

4.3 **NERC Approval of Non-Interconnection-wide Regional Reliability Standards** — NERC shall evaluate and recommend whether a proposed non-Interconnection-wide Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections. The Regional Entity, having been notified of the results of the

evaluation and recommendation concerning proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for approval as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, the recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether to approve the Regional Reliability Standard as a NERC Reliability Standard.

4.4 **Applicable Governmental Authority Approval** — A non-Interconnection-wide Regional Reliability Standard that has been approved by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

4.5 **Enforcement of Non-Interconnection-wide Regional Reliability Standards** — A non-Interconnection-wide Regional Reliability Standard that has been approved by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

5. **Appeals** — A Regional Entity shall have the right to appeal NERC's decision not to approve a proposed Regional Reliability Standard or Variance to the Commission or other Applicable Governmental Authority.

313. Other Regional Criteria, Guides, Procedures, Agreements, Etc.

1. **Regional Criteria** — Regional Entities may develop Regional Criteria that are necessary to implement, to augment, or to comply with Reliability Standards, but which are not Reliability Standards. Regional Criteria may also address issues not within the scope of Reliability Standards, such as resource adequacy. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents used to enhance the reliability of the Bulk Power System in the Region. These documents typically provide benefits by promoting more consistent implementation of the NERC Reliability Standards within the Region. These documents are not NERC Reliability Standards, Regional Reliability Standards, or regional Variances, and therefore are not enforceable under authority delegated by NERC pursuant to delegation agreements and do not require NERC approval.

2. **Catalog of Regional Criteria** — NERC shall maintain a current catalog of Regional Criteria. Regional Entities shall provide a catalog listing of Regional

Criteria to NERC and shall notify NERC of changes to the listing. Regional Entities shall provide any listed document to NERC upon written request.

314. Conflicts with Statutes, Regulations, and Orders

Notice of Potential Conflict — If a Bulk Power System owner, operator, or user determines that a NERC or Regional Reliability Standard may conflict with a function, rule, order, tariff, rate schedule, legislative requirement or agreement that has been accepted, approved, or ordered by a governmental authority affecting that entity, the entity shall expeditiously notify the governmental authority, NERC, and the relevant Regional Entity of the conflict.

1. **Determination of Conflict —** NERC, upon request of the governmental authority, may advise the governmental authority regarding the conflict and propose a resolution of the conflict, including revision of the Reliability Standard if appropriate.

2. **Regulatory Precedence** — Unless otherwise ordered by a governmental authority, the affected Bulk Power System owner, operator, or user shall continue to follow the function, rule, order, tariff, rate schedule, legislative requirement, or agreement accepted, approved, or ordered by the governmental authority until the governmental authority finds that a conflict exists and orders a remedy and such remedy is affected.

315. Revisions to NERC Reliability Standards Development Procedure

Any person or entity may submit a written request to modify NERC *Standard Processes Manual*. Consideration of the request and development of the revision shall follow the process defined in the NERC *Standard Processes Manual*. Upon approval by the Board, the revision shall be submitted to the Applicable Governmental Authorities for approval. Changes shall become effective only upon approval by the Applicable Governmental Authorities or on a date designated by the Applicable Governmental Authorities or as otherwise applicable in a particular jurisdiction.

316. Accreditation

NERC shall seek continuing accreditation of the NERC Reliability Standards development process by the American National Standards Institute and the Standards Council of Canada.

317. Five-Year Review of Reliability Standards

NERC shall complete a review of each NERC Reliability Standard at least once every five years from the effective date of the Reliability Standard or the latest revision to the Reliability Standard, whichever is later. The review process shall be conducted in accordance with the NERC *Standard Processes Manual*. The standards process manager shall be responsible for administration of the five-year review of Reliability Standards. As a result of this review, the NERC Reliability Standard shall be reaffirmed, revised, or withdrawn. If the review indicates a need to revise or withdraw the Reliability Standard, a request for revision or withdrawal shall be prepared, submitted and addressed in accordance with the NERC *Standard Processes Manual*.

318. Coordination with the North American Energy Standards Board

NERC shall, through a memorandum of understanding, maintain a close working relationship with the North American Energy Standards Board and ISO/RTO Council to ensure effective coordination of wholesale electric business practice standards and market protocols with the NERC Reliability Standards.

319. Archived Standards Information

NERC shall maintain a historical record of Reliability Standards information that is no longer maintained on-line. For example, Reliability Standards that expired or were replaced may be removed from the on-line system. Archived information shall be retained indefinitely as practical, but in no case less than five years or one complete Reliability Standards review cycle from the date on which the Reliability Standard was no longer in effect. Archived records of Reliability Standards information shall be available electronically within 30 days following the receipt by the standards process manager of a written request.

320. Alternate Method for Adopting Violation Risk Factors

In the event the Reliability Standards development process fails to produce Violation Risk Factors for a particular Reliability Standard in a timely manner, the Board of Trustees may adopt Violation Risk Factors for that Reliability Standard using the procedures set out in Section 1400 of these Rules of Procedure.

321. Special Rule to Address Certain Regulatory Directives

In circumstances where this Rule 321 applies, the Board of Trustees shall have the authority to take one or more of the actions set out below. The Board of Trustees shall have the authority to choose which one or more of the actions are appropriate to the circumstances and need not take these actions in sequential steps.

1. The Standards Committee shall have the responsibility to ensure that standards drafting teams address specific matters that are identified in directives issued by Applicable Governmental Authorities. If the Board of Trustees is presented with a proposed Reliability Standard that fails to address such directives, the Board of Trustees has the authority to remand, with instructions (including establishing a timetable for action), the proposed Reliability Standard to the Standards Committee.

2. Upon a written finding by the Board of Trustees that a ballot pool has failed to approve a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to remand the proposed Reliability Standard to the Standards Committee, with instructions to (i) convene a public technical conference to discuss the issues surrounding the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified; (ii) working with NERC staff, prepare a memorandum discussing the issues, an analysis of the alternatives considered and other appropriate matters; and (iii) re-ballot the proposed Reliability Standard one additional time, with such adjustments in the schedule as are necessary to meet the deadline contained in paragraph 2.1 of this Rule.

   2.1 Such a re-ballot shall be completed within forty-five (45) days of the remand. The Standards Committee memorandum shall be included in the materials made available to the ballot pool in connection with the re-ballot.

   2.2 In any such re-ballot, negative votes without comments related to the proposal shall be counted for purposes of establishing a quorum, but only affirmative votes and negative votes with comments related to the proposal shall be counted for purposes of determining the number of votes cast and whether the proposed Reliability Standard has been approved.

3. If the re-balloted proposed Reliability Standard achieves at least an affirmative two-thirds majority vote of the weighted Segment votes cast, with a quorum established, then the proposed Reliability Standard shall be deemed approved by the ballot pool and shall be considered by the Board of Trustees for approval.

4. If the re-balloted proposed Reliability Standard fails to achieve at least an affirmative two-thirds majority vote of the weighted Segment votes cast, but does achieve at least a sixty percent affirmative majority of the weighted Segment votes cast, with a quorum established, then the Board of Trustees has the authority to consider the proposed Reliability Standard for approval under the following procedures:

   4.1 The Board of Trustees shall issue notice of its intent to consider the proposed Reliability Standard and shall solicit written public comment

particularly focused on the technical aspects of the provisions of the proposed Reliability Standard that address the specific matter identified in the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified.

4.2 The Board of Trustees may, in its discretion, convene a public technical conference to receive additional input on the matter.

4.3 After considering the developmental record, the comments received during balloting and the additional input received under paragraphs 4.1 and 4.2 of this Rule, the Board of Trustees has authority to act on the proposed Reliability Standard.

4.3.1 If the Board of Trustees finds that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to approve the proposed Reliability Standard and direct that it be filed with Applicable Governmental Authorities with a request that it be made effective.

4.3.2 If the Board of Trustees is unable to find that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to treat the proposed Reliability Standard as a draft Reliability Standard and direct that the draft Reliability Standard and complete developmental record, including the additional input received under paragraphs 4.1 and 4.2 of this Rule, be filed with the Applicable Governmental Authorities as a compliance filing in response to the order giving rise to the regulatory directive, along with a recommendation that the Reliability Standard not be made effective and an explanation of the basis for the recommendation.

A5. Upon a written finding by the Board of Trustees that standard drafting team has failed to develop, or a ballot pool has failed to approve, a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to direct the Standards Committee (with the assistance of stakeholders and NERC staff) to prepare a draft Reliability Standard that addresses the regulatory directive, taking account of the entire developmental record pertaining to the matter. If the Standards Committee fails to prepare such

draft Reliability Standard, the Board of Trustees may direct NERC management to prepare such draft Reliability Standard.

5.1 The Board of Trustees may, in its discretion, convene a public technical conference to receive input on the matter. The draft Reliability Standard shall be posted for a 45-day public comment period.

5.2 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees finds that the draft Reliability Standard, with such modifications as the Board of Trustees determines are appropriate in light of the comments received, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to approve the draft Reliability Standard and direct that the proposed Reliability Standard be filed with Applicable Governmental Authorities with a request that the proposed Reliability Standard be made effective.

5.3 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees is unable to find that the draft Reliability Standard, even with modifications, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to direct that the draft Reliability Standard and complete developmental record be filed as a compliance filing in response to the regulatory directive with the Applicable Governmental Authority issuing the regulatory directive, with a recommendation that the draft Reliability Standard not be made effective.

5.4 The filing of the Reliability Standard under either paragraph 5.2 or paragraph 5.3 of this Rule shall include an explanation of the basis for the decision by the Board of Trustees.

5.5 A Reliability Standard approved under paragraph 5 of this Rule shall not be eligible for submission as an American National Standard.

6. NERC shall on or before March 31st of each year file a report with Applicable Governmental Authorities on the status and timetable for addressing each outstanding directive to address a specific matter received from an Applicable Governmental Authority.

SECTION 400 — COMPLIANCE ENFORCEMENT

401. Scope of the NERC Compliance Monitoring and Enforcement Program

1. **Components of the NERC Compliance Monitoring and Enforcement Program** — NERC shall develop and implement a NERC Compliance Monitoring and Enforcement Program to promote the reliability of the Bulk Power System by enforcing compliance with approved Reliability Standards in those regions of North American in which NERC and/or a Regional Entity (pursuant to a delegation agreement with NERC that has been approved by the Applicable Governmental Authority) has been given enforcement authority. There are four distinct parts of the NERC Compliance Monitoring and Enforcement Program: (1) NERC's oversight of the Regional Entity Compliance Monitoring and Enforcement Programs (Section 402), (2) the definition of the required Regional Entity Compliance Monitoring and Enforcement Program attributes (Section 403), (3) NERC's monitoring of Regional Entity compliance with Reliability Standards (Section 404), and (4) the monitoring of compliance with Reliability Standards that are applicable to NERC (Sections 405–406).

2. **Who Must Comply** — Where required by applicable legislation, regulation, rule or agreement, all Bulk Power System owners, operators, and users, Regional Entities, and NERC, are required to comply with all approved NERC Reliability Standards at all times. Regional Reliability Standards and Variances approved by NERC and the Applicable Governmental Authority shall be considered NERC Reliability Standards and shall apply to all Bulk Power System owners, operators, or users responsible for meeting those Reliability Standards within the Regional Entity boundaries, whether or not the Bulk Power System owner, operator, or user is a member of the Regional Entity.

3. **Data Access** — All Bulk Power System owners, operators, and users shall provide to NERC and the applicable Regional Entity such information as is necessary to monitor compliance with the Reliability Standards. NERC and the applicable Regional Entity will define the data retention and reporting requirements in the Reliability Standards and compliance reporting procedures.

4. **Role of Regional Entities in the Compliance Monitoring and Enforcement Program** — Each Regional Entity that has been delegated authority through a delegation agreement or other legal instrument approved by the Applicable Governmental Authority shall, in accordance with the terms of the approved delegation agreement, administer a Regional Entity Compliance Monitoring and Enforcement program to meet the NERC Compliance Monitoring and Enforcement Program goals and the requirements in this Section 400.

5. **Program Continuity** — NERC will ensure continuity of compliance monitoring and enforcement within the geographic boundaries of a Regional Entity in the event that NERC does not have a delegation agreement, or the Regional Entity withdraws from the agreement or does not operate its Compliance Monitoring and Enforcement Program in accordance with the delegation agreement or other applicable requirements.

5.1 Should NERC not have a delegation agreement with a Regional Entity covering a geographic area, or a Regional Entity withdraws from an existing delegation agreement or the delegation agreement is otherwise terminated, NERC will directly administer the Compliance Monitoring and Enforcement Program applicable to owners, operators and users of the Bulk Power System within that geographic area.

1. This monitoring and enforcement will be accomplished by NERC and Compliance Staff from another approved Regional Entity.

2. If an existing delegation agreement with a Regional Entity is terminating, the Regional Entity shall promptly provide to NERC all relevant compliance information regarding Registered Entities, contacts, prior compliance information and actions, Mitigation Plans, and remedial actions for the period in which the Regional Entity was responsible for administering the Compliance Monitoring and Enforcement Program.

3. NERC will levy and collect all Penalties directly and will utilize any Penalty monies collected to offset the expenses of administering the Compliance Monitoring and Enforcement Program for the geographic area.

5.2 Should a Regional Entity seek to withdraw from its delegation agreement, NERC will seek agreement from another Regional Entity to amend its delegation agreement with NERC to extend that Regional Entity's boundaries for compliance monitoring and enforcement. In the event no Regional Entity is willing to accept this responsibility, NERC will administer the Compliance Monitoring and Enforcement Program within the geographical boundaries of the Regional Entity seeking to withdraw from the delegation agreement, in accordance with Section 401.5.1.

6. **Actively Monitored Requirements** — NERC, with input from the Regional entities, stakeholders, and regulators, shall annually select a subset of the NERC Reliability Standards and Requirements to be actively monitored and audited in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan. Compliance is required with all NERC Reliability Standards whether or not they are included in the subset of Reliability Standards and Requirements designated to be actively monitored and audited in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan.

7. **Penalties, Sanctions, and Remedial Actions** — NERC and Regional Entities will apply Penalties, sanctions, and remedial actions that bear a reasonable relation to the seriousness of a violation and take into consideration timely remedial efforts as defined in the NERC *Sanction Guidelines*, which is incorporated into these rules as **Appendix 4B**.

8. **Multiple Enforcement Actions** – A Registered Entity shall not be subject to an enforcement action by NERC and a Regional Entity for the same violation.

9. **Records** — NERC shall maintain a record of each compliance submission, including Self-Reported, Possible, Alleged, and Confirmed Violations of approved Reliability Standards; associated Penalties, sanctions, remedial actions and settlements; and the status of mitigation actions.

10. **Confidential Information** — NERC will treat all Possible and Alleged Violations of Reliability Standards and matters related to a Compliance Monitoring and Enforcement Program process, including the status of any Compliance Investigation or other Compliance Monitoring and Enforcement Program process, as confidential in accordance with Section 1500.

    The types of information that will be considered confidential and will not (subject to statutory and regulatory requirements) be disclosed in any public information reported by NERC are identified in Section 1500. Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident, will be identified and protected from public disclosure as Critical Energy Infrastructure Information in accordance with Section 1500.

    The Regional Entity and NERC shall give Bulk Power System owners, operators, and users a reasonable opportunity to demonstrate that information concerning a violation is confidential before such report is disclosed to the public.

11. **Public Posting** — When the affected Bulk Power System owner, operator, or user either agrees with a Possible or Alleged Violation(s) of a Reliability Standard(s) or a report of a Compliance Audit or Compliance Investigation, or enters into a settlement agreement concerning a Possible or Alleged Violation(s), or the time for submitting an appeal is passed, or all appeals processes are complete, NERC shall, subject to the confidentiality requirements of these Rules of Procedure, publicly post each Confirmed Violation, Penalty or sanction, settlement agreement, and final Compliance Audit or Compliance Investigation report, on its website.

    11.1 Each Bulk Power System owner, operator, or user may provide NERC with a statement to accompany the Confirmed Violation or report to be posted publicly. The statement must be on company letterhead and include a signature, as well as the name and title of the person submitting the information.

    11.2 In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information (*NERC Security Guidelines for the Electricity Sector — Protecting Potentially Sensitive Information* may be used as a guide) or other Confidential Information shall be redacted in accordance with Section 1500 and not be released publicly.

    11.3 Subject to redaction of Critical Energy Infrastructure Information or other Confidential Information, for each Confirmed Violation or settlement relating to a Possible Violation or an Alleged Violation, the public posting

shall include the name of any relevant entity, the nature, time period, and circumstances of such Possible, Alleged or Confirmed Violation, any Mitigation Plan to be implemented by the Registered Entity in connection with the Confirmed Violation or settlement, and sufficient facts to assist owners, operators and users of the Bulk Power System to evaluate whether they have engaged in or are engaging in similar activities.

12. **Violation Information Review** — NERC Compliance Staff shall periodically review and analyze all reports of Possible, Alleged and Confirmed Violations to identify trends and other pertinent reliability issues.

402. NERC Oversight of the Regional Entity Compliance Monitoring and Enforcement Programs

1. **NERC Monitoring Program** — NERC shall have a program to monitor the Compliance Monitoring and Enforcement Program of each Regional Entity that has been delegated authority. The objective of this monitoring program shall be to ensure that the Regional Entity carries out its Compliance Monitoring and Enforcement Program in accordance with these Rules of Procedure and the terms of the delegation agreement, and to ensure consistency and fairness of the Regional Entity's Compliance Monitoring and Enforcement Program. Oversight and monitoring by NERC shall be accomplished through an annual Compliance Monitoring and Enforcement Program review, program audits, and regular evaluations of Regional Entity Compliance Monitoring and Enforcement Program performance as described below.

   1.1 **NERC Review of Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plans** — NERC shall require each Regional Entity to submit for review and approval an annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan. NERC shall review each annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan and shall accept the plan if it meets NERC requirements and the requirements of the delegation agreement.

   1.2 **Regional Entity Compliance Monitoring and Enforcement Program Evaluation** — NERC shall annually evaluate the goals, tools, and procedures of each Regional Entity Compliance Monitoring and Enforcement Program to determine the effectiveness of each Regional Entity Compliance Monitoring and Enforcement Program, using criteria developed by the NERC Compliance and Certification Committee.

   1.3 **Regional Entity Compliance Monitoring and Enforcement Program Audit** — At least once every five years, NERC shall conduct an audit to evaluate how each Regional Entity Compliance Monitoring and Enforcement Program implements the NERC Compliance Monitoring and Enforcement Program. The evaluation shall be based on these Rules of Procedure, including Appendix 4C, the delegation agreement, directives in effect pursuant to the delegation agreement, approved annual Regional

Entity Compliance Monitoring and Enforcement Program Implementation Plans, required Compliance Monitoring and Enforcement Program attributes, and the NERC Compliance Monitoring and Enforcement Program procedures. These evaluations shall be provided to the Applicable Governmental Authorities to demonstrate the effectiveness of each Regional Entity. In addition, audits of Cross-Border Regional Entities shall cover applicable requirements imposed on the Regional Entity by statute, regulation, or order of, or agreement with, provincial governmental and/or regulatory authorities for which NERC has auditing responsibilities over the Regional Entity's compliance with such requirements within Canada or Mexico. Participation of a representative of an Applicable Governmental Authority shall be subject to the limitations of sections 3.1.6 and 8.0 of Appendix 4C of these Rules of Procedure regarding disclosures of non-public compliance information related to other jurisdictions. NERC shall maintain an audit procedure containing the requirements, steps, and timelines to conduct an audit of each Regional Entity Compliance Monitoring and Enforcement Program. The current procedure is contained in the NERC Audit of Regional Entity Compliance Programs, which is incorporated into these rules as **Appendix 4A**.

1.3.1. NERC shall establish a program to audit bulk power system owners, operators, and users operating within a regional entity to verify the findings of previous compliance audits conducted by the regional entity to evaluate how well the regional entity compliance enforcement program is meeting its delegated authority and responsibility.

1.4 Applicable Governmental Authorities will be allowed to participate as an observer in any audit conducted by NERC of a Regional Entity's Compliance Monitoring and Enforcement Program. A representative of the Regional Entity being audited will be allowed to participate in the audit as an observer.

2. **Consistency Among Regional Compliance Monitoring and Enforcement Programs** — To provide for a consistent Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users required to comply with approved Reliability Standards, NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program, which is incorporated into these rules of procedure as **Appendix 4C**. Any differences in Regional Entity Compliance Monitoring and Enforcement Program methods, including determination of violations and Penalty assessment, shall be justified on a case-by-case basis and fully documented in each Regional Entity delegation agreement.

2.1 NERC shall ensure that each of the Regional Entity Compliance Monitoring and Enforcement Programs meets these Rules of Procedure, including **Appendix 4C**, and follows the terms of the delegation

agreement and the approved annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan.

2.2 NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program in **Appendix 4C** containing the procedures to ensure the consistency and fairness of the processes used to determine Regional Entity Compliance Monitoring and Enforcement Program findings of compliance and noncompliance, and the application of Penalties and sanctions.

2.3 NERC shall periodically conduct Regional Entity compliance manager forums. These forums shall use the results of Regional Entity Compliance Monitoring and Enforcement Program audits and findings of NERC Compliance Staff to identify and refine Regional Entity Compliance Monitoring and Enforcement Program differences into a set of best practices over time.

3. **Information Collection and Reporting** — NERC and the Regional Entities shall implement data management procedures that address data reporting requirements, data integrity, data retention, data security, and data confidentiality.

4. **Violation Disclosure** — NERC shall disclose all Confirmed Violations and maintain as confidential Possible Violations and Alleged Violations, according to the reporting and disclosure process in **Appendix 4C**.

5. **Authority to Determine Noncompliance, Levy Penalties and Sanctions, and Issue Remedial Action Directives** — NERC and Regional Entity Compliance Staff shall have the authority and responsibility to make initial determinations of compliance or noncompliance, and where authorized by the Applicable Governmental Authorities or where otherwise authorized, to determine Penalties and sanctions for noncompliance with a Reliability Standard, and issue Remedial Action Directives. Regional Entity boards or a compliance panel reporting directly to the Regional Entity board will be vested with the authority for the overall Regional Entity Compliance Monitoring and Enforcement Program and have the authority to impose Penalties and sanctions on behalf of NERC, where authorized by applicable legislation or agreement. Remedial Action Directives may be issued by NERC or a Regional Entity that is aware of a Bulk Power System owner, operator, or user that is about to engage in an act or practice that would result in noncompliance with a Reliability Standard, where such Remedial Action Directive is immediately necessary to protect the reliability of the Bulk Power System from an imminent threat. If, after receiving such a Remedial Action Directive, the Bulk Power System owner, operator, or user does not take appropriate action to avert a violation of a Reliability Standard, NERC may petition the Applicable Governmental Authority to issue a compliance order.

6. **Due Process** — NERC shall establish and maintain a fair, independent, and nondiscriminatory appeals process. The appeals process is set forth in Sections

408-410. The process shall allow Bulk Power System owners, operators, and users to appeal the Regional Entity's findings of noncompliance and to appeal Penalties, sanctions, and Remedial Action Directives that are levied by the Regional Entity. Appeals beyond the NERC process will be heard by the Applicable Governmental Authority.

The appeals process will also allow for appeals to NERC of any findings of noncompliance issued by NERC to a Regional Entity for Reliability Standards and Requirements where the Regional Entity is monitored for compliance to a Reliability Standard. No monetary Penalties will be levied in these matters; however sanctions, remedial actions, and directives to comply may be applied by NERC.

7. **Conflict Disclosure** — NERC shall disclose to the appropriate governmental authorities any potential conflicts between a market rule and the enforcement of a Regional Reliability Standard.

8. **Confidentiality** — To maintain the integrity of the NERC Compliance Monitoring and Enforcement Program, NERC and Regional Entity staff, Compliance Audit team members, and committee members shall maintain the confidentiality of information obtained and shared during compliance monitoring and enforcement processes including Compliance Investigations, Compliance Audits, Spot Checks, drafting of reports, appeals, and closed meetings.

   8.1 NERC and the Regional Entity shall have in place appropriate codes of conduct and confidentiality agreements for staff and other Compliance Monitoring and Enforcement Program participants.

   8.2 Individuals not bound by NERC or Regional Entity codes of conduct who serve on compliance-related committees or Compliance Audit teams shall sign a NERC confidentiality agreement prior to participating on the committee or Compliance Audit team.

   8.3 Information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall not be distributed outside of a committee or team, nor released publicly. Other information subject to confidentiality is identified in Section 1500.

   8.4 In the event that a staff, committee, or Compliance Audit team member violates any of the confidentiality rules set forth above, the staff, committee, or Compliance Audit team member and any member organization with which the individual is associated may be subject to appropriate action by the Regional Entity or NERC, including prohibiting participation in future Compliance Monitoring and Enforcement Program activities.

9. **Auditor Training** — NERC shall develop and provide training in auditing skills to all people who participate in NERC and Regional Entity Compliance Audits. Training for NERC and Regional Entity personnel and others who serve as Compliance Audit team leaders shall be more comprehensive than training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

403. Required Attributes of Regional Entity Compliance Monitoring and Enforcement Programs

Each Regional Entity Compliance Monitoring and Enforcement Program shall promote excellence in the enforcement of Reliability Standards. To accomplish this goal, each Regional Entity Compliance Monitoring and Enforcement Program shall (i) conform to and comply with the NERC uniform Compliance Monitoring and Enforcement Program, **Appendix 4C** to these Rules of Procedure, except to the extent of any deviations that are stated in the Regional Entity's delegation agreement, and (ii) meet all of the attributes set forth in this Section 403.

Program Structure

1. **Independence** — Each Regional Entity's governance of its Compliance Monitoring and Enforcement Program shall exhibit independence, meaning the Compliance Monitoring and Enforcement Program shall be organized so that its compliance monitoring and enforcement activities are carried out separately from other activities of the Regional Entity. The Compliance Monitoring and Enforcement Program shall not be unduly influenced by the Bulk Power System owners, operators, and users being monitored or other Regional Entity activities that are required to meet the Reliability Standards. Regional Entities must include rules providing that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

2. **Exercising Authority** — Each Regional Entity Compliance Monitoring and Enforcement Program shall exercise the responsibility and authority in carrying out the delegated functions of the NERC Compliance Monitoring and Enforcement Program in accordance with delegation agreements and **Appendix 4C**. These functions include but are not limited to: data gathering, data reporting, Compliance Investigations, Compliance Audit activities, evaluating compliance and noncompliance, imposing Penalties and sanctions, and approving and tracking mitigation actions.

3. **Delegation of Authority** — To maintain independence, fairness, and consistency in the NERC Compliance Monitoring and Enforcement Program, a Regional Entity shall not sub-delegate its Compliance Monitoring and Enforcement Program duties to entities or persons other than the Regional Entity Compliance Staff, unless (i) required by statute or regulation in the applicable jurisdiction, or (ii) by agreement with express approval of NERC and of FERC or other Applicable Governmental Authority, to another Regional Entity.

4. **Hearings of Contested Findings or Sanctions —** The Regional Entity board or compliance panel reporting directly to the Regional Entity board (with appropriate

recusal procedures) will be vested with the authority for conducting compliance hearings in which any Bulk Power System owner, operator, or user provided a Notice of Alleged Violation may present facts and other information to contest a Notice of Alleged Violation or any proposed Penalty, sanction, any Remedial Action Directive, or any Mitigation Plan component. Compliance hearings shall be conducted in accordance with the Hearing Procedures set forth in Attachment 2 to **Appendix 4C**. If a stakeholder body serves as the Hearing Body, no two industry sectors may control any decision and no single segment may veto any matter related to compliance after recusals.

Program Resources

5. **Regional Entity Compliance Staff** — Each Regional Entity shall have sufficient resources to meet delegated compliance monitoring and enforcement responsibilities, including the necessary professional staff to manage and implement the Regional Entity Compliance Monitoring and Enforcement Program.

6. **Regional Entity Compliance Staff Independence** — The Regional Entity Compliance Staff shall be capable of and required to make all determinations of compliance and noncompliance and determine Penalties, sanctions, and remedial actions.

    6.1 Regional Entity Compliance Staff shall not have a conflict of interest, real or perceived, in the outcome of compliance monitoring and enforcement processes, reports, or sanctions. The Regional Entity shall have in effect a conflict of interest policy.

    6.2 Regional Entity Compliance Staff shall have the authority and responsibility to carry out compliance monitoring and enforcement processes (with the input of industry subject matter experts), make determinations of compliance or noncompliance, and levy Penalties and sanctions without interference or undue influence from Regional Entity members and their representative or other industry entities.

    6.3 Regional Entity Compliance Staff may call upon independent technical subject matter experts who have no conflict of interest in the outcome of the compliance monitoring and enforcement process to provide technical advice or recommendations in the determination of compliance or noncompliance.

    6.4 Regional Entity Compliance Staff shall abide by the confidentiality requirements contained in Section 1500 and **Appendix 4C** of these Rules of Procedure, the NERC delegation agreement and other confidentiality agreements required by the NERC Compliance Monitoring and Enforcement Program.

    6.5 Contracting with independent consultants or others working for the Regional Entity Compliance Monitoring and Enforcement Program shall be permitted provided the individual has not received compensation from a Bulk Power System owner, operator, or user being monitored for a

period of at least the preceding six months and owns no financial interest in any Bulk Power System owner, operator, or user being monitored for compliance to the Reliability Standard, regardless of where the Bulk Power System owner, operator, or user operates. Any such individuals for the purpose of these Rules of Procedure shall be considered as augmenting Regional Entity Compliance Staff.

7. Use of Industry Subject Matter Experts and Regional Entity Members — Industry experts and Regional Entity members may be called upon to provide their technical expertise in Compliance Monitoring and Enforcement Program activities.

7.1 The Regional Entity shall have procedures defining the allowable involvement of industry subject matter experts and Regional Entity members. The procedures shall address applicable antitrust laws and conflicts of interest.

7.2 Industry subject matter experts and Regional Entity members shall have no conflict of interest or financial interests in the outcome of their activities.

7.3 Regional Entity members and industry subject matter experts, as part of teams or Regional Entity committees, may provide input to the Regional Entity Compliance Staff so long as the authority and responsibility for (i) evaluating and determining compliance or noncompliance and (ii) levying Penalties, sanctions, or remedial actions shall not be delegated to any person or entity other than the Compliance Staff of the Regional Entity. Industry subject matter experts, Regional Entity members, or Regional Entity committees shall not make determinations of noncompliance or levy Penalties, sanctions, or remedial actions. Any committee involved shall be organized so that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

7.4 Industry subject matter experts and Regional Entity members shall sign a confidentiality agreement appropriate for the activity being performed.

7.5 All industry subject matter experts and Regional Entity members participating in Compliance Audits and Compliance Investigations shall successfully complete auditor training provided by NERC or the Regional Entity prior to performing these activities

Program Design

8. **Regional Entity Compliance Monitoring and Enforcement Program Content** — All approved Reliability Standards shall be included in the Regional Entity Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users within the defined boundaries of the Regional Entity.

Compliance to approved Regional Reliability Standards is applicable only within the Region of the Regional Entity that submitted those particular Regional Reliability Standards for approval. NERC will identify the minimum set of Reliability Standards and Requirements to be actively monitored by the Regional Entity in a given year.

9. **Antitrust Provisions** — Each Regional Entity's Compliance Monitoring and Enforcement Program shall be structured and administered to abide by U.S. antitrust law and Canadian competition law.

10. **Information Submittal** — All Bulk Power System owners, operators, and users within the Regional Entity responsible for complying with Reliability Standards shall submit timely and accurate information when requested by the Regional Entity or NERC. NERC and the Regional Entities shall preserve any mark of confidentiality on information submitted pursuant to Section 1502.1.

    10.1 Each Regional Entity has the authority to collect the necessary information to determine compliance and shall develop processes for gathering data from the Bulk Power System owners, operators, and users the Regional Entity monitors.

    10.2 The Regional Entity or NERC has the authority to request information from Bulk Power System owners, operators, and users pursuant to Section 401.3 or this Section 403.10 without invoking a specific compliance monitoring and enforcement process in **Appendix 4C**, for purposes of determining whether to pursue one such process in a particular case and/or validating in the enforcement phase of a matter the conclusions reached through the compliance monitoring and enforcement process(es).

    10.3 When required or requested, the Regional Entities shall report information to NERC promptly and in accordance with **Appendix 4C** and other NERC procedures.

    10.4 Regional Entities shall notify NERC of all Possible, Alleged and Confirmed Violations of NERC Reliability Standards by Registered Entities over which the Regional Entity has compliance monitoring and enforcement authority, in accordance with **Appendix 4C**.

    10.5 A Bulk Power System owner, operator, or user found in noncompliance with a Reliability Standard shall submit a Mitigation Plan with a timeline addressing how the noncompliance will be corrected. The Regional Entity Compliance Staff shall review and approve the Mitigation Plan in accordance with **Appendix 4C**.

    10.6 An officer of a Bulk Power System owner, operator, or user shall certify as accurate all compliance data Self-Reported to the Regional Entity Compliance Monitoring and Enforcement Program.

10.7 Regional Entities shall develop and implement procedures to verify the compliance information submitted by Bulk Power System owners, operators, and users.

11. **Compliance Audits of Bulk Power System Owners, Operators, and Users** — Each Regional Entity will maintain and implement a program of proactive Compliance Audits of Bulk Power System owners, operators, and users responsible for complying with Reliability Standards, in accordance with **Appendix 4C**. A Compliance Audit is a process in which a detailed review of the activities of a Bulk Power System owner, operator, or user is performed to determine if that Bulk Power System owner, operator, or user is complying with approved Reliability Standards.

11.1 For an entity registered as a Balancing Authority, Reliability Coordinator, or Transmission Operator, the Compliance Audit will be performed at least once every three years. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, Compliance Audits shall be performed on a schedule established by NERC.

11.2 Compliance Audits of Balancing Authorities, Reliability Coordinators, and Transmission Operators will include a component at the audited entity's site. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, the Compliance Audit may be either an on-site Compliance Audit or based on review of documents, as determined to be necessary and appropriate by NERC or Regional Entity Compliance Staff.

11.3 Compliance Audits must include a detailed review of the activities of the Bulk Power System owner, operator, or user to determine if the Bulk Power System owner, operator, or user is complying with all approved Reliability Standards identified for audit by NERC. The Compliance Audit shall include a review of supporting documentation and evidence used by the Bulk Power System owner, operator or user to demonstrate compliance for an appropriate period prior to the Compliance Audit.

12. **Confidentiality of Compliance Monitoring and Enforcement Processes** — All compliance monitoring and enforcement processes, and information obtained from such processes, are to be non-public and treated as confidential in accordance with Section 1500 and **Appendix 4C** of these Rules of Procedure, unless NERC, the Regional Entity or FERC or another Applicable Governmental Authority with jurisdiction determines a need to conduct a Compliance Monitoring and Enforcement Program process on a public basis, provided, that NERC and the Regional Entities shall publish (i) schedules of Compliance Audits scheduled in each year, (ii) a public report of each Compliance Audit, and (iii) Notices of Penalty and settlement agreements. Advance authorization from the Applicable Governmental Authority is required to make public any compliance monitoring and enforcement process or any information relating to a compliance

monitoring and enforcement process, or to permit interventions when determining whether to impose a Penalty. This prohibition on making public any compliance monitoring and enforcement process does not prohibit NERC or a Regional Entity from publicly disclosing (i) the initiation of or results from an analysis of a significant system event under Section 807 or of off-normal events or system performance under Section 808, or (ii) information of general applicability and usefulness to owners, operators, and users of the Bulk Power System concerning reliability and compliance matters, so long as specific allegations or conclusions regarding Possible or Alleged Violations of Reliability Standards are not included in such disclosures.

13. **Critical Energy Infrastructure Information** — Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident will be identified and protected from public disclosure as Critical Energy Infrastructure Information. In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall be redacted according to NERC procedures and shall not be released publicly.

14. **Penalties, Sanctions, and Remedial Action Directives** — Each Regional Entity will apply all Penalties, sanctions, and Remedial Action Directives in accordance with the approved *Sanction Guidelines*, **Appendix 4B** to these Rules of Procedure. Any changes to the *Sanction Guidelines* to be used by any Regional Entity must be approved by NERC and submitted to the Applicable Governmental Authority for approval. All Confirmed Violations, Penalties, and sanctions will be provided to NERC for review and filing with Applicable Governmental Authorities as a Notice of Penalty, in accordance with **Appendix 4C**.

15. **Regional Entity Hearing Process** — Each Regional Entity Compliance Monitoring and Enforcement Program shall establish and maintain a fair, independent, and nondiscriminatory process for hearing contested violations and any Penalties or sanctions levied, in conformance with Attachment 2 to **Appendix 4C** to these Rules of Procedure and any deviations therefrom that are set forth in the Regional Entity's delegation agreement. The hearing process shall allow Bulk Power System owners, operators, and users to contest findings of compliance violations, any Penalties and sanctions that are proposed to be levied, proposed Remedial Action Directives, and components of proposed Mitigation Plans. The Regional Entity hearing process shall be conducted before the Regional Entity board or a balanced committee established by and reporting to the Regional Entity board as the final adjudicator, provided, that Canadian provincial regulators may act as the final adjudicator in their respective jurisdictions. The Regional Entity hearing process shall (i) include provisions for recusal of any members of the Hearing Body with a potential conflict of interest, real or perceived, from all compliance matters considered by the Hearing Body for which the potential conflict of interest exists and (ii) provide that no two industry sectors may control any decision and no single segment may veto any matter brought before the Hearing Body after recusals.

Each Regional Entity will notify NERC of all hearings and NERC may observe any of the proceedings. Each Regional Entity will notify NERC of the outcome of all hearings.

If a Bulk Power System owner, operator, or user has completed the Regional Entity hearing process and desires to appeal the outcome of the hearing, the Bulk Power System owner, operator, or user shall appeal to NERC in accordance with Section 409 of these Rules of Procedure, except that a determination of violation or Penalty that has been directly adjudicated by an Applicable Governmental Authority shall be appealed with that Applicable Governmental Authority.

16. **Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan** — Each Regional Entity shall annually develop and submit to NERC for approval a Regional Entity Compliance Monitoring and Enforcement Implementation Plan in accordance with **Appendix 4C** that identifies the Reliability Standards and Requirements to be actively monitored (both those required by NERC and any additional Reliability Standards the Regional Entity proposes to monitor), and how each NERC and Regional Entity identified Reliability Standard will be monitored, evaluated, reported, sanctioned, and appealed. These Regional Implementation Plans will be submitted to NERC on the schedule established by NERC, generally on or about November 1 of the preceding year. In conjunction with the annual Regional Implementation Plan, each Regional Entity must report to NERC regarding how it carried out its delegated compliance monitoring and enforcement authority in the previous year, the effectiveness of the Compliance Monitoring and Enforcement Program, and changes expected to correct any deficiencies identified. Each Regional Entity will provide its annual report on the schedule established by NERC, generally on or about February 15 of the following year.

404. NERC Monitoring of Compliance for Regional Entities or Bulk Power Owners, Operator, or Users

NERC shall monitor Regional Entity compliance with NERC Reliability Standards and, if no there is no delegation agreement in effect with a Regional Entity for the geographic area, shall monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards. Industry subject matter experts may be used as appropriate in Compliance Investigations, Compliance Audits, and other Compliance Monitoring and Enforcement Program activities, subject to confidentiality, antitrust, and conflict of interest provisions.

1. **NERC Obligations** — NERC Compliance Staff shall monitor the compliance of the Regional Entity with the Reliability Standards for which the Regional Entities are responsible, in accordance with **Appendix 4C**. NERC shall actively monitor in its annual Compliance Enforcement and Monitoring Program selected Reliability Standards that apply to the Regional Entities. NERC shall evaluate compliance and noncompliance with all of the Reliability Standards that apply to the Regional Entities and shall impose sanctions, Penalties, or Remedial Action

Directives when there is a finding of noncompliance. NERC shall post all violations of Reliability Standards that apply to the Regional Entities as described in the reporting and disclosure process in **Appendix 4C**.

In addition, NERC will directly monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards in any geographic area for which there is not a delegation agreement in effect with a Regional Entity, in accordance with **Appendix 4C**. In such cases, NERC will serve as the Compliance Enforcement Authority described in **Appendix 4C**. Compliance matters contested by Bulk Power System owners, operators, and users in such an event will be heard by the NERC Compliance and Certification Committee.

2. **Compliance Audit of the Regional Entity** — NERC shall perform a Compliance Audit of each Regional Entity responsible for complying with Reliability Standards at least once every three years. NERC shall make an evaluation of compliance based on the information obtained through the Compliance Audit. After due process is complete, the final Compliance Audit report shall be made public in accordance with the reporting and disclosure process in **Appendix 4C**.

3. **Appeals Process** —Any Regional Entity or Bulk Power System owner, operator or user found by NERC, as opposed to a Regional Entity, to be in noncompliance with a Reliability Standard may appeal the findings of noncompliance with Reliability Standards and any sanctions or Remedial Action Directives that are issued by, or Mitigation Plan components imposed by, NERC, pursuant to the processes described in Sections 408 through 410.

405. Monitoring of Reliability Standards and Other Requirements Applicable to NERC

The NERC Compliance and Certification Committee shall establish and implement a process to monitor NERC's compliance with the Reliability Standards that apply to NERC. The process shall use independent monitors with no conflict of interest, real or perceived, in the outcomes of the process. All violations shall be made public according to the reporting and disclosure process in **Appendix 4C**. The Compliance and Certification Committee will also establish a procedure for monitoring NERC's compliance with its Rules of Procedure for the Standards Development, Compliance Monitoring and Enforcement, and Organization Registration and Certification Programs. Such procedures shall not be used to circumvent the appeals processes established for those programs.

406. Independent Audits of the NERC Compliance Monitoring and Enforcement Program

NERC shall provide for an independent audit of its Compliance Monitoring and Enforcement Program at least once every three years, or more frequently as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board. The independent audit shall meet the following minimum requirements and any other requirements established by the NERC Board.

1. **Effectiveness** — The audit shall evaluate the success and effectiveness of the NERC Compliance Monitoring and Enforcement Program in achieving its mission.

2. **Relationship** — The audit shall evaluate the relationship between NERC and the Regional Entity Compliance Monitoring and Enforcement Programs and the effectiveness of the programs in ensuring reliability.

3. **Final Report Posting** — The final report shall be posted by NERC for public viewing in accordance with **Appendix 4C**.

4. **Response to Recommendations** — If the audit report includes recommendations to improve the NERC Compliance Monitoring and Enforcement Program, the administrators of the NERC Compliance Monitoring and Enforcement Program shall provide a written response and plan to the Board within 30 days of the release of the final audit report.

407. Penalties, Sanctions, and Remedial Actions

1. **NERC Review of Regional Entity Penalties and Sanctions —** NERC shall review all Penalties, sanctions, and remedial actions imposed by each Regional Entity for violations of Reliability Standards to determine if the Regional Entity's determination is supported by a sufficient record compiled by the Regional Entity, is consistent with the *Sanction Guidelines* incorporated into these Rules of Procedure as **Appendix 4B** and with other directives, guidance and directions issued by NERC pursuant to the delegation agreement, and is consistent with Penalties, sanctions and remedial actions imposed by the Regional Entity and by other Regional Entities for violations involving the same or similar facts and circumstances.

2. **Developing Penalties and Sanctions** — The Regional Entity Compliance Staff shall use the *Sanction Guidelines*, which are incorporated into these Rules of Procedure as **Appendix 4B**, to develop an appropriate Penalty, sanction, or remedial action for a violation, and shall notify NERC of the Penalty or sanction.

3. **Effective Date of Penalty** — Where authorized by applicable legislation or agreement, no Penalty imposed for a violation of a Reliability Standard shall take effect until the thirty-first day after NERC files, with the Applicable Governmental Authority, a "Notice of Penalty" and the record of the proceedings in which the violation and Penalty were determined, or such other date as ordered by the Applicable Governmental Authority.

408. Review of NERC Decisions

1. **Scope of Review** — A Registered Entity or a Regional Entity wishing to challenge a finding of noncompliance and the imposition of a Penalty for a compliance measure directly administered by NERC, or a Regional Entity wishing to challenge a Regional Entity Compliance Monitoring and Enforcement Program audit finding, may do so by filing a notice of the challenge with NERC's

Director of Compliance no later than 21 days after issuance of the notice of finding of violation or audit finding. Appeals by Registered Entities of decisions of Regional Entity Hearing Bodies shall be pursuant to Section 409 .

2. **Contents of Notice** — The notice of challenge shall include the full text of the decision that is being challenged, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief.

3. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of challenge, the NERC Director of Compliance may file with the Hearing Panel a response to the issues raised in the notice, with a copy to the Regional Entity.

4. **Hearing by Compliance and Certification Committee** — The NERC Compliance and Certification Committee shall provide representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program an opportunity to be heard and shall decide the matter based upon the filings and presentations made, with a written explanation of its decision.

5. **Appeal** — The Regional Entity, or Registered Entity may appeal the decision of the Compliance and Certification Committee by filing a notice of appeal with NERC's Director of Compliance no later than 21 days after issuance of the written decision by the Compliance and Certification Committee. The notice of appeal shall include the full text of the written decision of the Compliance and Certification Committee that is being appealed, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not presented to the Compliance and Certification Committee.

6. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of appeal, the NERC Compliance Monitoring and Enforcement Program staff may file its response to the issues raised in the notice of appeal, with a copy to the entity filing the notice.

7. **Reply** — The entity filing the appeal may file a reply within 7 days.

8. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record, the response, and any reply. At its discretion, the Compliance Committee may invite representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program to appear before the Compliance Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

9. **Impartiality** — No member of the Compliance and Certification Committee or the Board of Trustees Compliance Committee having an actual or perceived conflict of interest in the matter may participate in any aspect of the challenge or appeal except as a party or witness.

10. **Expenses** — Each party in the challenge and appeals processes shall pay its own expenses for each step in the process.

11. **Non-Public Proceedings —** All challenges and appeals shall be closed to the public to protect Confidential Information.

409. Appeals from Final Decisions of Regional Entities

1. **Time for Appeal** — An owner, operator or user of the Bulk Power System wishing to appeal from a final decision of a Regional Entity that finds a violation of a Reliability Standard or imposes a Penalty for violation of a Reliability Standard shall file its notice of appeal with NERC's Director of Compliance, with a copy to the Regional Entity, no later than 21 days after issuance of the final decision of the Regional Entity Hearing Body. The same appeal procedures will apply regardless of whether the matter first arose in a Compliance Investigation, Compliance Audit or Self-Report, other compliance monitoring and enforcement process, or in a reliability readiness evaluation.

2. **Contents** — The notice of appeal shall include the full text of the final decision of the Regional Entity Hearing Body that is being appealed, a concise statement of the error or errors contained in the final decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not first presented during the compliance hearing before the Regional Entity Hearing Body.

3. **Response by Regional Entity** — Within 21 days after receiving a copy of the notice of appeal, the Regional Entity shall file the entire record of the matter with NERC's Director of Compliance, with a copy to the Registered Entity filing the notice, together with its response to the issues raised in the notice of appeal.

4. **Reply** — The Registered Entity filing the appeal may file a reply to the Regional Entity within 7 days.

5. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record of the matter from the Regional Entity, the response, and any reply filed with NERC. At its discretion, the Compliance Committee may invite representatives of the Registered Entity making the appeal and the Regional Entity to appear before the Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

6. **Expenses** — Each party in the appeals process shall pay its own expenses for each step in the process.

7. **Non-Public Proceedings** — All appeals shall be closed to the public to protect Confidential Information.

410. Hold Harmless

A condition of invoking the challenge or appeals processes under Section 408 or 409 is that the entity requesting the challenge or appeal agrees that neither NERC (defined to include its Members, Board of Trustees, committees, subcommittees, staff and industry subject matter experts), any person assisting in the challenge or appeals processes, nor any company employing a person assisting in the challenge or appeals processes, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the challenge or appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

411. Requests for Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Reliability Standards

A Registered Entity that is subject to an Applicable Requirement of a NERC Critical Infrastructure Protection Standard for which Technical Feasibility Exceptions are permitted, may request a Technical Feasibility Exception to the Requirement, and the request will be reviewed, approved or disapproved, and if approved, implemented, in accordance with the NERC *Procedure for Requesting and Receiving Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Standard*, Appendix 4D to these Rules of Procedure.

SECTION 500 — ORGANIZATION REGISTRATION AND CERTIFICATION

501. Scope of the Organization Registration and Organization Certification Programs

The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved Reliability Standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable Reliability Standards. Registered Entities are not and do not become Members of NERC or a Regional Entity, by virtue of being listed on the NCR. Membership in NERC is governed by Article II of NERC's Bylaws; membership in a Regional Entity or regional reliability organization is governed by that entity's bylaws or rules.

The purpose of the Organization Certification Program is to ensure that the new entity (i.e., applicant to be an RC, BA, or TOP that is not already performing the function for which it is applying to be certified as) has the tools, processes, training, and procedures to demonstrate their ability to meet the Requirements/sub-Requirements of all of the Reliability Standards applicable to the function(s) for which it is applying thereby demonstrating the ability to become certified and then operational.

Organization Registration and Organization Certification may be delegated to Regional Entities in accordance with the procedures in this Section 500; the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into these Rules of Procedure as **Appendix 5A**; and, approved Regional Entity delegation agreements or other applicable agreements.

1. **NERC Compliance Registry** — NERC shall establish and maintain the NCR of the Bulk Power System owners, operators, and users that are subject to approved Reliability Standards.

   1.1 (a) The NCR shall set forth the identity and functions performed for each organization responsible for meeting Requirements/sub-Requirements of the Reliability Standards. Bulk Power System owners, operators, and users (i) shall provide to NERC and the applicable Regional Entity information necessary to complete the Registration, and (ii) shall provide NERC and the applicable Regional Entity with timely updates to information concerning the Registered Entity's ownership, operations, contact information, and other information that may affect the Registered Entity's Registration status or other information recorded in the Compliance Registry.

   (b) A generation or transmission cooperative, a joint-action agency or another organization may register as a Joint Registration Organization (JRO), in lieu of each of the JRO's members or related entities being registered individually for one or more functions. Refer to Section 507.

(c) Multiple entities may each register using a Coordinated Functional Registration (CFR) for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function pursuant to a written agreement for the division of compliance responsibility. Refer to Section 508.

1.2 In the development of the NCR, NERC and the Regional Entities shall determine which organizations should be placed on the NCR based on the criteria provided in the NERC *Statement of Compliance Registry Criteria* which is incorporated into these Rules of Procedure as **Appendix 5B**.

1.3 NERC and the Regional Entities shall use the following rules for establishing and maintaining the NCR based on the Registration criteria as set forth in **Appendix 5B** *Statement of Compliance Registry Criteria*:

1.3.1 NERC shall notify each organization that it is on the NCR. The Registered Entity is responsible for compliance with all the Reliability Standards applicable to the functions for which it is registered from the time it receives the Registration notification from NERC.

1.3.2 Any organization receiving such a notice may challenge its placement on the NCR according to the process in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section V.

1.3.3 The Compliance Committee of the Board of Trustees shall promptly issue a written decision on the challenge, including the reasons for the decision.

1.3.4 The decision of the Compliance Committee of the Board of Trustees shall be final unless, within 21 days of the date of the Compliance Committee of the Board of Trustees decision, the organization appeals the decision to the Applicable Governmental Authority.

1.3.5 Each Registered Entity identified on the NCR shall notify its corresponding Regional Entity(s) of any corrections, revisions, deletions, changes in ownership, corporate structure, or similar matters that affect the Registered Entity's responsibilities with respect to the Reliability Standards. Failure to notify will not relieve the Registered Entity from any responsibility to comply with the Reliability Standards or shield it from any Penalties or sanctions associated with failing to comply with the Reliability Standards applicable to its associated Registration.

1.4 For all geographical or electrical areas of the Bulk Power System, the Registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and required by the Reliability Standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall:

1.4.1 Ensure that all areas are under the oversight of one and only one Reliability Coordinator.

1.4.2 Ensure that all Balancing Authorities and Transmission Operator entities[2] are under the responsibility of one and only one Reliability Coordinator.

1.4.3 Ensure that all transmission Facilities of the Bulk Power System are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator.

1.4.4 Ensure that all Loads and generators are under the responsibility and control of one and only one Balancing Authority.

1.5 NERC shall maintain the NCR of organizations responsible for meeting the Requirements/sub-Requirements of the Reliability Standards currently in effect on its website and shall update the NCR monthly.

2. **Entity Certification** — NERC shall provide for Certification of all entities with primary reliability responsibilities requiring Certification. This includes those entities that satisfy the criteria established in the NERC provisional Certification process. The NERC programs shall:

2.1 Evaluate and certify the competency of entities performing reliability functions. The entities presently expected to be certified include Reliability Coordinators, Transmission Operators, and Balancing Authorities.

2.2 Evaluate and certify each applicant's ability to meet the requirements for Certification.

2.3 Maintain process documentation.

2.4 Maintain records of currently certified entities.

[2] Some organizations perform the listed functions (e.g., Balancing Authority, Transmission Operator) over areas that transcend the Footprints of more than one Reliability Coordinator. Such organizations will have multiple Registrations, with each such Registration corresponding to that portion of the organization's overall area that is within the Footprint of a particular Reliability Coordinator.

2.5 Issue a Certification document to the applicant that successfully demonstrates its competency to perform the evaluated functions.

3. **Delegation and Oversight**

3.1 NERC may delegate responsibilities for Organization Registration and Organization Certification to Regional Entities in accordance with requirements established by NERC. Delegation will be via the delegation agreement between NERC and the Regional Entity or other applicable agreement. The Regional Entity shall administer Organization Registration and Organization Certification Programs in accordance with such delegations to meet NERC's programs goals and requirements subject to NERC oversight.

3.2 NERC shall develop and maintain a plan to ensure the continuity of Organization Registration and Organization Certification within the geographic or electrical boundaries of a Regional Entity in the event that no entity is functioning as a Regional Entity for that Region, or the Regional Entity withdraws as a Regional Entity, or does not operate its Organization Registration and Organization Certification Programs in accordance with delegation agreements.

3.3 NERC shall develop and maintain a program to monitor and oversee the NERC Organization Registration and Organization Certification Programs activities that are delegated to each Regional Entity through a delegation agreement or other applicable agreement.

3.3.1 This program shall monitor whether the Regional Entity carries out those delegated activities in accordance with NERC requirements, and whether there is consistency, fairness of administration, and comparability.

3.3.2 Monitoring and oversight shall be accomplished through direct participation in the Organization Registration and Organization Certification Programs with periodic reviews of documents and records of both programs.

502. Organization Registration and Organization Certification Program Requirements

1. NERC shall maintain the Organization Registration and Organization Certification Programs.

1.1 The roles and authority of Regional Entities in the programs are delegated from NERC pursuant to the Rules of Procedure through regional delegation agreements or other applicable agreements.

1.2 Processes for the programs shall be administered by NERC and the Regional Entities. Materials that each Regional Entity uses are subject to review and approval by NERC.

1.3 The appeals process for the Organization Registration and Organization Certification Programs are identified in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Sections V and VI, respectively.

1.4 The Certification Team membership is identified in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section IV.8.d.

2. To ensure consistency and fairness of the Organization Registration and Organization Certification Programs, NERC shall develop procedures to be used by all Regional Entities and NERC in accordance with the following criteria:

2.1 NERC and the Regional Entities shall have data management processes and procedures that provide for confidentiality, integrity, and retention of data and information collected.

2.2 Documentation used to substantiate the conclusions of the Regional Entity/ NERC related to Registration and/or Certification must be retained by the Regional Entity for (6) six years, unless a different retention period is otherwise identified, for the purposes of future audits of these programs.

2.3 To maintain the integrity of the NERC Organization Registration and Organization Certification Programs, NERC, Regional Entities, Certification Team members, program audit team members (Section 506), and committee members shall maintain the confidentiality of information provided by an applicant or entities.

2.2.1 NERC and the Regional Entities shall have appropriate codes of conduct and confidentiality agreements for staff, Certification Team, Certification related committees, and Certification program audit team members.

2.2.2 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall maintain the confidentiality of any Registration or Certification-related discussions or documents designated as confidential (see Section 1500 for types of Confidential Information).

2.2.3 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall treat as confidential the individual comments expressed during evaluations, program audits and report-drafting sessions.

2.2.4 Copies of notes, draft reports, and other interim documents developed or used during an entity Certification evaluation or program audit shall be destroyed after the public posting of a final, uncontested report.

2.2.5 Information deemed by an applicant, entity, a Regional Entity, or NERC as confidential, including Critical Energy Infrastructure Information, shall not be released publicly or distributed outside of a committee or team.

2.2.6 In the event that an individual violates any of the confidentiality rules set forth above, that individual and any member organization with which the individual is associated will be subject to immediate dismissal from the audit team and may be prohibited from future participation in Compliance Monitoring and Enforcement Program activities by the Regional Entity or NERC.

2.2.7 NERC shall develop and provide training in auditing skills to all individuals prior to their participation in Certification evaluations. Training for Certification Team leaders shall be more comprehensive than the training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

2.4 An applicant that is determined to be competent to perform a function after completing all Certification requirements shall be deemed certified by NERC to perform that function for which it has demonstrated full competency.

2.4.1 All NERC certified entities shall be included on the NCR.

503. Regional Entity Implementation of Organization Registration and Organization Certification Program Requirements

1. **Delegation** — Recognizing the Regional Entity's knowledge of and experience with their members, NERC may delegate responsibility for Organization Registration and Organization Certification to the Regional Entity through a delegation agreement.

2. **Registration** — The following Organization Registration activities shall be managed by the Regional Entity per the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into the Rules of Procedure as Appendix 5A *Organization Registration and Organization Certification Manual*:

2.1 Regional Entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the Registration requirements of Section 501(1.4).

3. **Certification —** The following Organization Certification activities shall be managed by the Regional Entity in accordance with an approved delegation agreement or another applicable agreement:

   3.1 An entity seeking Certification to perform one of the functions requiring Certification shall contact the Regional Entity for the Region(s) in which it plans to operate to apply for Certification.

   3.2 An entity seeking Certification and other affected entities shall provide all information and data requested by NERC or the Regional Entity to conduct the Certification process.

   3.3 Regional Entities shall notify NERC of all Certification applicants.

   3.4 NERC and/or the Regional Entity shall evaluate the competency of entities requiring Certification to meet the NERC Certification requirements.

   3.5 NERC or the Regional Entity shall establish Certification procedures to include evaluation processes, schedules and deadlines, expectations of the applicants and all entities participating in the evaluation and Certification processes, and requirements for Certification Team members.

      3.5.1 The NERC / Regional Entity Certification procedures will include provisions for on-site visits to the applicant's facilities to review the data collected through questionnaires, interviewing the operations and management personnel, inspecting the facilities and equipment (including requesting a demonstration of all tools identified in the Certification process), reviewing all necessary documents and data (including all agreements, processes, and procedures identified in the Certification process), reviewing Certification documents and projected system operator work schedules, and reviewing any additional documentation needed to support the completed questionnaire or inquiries arising during the site visit.

      3.5.2 The NERC/ Regional Entity Certification procedures will provide for preparation of a written report by the Certification Team, detailing any deficiencies that must be resolved prior to granting Certification, along with any other recommendations for consideration by the applicant, the Regional Entity, or NERC.

504. Appeals

1. NERC shall maintain an appeals process to resolve any disputes related to Registration or Certification activities per the *Organization Registration and Organization Certification Manual,* which is incorporated in these Rules of Procedure as Appendix 5A.

2. The Regional Entity Certification appeals process shall culminate with the Regional Entity board or a committee established by and reporting to the Regional Entity board as the final adjudicator, provided that where applicable, Canadian provincial governmental authorities may act as the final adjudicator in their jurisdictions. NERC shall be notified of all appeals and may observe any proceedings **(Appendix 5A** *Organization Registration and Organization Certification Manual*).

505. Program Maintenance

NERC shall maintain its program materials, including such manuals or other documents as it deems necessary, of the governing policies and procedures of the Organization Registration and Organization Certification Programs.

506. Independent Audit of NERC Organization Registration and Organization Certification Program

1. NERC, through the Compliance and Certification Committee, shall provide for an independent audit of its Organization Registration and Organization Certification Programs at least once every three years, or more frequently, as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board.

2. The audit shall evaluate the success, effectiveness and consistency of the NERC Organization Registration and Organization Certification Programs.

3. The final report shall be posted by NERC for public viewing.

4. If the audit report includes recommendations to improve the program, the administrators of the program shall provide a written response to the Board within 30 days of the final report, detailing the disposition of each and every recommendation, including an explanation of the reasons for rejecting a recommendation and an implementation plan for the recommendations accepted.

507. Provisions Relating to Joint Registration Organizations (JRO)

1. In addition to registering as the entity responsible for all functions that it performs itself, an entity may register as a JRO on behalf of one or more of its members or related entities for one or more functions for which such members or related entities would otherwise be required to register and, thereby, accept on behalf of such members or related entities all compliance responsibility for that function or those functions including all reporting requirements. Any entity seeking to register as a JRO must submit a written agreement with its members or related entities for all Requirements/sub-Requirements for the function(s) for which the entity is registering for and takes responsibility for, which would otherwise be the responsibility of one or more of its members or related entities. Neither NERC nor

the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the JRO Registration.

2. The JRO Registration data must include the same Registration information as a normal compliance Registration entry. The JRO is responsible for providing all of the information and data, including submitting reports, as needed by the Regional Entity for performing assessments of compliance.

3. The Regional Entity shall notify NERC of each JRO that the Regional Entity accepts. The notification will identify the point of contact and the functions(s) being registered for on behalf of its members or related entities.

4. For purposes of Compliance Audits, the Regional Entity shall keep a list of all JROs. This document shall contain a list of each JRO's members or related entities and the function(s) for which the JRO is registered for that member(s) or related entity(s). It is the responsibility of the JRO to provide the Regional Entity with this information as well as the applicable JRO agreement(s).

5. The Regional Entity may request clarification of any list submitted to it that identifies the members of the JRO and may request such additional information as the Regional Entity deems appropriate.

6. The Regional Entity's acceptance of a JRO shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the JRO will meet the Registration requirements of Section 501(1.4).

7. NERC shall maintain, and post on its website, a JRO registry listing all JRO Registrations that have been reviewed and accepted by the Regional Entity. The posting shall identify the JRO entity taking compliance responsibilities for itself and its members.

8. The JRO shall inform the Regional Entity of any changes to an existing JRO. The Regional Entity shall promptly notify NERC of each such revision.

9. Nothing in Section 507 shall preclude a member of a JRO, a related entity, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the member or other entity is registering. A JRO member or related entity that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the JRO of its Registration.

508. Provisions Relating to Coordinated Functional Registration (CFR) Entities

1. In addition to registering as an entity responsible for all functions that it performs itself, multiple entities may each register using a CFR for one or more Reliability

Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function. The CFR submission must include a written agreement that governs itself and clearly specifies the entities' respective compliance responsibilities. The Registration of the CFR is the complete Registration for each entity. Additionally, each entity shall take full compliance responsibility for those Reliability Standards and/or Requirements/sub-Requirements it has registered for in the CFR. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the CFR.

2. Each CFR or each individual entity within a CFR must identify a point of contact that is responsible for providing information and data, including submitting reports as needed by the Regional Entity related to the CFR Registration.

3. The Regional Entity shall notify NERC of each CFR that the Regional Entity accepts.

4. NERC or the Regional Entity may request clarification of any list submitted to it that identifies the compliance responsibilities of the CFR and may request such additional information as NERC or the Regional Entity deems appropriate.

5. The Regional Entity's acceptance of that CFR shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the CFR will meet the Registration requirements of Section 501(1.4).

6. NERC shall maintain, and post on its website, a CFR registry listing all CFR Registrations that have been accepted by NERC or by a Regional Entity. The posting shall clearly list all the Reliability Standards or Requirements/sub-Requirements thereof for which each entity of the CFR is responsible for under the CFR.

7. The point of contact shall inform the Regional Entity of any changes to an existing CFR. The Regional Entity shall promptly notify NERC of each such revision.

8. In the event of a violation of a Reliability Standard or of a Requirement/sub-Requirement of a Reliability Standard for which an entity of a CFR is registered, that entity shall be identified in the Notice of Alleged Violation and shall be assessed the sanction or Penalty in accordance with the NERC Sanctions Guidelines. In the event a Regional Entity is not able to determine which entity(ies) is responsible for a particular Reliability Standard, or Requirements/sub-Requirements thereof that has been violated, the Regional Entity shall investigate the noncompliance in accordance with the NERC Rules of Procedure Section 400, *Compliance Enforcement*, to determine the entity(ies) to which the Regional Entity shall to issue the sanction or Penalty for the violation.

9. Nothing in Section 508 shall preclude an entity registered in a CFR, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the entity is registering. An entity registered in a CFR that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the point of contact of its Registration.

509. Exceptions to the Definition of the Bulk Electric System

An Element is considered to be (or not be) part of the Bulk Electric System by applying the BES Definition to the Element (including the inclusions and exclusions set forth therein). Appendix 5C sets forth the procedures by which (i) an entity may request a determination that an Element that falls within the definition of the Bulk Electric System should be exempted from being considered a part of the Bulk Electric System, or (ii) an entity may request that an Element that falls outside of the definition of the Bulk Electric System should be considered part of the Bulk Electric System.

SECTION 600 — PERSONNEL CERTIFICATION

601. Scope of Personnel Certification

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires skilled, trained and qualified system operators. The System Operator Certification Program provides the mechanism to ensure system operators are provided the education and training necessary to obtain the essential knowledge and skills and are therefore qualified to operate the Bulk Electric System. NERC, as the ERO, will ensure skilled, trained, and qualified system operators through the System Operator Certification Program.

NERC shall develop and maintain a personnel Certification program to evaluate individuals and to issue Credentials to individuals who demonstrate the required level of competence. A current version of such a program is the *System Operator Certification Program Manual*, which is incorporated into these Rules of Procedure as **Appendix 6**.

602. Structure of ERO Personnel Certification Program

1. The NERC personnel Certification program shall be international in scope.

2. The personnel Certification program shall have a governing body that (1) is able to independently exercise decision-making for all matters pertaining to Certification, (2) includes individuals from the discipline being certified and whose composition addresses the needs of the users of the program (e.g., employers, regulators, etc.), and (3) has representation for each specialty or level within a discipline.

3. NERC shall maintain a nominating process for membership in the governing body. Nominations shall be open to all interested parties and self-nominations shall be accepted. The NERC Board of Trustees shall appoint members to the governing body from among those nominated. The members of the governing body shall serve at the pleasure of the Board.

4. The personnel Certification program governing body shall have control over the matters related to the personnel Certification and re-Certification programs listed below, without being subject to approval by any other body.

    4.1 Policies and procedures, including eligibility requirements and application processing.

    4.2 Requirements for personnel Certification, maintaining Certification, and re-Certification.

    4.3 Examination content, development, and administration.

    4.4 Examination cut score.

    4.5 Grievance and disciplinary processes.

4.6 Governing body and subgroup(s)' meeting rules including agenda, frequency, and related procedures.

4.7 Subgroup(s) appointments and work assignments.

4.8 Publications about personnel Certification and re-Certification.

4.9 Setting fees for application, and all other services provided as a part of the personnel Certification and re-Certification activities.

4.10 Program funding, spending, and budget authority. Financial matters related to the operation of the program shall be segregated from other NERC activities.

5. The personnel Certification program shall utilize written procedures for the selection of members of the governing body that prohibit the governing body from selecting a majority of its successors.

6. The personnel Certification program shall be separate from the accreditation and education functions of NERC in related disciplines.

7. No member of the personnel Certification program governing body or staff member working with the personnel Certification program governing body shall have or exercise any authority or responsibility for compliance matters related to Reliability Standards concerning personnel Certification.

603. Candidate Testing Mechanisms

1. The personnel Certification program shall utilize reliable testing mechanisms to evaluate individual competence in a manner that is objective, fair to all candidates, job-related, and based on the knowledge and skill needed to function in the discipline.

2. The personnel Certification program shall implement a formal policy of periodic review of the testing mechanisms to ensure ongoing relevance of the mechanisms to knowledge and skill needed in the discipline.

3. The personnel Certification program shall utilize policies and procedures to ensure that all test administration and development materials are secure and demonstrate that these policies and procedures are consistently implemented.

4. The personnel Certification program shall establish pass/fail levels that protect the public with a method that is based on competence and generally accepted in the psychometric community as being fair and reasonable.

5. The personnel Certification program shall conduct ongoing studies to substantiate the reliability and validity of the testing mechanisms.

6. The personnel Certification program shall utilize policies and procedures that govern how long examination records are kept in their original format.

7. The personnel Certification program shall demonstrate that different forms of the testing mechanisms assess equivalent content and that candidates are not penalized for taking forms of varying difficulty.

604. Public Information About the Personnel Certification Program

1. The personnel Certification program shall provide for publishing and availability of general descriptive material on the procedures used in examination construction and validation; all eligibility requirements and determination; fees; and examination administration documents, including: reporting of results, re-Certification requirements, and disciplinary and grievance procedures.

2. The personnel Certification program shall publish and make available a comprehensive summary or outline of the information, knowledge, or functions covered by the examination.

3. The personnel Certification program shall publish and make available at least annually a summary of Certification activities for the program, including at least the following information: number of examinations delivered, the number passed, the number failed, and the number certified.

605. Responsibilities to Applicants for Certification or Re-Certification

The personnel Certification program:

1. Shall not discriminate among applicants as to age, gender, race, religion, national origin, disability, or marital status and shall include a statement of non-discrimination in announcements of the program.

2. Shall comply with all requirements of applicable federal and state/provincial laws with respect to all Certification and re-Certification activities, and shall require compliance of all contractors and/or providers of services.

3. Shall make available to all applicants copies of formalized procedures for application for, and attainment of, personnel Certification and re-Certification and shall uniformly follow and enforce such procedures for all applicants.

4. Shall implement a formal policy for the periodic review of eligibility criteria and application procedures to ensure that they are fair and equitable.

5. Shall provide competently proctored examination sites.

6. Shall uniformly report examination results to applicants in a timely manner.

7. Shall give applicants failing the examination information on general content areas of deficiency.

8. Shall implement policies and procedures providing due process for applicants questioning eligibility determination, examination results, and Certification status, and shall publish this information. A current version of such a procedure is the NERC *System Operator Certification Dispute Resolution Process*, which is incorporated into these Rules of Procedure as part of **Appendix 6**.

9. Shall develop and maintain a program manual containing the processes and procedures for applicants for Certification and re-Certification.

606. Responsibilities to the Public and to Employers of Certified Practitioners

The personnel Certification program:

1. Shall demonstrate that the testing mechanisms adequately measure the knowledge and skill required for entry, maintenance, and/or advancement in the profession for each position to be certified.

2. Shall award Certification and re-Certification only after the skill and knowledge of the individual have been evaluated and determined to be acceptable.

3. Shall periodically publish or maintain, in an electronic format, a current list of those persons certified in the programs and have polices and procedures that delineate what information about a Credential holder may be made public and under what circumstances.

4. Shall have formal policies and procedures for discipline of a Credential holder, including the revocation of the certificate, for conduct deemed harmful to the public or inappropriate to the discipline (e.g., incompetence, unethical behavior, physical or mental impairment affecting performance). These procedures shall incorporate due process. The current procedure is the *NERC Certified System Operator Credential Disciplinary Action Procedure*, which is incorporated into these Rules of Procedure as part of **Appendix 6**.

5. Shall demonstrate that any title or Credential awarded accurately reflects or applies to the practitioner's daily occupational or professional duties and is not confusing to employers, consumers, regulators, related professions, and/or other interested parties.

SECTION 700 — RELIABILITY READINESS EVALUATION AND IMPROVEMENT AND FORMATION OF SECTOR FORUMS

701. Confidentiality Requirements for Readiness Evaluations and Evaluation Team Members

1. All information made available or created during the course of any reliability readiness evaluation including, but not limited to, data, Documents, observations and notes, shall be maintained as confidential by all evaluation team members, in accordance with the requirements of Section 1500.

2. Evaluation team members are obligated to destroy all confidential evaluation notes following the posting of the final report of the reliability readiness evaluation.

3. NERC will retain reliability readiness evaluation-related documentation, notes, and materials for a period of time as defined by NERC.

4. These confidentiality requirements shall survive the termination of the NERC Reliability Readiness Evaluation and Improvement Program.

702. Formation of Sector Forum

1. NERC will form a sector forum at the request of any five members of NERC that share a common interest in the safety and reliability of the Bulk Power System. The members of sector forum may invite such others of the members of NERC to join the sector forum as the sector forum deems appropriate.

2. The request to form a sector forum must include a proposed charter for the sector forum. The Board must approve the charter.

3. NERC will provide notification of the formation of a sector forum to its membership roster. Notices and agendas of meetings shall be posted on NERC's website.

4. A sector forum may make recommendations to any of the NERC committees and may submit a Standards Authorization Request to the NERC *Reliability Standards Development Procedure*.

SECTION 800 — RELIABILITY ASSESSMENT AND PERFORMANCE ANALYSIS

801. Objectives of the Reliability Assessment and Performance Analysis Program

The objectives of the NERC Reliability Assessment and Performance Analysis Program are to: (1) conduct, and report the results of, an independent assessment of the overall reliability and adequacy of the interconnected North American Bulk Power Systems, both as existing and as planned; (2) analyze off-normal events on the Bulk Power System; (3) identify the root causes of events that may be precursors of potentially more serious events; (4) assess past reliability performance for lessons learned; (5) disseminate findings and lessons learned to the electric industry to improve reliability performance; and (6) develop reliability performance benchmarks. The final reliability assessment reports shall be approved by the Board for publication to the electric industry and the general public.

802. Scope of the Reliability Assessment Program

1. The scope of the Reliability Assessment Program shall include:

   1.1 Review, assess, and report on the overall electric generation and transmission reliability (adequacy and operating reliability) of the interconnected Bulk Power Systems, both existing and as planned.

   1.2 Assess and report on the key issues, risks, and uncertainties that affect or have the potential to affect the reliability of existing and future electric supply and transmission.

   1.3 Review, analyze, and report on Regional Entity self-assessments of electric supply and bulk power transmission reliability, including reliability issues of specific regional concern.

   1.4 Identify, analyze, and project trends in electric customer demand, supply, and transmission and their impacts on Bulk Power System reliability.

   1.5 Investigate, assess, and report on the potential impacts of new and evolving electricity market practices, new or proposed regulatory procedures, and new or proposed legislation (e.g. environmental requirements) on the adequacy and operating reliability of the Bulk Power Systems.

2. The Reliability Assessment Program shall be performed in a manner consistent with the Reliability Standards of NERC including but not limited to those that specify reliability assessment Requirements.

803. Reliability Assessment Reports

The number and type of periodic assessments that are to be conducted shall be at the discretion of NERC. The results of the reliability assessments shall be documented in three reports: the long-term and the annual seasonal (summer) and the annual seasonal (winter) assessment reports. NERC shall also conduct special reliability assessments from time to time as circumstances warrant. The reliability assessment reports shall be reviewed and approved for publication by the Board. The three regular reports are described below.

1. **Long-Term Reliability Assessment Report** — The annual long-term report shall cover a ten-year planning horizon. The planning horizon of the long-term reliability assessment report shall be subject to change at the discretion of NERC. Detailed generation and transmission adequacy assessments shall be conducted for the first five years of the review period. For the second five years of the review period, the assessment shall focus on the identification, analysis, and projection of trends in peak demand, electric supply, and transmission adequacy, as well as other industry trends and developments that may impact future electric system reliability. Reliability issues of concern and their potential impacts shall be presented along with any mitigation plans or alternatives. The long-term reliability assessment reports will generally be published in the fall (September) of each year. NERC will also publish electricity supply and demand data associated with the long-term reliability assessment report.

2. **Summer Assessment Report** — The annual summer seasonal assessment report typically shall cover the four-month (June–September) summer period. It shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected summer peak demands. It shall also identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may include possible mitigation alternatives. The report will generally be published in mid-May for the upcoming summer period.

3. **Winter Assessment Report** — The annual winter seasonal assessment report shall cover the three-month (December–February) winter period. The report shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected winter peak demands. Similar to the summer assessment, the winter assessment shall identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may also include possible mitigation alternatives. The winter assessment report will generally be published in mid-November for the upcoming winter period.

4. **Special Reliability Assessment Reports** — In addition to the long-term and seasonal reliability assessment reports, NERC shall also conduct special reliability assessments on a regional, interregional, and Interconnection basis as conditions warrant, or as requested by the Board or governmental authorities. The teams of reliability and technical experts also may initiate special assessments of key

reliability issues and their impacts on the reliability of a regions, subregions, or Interconnection (or a portion thereof). Such special reliability assessments may include, among other things, operational reliability assessments, evaluations of emergency response preparedness, adequacy of fuel supply, hydro conditions, reliability impacts of new or proposed environmental rules and regulations, and reliability impacts of new or proposed legislation that affects or has the potential to affect the reliability of the interconnected Bulk Power Systems in North America.

804. Reliability Assessment Data and Information Requirements

To carry out the reviews and assessments of the overall reliability of the interconnected Bulk Power Systems, the Regional Entities and other entities shall provide sufficient data and other information requested by NERC in support of the annual long-term and seasonal assessments and any special reliability assessments.

Some of the data provided for these reviews and assessment may be considered confidential from a competitive marketing perspective, a Critical Energy Infrastructure Information perspective, or for other purposes. Such data shall be treated in accordance with the provisions of Section 1500 – Confidential Information.

While the major sources of data and information for this program are the Regional Entities, a team of reliability and technical experts is responsible for developing and formulating its own independent conclusions about the near-term and long-term reliability of the Bulk Power Systems.

In connection with the reliability assessment reports, requests shall be submitted to each of the Regional Entities for required reliability assessment data and other information, and for each Regional Entity's self-assessment report. The timing of the requests will be governed by the schedule for the preparation of the assessment reports.

The Regional Entity self-assessments are to be conducted in compliance with NERC Reliability Standards and the respective regional planning criteria. The team(s) of reliability and technical experts shall also conduct interviews with the Regional Entities as needed. The summary of the Regional Entity self-assessments that are to be included in the assessment reports shall follow the general outline identified in NERC's request. This outline may change from time to time as key reliability issues change.

In general, the Regional Entity reliability self-assessments shall address, among other areas, the following topics: demand and Net Energy for Load; assessment of projected resource adequacy; any transmission constraints that may impact bulk transmission adequacy and plans to alleviate those constraints; any unusual operating conditions that could impact reliability for the assessment period; fuel supply adequacy; the deliverability of generation (both internal and external) to Load; and any other reliability issues in the Region and their potential impacts on the reliability of the Bulk Power Systems.

805. Reliability Assessment Process

Based on their expertise, the review of the collected data, the review of the Regional Entity self-assessment reports, and interviews with the Regional Entities, as appropriate, the teams of reliability and technical experts shall perform an independent review and assessment of the generation and transmission adequacy of each Region's existing and planned Bulk Power System. The results of the review teams shall form the basis of NERC's long-term and seasonal reliability assessment reports. The review and assessment process is briefly summarized below.

1. **Resource Adequacy Assessment** — The teams shall evaluate the regional demand and resource capacity data for completeness in the context of the overall resource capacity needs of the Region. The team shall independently evaluate the ability of the Regional Entity members to serve their obligations given the demand growth projections, the amount of existing and planned capacity, including committed and uncommitted capacity, contracted capacity, or capacity outside of the Region. If the Region relies on capacity from outside of the Region to meet its resource objectives, the ability to deliver that capacity shall be factored into the assessment. The demand and resource capacity information shall be compared to the resource adequacy requirements of the Regional Entity for the year(s) or season(s) being assessed. The assessment shall determine if the resource information submitted represents a reasonable and attainable plan for the Regional Entity and its members. For cases of inadequate capacity or reserve margin, the Regional Entity will be requested to analyze and explain any resource capacity inadequacies and its plans to mitigate the reliability impact of the potential inadequacies. The analysis may be expanded to include surrounding areas. If the expanded analysis indicates further inadequacies, then an interregional problem may exist and will be explored with the applicable Regions. The results of these analyses shall be described in the assessment report.

2. **Transmission Adequacy and Operating Reliability Assessment** — The teams shall evaluate transmission system information that relates to the adequacy and operating reliability of the regional transmission system. That information shall include: regional planning study reports, interregional planning study reports, and/or regional operational study reports. If additional information is required, another data request shall be sent to the Regional Entity. The assessment shall provide a judgment on the ability of the regional transmission system to operate reliably under the expected range of operating conditions over the assessment period as required by NERC Reliability Standards. If sub-areas of the regional system are especially critical to the Reliable Operation of the regional bulk transmission system, these Facilities or sub-areas shall be reviewed and addressed in the assessment. Any areas of concern related to the adequacy or operating reliability of the system shall be identified and reported in the assessment.

3. **Seasonal Operating Reliability Assessment** — The team(s) shall evaluate the overall operating reliability of the regional bulk transmission systems. In areas with potential resource adequacy or system operating reliability problems, operational readiness of the affected Regional Entities for the upcoming season

shall be reviewed and analyzed. The assessment may consider unusual but possible operating scenarios and how the system is expected to perform. Operating reliability shall take into account a wide range of activities, all of which should reinforce the Regional Entity's ability to deal with the situations that might occur during the upcoming season. Typical activities in the assessment may include: facility modifications and additions, new or modified operating procedures, emergency procedures enhancement, and planning and operating studies. The teams shall report the overall seasonal operating reliability of the regional transmission systems in the annual summer and winter assessment reports.

4. **Reporting of Reliability Assessment Results** — The teams of reliability and technical experts shall provide an independent assessment of the reliability of the Regional Entities and the North American interconnected Bulk Power System for the period of the assessment. While the Regional Entities are relied upon to provide the information to perform such assessments, the review team is not required to accept the conclusions provided by the Regional Entities. Instead, the review team is expected, based on their expertise, to reach their own independent conclusions about the status of the adequacy of the generation and bulk power transmission systems of North America.

   The review team also shall strive to achieve consensus in their assessments. The assessments that are made are based on the best information available at the time. However, since judgment is applied to this information, legitimate differences of opinion can develop. Despite these differences, the review team shall work to achieve consensus on their findings.

   In addition to providing long-term and seasonal assessments in connection with the Reliability Assessment Program, the review team of experts shall also be responsible for recommending new and revised Reliability Standards related to the reliability assessments and the reliability of the Bulk Power Systems. These proposals for new or revised Reliability Standards shall be entered into NERC's Reliability Standards development process.

   Upon completion of the assessment, the team shall share the results with the Regional Entities. The Regional Entities shall be given the opportunity to review and comment on the conclusions in the assessment and to provide additional information as appropriate. The reliability assessments and their conclusions are the responsibility of NERC's technical review team and NERC.

   The preparation and approval of NERC's reliability assessment reports shall follow a prescribed schedule including review, comment, and possible approval by appropriate NERC committees. The long-term and seasonal (summer and winter) reliability assessment reports shall be further reviewed for approval by the Board for publication to the electric industry.

806. Scope of the Reliability Performance and Analysis Program

The components of the program will include analysis of large-scale outages, disturbances, and near misses to determine root causes and lessons learned; identification and continuous monitoring of performance indices to detect emerging trends and signs of a decline in reliability performance; and communications of performance results, trends, recommendations, and initiatives to those responsible to take actions; followed with confirmation of actions to correct any deficiencies identified. Within NERC, the reliability performance program will provide performance results to the Reliability Standards Development and Compliance Monitoring and Enforcement Programs to make the necessary adjustments to preserve reliability based on a risk-based approach.

807. Analysis of Major Events

Responding to major blackouts and other system disturbances or emergencies can be divided into four phases: situational assessment and communications; situation tracking and communications; data collection, investigation, analysis, and reporting; and follow-up on recommendations.

a. NERC's role following a blackout or other major Bulk Power System disturbance or emergency is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the event. Working closely with the Regional Entities and Reliability Coordinators, NERC will coordinate and facilitate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

b. When responding to any event where physical or cyber security is suspected as a cause or contributing factor to an event, NERC will immediately notify appropriate government agencies and coordinate its activities with them.

c. Each user, owner, and operator of the Bulk Power System shall provide NERC and the applicable Regional Entities with such information as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

d. During the conduct of some NERC analyses, assistance may be needed from government agencies. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; investigations related to possible criminal or terrorist involvement in the event; resources for initial data gathering immediately after the event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies.

e. NERC shall work with other participants to establish a clear delineation of roles, responsibilities, and coordination requirements among industry and government for the investigation and reporting of findings, conclusions, and recommendations related to major blackouts, disturbances, or other emergencies affecting the Bulk Power System with the objective of avoiding, to the extent possible, multiple

investigations of the same event. If the event is confined to a single Regional Entity, NERC representatives will participate as members of the Regional Entity analysis team.

f. NERC and applicable entity(s) shall apply the NERC *Blackout and Disturbance Response Procedures*, which are incorporated into these Rules of Procedure as **Appendix 8**. These procedures provide a framework to guide NERC's response to events that may have multiregional, national, or international implications. Experienced industry leadership shall be applied to tailor the response to the specific circumstances of the event. In accordance with that procedure, the NERC president will determine whether the event warrants analysis at the NERC-level. A Regional Entity may request that NERC elevate any analysis to a NERC level.

g. NERC will screen and analyze the findings and recommendations from the analysis, and those with generic applicability will be disseminated to the industry in accordance with Section 810.

808. Analysis of Off-Normal Events, Potential System Vulnerabilities, and System Performance

1. NERC and Regional Entities shall analyze system and equipment performance events that do not rise to the level of a major blackout, disturbance, or system emergency, as described in Section 807. NERC and Regional Entities shall also analyze potential vulnerabilities in the Bulk Power System brought to their attention by government agencies. The purpose of these analyses is to identify the root causes of events that may be precursors of potentially more serious events or that have the potential to cause more serious events, to assess past reliability performance for lessons learned, and to develop reliability performance benchmarks and trends.

2. NERC and Regional Entities will screen and analyze events and potential vulnerabilities for significance, and information from those with generic applicability will be disseminated to the industry in accordance with Section 810.

3. Each user, owner, and operator, of the Bulk Power System shall provide NERC and the applicable Regional Entities with such information as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

809. Reliability Benchmarking

NERC shall identify and track key reliability indicators as a means of benchmarking reliability performance and measuring reliability improvements. This program will include assessing available metrics, developing guidelines for acceptable metrics, maintaining a performance metrics "dashboard" on the NERC website, and developing appropriate reliability performance benchmarks.

810. Information Exchange and Issuance of NERC Advisories, Recommendations and Essential Actions

1. Members of NERC and Bulk Power System owners, operators, and users shall provide NERC with detailed and timely operating experience information and data.

2. In the normal course of operations, NERC disseminates the results of its events analysis findings, lessons learned and other analysis and information gathering to the industry. These findings, lessons learned and other information will be used to guide the Reliability Assessment Program.

3. When NERC determines it is necessary to place the industry or segments of the industry on formal notice of its findings, analyses, and recommendations, NERC will provide such notification in the form of specific operations or equipment Advisories, Recommendations or Essential Actions:

3.1 Level 1 (Advisories) – purely informational, intended to advise certain segments of the owners, operators and users of the Bulk Power System of findings and lessons learned;

3.2 Level 2 (Recommendations) – specific actions that NERC is recommending be considered on a particular topic by certain segments of owners, operators, and users of the Bulk Power System according to each entity's facts and circumstances;

3.3 Level 3 (Essential Actions) – specific actions that NERC has determined are essential for certain segments of owners, operators, or users of the Bulk Power System to take to ensure the reliability of the Bulk Power System. Such Essential Actions require NERC Board approval before issuance.

4. The Bulk Power System owners, operators, and users to which Level 2 (Recommendations) and Level 3 (Essential Actions) notifications apply are to evaluate and take appropriate action on such issuances by NERC. Such Bulk Power System owners, operators, and users shall also provide reports of actions taken and timely updates on progress towards resolving the issues raised in the Recommendations and Essential Actions in accordance with the reporting date(s) specified by NERC.

5. NERC will advise the Commission and other Applicable Governmental Authorities of its intent to issue all Level 1 (Advisories), Level 2 (Recommendations), and Level 3 (Essential Actions) at least five (5) business days prior to issuance, unless extraordinary circumstances exist that warrant issuance less than five (5) business days after such advice. NERC will file a report with the Commission and other Applicable Governmental Authorities no later than thirty (30) days following the date by which NERC has requested the Bulk Power System owners, operators, and users to which a Level 2

(Recommendation) or Level 3 (Essential Action) issuance applies to provide reports of actions taken in response to the notification. NERC's report to the Commission and other Applicable Governmental Authorities will describe the actions taken by the relevant owners, operators, and users of the Bulk Power System and the success of such actions taken in correcting any vulnerability or deficiency that was the subject of the notification, with appropriate protection for Confidential Information or Critical Energy Infrastructure Information.

811. Equipment Performance Data

Through its Generating Availability Data System (GADS), NERC shall collect operating information about the performance of electric generating equipment; provide assistance to those researching information on power plant outages stored in its database; and support equipment reliability as well as availability analyses and other decision-making processes developed by GADS subscribers. GADS data is also used in conducting assessments of generation resource adequacy.

SECTION 900 — TRAINING AND EDUCATION

901. Scope of the Training and Education Program

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires informed and trained personnel. The training and education program will provide the education and training necessary for Bulk Power System personnel and regulators to obtain the essential knowledge necessary to understand and operate the Bulk Electric System.

NERC shall develop and maintain training and education programs for the purpose of establishing training requirements, developing materials, and developing training activities. The target audience of the training and education programs shall be Bulk Power System operating personnel including system operations personnel, operations support personnel (engineering and information technology), supervisors and managers, training personnel, and other personnel directly responsible for complying with NERC Reliability Standards who, through their actions or inactions, may impact the real-time, or day-ahead reliability of the Bulk Power System.

NERC shall also develop and provide appropriate training and education for industry participants and regulators affected by new or changed Reliability Standards or compliance Requirements.

To accomplish those objectives:

1. NERC shall periodically conduct job task analyses for targeted Bulk Power System personnel to ensure that the training program content is properly aligned to the job tasks performed by those personnel.

2. NERC shall develop and maintain personnel training program curriculum requirements based on valid job-task analysis.

3. NERC shall periodically conduct performance surveys to determine the effectiveness of the training program and identify areas for further training development and improvement.

4. NERC shall develop training and education materials and activities to assist Bulk Power System entities implementing new or revised Reliability Standard Requirements or other NERC-related changes.

5. NERC shall develop and provide training to people who participate in NERC and Regional Entity evaluations, audits, and investigations for the Compliance Monitoring and Enforcement Program, Organization Certification Program, and the continuing education program.

902. Continuing Education Program

NERC shall develop and maintain a continuing education program to foster the improvement of training and to promote quality in the training programs used by and

implemented by Bulk Power System entities. The program shall approve or accredit those activities and entities meeting NERC continuing education requirements.

1. NERC shall develop and implement continuing education program requirements that promote excellence in training programs and advance improved performance for Bulk Power System personnel identified in Section 901.

2. NERC shall develop and maintain a process to approve or accredit continuing education Providers and activities seeking approval or accreditation and meeting NERC-approved continuing education requirements.

3. NERC shall perform periodic audits on continuing education Providers and training activities to ensure that the approved or accredited Providers and training activities satisfy NERC continuing education requirements.

4. NERC shall develop and maintain an appeals process for disputed application reviews, interpretations of guidelines and standards, probation or suspension of NERC-approved Provider status, or Continuing Education Hour disputes.

SECTION 1000 — SITUATION AWARENESS AND INFRASTRUCTURE SECURITY

1001. Situation Awareness

NERC shall through the use of Reliability Coordinators and available tools, monitor present conditions on the Bulk Power System and provide leadership coordination, technical expertise, and assistance to the industry in responding to events as necessary. To accomplish these goals, NERC will:

1. Maintain real-time situation awareness of conditions on the Bulk Power System;

2. Notify the industry of significant Bulk Power System events that have occurred in one area, and which have the potential to impact reliability in other areas;

3. Maintain and strengthen high-level communication, coordination, and cooperation with governments and government agencies regarding real-time conditions; and

4. Enable the Reliable Operation of interconnected Bulk Power Systems by facilitating information exchange and coordination among reliability service organizations.

1002. Reliability Support Services

NERC will provide tools and other support services for the benefit of Reliability Coordinators and other system operators, including the Area Control Error (ACE) and Frequency Monitoring System, NERC Hotline, Real-time Flows, System Data Exchange (SDX), Reliability Coordinator Information System (RCIS), Transmission Services Information Network (TSIN), Interchange Distribution Calculator (IDC), Interregional Security Network (ISN), and Central Repository for Security Events (CRC). To accomplish this goal, NERC will:

1. Maintain the reliability and effectiveness of all mission-critical operating reliability support systems and services;

2. Continue to support maintenance of a transmission provider curtailment report on the CRC site in response to Federal Energy Regulatory Commission Order 605;

3. Investigate and analyze the use of high-speed real-time system measurements, including phasors, in predicting the behavior and performance of the Eastern Interconnection; and

4. Facilitate real-time voice and data exchange services among Reliability Coordinators (e.g., Hotline, Interregional Security Network, NERCnet, System Data Exchange, etc.).

1003. Infrastructure Security Program

NERC shall coordinate electric industry activities to promote Critical Infrastructure protection of the Bulk Power System in North America by taking a leadership role in

Critical Infrastructure protection of the electricity sector so as to reduce vulnerability and improve mitigation and protection of the electricity sector's Critical Infrastructure. To accomplish these goals, NERC shall perform the following functions.

1. Electric Sector Information Sharing and Analysis Center (ESISAC)

    1.1 NERC shall serve as the electricity sector's sector coordinator and operate its Information Sharing and Analysis Center to gather information and communicate security-related threats and incidents within the sector, with United States and Canadian government agencies, and with other Critical Infrastructure sectors.

    1.2 NERC shall improve the capability of the ESISAC to analyze security threats and incident information and provide situational assessments for the electricity sector and governments.

    1.3 NERC shall work closely with the United States Department of Homeland Security, Department of Energy, Natural Resources Canada, and Public Safety and Emergency Preparedness Canada.

    1.4 NERC shall strengthen and expand these functions and working relationships with the electricity sector, other Critical Infrastructure industries, governments, and government agencies throughout North America to ensure the protection of the infrastructure of the Bulk Power System.

    1.5 NERC shall fill the role of the Electricity Sector Coordinating Council and coordinate with the Government Coordinating Council.

    1.6 NERC shall coordinate with other Critical Infrastructure sectors through active participation with the other Sector Coordinating Councils, the other ISACs, and the National Infrastructure Advisory Committee.

    1.7 NERC shall encourage and participate in coordinated Critical Infrastructure protection exercises, including interdependencies with other Critical Infrastructure sectors.

2. Security Planning

    2.1 NERC shall take a risk management approach to Critical Infrastructure protection, considering probability and severity, and recognizing that mitigation and recovery can be practical alternatives to prevention.

    2.2 NERC shall keep abreast of the changing threat environment through collaboration with government agencies.

    2.3 NERC shall develop criteria to identify critical physical assets and Critical Cyber Assets, assess security threats, identify risk assessment

methodologies, and assess effectiveness of physical and cyber protection measures.

2.4 NERC shall enhance and maintain the Bulk Power System critical spare transformer program, encourage increased participation by asset owners, and continue to assess the need to expand this program to include other critical Bulk Power System equipment.

2.5 NERC shall support implementation of the Critical Infrastructure Protection Standards through education and outreach.

2.6 NERC shall review and improve existing security guidelines, develop new security guidelines to meet the needs of the electricity sector, and consider whether any guidelines should be developed into Reliability Standards.

2.7 NERC shall conduct education and outreach initiatives to increase awareness and respond to the needs of the electricity sector.

2.8 NERC shall strengthen relationships with federal, state, and provincial government agencies on Critical Infrastructure protection matters.

2.9 NERC shall maintain and improve mechanisms for the sharing of sensitive or classified information with federal, state, and provincial government agencies on Critical Infrastructure protection matters; work with DOE and DHS to implement the National Infrastructure Protection Plan, as applicable to the electricity sector; and coordinate this work with PSEPC.

2.10 NERC shall improve methods to better assess the impact of a possible physical attack on the Bulk Power System and means to deter, mitigate, and respond following an attack.

2.11 NERC shall assess the results of vulnerability assessments and enhance the security of system control and data acquisition (SCADA) and process control systems by developing methods to detect an emerging cyber attack and the means to mitigate impacts on the Bulk Power Systems.

2.12 NERC shall work with the National SCADA Test Bed and the Process Control Systems Forum to accelerate the development of technology that will enhance the security, safety, and reliability of process control and SCADA systems.

SECTION 1100 — ANNUAL NERC BUSINESS PLANS AND BUDGETS

1101. Scope of Business Plans and Budgets

The Board shall determine the content of the budgets to be submitted to the Applicable Governmental Authorities with consultation from the members of the Member Representatives Committee, Regional Entities, and others in accordance with the Bylaws. The Board shall identify any activities outside the scope of NERC's statutory reliability functions, if any, and the appropriate funding mechanisms for those activities.

1102. NERC Funding and Cost Allocation

1. In order that NERC's costs shall be fairly allocated among Interconnections and among Regional Entities, the NERC funding mechanism for all statutory functions shall be based on Net Energy for Load (NEL).

2. NERC's costs shall be allocated so that all Load (or, in the case of costs for an Interconnection or Regional Entity, all Load within that Interconnection or Regional Entity) bears an equitable share of such costs based on NEL.

3. Costs shall be equitably allocated between countries or Regional Entities thereof for which NERC has been designated or recognized as the Electric Reliability Organization.

4. Costs incurred to accomplish the statutory functions for one Interconnection, Regional Entity, or group of entities will be directly assigned to that Interconnection, Regional Entity, or group of entities provided that such costs are allocated equitably to end-users based on Net Energy for Load.

1103. NERC Budget Development

1. The NERC annual budget process shall be scheduled and conducted for each calendar year so as to allow a sufficient amount of time for NERC to receive Member inputs, develop the budget, and receive Board and, where authorized by applicable legislation or agreement, Applicable Governmental Authority approval of the NERC budget for the following fiscal year, including timely submission of the proposed budget to FERC for approval in accordance with FERC regulations.

2. The NERC budget submittal to Applicable Governmental Authorities shall include provisions for all ERO functions, all Regional Entity delegated functions as specified in delegation agreements and reasonable reserves and contingencies.

3. The NERC annual budget submittal to Applicable Governmental Authorities shall include description and explanation of NERC's proposed ERO program activities for the year; budget component justification based on statutory or other authorities; explanation of how each budgeted activity lends itself to the accomplishment of the statutory or other authorities; sufficiency of resources

provided for in the budget to carry out the ERO program responsibilities; explanation of the calculations and budget estimates; identification and explanation of changes in budget components from the previous year's budget; information on staffing and organization charts; and such other information as is required by FERC and other Applicable Governmental Authorities having authority to approve the proposed budget.

4. NERC shall develop, in consultation with the Regional Entities, a reasonable and consistent system of accounts, to allow a meaningful comparison of actual results at the NERC and Regional Entity level by the Applicable Governmental Authorities.

1104. Submittal of Regional Entity Budgets to NERC

1. Each Regional Entity shall submit its proposed annual budget for carrying out its delegated authority functions as well as all other activities and funding to NERC in accordance with a schedule developed by NERC and the Regional Entities, which shall provide for the Regional Entity to submit its final budget that has been approved by its board of directors or other governing body no later than July 1 of the prior year, in order to provide sufficient time for NERC's review and comment on the proposed budget and approval of the Regional Entity budget by the NERC Board of Trustees in time for the NERC and Regional Entity budgets to be submitted to FERC and other Applicable Governmental Authorities for approval in accordance with their regulations. The Regional Entity's budget shall include supporting materials in accordance with the budget and reporting format developed by NERC and the Regional Entities, including the Regional Entity's complete business plan and organization chart, explaining the proposed collection of all dues, fees, and charges and the proposed expenditure of funds collected in sufficient detail to justify the requested funding collection and budget expenditures.

2. NERC shall review and approve each Regional Entity's budget for meeting the requirements of its delegated authority. Concurrent with approving the NERC budget, NERC shall review and approve, or reject, each Regional Entity budget for filing.

3. NERC shall also have the right to review from time to time, in reasonable intervals but no less frequently than every three years, the financial books and records of each Regional Entity having delegated authority in order to ensure that the documentation fairly represents in all material aspects appropriate funding of delegated functions.

1105. Submittal of NERC and Regional Entity Budgets to Governmental Authorities for Approval

1. NERC shall file for approval by the Applicable Governmental Authorities at least 130 days in advance of the start of each fiscal year. The filing shall include: (1) the complete NERC and Regional Entity budgets including the business plans and organizational charts approved by the Board, (2) NERC's annual funding requirement (including Regional Entity costs for delegated functions), and (3) the

mechanism for assessing charges to recover that annual funding requirement, together with supporting materials in sufficient detail to support the requested funding requirement.

2. NERC shall seek approval from each Applicable Governmental Authority requiring such approval for the funding requirements necessary to perform ERO activities within their jurisdictions.

1106. NERC and Regional Entity Billing and Collections

1. NERC shall request the Regional Entities to identify all Load-Serving Entities[3] within each Regional Entity and the NEL assigned to each Load-Serving Entity, and the Regional Entities shall supply the requested information. The assignment of a funding requirement to an entity shall not be the basis for determining that the entity must be registered in the Compliance Registry.

2. NERC shall accumulate the NEL by Load-Serving Entities for each Applicable Governmental Authority and submit the proportional share of NERC funding requirements to each Applicable Governmental Authority for approval together with supporting materials in sufficient detail to support the requested funding requirement.

3. NEL reported by Balancing Authorities within a Region shall be used to rationalize and validate amounts allocated for collection through Regional Entity processes.

4. The billing and collection processes shall provide:

   4.1 A clear validation of billing and application of payments.

   4.2 A minimum of data requests to those being billed.

   4.3 Adequate controls to ensure integrity in the billing determinants including identification of entities responsible for funding NERC's activities.

   4.4 Consistent billing and collection terms.

5. NERC will bill and collect all budget requirements approved by Applicable Governmental Authorities (including the funds required to support those functions assigned to the Regional Entities through the delegation agreements) directly from the Load-Serving Entities or their designees or as directed by particular Applicable Governmental Authorities, except where the Regional Entity is required to collect the budget requirements for NERC, in which case the Regional Entity will collect directly from the Load-Serving Entities or as otherwise

[3] A Regional Entity may allocate funding obligations using an alternative method approved by NERC and by FERC and other Applicable Governmental Authorities, as provided for in the regional delegation agreement.

provided by agreement and submit funds to NERC. Alternatively, a load-serving entity may pay its allocated ERO costs through a Regional Entity managed collection mechanism.

6. NERC shall set a minimum threshold limit on the billing of small LSEs to minimize the administrative burden of collection.

7. NERC shall pursue any non-payments and shall request assistance from Applicable Governmental Authorities as necessary to secure collection.

8. In the case where a Regional Entity performs the collection for ERO, the Regional Entity will not be responsible for non-payment in the event that a user, owner or operator of the Bulk Power System does not pay its share of dues, fees and charges in a timely manner, provided that such a Regional Entity shall use reasonably diligent efforts to collect dues, fees, and other charges from all entities obligated to pay them. However, any revenues not paid shall be recovered from others within the same Region to avoid cross-subsidization between Regions.

9. Both NERC and the Regional Entities also may bill members or others for functions and services not within statutory requirements or otherwise authorized by the Applicable Governmental Authorities. Costs and revenues associated with these functions and services shall be separately identified and not commingled with billings associated with the funding of NERC or of the Regional Entities for delegated activities.

1107. Penalty Applications

1. Where NERC or a Regional Entity initiates a compliance monitoring and enforcement process that leads to imposition of a Penalty, the entity that initiated the process shall receive any Penalty monies imposed and collected as a result of that process, unless a different disposition of the Penalty monies is provided for in the delegation agreement, or in a contract or a disposition of the violation that is approved by NERC and FERC.

2. All funds from financial Penalties assessed in the United States received by the entity initiating the compliance monitoring and enforcement process shall be applied as a general offset to the entity's budget requirements for the subsequent fiscal year, if received by July 1, or for the second subsequent fiscal year, if received on or after July 1. Funds from financial Penalties shall not be directly applied to any program maintained by the entity conducting the compliance monitoring and enforcement process. Funds from financial Penalties assessed against a Canadian entity shall be applied as specified by legislation or agreement.

3. In the event that a compliance monitoring and enforcement process is conducted jointly by NERC and a Regional Entity, the Regional Entity shall receive the Penalty monies and offset the Regional Entity's budget requirements for the subsequent fiscal year.

4. Exceptions or alternatives to the foregoing provisions will be allowed if approved by NERC and by FERC or any other Applicable Governmental Authority.

1108. Special Assessments

On a demonstration of unforeseen and extraordinary circumstances requiring additional funds prior to the next funding cycle, NERC shall file with the Applicable Governmental Authorities, where authorized by applicable legislation or agreement, for authorization for an amended or supplemental budget for NERC or a Regional Entity and, if necessary under the amended or supplemental budget, to collect a special or additional assessment for statutory functions of NERC or the Regional Entity. Such filing shall include supporting materials to justify the requested funding, including any departure from the approved funding formula or method.

SECTION 1200 — REGIONAL DELEGATION AGREEMENTS

1201. Pro Forma Regional Delegation Agreement

NERC shall develop and maintain a pro forma Regional Entity delegation agreement, which shall serve as the basis for negotiation of consistent agreements for the delegation of ERO functions to Regional Entities.

1202. Regional Entity Essential Requirements

NERC shall establish the essential requirements for an entity to become qualified and maintain good standing as a Regional Entity.

1203. Negotiation of Regional Delegation Agreements

NERC shall, for all areas of North America that have provided NERC with the appropriate authority, negotiate regional delegation agreements for the purpose of ensuring all areas of the North American Bulk Power Systems are within a Regional Entity Region. In the event NERC is unable to reach agreement with Regional Entities for all areas, NERC shall provide alternative means and resources for implementing NERC functions within those areas. No delegation agreement shall take effect until it has been approved by the Applicable Governmental Authority.

1204. Conformance to Rules and Terms of Regional Delegation Agreements

NERC and each Regional Entity shall comply with all applicable ERO Rules of Procedure and the obligations stated in the regional delegation agreement.

1205. Sub-delegation

The Regional Entity shall not sub-delegate any responsibilities and authorities delegated to it by its regional delegation agreement with NERC except with the approval of NERC and FERC and other Applicable Governmental Authorities. Responsibilities and authorities may only be sub-delegated to another Regional Entity. Regional Entities may share resources with one another so long as such arrangements do not result in cross-subsidization or in any sub-delegation of authorities.

1206. Nonconformance to Rules or Terms of Regional Delegation Agreement

If a Regional Entity is unable to comply or is not in compliance with an ERO Rule of Procedure or the terms of the regional delegation agreement, the Regional Entity shall immediately notify NERC in writing, describing the area of nonconformance and the reason for not being able to conform to the Rule of Procedure. NERC shall evaluate each case and inform the affected Regional Entity of the results of the evaluation. If NERC determines that a Rule of Procedure or term of the regional delegation agreement has been violated by a Regional Entity or cannot practically be implemented by a Regional Entity, NERC shall notify the Applicable Governmental Authorities and take any actions necessary to address the situation.

1207. Regional Entity Audits

Approximately every five years and more frequently if necessary for cause, NERC shall audit each Regional Entity to verify that the Regional Entity continues to comply with NERC Rules of Procedure and the obligations of NERC delegation agreement. Audits of Regional Entities shall be conducted, to the extent practical, based on professional auditing standards recognized in the U.S., including Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards, and standards sanctioned by the Institute of Internal Auditors, and if applicable to the coverage of the audit, may be based on Canadian or other international standards. The audits required by this Section 1207 shall not duplicate the audits of Regional Entity Compliance Monitoring and Enforcement Programs provided for in **Appendix 4A**, Audit of Regional Compliance Programs, to these Rules of Procedure.

1208. Process for Considering Registered Entity Requests to Transfer to Another Regional Entity

1. A Registered Entity that is registered in the Region of one Regional Entity and believes its registration should be transferred to a different Regional Entity may submit a written request to both Regional Entities requesting that they process the proposed transfer in accordance with this section. The Registered Entity's written request shall set forth the reasons the Registered Entity believes justify the proposed transfer and shall describe any impacts of the proposed transfer on other Bulk Power System owners, operators, and users.

2. After receiving the Registered Entity's written request, the two Regional Entities shall consult with each other as to whether they agree or disagree that the requested transfer is appropriate. The Regional Entities may also consult with affected Reliability Coordinators, Balancing Authorities and Transmission Operators as appropriate. Each Regional Entity shall post the request on its website for public comment period of 21 days. In evaluating the proposed transfer, the Regional Entities shall consider the location of the Registered Entity's Bulk Power System facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators; and users, the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments to other Load-Serving Entities of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity would be transitioned from the current Regional Entity to the transferee Regional Entity; along with any other reasons for the proposed transfer stated by the Registered Entity and any other reasons either Regional Entity considers relevant. The Regional Entities may

request that the Registered Entity provide additional data and information concerning the proposed transfer for the Regional Entities' use in their evaluation. The Registered Entity's current Regional Entity shall notify the Registered Entity in writing as to whether (i) the two Regional Entities agree that the requested transfer is appropriate, (ii) the two Regional Entities agree that the requested transfer is not appropriate and should not be processed further, or (iii) the two Regional Entities disagree as to whether the proposed transfer is appropriate.

3. If the two Regional Entities agree that the requested transfer is appropriate, they shall submit a joint written request to NERC requesting that the proposed transfer be approved and that the delegation agreement between NERC and each of the Regional Entities be amended accordingly. The Regional Entities' joint written submission to NERC shall describe the reasons for the proposed transfer; the location of the Registered Entity's Bulk Power System Facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators, and users; the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity will be transitioned from the current Regional Entity to the transferee Regional Entity. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

4. If the two Regional Entities do not agree with each other that the proposed transfer is appropriate, the Regional Entity supporting the proposed transfer shall, if requested by the Registered Entity, submit a written request to NERC to approve the transfer and the related delegation agreement amendments. The Regional Entity's written request shall include the information specified in Section 1208.3. The Regional Entity that does not believe the proposed transfer is appropriate will be allowed to submit a written statement to NERC explaining why the Regional Entity believes the transfer is not appropriate and should not be approved. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional

information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

5. Prior to action by the NERC Board of Trustees on a proposed transfer of registration under Section 1208.3 or 1208.4, NERC shall post information concerning the proposed transfer, including the submissions from the Regional Entities, on its website for at least twenty-one (21) days for the purpose of receiving public comment.

6. If the NERC Board of Trustees disapproves a proposed transfer presented to it pursuant to either Section 1208.3 or 1208.4, the Regional Entity or Regional Entities that believe the transfer is appropriate may, if requested to do so by the Registered Entity, file a petition with FERC pursuant to 18 C.F.R. section 39.8(f) and (g) requesting that FERC order amendments to the delegation agreements of the two Regional Entities to effectuate the proposed transfer.

7. No transfer of a Registered Entity from one Regional Entity to another Regional Entity shall be effective (i) unless approved by FERC, and (ii) any earlier than the first day of January of the second calendar year following approval by FERC, unless an earlier effective date is agreed to by both Regional Entities and NERC and approved by FERC.

SECTION 1300 — COMMITTEES

1301. Establishing Standing Committees

The Board may from time to time create standing committees. In doing so, the Board shall approve the charter of each committee and assign specific authority to each committee necessary to conduct business within that charter. Each standing committee shall work within its Board-approved charter and shall be accountable to the Board for performance of its Board-assigned responsibilities. A NERC standing committee may not delegate its assigned work to a member forum, but, in its deliberations, may request the opinions of and consider the recommendations of a member forum.

1302. Committee Membership

Each committee shall have a defined membership composition that is explained in its charter. Committee membership may be unique to each committee, and can provide for balanced decision-making by providing for representatives from each Sector or, where Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area, by bringing together a wide diversity of opinions from industry experts with outstanding technical knowledge and experience in a particular subject area. Committee membership shall also provide the opportunity for an equitable number of members from the United States and Canada, based approximately on proportionate Net Energy for Load. All committees and other subgroups (except for those organized on other than a Sector basis because Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area) must ensure that no two stakeholder Sectors are able to control the vote on any matter, and no single Sector is able to defeat a matter. With regard to committees and subgroups pertaining to development of, interpretation of, or compliance with Reliability Standards, NERC shall provide a reasonable opportunity for membership from Sectors desiring to participate. Committees and subgroups organized on other than a Sector basis shall be reported to the NERC Board and the Member Representatives Committee, along with the reasons for constituting the committee or subgroup in the manner chosen. In such cases and subject to reasonable restrictions necessary to accomplish the mission of such committee or subgroup, NERC shall provide a reasonable opportunity for additional participation, as members or official observers, for Sectors not represented on the committee or subgroup.

1303. Procedures for Appointing Committee Members

Committee members shall be nominated and selected in a manner that is open, inclusive, and fair. Unless otherwise stated in these Rules of Procedure or approved by the Board, all committee member appointments shall be approved by the board, and committee officers shall be appointed by the Chairman of the Board.

1304. Procedures for Conduct of Committee Business

1. Notice to the public of the dates, places, and times of meetings of all committees, and all nonconfidential material provided to committee members, shall be posted

on NERC's website at approximately the same time that notice is given to committee members. Meetings of all standing committees shall be open to the public, subject to reasonable limitations due to the availability and size of meeting facilities; provided that the meeting may be held in or adjourn to closed session to discuss matters of a confidential nature, including but not limited to personnel matters, compliance enforcement matters, litigation, or commercially sensitive or Critical Energy Infrastructure Information of any entity.

2. NERC shall maintain a set of procedures, approved by the Board, to guide the conduct of business by standing committees.

1305. Committee Subgroups

Standing committees may appoint subgroups using the same principles as in Section 1302.

SECTION 1400 — AMENDMENTS TO THE NERC RULES OF PROCEDURE

1401. Proposals for Amendment or Repeal of Rules of Procedure

In accordance with the Bylaws of NERC, requests to amend or repeal the Rules of Procedure may be submitted by (1) any ten Members of NERC, which number shall include Members from at least three membership Sectors, (2) the Member Representatives Committee, (3) a standing committee of NERC to whose function and purpose the Rule of Procedure pertains, or (4) an officer of the ERO.

1402. Approval of Amendment or Repeal of Rules of Procedure

Amendment to or repeal of Rules of Procedure shall be approved by the Board after public notice and opportunity for comment in accordance with the Bylaws of NERC. In approving changes to the Rules of Procedure, the Board shall consider the inputs of the Member Representatives Committee, other ERO committees affected by the particular changes to the Rules of Procedure, and other stakeholders as appropriate. After Board approval, the amendment or repeal shall be submitted to the Applicable Governmental Authorities for approval, where authorized by legislation or agreement. No amendment to or repeal of the Rules of Procedure shall be effective until it has been approved by the Applicable Governmental Authorities.

1403. Alternative Procedure for Violation Risk Factors

In the event the Reliability Standards development process fails to produce Violation Risk Factors for a particular Reliability Standard in a timely manner, the Board of Trustees may adopt Violation Risk Factors for that standard after notice and opportunity for comment. In adopting Violation Risk Factors, the Board shall consider the inputs of the Member Representatives Committee and affected stakeholders.

SECTION 1500 — CONFIDENTIAL INFORMATION

1501. Definitions

1. **Confidential Information** means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition.

2. **Confidential Business and Market Information** means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

3. **Critical Energy Infrastructure Information** means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.

4. **Critical Infrastructure** means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.

5. **Cyber Security Incident Information** means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

1502. Protection of Confidential Information

1. **Identification of Confidential Information** — An owner, operator, or user of the Bulk Power System and any other party (the "Submitting Entity") shall mark as confidential any information that it submits to NERC or a Regional Entity (the "Receiving Entity") that it reasonably believes contains Confidential Information as defined by these Rules of Procedure, indicating the category or categories defined in Section 1501 in which the information falls. If the information is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the Submitting Entity shall so indicate and provide supporting references and details.

2. **Confidentiality** — Except as provided herein, a Receiving Entity shall keep in confidence and not copy, disclose, or distribute any Confidential Information or

any part thereof without the permission of the Submitting Entity, except as otherwise legally required.

3. **Information no longer Confidential –** If a Submitting Entity concludes that information for which it had sought confidential treatment no longer qualifies for that treatment, the Submitting Entity shall promptly so notify NERC or the relevant Regional Entity.

1503. Requests for Information

1. **Limitation** — A Receiving Entity shall make information available only to one with a demonstrated need for access to the information from the Receiving Entity.

2. **Form of Request** — A person with such a need may request access to information by using the following procedure:

   2.1 The request must be in writing and clearly marked "Request for Information."

   2.2 The request must identify the individual or entity that will use the information, explain the requester's need for access to the information, explain how the requester will use the information in furtherance of that need, and state whether the information is publicly available or available from another source or through another means. If the requester seeks access to information that is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the requester shall describe how it qualifies to receive such information.

   2.3 The request must stipulate that, if the requester does not seek public disclosure, the requester will maintain as confidential any information received for which a Submitting Party has made a claim of confidentiality in accordance with NERC's rules. As a condition to gaining access to such information, a requester shall execute a non-disclosure agreement in a form approved by NERC's Board of Trustees.

3. **Notice and Opportunity for Comment** — Prior to any decision to disclose information marked as confidential, the Receiving Entity shall provide written notice to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed. Failure to provide such comments or otherwise respond is not deemed waiver of the claim of confidentiality.

4. **Determination by ERO or Regional Entity** — Based on the information provided by the requester under Rule 1503.2, any comments provided by the Submitting Entity, and any other relevant available information, the chief

executive officer or his or her designee of the Receiving Entity shall determine whether to disclose such information.

5. **Appeal** — A person whose request for information is denied in whole or part may appeal that determination to the President of NERC (or the President's designee) within 30 days of the determination. Appeals filed pursuant to this Section must be in writing, addressed to the President of NERC (or the President's designee), and clearly marked "Appeal of Information Request Denial."

   NERC will provide written notice of such appeal to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed; provided that any such comments must be received within 30 days of the notice and any failure to provide such comments or otherwise respond is not deemed a waiver of the claim of confidentiality.

   The President of NERC (or the President's designee) will make a determination with respect to any appeal within 30 days. In unusual circumstances, this time limit may be extended by the President of NERC (or the President's designee), who will send written notice to the requester setting forth the reasons for the extension and the date on which a determination on the appeal is expected.

6. **Disclosure of Information** — In the event the Receiving Entity, after following the procedures herein, determines to disclose information designated as Confidential Information, it shall provide the Submitting Entity no fewer than 21 days' written notice prior to releasing the Confidential Information in order to enable such Submitting Entity to (a) seek an appropriate protective order or other remedy, (b) consult with the Receiving Entity with respect to taking steps to resist or narrow the scope of such request or legal process, or (c) waive compliance, in whole or in part, with the terms of this Section. Should a Receiving Entity be required to disclose Confidential Information, or should the Submitting Entity waive objection to disclosure, the Receiving Entity shall furnish only that portion of the Confidential Information which the Receiving Entity's counsel advises is legally required.

7. Posting of Determinations on Requests for Disclosure of Confidential Information — Upon making its determination on a request for disclosure of Confidential Information, NERC or the Regional Entity, as applicable, shall (i) notify the requester that the request for disclosure is granted or denied, (ii) publicly post any determination to deny the request to disclose Confidential Information, including in such posting an explanation of the reasons for the denial (but without in such explanation disclosing the Confidential Information), and (iii) publicly post any determination that information claimed by the Submitting Entity to be Confidential Information is not Confidential Information (but without in such posting disclosing any information that has been determined to be Confidential Information).

1504. Employees, Contractors and Agents

A Receiving Entity shall ensure that its officers, trustees, directors, employees, subcontractors and subcontractors' employees, and agents to whom Confidential Information is exposed are under obligations of confidentiality that are at least as restrictive as those contained herein.

1505. Provision of Information to FERC and Other Governmental Authorities

1. **Request** — A request from FERC for reliability information with respect to owners, operators, and users of the Bulk Power System within the United States is authorized by Section 215 of the Federal Power Act. Other Applicable Governmental Authorities may have similar authorizing legislation that grants a right of access to such information. Unless otherwise directed by FERC or its staff or the other Applicable Governmental Authority requesting the information, upon receiving such a request, a Receiving Entity shall provide contemporaneous notice to the applicable Submitting Entity. In its response to such a request, a Receiving Entity shall preserve any mark of confidentiality and shall notify FERC or other Applicable Governmental Authorities that the Submitting Entity has marked the information as confidential.

2. **Continued Confidentiality** — Each Receiving Entity shall continue to treat as confidential all Confidential Information that it has submitted to NERC or to FERC or another Applicable Governmental Authority, until such time as FERC or the other Applicable Governmental Authority authorizes disclosure of such information.

1506. Permitted Disclosures

1. **Confirmed Violations** — Nothing in this Section 1500 shall prohibit the disclosure of a violation at the point when the matter is filed with an Applicable Governmental Authority as a Notice of Penalty, the "violator" admits to the violation, or the alleged violator and NERC or the Regional Entity reach a settlement regarding the violation.

2. **Compliance Information** — NERC and the Regional Entities are authorized to exchange Confidential Information related to evaluations, Compliance Audits, and Compliance Investigations in furtherance of the Compliance Monitoring and Enforcement Program, on condition they continue to maintain the confidentiality of such information.

1507. Remedies for Improper Disclosure

Any person engaged in NERC or Regional Entity activity under Section 215 of the Federal Power Act or the equivalent laws of other Applicable Governmental Authorities who improperly discloses information determined to be confidential may lose access to Confidential Information on a temporary or permanent basis and may be subject to adverse personnel action, including suspension or termination. Nothing in Section 1500

precludes an entity whose information was improperly disclosed from seeking a remedy in an appropriate court.

SECTION 1600 — REQUESTS FOR DATA OR INFORMATION

1601. Scope of a NERC or Regional Entity Request for Data or Information

Within the United States, NERC and Regional Entities may request data or information that is necessary to meet their obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of the Commission's regulations, 18 C.F.R. § 39.2(d). In other jurisdictions NERC and Regional Entities may request comparable data or information, using such authority as may exist pursuant to these Rules of Procedure and as may be granted by Applicable Governmental Authorities in those other jurisdictions. The provisions of Section 1600 shall not apply to Requirements contained in any Reliability Standard to provide data or information; the Requirements in the Reliability Standards govern. The provisions of Section 1600 shall also not apply to data or information requested in connection with a compliance or enforcement action under Section 215 of the Federal Power Act, Section 400 of these Rules of Procedure, or any procedures adopted pursuant to those authorities, in which case the Rules of Procedure applicable to the production of data or information for compliance and enforcement actions shall apply.

1602. Procedure for Authorizing a NERC Request for Data or Information

1. NERC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in Section 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to the Office of Electric Reliability is for the information of the Commission. NERC is not required to receive any approval from the Commission prior to posting the proposed request or modification for public comment in accordance with Section 1602.2 or issuing the request or modification to Reporting Entities following approval by the Board of Trustees.

2. NERC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.

    2.1. A proposed request for data or information shall contain, at a minimum, the following information: (i) a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements; (ii) a description of how the data or information will be collected and validated; (iii) a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("Reporting Entities"); (iv) the schedule or due date for the data or information; (v) a description of any restrictions on disseminating the data or information (e.g., "Confidential Information," "Critical Energy Infrastructure Information,"

"aggregating" or "identity masking"); and (vi) an estimate of the relative burden imposed on the Reporting Entities to accommodate the data or information request.

2.2. A proposed modification to a previously authorized request for data or information shall explain (i) the nature of the modifications; (ii) an estimate of the burden imposed on the Reporting Entities to accommodate the modified data or information request, and (iii) any other items from Section 1602.2.1 that require updating as a result of the modifications.

3. After the close of the comment period, NERC shall make such revisions to the proposed request for data or information as are appropriate in light of the comments. NERC shall submit the proposed request for data or information, as revised, along with the comments received, NERC's evaluation of the comments and recommendations, to the Board of Trustees.

4. In acting on the proposed request for data or information, the Board of Trustees may authorize NERC to issue it, modify it, or remand it for further consideration.

5. NERC may make minor changes to an authorized request for data or information without Board approval. However, if a Reporting Entity objects to NERC in writing to such changes within 21 days of issuance of the modified request, such changes shall require Board approval before they are implemented.

6. Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the Board of Trustees, an affected party appeals the authorization under this Section 1600 to the Applicable Governmental Authority.

1603. Owners, Operators, and Users to Comply

Owners, operators, and users of the Bulk Power System registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a Reporting Entity within the United States fails to comply with an authorized request for data or information under Section 1600, NERC may request the Commission to exercise its enforcement authority to require the Reporting Entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. NERC will make any request for the Commission to enforce a request for data or information through a non-public submission to the Commission's enforcement staff.

1604. Requests by Regional Entity for Data or Information

1. A Regional Entity may request that NERC seek authorization for a request for data or information to be applicable within the Region of the Regional Entity, either as a freestanding request or as part of a proposed NERC request for data or information. Any such request must be consistent with this Section 1600.

2. A Regional Entity may also develop its own procedures for requesting data or information, but any such procedures must include at least the same procedural elements as are included in this Section 1600. Any such Regional Entity procedures or changes to such procedures shall be submitted to NERC for approval. Upon approving such procedures or changes thereto, NERC shall file the proposed procedures or proposed changes for approval by the Commission and any other Applicable Governmental Authorities applicable to the Regional Entity. The Regional Entity procedures or changes to such procedures shall not be effective in a jurisdiction until approved by, and in accordance with any revisions directed by, the Commission or other Applicable Governmental Authority.

1605. Confidentiality

If the approved data or information request includes a statement under Section 1602.1.1(v) that the requested data or information will be held confidential or treated as Critical Energy Infrastructure Information, then the applicable provisions of Section 1500 will apply without further action by a Submitting Entity. A Submitting Entity may designate any other data or information as Confidential Information pursuant to the provisions of Section 1500, and NERC or the Regional Entity shall treat that data or information in accordance with Section 1500. NERC or a Regional Entity may utilize additional protective procedures for handling particular requests for data or information as may be necessary under the circumstances.

1606. Expedited Procedures for Requesting Time-Sensitive Data or Information

1. In the event NERC or a Regional Entity must obtain data or information by a date or within a time period that does not permit adherence to the time periods specified in Section 1602, the procedures specified in Section 1606 may be used to obtain the data or information. Without limiting the circumstances in which the procedures in Section 1606 may be used, such circumstances include situations in which it is necessary to obtain the data or information (in order to evaluate a threat to the reliability or security of the Bulk Power System, or to comply with a directive in an order issued by the Commission or by another Applicable Governmental Authority) within a shorter time period than possible under Section 1602. The procedures specified in Section 1606 may only be used if authorized by the NERC Board of Trustees prior to activation of such procedures.

2. Prior to posting a proposed request for data or information, or a modification to a previously-authorized request, for public comment under Section 1606, NERC shall provide the proposed request or modification, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability. The submission to the Commission's Office of Electric Reliability shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information. The submission shall be made to the Commission's Office of Electric Reliability as far in advance, up to twenty-one (21) days, of the posting of the proposed request or modification for public comments as is

reasonably possible under the circumstances, but in no event less than two (2) days in advance of the public posting of the proposed request or modification.

3. NERC shall post the proposed request for data or information or proposed modification to a previously-authorized request for data or information for a public comment period that is reasonable in duration given the circumstances, but in no event shorter than five (5) days. The proposed request for data or information or proposed modification to a previously-authorized request for data or information shall include the information specified in Section 1602.2.1 or 1602.2.2, as applicable, and shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information.

4. The provisions of Sections 1602.3, 1602.4, 1602.5 and 1602.6 shall be applicable to a request for data or information or modification to a previously-authorized request for data or information developed and issued pursuant to Section 1606, except that (a) if NERC makes minor changes to an authorized request for data or information without Board approval, such changes shall require Board approval if a Reporting Entity objects to NERC in writing to such changes within five (5) days of issuance of the modified request; and (b) authorization of the request for data or information shall be final unless an affected party appeals the authorization of the request by the Board of Trustees to the Applicable Governmental Authority within five (5) days following the decision of the Board of Trustees authorizing the request, which decision shall be promptly posted on NERC's website.

SECTION 1700 — CHALLENGES TO DETERMINATIONS

1701. Scope of Authority

Section 1702 sets forth the procedures to be followed for Registered Entities to challenge determinations made by Planning Coordinators under Reliability Standard PRC-023. Section 1703 sets forth the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

1702. Challenges to Determinations by Planning Coordinators Under Reliability Standard PRC-023

1. This Section 1702 establishes the procedures to be followed when a Registered Entity wishes to challenge a determination by a Planning Coordinator of the sub-200 kV circuits in its Planning Coordinator area for which Transmission Owners, Generator Owners, and Distribution Providers (defined as "Registered Entities" for purposes of this Section 1702) must comply with the requirements of Reliability Standard PRC-023.

2. Planning Coordinator Procedures

    2.1 Each Planning Coordinator shall establish a procedure for a Registered Entity to submit a written request for an explanation of a determination made by the Planning Coordinator under PRC-023.

    2.2 A Registered Entity shall follow the procedure established by the Planning Coordinator for submitting the request for explanation and must submit any such request within 60 days of receiving the determination under PRC-023 from the Planning Coordinator.

    2.3 Within 30 days of receiving a written request from a Registered Entity, the Planning Coordinator shall provide the Registered Entity with a written explanation of the basis for its determination under PRC-023, unless the Planning Coordinator provided a written explanation of the basis for its determination when it initially informed the Registered Entity of its determination.

3. A Registered Entity may challenge the determination of the Planning Coordinator by filing with the appropriate Regional Entity, with a copy to the Planning Coordinator, within 60 days of receiving the written explanation from the Planning Coordinator. The challenge shall include the following: (a) an explanation of the technical reasons for its disagreement with the Planning Coordinator's determination, along with any supporting documentation, and (b) a copy of the Planning Coordinator's written explanation. Within 30 days of receipt of a challenge, the Planning Coordinator may file a response to the Regional Entity, with a copy to the Registered Entity.

4. The filing of a challenge in good faith shall toll the time period for compliance with PRC-023 with respect to the subject facility until such time as the challenge is withdrawn, settled or resolved.

5. The Regional Entity shall issue its written decision setting forth the basis of its determination within 90 days after it receives the challenge and send copies of the decision to the Registered Entity and the Planning Coordinator. The Regional Entity may convene a meeting of the involved entities and may request additional information. The Regional Entity shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

6. A Planning Coordinator or Registered Entity affected by the decision of the Regional Entity may, within 30 days of the decision, file an appeal with NERC, with copies to the Regional Entity and the Planning Coordinator or Registered Entity. The appeal shall state the basis of the objection to the decision of the Regional Entity and shall include the Regional Entity decision, the written explanation of the Planning Coordinator's determination under PRC-023, and the documents and reasoning filed by the Registered Entity with the Regional Entity in support of its objection. The Regional Entity, Planning Coordinator or Registered Entity may file a response to the appeal within 30 days of the appeal.

7. The NERC Board of Trustees shall appoint a panel to decide appeals from Region Entity decisions under Section 1702.5. The panel, which may contain alternates, shall consist of at least three appointees, one of whom must be a member of the NERC staff, who are knowledgeable about PRC-023 and transmission planning and do not have a direct financial or business interest in the outcome of the appeal. The panel shall decide the appeal within 90 days of receiving the appeal from the decision of the Regional Entity and shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

8. The Planning Coordinator or Registered Entity affected by the decision of the panel may request that the NERC Board of Trustees review the decision by filing its request for review and a statement of reasons with NERC's Chief Reliability Officer within 30 days of the panel decision. The Board of Trustees may, in its discretion, decline to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. Within 90 days of the request for review under this Section 1702.8, the NERC Board of Trustees may either (a) issue a decision on the merits, which shall be the final NERC decision, or (b) issue a notice declining to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. If no written decision or notice declining review is issued within 90 calendar days, the appeal shall be deemed to have been denied by the NERC Board of Trustees and this will have the same effect as a notice declining review.

9. The Registered Entity or Planning may appeal the final NERC decision to the applicable governmental authority within 30 days of receipt of the Board of

Trustees' final decision or notice declining review, or expiration of the 90-day review period without any action by NERC.

10. The Planning Coordinator and Registered Entity are encouraged, but not required, to meet to resolve any dispute, including use of mutually agreed to alternative dispute resolution procedures, at any time during the course of the matter. In the event resolution occurs after the filing of a challenge, the Registered Entity and Planning Coordinator shall jointly provide to the applicable Regional Entity a written acknowledgement of withdrawal of the challenge or appeal, including a statement that all outstanding issues have been resolved.

1703. Challenges to NERC Determinations of BES Exception Requests Under Section 509

1. This Section 1703 establishes the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

2. A Submitting Entity (or Owner if different) aggrieved by the decision of NERC to approve or disapprove an Exception Request or to terminate an Exception with respect to any Element may, within 30 days following the date of the decision, file a written challenge to the decision with the NERC director of compliance operations, with copies to the Regional Entity and the Submitting Entity or Owner if different. The written challenge shall state the basis of the objection to the decision of NERC. The Regional Entity and the Submitting Entity or Owner if different may file a response to the challenge within 30 days following the date the challenge is filed with NERC.

3. The challenge shall be decided by the Board of Trustees Compliance Committee. Within 90 days of the date of submission of the challenge, the Board of Trustees Compliance Committee shall issue its decision on the challenge. The decision of the Board of Trustees Compliance Committee shall be the final NERC decision; provided, that the Board of Trustees Compliance Committee may extend the deadline date for its decision to a date more than 90 days following submission of the challenge, by issuing a notice to the Submitting Entity, the Owner (if different) and the Regional Entity stating the revised deadline date and the reason for the extension.

4. The Submitting Entity, or Owner if different, may appeal the final NERC decision to, or seek review of the final NERC decision by, the Applicable Governmental Authority(ies), in accordance with the legal authority and rules and procedures of the Applicable Governmental Authority(ies). Any such appeal shall be filed within thirty (30) days following the date of the decision of the Board of Trustees Compliance Committee, or within such other time period as is provided for in the legal authority, rules or procedures of the Applicable Governmental Authority.

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF REVISIONS TO ITS RULES OF PROCEDURE
TO ADOPT A BULK ELECTRIC SYSTEM EXCEPTION PROCEDURE

ATTACHMENT 2B

REVISED RULES OF PROCEDURE, SECTIONS 100-1700

(INCLUDING PROPOSED NEW SECTIONS 509 AND 1703)

REDLINED VERSION

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Proposed Revisions 1-9-2012
[Incorporates proposed revisions filed with FERC on March 18, November 7 and November 29, 2011]

Rules of Procedure

Effective: January 10, 2012

Rules of Procedure Section 400 is subject to further revisions to comply with directives in a FERC Order issued October 7, 2011 (137 FERC ¶ 61,028).

SECTION 1700 — CHALLENGES TO DETERMINATIONS 92

1701. Scope of Authority 92
1702 Challenges to Determinations by Planning Coordinators Under Reliability Standard PRC-023 92
1703 Challenges to NERC Determinations of BES Exception Requests under Section 509 94

SECTION 100 — APPLICABILITY OF RULES OF PROCEDURE

NERC and NERC Members shall comply with these Rules of Procedure. Each Regional Entity shall comply with these Rules of Procedure as applicable to functions delegated to the Regional Entity by NERC or as required by an Applicable Governmental Authority or as otherwise provided.

Each Bulk Power System owner, operator, and user shall comply with all Rules of Procedure of NERC that are made applicable to such entities by approval pursuant to applicable legislation or regulation, or pursuant to agreement.

Any entity that is unable to comply or that is not in compliance with a NERC Rule of Procedure shall immediately notify NERC in writing, stating the Rule of Procedure of concern and the reason for not being able to comply with the Rule of Procedure.

NERC shall evaluate each case and inform the entity of the results of the evaluation. If NERC determines that a Rule of Procedure has been violated, or cannot practically be complied with, NERC shall notify the Applicable Governmental Authorities and take such other actions as NERC deems appropriate to address the situation.

NERC shall comply with each approved Reliability Standard that identifies NERC or the Electric Reliability Organization as a responsible entity. Regional Entities shall comply with each approved Reliability Standard that identifies Regional Entities as responsible entities. A violation by NERC or a Regional Entity of such a Reliability Standard shall constitute a violation of these Rules of Procedure.

SECTION 200 — DEFINITIONS OF TERMS

Definitions of terms used in the NERC Rules of Procedure are set forth in **Appendix 2**, *Definitions Used in the Rules of Procedure*.

SECTION 300 — RELIABILITY STANDARDS DEVELOPMENT

301. General

NERC shall develop and maintain Reliability Standards that apply to Bulk Power System owners, operators, and users and that enable NERC and Regional Entities to measure the reliability performance of Bulk Power System owners, operators, and users; and to hold them accountable for Reliable Operation of the Bulk Power Systems. The Reliability Standards shall be technically excellent, timely, just, reasonable, not unduly discriminatory or preferential, in the public interest, and consistent with other applicable standards of governmental authorities.

302. Essential Attributes for Technically Excellent Reliability Standards

1. **Applicability** — Each Reliability Standard shall clearly identify the functional classes of entities responsible for complying with the Reliability Standard, with any specific additions or exceptions noted. Such functional classes[1] include: Reliability Coordinators, Balancing Authorities, Transmission Operators, Transmission Owners, Generator Operators, Generator Owners, Interchange Authorities, Transmission Service Providers, market operators, Planning Authorities, Transmission Planners, Resource Planners, Load-Serving Entities, Purchasing-Selling Entities, and Distribution Providers. Each Reliability Standard shall also identify the geographic applicability of the Reliability Standard, such as the entire North American Bulk Power System, an Interconnection, or within a Region. A Reliability Standard may also identify any limitations on the applicability of the Reliability Standard based on electric Facility characteristics.

2. **Reliability Objectives** — Each Reliability Standard shall have a clear statement of purpose that shall describe how the Reliability Standard contributes to the reliability of the Bulk Power System. The following general objectives for the Bulk Power System provide a foundation for determining the specific objective(s) of each Reliability Standard:

    2.1 **Reliability Planning and Operating Performance**— Bulk Power Systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions.

    2.2 **Frequency and Voltage Performance**— The frequency and voltage of Bulk Power Systems shall be controlled within defined limits through the

[1] These functional classes of entities are derived from NERC's Reliability Functional Model. When a Reliability Standard identifies a class of entities to which it applies, that class must be defined in the Glossary of Terms Used in NERC Reliability Standards.

balancing of Real and Reactive Power ~~real and reactive power~~ supply and demand.

2.3 **Reliability Information** — Information necessary for the planning and operation of reliable Bulk Power Systems shall be made available to those entities responsible for planning and operating Bulk Power Systems.

2.4 **Emergency Preparation** — Plans for emergency operation and system restoration of Bulk Power Systems shall be developed, coordinated, maintained, and implemented.

2.5 **Communications and Control** — Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of Bulk Power Systems.

2.6 **Personnel** — Personnel responsible for planning and operating Bulk Power Systems shall be trained and qualified, and shall have the responsibility and authority to implement actions.

2.7 **Wide-Area View** — The reliability of the Bulk Power Systems shall be assessed, monitored, and maintained on a Wide-Area basis.

2.8 **Security** —Bulk Power Systems shall be protected from malicious physical or cyber attacks.

3. **Performance Requirement or Outcome**— Each Reliability Standard shall state one or more performance Requirements, which if achieved by the applicable entities, will provide for a reliable Bulk Power System, consistent with good utility practices and the public interest. Each Requirement is not a "lowest common denominator" compromise, but instead achieves an objective that is the best approach for Bulk Power System reliability, taking account of the costs and benefits of implementing the proposal.

4. **Measurability** — Each performance Requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that Requirement. Each performance Requirement shall have one or more associated measures used to objectively evaluate compliance with the Requirement. If performance can be practically measured quantitatively, metrics shall be provided to determine satisfactory performance.

5. **Technical Basis in Engineering and Operations**— Each Reliability Standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.

6. **Completeness** — Reliability Standards shall be complete and self-contained. The Reliability Standards shall not depend on external information to determine the required level of performance.

7. **Consequences for Noncompliance** — In combination with guidelines for Penalties and sanctions, as well as other ERO and Regional Entity compliance documents, the consequences of violating a Reliability Standard are clearly presented to the entities responsible for complying with the Reliability Standards.

8. **Clear Language** — Each Reliability Standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.

9. **Practicality** — Each Reliability Standard shall establish Requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.

10. **Consistent Terminology** — To the extent possible, Reliability Standards shall use a set of standard terms and definitions that are approved through the NERC Reliability Standards development process.

303. Relationship between Reliability Standards and Competition

To ensure Reliability Standards are developed with due consideration of impacts on competition, to ensure Reliability Standards are not unduly discriminatory or preferential, and recognizing that reliability is an essential requirement of a robust North American economy, each Reliability Standard shall meet all of these market-related objectives:

1. **Competition** — A Reliability Standard shall not give any market participant an unfair competitive advantage.

2. **Market Structures** — A Reliability Standard shall neither mandate nor prohibit any specific market structure.

3. **Market Solutions** — A Reliability Standard shall not preclude market solutions to achieving compliance with that Reliability Standard.

4. **Commercially Sensitive Information** — A Reliability Standard shall not require the public disclosure of commercially sensitive information or other Confidential Information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with Reliability Standards.

5. **Adequacy** — NERC shall not set Reliability Standards defining an adequate amount of, or requiring expansion of, Bulk Power System resources or delivery capability.

304. Essential Principles for the Development of Reliability Standards

NERC shall develop Reliability Standards in accordance with the NERC *Standard Processes Manual*, which is incorporated into these Rules of Procedure as **Appendix 3A**. Appeals in connection with the development of a Reliability Standard shall also be conducted in accordance with the NERC *Standard Processes Manual*. Any amendments or revisions to the *Standard Processes Manual* shall be consistent with the following essential principles:

1. **Openness** — Participation shall be open to all Persons who are directly and materially affected by the reliability of the North American Bulk Power System. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in NERC or any other organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

2. **Transparency** — The process shall be transparent to the public.

3. **Consensus-building** —The process shall build and document consensus for each Reliability Standard, both with regard to the need and justification for the Reliability Standard and the content of the Reliability Standard.

4. **Fair Balance of Interests** — The process shall fairly balance interests of all stakeholders and shall not be dominated by any single interest category.

5. **Due Process** — Development of Reliability Standards shall provide reasonable notice and opportunity for any Person with a direct and material interest to express views on a proposed Reliability Standard and the basis for those views, and to have that position considered in the development of the Reliability Standards.

6. **Timeliness** — Development of Reliability Standards shall be timely and responsive to new and changing priorities for reliability of the Bulk Power System.

305. Registered Ballot Body

NERC Reliability Standards shall be approved by a Registered Ballot Body prior to submittal to the Board and then to Applicable Governmental Authorities for their approval, where authorized by applicable legislation or agreement. This Section 305 sets

forth the rules pertaining to the composition of, and eligibility to participate in, the Registered Ballot Body.

1. **Eligibility to Vote on Reliability Standards** — Any person or entity may join the Registered Ballot Body to vote on Reliability Standards, whether or not such person or entity is a Member of NERC.

2. **Inclusive Participation** — The Segment qualification guidelines are inclusive; i.e., any entity with a legitimate interest in the reliability of the Bulk Power System that can meet any one of the eligibility criteria for a Segment is entitled to belong to and vote in each Segment for which it qualifies, subject to limitations defined in Sections 305.3 and 305.5.

3. **General Criteria for Registered Ballot Body Membership** — The general criteria for membership in the Segments are:

    3.1 **Multiple Segments** — A corporation or other organization with integrated operations or with affiliates that qualifies to belong to more than one Segment (e.g., Transmission Owners and Load-Serving Entities) may join once in each Segment for which it qualifies, provided that each Segment constitutes a separate membership and the organization is represented in each Segment by a different representative. Affiliated entities are collectively limited to one membership in each Segment for which they are qualified.

    3.2 **Withdrawing from a Segment or Changing Segments** — After its initial registration in a Segment, each registered participant may elect to withdraw from a Segment or apply to change Segments at any time.

    3.3 **Review of Segment Criteria** — The Board shall review the qualification guidelines and rules for joining Segments at least every three years to ensure that the process continues to be fair, open, balanced, and inclusive. Public input will be solicited in the review of these guidelines.

4. **Proxies for Voting on Reliability Standards** — Any registered participant may designate an agent or proxy to vote on its behalf. There are no limits on how many proxies an agent may hold. However, for the proxy to be valid, NERC must have in its possession written documentation signed by the representative of the registered participant that the voting right by proxy has been transferred from the registered participant to the agent.

5. **Segments** — The specific criteria for membership in each Registered Ballot Body Segment are defined in the *Standard Processes Manual* in **Appendix 3A.**

6. **Review of Segment Entries** — NERC shall review all applications for joining the Registered Ballot Body, and shall make a determination of whether the

applicant's self-selection of a Segment satisfies at least one of the guidelines to belong to that Segment. The entity shall then become eligible to participate as a voting member of that Segment. The Standards Committee shall resolve disputes regarding eligibility for membership in a Segment, with the applicant having the right of appeal to the Board.

306. Standards Committee

The Standards Committee shall provide oversight of the Reliability Standards development process to ensure stakeholder interests are fairly represented. The Standards Committee shall not under any circumstance change the substance of a draft or approved Reliability Standard.

1. **Membership** — The Standards Committee is a representative committee comprising representatives of two members of each of the Segments in the Registered Ballot Body.

2. **Elections** — Standards Committee members are elected for staggered (one per Segment per year) two-year terms by the respective Segments in accordance with the *Procedure for the Election of Members of the NERC Standards Committee*, which is incorporated into these Rules of Procedure as **Appendix 3B**. Segments may use their own election procedure if such a procedure is ratified by two-thirds of the members of a Segment and approved by the Board.

3. **Canadian Representation**

   3.1 **Provision for Sufficient Canadian Representation —** If any regular election of Standards Committee members does not result in at least two Canadian members on the Standards Committee, the Canadian nominees who were not elected but who received the next highest percentage of votes within their respective Segment(s) will be designated as additional members of the Standards Committee, as needed to achieve a total of two Canadian members.

   3.2 **Terms of Specially Designated Canadian Members** — Each specially designated Canadian member of the Standards Committee shall have a term ending with the next annual election.

   3.3 **Segment Preference** — If any Segment has an unfilled representative position on the Standards Committee following the annual election, the first preference is to assign each specially designated Canadian representative to a Segment with an unfilled representative position for which his or her organization qualifies.

   3.4 **Rights of Specially Designated Canadian Members** — Any specially designated Canadian members of the Standards Committee shall have the

same rights and obligations as all other members of the Standards Committee.

4. **Open Meetings** — All meetings of the Standards Committee shall be open and publicly noticed on the NERC website.

307. Standards Process Manager

NERC shall assign a standards process manager to administer the development of Reliability Standards. The standards process manager shall be responsible for ensuring that the development and revision of Reliability Standards are in accordance with the NERC *Standard Processes Manual*. The standards process manager shall work to achieve the highest degree of integrity and consistency of quality and completeness of the Reliability Standards. The standards process manager shall coordinate with any Regional Entities that develop Regional Reliability Standards to ensure those Regional Reliability Standards are effectively integrated with the NERC Reliability Standards.

308. Steps in the Development of Reliability Standards

1. **Procedure** — NERC shall develop Reliability Standards through the process set forth in the NERC *Standard Processes Manual* (**Appendix 3A**). The procedure includes a provision for approval of urgent action Reliability Standards that can be completed within 60 days and emergency actions that may be further expedited.

2. **Board Approval** — Reliability Standards or revisions to Reliability Standards approved by the ballot pool in accordance with the *Standard Processes Manual* shall be submitted for approval by the Board. No Reliability Standard or revision to a Reliability Standard shall be effective unless approved by the Board.

3. **Governmental Approval** — After receiving Board approval, a Reliability Standard or revision to a Reliability Standard shall be submitted to all Applicable Governmental Authorities in accordance with Section 309. No Reliability Standard or revision to a Reliability Standard shall be effective within a geographic area over which an Applicable Governmental Authority has jurisdiction unless approved by such Applicable Governmental Authority or is otherwise made effective pursuant to the laws applicable to such Applicable Governmental Authority.

309. Filing of Reliability Standards for Approval by Applicable Governmental Authorities

1. **Filing of Reliability Standards for Approval** — Where authorized by applicable legislation or agreement, NERC shall file with the Applicable Governmental

Authorities each Reliability Standard, modification to a Reliability Standard, or withdrawal of a Reliability Standard that is approved by the Board. Each filing shall be in the format required by the Applicable Governmental Authority and shall include: a concise statement of the basis and purpose of the Reliability Standard; the text of the Reliability Standard; the implementation plan for the Reliability Standard; a demonstration that the Reliability Standard meets the essential attributes of Reliability Standards as stated in Section 302; the drafting team roster; the ballot pool and final ballot results; and a discussion of public comments received during the development of the Reliability Standard and the consideration of those comments.

2. **Remanded Reliability Standards and Directives to Develop Standards** — If an Applicable Governmental Authority remands a Reliability Standard to NERC or directs NERC to develop a Reliability Standard, NERC shall within five (5) business days notify all other Applicable Governmental Authorities, and shall within thirty (30) calendar days report to all Applicable Governmental Authorities a plan and timetable for modification or development of the Reliability Standard. Reliability Standards that are remanded or directed by an Applicable Governmental Authority shall be modified or developed using the *Standard Processes Manual*. NERC shall, during the development of a modification for the remanded Reliability Standard or directed Reliability Standard, consult with other Applicable Governmental Authorities to coordinate any impacts of the proposed Reliability Standards in those other jurisdictions. The expedited action procedure may be applied if necessary to meet a timetable for action required by the Applicable Governmental Authorities, respecting to the extent possible the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interest in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental Authority, then Rule 321 of these Rules of Procedure shall apply.

3. **Directives to Develop Reliability Standards under Extraordinary Circumstances** — An Applicable Governmental Authority may, on its own initiative, determine that extraordinary circumstances exist requiring expedited development of a Reliability Standard. In such a case, the Applicable Governmental Authority may direct the development of a Reliability Standard within a certain deadline. NERC staff shall prepare the Standards Authorization Request and seek a stakeholder sponsor for the request. If NERC is unable to find a sponsor for the proposed Reliability Standard, NERC will be designated as the requestor. The proposed Reliability Standard will then proceed through the Reliability Standards development process, using the expedited action procedures described in the *Standard Processes Manual* as necessary to meet the specified deadline. The timeline will be developed to respect, to the extent possible, the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of

interests in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental Authority, then Rule 321 of these Rules of Procedure shall apply, with appropriate modification of the timeline.

3.1 Consistent with all Reliability Standards developed under the expedited action process, each of the three possible follow-up actions as documented in the *Standard Processes Manual* are to be completed through the Reliability Standards development process and are subject to approval by the Applicable Governmental Authorities in the U.S. and Canada.

310. Annual Reliability Standards Development Plan

NERC shall develop and provide an annual Reliability Standards Development Plan for development of Reliability Standards to the Applicable Governmental Authorities. NERC shall consider the comments and priorities of the Applicable Governmental Authorities in developing and updating the annual Reliability Standards Development Plan. Each annual Reliability Standards Development Plan shall include a progress report comparing results achieved to the prior year's Reliability Standards Development Plan.

311. Regional Entity Standards Development Procedures

1. **NERC Approval of Regional Entity Reliability Standards Development Procedure** — To enable a Regional Entity to develop Regional Reliability Standards that are to be recognized and made part of NERC Reliability Standards, a Regional Entity may request NERC to approve a Regional Reliability Standards development procedure.

2. **Public Notice and Comment on Regional Reliability Standards Development Procedure** — Upon receipt of such a request, NERC shall publicly notice and request comment on the proposed Regional Reliability Standards development procedure, allowing a minimum of 45 days for comment. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the Regional Reliability Standards development procedure and request another posting for comment, or submit the Regional Reliability Standards development procedure, along with its consideration of any objections received, for approval by NERC.

3. **Evaluation of Regional Reliability Standards Development Procedure** — NERC shall evaluate whether a Regional Reliability Standards development procedure meets the criteria listed below and shall consider stakeholder comments, any unresolved stakeholder objections, and the consideration of comments provided by the Regional Entity, in making that determination. If NERC determines the Regional Reliability Standards development procedure meets these requirements, the Regional Reliability Standards development

procedure shall be submitted to the Board for approval. The Board shall consider the recommended action, stakeholder comments, any unresolved stakeholder comments, and the Regional Entity consideration of comments in determining whether to approve the Regional Reliability Standards development procedure.

3.1 **Evaluation Criteria** — The Regional Reliability Standards development procedure shall be:

3.1.1 **Open** — The Regional Reliability Standards development procedure shall provide that any person or entity who is directly and materially affected by the reliability of the Bulk Power Systems within the Regional Entity shall be able to participate in the development and approval of Reliability Standards. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in the Regional Entity, a Regional Entity or any organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

3.1.2 **Inclusive** — The Regional Reliability Standards development procedure shall provide that any Person with a direct and material interest has a right to participate by expressing an opinion and its basis, having that position considered, and appealing through an established appeals process if adversely affected.

3.1.3 **Balanced** — The Regional Reliability Standards development procedure shall have a balance of interests and shall not permit any two interest categories to control the vote on a matter or any single interest category to defeat a matter.

3.1.4 **Due Process** — The Regional Reliability Standards development procedure shall provide for reasonable notice and opportunity for public comment. At a minimum, the Regional Reliability Standards development procedure shall include public notice of the intent to develop a Regional Reliability Standard, a public comment period on the proposed Regional Reliability Standard, due consideration of those public comments, and a ballot of interested stakeholders.

3.1.5 **Transparent** — All actions material to the development of Regional Reliability Standards shall be transparent. All Regional Reliability Standards development meetings shall be open and publicly noticed on the Regional Entity's website.

3.1.6 **Accreditation of Regional Standards Development Procedure** — A Regional Entity's Regional Reliability Standards

development procedure that is accredited by the American National Standards Institute or the Standards Council of Canada shall be deemed to meet the criteria listed in this Section 311.3.1, although such accreditation is not a prerequisite for approval by NERC.

3.1.7 **Use of NERC Procedure** — A Regional Entity may adopt the NERC *Standard Processes Manual* as the Regional Reliability Standards development procedure, in which case the Regional Entity's Regional Reliability Standards development procedure shall be deemed to meet the criteria listed in this Section 311.3.1.

4. **Revisions of Regional Reliability Standards Development Procedures** — Any revision to a Regional Reliability Standards development procedure shall be subject to the same approval requirements set forth in Sections 311.1 through 311.3.

5. **Duration of Regional Reliability Standards Development Procedures** — The Regional Reliability Standards development procedure shall remain in effect until such time as it is replaced with a new version approved by NERC or it is withdrawn by the Regional Entity. The Regional Entity may, at its discretion, withdraw its Regional Reliability Standards development procedure at any time.

312. Regional Reliability Standards

1. **Basis for Regional Reliability Standards** — Regional Entities may propose Regional Reliability Standards that set more stringent reliability requirements than the NERC Reliability Standard or cover matters not covered by an existing NERC Reliability Standard. Such Regional Reliability Standards shall in all cases be approved by NERC and made part of the NERC Reliability Standards and shall be enforceable in accordance with the delegation agreement between NERC and the Regional Entity or other instrument granting authority over enforcement to the Regional Entity. No entities other than NERC and the Regional Entity shall be permitted to develop Regional Reliability Standards that are enforceable under statutory authority delegated to NERC and the Regional Entity.

2. **Regional Reliability Standards That are Directed by a NERC Reliability Standard** — Although it is the intent of NERC to promote uniform Reliability Standards across North America, in some cases it may not be feasible to achieve a reliability objective with a Reliability Standard that is uniformly applicable across North America. In such cases, NERC may direct Regional Entities to develop Regional Reliability Standards necessary to implement a NERC Reliability Standard. Such Regional Reliability Standards that are developed pursuant to a direction by NERC shall be made part of the NERC Reliability Standards.

3. **Procedure for Developing an Interconnection-wide Regional Standard** — A Regional Entity organized on an Interconnection-wide basis may propose a Regional Reliability Standard for approval as a NERC Reliability Standard to be made mandatory for all applicable Bulk Power System owners, operators, and users within that Interconnection.

3.1 **Presumption of Validity** — An Interconnection-wide Regional Reliability Standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities, shall be adopted as a NERC Reliability Standard. NERC shall rebuttably presume that a Regional Reliability Standard developed, in accordance with a Regional Reliability Standards development process approved by NERC, by a Regional Entity organized on an Interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities.

3.2 **Notice and Comment Procedure for Interconnection-wide Regional Reliability Standard** — NERC shall publicly notice and request comment on the proposed Interconnection-wide Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to comment on or withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for approval by NERC.

3.3 **Approval of Interconnection-wide Regional Reliability Standard by NERC** — NERC shall evaluate and recommend whether a proposed Interconnection-wide Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections that could serve as a basis for rebutting the presumption of validity of the Regional Reliability Standard. The Regional Entity, having been notified of the results of the evaluation and recommendation concerning NERC proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for approval as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, NERC's recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether

to approve the Regional Reliability Standard as a NERC Reliability Standard.

3.4 **Applicable Governmental Authority Approval** — An Interconnection-wide Regional Reliability Standard that has been approved by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

3.5 **Enforcement of Interconnection-wide Regional Reliability Standard** — An Interconnection-wide Regional Reliability Standard that has been approved by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

4. **Procedure for Developing Non-Interconnection-Wide Regional Reliability Standards** — Regional Entities that are not organized on an Interconnection-wide basis may propose Regional Reliability Standards to apply within their respective Regions. Such Regional Reliability Standards may be developed through the NERC Reliability Standards development procedure, or alternatively, through a Regional Reliability Standards development procedure that has been approved by NERC.

4.1 **No Presumption of Validity** — Regional Reliability Standards that are not proposed to be applied on an Interconnection-wide basis are not presumed to be valid but may be demonstrated by the proponent to be valid.

4.2 **Notice and Comment Procedure for Non-Interconnection-wide Regional Reliability Standards** — NERC shall publicly notice and request comment on the proposed Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to comment on or resolve any objections identified in the comments and may choose to withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for approval by NERC.

4.3 **NERC Approval of Non-Interconnection-wide Regional Reliability Standards** — NERC shall evaluate and recommend whether a proposed non-Interconnection-wide Regional Reliability Standard has been

developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections. The Regional Entity, having been notified of the results of the evaluation and recommendation concerning proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for approval as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, the recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether to approve the Regional Reliability Standard as a NERC Reliability Standard.

4.4 **Applicable Governmental Authority Approval** — A non-Interconnection-wide Regional Reliability Standard that has been approved by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

4.5 **Enforcement of Non-Interconnection-wide Regional Reliability Standards** — A non-Interconnection-wide Regional Reliability Standard that has been approved by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

5. **Appeals** — A Regional Entity shall have the right to appeal NERC's decision not to approve a proposed Regional Reliability Standard or Variance to the Commission or other Applicable Governmental Authority.

313. Other Regional Criteria, Guides, Procedures, Agreements, Etc.

1. **Regional Criteria** — Regional Entities may develop Regional Criteria that are necessary to implement, to augment, or to comply with Reliability Standards, but which are not Reliability Standards. Regional Criteria may also address issues not within the scope of Reliability Standards, such as resource adequacy. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents used to enhance the reliability of the Bulk Power System in the Region. These documents typically provide benefits by promoting more consistent implementation of the NERC Reliability Standards within the Region. These documents are not NERC Reliability Standards, Regional Reliability Standards, or regional Variances, and therefore are not enforceable under authority delegated by NERC pursuant to delegation agreements and do not require NERC approval.

2. **Catalog of Regional Criteria** — NERC shall maintain a current catalog of Regional Criteria. Regional Entities shall provide a catalog listing of Regional Criteria to NERC and shall notify NERC of changes to the listing. Regional Entities shall provide any listed document to NERC upon written request.

314. Conflicts with Statutes, Regulations, and Orders

Notice of Potential Conflict — If a Bulk Power System owner, operator, or user determines that a NERC or Regional Reliability Standard may conflict with a function, rule, order, tariff, rate schedule, legislative requirement or agreement that has been accepted, approved, or ordered by a governmental authority affecting that entity, the entity shall expeditiously notify the governmental authority, NERC, and the relevant Regional Entity of the conflict.

1. **Determination of Conflict —** NERC, upon request of the governmental authority, may advise the governmental authority regarding the conflict and propose a resolution of the conflict, including revision of the Reliability Standard if appropriate.

2. **Regulatory Precedence** — Unless otherwise ordered by a governmental authority, the affected Bulk Power System owner, operator, or user shall continue to follow the function, rule, order, tariff, rate schedule, legislative requirement, or agreement accepted, approved, or ordered by the governmental authority until the governmental authority finds that a conflict exists and orders a remedy and such remedy is affected.

315. Revisions to NERC Reliability Standards Development Procedure

Any person or entity may submit a written request to modify NERC *Standard Processes Manual*. Consideration of the request and development of the revision shall follow the process defined in the NERC *Standard Processes Manual*. Upon approval by the Board, the revision shall be submitted to the Applicable Governmental Authorities for approval. Changes shall become effective only upon approval by the Applicable Governmental Authorities or on a date designated by the Applicable Governmental Authorities or as otherwise applicable in a particular jurisdiction.

316. Accreditation

NERC shall seek continuing accreditation of the NERC Reliability Standards development process by the American National Standards Institute and the Standards Council of Canada.

317. Five-Year Review of Reliability Standards

NERC shall complete a review of each NERC Reliability Standard at least once every five years from the effective date of the Reliability Standard or the latest revision to the Reliability Standard, whichever is later. The review process shall be conducted in accordance with the NERC *Standard Processes Manual*. The standards process manager shall be responsible for administration of the five-year review of Reliability Standards. As a result of this review, the NERC Reliability Standard shall be reaffirmed, revised, or withdrawn. If the review indicates a need to revise or withdraw the Reliability Standard, a request for revision or withdrawal shall be prepared, submitted and addressed in accordance with the NERC *Standard Processes Manual*.

318. Coordination with the North American Energy Standards Board

NERC shall, through a memorandum of understanding, maintain a close working relationship with the North American Energy Standards Board and ISO/RTO Council to ensure effective coordination of wholesale electric business practice standards and market protocols with the NERC Reliability Standards.

319. Archived Standards Information

NERC shall maintain a historical record of Reliability Standards information that is no longer maintained on-line. For example, Reliability Standards that expired or were replaced may be removed from the on-line system. Archived information shall be retained indefinitely as practical, but in no case less than five years or one complete Reliability Standards review cycle from the date on which the Reliability Standard was no longer in effect. Archived records of Reliability Standards information shall be available electronically within 30 days following the receipt by the standards process manager of a written request.

320. Alternate Method for Adopting Violation Risk Factors

In the event the Reliability Standards development process fails to produce Violation Risk Factors for a particular Reliability Standard in a timely manner, the Board of Trustees may adopt Violation Risk Factors for that Reliability Standard using the procedures set out in Section 1400 of these Rules of Procedure.

321. Special Rule to Address Certain Regulatory Directives

In circumstances where this Rule 321 applies, the Board of Trustees shall have the authority to take one or more of the actions set out below. The Board of Trustees shall have the authority to choose which one or more of the actions are appropriate to the circumstances and need not take these actions in sequential steps.

1. The Standards Committee shall have the responsibility to ensure that standards drafting teams address specific matters that are identified in directives issued by Applicable Governmental Authorities. If the Board of Trustees is presented with a proposed Reliability Standard that fails to address such directives, the Board of Trustees has the authority to remand, with instructions (including establishing a timetable for action), the proposed Reliability Standard to the Standards Committee.

2. Upon a written finding by the Board of Trustees that a ballot pool has failed to approve a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to remand the proposed Reliability Standard to the Standards Committee, with instructions to (i) convene a public technical conference to discuss the issues surrounding the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified; (ii) working with NERC staff, prepare a memorandum discussing the issues, an analysis of the alternatives considered and other appropriate matters; and (iii) re-ballot the proposed Reliability Standard one additional time, with such adjustments in the schedule as are necessary to meet the deadline contained in paragraph 2.1 of this Rule.

   2.1 Such a re-ballot shall be completed within forty-five (45) days of the remand. The Standards Committee memorandum shall be included in the materials made available to the ballot pool in connection with the re-ballot.

   2.2 In any such re-ballot, negative votes without comments related to the proposal shall be counted for purposes of establishing a quorum, but only affirmative votes and negative votes with comments related to the proposal shall be counted for purposes of determining the number of votes cast and whether the proposed Reliability Standard has been approved.

3. If the re-balloted proposed Reliability Standard achieves at least an affirmative two-thirds majority vote of the weighted Segment votes cast, with a quorum established, then the proposed Reliability Standard shall be deemed approved by the ballot pool and shall be considered by the Board of Trustees for approval.

4. If the re-balloted proposed Reliability Standard fails to achieve at least an affirmative two-thirds majority vote of the weighted Segment votes cast, but does achieve at least a sixty percent affirmative majority of the weighted Segment votes cast, with a quorum established, then the Board of Trustees has the authority to consider the proposed Reliability Standard for approval under the following procedures:

   4.1 The Board of Trustees shall issue notice of its intent to consider the proposed Reliability Standard and shall solicit written public comment

particularly focused on the technical aspects of the provisions of the proposed Reliability Standard that address the specific matter identified in the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified.

4.2 The Board of Trustees may, in its discretion, convene a public technical conference to receive additional input on the matter.

4.3 After considering the developmental record, the comments received during balloting and the additional input received under paragraphs 4.1 and 4.2 of this Rule, the Board of Trustees has authority to act on the proposed Reliability Standard.

4.3.1 If the Board of Trustees finds that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to approve the proposed Reliability Standard and direct that it be filed with Applicable Governmental Authorities with a request that it be made effective.

4.3.2 If the Board of Trustees is unable to find that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to treat the proposed Reliability Standard as a draft Reliability Standard and direct that the draft Reliability Standard and complete developmental record, including the additional input received under paragraphs 4.1 and 4.2 of this Rule, be filed with the Applicable Governmental Authorities as a compliance filing in response to the order giving rise to the regulatory directive, along with a recommendation that the Reliability Standard not be made effective and an explanation of the basis for the recommendation.

A5. Upon a written finding by the Board of Trustees that standard drafting team has failed to develop, or a ballot pool has failed to approve, a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to direct the Standards Committee (with the assistance of stakeholders and NERC staff) to prepare a draft Reliability Standard that addresses the regulatory directive, taking account of the entire developmental record pertaining to the matter. If the Standards Committee fails to prepare such

draft Reliability Standard, the Board of Trustees may direct NERC management to prepare such draft Reliability Standard.

5.1 The Board of Trustees may, in its discretion, convene a public technical conference to receive input on the matter. The draft Reliability Standard shall be posted for a 45-day public comment period.

5.2 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees finds that the draft Reliability Standard, with such modifications as the Board of Trustees determines are appropriate in light of the comments received, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to approve the draft Reliability Standard and direct that the proposed Reliability Standard be filed with Applicable Governmental Authorities with a request that the proposed Reliability Standard be made effective.

5.3 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees is unable to find that the draft Reliability Standard, even with modifications, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to direct that the draft Reliability Standard and complete developmental record be filed as a compliance filing in response to the regulatory directive with the Applicable Governmental Authority issuing the regulatory directive, with a recommendation that the draft Reliability Standard not be made effective.

5.4 The filing of the Reliability Standard under either paragraph 5.2 or paragraph 5.3 of this Rule shall include an explanation of the basis for the decision by the Board of Trustees.

5.5 A Reliability Standard approved under paragraph 5 of this Rule shall not be eligible for submission as an American National Standard.

6. NERC shall on or before March 31st of each year file a report with Applicable Governmental Authorities on the status and timetable for addressing each outstanding directive to address a specific matter received from an Applicable Governmental Authority.

SECTION 400 — COMPLIANCE ENFORCEMENT

401. Scope of the NERC Compliance Monitoring and Enforcement Program

1. **Components of the NERC Compliance Monitoring and Enforcement Program** — NERC shall develop and implement a NERC Compliance Monitoring and Enforcement Program to promote the reliability of the Bulk Power System by enforcing compliance with approved Reliability Standards in those regions of North American in which NERC and/or a Regional Entity (pursuant to a delegation agreement with NERC that has been approved by the Applicable Governmental Authority) has been given enforcement authority. There are four distinct parts of the NERC Compliance Monitoring and Enforcement Program: (1) NERC's oversight of the Regional Entity Compliance Monitoring and Enforcement Programs (Section 402), (2) the definition of the required Regional Entity Compliance Monitoring and Enforcement Program attributes (Section 403), (3) NERC's monitoring of Regional Entity compliance with Reliability Standards (Section 404), and (4) the monitoring of compliance with Reliability Standards that are applicable to NERC (Sections 405–406).

2. **Who Must Comply** — Where required by applicable legislation, regulation, rule or agreement, all Bulk Power System owners, operators, and users, Regional Entities, and NERC, are required to comply with all approved NERC Reliability Standards at all times. Regional Reliability Standards and Variances approved by NERC and the Applicable Governmental Authority shall be considered NERC Reliability Standards and shall apply to all Bulk Power System owners, operators, or users responsible for meeting those Reliability Standards within the Regional Entity boundaries, whether or not the Bulk Power System owner, operator, or user is a member of the Regional Entity.

3. **Data Access** — All Bulk Power System owners, operators, and users shall provide to NERC and the applicable Regional Entity such information as is necessary to monitor compliance with the Reliability Standards. NERC and the applicable Regional Entity will define the data retention and reporting requirements in the Reliability Standards and compliance reporting procedures.

4. **Role of Regional Entities in the Compliance Monitoring and Enforcement Program** — Each Regional Entity that has been delegated authority through a delegation agreement or other legal instrument approved by the Applicable Governmental Authority shall, in accordance with the terms of the approved delegation agreement, administer a Regional Entity Compliance Monitoring and Enforcement program to meet the NERC Compliance Monitoring and Enforcement Program goals and the requirements in this Section 400.

5. **Program Continuity** — NERC will ensure continuity of compliance monitoring and enforcement within the geographic boundaries of a Regional Entity in the event that NERC does not have a delegation agreement, or the Regional Entity withdraws from the agreement or does not operate its Compliance Monitoring and Enforcement Program in accordance with the delegation agreement or other applicable requirements.

5.1 Should NERC not have a delegation agreement with a Regional Entity covering a geographic area, or a Regional Entity withdraws from an existing delegation agreement or the delegation agreement is otherwise terminated, NERC will directly administer the Compliance Monitoring and Enforcement Program applicable to owners, operators and users of the Bulk Power System within that geographic area.

1. This monitoring and enforcement will be accomplished by NERC and Compliance Staff from another approved Regional Entity.

2. If an existing delegation agreement with a Regional Entity is terminating, the Regional Entity shall promptly provide to NERC all relevant compliance information regarding Registered Entities, contacts, prior compliance information and actions, Mitigation Plans, and remedial actions for the period in which the Regional Entity was responsible for administering the Compliance Monitoring and Enforcement Program.

3. NERC will levy and collect all Penalties directly and will utilize any Penalty monies collected to offset the expenses of administering the Compliance Monitoring and Enforcement Program for the geographic area.

5.2 Should a Regional Entity seek to withdraw from its delegation agreement, NERC will seek agreement from another Regional Entity to amend its delegation agreement with NERC to extend that Regional Entity's boundaries for compliance monitoring and enforcement. In the event no Regional Entity is willing to accept this responsibility, NERC will administer the Compliance Monitoring and Enforcement Program within the geographical boundaries of the Regional Entity seeking to withdraw from the delegation agreement, in accordance with Section 401.5.1.

6. **Actively Monitored Requirements** — NERC, with input from the Regional entities, stakeholders, and regulators, shall annually select a subset of the NERC Reliability Standards and Requirements to be actively monitored and audited in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan. Compliance is required with all NERC Reliability Standards whether or not they are included in the subset of Reliability Standards and Requirements designated to be actively monitored and audited in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan.

7. **Penalties, Sanctions, and Remedial Actions** — NERC and Regional Entities will apply Penalties, sanctions, and remedial actions that bear a reasonable relation to the seriousness of a violation and take into consideration timely remedial efforts as defined in the NERC *Sanction Guidelines*, which is incorporated into these rules as **Appendix 4B**.

8. **Multiple Enforcement Actions** – A Registered Entity shall not be subject to an enforcement action by NERC and a Regional Entity for the same violation.

9. **Records** — NERC shall maintain a record of each compliance submission, including Self-Reported, Possible, Alleged, and Confirmed Violations of approved Reliability Standards; associated Penalties, sanctions, remedial actions and settlements; and the status of mitigation actions.

10. **Confidential Information** — NERC will treat all Possible and Alleged Violations of Reliability Standards and matters related to a Compliance Monitoring and Enforcement Program process, including the status of any Compliance Investigation or other Compliance Monitoring and Enforcement Program process, as confidential in accordance with Section 1500.

    The types of information that will be considered confidential and will not (subject to statutory and regulatory requirements) be disclosed in any public information reported by NERC are identified in Section 1500. Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident, will be identified and protected from public disclosure as Critical Energy Infrastructure Information in accordance with Section 1500.

    The Regional Entity and NERC shall give Bulk Power System owners, operators, and users a reasonable opportunity to demonstrate that information concerning a violation is confidential before such report is disclosed to the public.

11. **Public Posting** — When the affected Bulk Power System owner, operator, or user either agrees with a Possible or Alleged Violation(s) of a Reliability Standard(s) or a report of a Compliance Audit or Compliance Investigation, or enters into a settlement agreement concerning a Possible or Alleged Violation(s), or the time for submitting an appeal is passed, or all appeals processes are complete, NERC shall, subject to the confidentiality requirements of these Rules of Procedure, publicly post each Confirmed Violation, Penalty or sanction, settlement agreement, and final Compliance Audit or Compliance Investigation report, on its website.

    11.1 Each Bulk Power System owner, operator, or user may provide NERC with a statement to accompany the Confirmed Violation or report to be posted publicly. The statement must be on company letterhead and include a signature, as well as the name and title of the person submitting the information.

    11.2 In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information (*NERC Security Guidelines for the Electricity Sector — Protecting Potentially Sensitive Information* may be used as a guide) or other Confidential Information shall be redacted in accordance with Section 1500 and not be released publicly.

    11.3 Subject to redaction of Critical Energy Infrastructure Information or other Confidential Information, for each Confirmed Violation or settlement relating to a Possible Violation or an Alleged Violation, the public posting

shall include the name of any relevant entity, the nature, time period, and circumstances of such Possible, Alleged or Confirmed Violation, any Mitigation Plan to be implemented by the Registered Entity in connection with the Confirmed Violation or settlement, and sufficient facts to assist owners, operators and users of the Bulk Power System to evaluate whether they have engaged in or are engaging in similar activities.

12. **Violation Information Review** — NERC Compliance Staff shall periodically review and analyze all reports of Possible, Alleged and Confirmed Violations to identify trends and other pertinent reliability issues.

402. NERC Oversight of the Regional Entity Compliance Monitoring and Enforcement Programs

1. **NERC Monitoring Program** — NERC shall have a program to monitor the Compliance Monitoring and Enforcement Program of each Regional Entity that has been delegated authority. The objective of this monitoring program shall be to ensure that the Regional Entity carries out its Compliance Monitoring and Enforcement Program in accordance with these Rules of Procedure and the terms of the delegation agreement, and to ensure consistency and fairness of the Regional Entity's Compliance Monitoring and Enforcement Program. Oversight and monitoring by NERC shall be accomplished through an annual Compliance Monitoring and Enforcement Program review, program audits, and regular evaluations of Regional Entity Compliance Monitoring and Enforcement Program performance as described below.

   1.1 **NERC Review of Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plans** — NERC shall require each Regional Entity to submit for review and approval an annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan. NERC shall review each annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan and shall accept the plan if it meets NERC requirements and the requirements of the delegation agreement.

   1.2 **Regional Entity Compliance Monitoring and Enforcement Program Evaluation** — NERC shall annually evaluate the goals, tools, and procedures of each Regional Entity Compliance Monitoring and Enforcement Program to determine the effectiveness of each Regional Entity Compliance Monitoring and Enforcement Program, using criteria developed by the NERC Compliance and Certification Committee.

   1.3 **Regional Entity Compliance Monitoring and Enforcement Program Audit** — At least once every five years, NERC shall conduct an audit to evaluate how each Regional Entity Compliance Monitoring and Enforcement Program implements the NERC Compliance Monitoring and Enforcement Program. The evaluation shall be based on these Rules of Procedure, including Appendix 4C, the delegation agreement, directives in effect pursuant to the delegation agreement, approved annual Regional

Entity Compliance Monitoring and Enforcement Program Implementation Plans, required Compliance Monitoring and Enforcement Program attributes, and the NERC Compliance Monitoring and Enforcement Program procedures. These evaluations shall be provided to the Applicable Governmental Authorities to demonstrate the effectiveness of each Regional Entity. In addition, audits of Cross-Border Regional Entities shall cover applicable requirements imposed on the Regional Entity by statute, regulation, or order of, or agreement with, provincial governmental and/or regulatory authorities for which NERC has auditing responsibilities over the Regional Entity's compliance with such requirements within Canada or Mexico. Participation of a representative of an Applicable Governmental Authority shall be subject to the limitations of sections 3.1.6 and 8.0 of Appendix 4C of these Rules of Procedure regarding disclosures of non-public compliance information related to other jurisdictions. NERC shall maintain an audit procedure containing the requirements, steps, and timelines to conduct an audit of each Regional Entity Compliance Monitoring and Enforcement Program. The current procedure is contained in the NERC Audit of Regional Entity Compliance Programs, which is incorporated into these rules as **Appendix 4A**.

1.3.1. NERC shall establish a program to audit bulk power system owners, operators, and users operating within a regional entity to verify the findings of previous compliance audits conducted by the regional entity to evaluate how well the regional entity compliance enforcement program is meeting its delegated authority and responsibility.

1.4 Applicable Governmental Authorities will be allowed to participate as an observer in any audit conducted by NERC of a Regional Entity's Compliance Monitoring and Enforcement Program. A representative of the Regional Entity being audited will be allowed to participate in the audit as an observer.

2. **Consistency Among Regional Compliance Monitoring and Enforcement Programs** — To provide for a consistent Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users required to comply with approved Reliability Standards, NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program, which is incorporated into these rules of procedure as **Appendix 4C**. Any differences in Regional Entity Compliance Monitoring and Enforcement Program methods, including determination of violations and Penalty assessment, shall be justified on a case-by-case basis and fully documented in each Regional Entity delegation agreement.

2.1 NERC shall ensure that each of the Regional Entity Compliance Monitoring and Enforcement Programs meets these Rules of Procedure, including **Appendix 4C**, and follows the terms of the delegation

agreement and the approved annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan.

2.2 NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program in **Appendix 4C** containing the procedures to ensure the consistency and fairness of the processes used to determine Regional Entity Compliance Monitoring and Enforcement Program findings of compliance and noncompliance, and the application of Penalties and sanctions.

2.3 NERC shall periodically conduct Regional Entity compliance manager forums. These forums shall use the results of Regional Entity Compliance Monitoring and Enforcement Program audits and findings of NERC Compliance Staff to identify and refine Regional Entity Compliance Monitoring and Enforcement Program differences into a set of best practices over time.

3. **Information Collection and Reporting** — NERC and the Regional Entities shall implement data management procedures that address data reporting requirements, data integrity, data retention, data security, and data confidentiality.

4. **Violation Disclosure** — NERC shall disclose all Confirmed Violations and maintain as confidential Possible Violations and Alleged Violations, according to the reporting and disclosure process in **Appendix 4C**.

5. **Authority to Determine Noncompliance, Levy Penalties and Sanctions, and Issue Remedial Action Directives** — NERC and Regional Entity Compliance Staff shall have the authority and responsibility to make initial determinations of compliance or noncompliance, and where authorized by the Applicable Governmental Authorities or where otherwise authorized, to determine Penalties and sanctions for noncompliance with a Reliability Standard, and issue Remedial Action Directives. Regional Entity boards or a compliance panel reporting directly to the Regional Entity board will be vested with the authority for the overall Regional Entity Compliance Monitoring and Enforcement Program and have the authority to impose Penalties and sanctions on behalf of NERC, where authorized by applicable legislation or agreement. Remedial Action Directives may be issued by NERC or a Regional Entity that is aware of a Bulk Power System owner, operator, or user that is about to engage in an act or practice that would result in noncompliance with a Reliability Standard, where such Remedial Action Directive is immediately necessary to protect the reliability of the Bulk Power System from an imminent threat. If, after receiving such a Remedial Action Directive, the Bulk Power System owner, operator, or user does not take appropriate action to avert a violation of a Reliability Standard, NERC may petition the Applicable Governmental Authority to issue a compliance order.

6. **Due Process** — NERC shall establish and maintain a fair, independent, and nondiscriminatory appeals process. The appeals process is set forth in Sections

408-410. The process shall allow Bulk Power System owners, operators, and users to appeal the Regional Entity's findings of noncompliance and to appeal Penalties, sanctions, and Remedial Action Directives that are levied by the Regional Entity. Appeals beyond the NERC process will be heard by the Applicable Governmental Authority.

The appeals process will also allow for appeals to NERC of any findings of noncompliance issued by NERC to a Regional Entity for Reliability Standards and Requirements where the Regional Entity is monitored for compliance to a Reliability Standard. No monetary Penalties will be levied in these matters; however sanctions, remedial actions, and directives to comply may be applied by NERC.

7. **Conflict Disclosure** — NERC shall disclose to the appropriate governmental authorities any potential conflicts between a market rule and the enforcement of a Regional Reliability Standard.

8. **Confidentiality** — To maintain the integrity of the NERC Compliance Monitoring and Enforcement Program, NERC and Regional Entity staff, Compliance Audit team members, and committee members shall maintain the confidentiality of information obtained and shared during compliance monitoring and enforcement processes including Compliance Investigations, Compliance Audits, Spot Checks, drafting of reports, appeals, and closed meetings.

   8.1 NERC and the Regional Entity shall have in place appropriate codes of conduct and confidentiality agreements for staff and other Compliance Monitoring and Enforcement Program participants.

   8.2 Individuals not bound by NERC or Regional Entity codes of conduct who serve on compliance-related committees or Compliance Audit teams shall sign a NERC confidentiality agreement prior to participating on the committee or Compliance Audit team.

   8.3 Information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall not be distributed outside of a committee or team, nor released publicly. Other information subject to confidentiality is identified in Section 1500.

   8.4 In the event that a staff, committee, or Compliance Audit team member violates any of the confidentiality rules set forth above, the staff, committee, or Compliance Audit team member and any member organization with which the individual is associated may be subject to appropriate action by the Regional Entity or NERC, including prohibiting participation in future Compliance Monitoring and Enforcement Program activities.

9. **Auditor Training** — NERC shall develop and provide training in auditing skills to all people who participate in NERC and Regional Entity Compliance Audits. Training for NERC and Regional Entity personnel and others who serve as Compliance Audit team leaders shall be more comprehensive than training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

403. Required Attributes of Regional Entity Compliance Monitoring and Enforcement Programs

Each Regional Entity Compliance Monitoring and Enforcement Program shall promote excellence in the enforcement of Reliability Standards. To accomplish this goal, each Regional Entity Compliance Monitoring and Enforcement Program shall (i) conform to and comply with the NERC uniform Compliance Monitoring and Enforcement Program, **Appendix 4C** to these Rules of Procedure, except to the extent of any deviations that are stated in the Regional Entity's delegation agreement, and (ii) meet all of the attributes set forth in this Section 403.

Program Structure

1. **Independence** — Each Regional Entity's governance of its Compliance Monitoring and Enforcement Program shall exhibit independence, meaning the Compliance Monitoring and Enforcement Program shall be organized so that its compliance monitoring and enforcement activities are carried out separately from other activities of the Regional Entity. The Compliance Monitoring and Enforcement Program shall not be unduly influenced by the Bulk Power System owners, operators, and users being monitored or other Regional Entity activities that are required to meet the Reliability Standards. Regional Entities must include rules providing that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

2. **Exercising Authority** — Each Regional Entity Compliance Monitoring and Enforcement Program shall exercise the responsibility and authority in carrying out the delegated functions of the NERC Compliance Monitoring and Enforcement Program in accordance with delegation agreements and **Appendix 4C**. These functions include but are not limited to: data gathering, data reporting, Compliance Investigations, Compliance Audit activities, evaluating compliance and noncompliance, imposing Penalties and sanctions, and approving and tracking mitigation actions.

3. **Delegation of Authority** — To maintain independence, fairness, and consistency in the NERC Compliance Monitoring and Enforcement Program, a Regional Entity shall not sub-delegate its Compliance Monitoring and Enforcement Program duties to entities or persons other than the Regional Entity Compliance Staff, unless (i) required by statute or regulation in the applicable jurisdiction, or (ii) by agreement with express approval of NERC and of FERC or other Applicable Governmental Authority, to another Regional Entity.

4. **Hearings of Contested Findings or Sanctions —** The Regional Entity board or compliance panel reporting directly to the Regional Entity board (with appropriate

recusal procedures) will be vested with the authority for conducting compliance hearings in which any Bulk Power System owner, operator, or user provided a Notice of Alleged Violation may present facts and other information to contest a Notice of Alleged Violation or any proposed Penalty, sanction, any Remedial Action Directive, or any Mitigation Plan component. Compliance hearings shall be conducted in accordance with the Hearing Procedures set forth in Attachment 2 to **Appendix 4C**. If a stakeholder body serves as the Hearing Body, no two industry sectors may control any decision and no single segment may veto any matter related to compliance after recusals.

Program Resources

5. **Regional Entity Compliance Staff** — Each Regional Entity shall have sufficient resources to meet delegated compliance monitoring and enforcement responsibilities, including the necessary professional staff to manage and implement the Regional Entity Compliance Monitoring and Enforcement Program.

6. **Regional Entity Compliance Staff Independence** — The Regional Entity Compliance Staff shall be capable of and required to make all determinations of compliance and noncompliance and determine Penalties, sanctions, and remedial actions.

    6.1 Regional Entity Compliance Staff shall not have a conflict of interest, real or perceived, in the outcome of compliance monitoring and enforcement processes, reports, or sanctions. The Regional Entity shall have in effect a conflict of interest policy.

    6.2 Regional Entity Compliance Staff shall have the authority and responsibility to carry out compliance monitoring and enforcement processes (with the input of industry subject matter experts), make determinations of compliance or noncompliance, and levy Penalties and sanctions without interference or undue influence from Regional Entity members and their representative or other industry entities.

    6.3 Regional Entity Compliance Staff may call upon independent technical subject matter experts who have no conflict of interest in the outcome of the compliance monitoring and enforcement process to provide technical advice or recommendations in the determination of compliance or noncompliance.

    6.4 Regional Entity Compliance Staff shall abide by the confidentiality requirements contained in Section 1500 and **Appendix 4C** of these Rules of Procedure, the NERC delegation agreement and other confidentiality agreements required by the NERC Compliance Monitoring and Enforcement Program.

    6.5 Contracting with independent consultants or others working for the Regional Entity Compliance Monitoring and Enforcement Program shall be permitted provided the individual has not received compensation from a Bulk Power System owner, operator, or user being monitored for a

period of at least the preceding six months and owns no financial interest in any Bulk Power System owner, operator, or user being monitored for compliance to the Reliability Standard, regardless of where the Bulk Power System owner, operator, or user operates. Any such individuals for the purpose of these Rules of Procedure shall be considered as augmenting Regional Entity Compliance Staff.

7. Use of Industry Subject Matter Experts and Regional Entity Members — Industry experts and Regional Entity members may be called upon to provide their technical expertise in Compliance Monitoring and Enforcement Program activities.

7.1 The Regional Entity shall have procedures defining the allowable involvement of industry subject matter experts and Regional Entity members. The procedures shall address applicable antitrust laws and conflicts of interest.

7.2 Industry subject matter experts and Regional Entity members shall have no conflict of interest or financial interests in the outcome of their activities.

7.3 Regional Entity members and industry subject matter experts, as part of teams or Regional Entity committees, may provide input to the Regional Entity Compliance Staff so long as the authority and responsibility for (i) evaluating and determining compliance or noncompliance and (ii) levying Penalties, sanctions, or remedial actions shall not be delegated to any person or entity other than the Compliance Staff of the Regional Entity. Industry subject matter experts, Regional Entity members, or Regional Entity committees shall not make determinations of noncompliance or levy Penalties, sanctions, or remedial actions. Any committee involved shall be organized so that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

7.4 Industry subject matter experts and Regional Entity members shall sign a confidentiality agreement appropriate for the activity being performed.

7.5 All industry subject matter experts and Regional Entity members participating in Compliance Audits and Compliance Investigations shall successfully complete auditor training provided by NERC or the Regional Entity prior to performing these activities

Program Design

8. **Regional Entity Compliance Monitoring and Enforcement Program Content** — All approved Reliability Standards shall be included in the Regional Entity Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users within the defined boundaries of the Regional Entity.

Compliance to approved Regional Reliability Standards is applicable only within the Region of the Regional Entity that submitted those particular Regional Reliability Standards for approval. NERC will identify the minimum set of Reliability Standards and Requirements to be actively monitored by the Regional Entity in a given year.

9. **Antitrust Provisions** — Each Regional Entity's Compliance Monitoring and Enforcement Program shall be structured and administered to abide by U.S. antitrust law and Canadian competition law.

10. **Information Submittal** — All Bulk Power System owners, operators, and users within the Regional Entity responsible for complying with Reliability Standards shall submit timely and accurate information when requested by the Regional Entity or NERC. NERC and the Regional Entities shall preserve any mark of confidentiality on information submitted pursuant to Section 1502.1.

    10.1 Each Regional Entity has the authority to collect the necessary information to determine compliance and shall develop processes for gathering data from the Bulk Power System owners, operators, and users the Regional Entity monitors.

    10.2 The Regional Entity or NERC has the authority to request information from Bulk Power System owners, operators, and users pursuant to Section 401.3 or this Section 403.10 without invoking a specific compliance monitoring and enforcement process in **Appendix 4C**, for purposes of determining whether to pursue one such process in a particular case and/or validating in the enforcement phase of a matter the conclusions reached through the compliance monitoring and enforcement process(es).

    10.3 When required or requested, the Regional Entities shall report information to NERC promptly and in accordance with **Appendix 4C** and other NERC procedures.

    10.4 Regional Entities shall notify NERC of all Possible, Alleged and Confirmed Violations of NERC Reliability Standards by Registered Entities over which the Regional Entity has compliance monitoring and enforcement authority, in accordance with **Appendix 4C**.

    10.5 A Bulk Power System owner, operator, or user found in noncompliance with a Reliability Standard shall submit a Mitigation Plan with a timeline addressing how the noncompliance will be corrected. The Regional Entity Compliance Staff shall review and approve the Mitigation Plan in accordance with **Appendix 4C**.

    10.6 An officer of a Bulk Power System owner, operator, or user shall certify as accurate all compliance data Self-Reported to the Regional Entity Compliance Monitoring and Enforcement Program.

10.7 Regional Entities shall develop and implement procedures to verify the compliance information submitted by Bulk Power System owners, operators, and users.

11. **Compliance Audits of Bulk Power System Owners, Operators, and Users** — Each Regional Entity will maintain and implement a program of proactive Compliance Audits of Bulk Power System owners, operators, and users responsible for complying with Reliability Standards, in accordance with **Appendix 4C**. A Compliance Audit is a process in which a detailed review of the activities of a Bulk Power System owner, operator, or user is performed to determine if that Bulk Power System owner, operator, or user is complying with approved Reliability Standards.

11.1 For an entity registered as a Balancing Authority, Reliability Coordinator, or Transmission Operator, the Compliance Audit will be performed at least once every three years. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, Compliance Audits shall be performed on a schedule established by NERC.

11.2 Compliance Audits of Balancing Authorities, Reliability Coordinators, and Transmission Operators will include a component at the audited entity's site. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, the Compliance Audit may be either an on-site Compliance Audit or based on review of documents, as determined to be necessary and appropriate by NERC or Regional Entity Compliance Staff.

11.3 Compliance Audits must include a detailed review of the activities of the Bulk Power System owner, operator, or user to determine if the Bulk Power System owner, operator, or user is complying with all approved Reliability Standards identified for audit by NERC. The Compliance Audit shall include a review of supporting documentation and evidence used by the Bulk Power System owner, operator or user to demonstrate compliance for an appropriate period prior to the Compliance Audit.

12. **Confidentiality of Compliance Monitoring and Enforcement Processes** — All compliance monitoring and enforcement processes, and information obtained from such processes, are to be non-public and treated as confidential in accordance with Section 1500 and **Appendix 4C** of these Rules of Procedure, unless NERC, the Regional Entity or FERC or another Applicable Governmental Authority with jurisdiction determines a need to conduct a Compliance Monitoring and Enforcement Program process on a public basis, provided, that NERC and the Regional Entities shall publish (i) schedules of Compliance Audits scheduled in each year, (ii) a public report of each Compliance Audit, and (iii) Notices of Penalty and settlement agreements. Advance authorization from the Applicable Governmental Authority is required to make public any compliance monitoring and enforcement process or any information relating to a compliance

monitoring and enforcement process, or to permit interventions when determining whether to impose a Penalty. This prohibition on making public any compliance monitoring and enforcement process does not prohibit NERC or a Regional Entity from publicly disclosing (i) the initiation of or results from an analysis of a significant system event under Section 807 or of off-normal events or system performance under Section 808, or (ii) information of general applicability and usefulness to owners, operators, and users of the Bulk Power System concerning reliability and compliance matters, so long as specific allegations or conclusions regarding Possible or Alleged Violations of Reliability Standards are not included in such disclosures.

13. **Critical Energy Infrastructure Information** — Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident will be identified and protected from public disclosure as Critical Energy Infrastructure Information. In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall be redacted according to NERC procedures and shall not be released publicly.

14. **Penalties, Sanctions, and Remedial Action Directives** — Each Regional Entity will apply all Penalties, sanctions, and Remedial Action Directives in accordance with the approved *Sanction Guidelines*, **Appendix 4B** to these Rules of Procedure. Any changes to the *Sanction Guidelines* to be used by any Regional Entity must be approved by NERC and submitted to the Applicable Governmental Authority for approval. All Confirmed Violations, Penalties, and sanctions will be provided to NERC for review and filing with Applicable Governmental Authorities as a Notice of Penalty, in accordance with **Appendix 4C**.

15. **Regional Entity Hearing Process** — Each Regional Entity Compliance Monitoring and Enforcement Program shall establish and maintain a fair, independent, and nondiscriminatory process for hearing contested violations and any Penalties or sanctions levied, in conformance with Attachment 2 to **Appendix 4C** to these Rules of Procedure and any deviations therefrom that are set forth in the Regional Entity's delegation agreement. The hearing process shall allow Bulk Power System owners, operators, and users to contest findings of compliance violations, any Penalties and sanctions that are proposed to be levied, proposed Remedial Action Directives, and components of proposed Mitigation Plans. The Regional Entity hearing process shall be conducted before the Regional Entity board or a balanced committee established by and reporting to the Regional Entity board as the final adjudicator, provided, that Canadian provincial regulators may act as the final adjudicator in their respective jurisdictions. The Regional Entity hearing process shall (i) include provisions for recusal of any members of the Hearing Body with a potential conflict of interest, real or perceived, from all compliance matters considered by the Hearing Body for which the potential conflict of interest exists and (ii) provide that no two industry sectors may control any decision and no single segment may veto any matter brought before the Hearing Body after recusals.

Each Regional Entity will notify NERC of all hearings and NERC may observe any of the proceedings. Each Regional Entity will notify NERC of the outcome of all hearings.

If a Bulk Power System owner, operator, or user has completed the Regional Entity hearing process and desires to appeal the outcome of the hearing, the Bulk Power System owner, operator, or user shall appeal to NERC in accordance with Section 409 of these Rules of Procedure, except that a determination of violation or Penalty that has been directly adjudicated by an Applicable Governmental Authority shall be appealed with that Applicable Governmental Authority.

16. **Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan** — Each Regional Entity shall annually develop and submit to NERC for approval a Regional Entity Compliance Monitoring and Enforcement Implementation Plan in accordance with **Appendix 4C** that identifies the Reliability Standards and Requirements to be actively monitored (both those required by NERC and any additional Reliability Standards the Regional Entity proposes to monitor), and how each NERC and Regional Entity identified Reliability Standard will be monitored, evaluated, reported, sanctioned, and appealed. These Regional Implementation Plans will be submitted to NERC on the schedule established by NERC, generally on or about November 1 of the preceding year. In conjunction with the annual Regional Implementation Plan, each Regional Entity must report to NERC regarding how it carried out its delegated compliance monitoring and enforcement authority in the previous year, the effectiveness of the Compliance Monitoring and Enforcement Program, and changes expected to correct any deficiencies identified. Each Regional Entity will provide its annual report on the schedule established by NERC, generally on or about February 15 of the following year.

404. NERC Monitoring of Compliance for Regional Entities or Bulk Power Owners, Operator, or Users

NERC shall monitor Regional Entity compliance with NERC Reliability Standards and, if no there is no delegation agreement in effect with a Regional Entity for the geographic area, shall monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards. Industry subject matter experts may be used as appropriate in Compliance Investigations, Compliance Audits, and other Compliance Monitoring and Enforcement Program activities, subject to confidentiality, antitrust, and conflict of interest provisions.

1. **NERC Obligations** — NERC Compliance Staff shall monitor the compliance of the Regional Entity with the Reliability Standards for which the Regional Entities are responsible, in accordance with **Appendix 4C**. NERC shall actively monitor in its annual Compliance Enforcement and Monitoring Program selected Reliability Standards that apply to the Regional Entities. NERC shall evaluate compliance and noncompliance with all of the Reliability Standards that apply to the Regional Entities and shall impose sanctions, Penalties, or Remedial Action

Directives when there is a finding of noncompliance. NERC shall post all violations of Reliability Standards that apply to the Regional Entities as described in the reporting and disclosure process in **Appendix 4C**.

In addition, NERC will directly monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards in any geographic area for which there is not a delegation agreement in effect with a Regional Entity, in accordance with **Appendix 4C**. In such cases, NERC will serve as the Compliance Enforcement Authority described in **Appendix 4C**. Compliance matters contested by Bulk Power System owners, operators, and users in such an event will be heard by the NERC Compliance and Certification Committee.

2. **Compliance Audit of the Regional Entity** — NERC shall perform a Compliance Audit of each Regional Entity responsible for complying with Reliability Standards at least once every three years. NERC shall make an evaluation of compliance based on the information obtained through the Compliance Audit. After due process is complete, the final Compliance Audit report shall be made public in accordance with the reporting and disclosure process in **Appendix 4C**.

3. **Appeals Process** —Any Regional Entity or Bulk Power System owner, operator or user found by NERC, as opposed to a Regional Entity, to be in noncompliance with a Reliability Standard may appeal the findings of noncompliance with Reliability Standards and any sanctions or Remedial Action Directives that are issued by, or Mitigation Plan components imposed by, NERC, pursuant to the processes described in Sections 408 through 410.

405. Monitoring of Reliability Standards and Other Requirements Applicable to NERC

The NERC Compliance and Certification Committee shall establish and implement a process to monitor NERC's compliance with the Reliability Standards that apply to NERC. The process shall use independent monitors with no conflict of interest, real or perceived, in the outcomes of the process. All violations shall be made public according to the reporting and disclosure process in **Appendix 4C**. The Compliance and Certification Committee will also establish a procedure for monitoring NERC's compliance with its Rules of Procedure for the Standards Development, Compliance Monitoring and Enforcement, and Organization Registration and Certification Programs. Such procedures shall not be used to circumvent the appeals processes established for those programs.

406. Independent Audits of the NERC Compliance Monitoring and Enforcement Program

NERC shall provide for an independent audit of its Compliance Monitoring and Enforcement Program at least once every three years, or more frequently as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board. The independent audit shall meet the following minimum requirements and any other requirements established by the NERC Board.

1. **Effectiveness** — The audit shall evaluate the success and effectiveness of the NERC Compliance Monitoring and Enforcement Program in achieving its mission.

2. **Relationship** — The audit shall evaluate the relationship between NERC and the Regional Entity Compliance Monitoring and Enforcement Programs and the effectiveness of the programs in ensuring reliability.

3. **Final Report Posting** — The final report shall be posted by NERC for public viewing in accordance with **Appendix 4C**.

4. **Response to Recommendations** — If the audit report includes recommendations to improve the NERC Compliance Monitoring and Enforcement Program, the administrators of the NERC Compliance Monitoring and Enforcement Program shall provide a written response and plan to the Board within 30 days of the release of the final audit report.

407. Penalties, Sanctions, and Remedial Actions

1. **NERC Review of Regional Entity Penalties and Sanctions —** NERC shall review all Penalties, sanctions, and remedial actions imposed by each Regional Entity for violations of Reliability Standards to determine if the Regional Entity's determination is supported by a sufficient record compiled by the Regional Entity, is consistent with the *Sanction Guidelines* incorporated into these Rules of Procedure as **Appendix 4B** and with other directives, guidance and directions issued by NERC pursuant to the delegation agreement, and is consistent with Penalties, sanctions and remedial actions imposed by the Regional Entity and by other Regional Entities for violations involving the same or similar facts and circumstances.

2. **Developing Penalties and Sanctions** — The Regional Entity Compliance Staff shall use the *Sanction Guidelines*, which are incorporated into these Rules of Procedure as **Appendix 4B**, to develop an appropriate Penalty, sanction, or remedial action for a violation, and shall notify NERC of the Penalty or sanction.

3. **Effective Date of Penalty** — Where authorized by applicable legislation or agreement, no Penalty imposed for a violation of a Reliability Standard shall take effect until the thirty-first day after NERC files, with the Applicable Governmental Authority, a "Notice of Penalty" and the record of the proceedings in which the violation and Penalty were determined, or such other date as ordered by the Applicable Governmental Authority.

408. Review of NERC Decisions

1. **Scope of Review** — A Registered Entity or a Regional Entity wishing to challenge a finding of noncompliance and the imposition of a Penalty for a compliance measure directly administered by NERC, or a Regional Entity wishing to challenge a Regional Entity Compliance Monitoring and Enforcement Program audit finding, may do so by filing a notice of the challenge with NERC's

Director of Compliance no later than 21 days after issuance of the notice of finding of violation or audit finding. Appeals by Registered Entities of decisions of Regional Entity Hearing Bodies shall be pursuant to Section 409 .

2. **Contents of Notice** — The notice of challenge shall include the full text of the decision that is being challenged, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief.

3. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of challenge, the NERC Director of Compliance may file with the Hearing Panel a response to the issues raised in the notice, with a copy to the Regional Entity.

4. **Hearing by Compliance and Certification Committee** — The NERC Compliance and Certification Committee shall provide representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program an opportunity to be heard and shall decide the matter based upon the filings and presentations made, with a written explanation of its decision.

5. **Appeal** — The Regional Entity, or Registered Entity may appeal the decision of the Compliance and Certification Committee by filing a notice of appeal with NERC's Director of Compliance no later than 21 days after issuance of the written decision by the Compliance and Certification Committee. The notice of appeal shall include the full text of the written decision of the Compliance and Certification Committee that is being appealed, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not presented to the Compliance and Certification Committee.

6. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of appeal, the NERC Compliance Monitoring and Enforcement Program staff may file its response to the issues raised in the notice of appeal, with a copy to the entity filing the notice.

7. **Reply** — The entity filing the appeal may file a reply within 7 days.

8. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record, the response, and any reply. At its discretion, the Compliance Committee may invite representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program to appear before the Compliance Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

9. **Impartiality** — No member of the Compliance and Certification Committee or the Board of Trustees Compliance Committee having an actual or perceived conflict of interest in the matter may participate in any aspect of the challenge or appeal except as a party or witness.

10. **Expenses** — Each party in the challenge and appeals processes shall pay its own expenses for each step in the process.

11. **Non-Public Proceedings —** All challenges and appeals shall be closed to the public to protect Confidential Information.

409. Appeals from Final Decisions of Regional Entities

1. **Time for Appeal** — An owner, operator or user of the Bulk Power System wishing to appeal from a final decision of a Regional Entity that finds a violation of a Reliability Standard or imposes a Penalty for violation of a Reliability Standard shall file its notice of appeal with NERC's Director of Compliance, with a copy to the Regional Entity, no later than 21 days after issuance of the final decision of the Regional Entity Hearing Body. The same appeal procedures will apply regardless of whether the matter first arose in a Compliance Investigation, Compliance Audit or Self-Report, other compliance monitoring and enforcement process, or in a reliability readiness evaluation.

2. **Contents** — The notice of appeal shall include the full text of the final decision of the Regional Entity Hearing Body that is being appealed, a concise statement of the error or errors contained in the final decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not first presented during the compliance hearing before the Regional Entity Hearing Body.

3. **Response by Regional Entity** — Within 21 days after receiving a copy of the notice of appeal, the Regional Entity shall file the entire record of the matter with NERC's Director of Compliance, with a copy to the Registered Entity filing the notice, together with its response to the issues raised in the notice of appeal.

4. **Reply** — The Registered Entity filing the appeal may file a reply to the Regional Entity within 7 days.

5. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record of the matter from the Regional Entity, the response, and any reply filed with NERC. At its discretion, the Compliance Committee may invite representatives of the Registered Entity making the appeal and the Regional Entity to appear before the Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

6. **Expenses** — Each party in the appeals process shall pay its own expenses for each step in the process.

7. **Non-Public Proceedings** — All appeals shall be closed to the public to protect Confidential Information.

410. Hold Harmless

A condition of invoking the challenge or appeals processes under Section 408 or 409 is that the entity requesting the challenge or appeal agrees that neither NERC (defined to include its Members, Board of Trustees, committees, subcommittees, staff and industry subject matter experts), any person assisting in the challenge or appeals processes, nor any company employing a person assisting in the challenge or appeals processes, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the challenge or appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

411. Requests for Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Reliability Standards

A Registered Entity that is subject to an Applicable Requirement of a NERC Critical Infrastructure Protection Standard for which Technical Feasibility Exceptions are permitted, may request a Technical Feasibility Exception to the Requirement, and the request will be reviewed, approved or disapproved, and if approved, implemented, in accordance with the NERC *Procedure for Requesting and Receiving Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Standard*, Appendix 4D to these Rules of Procedure.

SECTION 500 — ORGANIZATION REGISTRATION AND CERTIFICATION

501. Scope of the Organization Registration and Organization Certification Programs

The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved Reliability Standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable Reliability Standards. Registered Entities are not and do not become Members of NERC or a Regional Entity, by virtue of being listed on the NCR. Membership in NERC is governed by Article II of NERC's Bylaws; membership in a Regional Entity or regional reliability organization is governed by that entity's bylaws or rules.

The purpose of the Organization Certification Program is to ensure that the new entity (i.e., applicant to be an RC, BA, or TOP that is not already performing the function for which it is applying to be certified as) has the tools, processes, training, and procedures to demonstrate their ability to meet the Requirements/sub-Requirements of all of the Reliability Standards applicable to the function(s) for which it is applying thereby demonstrating the ability to become certified and then operational.

Organization Registration and Organization Certification may be delegated to Regional Entities in accordance with the procedures in this Section 500; the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into these Rules of Procedure as **Appendix 5A**; and, approved Regional Entity delegation agreements or other applicable agreements.

1. **NERC Compliance Registry** — NERC shall establish and maintain the NCR of the Bulk Power System owners, operators, and users that are subject to approved Reliability Standards.

   1.1 (a) The NCR shall set forth the identity and functions performed for each organization responsible for meeting Requirements/sub-Requirements of the Reliability Standards. Bulk Power System owners, operators, and users (i) shall provide to NERC and the applicable Regional Entity information necessary to complete the Registration, and (ii) shall provide NERC and the applicable Regional Entity with timely updates to information concerning the Registered Entity's ownership, operations, contact information, and other information that may affect the Registered Entity's Registration status or other information recorded in the Compliance Registry.

   (b) A generation or transmission cooperative, a joint-action agency or another organization may register as a Joint Registration Organization (JRO), in lieu of each of the JRO's members or related entities being registered individually for one or more functions. Refer to Section 507.

(c) Multiple entities may each register using a Coordinated Functional Registration (CFR) for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function pursuant to a written agreement for the division of compliance responsibility. Refer to Section 508.

1.2 In the development of the NCR, NERC and the Regional Entities shall determine which organizations should be placed on the NCR based on the criteria provided in the NERC *Statement of Compliance Registry Criteria* which is incorporated into these Rules of Procedure as **Appendix 5B**.

1.3 NERC and the Regional Entities shall use the following rules for establishing and maintaining the NCR based on the Registration criteria as set forth in **Appendix 5B** *Statement of Compliance Registry Criteria*:

1.3.1 NERC shall notify each organization that it is on the NCR. The Registered Entity is responsible for compliance with all the Reliability Standards applicable to the functions for which it is registered from the time it receives the Registration notification from NERC.

1.3.2 Any organization receiving such a notice may challenge its placement on the NCR according to the process in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section V.

1.3.3 The Compliance Committee of the Board of Trustees shall promptly issue a written decision on the challenge, including the reasons for the decision.

1.3.4 The decision of the Compliance Committee of the Board of Trustees shall be final unless, within 21 days of the date of the Compliance Committee of the Board of Trustees decision, the organization appeals the decision to the Applicable Governmental Authority.

1.3.5 Each Registered Entity identified on the NCR shall notify its corresponding Regional Entity(s) of any corrections, revisions, deletions, changes in ownership, corporate structure, or similar matters that affect the Registered Entity's responsibilities with respect to the Reliability Standards. Failure to notify will not relieve the Registered Entity from any responsibility to comply with the Reliability Standards or shield it from any Penalties or sanctions associated with failing to comply with the Reliability Standards applicable to its associated Registration.

1.4 For all geographical or electrical areas of the Bulk Power System, the Registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and required by the Reliability Standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall:

1.4.1 Ensure that all areas are under the oversight of one and only one Reliability Coordinator.

1.4.2 Ensure that all Balancing Authorities and Transmission Operator entities[2] are under the responsibility of one and only one Reliability Coordinator.

1.4.3 Ensure that all transmission Facilities of the Bulk Power System are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator.

1.4.4 Ensure that all Loads~~loads~~ and generators are under the responsibility and control of one and only one Balancing Authority.

1.5 NERC shall maintain the NCR of organizations responsible for meeting the Requirements/sub-Requirements of the Reliability Standards currently in effect on its website and shall update the NCR monthly.

2. **Entity Certification** — NERC shall provide for Certification of all entities with primary reliability responsibilities requiring Certification. This includes those entities that satisfy the criteria established in the NERC provisional Certification process. The NERC programs shall:

2.1 Evaluate and certify the competency of entities performing reliability functions. The entities presently expected to be certified include Reliability Coordinators, Transmission Operators, and Balancing Authorities.

2.2 Evaluate and certify each applicant's ability to meet the requirements for Certification.

2.3 Maintain process documentation.

[2] Some organizations perform the listed functions (e.g., Balancing Authority, Transmission Operator) over areas that transcend the Footprints of more than one Reliability Coordinator. Such organizations will have multiple Registrations, with each such Registration corresponding to that portion of the organization's overall area that is within the Footprint of a particular Reliability Coordinator.

2.4 Maintain records of currently certified entities.

2.5 Issue a Certification document to the applicant that successfully demonstrates its competency to perform the evaluated functions.

3. **Delegation and Oversight**

3.1 NERC may delegate responsibilities for Organization Registration and Organization Certification to Regional Entities in accordance with requirements established by NERC. Delegation will be via the delegation agreement between NERC and the Regional Entity or other applicable agreement. The Regional Entity shall administer Organization Registration and Organization Certification Programs in accordance with such delegations to meet NERC's programs goals and requirements subject to NERC oversight.

3.2 NERC shall develop and maintain a plan to ensure the continuity of Organization Registration and Organization Certification within the geographic or electrical boundaries of a Regional Entity in the event that no entity is functioning as a Regional Entity for that Region, or the Regional Entity withdraws as a Regional Entity, or does not operate its Organization Registration and Organization Certification Programs in accordance with delegation agreements.

3.3 NERC shall develop and maintain a program to monitor and oversee the NERC Organization Registration and Organization Certification Programs activities that are delegated to each Regional Entity through a delegation agreement or other applicable agreement.

3.3.1 This program shall monitor whether the Regional Entity carries out those delegated activities in accordance with NERC requirements, and whether there is consistency, fairness of administration, and comparability.

3.3.2 Monitoring and oversight shall be accomplished through direct participation in the Organization Registration and Organization Certification Programs with periodic reviews of documents and records of both programs.

502. Organization Registration and Organization Certification Program Requirements

1. NERC shall maintain the Organization Registration and Organization Certification Programs.

1.1 The roles and authority of Regional Entities in the programs are delegated from NERC pursuant to the Rules of Procedure through regional delegation agreements or other applicable agreements.

1.2 Processes for the programs shall be administered by NERC and the Regional Entities. Materials that each Regional Entity uses are subject to review and approval by NERC.

1.3 The appeals process for the Organization Registration and Organization Certification Programs are identified in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Sections V and VI, respectively.

1.4 The Certification Team membership is identified in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section IV.8.d.

2. To ensure consistency and fairness of the Organization Registration and Organization Certification Programs, NERC shall develop procedures to be used by all Regional Entities and NERC in accordance with the following criteria:

2.1 NERC and the Regional Entities shall have data management processes and procedures that provide for confidentiality, integrity, and retention of data and information collected.

2.2 Documentation used to substantiate the conclusions of the Regional Entity/ NERC related to Registration and/or Certification must be retained by the Regional Entity for (6) six years, unless a different retention period is otherwise identified, for the purposes of future audits of these programs.

2.3 To maintain the integrity of the NERC Organization Registration and Organization Certification Programs, NERC, Regional Entities, Certification Team members, program audit team members (Section 506), and committee members shall maintain the confidentiality of information provided by an applicant or entities.

2.2.1 NERC and the Regional Entities shall have appropriate codes of conduct and confidentiality agreements for staff, Certification Team, Certification related committees, and Certification program audit team members.

2.2.2 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall maintain the confidentiality of any Registration or Certification-related discussions or documents designated as confidential (see Section 1500 for types of Confidential Information).

2.2.3 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall treat as confidential the individual comments expressed during evaluations, program audits and report-drafting sessions.

2.2.4 Copies of notes, draft reports, and other interim documents developed or used during an entity Certification evaluation or program audit shall be destroyed after the public posting of a final, uncontested report.

2.2.5 Information deemed by an applicant, entity, a Regional Entity, or NERC as confidential, including Critical Energy Infrastructure Information, shall not be released publicly or distributed outside of a committee or team.

2.2.6 In the event that an individual violates any of the confidentiality rules set forth above, that individual and any member organization with which the individual is associated will be subject to immediate dismissal from the audit team and may be prohibited from future participation in Compliance Monitoring and Enforcement Program activities by the Regional Entity or NERC.

2.2.7 NERC shall develop and provide training in auditing skills to all individuals prior to their participation in Certification evaluations. Training for Certification Team leaders shall be more comprehensive than the training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

2.4 An applicant that is determined to be competent to perform a function after completing all Certification requirements shall be deemed certified by NERC to perform that function for which it has demonstrated full competency.

2.4.1 All NERC certified entities shall be included on the NCR.

503. Regional Entity Implementation of Organization Registration and Organization Certification Program Requirements

1. **Delegation** — Recognizing the Regional Entity's knowledge of and experience with their members, NERC may delegate responsibility for Organization Registration and Organization Certification to the Regional Entity through a delegation agreement.

2. **Registration** — The following Organization Registration activities shall be managed by the Regional Entity per the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into the Rules of Procedure as Appendix 5A *Organization Registration and Organization Certification Manual*:

2.1 Regional Entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the Registration requirements of Section 501(1.4).

3. **Certification —** The following Organization Certification activities shall be managed by the Regional Entity in accordance with an approved delegation agreement or another applicable agreement:

   3.1 An entity seeking Certification to perform one of the functions requiring Certification shall contact the Regional Entity for the Region(s) in which it plans to operate to apply for Certification.

   3.2 An entity seeking Certification and other affected entities shall provide all information and data requested by NERC or the Regional Entity to conduct the Certification process.

   3.3 Regional Entities shall notify NERC of all Certification applicants.

   3.4 NERC and/or the Regional Entity shall evaluate the competency of entities requiring Certification to meet the NERC Certification requirements.

   3.5 NERC or the Regional Entity shall establish Certification procedures to include evaluation processes, schedules and deadlines, expectations of the applicants and all entities participating in the evaluation and Certification processes, and requirements for Certification Team members.

      3.5.1 The NERC / Regional Entity Certification procedures will include provisions for on-site visits to the applicant's facilities to review the data collected through questionnaires, interviewing the operations and management personnel, inspecting the facilities and equipment (including requesting a demonstration of all tools identified in the Certification process), reviewing all necessary documents and data (including all agreements, processes, and procedures identified in the Certification process), reviewing Certification documents and projected system operator work schedules, and reviewing any additional documentation needed to support the completed questionnaire or inquiries arising during the site visit.

      3.5.2 The NERC/ Regional Entity Certification procedures will provide for preparation of a written report by the Certification Team, detailing any deficiencies that must be resolved prior to granting Certification, along with any other recommendations for consideration by the applicant, the Regional Entity, or NERC.

504. Appeals

1. NERC shall maintain an appeals process to resolve any disputes related to Registration or Certification activities per the *Organization Registration and Organization Certification Manual,* which is incorporated in these Rules of Procedure as Appendix 5A.

2. The Regional Entity Certification appeals process shall culminate with the Regional Entity board or a committee established by and reporting to the Regional Entity board as the final adjudicator, provided that where applicable, Canadian provincial governmental authorities may act as the final adjudicator in their jurisdictions. NERC shall be notified of all appeals and may observe any proceedings **(Appendix 5A** *Organization Registration and Organization Certification Manual*).

505. Program Maintenance

NERC shall maintain its program materials, including such manuals or other documents as it deems necessary, of the governing policies and procedures of the Organization Registration and Organization Certification Programs.

506. Independent Audit of NERC Organization Registration and Organization Certification Program

1. NERC, through the Compliance and Certification Committee, shall provide for an independent audit of its Organization Registration and Organization Certification Programs at least once every three years, or more frequently, as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board.

2. The audit shall evaluate the success, effectiveness and consistency of the NERC Organization Registration and Organization Certification Programs.

3. The final report shall be posted by NERC for public viewing.

4. If the audit report includes recommendations to improve the program, the administrators of the program shall provide a written response to the Board within 30 days of the final report, detailing the disposition of each and every recommendation, including an explanation of the reasons for rejecting a recommendation and an implementation plan for the recommendations accepted.

507. Provisions Relating to Joint Registration Organizations (JRO)

1. In addition to registering as the entity responsible for all functions that it performs itself, an entity may register as a JRO on behalf of one or more of its members or related entities for one or more functions for which such members or related entities would otherwise be required to register and, thereby, accept on behalf of such members or related entities all compliance responsibility for that function or those functions including all reporting requirements. Any entity seeking to register as a JRO must submit a written agreement with its members or related entities for all Requirements/sub-Requirements for the function(s) for which the entity is registering for and takes responsibility for, which would otherwise be the responsibility of one or more of its members or related entities. Neither NERC nor

the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the JRO Registration.

2. The JRO Registration data must include the same Registration information as a normal compliance Registration entry. The JRO is responsible for providing all of the information and data, including submitting reports, as needed by the Regional Entity for performing assessments of compliance.

3. The Regional Entity shall notify NERC of each JRO that the Regional Entity accepts. The notification will identify the point of contact and the functions(s) being registered for on behalf of its members or related entities.

4. For purposes of Compliance Audits, the Regional Entity shall keep a list of all JROs. This document shall contain a list of each JRO's members or related entities and the function(s) for which the JRO is registered for that member(s) or related entity(s). It is the responsibility of the JRO to provide the Regional Entity with this information as well as the applicable JRO agreement(s).

5. The Regional Entity may request clarification of any list submitted to it that identifies the members of the JRO and may request such additional information as the Regional Entity deems appropriate.

6. The Regional Entity's acceptance of a JRO shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the JRO will meet the Registration requirements of Section 501(1.4).

7. NERC shall maintain, and post on its website, a JRO registry listing all JRO Registrations that have been reviewed and accepted by the Regional Entity. The posting shall identify the JRO entity taking compliance responsibilities for itself and its members.

8. The JRO shall inform the Regional Entity of any changes to an existing JRO. The Regional Entity shall promptly notify NERC of each such revision.

9. Nothing in Section 507 shall preclude a member of a JRO, a related entity, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the member or other entity is registering. A JRO member or related entity that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the JRO of its Registration.

508. Provisions Relating to Coordinated Functional Registration (CFR) Entities

1. In addition to registering as an entity responsible for all functions that it performs itself, multiple entities may each register using a CFR for one or more Reliability

Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function. The CFR submission must include a written agreement that governs itself and clearly specifies the entities' respective compliance responsibilities. The Registration of the CFR is the complete Registration for each entity. Additionally, each entity shall take full compliance responsibility for those Reliability Standards and/or Requirements/sub-Requirements it has registered for in the CFR. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the CFR.

2. Each CFR or each individual entity within a CFR must identify a point of contact that is responsible for providing information and data, including submitting reports as needed by the Regional Entity related to the CFR Registration.

3. The Regional Entity shall notify NERC of each CFR that the Regional Entity accepts.

4. NERC or the Regional Entity may request clarification of any list submitted to it that identifies the compliance responsibilities of the CFR and may request such additional information as NERC or the Regional Entity deems appropriate.

5. The Regional Entity's acceptance of that CFR shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the CFR will meet the Registration requirements of Section 501(1.4).

6. NERC shall maintain, and post on its website, a CFR registry listing all CFR Registrations that have been accepted by NERC or by a Regional Entity. The posting shall clearly list all the Reliability Standards or Requirements/sub-Requirements thereof for which each entity of the CFR is responsible for under the CFR.

7. The point of contact shall inform the Regional Entity of any changes to an existing CFR. The Regional Entity shall promptly notify NERC of each such revision.

8. In the event of a violation of a Reliability Standard or of a Requirement/sub-Requirement of a Reliability Standard for which an entity of a CFR is registered, that entity shall be identified in the Notice of Alleged Violation and shall be assessed the sanction or Penalty in accordance with the NERC Sanctions Guidelines. In the event a Regional Entity is not able to determine which entity(ies) is responsible for a particular Reliability Standard, or Requirements/sub-Requirements thereof that has been violated, the Regional Entity shall investigate the noncompliance in accordance with the NERC Rules of Procedure Section 400, *Compliance Enforcement*, to determine the entity(ies) to which the Regional Entity shall to issue the sanction or Penalty for the violation.

9. Nothing in Section 508 shall preclude an entity registered in a CFR, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the entity is registering. An entity registered in a CFR that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the point of contact of its Registration.

509. Exceptions to the Definition of the Bulk Electric System

An Element is considered to be (or not be) part of the Bulk Electric System by applying the BES Definition to the Element (including the inclusions and exclusions set forth therein). Appendix 5C sets forth the procedures by which (i) an entity may request a determination that an Element that falls within the definition of the Bulk Electric System should be exempted from being considered a part of the Bulk Electric System, or (ii) an entity may request that an Element that falls outside of the definition of the Bulk Electric System should be considered part of the Bulk Electric System.

SECTION 600 — PERSONNEL CERTIFICATION

601. Scope of Personnel Certification

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires skilled, trained and qualified system operators. The System Operator Certification Program provides the mechanism to ensure system operators are provided the education and training necessary to obtain the essential knowledge and skills and are therefore qualified to operate the Bulk Electric System. NERC, as the ERO, will ensure skilled, trained, and qualified system operators through the System Operator Certification Program.

NERC shall develop and maintain a personnel Certification program to evaluate individuals and to issue Credentials to individuals who demonstrate the required level of competence. A current version of such a program is the *System Operator Certification Program Manual*, which is incorporated into these Rules of Procedure as **Appendix 6**.

602. Structure of ERO Personnel Certification Program

1. The NERC personnel Certification program shall be international in scope.

2. The personnel Certification program shall have a governing body that (1) is able to independently exercise decision-making for all matters pertaining to Certification, (2) includes individuals from the discipline being certified and whose composition addresses the needs of the users of the program (e.g., employers, regulators, etc.), and (3) has representation for each specialty or level within a discipline.

3. NERC shall maintain a nominating process for membership in the governing body. Nominations shall be open to all interested parties and self-nominations shall be accepted. The NERC Board of Trustees shall appoint members to the governing body from among those nominated. The members of the governing body shall serve at the pleasure of the Board.

4. The personnel Certification program governing body shall have control over the matters related to the personnel Certification and re-Certification programs listed below, without being subject to approval by any other body.

    4.1 Policies and procedures, including eligibility requirements and application processing.

    4.2 Requirements for personnel Certification, maintaining Certification, and re-Certification.

    4.3 Examination content, development, and administration.

    4.4 Examination cut score.

    4.5 Grievance and disciplinary processes.

4.6 Governing body and subgroup(s)' meeting rules including agenda, frequency, and related procedures.

4.7 Subgroup(s) appointments and work assignments.

4.8 Publications about personnel Certification and re-Certification.

4.9 Setting fees for application, and all other services provided as a part of the personnel Certification and re-Certification activities.

4.10 Program funding, spending, and budget authority. Financial matters related to the operation of the program shall be segregated from other NERC activities.

5. The personnel Certification program shall utilize written procedures for the selection of members of the governing body that prohibit the governing body from selecting a majority of its successors.

6. The personnel Certification program shall be separate from the accreditation and education functions of NERC in related disciplines.

7. No member of the personnel Certification program governing body or staff member working with the personnel Certification program governing body shall have or exercise any authority or responsibility for compliance matters related to Reliability Standards concerning personnel Certification.

603. Candidate Testing Mechanisms

1. The personnel Certification program shall utilize reliable testing mechanisms to evaluate individual competence in a manner that is objective, fair to all candidates, job-related, and based on the knowledge and skill needed to function in the discipline.

2. The personnel Certification program shall implement a formal policy of periodic review of the testing mechanisms to ensure ongoing relevance of the mechanisms to knowledge and skill needed in the discipline.

3. The personnel Certification program shall utilize policies and procedures to ensure that all test administration and development materials are secure and demonstrate that these policies and procedures are consistently implemented.

4. The personnel Certification program shall establish pass/fail levels that protect the public with a method that is based on competence and generally accepted in the psychometric community as being fair and reasonable.

5. The personnel Certification program shall conduct ongoing studies to substantiate the reliability and validity of the testing mechanisms.

6. The personnel Certification program shall utilize policies and procedures that govern how long examination records are kept in their original format.

7. The personnel Certification program shall demonstrate that different forms of the testing mechanisms assess equivalent content and that candidates are not penalized for taking forms of varying difficulty.

604. Public Information About the Personnel Certification Program

1. The personnel Certification program shall provide for publishing and availability of general descriptive material on the procedures used in examination construction and validation; all eligibility requirements and determination; fees; and examination administration documents, including: reporting of results, re-Certification requirements, and disciplinary and grievance procedures.

2. The personnel Certification program shall publish and make available a comprehensive summary or outline of the information, knowledge, or functions covered by the examination.

3. The personnel Certification program shall publish and make available at least annually a summary of Certification activities for the program, including at least the following information: number of examinations delivered, the number passed, the number failed, and the number certified.

605. Responsibilities to Applicants for Certification or Re-Certification

The personnel Certification program:

1. Shall not discriminate among applicants as to age, gender, race, religion, national origin, disability, or marital status and shall include a statement of non-discrimination in announcements of the program.

2. Shall comply with all requirements of applicable federal and state/provincial laws with respect to all Certification and re-Certification activities, and shall require compliance of all contractors and/or providers of services.

3. Shall make available to all applicants copies of formalized procedures for application for, and attainment of, personnel Certification and re-Certification and shall uniformly follow and enforce such procedures for all applicants.

4. Shall implement a formal policy for the periodic review of eligibility criteria and application procedures to ensure that they are fair and equitable.

5. Shall provide competently proctored examination sites.

6. Shall uniformly report examination results to applicants in a timely manner.

7. Shall give applicants failing the examination information on general content areas of deficiency.

8. Shall implement policies and procedures providing due process for applicants questioning eligibility determination, examination results, and Certification status, and shall publish this information. A current version of such a procedure is the NERC *System Operator Certification Dispute Resolution Process*, which is incorporated into these Rules of Procedure as part of **Appendix 6**.

9. Shall develop and maintain a program manual containing the processes and procedures for applicants for Certification and re-Certification.

606. Responsibilities to the Public and to Employers of Certified Practitioners

The personnel Certification program:

1. Shall demonstrate that the testing mechanisms adequately measure the knowledge and skill required for entry, maintenance, and/or advancement in the profession for each position to be certified.

2. Shall award Certification and re-Certification only after the skill and knowledge of the individual have been evaluated and determined to be acceptable.

3. Shall periodically publish or maintain, in an electronic format, a current list of those persons certified in the programs and have polices and procedures that delineate what information about a Credential holder may be made public and under what circumstances.

4. Shall have formal policies and procedures for discipline of a Credential holder, including the revocation of the certificate, for conduct deemed harmful to the public or inappropriate to the discipline (e.g., incompetence, unethical behavior, physical or mental impairment affecting performance). These procedures shall incorporate due process. The current procedure is the *NERC Certified System Operator Credential Disciplinary Action Procedure*, which is incorporated into these Rules of Procedure as part of **Appendix 6**.

5. Shall demonstrate that any title or Credential awarded accurately reflects or applies to the practitioner's daily occupational or professional duties and is not confusing to employers, consumers, regulators, related professions, and/or other interested parties.

SECTION 700 — RELIABILITY READINESS EVALUATION AND IMPROVEMENT AND FORMATION OF SECTOR FORUMS

701. Confidentiality Requirements for Readiness Evaluations and Evaluation Team Members

1. All information made available or created during the course of any reliability readiness evaluation including, but not limited to, data, Documents, observations and notes, shall be maintained as confidential by all evaluation team members, in accordance with the requirements of Section 1500.

2. Evaluation team members are obligated to destroy all confidential evaluation notes following the posting of the final report of the reliability readiness evaluation.

3. NERC will retain reliability readiness evaluation-related documentation, notes, and materials for a period of time as defined by NERC.

4. These confidentiality requirements shall survive the termination of the NERC Reliability Readiness Evaluation and Improvement Program.

702. Formation of Sector Forum

1. NERC will form a sector forum at the request of any five members of NERC that share a common interest in the safety and reliability of the Bulk Power System. The members of sector forum may invite such others of the members of NERC to join the sector forum as the sector forum deems appropriate.

2. The request to form a sector forum must include a proposed charter for the sector forum. The Board must approve the charter.

3. NERC will provide notification of the formation of a sector forum to its membership roster. Notices and agendas of meetings shall be posted on NERC's website.

4. A sector forum may make recommendations to any of the NERC committees and may submit a Standards Authorization Request to the NERC *Reliability Standards Development Procedure*.

SECTION 800 — RELIABILITY ASSESSMENT AND PERFORMANCE ANALYSIS

801. Objectives of the Reliability Assessment and Performance Analysis Program

The objectives of the NERC Reliability Assessment and Performance Analysis Program are to: (1) conduct, and report the results of, an independent assessment of the overall reliability and adequacy of the interconnected North American Bulk Power Systems, both as existing and as planned; (2) analyze off-normal events on the Bulk Power System; (3) identify the root causes of events that may be precursors of potentially more serious events; (4) assess past reliability performance for lessons learned; (5) disseminate findings and lessons learned to the electric industry to improve reliability performance; and (6) develop reliability performance benchmarks. The final reliability assessment reports shall be approved by the Board for publication to the electric industry and the general public.

802. Scope of the Reliability Assessment Program

1. The scope of the Reliability Assessment Program shall include:

    1.1 Review, assess, and report on the overall electric generation and transmission reliability (adequacy and operating reliability) of the interconnected Bulk Power Systems, both existing and as planned.

    1.2 Assess and report on the key issues, risks, and uncertainties that affect or have the potential to affect the reliability of existing and future electric supply and transmission.

    1.3 Review, analyze, and report on Regional Entity self-assessments of electric supply and bulk power transmission reliability, including reliability issues of specific regional concern.

    1.4 Identify, analyze, and project trends in electric customer demand, supply, and transmission and their impacts on Bulk Power System reliability.

    1.5 Investigate, assess, and report on the potential impacts of new and evolving electricity market practices, new or proposed regulatory procedures, and new or proposed legislation (e.g. environmental requirements) on the adequacy and operating reliability of the Bulk Power Systems.

2. The Reliability Assessment Program shall be performed in a manner consistent with the Reliability Standards of NERC including but not limited to those that specify reliability assessment Requirements.

803. Reliability Assessment Reports

The number and type of periodic assessments that are to be conducted shall be at the discretion of NERC. The results of the reliability assessments shall be documented in three reports: the long-term and the annual seasonal (summer) and the annual seasonal (winter) assessment reports. NERC shall also conduct special reliability assessments from time to time as circumstances warrant. The reliability assessment reports shall be reviewed and approved for publication by the Board. The three regular reports are described below.

1. **Long-Term Reliability Assessment Report** — The annual long-term report shall cover a ten-year planning horizon. The planning horizon of the long-term reliability assessment report shall be subject to change at the discretion of NERC. Detailed generation and transmission adequacy assessments shall be conducted for the first five years of the review period. For the second five years of the review period, the assessment shall focus on the identification, analysis, and projection of trends in peak demand, electric supply, and transmission adequacy, as well as other industry trends and developments that may impact future electric system reliability. Reliability issues of concern and their potential impacts shall be presented along with any mitigation plans or alternatives. The long-term reliability assessment reports will generally be published in the fall (September) of each year. NERC will also publish electricity supply and demand data associated with the long-term reliability assessment report.

2. **Summer Assessment Report** — The annual summer seasonal assessment report typically shall cover the four-month (June–September) summer period. It shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected summer peak demands. It shall also identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may include possible mitigation alternatives. The report will generally be published in mid-May for the upcoming summer period.

3. **Winter Assessment Report** — The annual winter seasonal assessment report shall cover the three-month (December–February) winter period. The report shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected winter peak demands. Similar to the summer assessment, the winter assessment shall identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may also include possible mitigation alternatives. The winter assessment report will generally be published in mid-November for the upcoming winter period.

4. **Special Reliability Assessment Reports** — In addition to the long-term and seasonal reliability assessment reports, NERC shall also conduct special reliability assessments on a regional, interregional, and Interconnection basis as conditions warrant, or as requested by the Board or governmental authorities. The teams of reliability and technical experts also may initiate special assessments of key

reliability issues and their impacts on the reliability of a regions, subregions, or Interconnection (or a portion thereof). Such special reliability assessments may include, among other things, operational reliability assessments, evaluations of emergency response preparedness, adequacy of fuel supply, hydro conditions, reliability impacts of new or proposed environmental rules and regulations, and reliability impacts of new or proposed legislation that affects or has the potential to affect the reliability of the interconnected Bulk Power Systems in North America.

804. Reliability Assessment Data and Information Requirements

To carry out the reviews and assessments of the overall reliability of the interconnected Bulk Power Systems, the Regional Entities and other entities shall provide sufficient data and other information requested by NERC in support of the annual long-term and seasonal assessments and any special reliability assessments.

Some of the data provided for these reviews and assessment may be considered confidential from a competitive marketing perspective, a Critical Energy Infrastructure Information perspective, or for other purposes. Such data shall be treated in accordance with the provisions of Section 1500 – Confidential Information.

While the major sources of data and information for this program are the Regional Entities, a team of reliability and technical experts is responsible for developing and formulating its own independent conclusions about the near-term and long-term reliability of the Bulk Power Systems.

In connection with the reliability assessment reports, requests shall be submitted to each of the Regional Entities for required reliability assessment data and other information, and for each Regional Entity's self-assessment report. The timing of the requests will be governed by the schedule for the preparation of the assessment reports.

The Regional Entity self-assessments are to be conducted in compliance with NERC Reliability Standards and the respective regional planning criteria. The team(s) of reliability and technical experts shall also conduct interviews with the Regional Entities as needed. The summary of the Regional Entity self-assessments that are to be included in the assessment reports shall follow the general outline identified in NERC's request. This outline may change from time to time as key reliability issues change.

In general, the Regional Entity reliability self-assessments shall address, among other areas, the following topics: demand and Net Energy for Load; assessment of projected resource adequacy; any transmission constraints that may impact bulk transmission adequacy and plans to alleviate those constraints; any unusual operating conditions that could impact reliability for the assessment period; fuel supply adequacy; the deliverability of generation (both internal and external) to Load~~load~~; and any other reliability issues in the Region and their potential impacts on the reliability of the Bulk Power Systems.

805. Reliability Assessment Process

Based on their expertise, the review of the collected data, the review of the Regional Entity self-assessment reports, and interviews with the Regional Entities, as appropriate, the teams of reliability and technical experts shall perform an independent review and assessment of the generation and transmission adequacy of each Region's existing and planned Bulk Power System. The results of the review teams shall form the basis of NERC's long-term and seasonal reliability assessment reports. The review and assessment process is briefly summarized below.

1. **Resource Adequacy Assessment** — The teams shall evaluate the regional demand and resource capacity data for completeness in the context of the overall resource capacity needs of the Region. The team shall independently evaluate the ability of the Regional Entity members to serve their obligations given the demand growth projections, the amount of existing and planned capacity, including committed and uncommitted capacity, contracted capacity, or capacity outside of the Region. If the Region relies on capacity from outside of the Region to meet its resource objectives, the ability to deliver that capacity shall be factored into the assessment. The demand and resource capacity information shall be compared to the resource adequacy requirements of the Regional Entity for the year(s) or season(s) being assessed. The assessment shall determine if the resource information submitted represents a reasonable and attainable plan for the Regional Entity and its members. For cases of inadequate capacity or reserve margin, the Regional Entity will be requested to analyze and explain any resource capacity inadequacies and its plans to mitigate the reliability impact of the potential inadequacies. The analysis may be expanded to include surrounding areas. If the expanded analysis indicates further inadequacies, then an interregional problem may exist and will be explored with the applicable Regions. The results of these analyses shall be described in the assessment report.

2. **Transmission Adequacy and Operating Reliability Assessment** — The teams shall evaluate transmission system information that relates to the adequacy and operating reliability of the regional transmission system. That information shall include: regional planning study reports, interregional planning study reports, and/or regional operational study reports. If additional information is required, another data request shall be sent to the Regional Entity. The assessment shall provide a judgment on the ability of the regional transmission system to operate reliably under the expected range of operating conditions over the assessment period as required by NERC Reliability Standards. If sub-areas of the regional system are especially critical to the Reliable Operation of the regional bulk transmission system, these Facilities or sub-areas shall be reviewed and addressed in the assessment. Any areas of concern related to the adequacy or operating reliability of the system shall be identified and reported in the assessment.

3. **Seasonal Operating Reliability Assessment** — The team(s) shall evaluate the overall operating reliability of the regional bulk transmission systems. In areas with potential resource adequacy or system operating reliability problems, operational readiness of the affected Regional Entities for the upcoming season

shall be reviewed and analyzed. The assessment may consider unusual but possible operating scenarios and how the system is expected to perform. Operating reliability shall take into account a wide range of activities, all of which should reinforce the Regional Entity's ability to deal with the situations that might occur during the upcoming season. Typical activities in the assessment may include: facility modifications and additions, new or modified operating procedures, emergency procedures enhancement, and planning and operating studies. The teams shall report the overall seasonal operating reliability of the regional transmission systems in the annual summer and winter assessment reports.

4. **Reporting of Reliability Assessment Results** — The teams of reliability and technical experts shall provide an independent assessment of the reliability of the Regional Entities and the North American interconnected Bulk Power System for the period of the assessment. While the Regional Entities are relied upon to provide the information to perform such assessments, the review team is not required to accept the conclusions provided by the Regional Entities. Instead, the review team is expected, based on their expertise, to reach their own independent conclusions about the status of the adequacy of the generation and bulk power transmission systems of North America.

   The review team also shall strive to achieve consensus in their assessments. The assessments that are made are based on the best information available at the time. However, since judgment is applied to this information, legitimate differences of opinion can develop. Despite these differences, the review team shall work to achieve consensus on their findings.

   In addition to providing long-term and seasonal assessments in connection with the Reliability Assessment Program, the review team of experts shall also be responsible for recommending new and revised Reliability Standards related to the reliability assessments and the reliability of the Bulk Power Systems. These proposals for new or revised Reliability Standards shall be entered into NERC's Reliability Standards development process.

   Upon completion of the assessment, the team shall share the results with the Regional Entities. The Regional Entities shall be given the opportunity to review and comment on the conclusions in the assessment and to provide additional information as appropriate. The reliability assessments and their conclusions are the responsibility of NERC's technical review team and NERC.

   The preparation and approval of NERC's reliability assessment reports shall follow a prescribed schedule including review, comment, and possible approval by appropriate NERC committees. The long-term and seasonal (summer and winter) reliability assessment reports shall be further reviewed for approval by the Board for publication to the electric industry.

806. Scope of the Reliability Performance and Analysis Program

The components of the program will include analysis of large-scale outages, disturbances, and near misses to determine root causes and lessons learned; identification and continuous monitoring of performance indices to detect emerging trends and signs of a decline in reliability performance; and communications of performance results, trends, recommendations, and initiatives to those responsible to take actions; followed with confirmation of actions to correct any deficiencies identified. Within NERC, the reliability performance program will provide performance results to the Reliability Standards Development and Compliance Monitoring and Enforcement Programs to make the necessary adjustments to preserve reliability based on a risk-based approach.

807. Analysis of Major Events

Responding to major blackouts and other system disturbances or emergencies can be divided into four phases: situational assessment and communications; situation tracking and communications; data collection, investigation, analysis, and reporting; and follow-up on recommendations.

a. NERC's role following a blackout or other major Bulk Power System disturbance or emergency is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the event. Working closely with the Regional Entities and Reliability Coordinators, NERC will coordinate and facilitate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

b. When responding to any event where physical or cyber security is suspected as a cause or contributing factor to an event, NERC will immediately notify appropriate government agencies and coordinate its activities with them.

c. Each user, owner, and operator of the Bulk Power System shall provide NERC and the applicable Regional Entities with such information as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

d. During the conduct of some NERC analyses, assistance may be needed from government agencies. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; investigations related to possible criminal or terrorist involvement in the event; resources for initial data gathering immediately after the event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies.

e. NERC shall work with other participants to establish a clear delineation of roles, responsibilities, and coordination requirements among industry and government for the investigation and reporting of findings, conclusions, and recommendations related to major blackouts, disturbances, or other emergencies affecting the Bulk Power System with the objective of avoiding, to the extent possible, multiple

investigations of the same event. If the event is confined to a single Regional Entity, NERC representatives will participate as members of the Regional Entity analysis team.

f. NERC and applicable entity(s) shall apply the NERC *Blackout and Disturbance Response Procedures*, which are incorporated into these Rules of Procedure as **Appendix 8**. These procedures provide a framework to guide NERC's response to events that may have multiregional, national, or international implications. Experienced industry leadership shall be applied to tailor the response to the specific circumstances of the event. In accordance with that procedure, the NERC president will determine whether the event warrants analysis at the NERC-level. A Regional Entity may request that NERC elevate any analysis to a NERC level.

g. NERC will screen and analyze the findings and recommendations from the analysis, and those with generic applicability will be disseminated to the industry in accordance with Section 810.

808. Analysis of Off-Normal Events, Potential System Vulnerabilities, and System Performance

1. NERC and Regional Entities shall analyze system and equipment performance events that do not rise to the level of a major blackout, disturbance, or system emergency, as described in Section 807. NERC and Regional Entities shall also analyze potential vulnerabilities in the Bulk Power System brought to their attention by government agencies. The purpose of these analyses is to identify the root causes of events that may be precursors of potentially more serious events or that have the potential to cause more serious events, to assess past reliability performance for lessons learned, and to develop reliability performance benchmarks and trends.

2. NERC and Regional Entities will screen and analyze events and potential vulnerabilities for significance, and information from those with generic applicability will be disseminated to the industry in accordance with Section 810.

3. Each user, owner, and operator, of the Bulk Power System shall provide NERC and the applicable Regional Entities with such information as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

809. Reliability Benchmarking

NERC shall identify and track key reliability indicators as a means of benchmarking reliability performance and measuring reliability improvements. This program will include assessing available metrics, developing guidelines for acceptable metrics, maintaining a performance metrics "dashboard" on the NERC website, and developing appropriate reliability performance benchmarks.

810. Information Exchange and Issuance of NERC Advisories, Recommendations and Essential Actions

1. Members of NERC and Bulk Power System owners, operators, and users shall provide NERC with detailed and timely operating experience information and data.

2. In the normal course of operations, NERC disseminates the results of its events analysis findings, lessons learned and other analysis and information gathering to the industry. These findings, lessons learned and other information will be used to guide the Reliability Assessment Program.

3. When NERC determines it is necessary to place the industry or segments of the industry on formal notice of its findings, analyses, and recommendations, NERC will provide such notification in the form of specific operations or equipment Advisories, Recommendations or Essential Actions:

3.1 Level 1 (Advisories) – purely informational, intended to advise certain segments of the owners, operators and users of the Bulk Power System of findings and lessons learned;

3.2 Level 2 (Recommendations) – specific actions that NERC is recommending be considered on a particular topic by certain segments of owners, operators, and users of the Bulk Power System according to each entity's facts and circumstances;

3.3 Level 3 (Essential Actions) – specific actions that NERC has determined are essential for certain segments of owners, operators, or users of the Bulk Power System to take to ensure the reliability of the Bulk Power System. Such Essential Actions require NERC Board approval before issuance.

4. The Bulk Power System owners, operators, and users to which Level 2 (Recommendations) and Level 3 (Essential Actions) notifications apply are to evaluate and take appropriate action on such issuances by NERC. Such Bulk Power System owners, operators, and users shall also provide reports of actions taken and timely updates on progress towards resolving the issues raised in the Recommendations and Essential Actions in accordance with the reporting date(s) specified by NERC.

5. NERC will advise the Commission and other Applicable Governmental Authorities of its intent to issue all Level 1 (Advisories), Level 2 (Recommendations), and Level 3 (Essential Actions) at least five (5) business days prior to issuance, unless extraordinary circumstances exist that warrant issuance less than five (5) business days after such advice. NERC will file a report with the Commission and other Applicable Governmental Authorities no later than thirty (30) days following the date by which NERC has requested the Bulk Power System owners, operators, and users to which a Level 2

(Recommendation) or Level 3 (Essential Action) issuance applies to provide reports of actions taken in response to the notification. NERC's report to the Commission and other Applicable Governmental Authorities will describe the actions taken by the relevant owners, operators, and users of the Bulk Power System and the success of such actions taken in correcting any vulnerability or deficiency that was the subject of the notification, with appropriate protection for Confidential Information or Critical Energy Infrastructure Information.

811. Equipment Performance Data

Through its Generating Availability Data System (GADS), NERC shall collect operating information about the performance of electric generating equipment; provide assistance to those researching information on power plant outages stored in its database; and support equipment reliability as well as availability analyses and other decision-making processes developed by GADS subscribers. GADS data is also used in conducting assessments of generation resource adequacy.

SECTION 900 — TRAINING AND EDUCATION

901. Scope of the Training and Education Program

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires informed and trained personnel. The training and education program will provide the education and training necessary for Bulk Power System personnel and regulators to obtain the essential knowledge necessary to understand and operate the Bulk Electric System.

NERC shall develop and maintain training and education programs for the purpose of establishing training requirements, developing materials, and developing training activities. The target audience of the training and education programs shall be Bulk Power System operating personnel including system operations personnel, operations support personnel (engineering and information technology), supervisors and managers, training personnel, and other personnel directly responsible for complying with NERC Reliability Standards who, through their actions or inactions, may impact the real-time, or day-ahead reliability of the Bulk Power System.

NERC shall also develop and provide appropriate training and education for industry participants and regulators affected by new or changed Reliability Standards or compliance Requirements.

To accomplish those objectives:

1. NERC shall periodically conduct job task analyses for targeted Bulk Power System personnel to ensure that the training program content is properly aligned to the job tasks performed by those personnel.

2. NERC shall develop and maintain personnel training program curriculum requirements based on valid job-task analysis.

3. NERC shall periodically conduct performance surveys to determine the effectiveness of the training program and identify areas for further training development and improvement.

4. NERC shall develop training and education materials and activities to assist Bulk Power System entities implementing new or revised Reliability Standard Requirements or other NERC-related changes.

5. NERC shall develop and provide training to people who participate in NERC and Regional Entity evaluations, audits, and investigations for the Compliance Monitoring and Enforcement Program, Organization Certification Program, and the continuing education program.

902. Continuing Education Program

NERC shall develop and maintain a continuing education program to foster the improvement of training and to promote quality in the training programs used by and

implemented by Bulk Power System entities. The program shall approve or accredit those activities and entities meeting NERC continuing education requirements.

1. NERC shall develop and implement continuing education program requirements that promote excellence in training programs and advance improved performance for Bulk Power System personnel identified in Section 901.

2. NERC shall develop and maintain a process to approve or accredit continuing education Providers and activities seeking approval or accreditation and meeting NERC-approved continuing education requirements.

3. NERC shall perform periodic audits on continuing education Providers and training activities to ensure that the approved or accredited Providers and training activities satisfy NERC continuing education requirements.

4. NERC shall develop and maintain an appeals process for disputed application reviews, interpretations of guidelines and standards, probation or suspension of NERC-approved Provider status, or Continuing Education Hour disputes.

SECTION 1000 — SITUATION AWARENESS AND INFRASTRUCTURE SECURITY

1001. Situation Awareness

NERC shall through the use of Reliability Coordinators and available tools, monitor present conditions on the Bulk Power System and provide leadership coordination, technical expertise, and assistance to the industry in responding to events as necessary. To accomplish these goals, NERC will:

1. Maintain real-time situation awareness of conditions on the Bulk Power System;

2. Notify the industry of significant Bulk Power System events that have occurred in one area, and which have the potential to impact reliability in other areas;

3. Maintain and strengthen high-level communication, coordination, and cooperation with governments and government agencies regarding real-time conditions; and

4. Enable the Reliable Operation of interconnected Bulk Power Systems by facilitating information exchange and coordination among reliability service organizations.

1002. Reliability Support Services

NERC will provide tools and other support services for the benefit of Reliability Coordinators and other system operators, including the Area Control Error (ACE) and Frequency Monitoring System, NERC Hotline, Real-time Flows, System Data Exchange (SDX), Reliability Coordinator Information System (RCIS), Transmission Services Information Network (TSIN), Interchange Distribution Calculator (IDC), Interregional Security Network (ISN), and Central Repository for Security Events (CRC). To accomplish this goal, NERC will:

1. Maintain the reliability and effectiveness of all mission-critical operating reliability support systems and services;

2. Continue to support maintenance of a transmission provider curtailment report on the CRC site in response to Federal Energy Regulatory Commission Order 605;

3. Investigate and analyze the use of high-speed real-time system measurements, including phasors, in predicting the behavior and performance of the Eastern Interconnection; and

4. Facilitate real-time voice and data exchange services among Reliability Coordinators (e.g., Hotline, Interregional Security Network, NERCnet, System Data Exchange, etc.).

1003. Infrastructure Security Program

NERC shall coordinate electric industry activities to promote Critical Infrastructure protection of the Bulk Power System in North America by taking a leadership role in

Critical Infrastructure protection of the electricity sector so as to reduce vulnerability and improve mitigation and protection of the electricity sector's Critical Infrastructure. To accomplish these goals, NERC shall perform the following functions.

1. Electric Sector Information Sharing and Analysis Center (ESISAC)

    1.1 NERC shall serve as the electricity sector's sector coordinator and operate its Information Sharing and Analysis Center to gather information and communicate security-related threats and incidents within the sector, with United States and Canadian government agencies, and with other Critical Infrastructure sectors.

    1.2 NERC shall improve the capability of the ESISAC to analyze security threats and incident information and provide situational assessments for the electricity sector and governments.

    1.3 NERC shall work closely with the United States Department of Homeland Security, Department of Energy, Natural Resources Canada, and Public Safety and Emergency Preparedness Canada.

    1.4 NERC shall strengthen and expand these functions and working relationships with the electricity sector, other Critical Infrastructure industries, governments, and government agencies throughout North America to ensure the protection of the infrastructure of the Bulk Power System.

    1.5 NERC shall fill the role of the Electricity Sector Coordinating Council and coordinate with the Government Coordinating Council.

    1.6 NERC shall coordinate with other Critical Infrastructure sectors through active participation with the other Sector Coordinating Councils, the other ISACs, and the National Infrastructure Advisory Committee.

    1.7 NERC shall encourage and participate in coordinated Critical Infrastructure protection exercises, including interdependencies with other Critical Infrastructure sectors.

2. Security Planning

    2.1 NERC shall take a risk management approach to Critical Infrastructure protection, considering probability and severity, and recognizing that mitigation and recovery can be practical alternatives to prevention.

    2.2 NERC shall keep abreast of the changing threat environment through collaboration with government agencies.

    2.3 NERC shall develop criteria to identify critical physical assets and Critical Cyber Assets, assess security threats, identify risk assessment

methodologies, and assess effectiveness of physical and cyber protection measures.

2.4 NERC shall enhance and maintain the Bulk Power System critical spare transformer program, encourage increased participation by asset owners, and continue to assess the need to expand this program to include other critical Bulk Power System equipment.

2.5 NERC shall support implementation of the Critical Infrastructure Protection Standards through education and outreach.

2.6 NERC shall review and improve existing security guidelines, develop new security guidelines to meet the needs of the electricity sector, and consider whether any guidelines should be developed into Reliability Standards.

2.7 NERC shall conduct education and outreach initiatives to increase awareness and respond to the needs of the electricity sector.

2.8 NERC shall strengthen relationships with federal, state, and provincial government agencies on Critical Infrastructure protection matters.

2.9 NERC shall maintain and improve mechanisms for the sharing of sensitive or classified information with federal, state, and provincial government agencies on Critical Infrastructure protection matters; work with DOE and DHS to implement the National Infrastructure Protection Plan, as applicable to the electricity sector; and coordinate this work with PSEPC.

2.10 NERC shall improve methods to better assess the impact of a possible physical attack on the Bulk Power System and means to deter, mitigate, and respond following an attack.

2.11 NERC shall assess the results of vulnerability assessments and enhance the security of system control and data acquisition (SCADA) and process control systems by developing methods to detect an emerging cyber attack and the means to mitigate impacts on the Bulk Power Systems.

2.12 NERC shall work with the National SCADA Test Bed and the Process Control Systems Forum to accelerate the development of technology that will enhance the security, safety, and reliability of process control and SCADA systems.

SECTION 1100 — ANNUAL NERC BUSINESS PLANS AND BUDGETS

1101. Scope of Business Plans and Budgets

The Board shall determine the content of the budgets to be submitted to the Applicable Governmental Authorities with consultation from the members of the Member Representatives Committee, Regional Entities, and others in accordance with the Bylaws. The Board shall identify any activities outside the scope of NERC's statutory reliability functions, if any, and the appropriate funding mechanisms for those activities.

1102. NERC Funding and Cost Allocation

1. In order that NERC's costs shall be fairly allocated among Interconnections and among Regional Entities, the NERC funding mechanism for all statutory functions shall be based on Net Energy for Load (NEL).

2. NERC's costs shall be allocated so that all Load~~load~~ (or, in the case of costs for an Interconnection or Regional Entity, all Load~~load~~ within that Interconnection or Regional Entity) bears an equitable share of such costs based on NEL.

3. Costs shall be equitably allocated between countries or Regional Entities thereof for which NERC has been designated or recognized as the Electric Reliability Organization.

4. Costs incurred to accomplish the statutory functions for one Interconnection, Regional Entity, or group of entities will be directly assigned to that Interconnection, Regional Entity, or group of entities provided that such costs are allocated equitably to end-users based on Net Energy for Load.

1103. NERC Budget Development

1. The NERC annual budget process shall be scheduled and conducted for each calendar year so as to allow a sufficient amount of time for NERC to receive Member inputs, develop the budget, and receive Board and, where authorized by applicable legislation or agreement, Applicable Governmental Authority approval of the NERC budget for the following fiscal year, including timely submission of the proposed budget to FERC for approval in accordance with FERC regulations.

2. The NERC budget submittal to Applicable Governmental Authorities shall include provisions for all ERO functions, all Regional Entity delegated functions as specified in delegation agreements and reasonable reserves and contingencies.

3. The NERC annual budget submittal to Applicable Governmental Authorities shall include description and explanation of NERC's proposed ERO program activities for the year; budget component justification based on statutory or other authorities; explanation of how each budgeted activity lends itself to the accomplishment of the statutory or other authorities; sufficiency of resources

provided for in the budget to carry out the ERO program responsibilities; explanation of the calculations and budget estimates; identification and explanation of changes in budget components from the previous year's budget; information on staffing and organization charts; and such other information as is required by FERC and other Applicable Governmental Authorities having authority to approve the proposed budget.

4. NERC shall develop, in consultation with the Regional Entities, a reasonable and consistent system of accounts, to allow a meaningful comparison of actual results at the NERC and Regional Entity level by the Applicable Governmental Authorities.

1104. Submittal of Regional Entity Budgets to NERC

1. Each Regional Entity shall submit its proposed annual budget for carrying out its delegated authority functions as well as all other activities and funding to NERC in accordance with a schedule developed by NERC and the Regional Entities, which shall provide for the Regional Entity to submit its final budget that has been approved by its board of directors or other governing body no later than July 1 of the prior year, in order to provide sufficient time for NERC's review and comment on the proposed budget and approval of the Regional Entity budget by the NERC Board of Trustees in time for the NERC and Regional Entity budgets to be submitted to FERC and other Applicable Governmental Authorities for approval in accordance with their regulations. The Regional Entity's budget shall include supporting materials in accordance with the budget and reporting format developed by NERC and the Regional Entities, including the Regional Entity's complete business plan and organization chart, explaining the proposed collection of all dues, fees, and charges and the proposed expenditure of funds collected in sufficient detail to justify the requested funding collection and budget expenditures.

2. NERC shall review and approve each Regional Entity's budget for meeting the requirements of its delegated authority. Concurrent with approving the NERC budget, NERC shall review and approve, or reject, each Regional Entity budget for filing.

3. NERC shall also have the right to review from time to time, in reasonable intervals but no less frequently than every three years, the financial books and records of each Regional Entity having delegated authority in order to ensure that the documentation fairly represents in all material aspects appropriate funding of delegated functions.

1105. Submittal of NERC and Regional Entity Budgets to Governmental Authorities for Approval

1. NERC shall file for approval by the Applicable Governmental Authorities at least 130 days in advance of the start of each fiscal year. The filing shall include: (1) the complete NERC and Regional Entity budgets including the business plans and organizational charts approved by the Board, (2) NERC's annual funding requirement (including Regional Entity costs for delegated functions), and (3) the

mechanism for assessing charges to recover that annual funding requirement, together with supporting materials in sufficient detail to support the requested funding requirement.

2. NERC shall seek approval from each Applicable Governmental Authority requiring such approval for the funding requirements necessary to perform ERO activities within their jurisdictions.

1106. NERC and Regional Entity Billing and Collections

1. NERC shall request the Regional Entities to identify all Load-Serving Entities[3] within each Regional Entity and the NEL assigned to each Load-Serving Entity, and the Regional Entities shall supply the requested information. The assignment of a funding requirement to an entity shall not be the basis for determining that the entity must be registered in the Compliance Registry.

2. NERC shall accumulate the NEL by Load-Serving Entities for each Applicable Governmental Authority and submit the proportional share of NERC funding requirements to each Applicable Governmental Authority for approval together with supporting materials in sufficient detail to support the requested funding requirement.

3. NEL reported by Balancing Authorities within a Region shall be used to rationalize and validate amounts allocated for collection through Regional Entity processes.

4. The billing and collection processes shall provide:

   4.1 A clear validation of billing and application of payments.

   4.2 A minimum of data requests to those being billed.

   4.3 Adequate controls to ensure integrity in the billing determinants including identification of entities responsible for funding NERC's activities.

   4.4 Consistent billing and collection terms.

5. NERC will bill and collect all budget requirements approved by Applicable Governmental Authorities (including the funds required to support those functions assigned to the Regional Entities through the delegation agreements) directly from the Load-Serving Entities or their designees or as directed by particular Applicable Governmental Authorities, except where the Regional Entity is required to collect the budget requirements for NERC, in which case the Regional Entity will collect directly from the Load-Serving Entities or as otherwise

[3] A Regional Entity may allocate funding obligations using an alternative method approved by NERC and by FERC and other Applicable Governmental Authorities, as provided for in the regional delegation agreement.

provided by agreement and submit funds to NERC. Alternatively, a load-serving entity may pay its allocated ERO costs through a Regional Entity managed collection mechanism.

6. NERC shall set a minimum threshold limit on the billing of small LSEs to minimize the administrative burden of collection.

7. NERC shall pursue any non-payments and shall request assistance from Applicable Governmental Authorities as necessary to secure collection.

8. In the case where a Regional Entity performs the collection for ERO, the Regional Entity will not be responsible for non-payment in the event that a user, owner or operator of the Bulk Power System does not pay its share of dues, fees and charges in a timely manner, provided that such a Regional Entity shall use reasonably diligent efforts to collect dues, fees, and other charges from all entities obligated to pay them. However, any revenues not paid shall be recovered from others within the same Region to avoid cross-subsidization between Regions.

9. Both NERC and the Regional Entities also may bill members or others for functions and services not within statutory requirements or otherwise authorized by the Applicable Governmental Authorities. Costs and revenues associated with these functions and services shall be separately identified and not commingled with billings associated with the funding of NERC or of the Regional Entities for delegated activities.

1107. Penalty Applications

1. Where NERC or a Regional Entity initiates a compliance monitoring and enforcement process that leads to imposition of a Penalty, the entity that initiated the process shall receive any Penalty monies imposed and collected as a result of that process, unless a different disposition of the Penalty monies is provided for in the delegation agreement, or in a contract or a disposition of the violation that is approved by NERC and FERC.

2. All funds from financial Penalties assessed in the United States received by the entity initiating the compliance monitoring and enforcement process shall be applied as a general offset to the entity's budget requirements for the subsequent fiscal year, if received by July 1, or for the second subsequent fiscal year, if received on or after July 1. Funds from financial Penalties shall not be directly applied to any program maintained by the entity conducting the compliance monitoring and enforcement process. Funds from financial Penalties assessed against a Canadian entity shall be applied as specified by legislation or agreement.

3. In the event that a compliance monitoring and enforcement process is conducted jointly by NERC and a Regional Entity, the Regional Entity shall receive the Penalty monies and offset the Regional Entity's budget requirements for the subsequent fiscal year.

4. Exceptions or alternatives to the foregoing provisions will be allowed if approved by NERC and by FERC or any other Applicable Governmental Authority.

1108. Special Assessments

On a demonstration of unforeseen and extraordinary circumstances requiring additional funds prior to the next funding cycle, NERC shall file with the Applicable Governmental Authorities, where authorized by applicable legislation or agreement, for authorization for an amended or supplemental budget for NERC or a Regional Entity and, if necessary under the amended or supplemental budget, to collect a special or additional assessment for statutory functions of NERC or the Regional Entity. Such filing shall include supporting materials to justify the requested funding, including any departure from the approved funding formula or method.

SECTION 1200 — REGIONAL DELEGATION AGREEMENTS

1201. Pro Forma Regional Delegation Agreement

NERC shall develop and maintain a pro forma Regional Entity delegation agreement, which shall serve as the basis for negotiation of consistent agreements for the delegation of ERO functions to Regional Entities.

1202. Regional Entity Essential Requirements

NERC shall establish the essential requirements for an entity to become qualified and maintain good standing as a Regional Entity.

1203. Negotiation of Regional Delegation Agreements

NERC shall, for all areas of North America that have provided NERC with the appropriate authority, negotiate regional delegation agreements for the purpose of ensuring all areas of the North American Bulk Power Systems are within a Regional Entity Region. In the event NERC is unable to reach agreement with Regional Entities for all areas, NERC shall provide alternative means and resources for implementing NERC functions within those areas. No delegation agreement shall take effect until it has been approved by the Applicable Governmental Authority.

1204. Conformance to Rules and Terms of Regional Delegation Agreements

NERC and each Regional Entity shall comply with all applicable ERO Rules of Procedure and the obligations stated in the regional delegation agreement.

1205. Sub-delegation

The Regional Entity shall not sub-delegate any responsibilities and authorities delegated to it by its regional delegation agreement with NERC except with the approval of NERC and FERC and other Applicable Governmental Authorities. Responsibilities and authorities may only be sub-delegated to another Regional Entity. Regional Entities may share resources with one another so long as such arrangements do not result in cross-subsidization or in any sub-delegation of authorities.

1206. Nonconformance to Rules or Terms of Regional Delegation Agreement

If a Regional Entity is unable to comply or is not in compliance with an ERO Rule of Procedure or the terms of the regional delegation agreement, the Regional Entity shall immediately notify NERC in writing, describing the area of nonconformance and the reason for not being able to conform to the Rule of Procedure. NERC shall evaluate each case and inform the affected Regional Entity of the results of the evaluation. If NERC determines that a Rule of Procedure or term of the regional delegation agreement has been violated by a Regional Entity or cannot practically be implemented by a Regional Entity, NERC shall notify the Applicable Governmental Authorities and take any actions necessary to address the situation.

1207. Regional Entity Audits

Approximately every five years and more frequently if necessary for cause, NERC shall audit each Regional Entity to verify that the Regional Entity continues to comply with NERC Rules of Procedure and the obligations of NERC delegation agreement. Audits of Regional Entities shall be conducted, to the extent practical, based on professional auditing standards recognized in the U.S., including Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards, and standards sanctioned by the Institute of Internal Auditors, and if applicable to the coverage of the audit, may be based on Canadian or other international standards. The audits required by this Section 1207 shall not duplicate the audits of Regional Entity Compliance Monitoring and Enforcement Programs provided for in **Appendix 4A**, Audit of Regional Compliance Programs, to these Rules of Procedure.

1208. Process for Considering Registered Entity Requests to Transfer to Another Regional Entity

1. A Registered Entity that is registered in the Region of one Regional Entity and believes its registration should be transferred to a different Regional Entity may submit a written request to both Regional Entities requesting that they process the proposed transfer in accordance with this section. The Registered Entity's written request shall set forth the reasons the Registered Entity believes justify the proposed transfer and shall describe any impacts of the proposed transfer on other Bulk Power System owners, operators, and users.

2. After receiving the Registered Entity's written request, the two Regional Entities shall consult with each other as to whether they agree or disagree that the requested transfer is appropriate. The Regional Entities may also consult with affected Reliability Coordinators, Balancing Authorities and Transmission Operators as appropriate. Each Regional Entity shall post the request on its website for public comment period of 21 days. In evaluating the proposed transfer, the Regional Entities shall consider the location of the Registered Entity's Bulk Power System facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators; and users, the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments to other Load-Serving Entities of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity would be transitioned from the current Regional Entity to the transferee Regional Entity; along with any other reasons for the proposed transfer stated by the Registered Entity and any other reasons either Regional Entity considers relevant. The Regional Entities may

request that the Registered Entity provide additional data and information concerning the proposed transfer for the Regional Entities' use in their evaluation. The Registered Entity's current Regional Entity shall notify the Registered Entity in writing as to whether (i) the two Regional Entities agree that the requested transfer is appropriate, (ii) the two Regional Entities agree that the requested transfer is not appropriate and should not be processed further, or (iii) the two Regional Entities disagree as to whether the proposed transfer is appropriate.

3. If the two Regional Entities agree that the requested transfer is appropriate, they shall submit a joint written request to NERC requesting that the proposed transfer be approved and that the delegation agreement between NERC and each of the Regional Entities be amended accordingly. The Regional Entities' joint written submission to NERC shall describe the reasons for the proposed transfer; the location of the Registered Entity's Bulk Power System Facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators, and users; the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity will be transitioned from the current Regional Entity to the transferee Regional Entity. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

4. If the two Regional Entities do not agree with each other that the proposed transfer is appropriate, the Regional Entity supporting the proposed transfer shall, if requested by the Registered Entity, submit a written request to NERC to approve the transfer and the related delegation agreement amendments. The Regional Entity's written request shall include the information specified in Section 1208.3. The Regional Entity that does not believe the proposed transfer is appropriate will be allowed to submit a written statement to NERC explaining why the Regional Entity believes the transfer is not appropriate and should not be approved. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional

information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

5. Prior to action by the NERC Board of Trustees on a proposed transfer of registration under Section 1208.3 or 1208.4, NERC shall post information concerning the proposed transfer, including the submissions from the Regional Entities, on its website for at least twenty-one (21) days for the purpose of receiving public comment.

6. If the NERC Board of Trustees disapproves a proposed transfer presented to it pursuant to either Section 1208.3 or 1208.4, the Regional Entity or Regional Entities that believe the transfer is appropriate may, if requested to do so by the Registered Entity, file a petition with FERC pursuant to 18 C.F.R. section 39.8(f) and (g) requesting that FERC order amendments to the delegation agreements of the two Regional Entities to effectuate the proposed transfer.

7. No transfer of a Registered Entity from one Regional Entity to another Regional Entity shall be effective (i) unless approved by FERC, and (ii) any earlier than the first day of January of the second calendar year following approval by FERC, unless an earlier effective date is agreed to by both Regional Entities and NERC and approved by FERC.

SECTION 1300 — COMMITTEES

1301. Establishing Standing Committees

The Board may from time to time create standing committees. In doing so, the Board shall approve the charter of each committee and assign specific authority to each committee necessary to conduct business within that charter. Each standing committee shall work within its Board-approved charter and shall be accountable to the Board for performance of its Board-assigned responsibilities. A NERC standing committee may not delegate its assigned work to a member forum, but, in its deliberations, may request the opinions of and consider the recommendations of a member forum.

1302. Committee Membership

Each committee shall have a defined membership composition that is explained in its charter. Committee membership may be unique to each committee, and can provide for balanced decision-making by providing for representatives from each Sector or, where Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area, by bringing together a wide diversity of opinions from industry experts with outstanding technical knowledge and experience in a particular subject area. Committee membership shall also provide the opportunity for an equitable number of members from the United States and Canada, based approximately on proportionate Net Energy for Load. All committees and other subgroups (except for those organized on other than a Sector basis because Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area) must ensure that no two stakeholder Sectors are able to control the vote on any matter, and no single Sector is able to defeat a matter. With regard to committees and subgroups pertaining to development of, interpretation of, or compliance with Reliability Standards, NERC shall provide a reasonable opportunity for membership from Sectors desiring to participate. Committees and subgroups organized on other than a Sector basis shall be reported to the NERC Board and the Member Representatives Committee, along with the reasons for constituting the committee or subgroup in the manner chosen. In such cases and subject to reasonable restrictions necessary to accomplish the mission of such committee or subgroup, NERC shall provide a reasonable opportunity for additional participation, as members or official observers, for Sectors not represented on the committee or subgroup.

1303. Procedures for Appointing Committee Members

Committee members shall be nominated and selected in a manner that is open, inclusive, and fair. Unless otherwise stated in these Rules of Procedure or approved by the Board, all committee member appointments shall be approved by the board, and committee officers shall be appointed by the Chairman of the Board.

1304. Procedures for Conduct of Committee Business

1. Notice to the public of the dates, places, and times of meetings of all committees, and all nonconfidential material provided to committee members, shall be posted

on NERC's website at approximately the same time that notice is given to committee members. Meetings of all standing committees shall be open to the public, subject to reasonable limitations due to the availability and size of meeting facilities; provided that the meeting may be held in or adjourn to closed session to discuss matters of a confidential nature, including but not limited to personnel matters, compliance enforcement matters, litigation, or commercially sensitive or Critical Energy Infrastructure Information of any entity.

2. NERC shall maintain a set of procedures, approved by the Board, to guide the conduct of business by standing committees.

1305. Committee Subgroups

Standing committees may appoint subgroups using the same principles as in Section 1302.

SECTION 1400 — AMENDMENTS TO THE NERC RULES OF PROCEDURE

1401. Proposals for Amendment or Repeal of Rules of Procedure

In accordance with the Bylaws of NERC, requests to amend or repeal the Rules of Procedure may be submitted by (1) any ten Members of NERC, which number shall include Members from at least three membership Sectors, (2) the Member Representatives Committee, (3) a standing committee of NERC to whose function and purpose the Rule of Procedure pertains, or (4) an officer of the ERO.

1402. Approval of Amendment or Repeal of Rules of Procedure

Amendment to or repeal of Rules of Procedure shall be approved by the Board after public notice and opportunity for comment in accordance with the Bylaws of NERC. In approving changes to the Rules of Procedure, the Board shall consider the inputs of the Member Representatives Committee, other ERO committees affected by the particular changes to the Rules of Procedure, and other stakeholders as appropriate. After Board approval, the amendment or repeal shall be submitted to the Applicable Governmental Authorities for approval, where authorized by legislation or agreement. No amendment to or repeal of the Rules of Procedure shall be effective until it has been approved by the Applicable Governmental Authorities.

1403. Alternative Procedure for Violation Risk Factors

In the event the Reliability Standards development process fails to produce Violation Risk Factors for a particular Reliability Standard in a timely manner, the Board of Trustees may adopt Violation Risk Factors for that standard after notice and opportunity for comment. In adopting Violation Risk Factors, the Board shall consider the inputs of the Member Representatives Committee and affected stakeholders.

SECTION 1500 — CONFIDENTIAL INFORMATION

1501. Definitions

1. **Confidential Information** means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition.

2. **Confidential Business and Market Information** means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

3. **Critical Energy Infrastructure Information** means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.

4. **Critical Infrastructure** means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.

5. **Cyber Security Incident Information** means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

1502. Protection of Confidential Information

1. **Identification of Confidential Information** — An owner, operator, or user of the Bulk Power System and any other party (the "Submitting Entity") shall mark as confidential any information that it submits to NERC or a Regional Entity (the "Receiving Entity") that it reasonably believes contains Confidential Information as defined by these Rules of Procedure, indicating the category or categories defined in Section 1501 in which the information falls. If the information is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the Submitting Entity shall so indicate and provide supporting references and details.

2. **Confidentiality** — Except as provided herein, a Receiving Entity shall keep in confidence and not copy, disclose, or distribute any Confidential Information or

any part thereof without the permission of the Submitting Entity, except as otherwise legally required.

3. **Information no longer Confidential –** If a Submitting Entity concludes that information for which it had sought confidential treatment no longer qualifies for that treatment, the Submitting Entity shall promptly so notify NERC or the relevant Regional Entity.

1503. Requests for Information

1. **Limitation** — A Receiving Entity shall make information available only to one with a demonstrated need for access to the information from the Receiving Entity.

2. **Form of Request** — A person with such a need may request access to information by using the following procedure:

   2.1 The request must be in writing and clearly marked "Request for Information."

   2.2 The request must identify the individual or entity that will use the information, explain the requester's need for access to the information, explain how the requester will use the information in furtherance of that need, and state whether the information is publicly available or available from another source or through another means. If the requester seeks access to information that is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the requester shall describe how it qualifies to receive such information.

   2.3 The request must stipulate that, if the requester does not seek public disclosure, the requester will maintain as confidential any information received for which a Submitting Party has made a claim of confidentiality in accordance with NERC's rules. As a condition to gaining access to such information, a requester shall execute a non-disclosure agreement in a form approved by NERC's Board of Trustees.

3. **Notice and Opportunity for Comment** — Prior to any decision to disclose information marked as confidential, the Receiving Entity shall provide written notice to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed. Failure to provide such comments or otherwise respond is not deemed waiver of the claim of confidentiality.

4. **Determination by ERO or Regional Entity** — Based on the information provided by the requester under Rule 1503.2, any comments provided by the Submitting Entity, and any other relevant available information, the chief

executive officer or his or her designee of the Receiving Entity shall determine whether to disclose such information.

5. **Appeal** — A person whose request for information is denied in whole or part may appeal that determination to the President of NERC (or the President's designee) within 30 days of the determination. Appeals filed pursuant to this Section must be in writing, addressed to the President of NERC (or the President's designee), and clearly marked "Appeal of Information Request Denial."

   NERC will provide written notice of such appeal to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed; provided that any such comments must be received within 30 days of the notice and any failure to provide such comments or otherwise respond is not deemed a waiver of the claim of confidentiality.

   The President of NERC (or the President's designee) will make a determination with respect to any appeal within 30 days. In unusual circumstances, this time limit may be extended by the President of NERC (or the President's designee), who will send written notice to the requester setting forth the reasons for the extension and the date on which a determination on the appeal is expected.

6. **Disclosure of Information** — In the event the Receiving Entity, after following the procedures herein, determines to disclose information designated as Confidential Information, it shall provide the Submitting Entity no fewer than 21 days' written notice prior to releasing the Confidential Information in order to enable such Submitting Entity to (a) seek an appropriate protective order or other remedy, (b) consult with the Receiving Entity with respect to taking steps to resist or narrow the scope of such request or legal process, or (c) waive compliance, in whole or in part, with the terms of this Section. Should a Receiving Entity be required to disclose Confidential Information, or should the Submitting Entity waive objection to disclosure, the Receiving Entity shall furnish only that portion of the Confidential Information which the Receiving Entity's counsel advises is legally required.

7. Posting of Determinations on Requests for Disclosure of Confidential Information — Upon making its determination on a request for disclosure of Confidential Information, NERC or the Regional Entity, as applicable, shall (i) notify the requester that the request for disclosure is granted or denied, (ii) publicly post any determination to deny the request to disclose Confidential Information, including in such posting an explanation of the reasons for the denial (but without in such explanation disclosing the Confidential Information), and (iii) publicly post any determination that information claimed by the Submitting Entity to be Confidential Information is not Confidential Information (but without in such posting disclosing any information that has been determined to be Confidential Information).

1504. Employees, Contractors and Agents

A Receiving Entity shall ensure that its officers, trustees, directors, employees, subcontractors and subcontractors' employees, and agents to whom Confidential Information is exposed are under obligations of confidentiality that are at least as restrictive as those contained herein.

1505. Provision of Information to FERC and Other Governmental Authorities

1. **Request** — A request from FERC for reliability information with respect to owners, operators, and users of the Bulk Power System within the United States is authorized by Section 215 of the Federal Power Act. Other Applicable Governmental Authorities may have similar authorizing legislation that grants a right of access to such information. Unless otherwise directed by FERC or its staff or the other Applicable Governmental Authority requesting the information, upon receiving such a request, a Receiving Entity shall provide contemporaneous notice to the applicable Submitting Entity. In its response to such a request, a Receiving Entity shall preserve any mark of confidentiality and shall notify FERC or other Applicable Governmental Authorities that the Submitting Entity has marked the information as confidential.

2. **Continued Confidentiality** — Each Receiving Entity shall continue to treat as confidential all Confidential Information that it has submitted to NERC or to FERC or another Applicable Governmental Authority, until such time as FERC or the other Applicable Governmental Authority authorizes disclosure of such information.

1506. Permitted Disclosures

1. **Confirmed Violations** — Nothing in this Section 1500 shall prohibit the disclosure of a violation at the point when the matter is filed with an Applicable Governmental Authority as a Notice of Penalty, the "violator" admits to the violation, or the alleged violator and NERC or the Regional Entity reach a settlement regarding the violation.

2. **Compliance Information** — NERC and the Regional Entities are authorized to exchange Confidential Information related to evaluations, Compliance Audits, and Compliance Investigations in furtherance of the Compliance Monitoring and Enforcement Program, on condition they continue to maintain the confidentiality of such information.

1507. Remedies for Improper Disclosure

Any person engaged in NERC or Regional Entity activity under Section 215 of the Federal Power Act or the equivalent laws of other Applicable Governmental Authorities who improperly discloses information determined to be confidential may lose access to Confidential Information on a temporary or permanent basis and may be subject to adverse personnel action, including suspension or termination. Nothing in Section 1500

precludes an entity whose information was improperly disclosed from seeking a remedy in an appropriate court.

SECTION 1600 — REQUESTS FOR DATA OR INFORMATION

1601. Scope of a NERC or Regional Entity Request for Data or Information

Within the United States, NERC and Regional Entities may request data or information that is necessary to meet their obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of the Commission's regulations, 18 C.F.R. § 39.2(d). In other jurisdictions NERC and Regional Entities may request comparable data or information, using such authority as may exist pursuant to these Rules of Procedure and as may be granted by Applicable Governmental Authorities in those other jurisdictions. The provisions of Section 1600 shall not apply to Requirements contained in any Reliability Standard to provide data or information; the Requirements in the Reliability Standards govern. The provisions of Section 1600 shall also not apply to data or information requested in connection with a compliance or enforcement action under Section 215 of the Federal Power Act, Section 400 of these Rules of Procedure, or any procedures adopted pursuant to those authorities, in which case the Rules of Procedure applicable to the production of data or information for compliance and enforcement actions shall apply.

1602. Procedure for Authorizing a NERC Request for Data or Information

1. NERC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in Section 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to the Office of Electric Reliability is for the information of the Commission. NERC is not required to receive any approval from the Commission prior to posting the proposed request or modification for public comment in accordance with Section 1602.2 or issuing the request or modification to Reporting Entities following approval by the Board of Trustees.

2. NERC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.

    2.1. A proposed request for data or information shall contain, at a minimum, the following information: (i) a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements; (ii) a description of how the data or information will be collected and validated; (iii) a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("Reporting Entities"); (iv) the schedule or due date for the data or information; (v) a description of any restrictions on disseminating the data or information (e.g., "Confidential Information," "Critical Energy Infrastructure Information,"

"aggregating" or "identity masking"); and (vi) an estimate of the relative burden imposed on the Reporting Entities to accommodate the data or information request.

2.2. A proposed modification to a previously authorized request for data or information shall explain (i) the nature of the modifications; (ii) an estimate of the burden imposed on the Reporting Entities to accommodate the modified data or information request, and (iii) any other items from Section 1602.2.1 that require updating as a result of the modifications.

3. After the close of the comment period, NERC shall make such revisions to the proposed request for data or information as are appropriate in light of the comments. NERC shall submit the proposed request for data or information, as revised, along with the comments received, NERC's evaluation of the comments and recommendations, to the Board of Trustees.

4. In acting on the proposed request for data or information, the Board of Trustees may authorize NERC to issue it, modify it, or remand it for further consideration.

5. NERC may make minor changes to an authorized request for data or information without Board approval. However, if a Reporting Entity objects to NERC in writing to such changes within 21 days of issuance of the modified request, such changes shall require Board approval before they are implemented.

6. Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the Board of Trustees, an affected party appeals the authorization under this Section 1600 to the Applicable Governmental Authority.

1603. Owners, Operators, and Users to Comply

Owners, operators, and users of the Bulk Power System registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a Reporting Entity within the United States fails to comply with an authorized request for data or information under Section 1600, NERC may request the Commission to exercise its enforcement authority to require the Reporting Entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. NERC will make any request for the Commission to enforce a request for data or information through a non-public submission to the Commission's enforcement staff.

1604. Requests by Regional Entity for Data or Information

1. A Regional Entity may request that NERC seek authorization for a request for data or information to be applicable within the Region of the Regional Entity, either as a freestanding request or as part of a proposed NERC request for data or information. Any such request must be consistent with this Section 1600.

2. A Regional Entity may also develop its own procedures for requesting data or information, but any such procedures must include at least the same procedural elements as are included in this Section 1600. Any such Regional Entity procedures or changes to such procedures shall be submitted to NERC for approval. Upon approving such procedures or changes thereto, NERC shall file the proposed procedures or proposed changes for approval by the Commission and any other Applicable Governmental Authorities applicable to the Regional Entity. The Regional Entity procedures or changes to such procedures shall not be effective in a jurisdiction until approved by, and in accordance with any revisions directed by, the Commission or other Applicable Governmental Authority.

1605. Confidentiality

If the approved data or information request includes a statement under Section 1602.1.1(v) that the requested data or information will be held confidential or treated as Critical Energy Infrastructure Information, then the applicable provisions of Section 1500 will apply without further action by a Submitting Entity. A Submitting Entity may designate any other data or information as Confidential Information pursuant to the provisions of Section 1500, and NERC or the Regional Entity shall treat that data or information in accordance with Section 1500. NERC or a Regional Entity may utilize additional protective procedures for handling particular requests for data or information as may be necessary under the circumstances.

1606. Expedited Procedures for Requesting Time-Sensitive Data or Information

1. In the event NERC or a Regional Entity must obtain data or information by a date or within a time period that does not permit adherence to the time periods specified in Section 1602, the procedures specified in Section 1606 may be used to obtain the data or information. Without limiting the circumstances in which the procedures in Section 1606 may be used, such circumstances include situations in which it is necessary to obtain the data or information (in order to evaluate a threat to the reliability or security of the Bulk Power System, or to comply with a directive in an order issued by the Commission or by another Applicable Governmental Authority) within a shorter time period than possible under Section 1602. The procedures specified in Section 1606 may only be used if authorized by the NERC Board of Trustees prior to activation of such procedures.

2. Prior to posting a proposed request for data or information, or a modification to a previously-authorized request, for public comment under Section 1606, NERC shall provide the proposed request or modification, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability. The submission to the Commission's Office of Electric Reliability shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information. The submission shall be made to the Commission's Office of Electric Reliability as far in advance, up to twenty-one (21) days, of the posting of the proposed request or modification for public comments as is

reasonably possible under the circumstances, but in no event less than two (2) days in advance of the public posting of the proposed request or modification.

3. NERC shall post the proposed request for data or information or proposed modification to a previously-authorized request for data or information for a public comment period that is reasonable in duration given the circumstances, but in no event shorter than five (5) days. The proposed request for data or information or proposed modification to a previously-authorized request for data or information shall include the information specified in Section 1602.2.1 or 1602.2.2, as applicable, and shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information.

4. The provisions of Sections 1602.3, 1602.4, 1602.5 and 1602.6 shall be applicable to a request for data or information or modification to a previously-authorized request for data or information developed and issued pursuant to Section 1606, except that (a) if NERC makes minor changes to an authorized request for data or information without Board approval, such changes shall require Board approval if a Reporting Entity objects to NERC in writing to such changes within five (5) days of issuance of the modified request; and (b) authorization of the request for data or information shall be final unless an affected party appeals the authorization of the request by the Board of Trustees to the Applicable Governmental Authority within five (5) days following the decision of the Board of Trustees authorizing the request, which decision shall be promptly posted on NERC's website.

SECTION 1700 — CHALLENGES TO DETERMINATIONS

1701. Scope of Authority

Section ~~1700~~1702 sets forth the procedures to be followed for Registered Entities to challenge determinations made by Planning Coordinators under ~~various~~ Reliability Standard~~s~~ PRC-023~~ or terms defined in the Glossary of Terms Used in NERC Reliability Standards~~. Section 1703 sets forth the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

1702. Challenges to Determinations by Planning Coordinators Under Reliability Standard PRC-023

1. This Section 1702 establishes the procedures to be followed when a Registered Entity wishes to challenge a determination by a Planning Coordinator of the sub-200 kV circuits in its Planning Coordinator area for which Transmission Owners, Generator Owners, and Distribution Providers (defined as "Registered Entities" for purposes of this Section 1702) must comply with the requirements of Reliability Standard PRC-023.

2. Planning Coordinator Procedures

   2.1 Each Planning Coordinator shall establish a procedure for a Registered Entity to submit a written request for an explanation of a determination made by the Planning Coordinator under PRC-023.

   2.2 A Registered Entity shall follow the procedure established by the Planning Coordinator for submitting the request for explanation and must submit any such request within 60 days of receiving the determination under PRC-023 from the Planning Coordinator.

   2.3 Within 30 days of receiving a written request from a Registered Entity, the Planning Coordinator shall provide the Registered Entity with a written explanation of the basis for its determination under PRC-023, unless the Planning Coordinator provided a written explanation of the basis for its determination when it initially informed the Registered Entity of its determination.

3. A Registered Entity may challenge the determination of the Planning Coordinator by filing with the appropriate Regional Entity, with a copy to the Planning Coordinator, within 60 days of receiving the written explanation from the Planning Coordinator. The challenge shall include the following: (a) an explanation of the technical reasons for its disagreement with the Planning Coordinator's determination, along with any supporting documentation, and (b) a copy of the Planning Coordinator's written explanation. Within 30 days of

receipt of a challenge, the Planning Coordinator may file a response to the Regional Entity, with a copy to the Registered Entity.

4. The filing of a challenge in good faith shall toll the time period for compliance with PRC-023 with respect to the subject facility until such time as the challenge is withdrawn, settled or resolved.

5. The Regional Entity shall issue its written decision setting forth the basis of its determination within 90 days after it receives the challenge and send copies of the decision to the Registered Entity and the Planning Coordinator. The Regional Entity may convene a meeting of the involved entities and may request additional information. The Regional Entity shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

6. A Planning Coordinator or Registered Entity affected by the decision of the Regional Entity may, within 30 days of the decision, file an appeal with NERC, with copies to the Regional Entity and the Planning Coordinator or Registered Entity. The appeal shall state the basis of the objection to the decision of the Regional Entity and shall include the Regional Entity decision, the written explanation of the Planning Coordinator's determination under PRC-023, and the documents and reasoning filed by the Registered Entity with the Regional Entity in support of its objection. The Regional Entity, Planning Coordinator or Registered Entity may file a response to the appeal within 30 days of the appeal.

7. The NERC Board of Trustees shall appoint a panel to decide appeals from Region Entity decisions under Section 1702.5. The panel, which may contain alternates, shall consist of at least three appointees, one of whom must be a member of the NERC staff, who are knowledgeable about PRC-023 and transmission planning and do not have a direct financial or business interest in the outcome of the appeal. The panel shall decide the appeal within 90 days of receiving the appeal from the decision of the Regional Entity and shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

8. The Planning Coordinator or Registered Entity affected by the decision of the panel may request that the NERC Board of Trustees review the decision by filing its request for review and a statement of reasons with NERC's Chief Reliability Officer within 30 days of the panel decision. The Board of Trustees may, in its discretion, decline to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. Within 90 days of the request for review under this Section 1702.8, the NERC Board of Trustees may either (a) issue a decision on the merits, which shall be the final NERC decision, or (b) issue a notice declining to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. If no written decision or notice declining review is issued within 90 calendar days, the appeal shall be deemed to have been denied by the NERC Board of Trustees and this will have the same effect as a notice declining review.

9. The Registered Entity or Planning may appeal the final NERC decision to the applicable governmental authority within 30 days of receipt of the Board of Trustees' final decision or notice declining review, or expiration of the 90-day review period without any action by NERC.

10. The Planning Coordinator and Registered Entity are encouraged, but not required, to meet to resolve any dispute, including use of mutually agreed to alternative dispute resolution procedures, at any time during the course of the matter. In the event resolution occurs after the filing of a challenge, the Registered Entity and Planning Coordinator shall jointly provide to the applicable Regional Entity a written acknowledgement of withdrawal of the challenge or appeal, including a statement that all outstanding issues have been resolved.

1703. Challenges to NERC Determinations of BES Exception Requests Under Section 509

1. This Section 1703 establishes the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

2. A Submitting Entity (or Owner if different) aggrieved by the decision of NERC to approve or disapprove an Exception Request or to terminate an Exception with respect to any Element may, within 30 days following the date of the decision, file a written challenge to the decision with the NERC director of compliance operations, with copies to the Regional Entity and the Submitting Entity or Owner if different. The written challenge shall state the basis of the objection to the decision of NERC. The Regional Entity and the Submitting Entity or Owner if different may file a response to the challenge within 30 days following the date the challenge is filed with NERC.

3. The challenge shall be decided by the Board of Trustees Compliance Committee. Within 90 days of the date of submission of the challenge, the Board of Trustees Compliance Committee shall issue its decision on the challenge. The decision of the Board of Trustees Compliance Committee shall be the final NERC decision; provided, that the Board of Trustees Compliance Committee may extend the deadline date for its decision to a date more than 90 days following submission of the challenge, by issuing a notice to the Submitting Entity, the Owner (if different) and the Regional Entity stating the revised deadline date and the reason for the extension.

4. The Submitting Entity, or Owner if different, may appeal the final NERC decision to, or seek review of the final NERC decision by, the Applicable Governmental Authority(ies), in accordance with the legal authority and rules and procedures of the Applicable Governmental Authority(ies). Any such appeal shall be filed within thirty (30) days following the date of the decision of the Board of Trustees Compliance Committee, or within such other time period as is provided for in the legal authority, rules or procedures of the Applicable Governmental Authority.

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF REVISIONS TO ITS RULES OF PROCEDURE
TO ADOPT A BULK ELECTRIC SYSTEM EXCEPTION PROCEDURE

ATTACHMENT 3A

REVISED APPENDIX 2 OF THE RULES OF PROCEDURE,

DEFINITIONS USED IN THE RULES OF PROCEDURE

CLEAN VERSION

Proposed revisions 1-9-2012

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

DEFINITIONS USED IN THE RULES OF PROCEDURE

APPENDIX 2 TO THE RULES OF PROCEDURE

Effective: [DATE], 2012

General

For purposes of the NERC Rules of Procedure, including all Appendices, the terms defined in this Appendix shall have the meanings set forth herein. For convenience of reference to the user, definitions of terms that are used in a particular Appendix may be repeated in that Appendix.

Where used in the Rules of Procedure, a defined term will be capitalized. Where a term defined in this Appendix appears in the Rules of Procedure but is not capitalized, the term is there being used in its ordinary and commonly understood meaning and not as defined in this Appendix (if different). Other terms that are not defined terms, such as the names of entities, organizations, committees, or programs; position titles; titles of documents or forms; section headings; geographic locations; and other terms commonly presented as proper nouns, may also be capitalized in the Rules of Procedure without being defined in this Appendix.

Definitions of terms in this Appendix that are marked with asterisks (**) are taken from the NERC *Glossary of Terms Used in Reliability Standards*. Definitions of terms in this Appendix that are marked with "pluses" (++) are taken from Section 215 of the Federal Power Act or the Commission's regulations at 18 C.F.R. Part 39 or Part 388.

Other terms used in the Rules of Procedure but not defined in this Appendix that have commonly understood and used technical meanings in the electric power industry, including applicable codes and standards, shall be construed in accordance with such commonly understood and used technical meanings.

Specific Definitions

"Acceptance of the Exception Request" or "Acceptance" means the determination that an eligible Exception Request (i.e., a Request permitted by section 4.1 of Appendix 5C) contains all the Required Information so that it can undergo substantive review.

"Adjacent Balancing Authority" means a Balancing Authority Area that is interconnected to another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.**

"Adjusted Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as determined based on application of the adjustment factors identified in Section 4.3 of the *Sanction Guidelines* to the Base Penalty Amount.

"Advisories" or "Level 1 (Advisories)" is a notification issued by NERC in accordance with Section 810.3.1 of the Rules of Procedure.

"Alleged Violation" means a Possible Violation for which the Compliance Enforcement Authority has determined, based on an assessment of the facts and circumstances surrounding the Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard.

"Annual Audit Plan" means a plan developed annually by the Compliance Enforcement Authority that includes the Reliability Standards and Registered Entities to be audited, the schedule of Compliance Audits, and Compliance Audit Participant requirements for the calendar year.

"Annual Report" means the annual report to be filed by NERC with FERC and other Applicable Governmental Authorities in accordance with Section 13.0 of Appendix 4D.

"Applicable Governmental Authority" means the FERC within the United States and the appropriate governmental authority with subject matter jurisdiction over reliability in Canada and Mexico.

"Applicable Requirement" means a Requirement of a CIP Standard that (i) expressly provides either (A) that compliance with the terms of the Requirement is required where or as technically feasible, or (B) that technical limitations may preclude compliance with the terms of the Requirement; or (ii) is subject to Appendix 4D by FERC directive.

"Approval of the Exception Request" or "Approval" means the determination by NERC that an Exception Request meets the criteria to receive the requested Exception.

"Balancing Authority" means the responsible entity that integrates resource plans ahead of time, maintains Load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.**

"Balancing Authority Area" means the collection of generation, transmission, and Loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains Load-resource balance within this area.**

"Base Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as initially determined pursuant to Sections 4.1 and 4.2 of the NERC *Sanction Guidelines,* before application of any adjustment factors.

"BES Definition" means the NERC definition of the Bulk Electric System as set forth in the NERC *Glossary of Terms Used in Reliability Standards.*

"Blackstart Resource" means a generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for Real and Reactive Power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan.**

"Board" or "Board of Trustees" means the Board of Trustees of NERC.

"Board of Trustees Compliance Committee," "BOTCC" or "Compliance Committee" means the Compliance Committee of the NERC Board of Trustees.

"Bulk Electric System" or "BES" means unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- **I1** - Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded under Exclusion E1 or E3.
- **I2** - Generating resource(s) with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.
- **I3** - Blackstart Resources identified in the Transmission Operator's restoration plan.
- **I4** - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above.
- **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

Exclusions:

- **E1** - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:
    a) Only serves Load. Or,
    b) Only includes generation resources, not identified in Inclusion I3, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,
    c) Where the radial system serves Load and includes generation resources, not identified in Inclusion I3, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

    Note – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.
- **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding

obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.

- **E3** - Local networks (LN): A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:
    a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);
    b) Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and
    c) Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).
- **E4** – Reactive Power devices owned and operated by the retail customer solely for its own use.

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.**

"Bulk Power System" means, depending on the context: (i) Facilities and control systems necessary for operating an interconnected electric energy supply and transmission network (or any portion thereof), and electric energy from generating facilities needed to maintain transmission system reliability. The term does not include facilities used in the local distribution of electric energy [++]. (ii) Solely for purposes of Appendix 4E, Bulk Electric System.

"Canadian" means one of the following: (a) a company or association incorporated or organized under the laws of Canada, or its designated representative(s) irrespective of nationality; (b) an agency of a federal, provincial, or local government in Canada, or its designated representative(s) irrespective of nationality; or (c) a self-representing individual who is a Canadian citizen residing in Canada.

"Canadian Entity" means a Registered Entity (or, solely for purposes of Appendix 4D, a Responsible Entity) that is organized under Canadian federal or provincial law.

"Cascading" means the uncontrolled successive loss of System Elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.**

"CCC" means the NERC Compliance and Certification Committee.

"Certification" means, depending on the context, (i) the process undertaken by NERC and a Regional Entity to verify that an entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator and/or Reliability Coordinator; such Certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure; or (ii) for purposes of Appendix 6, an official recognition that indicates the recipient has passed a NERC exam or completed a specified number of Continuing Education Hours.

"Certification Staff" means individuals employed or contracted by NERC who have the authority to make initial determinations of Certification of entities performing reliability functions.

"Certification Team" means a team assembled by a Regional Entity that will be responsible for performing the activities included in the Certification process for an entity pursuant to Appendix 5A.

"Classified National Security Information" means Required Information that has been determined to be protected from unauthorized disclosure pursuant to Executive Order No. 12958, as amended, and/or the regulations of the NRC at 10 C.F.R. §95.35; or pursuant to any comparable provision of Canadian federal or provincial law.

"Clerk" means an individual as assigned by the Compliance Enforcement Authority to perform duties described in Attachment 2, Hearing Procedures, to Appendix 4C.

"Commission" means the Federal Energy Regulatory Commission or FERC.

"Complaint" means an allegation that a Registered Entity violated a Reliability Standard.

"Compliance and Certification Manager" means individual/individuals within the Regional Entity that is/are responsible for monitoring compliance of entities with applicable NERC Reliability Standards.

"Compliance Audit" means a systematic, objective review and examination of records and activities to determine whether a Registered Entity meets the Requirements of applicable Reliability Standards.

"Compliance Audit Participants" means Registered Entities scheduled to be audited and the audit team members.

"Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

"Compliance Enforcement Authority's Area of Responsibility" means the Compliance Enforcement Authority's Region. If a Regional Entity is the Compliance Enforcement Authority, the Compliance Enforcement Authority's Area of Responsibility is shown in Exhibit A to the delegation agreement between the Regional Entity and NERC.

"Compliance Investigation" means a comprehensive investigation, which may include an on-site visit with interviews of the appropriate personnel, to determine if a violation of a Reliability Standard has occurred.

"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC *Uniform Compliance Monitoring and Enforcement Program* (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

"Compliant Date" means the date by which a Responsible Entity is required to be in compliance with an Applicable Requirement of a CIP Standard.

"Confidential Business and Market Information" means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

"Confidential Information" means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition; or (vii) for purposes of Appendix 4D, any other information that is designated as Confidential Information in Section 11.0 of Appendix 4D.

"Confirmed Violation" means an Alleged Violation for which an entity has: (1) accepted the finding of the violation by a Regional Entity or NERC and will not seek an appeal, or (2) completed the hearing and appeals process within NERC, or (3) allowed the time for requesting a hearing or submitting an appeal to expire, or (4) admitted to the violation in a settlement agreement.

"Continuing Education Hour" or "CE Hour" means sixty minutes of participation in a group, independent study, or self-study learning activity as approved by the NERC Continuing Education Program.

"Continuing Education Program Provider" or "Provider" means the individual or organization offering a learning activity to participants and maintaining documentation required by Appendix 6.

"Coordinated Functional Registration" means where two or more entities (parties) agree in writing upon a division of compliance responsibility among the parties for one or more Reliability Standard(s) applicable to a particular function, and/or for one or more Requirement(s)/sub-Requirement(s) within particular Reliability Standard(s).

"Covered Asset" means a Cyber Asset or Critical Cyber Asset that is subject to an Applicable Requirement.

"Credential" means a NERC designation that indicates the level of qualification achieved (i.e., reliability operator; balancing, interchange, and transmission operator; balancing and interchange operator; and transmission operator).

"Credential Maintenance" means to meet NERC CE Hours' requirements to maintain a valid NERC-issued system operator Credential.

"Critical Assets" means Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.**

"Critical Cyber Assets" means Cyber Assets critical to the reliable operation of Critical Assets.**

"Critical Energy Infrastructure Information" means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.++

"Critical Infrastructure" means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.++

"Critical Infrastructure Protection Standard" or "CIP Standard" means any of NERC Reliability Standards CIP-002 through CIP-009.

"Cross-Border Regional Entity" means a Regional Entity that encompasses a part of the United States and a part of Canada or Mexico.++

"Cyber Assets" means programmable electronic devices and communication networks including hardware, software, and data.**

"Cyber Security Incident" means any malicious or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communications networks including hardware, software and data that are essential to the Reliable Operation of the Bulk Power System.++

"Cyber Security Incident Information" means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

"Days", as used in Appendix 5A with respect to the Registration and Certification processes, means calendar days.

"Delegate" means a person to whom the Senior Manager of a Responsible Entity has delegated authority pursuant to Requirement R2.3 of CIP Standard CIP-003-1 (or any successor provision).

"Director of Compliance" means the Director of Compliance of NERC or of the Compliance Enforcement Authority, as applicable, who is responsible for the management and supervision of Compliance Staff, or his or her designee.

"Disapproval of the Exception Request" or "Disapproval" means the determination by NERC that an Exception Request does not meet the criteria to receive the requested Exception.

"Distribution Factor" means the portion of an Interchange Transaction, typically expressed in per unit that flows across a transmission facility (Flowgate).**

"Distribution Provider" means the entity that provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.**

"Document" means, in addition to the commonly understood meaning of the term as information written or printed on paper, any electronically stored information, including writings, drawings, graphs, charts, photographs, sound recordings, images and other data or data compilations stored in any medium from which information can be obtained, and shall be translated by the producing party into reasonably usable form.

"Effective Date" means the date, as specified in a notice rejecting or disapproving a TFE Request or terminating an approved TFE, on which the rejection, disapproval or termination becomes effective.

"Electric Reliability Organization" or "ERO" means the organization that is certified by the Commission under Section 39.3 of its regulations, the purpose of which is to establish and enforce Reliability Standards for the Bulk Power System in the United States, subject to Commission review. The organization may also have received recognition by Applicable Governmental Authorities in Canada and Mexico to establish and enforce Reliability Standards for the Bulk Power Systems of the respective countries.

"Element" means any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An Element may be comprised of one or more components.**

"Eligible Reviewer" means a person who has the required security clearances or other qualifications, or who otherwise meets the applicable criteria, to have access to Confidential Information, Classified National Security Information, NRC Safeguards Information or Protected FOIA Information, as applicable to the particular information to be reviewed.

"End Date" means the last date of the period to be covered in a Compliance Audit.

"Essential Actions" or "Level 3 (Essential Actions)" is a notification issued by NERC in accordance with Section 810.3.3 of the Rules of Procedure.

"Exception" means either an Inclusion Exception or an Exclusion Exception.

"Exception Procedure" means the procedure set forth in Appendix 5C.

"Exception Reporting" means information provided to the Compliance Enforcement Authority by a Registered Entity indicating that a violation of a Reliability Standard has occurred (e.g., a System Operating Limit has been exceeded) or enabling the Compliance Enforcement Authority to ascertain the Registered Entity's compliance.

"Exception Request" means a request made by a Submitting Entity in accordance with Appendix 5C for an Exception.

"Exception Request Form" means the form adopted by each Regional Entity, in accordance with a template provided by NERC, for use by Submitting Entities in submitting Exception Requests; provided, that the Exception Request Form must include Section III.B as adopted by NERC.

"Exclusion Exception" means a determination that an Element that falls within the BES Definition should be excluded from the BES.

"Expiration Date" means the date on which an approved TFE expires.

"Facility" means a set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)**

"FERC" means the United States Federal Energy Regulatory Commission.

"Final Penalty Amount" means the final, proposed Penalty for violation of a Reliability Standard, determined in accordance with the *Sanction Guidelines*.

"Flowgate" means 1.) A portion of the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions. 2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.**

"FOIA" means the U.S. Freedom of Information Act, 5 U.S.C. §552.

"Footprint" means the geographical or electric area served by an entity.

"Functional Entity" means an entity responsible for a function that is required to ensure the Reliable Operation of the electric grid as identified in the NERC Reliability Standards.

"Generator Operator" means the entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.**

"Generator Owner" means an entity that owns and maintains generating units.**

"Hearing Body" or "Regional Entity Hearing Body" means the body established by a Regional Entity to conduct hearings pursuant to the Hearing Procedures.

"Hearing Officer" means, depending on the context, (i) an individual employed or contracted by the Compliance Enforcement Authority and designated by the Compliance Enforcement Authority to preside over hearings conducted pursuant to Attachment 2, Hearing Procedures, of Appendix 4C, or (ii) solely for hearings conducted pursuant to Appendix 4E, (A) a CCC member or (B) an individual employed or contracted by NERC, as designated and approved by the CCC to preside over hearings conducted pursuant to the Hearing Procedures in Appendix E; the Hearing Officer shall not be a member of the Hearing Panel.

"Hearing Panel" means the five person hearing body established as set forth in the CCC Charter on a case by case basis and that is responsible for adjudicating a matter as set forth in Appendix 4E.

"Hearing Procedures" means, depending on the context, (i) Attachment 2 to the NERC or a Regional Entity CMEP, as applicable, or (ii) the hearing procedures of the NERC Compliance and Certification Committee in Appendix 4E.

"Inclusion Exception" means a determination that an Element that falls outside the BES Definition should be included in the BES.

"Interchange" means energy transfers that cross Balancing Authority boundaries.**

"Interchange Authority" means the responsible entity that authorizes the implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communications of Interchange information for reliability assessment purposes.**

"Interchange Distribution Calculator" means the mechanism used by Reliability Coordinators in the Eastern Interconnection to calculate the distribution of Interchange Transactions over specific Flowgates. It includes a database of all Interchange Transactions and a matrix of the Distribution Factors for the Eastern Interconnection.**

"Interchange Schedule" means an agreed-upon Interchange Transaction size (megawatts), start and end time, beginning and ending ramp times and rate, and type required for delivery and

receipt of power and energy between the Source and Sink Balancing Authorities involved in the transaction.**

"Interchange Transaction" means an agreement to transfer energy from a seller to a buyer that crosses one or more Balancing Authority Area boundaries.**

"Interconnected Operations Service" means a service (exclusive of basic energy and Transmission Services) that is required to support the Reliable Operation of interconnected Bulk Electric Systems.**

"Interconnection" means a geographic area in which the operation of Bulk Power System components is synchronized such that the failure of one or more of such components may adversely affect the ability of the operators of other components within the system to maintain Reliable Operation of the Facilities within their control.++

"Interconnection Reliability Operating Limit" means a System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System.**

"Interpretation" means an addendum to a Reliability Standard, developed in accordance with the NERC *Standard Processes Manual* and approved by the Applicable Governmental Authority(ies), that provides additional clarity about one or more Requirements in the Reliability Standard.

"Joint Registration Organization" means an entity that registers in the Compliance Registry to perform reliability functions for itself and on behalf of one or more of its members or related entities for which such members or related entities would otherwise be required to register.

"Lead Entity" means the entity that submits Exception Request information that is common to a group of Submitting Entities that are submitting Exception Requests jointly.

"Lead Mediator" means a member of a mediation team formed pursuant to Appendix 4E who is selected by the members to coordinate the mediation process and serve as the mediation team's primary contact with the Parties.

"Load" means an end-user device or customer that receives power from the electric system.**

"Load-Serving Entity" means an entity that secures energy and Transmission Service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.**

"Mapping" means the process of determining whether a Regional Entity's Footprint is being served by Registered Entities.
"Mediation Settlement Agreement" means a written agreement entered into by the Parties to a mediation pursuant to Appendix 4E that resolves the dispute.

"Member" means a member of NERC pursuant to Article II of its Bylaws.

"Member Representatives Committee" or "MRC" means the body established pursuant to Article VIII of the NERC Bylaws.

"Mexican Entity" means a Registered Entity that is organized under Mexican law.

"Mitigation Plan" means an action plan, required when a Registered Entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, settlement agreement, or otherwise, that is developed by the Registered Entity to (1) correct a violation of a Reliability Standard and (2) prevent re-occurrence of the violation.

"NERC-Approved Learning Activity" means training that maintains or improves professional competence and has been approved by NERC for use in its Continuing Education Program.

"NERC Compliance Monitoring and Enforcement Program Implementation Plan" or "NERC Implementation Plan" means the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan that specifies the Reliability Standards that are subject to reporting by Registered Entities to the Compliance Enforcement Authority in order to verify compliance and identifies the appropriate monitoring procedures and reporting schedules for each such Reliability Standard.

"NERC Compliance Registry," "Compliance Registry" or "NCR" means a list, maintained by NERC pursuant to Section 500 of the NERC Rules of Procedure and Appendix 5B, the NERC *Statement of Compliance Registry Criteria*, of the owners, operators and users of the Bulk Power System, and the entities registered as their designees, that perform one or more functions in support of reliability of the Bulk Power System and are required to comply with one or more Requirements of Reliability Standards.

"NERC Identification Number" or "NERC ID" means a number given to NERC Registered Entities that will be used to identify the entity for certain NERC activities. Corporate entities may have multiple NERC IDs to show different corporate involvement in NERC activities.

"NERC Organization Certification" or "Organization Certification" means the process undertaken by NERC and a Regional Entity to verify that a new entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator, and/or Reliability Coordinator; such certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure.

"Net Energy for Load" or "NEL" means net generation of an electric system plus energy received from others less energy delivered to others through interchange. It includes system losses but excludes energy required for the storage of energy at energy storage facilities.

"Notice of Alleged Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity pursuant to Section 5.3 of Appendix 4C.

"Notice of Completion of Enforcement Action" means a notice issued by the Compliance Enforcement Authority to a Registered Entity, pursuant to Section 5.10 of Appendix 4C, stating than an enforcement action is closed.

"Notice of Confirmed Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity confirming the violation of one or more Reliability Standards, as a result of (1) the Registered Entity accepting a Notice of Alleged Violation and the proposed Penalty or sanction, or (2) the finding of a violation through a hearing and appeal, or (3) the expiration of the period for requesting a hearing or an appeal, or (4) the Registered Entity admitting the violation as part of an executed settlement agreement.

"Notice of Penalty" means a notice prepared by NERC and filed with FERC, following approval by NERC of a Notice of Confirmed Violation or a settlement agreement, stating the Penalty or sanction imposed or agreed to for the Confirmed Violation or as part of the settlement.

"Notice of Possible Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity that (1) states a Possible Violation has been identified, (2) provides a brief description of the Possible Violation, including the Reliability Standard Requirement(s) and the date(s) involved, and (3) instructs the Registered Entity to retain and preserve all data and records relating to the Possible Violation.

"NRC" means the United States Nuclear Regulatory Commission.

"NRC Safeguards Information" means Required Information that is subject to restrictions on disclosure pursuant to 42 U.S.C. §2167 and the regulations of the NRC at 10 C.F.R. §73.21-73.23; or pursuant to comparable provisions of Canadian federal or provincial law.

"Open Access Transmission Tariff" means an electronic transmission tariff accepted by the U.S. Federal Energy Regulatory Commission requiring the Transmission Service Provider to furnish to all shippers with non-discriminating service comparable to that provided by Transmission Owners to themselves.**

"Owner" means the owner(s) of an Element or Elements that is or may be determined to be part of the BES as a result of either the application of the BES Definition or an Exception, or another entity, such as an operator, authorized to act on behalf of the owner of the Element or Elements in the context of an Exception Request.

"Part A Required Information" means Required Information that is to be provided in Part A of a Responsible Entity's TFE Request.

"Part B Required Information" means Required Information that is to be provided in Part B of a Responsible Entity's TFE Request.

"Participant" means a Respondent and any other Person who is allowed or required by FERC to participate as an intervenor in a proceeding conducted pursuant to the Hearing Procedures, and as used in the Hearing Procedures shall include, depending on the context, the members of the

Compliance Staff that participate in a proceeding or the members of the Certification Staff that participate in a proceeding pursuant to Appendix 4E.

"Party" or "Parties" means a Person or the Persons participating in a mediation pursuant to Appendix 4E.

"Penalty" means and includes all penalties and sanctions, including but not limited to a monetary or non-monetary penalty; a limitation on an activity, function, operation or other appropriate sanction; or the addition of the Registered Entity or Respondent to a reliability watch list composed of major violators. Penalties must be within the range set forth in the NERC *Sanction Guidelines* approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2), and shall bear a reasonable relation to the seriousness of a Registered Entity's or Respondent's violation and take into consideration any timely efforts made by the Registered Entity or Respondent to remedy the violation.

"Periodic Data Submittals" means modeling, studies, analyses, documents, procedures, methodologies, operating data, process information or other information to demonstrate compliance with Reliability Standards and provided by Registered Entities to the Compliance Enforcement Authority on a time frame required by a Reliability Standard or an ad hoc basis.

"Person" means any individual, partnership, corporation, limited liability company, governmental body, association, joint stock company, public trust, organized group of persons, whether incorporated or not, or any other legal entity.

"Planning Authority" means the responsible entity that coordinates and integrates transmission Facilities and service plans, resource plans, and Protection Systems.**

"Point of Delivery" means a location that a Transmission Service Provider specifies on its transmission system where an Interchange Transaction leaves or a Load-Serving Entity receives its energy.**

"Point of Receipt" means a location that the Transmission Service Provider specifies on its transmission system where an Interchange Transaction enters or a generator delivers its output.

"Possible Violation" means the identification, by the Compliance Enforcement Authority, using one of the compliance monitoring and enforcement processes in Section 3.0 of Appendix 4C, of a possible failure by a Registered Entity to comply with a Reliability Standard that is applicable to the Registered Entity.

"Preliminary Screen" means an initial evaluation of evidence indicating potential noncompliance with a Reliability Standard has occurred or is occurring, conducted by the Compliance Enforcement Authority for the purpose of determining whether a Possible Violation exists, and consisting of an evaluation of whether (1) the entity allegedly involved in the potential noncompliance is registered, and (2) the Reliability Standard Requirement to which the evidence of potential noncompliance relates is applicable to a reliability function for which the entity is registered.

"Probation" means a step in the disciplinary process pursuant to Appendix 6 during which the certificate is still valid. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

"Protected FOIA Information" means Required Information, held by a governmental entity, that is subject to an exemption from disclosure under FOIA (5 U.S.C. §552(e)), under any similar state or local statutory provision, or under any comparable provision of Canadian federal or provincial law, which would be lost were the Required Information to be placed into the public domain.

"Protection System" means protective relays which respond to electrical quantities, communications systems necessary for correct operation of protective functions, voltage and current sensing devices providing inputs to protective relays, station dc supply associated with protective functions (including batteries, battery chargers, and non-battery-based dc supply), and control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.**

"Purchasing-Selling Entity" means the entity that purchases, or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.**

"Reactive Power" means the portion of electricity that establishes and sustains the electric and magnetic fields of alternating-current equipment. Reactive Power must be supplied to most types of magnetic equipment, such as motors and transformers. It also must supply the reactive losses on transmission facilities. Reactive Power is provided by generators, synchronous condensers, or electrostatic equipment such as capacitors and directly influences electric system voltage. It is usually expressed in kilovars (kvar) or megavars (Mvar).**

"Real Power" means the portion of electricity that supplies energy to the Load.**

"Receiving Entity" means NERC or a Regional Entity receiving Confidential Information from an owner, operator, or user of the Bulk Power System or from any other party.

"Recommendation" for purposes of Appendix 5C means the report to NERC containing the evaluation prepared in accordance with section 5.2 of Appendix 5C concerning whether or to what extent an Exception Request should be approved.

"Recommendations" or "Level 2 (Recommendations)" is a notification issued by NERC in accordance with Section 810.3.2 of the Rules of Procedure.

"Region" means the geographic area, as specified in a Regional Entity's delegation agreement with NERC, within which the Regional Entity is responsible for performing delegated functions.

"Regional Criteria" means reliability requirements developed by a Regional Entity that are necessary to implement, to augment, or to comply with Reliability Standards, but which are not

Reliability Standards. Such Regional Criteria may be necessary to account for physical differences in the Bulk Power System but are not inconsistent with Reliability Standards nor do they result in lesser reliability. Such Regional Criteria are not enforceable pursuant to NERC-delegated authorities, but may be enforced through other available mechanisms. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents.

"Regional Entity" means an entity having enforcement authority pursuant to 18 C.F.R. § 39.8.++

"Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan" or "Regional Implementation Plan" means an annual plan, submitted by November 1 of each year to NERC for approval that, in accordance with NERC Rule of Procedure Section 401.6 and the NERC Compliance Monitoring and Enforcement Program Implementation Plan, identifies (1) all Reliability Standards identified by NERC to be actively monitored during each year, (2) other Reliability Standards proposed for active monitoring by the Regional Entity, (3) the methods to be used by the Regional Entity for reporting, monitoring, evaluation, and assessment of performance criteria with each Reliability Standard, and (4) the Regional Entity's Annual Audit Plan.

"Regional Reliability Standard" means a type of Reliability Standard that is applicable only within a particular Regional Entity or group of Regional Entities. A Regional Reliability Standard may augment, add detail to, or implement another Reliability Standard or cover matters not addressed by other Reliability Standards. Regional Reliability Standards, upon adoption by NERC and approval by the Applicable Governmental Authority(ies), shall be Reliability Standards and shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Registered Ballot Body" means that aggregation of all entities or individuals that qualify for one of the Segments approved by the Board of Trustees, and are registered with NERC as potential ballot participants in the voting on proposed Reliability Standards.

"Registered Entity" means an owner, operator, or user of the Bulk Power System, or the entity registered as its designee for the purpose of compliance, that is included in the NERC Compliance Registry.

"Registration" or "Organization Registration" means the processes undertaken by NERC and Regional Entities to identify which entities are responsible for reliability functions within the Regional Entity's Region.

"Rejection of the Exception Request" or "Rejection" means the determination that an Exception Request is not an eligible Exception Request (i.e., a Request permitted by section 4.1 of Appendix 5C) or does not contain all the Required Information in accordance with section 4.5 of Appendix 5C in order to be reviewed for substance.

"Reliability Coordinator" means the entity that is the highest level of authority who is responsible for the Reliable Operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.**

"Reliability Coordinator Area" means the collection of generation, transmission and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas.**

"Reliability Standard" means a requirement to provide for Reliable Operation of the Bulk Power System, including without limiting the foregoing, requirements for the operation of existing Bulk Power System Facilities, including cyber security protection, and including the design of planned additions or modifications to such Facilities to the extent necessary for Reliable Operation of the Bulk Power System, but the term does not include any requirement to enlarge Bulk Power System Facilities or to construct new transmission capacity or generation capacity. A Reliability Standard shall not be effective in the United States until approved by the Federal Energy Regulatory Commission and shall not be effective in other jurisdictions until made or allowed to become effective by the Applicable Governmental Authority.

"Reliability Standards Development Plan" means the forward-looking plan developed by NERC on an annual basis setting forth the Reliability Standards development projects that are scheduled to be worked on during the ensuing three-year period, as specified in Section 310 of the Rules of Procedure.

"Reliable Operation" means operating the Elements of the Bulk Power System within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or Cascading failures of such system will not occur as a result of a sudden disturbance, including a Cyber Security Incident, or unanticipated failure of system Elements.++

"Remedial Action Directive" means an action (other than a Penalty or sanction) required by a Compliance Enforcement Authority that (1) is to bring a Registered Entity into compliance with a Reliability Standard or to avoid a Reliability Standard violation, and (2) is immediately necessary to protect the reliability of the Bulk Power System from an imminent threat.

"Reporting Entity" means an entity required to provide data or information requested by NERC or a Regional Entity in a request for data or information pursuant to Section 1600 of the Rules of Procedure.

"Requirement" means an explicit statement in a Reliability Standard that identifies the functional entity responsible, the action or outcome that must be achieved, any conditions achieving the action or outcome, and the reliability-related benefit of the action or outcome. Each Requirement shall be a statement with which compliance is mandatory.

"Required Date" means the date given a Registered Entity in a notice from the Compliance Enforcement Authority by which some action by the Registered Entity is required.

"Required Information" means, as applicable, either (i) the information required to be provided in a TFE Request, as specified in Section 4.0 of Appendix 4D; or (ii) the information required to be provided in an Exception Request, as specified in section 4.0 of Appendix 5C.

"Reserve Sharing Group" means a group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g. ten minutes). If the transaction is ramped in quicker, (e.g., between zero and ten minutes), then, for the purposes of disturbance control performance, the areas become a Reserve Sharing Group.**

"Resource Planner" means the entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority area.**

"Respondent" means, depending on the context, the Registered Entity, who is the subject of the Notice of Alleged Violation, contested Mitigation Plan or contested Remedial Action Directive that is the basis for the proceeding, whichever is applicable, or the Registered Entity that is the subject of the Certification decision that is the basis for a proceeding under Appendix 4E.

"Responsible Entity" means an entity that is registered for a reliability function in the NERC Compliance Registry and is responsible for complying with an Applicable Requirement, as specified in the "Applicability" section of the CIP Standard.

"Revoked" means a NERC certificate that has been suspended for more than twelve months. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified. The certificate holder will be required to pass an exam to be certified again. Any CE Hours accumulated prior to or during the revocation period will not be counted towards Credential Maintenance.

"Revoke for Cause" means a step in the disciplinary process pursuant to Appendix 6 during which the certificate is no longer valid and requiring successfully passing an exam to become certified. However, an exam will not be authorized until the revocation period expires. CE Hours earned before or during this revocation period will not be counted for maintaining a Credential.

"Scope of Responsibility" means the registered functions of a Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Planner or Balancing Authority and the geographical or electric region in which the Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Planner or Balancing Authority operates to perform its registered functions, or with respect to a Regional Entity, its Regional Entity Region.

"Section I Required Information" means Required Information that is to be provided in Section I of a Submitting Entity's Exception Request.

"Section II Required Information" means Required Information that is to be provided in Section II of a Submitting Entity's Exception Request.

"Section III Required Information" means Required Information that is to be provided in Section III of a Submitting Entity's Exception Request.

"Sector" means a group of Members of NERC that are Bulk Power System owners, operators, or users or other persons and entities with substantially similar interests, including governmental entities, as pertinent to the purposes and operations of NERC and the operation of the Bulk Power System, as defined in Article II, Section 4 of the NERC Bylaws. Each Sector shall constitute a class of Members for purposes of the New Jersey Nonprofit Corporation Act.

"Segment" means one of the subsets of the Registered Ballot Body whose members meet the qualification criteria for the subset.

"Self-Certification" means attestation by a Registered Entity of compliance or non-compliance with a Reliability Standard for which Self-Certification is required by the Compliance Enforcement Authority and that is included for monitoring in the Regional Implementation Plan.

"Self-Reporting" means a report by a Registered Entity stating (1) that the Registered Entity believes it has violated a Reliability Standard, and (2) the actions that have been taken or will be taken to resolve the violation.

"Senior Manager" means the person assigned by the Responsible Entity, in accordance with CIP Standard CIP-003-1 Requirement R2 (or subsequent versions), to have overall responsibility for leading and managing the Responsible Entity's implementation of, and adherence to, the CIP Standards.

"Sink Balancing Authority" means the Balancing Authority in which the Load (sink) is located for an Interchange Transaction.**

"Source Balancing Authority" means the Balancing Authority in which the generation (source) is located for an Interchange Transaction.**

"Special Protection System" means an automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. A Special Protection System does not include (a) underfrequency or undervoltage Load shedding or (b) fault conditions that must be isolated, or (c) out-of-step relaying (not designed as an integral part of a Special Protection System).**

"Spot Checking" means a process in which the Compliance Enforcement Authority requests a Registered Entity to provide information (1) to support the Registered Entity's Self-Certification,

Self-Reporting, or Periodic Data Submittal and to assess whether the Registered Entity complies with Reliability Standards, or (2) as a random check, or (3) in response to events, as described in the Reliability Standards or based on operating problems or system events.

"Staff" or "Compliance Staff" means individuals employed or contracted by NERC or the Compliance Enforcement Authority who have the authority to make initial determinations of compliance or violation with Reliability Standards by Registered Entities and associated Penalties and Mitigation Plans.

"Strict Compliance" means compliance with the terms of an Applicable Requirement without reliance on a Technical Feasibility Exception.

"Submitting Entity" means (i) an owner, operator, or user of the Bulk Power System or any other party that submits information to NERC or a Regional Entity that it reasonably believes contains Confidential Information or, (ii) solely for purposes of Appendix 5C, the entity that submits an Exception Request in accordance with section 4.0 of Appendix 5C.

"Suspended" means certificate status due to an insufficient number of CE Hours being submitted prior to the expiration of a certificate. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified.

"System" means a combination of generation, transmission and distribution components.**

"System Operating Limit" means the value (such as MW, Mvar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria.**

"Technical Advisor" means any Staff member, third-party contractor, or industry stakeholder who satisfies NERC's or the Compliance Enforcement Authority's (as applicable) conflict of interest policy and is selected to assist in a proceeding by providing technical advice to the Hearing Officer and/or the Hearing Body or Hearing Panel.

"Technical Feasibility Exception" or "TFE" means an exception from Strict Compliance with the terms of an Applicable Requirement on grounds of technical feasibility or technical limitations in accordance with one or more of the criteria in section 3.0 of Appendix 4D.

"Technical Review Panel" means a panel established pursuant to section 5.3 of Appendix 5C.

"Termination of Credential" means a step in the disciplinary process pursuant to Appendix 6 whereby a Credential is permanently Revoked.
"TFE Request" means a request submitted by a Responsible Entity in accordance with Appendix 4D for an exception from Strict Compliance with an Applicable Requirement.

"Transmission Customer" means 1. any eligible customer (or its designated agent) that can or does execute a Transmission Service agreement or can and does receive Transmission Service.

2. Any of the following responsible entities: Generator Owner, Load-Serving Entity, or Purchasing-Selling Entity.**

"Transmission Operator" means the entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission Facilities.**

"Transmission Owner" means the entity that owns and maintains transmission Facilities.**

"Transmission Planner" means the entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area.**

"Transmission Service" means services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.**

"Transmission Service Provider" means the entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable Transmission Service agreements.**

"Type of CE Hours" means NERC-Approved Learning Activity covering topics from Appendix A to Appendix 6, NERC Reliability Standards and/or simulations for which there is a minimum requirement for Credential Maintenance.

"Variance" means an aspect or element of a Reliability Standard that applies only within a particular Regional Entity or group of Regional Entities, or to a particular entity or class of entities. A Variance allows an alternative approach to meeting the same reliability objective as the Reliability Standard, and is typically necessitated by a physical difference. A Variance is embodied within a Reliability Standard and as such, if adopted by NERC and approved by the Applicable Governmental Authority(ies), shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Violation Risk Factor" or "VRF" means a factor (lower, medium or high) assigned to each Requirement of a Reliability Standard to identify the potential reliability significance of noncompliance with the Requirement.

"Violation Severity Level" or "VSL" means a measure (lower, moderate, high or severe) of the degree to which compliance with a Requirement was not achieved.

"Wide Area" means the entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits.**

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF REVISIONS TO ITS RULES OF PROCEDURE
TO ADOPT A BULK ELECTRIC SYSTEM EXCEPTION PROCEDURE

ATTACHMENT 3B

REVISED APPENDIX 2 OF THE RULES OF PROCEDURE,

DEFINITIONS USED IN THE RULES OF PROCEDURE

REDLINED VERSION

Proposed revisions 1-9-2012

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

DEFINITIONS USED IN THE RULES OF PROCEDURE

APPENDIX 2 TO THE RULES OF PROCEDURE

Effective: [DATE], 2012

General

For purposes of the NERC Rules of Procedure, including all Appendices, the terms defined in this Appendix shall have the meanings set forth herein. For convenience of reference to the user, definitions of terms that are used in a particular Appendix may be repeated in that Appendix.

Where used in the Rules of Procedure, a defined term will be capitalized. Where a term defined in this Appendix appears in the Rules of Procedure but is not capitalized, the term is there being used in its ordinary and commonly understood meaning and not as defined in this Appendix (if different). Other terms that are not defined terms, such as the names of entities, organizations, committees, or programs; position titles; titles of documents or forms; section headings; geographic locations; and other terms commonly presented as proper nouns, may also be capitalized in the Rules of Procedure without being defined in this Appendix.

Definitions of terms in this Appendix that are marked with asterisks (**) are taken from the NERC *Glossary of Terms Used in Reliability Standards*. Definitions of terms in this Appendix that are marked with "pluses" (++) are taken from Section 215 of the Federal Power Act or the Commission's regulations at 18 C.F.R. Part 39 or Part 388.

Other terms used in the Rules of Procedure but not defined in this Appendix that have commonly understood and used technical meanings in the electric power industry, including applicable codes and standards, shall be construed in accordance with such commonly understood and used technical meanings.

Specific Definitions

"Acceptance of the Exception Request" or "Acceptance" means the determination that an eligible Exception Request (i.e., a Request permitted by section 4.1 of Appendix 5C) contains all the Required Information so that it can undergo substantive review.

"Adjacent Balancing Authority" means a Balancing Authority Area that is interconnected to another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.**

"Adjusted Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as determined based on application of the adjustment factors identified in Section 4.3 of the *Sanction Guidelines* to the Base Penalty Amount.

"Advisories" or "Level 1 (Advisories)" is a notification issued by NERC in accordance with Section 810.3.1 of the Rules of Procedure.

"Alleged Violation" means a Possible Violation for which the Compliance Enforcement Authority has determined, based on an assessment of the facts and circumstances surrounding the Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard.

"Annual Audit Plan" means a plan developed annually by the Compliance Enforcement Authority that includes the Reliability Standards and Registered Entities to be audited, the schedule of Compliance Audits, and Compliance Audit Participant requirements for the calendar year.

"Annual Report" means the annual report to be filed by NERC with FERC and other Applicable Governmental Authorities in accordance with Section 13.0 of Appendix 4D.

"Applicable Governmental Authority" means the FERC within the United States and the appropriate governmental authority with subject matter jurisdiction over reliability in Canada and Mexico.

"Applicable Requirement" means a Requirement of a CIP Standard that (i) expressly provides either (A) that compliance with the terms of the Requirement is required where or as technically feasible, or (B) that technical limitations may preclude compliance with the terms of the Requirement; or (ii) is subject to Appendix 4D by FERC directive.

"Approval of the Exception Request" or "Approval" means the determination by NERC that an Exception Request meets the criteria to receive the requested Exception.

"Balancing Authority" means the responsible entity that integrates resource plans ahead of time, maintains ~~l~~Load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.**

"Balancing Authority Area" means the collection of generation, transmission, and ~~l~~Loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains ~~l~~Load-resource balance within this area.**

"Base Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as initially determined pursuant to Sections 4.1 and 4.2 of the NERC *Sanction Guidelines*, before application of any adjustment factors.

"BES Definition" means the NERC definition of the Bulk Electric System as set forth in the NERC *Glossary of Terms Used in Reliability Standards.*

"Blackstart Resource" means a generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for ~~r~~Real and ~~r~~Reactive ~~p~~Power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan.**

"Board" or "Board of Trustees" means the Board of Trustees of NERC.

"Board of Trustees Compliance Committee," "BOTCC" or "Compliance Committee" means the Compliance Committee of the NERC Board of Trustees.

"Bulk Electric System" or "BES" means unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- **I1** - Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded under Exclusion E1 or E3.
- **I2** - Generating resource(s) with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.
- **I3** - Blackstart Resources identified in the Transmission Operator's restoration plan.
- **I4** - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above.
- **I5** –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

Exclusions:

- **E1** - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:
    a) Only serves Load. Or,
    b) Only includes generation resources, not identified in Inclusion I3, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,
    c) Where the radial system serves Load and includes generation resources, not identified in Inclusion I3, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

    Note – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.
- **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding

obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.

- **E3** - Local networks (LN): A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:
    a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);
    b) Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and
    c) Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).
- **E4** – Reactive Power devices owned and operated by the retail customer solely for its own use.

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.~~, as defined by the Regional Entity, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition.~~**

"Bulk Power System" means, depending on the context: (i) Facilities and control systems necessary for operating an interconnected electric energy supply and transmission network (or any portion thereof), and electric energy from generating facilities needed to maintain transmission system reliability. The term does not include facilities used in the local distribution of electric energy [++]. (ii) Solely for purposes of Appendix 4E, Bulk Electric System.

"Canadian" means one of the following: (a) a company or association incorporated or organized under the laws of Canada, or its designated representative(s) irrespective of nationality; (b) an agency of a federal, provincial, or local government in Canada, or its designated representative(s) irrespective of nationality; or (c) a self-representing individual who is a Canadian citizen residing in Canada.

"Canadian Entity" means a Re~~sponsible~~gistered Entity (or, solely for purposes of Appendix 4D, a Responsible Entity) that is organized under Canadian federal or provincial law.

"Cascading" means the uncontrolled successive loss of System Elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.**

"CCC" means the NERC Compliance and Certification Committee.

"Certification" means, depending on the context, (i) the process undertaken by NERC and a Regional Entity to verify that an entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator and/or Reliability Coordinator; such Certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure; or (ii) for purposes of Appendix 6, an official recognition that indicates the recipient has passed a NERC exam or completed a specified number of Continuing Education Hours.

"Certification Staff" means individuals employed or contracted by NERC who have the authority to make initial determinations of Certification of entities performing reliability functions.

"Certification Team" means a team assembled by a Regional Entity that will be responsible for performing the activities included in the Certification process for an entity pursuant to Appendix 5A.

"Classified National Security Information" means Required Information that has been determined to be protected from unauthorized disclosure pursuant to Executive Order No. 12958, as amended, and/or the regulations of the NRC at 10 C.F.R. §95.35; or pursuant to any comparable provision of Canadian federal or provincial law.

"Clerk" means an individual as assigned by the Compliance Enforcement Authority to perform duties described in Attachment 2, Hearing Procedures, to Appendix 4C.

"Commission" means the Federal Energy Regulatory Commission or FERC.

"Complaint" means an allegation that a Registered Entity violated a Reliability Standard.

"Compliance and Certification Manager" means individual/individuals within the Regional Entity that is/are responsible for monitoring compliance of entities with applicable NERC Reliability Standards.

"Compliance Audit" means a systematic, objective review and examination of records and activities to determine whether a Registered Entity meets the Requirements of applicable Reliability Standards.

"Compliance Audit Participants" means Registered Entities scheduled to be audited and the audit team members.

"Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

"Compliance Enforcement Authority's Area of Responsibility" means the Compliance Enforcement Authority's Region. If a Regional Entity is the Compliance Enforcement Authority, the Compliance Enforcement Authority's Area of Responsibility is shown in Exhibit A to the delegation agreement between the Regional Entity and NERC.

"Compliance Investigation" means a comprehensive investigation, which may include an on-site visit with interviews of the appropriate personnel, to determine if a violation of a Reliability Standard has occurred.

"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC *Uniform Compliance Monitoring and Enforcement Program* (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

"Compliant Date" means the date by which a Responsible Entity is required to be in compliance with an Applicable Requirement of a CIP Standard.

"Confidential Business and Market Information" means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

"Confidential Information" means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition; or (vii) for purposes of Appendix 4D, any other information that is designated as Confidential Information in Section 11.0 of Appendix 4D.

"Confirmed Violation" means an Alleged Violation for which an entity has: (1) accepted the finding of the violation by a Regional Entity or NERC and will not seek an appeal, or (2) completed the hearing and appeals process within NERC, or (3) allowed the time for requesting a hearing or submitting an appeal to expire, or (4) admitted to the violation in a settlement agreement.

"Continuing Education Hour" or "CE Hour" means sixty minutes of participation in a group, independent study, or self-study learning activity as approved by the NERC Continuing Education Program.

"Continuing Education Program Provider" or "Provider" means the individual or organization offering a learning activity to participants and maintaining documentation required by Appendix 6.

"Coordinated Functional Registration" means where two or more entities (parties) agree in writing upon a division of compliance responsibility among the parties for one or more Reliability Standard(s) applicable to a particular function, and/or for one or more Requirement(s)/sub-Requirement(s) within particular Reliability Standard(s).

"Covered Asset" means a Cyber Asset or Critical Cyber Asset that is subject to an Applicable Requirement.

"Credential" means a NERC designation that indicates the level of qualification achieved (i.e., reliability operator; balancing, interchange, and transmission operator; balancing and interchange operator; and transmission operator).

"Credential Maintenance" means to meet NERC CE Hours' requirements to maintain a valid NERC-issued system operator Credential.

"Critical Assets" means Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.**

"Critical Cyber Assets" means Cyber Assets critical to the reliable operation of Critical Assets.**

"Critical Energy Infrastructure Information" means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.++

"Critical Infrastructure" means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.++

"Critical Infrastructure Protection Standard" or "CIP Standard" means any of NERC Reliability Standards CIP-002 through CIP-009.

"Cross-Border Regional Entity" means a Regional Entity that encompasses a part of the United States and a part of Canada or Mexico.++

"Cyber Assets" means programmable electronic devices and communication networks including hardware, software, and data.**

"Cyber Security Incident" means any malicious or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communications networks including hardware, software and data that are essential to the Reliable Operation of the Bulk Power System.++

"Cyber Security Incident Information" means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

"Days", as used in Appendix 5A with respect to the Registration and Certification processes, means calendar days.

"Delegate" means a person to whom the Senior Manager of a Responsible Entity has delegated authority pursuant to Requirement R2.3 of CIP Standard CIP-003-1 (or any successor provision).

"Director of Compliance" means the Director of Compliance of NERC or of the Compliance Enforcement Authority, as applicable, who is responsible for the management and supervision of Compliance Staff, or his or her designee.

"Disapproval of the Exception Request" or "Disapproval" means the determination by NERC that an Exception Request does not meet the criteria to receive the requested Exception.

"Distribution Factor" means the portion of an Interchange Transaction, typically expressed in per unit that flows across a transmission facility (Flowgate).**

"Distribution Provider" means the entity that provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.**

"Document" means, in addition to the commonly understood meaning of the term as information written or printed on paper, any electronically stored information, including writings, drawings, graphs, charts, photographs, sound recordings, images and other data or data compilations stored in any medium from which information can be obtained, and shall be translated by the producing party into reasonably usable form.

"Effective Date" means the date, as specified in a notice rejecting or disapproving a TFE Request or terminating an approved TFE, on which the rejection, disapproval or termination becomes effective.

"Electric Reliability Organization" or "ERO" means the organization that is certified by the Commission under Section 39.3 of its regulations, the purpose of which is to establish and enforce Reliability Standards for the Bulk Power System in the United States, subject to Commission review. The organization may also have received recognition by Applicable Governmental Authorities in Canada and Mexico to establish and enforce Reliability Standards for the Bulk Power Systems of the respective countries.

"Element" means any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An Element may be comprised of one or more components.**

"Eligible Reviewer" means a person who has the required security clearances or other qualifications, or who otherwise meets the applicable criteria, to have access to Confidential Information, Classified National Security Information, NRC Safeguards Information or Protected FOIA Information, as applicable to the particular information to be reviewed.

"End Date" means the last date of the period to be covered in a Compliance Audit.

"Essential Actions" or "Level 3 (Essential Actions)" is a notification issued by NERC in accordance with Section 810.3.3 of the Rules of Procedure.

"Exception" means either an Inclusion Exception or an Exclusion Exception.

"Exception Procedure" means the procedure set forth in Appendix 5C.

"Exception Reporting" means information provided to the Compliance Enforcement Authority by a Registered Entity indicating that a violation of a Reliability Standard has occurred (e.g., a System Operating Limit has been exceeded) or enabling the Compliance Enforcement Authority to ascertain the Registered Entity's compliance.

"Exception Request" means a request made by a Submitting Entity in accordance with Appendix 5C for an Exception.

"Exception Request Form" means the form adopted by each Regional Entity, in accordance with a template provided by NERC, for use by Submitting Entities in submitting Exception Requests; provided, that the Exception Request Form must include Section III.B as adopted by NERC.

"Exclusion Exception" means a determination that an Element that falls within the BES Definition should be excluded from the BES.

"Expiration Date" means the date on which an approved TFE expires.

"Facility" means a set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)**

"FERC" means the United States Federal Energy Regulatory Commission.

"Final Penalty Amount" means the final, proposed Penalty for violation of a Reliability Standard, determined in accordance with the *Sanction Guidelines*.

"Flowgate" means 1.) A portion of the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions. 2.) A mathematical construct, comprised of one or more monitored transmission Facilities and

optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.**

"FOIA" means the U.S. Freedom of Information Act, 5 U.S.C. §552.

"Footprint" means the geographical or electric area served by an entity.
"Functional Entity" means an entity responsible for a function that is required to ensure the Reliable Operation of the electric grid as identified in the NERC Reliability Standards.

"Generator Operator" means the entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.**

"Generator Owner" means an entity that owns and maintains generating units.**

"Hearing Body" or "Regional Entity Hearing Body" means the body established by a Regional Entity to conduct hearings pursuant to the Hearing Procedures.

"Hearing Officer" means, depending on the context, (i) an individual employed or contracted by the Compliance Enforcement Authority and designated by the Compliance Enforcement Authority to preside over hearings conducted pursuant to Attachment 2, Hearing Procedures, of Appendix 4C, or (ii) solely for hearings conducted pursuant to Appendix 4E, (A) a CCC member or (B) an individual employed or contracted by NERC, as designated and approved by the CCC to preside over hearings conducted pursuant to the Hearing Procedures in Appendix E; the Hearing Officer shall not be a member of the Hearing Panel.

"Hearing Panel" means the five person hearing body established as set forth in the CCC Charter on a case by case basis and that is responsible for adjudicating a matter as set forth in Appendix 4E.

"Hearing Procedures" means, depending on the context, (i) Attachment 2 to the NERC or a Regional Entity CMEP, as applicable, or (ii) the hearing procedures of the NERC Compliance and Certification Committee in Appendix 4E.

"Inclusion Exception" means a determination that an Element that falls outside the BES Definition should be included in the BES.

"Interchange" means energy transfers that cross Balancing Authority boundaries.**

"Interchange Authority" means the responsible entity that authorizes the implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communications of Interchange information for reliability assessment purposes.**

"Interchange Distribution Calculator" means the mechanism used by Reliability Coordinators in the Eastern Interconnection to calculate the distribution of Interchange Transactions over specific Flowgates. It includes a database of all Interchange Transactions and a matrix of the Distribution Factors for the Eastern Interconnection.**

"Interchange Schedule" means an agreed-upon Interchange Transaction size (megawatts), start and end time, beginning and ending ramp times and rate, and type required for delivery and receipt of power and energy between the Source and Sink Balancing Authorities involved in the transaction.**

"Interchange Transaction" means an agreement to transfer energy from a seller to a buyer that crosses one or more Balancing Authority Area boundaries.**

"Interconnected Operations Service" means a service (exclusive of basic energy and Transmission Services) that is required to support the Reliable Operation of interconnected Bulk Electric Systems.**

"Interconnection" means a geographic area in which the operation of Bulk Power System components is synchronized such that the failure of one or more of such components may adversely affect the ability of the operators of other components within the system to maintain Reliable Operation of the Facilities within their control.++

"Interconnection Reliability Operating Limit" means a System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System.**

"Interpretation" means an addendum to a Reliability Standard, developed in accordance with the NERC *Standard Processes Manual* and approved by the Applicable Governmental Authority(ies), that provides additional clarity about one or more Requirements in the Reliability Standard.

"Joint Registration Organization" means an entity that registers in the Compliance Registry to perform reliability functions for itself and on behalf of one or more of its members or related entities for which such members or related entities would otherwise be required to register.

"Lead Entity" means the entity that submits Exception Request information that is common to a group of Submitting Entities that are submitting Exception Requests jointly.

"Lead Mediator" means a member of a mediation team formed pursuant to Appendix 4E who is selected by the members to coordinate the mediation process and serve as the mediation team's primary contact with the Parties.

"Load" means an end-user device or customer that receives power from the electric system.**

"Load-Serving Entity" means an entity that secures energy and Transmission Service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.**

"Mapping" means the process of determining whether a Regional Entity's Footprint is being served by Registered Entities.

"Mediation Settlement Agreement" means a written agreement entered into by the Parties to a mediation pursuant to Appendix 4E that resolves the dispute.

"Member" means a member of NERC pursuant to Article II of its Bylaws.

"Member Representatives Committee" or "MRC" means the body established pursuant to Article VIII of the NERC Bylaws.

"Mexican Entity" means a Registered Entity that is organized under Mexican law.

"Mitigation Plan" means an action plan, required when a Registered Entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, settlement agreement, or otherwise, that is developed by the Registered Entity to (1) correct a violation of a Reliability Standard and (2) prevent re-occurrence of the violation.

"NERC-Approved Learning Activity" means training that maintains or improves professional competence and has been approved by NERC for use in its Continuing Education Program.

"NERC Compliance Monitoring and Enforcement Program Implementation Plan" or "NERC Implementation Plan" means the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan that specifies the Reliability Standards that are subject to reporting by Registered Entities to the Compliance Enforcement Authority in order to verify compliance and identifies the appropriate monitoring procedures and reporting schedules for each such Reliability Standard.

"NERC Compliance Registry," "Compliance Registry" or "NCR" means a list, maintained by NERC pursuant to Section 500 of the NERC Rules of Procedure and Appendix 5B, the NERC *Statement of Compliance Registry Criteria*, of the owners, operators and users of the Bulk Power System, and the entities registered as their designees, that perform one or more functions in support of reliability of the Bulk Power System and are required to comply with one or more Requirements of Reliability Standards.

"NERC Identification Number" or "NERC ID" means a number given to NERC Registered Entities that will be used to identify the entity for certain NERC activities. Corporate entities may have multiple NERC IDs to show different corporate involvement in NERC activities.

"NERC Organization Certification" or "Organization Certification" means the process undertaken by NERC and a Regional Entity to verify that a new entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator, and/or Reliability Coordinator; such certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure.

"Net Energy for Load" or "NEL" means net generation of an electric system plus energy received from others less energy delivered to others through interchange. It includes system losses but excludes energy required for the storage of energy at energy storage facilities.

"Notice of Alleged Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity pursuant to Section 5.3 of Appendix 4C.

"Notice of Completion of Enforcement Action" means a notice issued by the Compliance Enforcement Authority to a Registered Entity, pursuant to Section 5.10 of Appendix 4C, stating than an enforcement action is closed.

"Notice of Confirmed Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity confirming the violation of one or more Reliability Standards, as a result of (1) the Registered Entity accepting a Notice of Alleged Violation and the proposed Penalty or sanction, or (2) the finding of a violation through a hearing and appeal, or (3) the expiration of the period for requesting a hearing or an appeal, or (4) the Registered Entity admitting the violation as part of an executed settlement agreement.

"Notice of Penalty" means a notice prepared by NERC and filed with FERC, following approval by NERC of a Notice of Confirmed Violation or a settlement agreement, stating the Penalty or sanction imposed or agreed to for the Confirmed Violation or as part of the settlement.

"Notice of Possible Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity that (1) states a Possible Violation has been identified, (2) provides a brief description of the Possible Violation, including the Reliability Standard Requirement(s) and the date(s) involved, and (3) instructs the Registered Entity to retain and preserve all data and records relating to the Possible Violation.

"NRC" means the United States Nuclear Regulatory Commission.

"NRC Safeguards Information" means Required Information that is subject to restrictions on disclosure pursuant to 42 U.S.C. §2167 and the regulations of the NRC at 10 C.F.R. §73.21-73.23; or pursuant to comparable provisions of Canadian federal or provincial law.

"Open Access Transmission Tariff" means an electronic transmission tariff accepted by the U.S. Federal Energy Regulatory Commission requiring the Transmission Service Provider to furnish to all shippers with non-discriminating service comparable to that provided by Transmission Owners to themselves.**

"Owner" means the owner(s) of an Element or Elements that is or may be determined to be part of the BES as a result of either the application of the BES Definition or an Exception, or another entity, such as an operator, authorized to act on behalf of the owner of the Element or Elements in the context of an Exception Request.

"Part A Required Information" means Required Information that is to be provided in Part A of a Responsible Entity's TFE Request.

"Part B Required Information" means Required Information that is to be provided in Part B of a Responsible Entity's TFE Request.

"Participant" means a Respondent and any other Person who is allowed or required by FERC to participate as an intervenor in a proceeding conducted pursuant to the Hearing Procedures, and as used in the Hearing Procedures shall include, depending on the context, the members of the Compliance Staff that participate in a proceeding or the members of the Certification Staff that participate in a proceeding pursuant to Appendix 4E.

"Party" or "Parties" means a Person or the Persons participating in a mediation pursuant to Appendix 4E.

"Penalty" means and includes all penalties and sanctions, including but not limited to a monetary or non-monetary penalty; a limitation on an activity, function, operation or other appropriate sanction; or the addition of the Registered Entity or Respondent to a reliability watch list composed of major violators. Penalties must be within the range set forth in the NERC *Sanction Guidelines* approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2), and shall bear a reasonable relation to the seriousness of a Registered Entity's or Respondent's violation and take into consideration any timely efforts made by the Registered Entity or Respondent to remedy the violation.

"Periodic Data Submittals" means modeling, studies, analyses, documents, procedures, methodologies, operating data, process information or other information to demonstrate compliance with Reliability Standards and provided by Registered Entities to the Compliance Enforcement Authority on a time frame required by a Reliability Standard or an ad hoc basis.

"Person" means any individual, partnership, corporation, limited liability company, governmental body, association, joint stock company, public trust, organized group of persons, whether incorporated or not, or any other legal entity.

"Planning Authority" means the responsible entity that coordinates and integrates transmission Facilities and service plans, resource plans, and Protection Systems.**

"Point of Delivery" means a location that a Transmission Service Provider specifies on its transmission system where an Interchange Transaction leaves or a Load-Serving Entity receives its energy.**

"Point of Receipt" means a location that the Transmission Service Provider specifies on its transmission system where an Interchange Transaction enters or a generator delivers its output.

"Possible Violation" means the identification, by the Compliance Enforcement Authority, using one of the compliance monitoring and enforcement processes in Section 3.0 of Appendix 4C, of a possible failure by a Registered Entity to comply with a Reliability Standard that is applicable to the Registered Entity.

"Preliminary Screen" means an initial evaluation of evidence indicating potential noncompliance with a Reliability Standard has occurred or is occurring, conducted by the Compliance Enforcement Authority for the purpose of determining whether a Possible Violation exists, and consisting of an evaluation of whether (1) the entity allegedly involved in the potential

noncompliance is registered, and (2) the Reliability Standard Requirement to which the evidence of potential noncompliance relates is applicable to a reliability function for which the entity is registered.

"Probation" means a step in the disciplinary process pursuant to Appendix 6 during which the certificate is still valid. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

"Protected FOIA Information" means Required Information, held by a governmental entity, that is subject to an exemption from disclosure under FOIA (5 U.S.C. §552(e)), under any similar state or local statutory provision, or under any comparable provision of Canadian federal or provincial law, which would be lost were the Required Information to be placed into the public domain.

"Protection System" means protective relays which respond to electrical quantities, communications systems necessary for correct operation of protective functions, voltage and current sensing devices providing inputs to protective relays, station dc supply associated with protective functions (including batteries, battery chargers, and non-battery-based dc supply), and control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.**

"Purchasing-Selling Entity" means the entity that purchases, or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.**

"Reactive Power" means the portion of electricity that establishes and sustains the electric and magnetic fields of alternating-current equipment. Reactive Power must be supplied to most types of magnetic equipment, such as motors and transformers. It also must supply the reactive losses on transmission facilities. Reactive Power is provided by generators, synchronous condensers, or electrostatic equipment such as capacitors and directly influences electric system voltage. It is usually expressed in kilovars (kvar) or megavars (Mvar).**

"Real Power" means the portion of electricity that supplies energy to the Load.**

"Receiving Entity" means NERC or a Regional Entity receiving Confidential Information from an owner, operator, or user of the Bulk Power System or from any other party.

"Recommendation" for purposes of Appendix 5C means the report to NERC containing the evaluation prepared in accordance with section 5.2 of Appendix 5C concerning whether or to what extent an Exception Request should be approved.

"Recommendations" or "Level 2 (Recommendations)" is a notification issued by NERC in accordance with Section 810.3.2 of the Rules of Procedure.

"Region" means the geographic area, as specified in a Regional Entity's delegation agreement with NERC, within which the Regional Entity is responsible for performing delegated functions.

"Regional Criteria" means reliability requirements developed by a Regional Entity that are necessary to implement, to augment, or to comply with Reliability Standards, but which are not Reliability Standards. Such Regional Criteria may be necessary to account for physical differences in the Bulk Power System but are not inconsistent with Reliability Standards nor do they result in lesser reliability. Such Regional Criteria are not enforceable pursuant to NERC-delegated authorities, but may be enforced through other available mechanisms. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents.

"Regional Entity" means an entity having enforcement authority pursuant to 18 C.F.R. § 39.8.++

"Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan" or "Regional Implementation Plan" means an annual plan, submitted by November 1 of each year to NERC for approval that, in accordance with NERC Rule of Procedure Section 401.6 and the NERC Compliance Monitoring and Enforcement Program Implementation Plan, identifies (1) all Reliability Standards identified by NERC to be actively monitored during each year, (2) other Reliability Standards proposed for active monitoring by the Regional Entity, (3) the methods to be used by the Regional Entity for reporting, monitoring, evaluation, and assessment of performance criteria with each Reliability Standard, and (4) the Regional Entity's Annual Audit Plan.

"Regional Reliability Standard" means a type of Reliability Standard that is applicable only within a particular Regional Entity or group of Regional Entities. A Regional Reliability Standard may augment, add detail to, or implement another Reliability Standard or cover matters not addressed by other Reliability Standards. Regional Reliability Standards, upon adoption by NERC and approval by the Applicable Governmental Authority(ies), shall be Reliability Standards and shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Registered Ballot Body" means that aggregation of all entities or individuals that qualify for one of the Segments approved by the Board of Trustees, and are registered with NERC as potential ballot participants in the voting on proposed Reliability Standards.

"Registered Entity" means an owner, operator, or user of the Bulk Power System, or the entity registered as its designee for the purpose of compliance, that is included in the NERC Compliance Registry.

"Registration" or "Organization Registration" means the processes undertaken by NERC and Regional Entities to identify which entities are responsible for reliability functions within the Regional Entity's Region.

"Rejection of the Exception Request" or "Rejection" means the determination that an Exception Request is not an eligible Exception Request (i.e., a Request permitted by section 4.1 of Appendix 5C) or does not contain all the Required Information in accordance with section 4.5 of Appendix 5C in order to be reviewed for substance.

"Reliability Coordinator" means the entity that is the highest level of authority who is responsible for the Reliable Operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.**

"Reliability Coordinator Area" means the collection of generation, transmission and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas.**

"Reliability Standard" means a requirement to provide for Reliable Operation of the Bulk Power System, including without limiting the foregoing, requirements for the operation of existing Bulk Power System Facilities, including cyber security protection, and including the design of planned additions or modifications to such Facilities to the extent necessary for Reliable Operation of the Bulk Power System, but the term does not include any requirement to enlarge Bulk Power System Facilities or to construct new transmission capacity or generation capacity. A Reliability Standard shall not be effective in the United States until approved by the Federal Energy Regulatory Commission and shall not be effective in other jurisdictions until made or allowed to become effective by the Applicable Governmental Authority.

"Reliability Standards Development Plan" means the forward-looking plan developed by NERC on an annual basis setting forth the Reliability Standards development projects that are scheduled to be worked on during the ensuing three-year period, as specified in Section 310 of the Rules of Procedure.

"Reliable Operation" means operating the Elements of the Bulk Power System within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or Cascading failures of such system will not occur as a result of a sudden disturbance, including a Cyber Security Incident, or unanticipated failure of system Elements.++

"Remedial Action Directive" means an action (other than a Penalty or sanction) required by a Compliance Enforcement Authority that (1) is to bring a Registered Entity into compliance with a Reliability Standard or to avoid a Reliability Standard violation, and (2) is immediately necessary to protect the reliability of the Bulk Power System from an imminent threat.

"Reporting Entity" means an entity required to provide data or information requested by NERC or a Regional Entity in a request for data or information pursuant to Section 1600 of the Rules of Procedure.

"Requirement" means an explicit statement in a Reliability Standard that identifies the functional entity responsible, the action or outcome that must be achieved, any conditions achieving the action or outcome, and the reliability-related benefit of the action or outcome. Each Requirement shall be a statement with which compliance is mandatory.

"Required Date" means the date given a Registered Entity in a notice from the Compliance Enforcement Authority by which some action by the Registered Entity is required.

"Required Information" means, as applicable, either (i) the information required to be provided in a TFE Request, as specified in Section 4.0 of Appendix 4D; or (ii) the information required to be provided in an Exception Request, as specified in section 4.0 of Appendix 5C.

"Reserve Sharing Group" means a group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g. ten minutes). If the transaction is ramped in quicker, (e.g., between zero and ten minutes), then, for the purposes of disturbance control performance, the areas become a Reserve Sharing Group.**

"Resource Planner" means the entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority area.**

"Respondent" means, depending on the context, the Registered Entity, who is the subject of the Notice of Alleged Violation, contested Mitigation Plan or contested Remedial Action Directive that is the basis for the proceeding, whichever is applicable, or the Registered Entity that is the subject of the Certification decision that is the basis for a proceeding under Appendix 4E.

"Responsible Entity" means an entity that is registered for a reliability function in the NERC Compliance Registry and is responsible for complying with an Applicable Requirement, as specified in the "Applicability" section of the CIP Standard.

"Revoked" means a NERC certificate that has been suspended for more than twelve months. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified. The certificate holder will be required to pass an exam to be certified again. Any CE Hours accumulated prior to or during the revocation period will not be counted towards Credential Maintenance.

"Revoke for Cause" means a step in the disciplinary process pursuant to Appendix 6 during which the certificate is no longer valid and requiring successfully passing an exam to become certified. However, an exam will not be authorized until the revocation period expires. CE Hours earned before or during this revocation period will not be counted for maintaining a Credential.

"Scope of Responsibility" means the registered functions of a Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Planner or Balancing Authority and the geographical or electric region in which the Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Planner or Balancing Authority operates to perform its registered functions, or with respect to a Regional Entity, its Regional Entity Region.

"Section I Required Information" means Required Information that is to be provided in Section I of a Submitting Entity's Exception Request.

"Section II Required Information" means Required Information that is to be provided in Section II of a Submitting Entity's Exception Request.

"Section III Required Information" means Required Information that is to be provided in Section III of a Submitting Entity's Exception Request.

"Sector" means a group of Members of NERC that are Bulk Power System owners, operators, or users or other persons and entities with substantially similar interests, including governmental entities, as pertinent to the purposes and operations of NERC and the operation of the Bulk Power System, as defined in Article II, Section 4 of the NERC Bylaws. Each Sector shall constitute a class of Members for purposes of the New Jersey Nonprofit Corporation Act.

"Segment" means one of the subsets of the Registered Ballot Body whose members meet the qualification criteria for the subset.

"Self-Certification" means attestation by a Registered Entity of compliance or non-compliance with a Reliability Standard for which Self-Certification is required by the Compliance Enforcement Authority and that is included for monitoring in the Regional Implementation Plan.

"Self-Reporting" means a report by a Registered Entity stating (1) that the Registered Entity believes it has violated a Reliability Standard, and (2) the actions that have been taken or will be taken to resolve the violation.

"Senior Manager" means the person assigned by the Responsible Entity, in accordance with CIP Standard CIP-003-1 Requirement R2 (or subsequent versions), to have overall responsibility for leading and managing the Responsible Entity's implementation of, and adherence to, the CIP Standards.

"Sink Balancing Authority" means the Balancing Authority in which the ~~l~~Load (sink) is located for an Interchange Transaction.**

"Source Balancing Authority" means the Balancing Authority in which the generation (source) is located for an Interchange Transaction.**

"Special Protection System" means an automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system

stability, acceptable voltage, or power flows. A Special Protection System does not include (a) underfrequency or undervoltage ~~l~~Load shedding or (b) fault conditions that must be isolated, or (c) out-of-step relaying (not designed as an integral part of a Special Protection System).**

"Spot Checking" means a process in which the Compliance Enforcement Authority requests a Registered Entity to provide information (1) to support the Registered Entity's Self-Certification, Self-Reporting, or Periodic Data Submittal and to assess whether the Registered Entity complies with Reliability Standards, or (2) as a random check, or (3) in response to events, as described in the Reliability Standards or based on operating problems or system events.

"Staff" or "Compliance Staff" means individuals employed or contracted by NERC or the Compliance Enforcement Authority who have the authority to make initial determinations of compliance or violation with Reliability Standards by Registered Entities and associated Penalties and Mitigation Plans.

"Strict Compliance" means compliance with the terms of an Applicable Requirement without reliance on a Technical Feasibility Exception.

"Submitting Entity" means (i) an owner, operator, or user of the Bulk Power System or any other party that submits information to NERC or a Regional Entity that it reasonably believes contains Confidential Information or, (ii) solely for purposes of Appendix 5C, the entity that submits an Exception Request in accordance with section 4.0 of Appendix 5C.

"Suspended" means certificate status due to an insufficient number of CE Hours being submitted prior to the expiration of a certificate. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified.

"System" means a combination of generation, transmission and distribution components.**

"System Operating Limit" means the value (such as MW, Mvar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria.**

"Technical Advisor" means any Staff member, third-party contractor, or industry stakeholder who satisfies NERC's or the Compliance Enforcement Authority's (as applicable) conflict of interest policy and is selected to assist in a proceeding by providing technical advice to the Hearing Officer and/or the Hearing Body or Hearing Panel.

"Technical Feasibility Exception" or "TFE" means an exception from Strict Compliance with the terms of an Applicable Requirement on grounds of technical feasibility or technical limitations in accordance with one or more of the criteria in section 3.0 of Appendix 4D.

"Technical Review Panel" means a panel established pursuant to section 5.3 of Appendix 5C.

"Termination of Credential" means a step in the disciplinary process pursuant to Appendix 6 whereby a Credential is permanently Revoked.

"TFE Request" means a request submitted by a Responsible Entity in accordance with Appendix 4D for an exception from Strict Compliance with an Applicable Requirement.

"Transmission Customer" means 1. any eligible customer (or its designated agent) that can or does execute a Transmission Service agreement or can and does receive Transmission Service. 2. Any of the following responsible entities: Generator Owner, Load-Serving Entity, or Purchasing-Selling Entity.**

"Transmission Operator" means the entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission Facilities.**

"Transmission Owner" means the entity that owns and maintains transmission Facilities.**

"Transmission Planner" means the entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area.**

"Transmission Service" means services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.**

"Transmission Service Provider" means the entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable Transmission Service agreements.**

"Type of CE Hours" means NERC-Approved Learning Activity covering topics from Appendix A to Appendix 6, NERC Reliability Standards and/or simulations for which there is a minimum requirement for Credential Maintenance.

"Variance" means an aspect or element of a Reliability Standard that applies only within a particular Regional Entity or group of Regional Entities, or to a particular entity or class of entities. A Variance allows an alternative approach to meeting the same reliability objective as the Reliability Standard, and is typically necessitated by a physical difference. A Variance is embodied within a Reliability Standard and as such, if adopted by NERC and approved by the Applicable Governmental Authority(ies), shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Violation Risk Factor" or "VRF" means a factor (lower, medium or high) assigned to each Requirement of a Reliability Standard to identify the potential reliability significance of noncompliance with the Requirement.

"Violation Severity Level" or "VSL" means a measure (lower, moderate, high or severe) of the degree to which compliance with a Requirement was not achieved.

"Wide Area" means the entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits.**

Appendix 3D — Development of the Registered Ballot Body[1]

Registration Procedures

The Registered Ballot Body comprises all organizations, entities, and individuals that:

1. Qualify for one of the Segments, and
2. Are registered with NERC as potential ballot participants in the voting on Reliability Standards, and
3. Are current with any designated fees.

Each participant, when initially registering to join the Registered Ballot Body, and annually thereafter, shall self-select to belong to one of the Segments described below.

NERC general counsel will review all applications for joining the Registered Ballot Body, and make a determination of whether the self-selection satisfies at least one of the guidelines to belong to that Segment. The entity or individual will then be "credentialed" to participate as a voting member of that Segment. The Standards Committee will decide disputes, with an appeal to the Board of Trustees.

All registrations will be done electronically.

Segment Qualification Guidelines

1. Except as set forth below, the Segment qualification guidelines are inclusive; i.e., any entity or individual with a legitimate interest in the reliability of the Bulk Power System that can meet any one of the guidelines for a Segment is entitled to belong to and vote in that Segment.

2. Corporations or organizations with integrated operations or with affiliates that qualify to belong to more than one Segment (e.g., transmission owners and Load Serving Entities) may belong to each of the Segments in which they qualify, provided that each Segment constitutes a separate membership and is represented by a different representative. Individuals or entities that elect to participate in Segment 8 are not eligible to participate in multiple Segments.

3. At any given time, affiliated entities may collectively be registered only once within a Segment.

4. Any individual or entity, such as a consultant or vendor, providing products or services related to Bulk Power System reliability within the previous 12 months to another entity eligible to join Segments 1 through 7 shall be qualified to join any one Segment for which one of the entities receiving those products or services is qualified to join.

5. Corporations, organizations, entities, and individuals may participate freely in all subgroups.

6. After their initial selection, registered participants may apply to change Segments annually, on a schedule determined by the Standards Committee.

---

[1] The Segment qualification guidelines were proposed in the final report of the NERC Standing Committees Representation Task Force on February 7, 2002. The Board of Trustees endorsed the industry Segments and weighted Segment voting model on February 20, 2002 and may change the model from time to time.

7. The qualification guidelines and rules for joining Segments will be reviewed periodically to ensure that the process continues to be fair, open, balanced, and inclusive. Public input will be solicited in the review of these guidelines.

8. Since all balloting of Reliability Standards will be done electronically, any registered participant may designate a proxy to vote on its behalf. There are no limits on how many proxies a person may hold. However, NERC must have in its possession, either in writing or by email, documentation that the voting right by proxy has been transferred.

Segments

Segment 1. Transmission Owners

a. Any entity that owns or controls at least 200 circuit miles of integrated transmission facilities, or has an Open Access Transmission Tariff or equivalent on file with a regulatory authority.

b. Transmission owners that have placed their transmission under the operational control of an RTO or ISO.

c. Independent transmission companies or organizations, merchant transmission developers, and transcos that are not RTOs or ISOs.

d. Excludes RTOs and ISOs that are eligible to join to Segment 2.

Segment 2. Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs)

a. Any entity authorized by appropriate governmental authority to operate as an RTO or ISO.

Segment 3. Load-Serving Entities (LSEs)

a. Entities serving end-use customers under a regulated tariff, a contract governed by a regulatory tariff, or other legal obligation to serve.

b. A member of a generation and transmission (G&T) cooperative or a joint-action agency is permitted to designate the G&T or joint-action agency to represent it in this Segment; such designation does not preclude the G&T or joint-action agency from participation and voting in another Segment representing its direct interests.

c. Agents or associations can represent groups of LSEs

Segment 4. Transmission Dependent Utilities (TDUs)

a. Entities with a regulatory, contractual, or other legal obligation to serve wholesale aggregators or customers or end-use customers and that depend primarily on the transmission systems of third parties to provide this service.

b. Agents or associations can represent groups of TDUs.

Segment 5. Electric Generators

a. Affiliated and independent generators, including variable and other renewable resources.

b. A corporation that sets up separate corporate entities for each one or more generating plants in which it is involved may only have one vote in this Segment regardless of how many single-plant or multiple-plant corporations the parent corporation has established or is involved in.

c. Agents or associations can represent groups of electrical generators.

Segment 6. Electricity Brokers, Aggregators, and Marketers

a. Entities serving end-use customers under a power marketing agreement or other authorization not classified as a regulated tariff.

b. An entity that buys, sells, or brokers energy and related services for resale in wholesale or retail markets, whether a non-jurisdictional entity operating within its charter or an entity licensed by a jurisdictional regulator.

c. G&T cooperatives and joint-action agencies that perform an electricity broker, aggregator, or marketer function are permitted to belong to this Segment.

d. Agents or associations can represent groups of electricity brokers, aggregators, or marketers.

e. This Segment also includes demand-side management providers.

Segment 7. Large Electricity End Users

a. At least one service delivery taken at 50 kV (radial supply or facilities dedicated to serve customers) that is not purchased for resale.

b. A single customer with an average aggregated service Load (not purchased for resale) of at least 50,000 MWh annually, excluding cogeneration or other back feed to the serving utility.

c. Agents or associations can represent groups of large end users.

Segment 8. Small Electricity Users

a. Service taken at below 50 kV.

b. A single customer with an average aggregated service Load (not purchased for resale) of less than 50,000 MWh annually, excluding cogeneration or other back feed to the serving utility.

c. Agents, state consumer advocates, or other advocate groups can represent groups of small customers.

d. Any entity or individual currently employed by an entity that is eligible to join one or more of the other nine Segments, shall not be qualified to join Segment 8.

e. Any individual or entity, such as a consultant, employee or vendor, providing products or services related to Bulk Power System reliability within the previous 12 months to another entity eligible to join Segments 1 through 7, including trade associations representing such Segments, shall be qualified to join any one Segment for which one of the entities receiving those products or services is qualified to join and shall not be eligible to join Segment 8.

Segment 9. Federal, State, and Provincial Regulatory or other Government Entities

a. Does not include federal power management agencies or the Tennessee Valley Authority.

b. May include public utility commissions.

Segment 10. Regional Entities

a. Any entity that is a Regional Entity. It is recognized that there may be instances in which an entity is both an RTO or ISO and a Regional Entity. In such a case, the two functions must be sufficiently independent to meet NERC's Rules of Procedure and applicable regulatory

requirements, as evidenced by the approval of a Regional Entity delegation agreement. Without such an approval, the entity shall be limited to choosing to enter one Segment or the other, but not both.

However, NERC must have in its possession, either in writing or by email, documentation that the voting right by proxy has been transferred.

Segments

Segment 1. Transmission Owners

a. Any entity that owns or controls at least 200 circuit miles of integrated transmission facilities, or has an Open Access Transmission Tariff or equivalent on file with a regulatory authority.

b. Transmission owners that have placed their transmission under the operational control of an RTO or ISO.

c. Independent transmission companies or organizations, merchant transmission developers, and transcos that are not RTOs or ISOs.

d. Excludes RTOs and ISOs that are eligible to join to Segment 2.

Segment 2. Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs)

a. Any entity authorized by appropriate governmental authority to operate as an RTO or ISO.

Segment 3. Load-Serving Entities (LSEs)

a. Entities serving end-use customers under a regulated tariff, a contract governed by a regulatory tariff, or other legal obligation to serve.

b. A member of a generation and transmission (G&T) cooperative or a joint-action agency is permitted to designate the G&T or joint-action agency to represent it in this Segment; such designation does not preclude the G&T or joint-action agency from participation and voting in another Segment representing its direct interests.

c. Agents or associations can represent groups of LSEs

Segment 4. Transmission Dependent Utilities (TDUs)

a. Entities with a regulatory, contractual, or other legal obligation to serve wholesale aggregators or customers or end-use customers and that depend primarily on the transmission systems of third parties to provide this service.

b. Agents or associations can represent groups of TDUs.

Segment 5. Electric Generators

a. Affiliated and independent generators, including variable and other renewable resources.

b. A corporation that sets up separate corporate entities for each one or more generating plants in which it is involved may only have one vote in this Segment regardless of how many single-plant or multiple-plant corporations the parent corporation has established or is involved in.

c. Agents or associations can represent groups of electrical generators.

Segment 6. Electricity Brokers, Aggregators, and Marketers

a. Entities serving end-use customers under a power marketing agreement or other authorization not classified as a regulated tariff.

b. An entity that buys, sells, or brokers energy and related services for resale in wholesale or retail markets, whether a non-jurisdictional entity operating within its charter or an entity licensed by a jurisdictional regulator.

c. G&T cooperatives and joint-action agencies that perform an electricity broker, aggregator, or marketer function are permitted to belong to this Segment.

d. Agents or associations can represent groups of electricity brokers, aggregators, or marketers.

e. This Segment also includes demand-side management providers.

Segment 7. Large Electricity End Users

a. At least one service delivery taken at 50 kV (radial supply or facilities dedicated to serve customers) that is not purchased for resale.

b. A single customer with an average aggregated service Load~~load~~ (not purchased for resale) of at least 50,000 MWh annually, excluding cogeneration or other back feed to the serving utility.

c. Agents or associations can represent groups of large end users.

Segment 8. Small Electricity Users

a. Service taken at below 50 kV.

b. A single customer with an average aggregated service Load~~load~~ (not purchased for resale) of less than 50,000 MWh annually, excluding cogeneration or other back feed to the serving utility.

c. Agents, state consumer advocates, or other advocate groups can represent groups of small customers.

d. Any entity or individual currently employed by an entity that is eligible to join one or more of the other nine Segments, shall not be qualified to join Segment 8.

e. Any individual or entity, such as a consultant, employee or vendor, providing products or services related to Bulk Power System reliability within the previous 12 months to another entity eligible to join Segments 1 through 7, including trade associations representing such Segments, shall be qualified to join any one Segment for which one of the entities receiving those products or services is qualified to join and shall not be eligible to join Segment 8.

Segment 9. Federal, State, and Provincial Regulatory or other Government Entities

a. Does not include federal power management agencies or the Tennessee Valley Authority.

b. May include public utility commissions.

Segment 10. Regional Entities

a. Any entity that is a Regional Entity. It is recognized that there may be instances in which an entity is both an RTO or ISO and a Regional Entity. In such a case, the two functions must be sufficiently independent to meet NERC's Rules of Procedure and applicable regulatory

requirements, as evidenced by the approval of a Regional Entity delegation agreement. Without such an approval, the entity shall be limited to choosing to enter one Segment or the other, but not both.

Sanction Guidelines of the North American Electric Reliability Corporation

Effective: January 1, 2011

Table of Contents

1. Preamble and Overview 1

2. Document Scope and Exclusions 2

3. Basic Principles 3
3.1 Necessary Element of NERC Compliance Program 3
3.2 Settlement of Compliance Violations 3
3.3 Settlement Request 4
3.4 Settlement Effect on Continuation of Determination of Penalties, Sanctions, or Remedial Actions 4
3.5 Timing of Determination of Penalty, Sanction or Remedial Action 4
3.6 Determining Party 4
3.7 No Influence of Penalty, Sanction or Remedial Action upon Violation Confirmation Process 4
3.8 Reasonable Relationship to Violation 4
3.9 Use and Facets of Factors to Determine Penalties 5
3.10 Multiple Violations 5
3.11 Relation of the Penalty to the Seriousness of the Violation and Violator's Ability to Pay 5
3.12 Violation Time Horizon 6
3.13 Extenuating Circumstances 7
3.14 Concealment or Intentional Violation 7
3.15 Economic Choice to Violate 7
3.16 No Influence by Outcome of Economic Choice to Violate 7
3.17 Non-Monetary Sanctions or Remedial Actions 7
3.18 Non-Exclusiveness of Monetary Penalties or Non-Monetary Sanctions 7
3.19 Monetization of the Value of Sanctions 7
3.20 Maximum Limitations on Penalties 8
3.21 Frequency and Duration of Violations 9

4. Determination of Monetary Penalties 11
4.1 Initial Value Range of the Base Penalty Amount 11
4.1.1 Violation Risk Factor 11
4.1.2 Violation Severity Level 11
4.2 Setting of the Base Penalty Amount 12
4.2.1 Applicability of the Violation Risk Factor 12
4.2.2 First Violation 12
4.3 Application of Adjustment Factors 13
4.3.1 Repetitive Violations and Compliance History 13
4.3.2 Failure to Comply with Compliance Directives 14
4.3.3 Self-Disclosure and Voluntary Corrective Action 14
4.3.4 Degree and Quality of Cooperation in Violation Investigation and Remedial Action 14
4.3.5 Presence and Quality of Compliance Program 14
4.3.6 Violation Concealment 14
4.3.7 Intentional Violation 15
4.3.8 Extenuating Circumstances 15
4.4 Setting of the Final Penalty Amount 15
4.4.1 Violator's Financial Ability to Pay 15
4.4.2 Reconfirmation of Disgorgement of Unjust Profit or Gain 16

5. Determination of Non-Monetary Sanctions 17

6. Remedial Action 18
6.1 Definition and Anticipated Use 18
6.2 Compliance Requirements 18
6.3 No Obligation to Issue 18

6.4 Scope of Application 18
6.5 Availability 19
6.6 No Impact on Confirmation of Violation, or Penalties or Sanctions 19
6.7 Types of Remedial Actions 19

Appendix A: Base Penalty Amount Table 20

1. Preamble and Overview

The North American Electric Reliability Corporation, as the Electric Reliability Organization (ERO), and Regional Entities to whom NERC has delegated authority (hereinafter referred to collectively as "Regional Entities" or individually as a "Regional Entity") shall determine and may levy monetary Penalties and non-monetary sanctions and remedial actions against owners, operators, and users of the Bulk Power System for violations of the Requirements of NERC Reliability Standards approved by the Federal Energy Regulatory Commission (FERC) and Applicable Governmental Authorities in Canada and/or Mexico. This document sets out the processes and principles to be followed, and factors that will be considered when determining Penalties, sanctions, or remedial actions for violations. Collectively these processes, principles and factors are NERC's Penalties, sanctions, and remedial action guidelines.

NERC and the Regional Entities will exclusively follow the directives, principles and processes in these Sanction Guidelines when determining Penalties, sanctions, or remedial action for a violation. However, adjustment factors are also provided to afford NERC or the Regional Entity the flexibility needed to accommodate the facts surrounding each violation. In this manner, rigid prescription of specific Penalty formulae can be avoided at the same time that appropriate limitations on the degree of discretion and flexibility available to address each violation on its merits is maintained. The outcome will be remedies that are commensurate and fair compared to the reliability impact of the violation and to remedies levied for similar violations, yet appropriately reflective of any unique facts and circumstances regarding the specific violation and violator.

The adjustment factors established in this document are generally consistent with those listed in the FERC Policy Statement on Enforcement issued on October 20, 2005. However, discussion of the factors presented in this document is not exhaustive as other facets of these factors, or other additional factors not discussed herein, may also be considered to determine a given Penalty, sanction, or remedial action, as NERC or the Regional Entity deems appropriate under the circumstances.

Regional Entities shall follow these guidelines to determine Penalties, sanctions, or remedial actions. NERC shall oversee the Regional Entities' application of the guidelines to ensure that acceptable levels of consistency are achieved. NERC's oversight will also ensure comparable outcomes; i.e. that there is acceptable similarity in the degree and type of sanction for violations constituting comparable levels of threat to reliability of the Bulk Power System. In order to facilitate this oversight, Regional Entities' reporting to NERC of Penalties and sanctions they have determined will be thorough and in sufficient detail that NERC can understand and reasonably replicate the outcomes reached; NERC may develop reporting requirements or a standard reporting form for use by the Regional Entities for this purpose, as NERC deems necessary or appropriate.

As experience is gained by NERC and the Regional Entities through the use and application of these guidelines, NERC will review the guidelines and may modify them as NERC deems appropriate or necessary. Authority delegated by NERC to the Regional Entities with respect to Penalties, sanctions, or remedial actions does not include the authority to modify these guidelines.

Any revision to this document or to the principles and factors identified or addressed within it must first be approved by the NERC Board, then by FERC, Applicable Governmental Authorities in Canada or Applicable Governmental Authorities in Mexico prior to becoming effective and applicable within the United States or these Applicable Governmental Authorities' respective jurisdictions.

2. Document Scope and Exclusions

This document identifies and discusses the processes and principles to be followed, and factors that will be considered to determine Penalties, sanctions, or remedial actions for violations of the Reliability Standards.

This document notes but does not otherwise address the progression of actions and steps that NERC or the Regional Entity will follow to process a violation from its initial incoming status upon discovery as a Possible Violation, through to its possible final determination as a Confirmed Violation. This is set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure.

This document notes but does not otherwise address how a Possible Violation or Alleged Violation is reviewed in order to confirm or dismiss it. NERC's process and requirements for this review are set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure. Regional Entities will undertake such reviews using the processes and requirements set out in the NERC Compliance Monitoring and Enforcement Program.

This document notes but does not otherwise address the processes and procedural steps by which a Confirmed Violation can be appealed, or by which a Penalty, sanction, or remedial action determined and levied for a violation can be appealed. These procedures are set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure, and applicable Regional Entity program documents.

The NERC Compliance Monitoring and Enforcement Program provides for the possibility of settlements within NERC or Regional Entity Compliance Monitoring and Enforcement Programs. This document makes reference to settlements too, but does not address them further.

3. Basic Principles

The following paragraphs identify and discuss the basic principles underpinning why and how NERC and the Regional Entities will determine Penalties, sanctions, and remedial actions for violations of the Requirements of the Reliability Standards.

The principles are unique and complimentary; the order in which they are presented does not set or indicate order of precedence.

3.1 Necessary Element of NERC Compliance Program

Primary objectives of NERC as the ERO include the promotion and enforcement of compliance with the Reliability Standards by owners, operators, and users of the Bulk Power System; Reliability Standards made mandatory by duly-authorized legislative bodies in the U.S and Canada, and designed to maintain and promote the reliability of the two countries' shared power grids. Consistent with these objectives, NERC and the Regional Entities will monitor and act to verify compliance with Reliability Standards' Requirements; however, beyond monitoring and acting only to verify compliance, NERC and the Regional Entities will also hold Bulk Power System owners, operators, and users — or their delegates — accountable for Confirmed Violations. This accountability will include determination and the possible levying of Penalties, sanctions, or remedial actions.

Penalties, sanctions, and remedial actions are valid and necessary mechanisms to NERC and the Regional Entities for the enforcement and promotion of compliance to the Reliability Standards, in part because they can:

a. promote compliance behavior;

b. provide deterrence to future incidents, actions or situations of noncompliance by the violator or others;

c. implement actions that will promptly correct behavior;

d. disgorge benefits that may or may have accrued to a violator as a consequence of violating;

e. visit upon a violator some portion of any damage their violation may or may have visited upon others.

Accordingly, the determination and potential levying of appropriate Penalties, sanctions, or remedial actions by NERC or the Regional Entity upon those responsible for violations shall be a required step within the NERC and Regional Entity Compliance Monitoring and Enforcement Programs.

3.2 Settlement of Compliance Violations

NERC and the Regional Entities shall maintain the reliability of the Bulk Power System by enforcing compliance with NERC and Regional Reliability Standards. NERC and Regional Entity Compliance Monitoring and Enforcements Programs will lay out how NERC and the Regional Entities will do this. In particular and by necessity, elements of these programs regarding the confirmation of violations, the determination and levying of Penalties, sanctions, or remedial actions, and appeals are rigid and legalistic in form and nature in order to respect the basic tenets of due process and natural justice inherent within United States and Canadian justice systems, respectively, upon which they are being based. However, absolute adherence to the Compliance Monitoring and Enforcement Programs, to the exclusion of other options, may not be the most appropriate, efficient or desirable means by which to achieve the end goal in all circumstances, to all entities party to a violation.

As set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure, violations of the Reliability Standards may be dealt with through settlements reached between NERC, Regional Entity and the Registered Entity or Entities to whom a Possible, Alleged, or Confirmed Violation is attributed to by NERC or the Regional Entity. Any provisions made within a settlement regarding Penalties, sanctions, or remedial actions can supersede

any corresponding Penalties, sanctions that would otherwise be determined pursuant to these guidelines.

3.3 Settlement Request

Any Registered Entity found in or being investigated for a violation may request settlement negotiations at any time, including prior to issuance of a Notice of Alleged Violation; however, NERC or the Regional Entity may decline to enter into or continue settlement negotiations after the Possible Violation or Alleged Violation becomes a Confirmed Violation.

3.4 Settlement Effect on Continuation of Determination of Penalties, Sanctions, or Remedial Actions

Until a settlement is finalized or parties to that settlement agree otherwise, NERC or the Regional Entity may continue activities and actions towards the determination and levying of a Penalty, sanction, or remedial action that would otherwise be applicable pursuant to these guidelines, or that will be applicable if the settlement is not finalized.

3.5 Timing of Determination of Penalty, Sanction or Remedial Action

All Possible Violations and Alleged Violations will be reviewed by NERC or the Regional Entity with the outcome that either the violation will be confirmed or the violation will be dismissed.

The Penalty, sanction, or other remedial action for a violation will be determined when the violation becomes a Confirmed Violation or is resolved as part of a settlement agreement.

At any time during confirmation review, hearing, or appeals NERC or the Regional Entity may determine that remedial action is warranted by the subject Registered Entity of the review, hearing, or appeals. NERC or the Regional Entity may direct that such remedial actions be undertaken by the subject Registered Entity at any time, including prior to confirmation of a violation, and without regulatory approval.

3.6 Determining Party

The determination of Penalty, sanction or other remedial action for a violation will generally be undertaken by the same entity determining the violation to be a Confirmed Violation, but subject to review by NERC if the determination is made by a Regional Entity.

3.7 No Influence of Penalty, Sanction or Remedial Action upon Violation Confirmation Process

The Penalty, sanction, or remedial action determined for a violation will not influence the outcome of the Regional Entity' or NERC's confirmation review of the violation. In particular, if the determination of Penalty, sanction, or remedial action for a probable violation is being undertaken by the same entity undertaking the confirmation review, the entity will insure that there is sufficient separation, in such terms as time, process, personnel or the like, to preclude that the Penalty, sanction, or remedial action determined influences the outcome of the confirmation review.

3.8 Reasonable Relationship to Violation

Penalties, sanctions, and remedial actions levied or applied for the violation of a Reliability Standard shall bear a reasonable relation to the seriousness of the violation while also reflecting consideration of the factors that these guidelines direct to take into account. In the United States, the legislation establishing mandatory enforceable Reliability Standards and the ERO requires that "Any penalty imposed … shall; (A) bear a reasonable relation to the seriousness of the violation; and (B) take into consideration the efforts of the user, owner, or operator to remedy the violation in a timely manner[1]."

[1] H.R.6, Energy Policy Act of 2005, Section 215, Paragraph e, subparagraph 6.

3.9 Use and Facets of Factors to Determine Penalties

Penalties levied for a given violation will be based on all facts and other information relevant to the incident or situation. To that end, these guidelines include factors which NERC and the Regional Entities will consider while determining the Penalty or sanction to be levied.

NERC considers, and these guidelines direct, that the presence of some factors within a violation aggravates the seriousness of that violation and should cause an increase or expansion of the Penalty to be levied. Conversely, the presence of some other factors mitigates that seriousness and should cause a decrease or reduction of the Penalty to be levied. Also, some factors may mitigate or aggravate, and should have commensurate impact. NERC considers, and these guidelines direct, that the absence of an aggravating or mitigating factor will have no impact, as opposed to a mitigating or aggravating impact, respectively, to a Penalty.

This document presents many of the relevant facets of the factors included in these guidelines. However, additional facets of these factors, or additional factors not discussed herein, may also be considered to determine a given Penalty, sanction, or remedial action, as NERC or the Regional Entity deems appropriate under the circumstances. Where additional factors or facets are used they will be identified and their use will be justified. The effect of using these factors or facets on the Penalty, sanction, or remedial action determined will also be fully and clearly disclosed.

3.10 Multiple Violations

A violation is a failure or inadequacy to meet a Requirement of a Reliability Standard by a party responsible to comply with that Requirement.

The failure or inadequacy of a violator to comply may involve more than one Reliability Standard or several Requirements of a single Reliability Standard; as such, multiple individual violations may be in play when Penalties, sanctions, or remedial actions for an incident or situation of noncompliance are being determined.

Strictly speaking, NERC or the Regional Entity can determine and levy a separate Penalty or sanction, or direct remedial action, upon a violator for each individual violation. However, in instances of multiple violations related to a single act or common incidence of noncompliance, NERC or the Regional Entity will generally determine and issue a single aggregate Penalty, sanction, or Remedial Action Directive bearing reasonable relationship to the aggregate of the related violations. The Penalty, sanction, or remedial action will not be that determined individually for the least serious of the violations; it will generally be at least as large or expansive as what would be called for individually for the most serious of the violations.

Some entities may be registered as being responsible for more than one function (e.g., Transmission Owner, Transmission Operator, Balancing Authority, Generation Operator), and a single Requirement in some Reliability Standards may apply to the responsible entity for several functions. Where several functions are performed by the same Registered Entity, a violation will be assessed against the Registered Entity, not against each function.

3.11 Relation of the Penalty to the Seriousness of the Violation and Violator's Ability to Pay

As discussed in Section 3.8, above, Penalties levied for the violation of a Reliability Standard shall bear a reasonable relation to the seriousness of the violation. The seriousness of a given violation by a given violator shall be assessed by review of the applicability of the Violation Risk Factors[2] associated with the violation to the characteristics of the violator's operation or power system. Size is a characteristic of a violator's operation or system. The size of the violator can be considered in the assessment but shall not be the only characteristic considered. Where size is considered in such a

[2] See Section 4 Part 4.11 for a discussion of these factors

review the facts relating to the violation in question will be reviewed such that the "actual" size of the violator is properly discerned and appropriately considered; the following are provided as illustrative examples:

- If the violator belongs to a generation and transmission cooperative or joint-action agency, size will be attributed to the particular violator, rather than to that generation and transmission cooperative or joint-action agency.
- If the violator constitutes part of a corporate family the size of the violator will be attributed to that violator alone, in the absence of any facts indicating involvement of the whole corporation or corporate affiliates of the violator.
- If the violator is an entity established solely as a shell to register as subject to one or more Reliability Standards the size of the entity will be disregarded in favor of consideration of the size of parent entity or any affiliates that NERC or the Regional Entity deems involved and constituting the "actual" size of the violator.

At the request of the violator, NERC or the Regional Entity may review the Penalty in light of the violator's financial ability to pay the Penalty. Financial ability shall include both the financial strength of the Registered Entity as well as its structure (e.g., for-profit versus non-profit). Where Penalties are reduced or eliminated NERC or the Regional Entity shall consider non-monetary sanctions or remedial action as alternatives or substitutes to the Penalty, pursuant to Sections 3.17, 3.18 and 3.19, below, of this document.

The above actions will: (i) promote that violators are penalized or sanctioned commensurate with the risk or effect that their specific violation of the Reliability Standards had or is having to the reliability of the Bulk Power System while also; (ii) mitigating overly burdensome Penalties to less consequential or financially-limited entities concurrent with; (iii) promoting that no Penalty is inconsequential to the violator to whom it is assessed. This will promote that Penalties levied for violations of Reliability Standards bear a reasonable relation to the seriousness of the violation while also addressing violators' ability to pay the Penalties they are assessed.

3.12 Violation Time Horizon

Reliability Standards involving longer and broader time horizons, such as long-term planning activities, may have a lesser immediate impact and pose less immediate risk to the reliability of the Bulk Power System than Reliability Standards addressing shorter and narrower timeframes, such as Registered Entities' conduct in real time. Similarly, Reliability Standards involving longer and broader time horizons typically will provide a longer time period over which to discover and remedy a violation when compared to Reliability Standards addressing more immediate activities such as next-day planning, same-day operations or real-time operations. Using a time horizon element in the determination of Penalties for violations provides for recognition of the "more immediate" nature — and hence higher risk — of the threat of some violations as opposed to the lesser-risk "future threat if not corrected" nature of other violations.

Penalties levied for the violation of a Reliability Standard shall consider the time horizon of the Reliability Standard violated; violations of Reliability Standards involving more immediate or real-time activities will generally incur larger Penalties than violations of Reliability Standards with longer or broader horizons.

Time horizons inherent in Reliability Standard Requirements are not reflected in their assigned Violation Risk Factors or Violation Severity Levels[3]. Accordingly, the time horizon element of a violation will be considered when determining the Base Penalty Amount[4] for the violation.

[3] See Section 4 Part 4.11 for a discussion of these factors.
[4] See Section 4 Part 4.2

The time horizon considered and its impact on the selection of the Base Penalty Amount for the violation will be decided upon by NERC or the Regional Entity based upon judgment and the facts of the violation. The rationale for the time horizon used and its impact on the setting of the Base Penalty Amount will be documented by NERC or the Regional Entity and provided within the Notice of Penalty issued for the violation.

3.13 Extenuating Circumstances

In unique extenuating circumstances, such as significant natural disasters, Penalties may be significantly reduced or eliminated.

3.14 Concealment or Intentional Violation

Penalties levied for the violation of a Reliability Standard shall always take into consideration any attempt by a violator to conceal the violation from NERC or the Regional Entity, or any intentional violation incurred for purposes other than a demonstrably good faith effort to avoid a significant and greater threat to the immediate reliability of the Bulk Power System.

3.15 Economic Choice to Violate

Owners, operators, and users of the Bulk Power System may be presented with situations or circumstances where compliance with the Reliability Standards preclude or reduce an economic gain that could be realized by violating the Reliability Standards. Penalties shall be sufficient to assure that entities responsible for complying with Reliability Standards do not find it attractive to make economic choices that cause or unduly risk violations to Reliability Standards, or risk or cause incidents resulting from violations of the Reliability Standards. Penalties levied to violators who have made such a choice shall reflect this aspect of the violation.

3.16 No Influence by Outcome of Economic Choice to Violate

Economic choices to violate are generally made for the violator's own potential gain, but making such a choice does not always result in all potential gains being realized or may result in damage or loss. However, irrespective of the outcome to the Registered Entity making an economic choice to violate, such decisions risk others' reliability, commonly without either their knowledge or consent. Penalties levied to violators making an economic choice to violate shall reflect only that the choice was made at all; the lack of or reduced magnitude of any actual benefit received, or any damage suffered, by the violator as a consequence of making this choice will have no influence on the determination of the Penalty to be levied.

3.17 Non-Monetary Sanctions or Remedial Actions

Enforcement actions taken by NERC or a Regional Entity are not limited to monetary Penalties; at the discretion of NERC or the Regional Entity, sanctions or remedial actions may also be applied and can include limitations on activities, functions, operations, or other appropriate sanctions, including the establishment of a reliability watch list composed of major violators.

3.18 Non-Exclusiveness of Monetary Penalties or Non-Monetary Sanctions

A non-monetary sanction may be imposed either in lieu of or in addition to a monetary Penalty imposed for the same Confirmed Violation, and vice versa. Imposition of a monetary Penalty or non-monetary sanction for a violation does not preclude the imposition of the other as long as, in combination, the aggregate Penalty continues to bear a reasonable relation to the seriousness of the violation.

3.19 Monetization of the Value of Sanctions

A significant element of NERC's oversight of Penalties, sanctions, and remedial action determined and levied by Regional Entities is ensuring acceptable similarity in the degree and type of sanction for violations constituting comparable levels of threat to the reliability of the Bulk Power System. It is also a requirement and a commitment of NERC and its designees that Penalties, sanctions, or

remedial actions levied or applied for the violation of a Reliability Standard bear reasonable relation to the seriousness of the violation. Specifically with respect to Penalties and sanctions, it is intuitive that it will be easier, more objective, and more transparent to monitor and test for acceptable similarity if (monetary) Penalties or monetized values of sanctions determined for violations are used as the primary basis of comparison, versus comparisons made on the basis of other (non-monetized) considerations. Similarly, there will be strong intuitiveness and transparency, particularly to those interested but not strongly familiar with the power industry, that the seriousness of a violation has been reasonably addressed if the consequences for it to the violator are determined and can be expressed clearly and quantifiably in monetary terms.

Penalties determined and levied by NERC or Regional Entities will by definition be valued in monetary terms: U.S or Canadian dollars. It will be the preference of NERC that (non-monetary) sanctions imposed either in lieu of or in addition to a Penalty include disclosure of the monetary value that the sanctions represent to the violator. It is intuitive that defensible monetary values for those sanctions will be most easily determined if the Penalty for the violation pursuant to these guidelines is first determined and then the sanctions to be levied are introduced and justified as appropriate alternatives to that Penalty or additions to a lesser Penalty. However, sanctions may be determined directly (e.g. without first determining a Penalty amount) and monetized using other methods.

NERC does not have a preference between Penalties and sanctions for violations. The preference expressed here will support ensuring comparability of outcomes regarding application of these guidelines and the promotion of reasonable relationship between the seriousness of a violation and the sanctions, or Penalties and sanctions, levied for it.

3.20 Maximum Limitations on Penalties

Penalties are direct, monetary judgments levied against a violator by NERC or the Regional Entity for the violation of Requirements of the Reliability Standards. In contrast, sanctions will impose limitations or restrictions of some kind that may result in economic or other impacts to the violator, and remedial actions are directives by NERC or a Regional Entity to the violator regarding the correction of conditions, practices or any other relevant action or activity underlying the noncompliance(s) involved.

In the United States, the Federal Power Act allows for the imposition of civil penalties of up to $1,000,000 per day per violation. NERC and the Regional Entities draw their authority to levy Penalties from the Federal Power Act; accordingly this figure is and can be understood as the maximum monetary Penalty that NERC or Regional Entities are authorized to levy. However, as this legislation also requires that "[a]ny penalty imposed … shall; (A) bear a reasonable relation to the seriousness of the violation; and (B) take into consideration the efforts of the user, owner, or operator to remedy the violation in a timely manner[5]**" *entities required to comply with the Reliability Standards must also understand that NERC and the Regional Entities will be obligated to assess Penalties amounts up to and including the maximum amount for violations where warranted pursuant to these guidelines.***

In Canadian jurisdictions, the maximum monetary Penalty potentially assessable for a Reliability Standard violation is significantly less than the amount allowed in the United States under the Federal Power Act. Also, legislation presently governing some Canadian jurisdictions does not accommodate the levying of such a Penalty under some circumstances, may not accommodate the levying of such a Penalty for all violations, or does not accommodate the levying of any monetary Penalties.

[5] H.R.6, Energy Policy Act of 2005, Section 215, Paragraph e, subparagraph 6.

When a Penalty may be levied, or proposed to Applicable Governmental Authorities with jurisdiction to be levied, the following steps will be followed:

a. NERC or the Regional Entity will initially disregard the Penalty limitations of the Applicable Governmental Authorities with jurisdiction, and determine what the Penalties or sanctions would be pursuant to these sanction guidelines only.

b. NERC or the Regional Entity will review the maximum Penalty allowed by the Applicable Governmental Authorities with jurisdiction.

c. NERC or the Regional Entity will set the actual Penalty to be levied, or proposed to the Applicable Governmental Authorities with jurisdiction to be levied, as the lesser of that determined pursuant to these guidelines and the maximum Penalty or sanction allowed by the Applicable Governmental Authorities.

d. If the lesser Penalty is the maximum Penalty allowed by the Applicable Governmental Authorities, the Notice of Penalty or similar document issued by NERC or the Regional Entity regarding the violation will also list the Penalty that was determined pursuant to these guidelines.

Adhering to the above steps will insure that the result of the determination of any Penalty for any violation will produce output that can be directly compared (i.e. without influence of local Applicable Governmental Authorities' Penalty limitations or restrictions) with the Penalty determined for any other violation, assisting efforts of NERC and others to ensure that these guidelines are uniformly applied and that there is an acceptable level of consistency in the application of these sanction guidelines across North America. Applicable Governmental Authorities with jurisdiction may also find such information useful for their determination of the appropriateness of any Penalty or sanction proposed to them to be levied. Similarly, policy and legislative bodies may find such information of value to the review or development of arrangements addressing such matters.

3.21 Frequency and Duration of Violations

Section 316A of the Federal Power Act [16 U.S.C. § 825o-1(b)], as amended by the Energy Policy Act of 2005, provides that "any person who violates any provision of Part II of this title or any provision of any rule or order thereunder shall be subject to a civil penalty of not more than $1,000,000 for each day that such violation continues."

FERC Order No. 672 interprets this statement as setting a cap on the monetary Penalties that the Commission, NERC and Regional Entities can impose under FPA section 215. FERC has referred to this statutory provision as imposing a maximum $1,000,000 "per day, per violation" Penalty and has directed that the ERO must ensure that in the U.S. such a Penalty amount ($1,000,000), in such a manner ("per day, per violation"), can be imposed for a violation of the Reliability Standards should the conduct at issue so warrant.

Some Reliability Standards may not support the assessment of Penalties on a "per day, per violation" basis, but instead should have Penalties calculated based on an alternative Penalty frequency or duration. Where NERC or the Regional Entity deems that a monetary Penalty is warranted, or where NERC or the Regional Entity is monetizing (Section 3.19) the value of a non-monetary sanction, for the violation of such a Reliability Standard NERC or the Regional Entity shall determine the Penalty or monetized amount consistent with the following:

Multiple Instances of Violation on One Day

The nature of some Reliability Standards includes the possibility that a Registered Entity could violate the same Requirement two or more times on the same day. In this instance NERC or the Regional Entity is not limited to penalizing the violator a maximum of $1,000,000 per day. As NERC or the Regional Entity deems appropriate NERC or the Regional Entity may deem that there have

been multiple violations that occurred on the same day, each of which is subject to the maximum potential Penalty of $1,000,000 per violation, per day. Also, NERC or the Regional Entity is not constrained to assessing the same Penalty amount for each of the multiple violations, irrespective of their proximity in time.

Cumulative Over Time

Certain Requirements of the Reliability Standards are measured not on the basis of discrete acts, but of cumulative acts over time. Reliability Standards that fall into this category are generally those involving measurements based on averages over a given period. Where a violation of such a Reliability Standard has occurred the element of averaging performance over a period of time introduces the difficulty to NERC or the Regional Entity of reasonably identifying (i) what date the violation should be deemed to have occurred and (ii) its duration.

If a Reliability Standard Requirement measured by an average over time can only be violated once per applicable period, then there is risk that a disproportionately mild Penalty might be levied in a situation where the violation was serious and the effects on the Bulk Power System severe. In the future, each Reliability Standard Requirement that is based on an average over time will specify the minimum period in which a violation could occur and how to determine when a violation arises, which may be other than once per applicable period[6]. In the interim until relevant Reliability Standards are so modified, any ambiguity on this point will be construed conservatively, meaning that where a Registered Entity has not complied with such a Reliability Standard NERC or the Regional Entity will generally consider that only one violation occurred per measurement period. However, notwithstanding this general principle of one violation per measurement period, if an average must be measured by a span of time greater than a month, each month of that span shall constitute at a minimum one violation.

Periodically Monitored Discrete Violation

Some Reliability Standards may involve discrete events which are only monitored periodically or which are reported by exception. If a Requirement of such a Reliability Standard states that a discrete event constitutes a violation, then (i) a violation arises when that event occurs and (ii) that violation continues until remedied; furthermore, (iii) the violation is deemed to have occurred at the point that the Registered Entity entered into noncompliance with the Reliability Standard regardless of the monitoring period for the activity or its date of discovery or reporting. For example, if a task required by a Reliability Standard Requirement has not been done by the required date, it is irrelevant that monitoring for compliance for the Requirement occurs only on a yearly or other periodic basis; NERC or the Regional Entity will deem a violation to have occurred on the first day of noncompliance and each day thereafter until compliance is effectuated. Similarly, if a discrete event occurs and is not remedied on the date of occurrence, then NERC or the Regional Entity will deem a violation to have occurred on the day of the first instance of the noncompliance and each day, or portion thereof thereafter until compliance is effectuated.

Non-compliance with a Reliability Standard of this type will subject the violator to the potential maximum monetary Penalty of $1,000,000 per violation per day in violation.

NERC or the Regional Entity is not constrained to assessing the same Penalty amount for each day that the Registered Entity was in violation of the Reliability Standard Requirement in question.

[6] Para. 41; FERC Order on Clarification and Rehearing [Docket No. RR06-1-006]

4. Determination of Monetary Penalties

The following describes the steps that NERC or the Regional Entity will follow to determine the monetary Penalty for a violation[7]. The determination of non-monetary sanctions is discussed in Section 5 of this document; Section 6 discusses remedial action.

Step 1. The Base Penalty Amount for the violation will be set as discussed in Sections 4.1 and 4.2, below.

Step 2. The Base Penalty Amount set in Step 1 will be reviewed pursuant to Section 4.3, below. This will result in the Adjusted Penalty Amount.

Step 3. The Adjusted Penalty Amount determined in Step 2 may be reviewed in light of the violator's financial ability to pay the Penalty. Also, where applicable NERC or the Regional Entity will reconfirm that the Penalty set will disgorge unjust profits or economic benefits associated with an economic choice to violate[8]. At the conclusion of this review the Final Penalty Amount will be set.

Unless NERC or the Regional Entity deems alternative frequency or duration is warranted Penalties shall be assessed on a per violation per day basis. Where NERC or the Regional Entity deems that alternative Penalty frequency or duration is warranted the Notice of Penalty associated with the violation will clearly identify this and provide the rationale for it. Where NERC or the Regional Entity deems that alternative Penalty frequency or duration is warranted, Penalties shall be determined in accordance with section 3.21 of the Sanction Guidelines.

4.1 Initial Value Range of the Base Penalty Amount

NERC or the Regional Entity will determine an initial value range for the Base Penalty Amount by considering two factors regarding the violation: the Violation Risk Factor (VRF) of the Requirement violated and the Violation Severity Level (VSL) assessed for the violation. Using the Base Penalty Amount Table provided in Appendix A NERC or the Regional Entity will look up the initial value range for the Base Penalty Amount by finding the intersection of the violation's VRF and VSL on the table[9].

4.1.1 Violation Risk Factor

Each Requirement set out within NERC's Reliability Standards has been assigned a Violation Risk Factor (VRF) through the NERC Reliability Standards development process. The factors have been defined and approved through the Reliability Standards development process and are assigned to Requirements to provide clear, concise and comparative association between the violation of a Requirement and the expected or potential impact of the violation to the reliability of the Bulk Power System. One of three defined levels of risk is assigned to each Reliability Standards Requirement: lower Violation Risk Factor, or; medium Violation Risk Factor, or; high Violation Risk Factor. Definitions of the factors can be found in appropriate Reliability Standards development process documentation.

4.1.2 Violation Severity Level

Violation Severity Levels (VSLs) are defined measurements of the degree to which a violator violated a Requirement of a Reliability Standard. Whereas Violation Risk Factors are determined pre-violation and indicate the relative potential impacts that violations of each

[7] The text in this section discusses the determination of a single Penalty for an individual violation; however, the process laid out is also applicable to determining the individual Penalties, or a single aggregate Penalty, for multiple violations that are associated with each other as discussed in Section 3 Part 3.1 of this document.
[8] Reference: Section 3 Parts 3.15 and 3.16.
[9] As discussed in Section 3 Part 3.1 of this document where there is more than one violation in play, but the violations are sufficiently associated, NERC or the Regional Entity may set a single initial value range that is appropriate in light of the individual VRF/VSL combinations of the violations.

Reliability Standard could pose to the reliability of the Bulk Power System, the Violation Severity Level is assessed post-violation and is an indicator of how severely the violator actually violated the Reliability Standard(s) Requirement(s) in question.

These guidelines utilize the Violation Severity Levels that have been established[10] by NERC for Requirements of the Reliability Standards. Up to four levels can be defined for each Requirement; the levels have been designated as: lower, moderate, high, and severe.

4.2 Setting of the Base Penalty Amount

NERC or the Regional Entity will set the Base Penalty Amount for the violation. The Base Penalty Amount set for the violation may be set at the highest figure of the initial value range determined pursuant to Section 4.1, above. However, NERC or the Regional Entity may set the Base Penalty Amount at or below the lowest figure of the initial value range in light of two specific circumstances regarding the violation and the violator, specifically:

a. The applicability of the Violation Risk Factor of the violation to the specific circumstances[11] of violator.

b. Whether this is an inconsequential first violation by the violator of the Reliability Standard(s) in question.

As noted in Section 3.12 NERC or the Regional Entity will consider the time horizon involved with the violation when setting the Base Penalty Amount for the violation. As also noted in Section 3.12 this consideration will be documented for inclusion in the Notice of Penalty issued for the violation.

The Penalty amount resulting from this review will be the Base Penalty Amount that is used as the basis for further adjustment pursuant to the factors discussed in the next section (4.3) of this document.

4.2.1 Applicability of the Violation Risk Factor

Violation Risk Factors are assigned to Reliability Standards' Requirements as indicators of the expected risk or harm to the Bulk Power System posed by the violation of a Requirement by a typical or median Registered Entity that is required to comply. NERC or the Regional Entity may consider the specific circumstances of the violator to determine if the violation of the Requirement in question actually produced the degree of risk or harm anticipated by the Violation Risk Factor. If that expected risk or harm was not or would not have been produced, NERC or the Regional Entity may set the Base Penalty Amount to a value it (i) deems appropriate and (ii) is within the initial value range set above pursuant to Section 4.1.

4.2.2 First Violation

If the actual or foreseen impact of the violation is judged to be inconsequential by NERC or the Regional Entity and the violation is the first incidence of violation of the Requirement in question by the violator, NERC or the Regional Entity may at its discretion: (i) set the Base Penalty Amount to a value it deems appropriate within the initial value range set above pursuant to Section 4.1, or (ii) excuse the Penalty for the violation (i.e. set the Base Penalty Amount to 0$).

This relief will generally not be afforded to the violator if NERC or the Regional Entity determines that the violator has a poor compliance record; e.g. the circumstances discussed in

[10] Assignment of these levels will be complete and filed with the Commission by March 1, 2008 in accordance with FERC Order on Compliance Filing dated June 7, 2007 [Docket No. RR06-1-007] .

[11] The circumstances of the violator will include but not be limited to, as appropriate: the violator's aggregate and net Load; interconnections characteristics such as voltage class and transfer ratings.

Section 4.3.1 have been an aggravating factor in one or more previous Penalties assessed to the violator.

This relief will not be available for consideration in instances where the violator has concealed or attempted to conceal the violation, failed or refused to comply with compliance directives from NERC or the Regional Entity, or intentionally violated for purposes other than a demonstrably good faith effort to avoid a significant and greater threat to the immediate reliability of the Bulk Power System.

4.3 Application of Adjustment Factors

Adjustment factors provide the opportunity to NERC or the Regional Entity to adjust the Base Penalty Amount to reflect the specific facts and circumstances material to each violation and violator.

These guidelines recognize and require that, as a minimum, NERC or the Regional Entity consider the following:

a. Repetitive violations and the violator's compliance history

b. Failure of the violator to comply with compliance directives

c. Self-disclosure and voluntary corrective action by the violator

d. Degree and quality of cooperation by the violator in the violation investigation and in any remedial action directed for the violation

e. The presence and quality of the violator's compliance program quality

f. Any attempt by the violator to conceal the violation

g. Intentional violations

h. Extenuating circumstances

Two documents issued by United States regulatory agencies will be instructive to NERC and the Regional Entities when they are determining Penalties for violations of the Reliability Standards: the FERC's Policy Statement on Enforcement issued on October 20, 2005 under Docket No. PL06-00, and; U.S Securities and Exchange Commission (SEC) Release No. 44969 under the Securities and Exchange Act of 1934, issued on October 23 2001, also concurrently issued by the SEC as Release No. 1470 under Accounting and Auditing Enforcement.

NERC or the Regional Entity may also consider other additional factors it deems appropriate under the circumstances as long as their use is clearly identified and adequately justified. The effect of using these factors will also be fully and clearly disclosed.

4.3.1 Repetitive Violations and Compliance History

A bulleted point under Paragraph 20 of the FERC Policy Statement on Enforcement highlights repeat offenses by a violator. If a violator has had repetitive infractions of the same or a closely-related Reliability Standard Requirement, particularly within a time frame defined within the Reliability Standard(s) or deemed appropriate by NERC or the Regional Entity in the absence of the Reliability Standard(s) defining the time frame, NERC or the Regional Entity shall consider some increase to the Penalty.

The term "violation reset time period" of a Reliability Standards Requirement may be defined or implied within a given Reliability Standard to describe the period of time generally required for a violator to continue operations without incidence of further violation(s) of the Reliability Standards, particularly of the initial or a similar Reliability Standard violated, in order to avoid or minimize consideration of the violator's previous violation history for sanctioning purposes in the event of a subsequent violation(s). NERC and the Regional

Entities shall exercise appropriate judgment and discretion in this regard as warranted, particularly where no reset time period is specifically set within the Reliability Standard violated. Repeat violations within violation reset time periods are aggravating factors in the determination of sanctioning. Accordingly, a violation history of no violations will produce no mitigation of the Penalty otherwise determined; a violation history of infrequent minor violations of lesser risk Requirements assessed lower Violation Severity Levels may result in small or no increase; a history of more frequent violations or previous violations of higher risk Requirements assessed more severe Violation Severity Levels will generally incur commensurately larger increases.

4.3.2 Failure to Comply with Compliance Directives

If the violator has violated Reliability Standard Requirements notwithstanding having received related compliance directives, such as for remedial action from NERC or the Regional Entity, NERC or the Regional Entity shall consider some increase to the Penalty.

4.3.3 Self-Disclosure and Voluntary Corrective Action

NERC or the Regional Entity shall consider whether a violator self-disclosed the violation prior to detection or intervention by NERC or the Regional Entity, and any action undertaken by the violator to correct the situation. NERC or the Regional Entity will be instructed in their consideration of these factors by the text of Paragraphs 24 and 25 of the FERC Policy Statement on Enforcement. As they deem warranted, NERC or the Regional Entity may reduce the violator's Penalty consistent with the cited sections of the FERC policy.

4.3.4 Degree and Quality of Cooperation in Violation Investigation and Remedial Action

NERC or the Regional Entity shall consider the degree and quality of the violator's cooperation with NERC or the Regional Entity in the investigation of the violation and any remedial action arising from it. NERC or the Regional Entity will be instructed in making their determination on this by the text of Paragraphs 26 and 27 of the FERC Policy Statement on Enforcement. NERC or the Regional Entity may adjust the violator's Penalty as they deem warranted commensurate with the cited sections of the FERC policy statement. This may result in an increase, a decrease or no change to the Penalty.

4.3.5 Presence and Quality of Compliance Program

NERC or the Regional Entity shall consider the presence and quality of the violator's compliance program. NERC or the Regional Entity will be instructed in making their determination on this factor by the text of Paragraphs 22 and 23 of the FERC Policy Statement on Enforcement. As they deem warranted, NERC or the Regional Entity may reduce the violator's Penalty consistent with the cited sections of the FERC policy. Consistent with the FERC policy NERC or the Regional Entity may not increase a violator's Penalty specifically on the grounds that the violator has no program or a poor quality program.

4.3.6 Violation Concealment

Two bulleted points under Paragraph 20 of the FERC Policy Statement on Enforcement highlight misrepresentation of material facts and resistance or impediment to inquiry of a violation. When determining a Penalty NERC or the Regional Entity shall consider any concealment or attempt to conceal the violation, or information needed to investigate the violation, on the part of the violator. If the violator concealed or attempted to conceal, some significant increase to the Penalty shall be considered; doubling of the Penalty otherwise determined is suggested. Conduct of this nature on more than one occasion regarding one violation, or with respect to more than one violation, should incur an even larger increase to the Penalty otherwise determined.

4.3.7 Intentional Violation

Another bulleted point under Paragraph 20 of the FERC Policy Statement on Enforcement highlights offenses as willful action by a violator. When determining a Penalty NERC or the Regional Entity shall consider if the violator intentionally violated without just cause; i.e., for purposes other than a demonstrably good faith effort to avoid a significant and greater threat to the immediate reliability of the Bulk Power System. If the violator engaged in such conduct, some significant increase to the Penalty shall be considered; doubling of the Penalty otherwise determined is suggested. If conduct of this nature has been detected on more than one occasion, NERC or the Regional Entity should assess an even larger increase to the Penalty otherwise determined.

NERC or the Regional Entity will consider violations attributable to an economic choice to violate as intentional violations. Consistent with the FERC Policy Statement on Enforcement any Penalty issued involving conduct of this manner shall as a minimum disgorge any profits or economic benefits acquired as a consequence of the behavior, whenever and to the extent that they can be determined or reasonably estimated.

4.3.8 Extenuating Circumstances

NERC or the Regional Entity will consider if there are extenuating circumstances regarding the violation that justify reduction or elimination of the Penalty otherwise determined.

Consideration of adjusting a Penalty for this factor would be inconsistent with NERC or the Regional Entity increasing a Penalty after consideration of any other factor included in this section of these guidelines, such as intentional violation without justifiable cause or concealment or attempt to conceal.

4.4 Setting of the Final Penalty Amount

The Adjusted Penalty Amount determined in Step 2 may be reviewed in light of the violator's financial ability to pay the Penalty. Also, if the violation was an economic choice, NERC or the Regional Entity will reconfirm that the Penalty set will disgorge any unjust profits or economic benefits. At the conclusion of this review the Final Penalty Amount will be set.

4.4.1 Violator's Financial Ability to Pay[12]

At the written request of the violator NERC or the Regional Entity will review the Penalty determined in Step 2 in light of relevant, verifiable information that the violator provides regarding their financial ability to pay. At the conclusion of this review NERC or the Regional Entity may:

1. Reduce the Penalty payable to an amount that NERC or the Regional Entity, as applicable, deems the violator has the financial ability to pay, or;
2. Excuse the Penalty amount payable, or;
3. Sustain the Penalty amount determined in Step 2.

Where the Penalty amount has been reduced or excused, NERC or the Regional Entity shall consider the assessment of appropriate non-monetary sanction(s) as a substitute or an alternative for the Penalty amount that has been excused or by which the Penalty has been reduced.

[12] NERC anticipates that this will be the primary vehicle for addressing the ability to pay of "not-for-profit" and other similar organizations.

4.4.2 Reconfirmation of Disgorgement of Unjust Profit or Gain

Notwithstanding the application of any other consideration or factor applicable to the determination of a just and reasonable Penalty for the violation, if the violation in question involved an economic choice to violate NERC or the Regional Entity shall reconfirm that the Penalty set meets the requirements set forth in Parts 3.15 and 3.16 of Section 3 of this document.

5. Determination of Non-Monetary Sanctions

The imposition of sanctions is not bounded to monetary Penalties. Non-monetary sanctions applied must be applied with the objective of promoting reliability and compliance with the Reliability Standards. Non-monetary sanctions may include, but not be limited to, the following:

a. Limitations on activities, functions, or operations

b. Placing an entity on a reliability watch list composed of major violators

6. Remedial Action Directives

6.1 Definition and Anticipated Use

Remedial Action Directives are directives that may be issued to a Bulk Power System owner, operator, or user to resolve an Alleged Violation of a Reliability Standard by addressing conditions, practices, or any other relevant action or activity that is immediately necessary to terminate or correct to protect the reliability of the Bulk Power System from an imminent threat. A Remedial Action Directive will be issued when NERC or the Regional Entity identifies an Alleged Violation of a Reliability Standard that must be corrected immediately to protect the reliability of the Bulk Power System from the imminent threat that NERC or the Regional Entity has identified.

NERC or the Regional Entity will generally employ Remedial Action Directives where they deem it necessary to clearly specify minimum corrective actions that the subject of the Remedial Action Directive must take; additionally or alternatively a Remedial Action Directive may clearly specify timelines within which the Registered Entity must take specified actions, complete specified tasks, or achieve specified outcomes. Also, to the extent NERC or the Regional Entity is authorized to do so, a Remedial Action Directive may communicate Penalties, sanctions, or further Remedial Action Directives that may be imposed should the specific Remedial Action Directive not be complied with by those to whom it has been issued. As a rule of thumb, Remedial Action Directives will be of use to NERC or the Regional Entity whenever any significant combination of specificity, clarity, or time is of the essence to address a threat to the reliability of the Bulk Power System brought on by lack of or inadequate compliance to the Reliability Standards.

6.2 Compliance Requirements

In the United States, the Commission has concluded that owners, operators, or users of the Bulk Power System must comply with Remedial Action Directives issued to them by NERC or a Regional Entity. Noncompliance with a Remedial Action Directive may result in a substantially increased Penalty or sanction.

Remedial Action Directives issued by NERC or the Regional Entity will include a deadline by which time the owner, operator, or user must complete requirements set out in the Remedial Action Directive, and by which time the Registered Entity must demonstrate compliance to the Remedial Action Directive to NERC or the Regional Entity that issued it. Failure or refusal to meet the requirements or deadlines set out in a Remedial Action Directive may itself result in further Remedial Action Directives or significantly increased Penalties or sanctions by NERC or the Regional Entity.

6.3 No Obligation to Issue

NERC or the Regional Entity may, but is not obligated, to issue Remedial Action Directives. Lack of being issued a Remedial Action Directive does not relieve a Bulk Power System owner, operator, or user from any responsibilities they otherwise have to comply or maintain compliance with Requirements of the Reliability Standards. Remedial Action Directives will be used by NERC or the Regional Entities only as they deem warranted, when they deem warranted.

6.4 Scope of Application

The scope of Remedial Action Directives issued by NERC or the Regional Entity will be limited to conditions, practices, or any other relevant actions or activities resulting in noncompliance, or that NERC or the Regional Entity considers at significant risk of becoming noncompliant, to Requirements of the Reliability Standards, and that present an imminent threat to the reliability of the Bulk Power System. However, beyond merely directing compliance or improved compliance with Reliability Standards' Requirements, where NERC or the Regional Entity is authorized to do so, the Remedial Action Directive may also stipulate how compliance or the improvement to compliance is to be achieved.

6.5 Availability

In the United States, the Commission has interpreted the Federal Power Act to authorize the NERC or the Regional Entity can issue a Remedial Action Directive prior to completion of the confirmation review of a probable violation, or prior to the determination of a Penalty or sanction for that violation. The Commission also concluded it is not necessary for NERC or the Regional Entity to acquire the Commission's or other regulators' approval prior to issuing Remedial Action Directives. Accordingly, NERC or the Regional Entity may issue Remedial Action Directives to Registered Entities in the United States whenever they deem it necessary or otherwise warranted to do so. Also, NERC or the Regional Entity may issue Remedial Action Directives to Registered Entities in the United States regarding a violation that is immediately necessary to terminate or correct to protect the reliability of the Bulk Power System from an imminent threat, irrespective of whether that violation is ultimately verified or dismissed by NERC or the Regional Entity's investigation of the violation.

6.6 No Impact on Confirmation of Violation, or Penalties or Sanctions

Remedial Action Directives issued regarding a violation, in particular any costs incurred by the violator to comply with any such Remedial Action Directive, will not be considered when reviewing whether the aggregate of any Penalties and sanctions levied for that violation bear a reasonable relation to the seriousness of the violation. Also, any Remedial Action Directives issued with respect to a violation will not influence the outcome of the confirmation review of that violation nor the determination of Penalties or sanctions for that violation; ordering a violator to correct what needs correcting anyway is no grounds for dispelling a violation nor reducing or eliminating a Penalty or sanction that would otherwise be determined appropriate for the violator for that violation.

6.7 Types of Remedial Actions

NERC or the Regional Entities may issue Remedial Action Directives to correct compliance with NERC or Regional Reliability Standards and reduce or eliminate imminent threats to the reliability of the Bulk Power System. Examples of Remedial Action Directives include:

a. Specifying operating or planning criteria, limits, or limitations

b. Requiring specific system studies

c. Defining operating practices or guidelines

d. Requiring confirmation of data, practices, or procedures through inspection testing or other methods

e. Requiring specific training for personnel

f. Requiring development of specific operating plans

Appendix A: Base Penalty Amount Table

The following lists the Base Penalty amounts corresponding to combinations of Violation Risk Factor and Violation Severity Level.

Violation Risk Factor	Violation Severity Level							
	Lower		Moderate		High		Severe	
	Range Limits		Range Limits		Range Limits		Range Limits	
	Low	High	Low	High	Low	High	Low	High
Lower	$1,000	$3,000	$2,000	$7,500	$3,000	$15,000	$5,000	$25,000
Medium	$2,000	$30,000	$4,000	$100,000	$6,000	$200,000	$10,000	$335,000
High	$4,000	$125,000	$8,000	$300,000	$12,000	$625,000	$20,000	$1,000,000

NOTE: This table describes the amount of Penalty that could be applied for each day that a violation continues, subject to the considerations of Section 3.21 regarding frequency and duration of violations.

6.7 Types of Remedial Actions 19

Appendix A: Base Penalty Amount Table 20

1. Preamble and Overview

The North American Electric Reliability Corporation, as the Electric Reliability Organization (ERO), and Regional Entities to whom NERC has delegated authority (hereinafter referred to collectively as "Regional Entities" or individually as a "Regional Entity") shall determine and may levy monetary Penalties and non-monetary sanctions and remedial actions against owners, operators, and users of the Bulk Power System for violations of the Requirements of NERC Reliability Standards approved by the Federal Energy Regulatory Commission (FERC) and Applicable Governmental Authorities in Canada and/or Mexico. This document sets out the processes and principles to be followed, and factors that will be considered when determining Penalties, sanctions, or remedial actions for violations. Collectively these processes, principles and factors are NERC's Penalties, sanctions, and remedial action guidelines.

NERC and the Regional Entities will exclusively follow the directives, principles and processes in these Sanction Guidelines when determining Penalties, sanctions, or remedial action for a violation. However, adjustment factors are also provided to afford NERC or the Regional Entity the flexibility needed to accommodate the facts surrounding each violation. In this manner, rigid prescription of specific Penalty formulae can be avoided at the same time that appropriate limitations on the degree of discretion and flexibility available to address each violation on its merits is maintained. The outcome will be remedies that are commensurate and fair compared to the reliability impact of the violation and to remedies levied for similar violations, yet appropriately reflective of any unique facts and circumstances regarding the specific violation and violator.

The adjustment factors established in this document are generally consistent with those listed in the FERC Policy Statement on Enforcement issued on October 20, 2005. However, discussion of the factors presented in this document is not exhaustive as other facets of these factors, or other additional factors not discussed herein, may also be considered to determine a given Penalty, sanction, or remedial action, as NERC or the Regional Entity deems appropriate under the circumstances.

Regional Entities shall follow these guidelines to determine Penalties, sanctions, or remedial actions. NERC shall oversee the Regional Entities' application of the guidelines to ensure that acceptable levels of consistency are achieved. NERC's oversight will also ensure comparable outcomes; i.e. that there is acceptable similarity in the degree and type of sanction for violations constituting comparable levels of threat to reliability of the Bulk Power System. In order to facilitate this oversight, Regional Entities' reporting to NERC of Penalties and sanctions they have determined will be thorough and in sufficient detail that NERC can understand and reasonably replicate the outcomes reached; NERC may develop reporting requirements or a standard reporting form for use by the Regional Entities for this purpose, as NERC deems necessary or appropriate.

As experience is gained by NERC and the Regional Entities through the use and application of these guidelines, NERC will review the guidelines and may modify them as NERC deems appropriate or necessary. Authority delegated by NERC to the Regional Entities with respect to Penalties, sanctions, or remedial actions does not include the authority to modify these guidelines.

Any revision to this document or to the principles and factors identified or addressed within it must first be approved by the NERC Board, then by FERC, Applicable Governmental Authorities in Canada or Applicable Governmental Authorities in Mexico prior to becoming effective and applicable within the United States or these Applicable Governmental Authorities' respective jurisdictions.

2. Document Scope and Exclusions

This document identifies and discusses the processes and principles to be followed, and factors that will be considered to determine Penalties, sanctions, or remedial actions for violations of the Reliability Standards.

This document notes but does not otherwise address the progression of actions and steps that NERC or the Regional Entity will follow to process a violation from its initial incoming status upon discovery as a Possible Violation, through to its possible final determination as a Confirmed Violation. This is set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure.

This document notes but does not otherwise address how a Possible Violation or Alleged Violation is reviewed in order to confirm or dismiss it. NERC's process and requirements for this review are set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure. Regional Entities will undertake such reviews using the processes and requirements set out in the NERC Compliance Monitoring and Enforcement Program.

This document notes but does not otherwise address the processes and procedural steps by which a Confirmed Violation can be appealed, or by which a Penalty, sanction, or remedial action determined and levied for a violation can be appealed. These procedures are set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure, and applicable Regional Entity program documents.

The NERC Compliance Monitoring and Enforcement Program provides for the possibility of settlements within NERC or Regional Entity Compliance Monitoring and Enforcement Programs. This document makes reference to settlements too, but does not address them further.

3. Basic Principles

The following paragraphs identify and discuss the basic principles underpinning why and how NERC and the Regional Entities will determine Penalties, sanctions, and remedial actions for violations of the Requirements of the Reliability Standards.

The principles are unique and complimentary; the order in which they are presented does not set or indicate order of precedence.

3.1 Necessary Element of NERC Compliance Program

Primary objectives of NERC as the ERO include the promotion and enforcement of compliance with the Reliability Standards by owners, operators, and users of the Bulk Power System; Reliability Standards made mandatory by duly-authorized legislative bodies in the U.S and Canada, and designed to maintain and promote the reliability of the two countries' shared power grids. Consistent with these objectives, NERC and the Regional Entities will monitor and act to verify compliance with Reliability Standards' Requirements; however, beyond monitoring and acting only to verify compliance, NERC and the Regional Entities will also hold Bulk Power System owners, operators, and users — or their delegates — accountable for Confirmed Violations. This accountability will include determination and the possible levying of Penalties, sanctions, or remedial actions.

Penalties, sanctions, and remedial actions are valid and necessary mechanisms to NERC and the Regional Entities for the enforcement and promotion of compliance to the Reliability Standards, in part because they can:

a. promote compliance behavior;

b. provide deterrence to future incidents, actions or situations of noncompliance by the violator or others;

c. implement actions that will promptly correct behavior;

d. disgorge benefits that may or may have accrued to a violator as a consequence of violating;

e. visit upon a violator some portion of any damage their violation may or may have visited upon others.

Accordingly, the determination and potential levying of appropriate Penalties, sanctions, or remedial actions by NERC or the Regional Entity upon those responsible for violations shall be a required step within the NERC and Regional Entity Compliance Monitoring and Enforcement Programs.

3.2 Settlement of Compliance Violations

NERC and the Regional Entities shall maintain the reliability of the Bulk Power System by enforcing compliance with NERC and Regional Reliability Standards. NERC and Regional Entity Compliance Monitoring and Enforcements Programs will lay out how NERC and the Regional Entities will do this. In particular and by necessity, elements of these programs regarding the confirmation of violations, the determination and levying of Penalties, sanctions, or remedial actions, and appeals are rigid and legalistic in form and nature in order to respect the basic tenets of due process and natural justice inherent within United States and Canadian justice systems, respectively, upon which they are being based. However, absolute adherence to the Compliance Monitoring and Enforcement Programs, to the exclusion of other options, may not be the most appropriate, efficient or desirable means by which to achieve the end goal in all circumstances, to all entities party to a violation.

As set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure, violations of the Reliability Standards may be dealt with through settlements reached between NERC, Regional Entity and the Registered Entity or Entities to whom a Possible, Alleged, or Confirmed Violation is attributed to by NERC or the Regional Entity. Any provisions made within a settlement regarding Penalties, sanctions, or remedial actions can supersede

any corresponding Penalties, sanctions that would otherwise be determined pursuant to these guidelines.

3.3 Settlement Request

Any Registered Entity found in or being investigated for a violation may request settlement negotiations at any time, including prior to issuance of a Notice of Alleged Violation; however, NERC or the Regional Entity may decline to enter into or continue settlement negotiations after the Possible Violation or Alleged Violation becomes a Confirmed Violation.

3.4 Settlement Effect on Continuation of Determination of Penalties, Sanctions, or Remedial Actions

Until a settlement is finalized or parties to that settlement agree otherwise, NERC or the Regional Entity may continue activities and actions towards the determination and levying of a Penalty, sanction, or remedial action that would otherwise be applicable pursuant to these guidelines, or that will be applicable if the settlement is not finalized.

3.5 Timing of Determination of Penalty, Sanction or Remedial Action

All Possible Violations and Alleged Violations will be reviewed by NERC or the Regional Entity with the outcome that either the violation will be confirmed or the violation will be dismissed.

The Penalty, sanction, or other remedial action for a violation will be determined when the violation becomes a Confirmed Violation or is resolved as part of a settlement agreement.

At any time during confirmation review, hearing, or appeals NERC or the Regional Entity may determine that remedial action is warranted by the subject Registered Entity of the review, hearing, or appeals. NERC or the Regional Entity may direct that such remedial actions be undertaken by the subject Registered Entity at any time, including prior to confirmation of a violation, and without regulatory approval.

3.6 Determining Party

The determination of Penalty, sanction or other remedial action for a violation will generally be undertaken by the same entity determining the violation to be a Confirmed Violation, but subject to review by NERC if the determination is made by a Regional Entity.

3.7 No Influence of Penalty, Sanction or Remedial Action upon Violation Confirmation Process

The Penalty, sanction, or remedial action determined for a violation will not influence the outcome of the Regional Entity' or NERC's confirmation review of the violation. In particular, if the determination of Penalty, sanction, or remedial action for a probable violation is being undertaken by the same entity undertaking the confirmation review, the entity will insure that there is sufficient separation, in such terms as time, process, personnel or the like, to preclude that the Penalty, sanction, or remedial action determined influences the outcome of the confirmation review.

3.8 Reasonable Relationship to Violation

Penalties, sanctions, and remedial actions levied or applied for the violation of a Reliability Standard shall bear a reasonable relation to the seriousness of the violation while also reflecting consideration of the factors that these guidelines direct to take into account. In the United States, the legislation establishing mandatory enforceable Reliability Standards and the ERO requires that "Any penalty imposed … shall; (A) bear a reasonable relation to the seriousness of the violation; and (B) take into consideration the efforts of the user, owner, or operator to remedy the violation in a timely manner[1]."

[1] H.R.6, Energy Policy Act of 2005, Section 215, Paragraph e, subparagraph 6.

3.9 Use and Facets of Factors to Determine Penalties

Penalties levied for a given violation will be based on all facts and other information relevant to the incident or situation. To that end, these guidelines include factors which NERC and the Regional Entities will consider while determining the Penalty or sanction to be levied.

NERC considers, and these guidelines direct, that the presence of some factors within a violation aggravates the seriousness of that violation and should cause an increase or expansion of the Penalty to be levied. Conversely, the presence of some other factors mitigates that seriousness and should cause a decrease or reduction of the Penalty to be levied. Also, some factors may mitigate or aggravate, and should have commensurate impact. NERC considers, and these guidelines direct, that the absence of an aggravating or mitigating factor will have no impact, as opposed to a mitigating or aggravating impact, respectively, to a Penalty.

This document presents many of the relevant facets of the factors included in these guidelines. However, additional facets of these factors, or additional factors not discussed herein, may also be considered to determine a given Penalty, sanction, or remedial action, as NERC or the Regional Entity deems appropriate under the circumstances. Where additional factors or facets are used they will be identified and their use will be justified. The effect of using these factors or facets on the Penalty, sanction, or remedial action determined will also be fully and clearly disclosed.

3.10 Multiple Violations

A violation is a failure or inadequacy to meet a Requirement of a Reliability Standard by a party responsible to comply with that Requirement.

The failure or inadequacy of a violator to comply may involve more than one Reliability Standard or several Requirements of a single Reliability Standard; as such, multiple individual violations may be in play when Penalties, sanctions, or remedial actions for an incident or situation of noncompliance are being determined.

Strictly speaking, NERC or the Regional Entity can determine and levy a separate Penalty or sanction, or direct remedial action, upon a violator for each individual violation. However, in instances of multiple violations related to a single act or common incidence of noncompliance, NERC or the Regional Entity will generally determine and issue a single aggregate Penalty, sanction, or Remedial Action Directive bearing reasonable relationship to the aggregate of the related violations. The Penalty, sanction, or remedial action will not be that determined individually for the least serious of the violations; it will generally be at least as large or expansive as what would be called for individually for the most serious of the violations.

Some entities may be registered as being responsible for more than one function (e.g., Transmission Owner, Transmission Operator, Balancing Authority, Generation Operator), and a single Requirement in some Reliability Standards may apply to the responsible entity for several functions. Where several functions are performed by the same Registered Entity, a violation will be assessed against the Registered Entity, not against each function.

3.11 Relation of the Penalty to the Seriousness of the Violation and Violator's Ability to Pay

As discussed in Section 3.8, above, Penalties levied for the violation of a Reliability Standard shall bear a reasonable relation to the seriousness of the violation. The seriousness of a given violation by a given violator shall be assessed by review of the applicability of the Violation Risk Factors[2] associated with the violation to the characteristics of the violator's operation or power system. Size is a characteristic of a violator's operation or system. The size of the violator can be considered in the assessment but shall not be the only characteristic considered. Where size is considered in such a

[2] See Section 4 Part 4.11 for a discussion of these factors

review the facts relating to the violation in question will be reviewed such that the "actual" size of the violator is properly discerned and appropriately considered; the following are provided as illustrative examples:

- If the violator belongs to a generation and transmission cooperative or joint-action agency, size will be attributed to the particular violator, rather than to that generation and transmission cooperative or joint-action agency.
- If the violator constitutes part of a corporate family the size of the violator will be attributed to that violator alone, in the absence of any facts indicating involvement of the whole corporation or corporate affiliates of the violator.
- If the violator is an entity established solely as a shell to register as subject to one or more Reliability Standards the size of the entity will be disregarded in favor of consideration of the size of parent entity or any affiliates that NERC or the Regional Entity deems involved and constituting the "actual" size of the violator.

At the request of the violator, NERC or the Regional Entity may review the Penalty in light of the violator's financial ability to pay the Penalty. Financial ability shall include both the financial strength of the Registered Entity as well as its structure (e.g., for-profit versus non-profit). Where Penalties are reduced or eliminated NERC or the Regional Entity shall consider non-monetary sanctions or remedial action as alternatives or substitutes to the Penalty, pursuant to Sections 3.17, 3.18 and 3.19, below, of this document.

The above actions will: (i) promote that violators are penalized or sanctioned commensurate with the risk or effect that their specific violation of the Reliability Standards had or is having to the reliability of the Bulk Power System while also; (ii) mitigating overly burdensome Penalties to less consequential or financially-limited entities concurrent with; (iii) promoting that no Penalty is inconsequential to the violator to whom it is assessed. This will promote that Penalties levied for violations of Reliability Standards bear a reasonable relation to the seriousness of the violation while also addressing violators' ability to pay the Penalties they are assessed.

3.12 Violation Time Horizon

Reliability Standards involving longer and broader time horizons, such as long-term planning activities, may have a lesser immediate impact and pose less immediate risk to the reliability of the Bulk Power System than Reliability Standards addressing shorter and narrower timeframes, such as Registered Entities' conduct in real time. Similarly, Reliability Standards involving longer and broader time horizons typically will provide a longer time period over which to discover and remedy a violation when compared to Reliability Standards addressing more immediate activities such as next-day planning, same-day operations or real-time operations. Using a time horizon element in the determination of Penalties for violations provides for recognition of the "more immediate" nature — and hence higher risk — of the threat of some violations as opposed to the lesser-risk "future threat if not corrected" nature of other violations.

Penalties levied for the violation of a Reliability Standard shall consider the time horizon of the Reliability Standard violated; violations of Reliability Standards involving more immediate or real-time activities will generally incur larger Penalties than violations of Reliability Standards with longer or broader horizons.

Time horizons inherent in Reliability Standard Requirements are not reflected in their assigned Violation Risk Factors or Violation Severity Levels[3]. Accordingly, the time horizon element of a violation will be considered when determining the Base Penalty Amount[4] for the violation.

[3] See Section 4 Part 4.11 for a discussion of these factors.
[4] See Section 4 Part 4.2

The time horizon considered and its impact on the selection of the Base Penalty Amount for the violation will be decided upon by NERC or the Regional Entity based upon judgment and the facts of the violation. The rationale for the time horizon used and its impact on the setting of the Base Penalty Amount will be documented by NERC or the Regional Entity and provided within the Notice of Penalty issued for the violation.

3.13 Extenuating Circumstances

In unique extenuating circumstances, such as significant natural disasters, Penalties may be significantly reduced or eliminated.

3.14 Concealment or Intentional Violation

Penalties levied for the violation of a Reliability Standard shall always take into consideration any attempt by a violator to conceal the violation from NERC or the Regional Entity, or any intentional violation incurred for purposes other than a demonstrably good faith effort to avoid a significant and greater threat to the immediate reliability of the Bulk Power System.

3.15 Economic Choice to Violate

Owners, operators, and users of the Bulk Power System may be presented with situations or circumstances where compliance with the Reliability Standards preclude or reduce an economic gain that could be realized by violating the Reliability Standards. Penalties shall be sufficient to assure that entities responsible for complying with Reliability Standards do not find it attractive to make economic choices that cause or unduly risk violations to Reliability Standards, or risk or cause incidents resulting from violations of the Reliability Standards. Penalties levied to violators who have made such a choice shall reflect this aspect of the violation.

3.16 No Influence by Outcome of Economic Choice to Violate

Economic choices to violate are generally made for the violator's own potential gain, but making such a choice does not always result in all potential gains being realized or may result in damage or loss. However, irrespective of the outcome to the Registered Entity making an economic choice to violate, such decisions risk others' reliability, commonly without either their knowledge or consent. Penalties levied to violators making an economic choice to violate shall reflect only that the choice was made at all; the lack of or reduced magnitude of any actual benefit received, or any damage suffered, by the violator as a consequence of making this choice will have no influence on the determination of the Penalty to be levied.

3.17 Non-Monetary Sanctions or Remedial Actions

Enforcement actions taken by NERC or a Regional Entity are not limited to monetary Penalties; at the discretion of NERC or the Regional Entity, sanctions or remedial actions may also be applied and can include limitations on activities, functions, operations, or other appropriate sanctions, including the establishment of a reliability watch list composed of major violators.

3.18 Non-Exclusiveness of Monetary Penalties or Non-Monetary Sanctions

A non-monetary sanction may be imposed either in lieu of or in addition to a monetary Penalty imposed for the same Confirmed Violation, and vice versa. Imposition of a monetary Penalty or non-monetary sanction for a violation does not preclude the imposition of the other as long as, in combination, the aggregate Penalty continues to bear a reasonable relation to the seriousness of the violation.

3.19 Monetization of the Value of Sanctions

A significant element of NERC's oversight of Penalties, sanctions, and remedial action determined and levied by Regional Entities is ensuring acceptable similarity in the degree and type of sanction for violations constituting comparable levels of threat to the reliability of the Bulk Power System. It is also a requirement and a commitment of NERC and its designees that Penalties, sanctions, or

remedial actions levied or applied for the violation of a Reliability Standard bear reasonable relation to the seriousness of the violation. Specifically with respect to Penalties and sanctions, it is intuitive that it will be easier, more objective, and more transparent to monitor and test for acceptable similarity if (monetary) Penalties or monetized values of sanctions determined for violations are used as the primary basis of comparison, versus comparisons made on the basis of other (non-monetized) considerations. Similarly, there will be strong intuitiveness and transparency, particularly to those interested but not strongly familiar with the power industry, that the seriousness of a violation has been reasonably addressed if the consequences for it to the violator are determined and can be expressed clearly and quantifiably in monetary terms.

Penalties determined and levied by NERC or Regional Entities will by definition be valued in monetary terms: U.S or Canadian dollars. It will be the preference of NERC that (non-monetary) sanctions imposed either in lieu of or in addition to a Penalty include disclosure of the monetary value that the sanctions represent to the violator. It is intuitive that defensible monetary values for those sanctions will be most easily determined if the Penalty for the violation pursuant to these guidelines is first determined and then the sanctions to be levied are introduced and justified as appropriate alternatives to that Penalty or additions to a lesser Penalty. However, sanctions may be determined directly (e.g. without first determining a Penalty amount) and monetized using other methods.

NERC does not have a preference between Penalties and sanctions for violations. The preference expressed here will support ensuring comparability of outcomes regarding application of these guidelines and the promotion of reasonable relationship between the seriousness of a violation and the sanctions, or Penalties and sanctions, levied for it.

3.20 Maximum Limitations on Penalties

Penalties are direct, monetary judgments levied against a violator by NERC or the Regional Entity for the violation of Requirements of the Reliability Standards. In contrast, sanctions will impose limitations or restrictions of some kind that may result in economic or other impacts to the violator, and remedial actions are directives by NERC or a Regional Entity to the violator regarding the correction of conditions, practices or any other relevant action or activity underlying the noncompliance(s) involved.

In the United States, the Federal Power Act allows for the imposition of civil penalties of up to $1,000,000 per day per violation. NERC and the Regional Entities draw their authority to levy Penalties from the Federal Power Act; accordingly this figure is and can be understood as the maximum monetary Penalty that NERC or Regional Entities are authorized to levy. However, as this legislation also requires that "[a]ny penalty imposed … shall; (A) bear a reasonable relation to the seriousness of the violation; and (B) take into consideration the efforts of the user, owner, or operator to remedy the violation in a timely manner[5]**" *entities required to comply with the Reliability Standards must also understand that NERC and the Regional Entities will be obligated to assess Penalties amounts up to and including the maximum amount for violations where warranted pursuant to these guidelines.***

In Canadian jurisdictions, the maximum monetary Penalty potentially assessable for a Reliability Standard violation is significantly less than the amount allowed in the United States under the Federal Power Act. Also, legislation presently governing some Canadian jurisdictions does not accommodate the levying of such a Penalty under some circumstances, may not accommodate the levying of such a Penalty for all violations, or does not accommodate the levying of any monetary Penalties.

[5] H.R.6, Energy Policy Act of 2005, Section 215, Paragraph e, subparagraph 6.

When a Penalty may be levied, or proposed to Applicable Governmental Authorities with jurisdiction to be levied, the following steps will be followed:

a. NERC or the Regional Entity will initially disregard the Penalty limitations of the Applicable Governmental Authorities with jurisdiction, and determine what the Penalties or sanctions would be pursuant to these sanction guidelines only.

b. NERC or the Regional Entity will review the maximum Penalty allowed by the Applicable Governmental Authorities with jurisdiction.

c. NERC or the Regional Entity will set the actual Penalty to be levied, or proposed to the Applicable Governmental Authorities with jurisdiction to be levied, as the lesser of that determined pursuant to these guidelines and the maximum Penalty or sanction allowed by the Applicable Governmental Authorities.

d. If the lesser Penalty is the maximum Penalty allowed by the Applicable Governmental Authorities, the Notice of Penalty or similar document issued by NERC or the Regional Entity regarding the violation will also list the Penalty that was determined pursuant to these guidelines.

Adhering to the above steps will insure that the result of the determination of any Penalty for any violation will produce output that can be directly compared (i.e. without influence of local Applicable Governmental Authorities' Penalty limitations or restrictions) with the Penalty determined for any other violation, assisting efforts of NERC and others to ensure that these guidelines are uniformly applied and that there is an acceptable level of consistency in the application of these sanction guidelines across North America. Applicable Governmental Authorities with jurisdiction may also find such information useful for their determination of the appropriateness of any Penalty or sanction proposed to them to be levied. Similarly, policy and legislative bodies may find such information of value to the review or development of arrangements addressing such matters.

3.21 Frequency and Duration of Violations

Section 316A of the Federal Power Act [16 U.S.C. § 825o-1(b)], as amended by the Energy Policy Act of 2005, provides that "any person who violates any provision of Part II of this title or any provision of any rule or order thereunder shall be subject to a civil penalty of not more than $1,000,000 for each day that such violation continues."

FERC Order No. 672 interprets this statement as setting a cap on the monetary Penalties that the Commission, NERC and Regional Entities can impose under FPA section 215. FERC has referred to this statutory provision as imposing a maximum $1,000,000 "per day, per violation" Penalty and has directed that the ERO must ensure that in the U.S. such a Penalty amount ($1,000,000), in such a manner ("per day, per violation"), can be imposed for a violation of the Reliability Standards should the conduct at issue so warrant.

Some Reliability Standards may not support the assessment of Penalties on a "per day, per violation" basis, but instead should have Penalties calculated based on an alternative Penalty frequency or duration. Where NERC or the Regional Entity deems that a monetary Penalty is warranted, or where NERC or the Regional Entity is monetizing (Section 3.19) the value of a non-monetary sanction, for the violation of such a Reliability Standard NERC or the Regional Entity shall determine the Penalty or monetized amount consistent with the following:

Multiple Instances of Violation on One Day

The nature of some Reliability Standards includes the possibility that a Registered Entity could violate the same Requirement two or more times on the same day. In this instance NERC or the Regional Entity is not limited to penalizing the violator a maximum of $1,000,000 per day. As NERC or the Regional Entity deems appropriate NERC or the Regional Entity may deem that there have

been multiple violations that occurred on the same day, each of which is subject to the maximum potential Penalty of $1,000,000 per violation, per day. Also, NERC or the Regional Entity is not constrained to assessing the same Penalty amount for each of the multiple violations, irrespective of their proximity in time.

Cumulative Over Time

Certain Requirements of the Reliability Standards are measured not on the basis of discrete acts, but of cumulative acts over time. Reliability Standards that fall into this category are generally those involving measurements based on averages over a given period. Where a violation of such a Reliability Standard has occurred the element of averaging performance over a period of time introduces the difficulty to NERC or the Regional Entity of reasonably identifying (i) what date the violation should be deemed to have occurred and (ii) its duration.

If a Reliability Standard Requirement measured by an average over time can only be violated once per applicable period, then there is risk that a disproportionately mild Penalty might be levied in a situation where the violation was serious and the effects on the Bulk Power System severe. In the future, each Reliability Standard Requirement that is based on an average over time will specify the minimum period in which a violation could occur and how to determine when a violation arises, which may be other than once per applicable period[6]. In the interim until relevant Reliability Standards are so modified, any ambiguity on this point will be construed conservatively, meaning that where a Registered Entity has not complied with such a Reliability Standard NERC or the Regional Entity will generally consider that only one violation occurred per measurement period. However, notwithstanding this general principle of one violation per measurement period, if an average must be measured by a span of time greater than a month, each month of that span shall constitute at a minimum one violation.

Periodically Monitored Discrete Violation

Some Reliability Standards may involve discrete events which are only monitored periodically or which are reported by exception. If a Requirement of such a Reliability Standard states that a discrete event constitutes a violation, then (i) a violation arises when that event occurs and (ii) that violation continues until remedied; furthermore, (iii) the violation is deemed to have occurred at the point that the Registered Entity entered into noncompliance with the Reliability Standard regardless of the monitoring period for the activity or its date of discovery or reporting. For example, if a task required by a Reliability Standard Requirement has not been done by the required date, it is irrelevant that monitoring for compliance for the Requirement occurs only on a yearly or other periodic basis; NERC or the Regional Entity will deem a violation to have occurred on the first day of noncompliance and each day thereafter until compliance is effectuated. Similarly, if a discrete event occurs and is not remedied on the date of occurrence, then NERC or the Regional Entity will deem a violation to have occurred on the day of the first instance of the noncompliance and each day, or portion thereof thereafter until compliance is effectuated.

Non-compliance with a Reliability Standard of this type will subject the violator to the potential maximum monetary Penalty of $1,000,000 per violation per day in violation.

NERC or the Regional Entity is not constrained to assessing the same Penalty amount for each day that the Registered Entity was in violation of the Reliability Standard Requirement in question.

[6] Para. 41; FERC Order on Clarification and Rehearing [Docket No. RR06-1-006]

4. Determination of Monetary Penalties

The following describes the steps that NERC or the Regional Entity will follow to determine the monetary Penalty for a violation[7]. The determination of non-monetary sanctions is discussed in Section 5 of this document; Section 6 discusses remedial action.

Step 1. The Base Penalty Amount for the violation will be set as discussed in Sections 4.1 and 4.2, below.

Step 2. The Base Penalty Amount set in Step 1 will be reviewed pursuant to Section 4.3, below. This will result in the Adjusted Penalty Amount.

Step 3. The Adjusted Penalty Amount determined in Step 2 may be reviewed in light of the violator's financial ability to pay the Penalty. Also, where applicable NERC or the Regional Entity will reconfirm that the Penalty set will disgorge unjust profits or economic benefits associated with an economic choice to violate[8]. At the conclusion of this review the Final Penalty Amount will be set.

Unless NERC or the Regional Entity deems alternative frequency or duration is warranted Penalties shall be assessed on a per violation per day basis. Where NERC or the Regional Entity deems that alternative Penalty frequency or duration is warranted the Notice of Penalty associated with the violation will clearly identify this and provide the rationale for it. Where NERC or the Regional Entity deems that alternative Penalty frequency or duration is warranted, Penalties shall be determined in accordance with section 3.21 of the Sanction Guidelines.

4.1 Initial Value Range of the Base Penalty Amount

NERC or the Regional Entity will determine an initial value range for the Base Penalty Amount by considering two factors regarding the violation: the Violation Risk Factor (VRF) of the Requirement violated and the Violation Severity Level (VSL) assessed for the violation. Using the Base Penalty Amount Table provided in Appendix A NERC or the Regional Entity will look up the initial value range for the Base Penalty Amount by finding the intersection of the violation's VRF and VSL on the table[9].

4.1.1 Violation Risk Factor

Each Requirement set out within NERC's Reliability Standards has been assigned a Violation Risk Factor (VRF) through the NERC Reliability Standards development process. The factors have been defined and approved through the Reliability Standards development process and are assigned to Requirements to provide clear, concise and comparative association between the violation of a Requirement and the expected or potential impact of the violation to the reliability of the Bulk Power System. One of three defined levels of risk is assigned to each Reliability Standards Requirement: lower Violation Risk Factor, or; medium Violation Risk Factor, or; high Violation Risk Factor. Definitions of the factors can be found in appropriate Reliability Standards development process documentation.

4.1.2 Violation Severity Level

Violation Severity Levels (VSLs) are defined measurements of the degree to which a violator violated a Requirement of a Reliability Standard. Whereas Violation Risk Factors are determined pre-violation and indicate the relative potential impacts that violations of each

[7] The text in this section discusses the determination of a single Penalty for an individual violation; however, the process laid out is also applicable to determining the individual Penalties, or a single aggregate Penalty, for multiple violations that are associated with each other as discussed in Section 3 Part 3.1 of this document.
[8] Reference: Section 3 Parts 3.15 and 3.16.
[9] As discussed in Section 3 Part 3.1 of this document where there is more than one violation in play, but the violations are sufficiently associated, NERC or the Regional Entity may set a single initial value range that is appropriate in light of the individual VRF/VSL combinations of the violations.

Reliability Standard could pose to the reliability of the Bulk Power System, the Violation Severity Level is assessed post-violation and is an indicator of how severely the violator actually violated the Reliability Standard(s) Requirement(s) in question.

These guidelines utilize the Violation Severity Levels that have been established[10] by NERC for Requirements of the Reliability Standards. Up to four levels can be defined for each Requirement; the levels have been designated as: lower, moderate, high, and severe.

4.2 Setting of the Base Penalty Amount

NERC or the Regional Entity will set the Base Penalty Amount for the violation. The Base Penalty Amount set for the violation may be set at the highest figure of the initial value range determined pursuant to Section 4.1, above. However, NERC or the Regional Entity may set the Base Penalty Amount at or below the lowest figure of the initial value range in light of two specific circumstances regarding the violation and the violator, specifically:

a. The applicability of the Violation Risk Factor of the violation to the specific circumstances[11] of violator.

b. Whether this is an inconsequential first violation by the violator of the Reliability Standard(s) in question.

As noted in Section 3.12 NERC or the Regional Entity will consider the time horizon involved with the violation when setting the Base Penalty Amount for the violation. As also noted in Section 3.12 this consideration will be documented for inclusion in the Notice of Penalty issued for the violation.

The Penalty amount resulting from this review will be the Base Penalty Amount that is used as the basis for further adjustment pursuant to the factors discussed in the next section (4.3) of this document.

4.2.1 Applicability of the Violation Risk Factor

Violation Risk Factors are assigned to Reliability Standards' Requirements as indicators of the expected risk or harm to the Bulk Power System posed by the violation of a Requirement by a typical or median Registered Entity that is required to comply. NERC or the Regional Entity may consider the specific circumstances of the violator to determine if the violation of the Requirement in question actually produced the degree of risk or harm anticipated by the Violation Risk Factor. If that expected risk or harm was not or would not have been produced, NERC or the Regional Entity may set the Base Penalty Amount to a value it (i) deems appropriate and (ii) is within the initial value range set above pursuant to Section 4.1.

4.2.2 First Violation

If the actual or foreseen impact of the violation is judged to be inconsequential by NERC or the Regional Entity and the violation is the first incidence of violation of the Requirement in question by the violator, NERC or the Regional Entity may at its discretion: (i) set the Base Penalty Amount to a value it deems appropriate within the initial value range set above pursuant to Section 4.1, or (ii) excuse the Penalty for the violation (i.e. set the Base Penalty Amount to 0$).

This relief will generally not be afforded to the violator if NERC or the Regional Entity determines that the violator has a poor compliance record; e.g. the circumstances discussed in

[10] Assignment of these levels will be complete and filed with the Commission by March 1, 2008 in accordance with FERC Order on Compliance Filing dated June 7, 2007 [Docket No. RR06-1-007] .

[11] The circumstances of the violator will include but not be limited to, as appropriate: the violator's aggregate and net Load~~load~~; interconnections characteristics such as voltage class and transfer ratings.

Section 4.3.1 have been an aggravating factor in one or more previous Penalties assessed to the violator.

This relief will not be available for consideration in instances where the violator has concealed or attempted to conceal the violation, failed or refused to comply with compliance directives from NERC or the Regional Entity, or intentionally violated for purposes other than a demonstrably good faith effort to avoid a significant and greater threat to the immediate reliability of the Bulk Power System.

4.3 Application of Adjustment Factors

Adjustment factors provide the opportunity to NERC or the Regional Entity to adjust the Base Penalty Amount to reflect the specific facts and circumstances material to each violation and violator.

These guidelines recognize and require that, as a minimum, NERC or the Regional Entity consider the following:

a. Repetitive violations and the violator's compliance history

b. Failure of the violator to comply with compliance directives

c. Self-disclosure and voluntary corrective action by the violator

d. Degree and quality of cooperation by the violator in the violation investigation and in any remedial action directed for the violation

e. The presence and quality of the violator's compliance program quality

f. Any attempt by the violator to conceal the violation

g. Intentional violations

h. Extenuating circumstances

Two documents issued by United States regulatory agencies will be instructive to NERC and the Regional Entities when they are determining Penalties for violations of the Reliability Standards: the FERC's Policy Statement on Enforcement issued on October 20, 2005 under Docket No. PL06-00, and; U.S Securities and Exchange Commission (SEC) Release No. 44969 under the Securities and Exchange Act of 1934, issued on October 23 2001, also concurrently issued by the SEC as Release No. 1470 under Accounting and Auditing Enforcement.

NERC or the Regional Entity may also consider other additional factors it deems appropriate under the circumstances as long as their use is clearly identified and adequately justified. The effect of using these factors will also be fully and clearly disclosed.

4.3.1 Repetitive Violations and Compliance History

A bulleted point under Paragraph 20 of the FERC Policy Statement on Enforcement highlights repeat offenses by a violator. If a violator has had repetitive infractions of the same or a closely-related Reliability Standard Requirement, particularly within a time frame defined within the Reliability Standard(s) or deemed appropriate by NERC or the Regional Entity in the absence of the Reliability Standard(s) defining the time frame, NERC or the Regional Entity shall consider some increase to the Penalty.

The term "violation reset time period" of a Reliability Standards Requirement may be defined or implied within a given Reliability Standard to describe the period of time generally required for a violator to continue operations without incidence of further violation(s) of the Reliability Standards, particularly of the initial or a similar Reliability Standard violated, in order to avoid or minimize consideration of the violator's previous violation history for sanctioning purposes in the event of a subsequent violation(s). NERC and the Regional

Entities shall exercise appropriate judgment and discretion in this regard as warranted, particularly where no reset time period is specifically set within the Reliability Standard violated. Repeat violations within violation reset time periods are aggravating factors in the determination of sanctioning. Accordingly, a violation history of no violations will produce no mitigation of the Penalty otherwise determined; a violation history of infrequent minor violations of lesser risk Requirements assessed lower Violation Severity Levels may result in small or no increase; a history of more frequent violations or previous violations of higher risk Requirements assessed more severe Violation Severity Levels will generally incur commensurately larger increases.

4.3.2 Failure to Comply with Compliance Directives

If the violator has violated Reliability Standard Requirements notwithstanding having received related compliance directives, such as for remedial action from NERC or the Regional Entity, NERC or the Regional Entity shall consider some increase to the Penalty.

4.3.3 Self-Disclosure and Voluntary Corrective Action

NERC or the Regional Entity shall consider whether a violator self-disclosed the violation prior to detection or intervention by NERC or the Regional Entity, and any action undertaken by the violator to correct the situation. NERC or the Regional Entity will be instructed in their consideration of these factors by the text of Paragraphs 24 and 25 of the FERC Policy Statement on Enforcement. As they deem warranted, NERC or the Regional Entity may reduce the violator's Penalty consistent with the cited sections of the FERC policy.

4.3.4 Degree and Quality of Cooperation in Violation Investigation and Remedial Action

NERC or the Regional Entity shall consider the degree and quality of the violator's cooperation with NERC or the Regional Entity in the investigation of the violation and any remedial action arising from it. NERC or the Regional Entity will be instructed in making their determination on this by the text of Paragraphs 26 and 27 of the FERC Policy Statement on Enforcement. NERC or the Regional Entity may adjust the violator's Penalty as they deem warranted commensurate with the cited sections of the FERC policy statement. This may result in an increase, a decrease or no change to the Penalty.

4.3.5 Presence and Quality of Compliance Program

NERC or the Regional Entity shall consider the presence and quality of the violator's compliance program. NERC or the Regional Entity will be instructed in making their determination on this factor by the text of Paragraphs 22 and 23 of the FERC Policy Statement on Enforcement. As they deem warranted, NERC or the Regional Entity may reduce the violator's Penalty consistent with the cited sections of the FERC policy. Consistent with the FERC policy NERC or the Regional Entity may not increase a violator's Penalty specifically on the grounds that the violator has no program or a poor quality program.

4.3.6 Violation Concealment

Two bulleted points under Paragraph 20 of the FERC Policy Statement on Enforcement highlight misrepresentation of material facts and resistance or impediment to inquiry of a violation. When determining a Penalty NERC or the Regional Entity shall consider any concealment or attempt to conceal the violation, or information needed to investigate the violation, on the part of the violator. If the violator concealed or attempted to conceal, some significant increase to the Penalty shall be considered; doubling of the Penalty otherwise determined is suggested. Conduct of this nature on more than one occasion regarding one violation, or with respect to more than one violation, should incur an even larger increase to the Penalty otherwise determined.

4.3.7 Intentional Violation

Another bulleted point under Paragraph 20 of the FERC Policy Statement on Enforcement highlights offenses as willful action by a violator. When determining a Penalty NERC or the Regional Entity shall consider if the violator intentionally violated without just cause; i.e., for purposes other than a demonstrably good faith effort to avoid a significant and greater threat to the immediate reliability of the Bulk Power System. If the violator engaged in such conduct, some significant increase to the Penalty shall be considered; doubling of the Penalty otherwise determined is suggested. If conduct of this nature has been detected on more than one occasion, NERC or the Regional Entity should assess an even larger increase to the Penalty otherwise determined.

NERC or the Regional Entity will consider violations attributable to an economic choice to violate as intentional violations. Consistent with the FERC Policy Statement on Enforcement any Penalty issued involving conduct of this manner shall as a minimum disgorge any profits or economic benefits acquired as a consequence of the behavior, whenever and to the extent that they can be determined or reasonably estimated.

4.3.8 Extenuating Circumstances

NERC or the Regional Entity will consider if there are extenuating circumstances regarding the violation that justify reduction or elimination of the Penalty otherwise determined.

Consideration of adjusting a Penalty for this factor would be inconsistent with NERC or the Regional Entity increasing a Penalty after consideration of any other factor included in this section of these guidelines, such as intentional violation without justifiable cause or concealment or attempt to conceal.

4.4 Setting of the Final Penalty Amount

The Adjusted Penalty Amount determined in Step 2 may be reviewed in light of the violator's financial ability to pay the Penalty. Also, if the violation was an economic choice, NERC or the Regional Entity will reconfirm that the Penalty set will disgorge any unjust profits or economic benefits. At the conclusion of this review the Final Penalty Amount will be set.

4.4.1 Violator's Financial Ability to Pay[12]

At the written request of the violator NERC or the Regional Entity will review the Penalty determined in Step 2 in light of relevant, verifiable information that the violator provides regarding their financial ability to pay. At the conclusion of this review NERC or the Regional Entity may:

1. Reduce the Penalty payable to an amount that NERC or the Regional Entity, as applicable, deems the violator has the financial ability to pay, or;
2. Excuse the Penalty amount payable, or;
3. Sustain the Penalty amount determined in Step 2.

Where the Penalty amount has been reduced or excused, NERC or the Regional Entity shall consider the assessment of appropriate non-monetary sanction(s) as a substitute or an alternative for the Penalty amount that has been excused or by which the Penalty has been reduced.

[12] NERC anticipates that this will be the primary vehicle for addressing the ability to pay of "not-for-profit" and other similar organizations.

4.4.2 Reconfirmation of Disgorgement of Unjust Profit or Gain

Notwithstanding the application of any other consideration or factor applicable to the determination of a just and reasonable Penalty for the violation, if the violation in question involved an economic choice to violate NERC or the Regional Entity shall reconfirm that the Penalty set meets the requirements set forth in Parts 3.15 and 3.16 of Section 3 of this document.

5. Determination of Non-Monetary Sanctions

The imposition of sanctions is not bounded to monetary Penalties. Non-monetary sanctions applied must be applied with the objective of promoting reliability and compliance with the Reliability Standards. Non-monetary sanctions may include, but not be limited to, the following:

a. Limitations on activities, functions, or operations

b. Placing an entity on a reliability watch list composed of major violators

6. Remedial Action Directives

6.1 Definition and Anticipated Use

Remedial Action Directives are directives that may be issued to a Bulk Power System owner, operator, or user to resolve an Alleged Violation of a Reliability Standard by addressing conditions, practices, or any other relevant action or activity that is immediately necessary to terminate or correct to protect the reliability of the Bulk Power System from an imminent threat. A Remedial Action Directive will be issued when NERC or the Regional Entity identifies an Alleged Violation of a Reliability Standard that must be corrected immediately to protect the reliability of the Bulk Power System from the imminent threat that NERC or the Regional Entity has identified.

NERC or the Regional Entity will generally employ Remedial Action Directives where they deem it necessary to clearly specify minimum corrective actions that the subject of the Remedial Action Directive must take; additionally or alternatively a Remedial Action Directive may clearly specify timelines within which the Registered Entity must take specified actions, complete specified tasks, or achieve specified outcomes. Also, to the extent NERC or the Regional Entity is authorized to do so, a Remedial Action Directive may communicate Penalties, sanctions, or further Remedial Action Directives that may be imposed should the specific Remedial Action Directive not be complied with by those to whom it has been issued. As a rule of thumb, Remedial Action Directives will be of use to NERC or the Regional Entity whenever any significant combination of specificity, clarity, or time is of the essence to address a threat to the reliability of the Bulk Power System brought on by lack of or inadequate compliance to the Reliability Standards.

6.2 Compliance Requirements

In the United States, the Commission has concluded that owners, operators, or users of the Bulk Power System must comply with Remedial Action Directives issued to them by NERC or a Regional Entity. Noncompliance with a Remedial Action Directive may result in a substantially increased Penalty or sanction.

Remedial Action Directives issued by NERC or the Regional Entity will include a deadline by which time the owner, operator, or user must complete requirements set out in the Remedial Action Directive, and by which time the Registered Entity must demonstrate compliance to the Remedial Action Directive to NERC or the Regional Entity that issued it. Failure or refusal to meet the requirements or deadlines set out in a Remedial Action Directive may itself result in further Remedial Action Directives or significantly increased Penalties or sanctions by NERC or the Regional Entity.

6.3 No Obligation to Issue

NERC or the Regional Entity may, but is not obligated, to issue Remedial Action Directives. Lack of being issued a Remedial Action Directive does not relieve a Bulk Power System owner, operator, or user from any responsibilities they otherwise have to comply or maintain compliance with Requirements of the Reliability Standards. Remedial Action Directives will be used by NERC or the Regional Entities only as they deem warranted, when they deem warranted.

6.4 Scope of Application

The scope of Remedial Action Directives issued by NERC or the Regional Entity will be limited to conditions, practices, or any other relevant actions or activities resulting in noncompliance, or that NERC or the Regional Entity considers at significant risk of becoming noncompliant, to Requirements of the Reliability Standards, and that present an imminent threat to the reliability of the Bulk Power System. However, beyond merely directing compliance or improved compliance with Reliability Standards' Requirements, where NERC or the Regional Entity is authorized to do so, the Remedial Action Directive may also stipulate how compliance or the improvement to compliance is to be achieved.

6.5 Availability

In the United States, the Commission has interpreted the Federal Power Act to authorize the NERC or the Regional Entity can issue a Remedial Action Directive prior to completion of the confirmation review of a probable violation, or prior to the determination of a Penalty or sanction for that violation. The Commission also concluded it is not necessary for NERC or the Regional Entity to acquire the Commission's or other regulators' approval prior to issuing Remedial Action Directives. Accordingly, NERC or the Regional Entity may issue Remedial Action Directives to Registered Entities in the United States whenever they deem it necessary or otherwise warranted to do so. Also, NERC or the Regional Entity may issue Remedial Action Directives to Registered Entities in the United States regarding a violation that is immediately necessary to terminate or correct to protect the reliability of the Bulk Power System from an imminent threat, irrespective of whether that violation is ultimately verified or dismissed by NERC or the Regional Entity's investigation of the violation.

6.6 No Impact on Confirmation of Violation, or Penalties or Sanctions

Remedial Action Directives issued regarding a violation, in particular any costs incurred by the violator to comply with any such Remedial Action Directive, will not be considered when reviewing whether the aggregate of any Penalties and sanctions levied for that violation bear a reasonable relation to the seriousness of the violation. Also, any Remedial Action Directives issued with respect to a violation will not influence the outcome of the confirmation review of that violation nor the determination of Penalties or sanctions for that violation; ordering a violator to correct what needs correcting anyway is no grounds for dispelling a violation nor reducing or eliminating a Penalty or sanction that would otherwise be determined appropriate for the violator for that violation.

6.7 Types of Remedial Actions

NERC or the Regional Entities may issue Remedial Action Directives to correct compliance with NERC or Regional Reliability Standards and reduce or eliminate imminent threats to the reliability of the Bulk Power System. Examples of Remedial Action Directives include:

a. Specifying operating or planning criteria, limits, or limitations

b. Requiring specific system studies

c. Defining operating practices or guidelines

d. Requiring confirmation of data, practices, or procedures through inspection testing or other methods

e. Requiring specific training for personnel

f. Requiring development of specific operating plans

Appendix A: Base Penalty Amount Table

The following lists the Base Penalty amounts corresponding to combinations of Violation Risk Factor and Violation Severity Level.

Violation Risk Factor	Violation Severity Level							
	Lower		Moderate		High		Severe	
	Range Limits		Range Limits		Range Limits		Range Limits	
	Low	High	Low	High	Low	High	Low	High
Lower	$1,000	$3,000	$2,000	$7,500	$3,000	$15,000	$5,000	$25,000
Medium	$2,000	$30,000	$4,000	$100,000	$6,000	$200,000	$10,000	$335,000
High	$4,000	$125,000	$8,000	$300,000	$12,000	$625,000	$20,000	$1,000,000

NOTE: This table describes the amount of Penalty that could be applied for each day that a violation continues, subject to the considerations of Section 3.21 regarding frequency and duration of violations.

Statement of Compliance Registry Criteria

Revision 5.0 — Approved: NERC Board of Trustees July 30, 2008

Effective: October 16, 2008

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Statement of Compliance Registry Criteria (Revision 5.0)

Summary

Since becoming the Electric Reliability Organization (ERO), NERC has initiated a program to identify candidate organizations for its Compliance Registry. The program, conducted by NERC and the Regional Entities[1], will also confirm the functions and information now on file for currently-registered organizations. NERC and the Regional Entities have the obligation to identify and register all entities that meet the criteria for inclusion in the Compliance Registry, as further explained in the balance of this document.

This document describes how NERC will identify organizations that may be candidates for Registration and assign them to the Compliance Registry.

Organizations will be responsible to register and to comply with approved Reliability Standards to the extent that they are owners, operators, and users of the Bulk Power System, perform a function listed in the functional types identified in Section II of this document, and are material to the Reliable Operation of the interconnected Bulk Power System as defined by the criteria and notes set forth in this document. NERC will apply the following principles to the Compliance Registry:

- In order to carry out its responsibilities related to enforcement of Reliability Standards, NERC must identify the owners, operators, and users of the Bulk Power System who have a material impact[2] on the Bulk Power System through a Compliance Registry. NERC and the Regional Entities will make their best efforts to identify all owners, users and operators who have a material reliability impact on the Bulk Power System in order to develop a complete and current Compliance Registry list. The Compliance Registry will be updated as required and maintained on an on-going basis.
- Organizations listed in the Compliance Registry are responsible and will be monitored for compliance with applicable mandatory Reliability Standards. They will be subject to NERC's and the Regional Entities' Compliance Monitoring and Enforcement Programs.

[1] The term “Regional Entities” includes Cross-Border Regional Entities.
[2] The criteria for determining whether an entity will be placed on the Compliance Registry are set forth in the balance of this document. At any time a person may recommend in writing, with supporting reasons, to the Director of Compliance that an organization be added to or removed from the Compliance Registry, pursuant to NERC ROP 501.1.3.5.

- NERC and Regional Entities will not monitor nor hold those not in the Compliance Registry responsible for compliance with the Reliability Standards. An entity which is not initially placed on the Compliance Registry, but which is identified subsequently as having a material reliability impact, will be added to the Compliance Registry. Such entity will not be subject to a sanction or Penalty by NERC or the Regional Entity for actions or inactions prior to being placed on the Compliance Registry, but may be required to comply with a Remedial Action Directive or Mitigation Plan in order to become compliant with applicable Reliability Standards. After such entity has been placed on the Compliance Registry, it shall be responsible for complying with Reliability Standards and may be subject to sanctions or Penalties as well as any Remedial Action Directives and Mitigation Plans required by the Regional Entities or NERC for future violations, including any failure to follow a Remedial Action Directive or Mitigation Plan to become compliant with Reliability Standards.
- Required compliance by a given organization with the Reliability Standards will begin the later of (i) inclusion of that organization in the Compliance Registry and (ii) approval by the Applicable Governmental Authority of mandatory Reliability Standards applicable to the Registered Entity.

Entities responsible for funding NERC and the Regional Entities have been identified in the budget documents filed with FERC. Presence on or absence from the Compliance Registry has no bearing on an entity's independent responsibility for funding NERC and the Regional Entities.

Background

In 2005, NERC and the Regional Entities conducted a voluntary organization registration program limited to Balancing Authorities, Planning Authorities, regional reliability organizations, Reliability Coordinators, Transmission Operators, and Transmission Planners. The list of the entities that were registered constitutes what NERC considered at that time as its Compliance Registry.

NERC has recently initiated a broader program to identify additional organizations potentially eligible to be included in the Compliance Registry and to confirm the information of organizations currently on file. NERC believes this is a prudent activity at this time because:

- As of July 20, 2006, NERC was certified as the ERO created for the U.S. by the Energy Policy Act of 2005 (EPAct) and FERC Order 672. NERC has also filed with Canadian authorities for similar recognition in their respective jurisdictions.
- FERC's Order 672 directs that owners, operators and users of the Bulk Power System shall be registered with the ERO and the appropriate Regional Entities.
- As the ERO, NERC has filed its current Reliability Standards with FERC and with Canadian authorities. A s accepted and approved by FERC and appropriate Canadian authorities, the Reliability Standards are no longer voluntary, and organizations that do not fully comply with them may face Penalties or other sanctions determined and levied by NERC or the Regional Entities.

- NERC's Reliability Standards include compliance Requirements for additional reliability function types beyond the six types registered by earlier registration programs.
- Based on selection as the ERO, the extension and expansion of NERC's current Registration program[3] is the means by which NERC and the Regional Entities will plan, manage and execute Reliability Standard compliance oversight of owners, operators, and users of the Bulk Power System.
- Organizations listed in the Compliance Registry are subject to NERC's and the Regional Entities' Compliance Monitoring and Enforcement Programs.

Statement of Issue

As the ERO, NERC intends to comprehensively and thoroughly protect the reliability of the grid. To support this goal NERC will include in its Compliance Registry each entity that NERC concludes can materially impact the reliability of the Bulk Power System. However, the potential costs and effort of ensuring that every organization potentially within the scope of "owner, operator, and user of the Bulk Power System" becomes registered while ignoring their impact upon reliability, would be disproportionate to the improvement in reliability that would reasonably be anticipated from doing so.

NERC wishes to identify as many organizations as possible that may need to be listed in its Compliance Registry. Identifying these organizations is necessary and prudent at this time for the purpose of determining resource needs, both at the NERC and Regional Entity level, and to begin the process of communication with these entities regarding their potential responsibilities and obligations. NERC and the Regional Entities believe that primary candidate entities can be identified at this time, while other entities can be identified later, as and when needed. Selection principles and criteria for the identification of these initial entities are required. This list will become the "Initial Non-binding Organization Registration List". With FERC having made the approved Reliability Standards enforceable, this list becomes the NERC Compliance Registry.

Resolution

NERC and the Regional Entities have identified two principles they believe are key to the entity selection process. These are:

1. There needs to be consistency between Regions and across the continent with respect to which entities are registered, and;
2. Any entity reasonably deemed material to the reliability of the Bulk Bower System will be registered, irrespective of other considerations.

To address the second principle the Regional Entities, working with NERC, will identify and register any entity they deem material to the reliability of the Bulk Power System.

In order to promote consistency, NERC and the Regional Entities intend to use the following criteria as the basis for determining whether particular entities should be identified as candidates

[3] See: NERC ERO Application; Exhibit C; Section 500 – Organization Registration and Certification.

for Registration. All organizations meeting or exceeding the criteria will be identified as candidates.

The following four groups of criteria (Sections I-IV) plus the statements in Section V will provide guidance regarding an entity's Registration status:

- Section I determines if the entity is an owner, operator, or user of the Bulk Power System and, hence, a candidate for organization Registration.
- Section II uses NERC's current functional type definitions to provide an initial determination of the functional types for which the entities identified in Section I should be considered for Registration.
- Section III lists the criteria regarding smaller entities; these criteria can be used to forego the Registration of entities that were selected to be considered for Registration pursuant to Sections I and II and, if circumstances change, for later removing entities from the Registration list that no longer meet the relevant criteria.
- Section IV — additional criteria for joint Registration. Joint Registration criteria may be used by joint action agencies, generation and transmission cooperatives and other entities which agree upon a clear division of compliance responsibility for Reliability Standards by written agreement. Pursuant to FERC's directive in paragraph 107 of Order No. 693, rules pertaining to joint Registration and Joint Registration Organizations will now be found in Sections 501 and 507 of the NERC Rules of Procedure.

I. Entities that use, own or operate Elements of the Bulk Electric System as established by NERC's approved definition of Bulk Electric System below are (i) owners, operators, and users of the Bulk Power System and (ii) candidates for Registration:

"Bulk Electric System" or "BES" means unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- ***I1*** *- Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded under Exclusion E1 or E3.*
- ***I2*** *- Generating resource(s) with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.*
- ***I3*** *- Blackstart Resources identified in the Transmission Operator's restoration plan.*
- ***I4*** *- Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above.*
- ***I5*** *–Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a*

dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

Exclusions:

- ***E1*** *- Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:*
  a) Only serves Load. Or,
  b) Only includes generation resources, not identified in Inclusion I3, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,
  c) Where the radial system serves Load and includes generation resources, not identified in Inclusion I3, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

  Note – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.
- ***E2*** *- A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.*
- ***E3*** *- Local networks (LN): A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:*
  a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);
  b) Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and
  c) Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).
- ***E4*** *– Reactive Power devices owned and operated by the retail customer solely for its own use.*

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

II. Entities identified in Part I above will be categorized as Registration candidates who may be subject to Registration under one or more appropriate Functional Entity types based on a comparison of the functions the entity normally performs against the following function type definitions:

Function Type	**Acronym**	**Definition/Discussion**
Balancing Authority	BA	The responsible entity that integrates resource plans ahead of time, maintains Load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real-time.
Distribution Provider	DP	Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.
Generator Operator	GOP	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
Generator Owner	GO	Entity that owns and maintains generating units.
Interchange Authority	IA	The responsible entity that authorizes implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communication of Interchange information for reliability assessment purposes.
Load-Serving Entity	LSE	Secures energy and Transmission Service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.
Planning Authority	PA	The responsible entity that coordinates and integrates transmission Facilities and service plans, resource plans, and Protection Systems.
Purchasing-Selling Entity	PSE	The entity that purchases, or sells, and takes title to, energy, capacity, and Interconnected Operations Services. PSE may be affiliated or unaffiliated merchants and may or may not own generating Facilities.

Function Type	Acronym	Definition/Discussion
Reliability Coordinator	RC	The entity that is the highest level of authority who is responsible for the Reliable Operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
Reserve Sharing Group	RSG	A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g., ten minutes). If the transaction is ramped in quicker, (e.g., between zero and ten minutes), then, for the purposes of disturbance control performance, the areas become a Reserve Sharing Group.
Resource Planner	RP	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific Loads (customer demand and energy requirements) within a Planning Authority area.
Transmission Owner	TO	The entity that owns and maintains transmission Facilities.
Transmission Operator	TOP	The entity responsible for the reliability of its local transmission system and operates or directs the operations of the transmission Facilities.
Transmission Planner	TP	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area.

Function Type	Acronym	Definition/Discussion
Transmission Service Provider	TSP	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable Transmission Service agreements.

III. Entities identified in Part II above as being subject to Registration as an LSE, DP, GO, GOP, TO, or TOP should be excluded from the Compliance Registry for these functions if they do not meet any of the criteria listed below:

III (a)Load-Serving Entity:

III.a.1 Load-Serving Entity peak Load is > 25 MW and is directly connected to the Bulk Power (>100 kV) System, or;

III.a.2 Load-Serving Entity is designated as the responsible entity for Facilities that are part of a required underfrequency Load shedding (UFLS) program designed, installed, and operated for the protection of the Bulk Power System, or;

III.a.3 Load-Serving Entity is designated as the responsible entity for Facilities that are part of a required undervoltage Load shedding (UVLS) program designed, installed, and operated for the protection of the Bulk Power System.

[Exclusion: A Load-Serving Entity will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]

III.a.4 Distribution Providers registered under the criteria in III.b.1 or III.b.2 will be registered as a Load Serving Entity (LSE) for all Load directly connected to their distribution facilities.

[Exclusion: A Distribution Provider will not be registered based on this criterion if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]

III(b) Distribution Provider:

III.b.1 Distribution Provider system serving >25 MW of peak Load that is directly connected to the Bulk Power System.

[Exclusion: A Distribution Provider will not be registered based on this criterion if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.] or;

III.b.2 Distribution Provider is the responsible entity that owns, controls, or operates Facilities that are part of any of the following Protection Systems or programs designed, installed, and operated for the protection of the Bulk Power System:

- a required UFLS program.
- a required UVLS program.
- a required Special Protection System.
- a required transmission Protection System.

[Exclusion: A Distribution Provider will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]

III(c) Generator Owner/Operator:

III.c.1 Individual generating unit > 20 MVA (gross nameplate rating) and is directly connected to the Bulk Power System, or;

III.c.2 Generating plant/facility > 75 MVA (gross aggregate nameplate rating) or when the entity has responsibility for any facility consisting of one or more units that are connected to the Bulk Power System at a common bus with total generation above 75 MVA gross nameplate rating, or;

III.c.3 Any generator, regardless of size, that is a Blackstart Resource material to and designated as part of a Transmission Operator entity's restoration plan, or;

III.c.4 Any generator, regardless of size, that is material to the reliability of the Bulk Power System.

[Exclusions:

A Generator Owner/Operator will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.

As a general matter, a customer-owned or operated generator/generation that serves all or part of retail Load with electric energy on the customer's side of the retail meter may be excluded as a candidate for Registration based on these criteria if (i) the net capacity provided to the Bulk Power System does not exceed the criteria above or the Regional Entity otherwise determines the generator is not material to the Bulk Power System and (ii) standby, back-up and maintenance power services are provided to the generator or to the retail Load pursuant to a binding obligation with another Generator Owner/Operator or under terms approved by the local regulatory authority or the Federal Energy Regulatory Commission, as applicable.]

III(d) Transmission Owner/Operator:

III.d.1 An entity that owns/operates an integrated transmission Element associated with the Bulk Power System 100 kV and above, or lower voltage as defined by the Regional Entity necessary to provide for the Reliable Operation of the interconnected transmission grid; or

III.d.2 An entity that owns/operates a transmission Element below 100 kV associated with a Facility that is included on a critical Facilities list that is defined by the Regional Entity.

[Exclusion: A Transmission Owner/Operator will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.

IV. Joint Registration Organization and applicable Member Registration.

Pursuant to FERC's directive in paragraph 107 of Order No. 693, NERC's rules pertaining to joint Registrations and Joint Registration Organizations are now found in Section 501 and 507 of the NERC Rules of Procedure.

V. If NERC or a Regional Entity encounters an organization that is not listed in the Compliance Registry, but which should be subject to the Reliability Standards, NERC or

the Regional Entity is obligated and will add that organization to the Compliance Registry, subject to that organization's right to challenge as provided in Section 500 of NERC's Rules of Procedure and as described in Note 3 below.

Notes to the above Criteria

1. The above are general criteria only. The Regional Entity considering Registration of an organization not meeting (e.g., smaller in size than) the criteria may propose Registration of that organization if the Regional Entity believes and can reasonably demonstrate[4] that the organization is a Bulk Power System owner, or operates, or uses Bulk Power System assets, and is material to the reliability of the Bulk Power System. Similarly, the Regional Entity may exclude an organization that meets the criteria described above as a candidate for Registration if it believes and can reasonably demonstrate to NERC that the Bulk Power System owner, operator, or user does not have a material impact on the reliability of the Bulk Power System.

2. An organization not identified using the criteria, but wishing to be registered, may request that it be registered. For further information refer to: NERC Rules of Procedure, Section 500 – Organization Registration and Certification; Part 1.3.

3. An organization may challenge its Registration within the Compliance Registry. NERC or the Regional Entity will provide the organization with all information necessary to timely challenge that determination including notice of the deadline for contesting the determination and the relevant procedures to be followed as described in the NERC Rules of Procedure; Section 500 – Organization Registration and Certification.

4. If an entity is part of a class of entities excluded based on the criteria above as individually being unlikely to have a material impact on the reliability of the Bulk Power System, but that in aggregate have been demonstrated to have such an impact it may be registered for applicable Reliability Standards and Requirements irrespective of other considerations.

[4] The reasonableness of any such demonstration will be subject to review and remand by NERC itself, or by any Applicable Governmental Authority.

Statement of Compliance Registry Criteria

Revision 5.0 — Approved: NERC Board of Trustees July 30, 2008

Effective: October 16, 2008

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Statement of Compliance Registry Criteria (Revision 5.0)

Summary

Since becoming the Electric Reliability Organization (ERO), NERC has initiated a program to identify candidate organizations for its Compliance Registry. The program, conducted by NERC and the Regional Entities[1], will also confirm the functions and information now on file for currently-registered organizations. NERC and the Regional Entities have the obligation to identify and register all entities that meet the criteria for inclusion in the Compliance Registry, as further explained in the balance of this document.

This document describes how NERC will identify organizations that may be candidates for Registration and assign them to the Compliance Registry.

Organizations will be responsible to register and to comply with approved Reliability Standards to the extent that they are owners, operators, and users of the Bulk Power System, perform a function listed in the functional types identified in Section II of this document, and are material to the Reliable Operation of the interconnected Bulk Power System as defined by the criteria and notes set forth in this document. NERC will apply the following principles to the Compliance Registry:

- In order to carry out its responsibilities related to enforcement of Reliability Standards, NERC must identify the owners, operators, and users of the Bulk Power System who have a material impact[2] on the Bulk Power System through a Compliance Registry. NERC and the Regional Entities will make their best efforts to identify all owners, users and operators who have a material reliability impact on the Bulk Power System in order to develop a complete and current Compliance Registry list. The Compliance Registry will be updated as required and maintained on an on-going basis.
- Organizations listed in the Compliance Registry are responsible and will be monitored for compliance with applicable mandatory Reliability Standards. They will be subject to NERC's and the Regional Entities' Compliance Monitoring and Enforcement Programs.

[1] The term “Regional Entities” includes Cross-Border Regional Entities.
[2] The criteria for determining whether an entity will be placed on the Compliance Registry are set forth in the balance of this document. At any time a person may recommend in writing, with supporting reasons, to the Director of Compliance that an organization be added to or removed from the Compliance Registry, pursuant to NERC ROP 501.1.3.5.

- NERC and Regional Entities will not monitor nor hold those not in the Compliance Registry responsible for compliance with the Reliability Standards. An entity which is not initially placed on the Compliance Registry, but which is identified subsequently as having a material reliability impact, will be added to the Compliance Registry. Such entity will not be subject to a sanction or Penalty by NERC or the Regional Entity for actions or inactions prior to being placed on the Compliance Registry, but may be required to comply with a Remedial Action Directive or Mitigation Plan in order to become compliant with applicable Reliability Standards. After such entity has been placed on the Compliance Registry, it shall be responsible for complying with Reliability Standards and may be subject to sanctions or Penalties as well as any Remedial Action Directives and Mitigation Plans required by the Regional Entities or NERC for future violations, including any failure to follow a Remedial Action Directive or Mitigation Plan to become compliant with Reliability Standards.
- Required compliance by a given organization with the Reliability Standards will begin the later of (i) inclusion of that organization in the Compliance Registry and (ii) approval by the Applicable Governmental Authority of mandatory Reliability Standards applicable to the Registered Entity.

Entities responsible for funding NERC and the Regional Entities have been identified in the budget documents filed with FERC. Presence on or absence from the Compliance Registry has no bearing on an entity's independent responsibility for funding NERC and the Regional Entities.

Background

In 2005, NERC and the Regional Entities conducted a voluntary organization registration program limited to Balancing Authorities, Planning Authorities, regional reliability organizations, Reliability Coordinators, Transmission Operators, and Transmission Planners. The list of the entities that were registered constitutes what NERC considered at that time as its Compliance Registry.

NERC has recently initiated a broader program to identify additional organizations potentially eligible to be included in the Compliance Registry and to confirm the information of organizations currently on file. NERC believes this is a prudent activity at this time because:

- As of July 20, 2006, NERC was certified as the ERO created for the U.S. by the Energy Policy Act of 2005 (EPAct) and FERC Order 672. NERC has also filed with Canadian authorities for similar recognition in their respective jurisdictions.
- FERC's Order 672 directs that owners, operators and users of the Bulk Power System shall be registered with the ERO and the appropriate Regional Entities.
- As the ERO, NERC has filed its current Reliability Standards with FERC and with Canadian authorities. A s accepted and approved by FERC and appropriate Canadian authorities, the Reliability Standards are no longer voluntary, and organizations that do not fully comply with them may face Penalties or other sanctions determined and levied by NERC or the Regional Entities.

- NERC's Reliability Standards include compliance Requirements for additional reliability function types beyond the six types registered by earlier registration programs.
- Based on selection as the ERO, the extension and expansion of NERC's current Registration program[3] is the means by which NERC and the Regional Entities will plan, manage and execute Reliability Standard compliance oversight of owners, operators, and users of the Bulk Power System.
- Organizations listed in the Compliance Registry are subject to NERC's and the Regional Entities' Compliance Monitoring and Enforcement Programs.

Statement of Issue

As the ERO, NERC intends to comprehensively and thoroughly protect the reliability of the grid. To support this goal NERC will include in its Compliance Registry each entity that NERC concludes can materially impact the reliability of the Bulk Power System. However, the potential costs and effort of ensuring that every organization potentially within the scope of "owner, operator, and user of the Bulk Power System" becomes registered while ignoring their impact upon reliability, would be disproportionate to the improvement in reliability that would reasonably be anticipated from doing so.

NERC wishes to identify as many organizations as possible that may need to be listed in its Compliance Registry. Identifying these organizations is necessary and prudent at this time for the purpose of determining resource needs, both at the NERC and Regional Entity level, and to begin the process of communication with these entities regarding their potential responsibilities and obligations. NERC and the Regional Entities believe that primary candidate entities can be identified at this time, while other entities can be identified later, as and when needed. Selection principles and criteria for the identification of these initial entities are required. This list will become the "Initial Non-binding Organization Registration List". With FERC having made the approved Reliability Standards enforceable, this list becomes the NERC Compliance Registry.

Resolution

NERC and the Regional Entities have identified two principles they believe are key to the entity selection process. These are:

1. There needs to be consistency between Regions and across the continent with respect to which entities are registered, and;
2. Any entity reasonably deemed material to the reliability of the Bulk Bower System will be registered, irrespective of other considerations.

To address the second principle the Regional Entities, working with NERC, will identify and register any entity they deem material to the reliability of the Bulk Power System.

In order to promote consistency, NERC and the Regional Entities intend to use the following criteria as the basis for determining whether particular entities should be identified as candidates

[3] See: NERC ERO Application; Exhibit C; Section 500 – Organization Registration and Certification.

for Registration. All organizations meeting or exceeding the criteria will be identified as candidates.

The following four groups of criteria (Sections I-IV) plus the statements in Section V will provide guidance regarding an entity's Registration status:

- Section I determines if the entity is an owner, operator, or user of the Bulk Power System and, hence, a candidate for organization Registration.
- Section II uses NERC's current functional type definitions to provide an initial determination of the functional types for which the entities identified in Section I should be considered for Registration.
- Section III lists the criteria regarding smaller entities; these criteria can be used to forego the Registration of entities that were selected to be considered for Registration pursuant to Sections I and II and, if circumstances change, for later removing entities from the Registration list that no longer meet the relevant criteria.
- Section IV — additional criteria for joint Registration. Joint Registration criteria may be used by joint action agencies, generation and transmission cooperatives and other entities which agree upon a clear division of compliance responsibility for Reliability Standards by written agreement. Pursuant to FERC's directive in paragraph 107 of Order No. 693, rules pertaining to joint Registration and Joint Registration Organizations will now be found in Sections 501 and 507 of the NERC Rules of Procedure.

I. Entities that use, own or operate Elements of the Bulk Electric System as established by NERC's approved definition of Bulk Electric System below are (i) owners, operators, and users of the Bulk Power System and (ii) candidates for Registration:

"Bulk Electric System" or "BES" means unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- ***I1*** *- Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded under Exclusion E1 or E3.*
- ***I2*** *- Generating resource(s) with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.*
- ***I3*** *- Blackstart Resources identified in the Transmission Operator's restoration plan.*
- ***I4*** *- Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above.*
- ***I5*** *–Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a*

dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

Exclusions:

- ***E1*** *- Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:*
  - *a) Only serves Load. Or,*
  - *b) Only includes generation resources, not identified in Inclusion I3, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,*
  - *c) Where the radial system serves Load and includes generation resources, not identified in Inclusion I3, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).*

  Note – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.
- ***E2*** *- A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.*
- ***E3*** *- Local networks (LN): A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:*
  - *a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusion I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);*
  - *b) Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and*
  - *c) Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).*
- ***E4*** *– Reactive Power devices owned and operated by the retail customer solely for its own use.*

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process. ~~*"As defined by the Regional Entity, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated*~~

~~*equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition.*[4]"~~

II. Entities identified in Part I above will be categorized as Registration candidates who may be subject to Registration under one or more appropriate Functional Entity types based on a comparison of the functions the entity normally performs against the following function type definitions:

Function Type	Acronym	Definition/Discussion
Balancing Authority	BA	The responsible entity that integrates resource plans ahead of time, maintains Load~~load~~-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real-time.
Distribution Provider	DP	Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.
Generator Operator	GOP	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
Generator Owner	GO	Entity that owns and maintains generating units.
Interchange Authority	IA	The responsible entity that authorizes implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communication of Interchange information for reliability assessment purposes.
Load-Serving Entity	LSE	Secures energy and Transmission Service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

[4] ~~However, ownership of radial transmission Facilities intended to be covered by the vegetation management standard (applicable to transmission lines 200 kV and above) would be included in this definition.~~

Function Type	Acronym	Definition/Discussion
Planning Authority	PA	The responsible entity that coordinates and integrates transmission Facilities and service plans, resource plans, and Protection Systems.
Purchasing-Selling Entity	PSE	The entity that purchases, or sells, and takes title to, energy, capacity, and Interconnected Operations Services. PSE may be affiliated or unaffiliated merchants and may or may not own generating Facilities.
Reliability Coordinator	RC	The entity that is the highest level of authority who is responsible for the Reliable Operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
Reserve Sharing Group	RSG	A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g., ten minutes). If the transaction is ramped in quicker, (e.g., between zero and ten minutes), then, for the purposes of disturbance control performance, the areas become a Reserve Sharing Group.
Resource Planner	RP	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific Loads~~loads~~ (customer demand and energy requirements) within a Planning Authority area.
Transmission Owner	TO	The entity that owns and maintains transmission Facilities.

Function Type	Acronym	Definition/Discussion
Transmission Operator	TOP	The entity responsible for the reliability of its local transmission system and operates or directs the operations of the transmission Facilities.
Transmission Planner	TP	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area.
Transmission Service Provider	TSP	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable Transmission Service agreements.

III. Entities identified in Part II above as being subject to Registration as an LSE, DP, GO, GOP, TO, or TOP should be excluded from the Compliance Registry for these functions if they do not meet any of the criteria listed below:

III (a)Load-Serving Entity:

III.a.1 Load-Serving Entity peak Load~~load~~ is > 25 MW and is directly connected to the Bulk Power (>100 kV) System, or;

III.a.2 Load-Serving Entity is designated as the responsible entity for Facilities that are part of a required underfrequency Load~~load~~ shedding (UFLS) program designed, installed, and operated for the protection of the Bulk Power System, or;

III.a.3 Load-Serving Entity is designated as the responsible entity for Facilities that are part of a required undervoltage Load~~load~~ shedding (UVLS) program designed, installed, and operated for the protection of the Bulk Power System.

[Exclusion: A Load-Serving Entity will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]

III.a.4 Distribution Providers registered under the criteria in III.b.1 or III.b.2 will be registered as a Load Serving Entity (LSE) for all Load~~load~~ directly connected to their distribution facilities.

[Exclusion: A Distribution Provider will not be registered based on this criterion if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]

III(b) Distribution Provider:

III.b.1 Distribution Provider system serving >25 MW of peak Load~~load~~ that is directly connected to the Bulk Power System.

[Exclusion: A Distribution Provider will not be registered based on this criterion if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.] or;

III.b.2 Distribution Provider is the responsible entity that owns, controls, or operates Facilities that are part of any of the following Protection Systems or programs designed, installed, and operated for the protection of the Bulk Power System:

- a required UFLS program.
- a required UVLS program.
- a required Special Protection System.
- a required transmission Protection System.

[Exclusion: A Distribution Provider will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]

III(c) Generator Owner/Operator:

III.c.1 Individual generating unit > 20 MVA (gross nameplate rating) and is directly connected to the Bulk Power System, or;

III.c.2 Generating plant/facility > 75 MVA (gross aggregate nameplate rating) or when the entity has responsibility for any facility consisting of one or

more units that are connected to the Bulk Power System at a common bus with total generation above 75 MVA gross nameplate rating, or;

III.c.3 Any generator, regardless of size, that is a Blackstart Resource material to and designated as part of a Transmission Operator entity's restoration plan, or;

III.c.4 Any generator, regardless of size, that is material to the reliability of the Bulk Power System.

[Exclusions:

A Generator Owner/Operator will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.

As a general matter, a customer-owned or operated generator/generation that serves all or part of retail Load ~~load~~ with electric energy on the customer's side of the retail meter may be excluded as a candidate for Registration based on these criteria if (i) the net capacity provided to the Bulk Power System does not exceed the criteria above or the Regional Entity otherwise determines the generator is not material to the Bulk Power System and (ii) standby, back-up and maintenance power services are provided to the generator or to the retail Load~~load~~ pursuant to a binding obligation with another Generator Owner/Operator or under terms approved by the local regulatory authority or the Federal Energy Regulatory Commission, as applicable.]

III(d) Transmission Owner/Operator:

III.d.1 An entity that owns/operates an integrated transmission Element associated with the Bulk Power System 100 kV and above, or lower voltage as defined by the Regional Entity necessary to provide for the Reliable Operation of the interconnected transmission grid; or

III.d.2 An entity that owns/operates a transmission Element below 100 kV associated with a Facility that is included on a critical Facilities list that is defined by the Regional Entity.

[Exclusion: A Transmission Owner/Operator will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, generation and transmission cooperative

or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.

IV. Joint Registration Organization and applicable Member Registration.

Pursuant to FERC's directive in paragraph 107 of Order No. 693, NERC's rules pertaining to joint Registrations and Joint Registration Organizations are now found in Section 501 and 507 of the NERC Rules of Procedure.

V. If NERC or a Regional Entity encounters an organization that is not listed in the Compliance Registry, but which should be subject to the Reliability Standards, NERC or the Regional Entity is obligated and will add that organization to the Compliance Registry, subject to that organization's right to challenge as provided in Section 500 of NERC's Rules of Procedure and as described in Note 3 below.

Notes to the above Criteria

1. The above are general criteria only. The Regional Entity considering Registration of an organization not meeting (e.g., smaller in size than) the criteria may propose Registration of that organization if the Regional Entity believes and can reasonably demonstrate[5] that the organization is a Bulk Power System owner, or operates, or uses Bulk Power System assets, and is material to the reliability of the Bulk Power System. Similarly, the Regional Entity may exclude an organization that meets the criteria described above as a candidate for Registration if it believes and can reasonably demonstrate to NERC that the Bulk Power System owner, operator, or user does not have a material impact on the reliability of the Bulk Power System.

2. An organization not identified using the criteria, but wishing to be registered, may request that it be registered. For further information refer to: NERC Rules of Procedure, Section 500 – Organization Registration and Certification; Part 1.3.

3. An organization may challenge its Registration within the Compliance Registry. NERC or the Regional Entity will provide the organization with all information necessary to timely challenge that determination including notice of the deadline for contesting the determination and the relevant procedures to be followed as described in the NERC Rules of Procedure; Section 500 – Organization Registration and Certification.

4. If an entity is part of a class of entities excluded based on the criteria above as individually being unlikely to have a material impact on the reliability of the Bulk Power System, but that in aggregate have been demonstrated to have such an impact it may be registered for applicable Reliability Standards and Requirements irrespective of other considerations.

[5] The reasonableness of any such demonstration will be subject to review and remand by NERC itself, or by any Applicable Governmental Authority.

Executive Summary

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires skilled, trained and qualified system operators. The System Operator Certification Program provides the mechanism to ensure system operators are provided the education and training necessary to obtain the essential knowledge and skills and are therefore qualified to operate the Bulk Electric System.

The System Operator Certification Program provides the framework for the examinations used to obtain initial Certification in one of four NERC Credentials: transmission operator, balancing and interchange operator, balancing, interchange and transmission operator, and reliability operator. A system operator Credential is a personal Credential issued to a person for successfully passing a NERC system operator Certification exam. The Credential is maintained by accumulating a specified number of Continuing Education Hours within a specified period of time. The program will allow system operators to maintain their Credential through continuing education rather than to recertify by retaking an examination.

The NERC Personnel Certification Governance Committee (PCGC) is the governing body that establishes the policies, sets fees, and monitors the performance of the System Operator Certification Program. As program administrator, NERC maintains databases, records, and applications, collects fees, maintains contracts with vendors, and provides reports on system operator Certification related activities. The PCGC is responsible for ensuring the program is not-for-profit and financially sound, and annually reviews the program to ensure that it is adequately funded.

Section I — Certification Examinations

Overview

The System Operator Certification Program awards Certification Credentials to those individuals who demonstrate that they have attained sufficient knowledge relating to NERC Reliability Standards as well as the basic principles of Bulk Power System operations by passing one of four specialty examinations. A certificate is issued to a candidate who successfully completes an examination. Certificates issued prior to the implementation of the new Continuing Education Hours requirement will be valid for five years. Certificates issued after the implementation of this requirement will be valid for three years.

The members of the Examination Working Group (EWG) represent each of the specialty areas tested in the examinations. The EWG develops the examinations under the guidance of a psychometric consultant. The examinations are based on content outlines that were developed through a job analysis. Prior to being used in the scoring process, each question is 'piloted' (not scored) for one full examination cycle (eighteen months), and the performance of each question is continually tracked. The direct involvement of system operators, supervisors, and trainers in the examination development process will remain a primary requirement of future NERC system operator Certification examinations.

Earning a Credential

Examinations

There are four specialty examinations: reliability operator, balancing and interchange operator, transmission operator, and balancing, interchange, and transmission operator. Each of the examinations has its own content outline that can be accessed from the Program's web page. The specifics of the individual examinations can be obtained from the table below. The individual content outlines for each of the specialty examinations can be obtained by clicking on the name of the exam.

Examination Title	Total Questions	Scored Questions	Passing Score (# of answers correct)	Passing Score (% of answers correct)
Reliability operator Certification examination	150	125	93	74.4
Balancing, interchange, and transmission operator Certification examination	150	125	93	74.4
Transmission operator Certification examination	125	100	76	76
Balancing and interchange operator Certification examination	125	100	76	76

Applying for Certification Examinations

1. You must first establish a NERC.net user account. Once you are registered, you can access the on-line application form.

   a. If you do not have a NERC.net user account, please click here (https://soc.nerc.net/registration/default.aspx) to set up your free account.

2. If you already have a NERC.net user account, please click here (https://soc.nerc.net/default.aspx) to sign-in to your NERC.net user account to access the on-line examination application form.

   a. If you have forgotten your user name or password, contact the NERC office at phone number (609) 452-8060 (Mon–Fri, 8:00 a.m.–4:00 p.m. Eastern).

3. Select *Exam Application Form*
4. Select the examination you wish to take then click *SUBMIT*
5. You may submit your payment either by selecting credit card (VISA or MasterCard only) or invoice for check payments. A copy of the invoice and check or money order must be mailed to NERC to complete your examination application process.

North American Electric Reliability Corporation
System Operator Certification Program
116-390 Village Boulevard
Princeton, New Jersey 08540-5731

Applications are accepted year round. Allow two weeks for the processing of your application and receipt of notification that you are approved to take the examination.

An application is considered complete and processed only when all required information is provided and fees are received. After the application is processed, the authorization-to-test (ATT) letter containing the assigned ATT number is sent to each eligible candidate by e-mail followed by regular mail.

Eligibility Period

Eligibility to take the examination remains in effect for one year from the date the ATT number is issued. Candidates are encouraged to schedule an appointment to sit for the examination promptly. If a candidate fails to schedule and take the examination during the one-year eligibility period, the candidate shall forfeit all payments made to NERC. Candidates who fail to take the examination within the one-year eligibility must submit a new application and pay the full fee to be considered for eligibility again.

Fees

Fee Schedule	
Application to test	$350
Application to retest	$350
Application to withdraw	$50
Bad check/credit	$25

**All funds shall be payable in U.S. dollars.

Before scheduling an examination, please do the following:

- Review all parts of this Program Manual.
- Complete and submit the application to NERC, along with the appropriate fee.
- Receive an ATT letter containing the assigned ATT number by e-mail and regular mail from NERC declaring that you are eligible to take the examination. The letter will also provide instructions on how you may arrange the location, date, and time of your examination. The ATT number will be needed when you contact Prometric to schedule your test appointment.

Scheduling an Examination

NERC will send you an ATT letter by e-mail and regular mail with instructions about the identification items to bring with you on the day of the examination. To select your examination location, date, and time go to the Prometric website at http://www.prometric.com. All attempts should be made to schedule your examination as soon as possible because testing center appointments are in high demand by other professions. Waiting to schedule your appointment may significantly limit the locations, dates, and times available. Examinations may be administered on any Monday through Saturday. Examinations may be taken on any day that accommodates your schedule and where and when examination space is available.

During the scheduling process, you will be required to confirm your ATT number and your first and last name. You will be advised of available testing locations, dates, and times.

Note: When you schedule your test date, you will receive a confirmation number from Prometric. Please retain this number, as it will be useful should you have to use Prometric's automated cancellation system or if there is a conflict with the test center appointment. Prometric will not mail you a confirmation notice.

Examination Content Outline

The computer-based examination consists of objective, multiple-choice questions. The questions are based on the published Content Outline for each of the NERC system operator Certification examinations.

Day of the Examination

Time at Testing Center — Plan to arrive at the testing center at least thirty minutes early to sign in. You should allocate at least four hours to accommodate the total time you might be at the testing center. This includes:

Examination Time Allocation	
Examination Stages	**Time Allocation**
Administration & Review of Candidate Identification	30 minutes
Computer-Based Tutorial	15 minutes
Examination	2 hours & 45 minutes
Post-Examination Survey	15 minutes
Total Time to be Allocated	**3 hours & 45 minutes**

Computer Familiarization — A fifteen-minute tutorial on operating instructions for the computer-based examination will be provided before the start of each examination. The tutorial is self-explanatory, and no prior computer knowledge is needed. You may bypass this feature if you wish (not recommended).

Computer-based testing allows you to skip questions, mark, and return to them at a later time. During the examination, you may change your answer to any question. A clock is on the screen at all times indicating the time remaining. Before exiting the examination, the computer will indicate any question(s) you have marked for review or those that remain unanswered.

Post-Examination Survey — At the completion of the examination, you will be invited to complete a brief questionnaire on your reactions to the examination experience and the quality of the testing center staff and services. ***This is also your opportunity to comment on the content of the examination and to challenge any particular examination questions or answers***.

Comments — Comments on the examination process or questions will be collected in the post-examination survey. All comments will be forwarded to NERC.

Testing Center Requirements

Required Methods of Identification — You will be required to show two forms of identification before being admitted to the examination. You will be required to show at least one primary form of identification and either another primary or a secondary form of identification.

- Primary identification — Primary identification is a government-issued form of identification and must have **both** your picture **and** your signature on it. Some examples of primary identification are: a driver's license (if it has both your picture and your signature), a passport, or a military ID.
- Secondary identification — Secondary identification must have **either** your picture **or** your signature **or** both. Acceptable forms of secondary ID are: a second government-issued ID as above, or an employment ID, or a credit card or debit card.

Identification(s) that have been altered or damaged will not be accepted at the Prometric Test Center. If there is any discrepancy between the name on the identification presented to the test center staff and the NERC registration, the candidate will not be admitted to test and will be marked as a no-show. All no-shows forfeit all funds paid – no refunds are granted to no-shows.

Testing Center Regulations

- Candidates who arrive late for the examination might not be seated for the examination, depending on the criteria established by that testing center. Late arrivals that are not permitted to take the examination will be considered a no-show and must reapply and pay the full test fee to take the examination.
- No reference materials, calculators, or recording equipment may be taken into the examination. Candidates will be provided a keyed locker to store personal items while taking the examination.
- No test materials, documents, notes, or scratch paper of any sort may be taken from the examination.
- Visitors are not permitted during the examination.
- Testing center staff is instructed to answer questions about testing procedures only. They cannot respond to inquiries regarding the examination's content.
- During the examination, candidates may use the rest rooms for a biological break; however, the examination clock will continue running during such times.
- Candidates may not leave the testing center until they have finished the examination.
- Smoking is not permitted in any testing center.
- Any candidate giving or receiving assistance, or making a disturbance, will be required to turn in their examination materials, exit the examination room, and leave the testing center. Your test will be scored whether you have completed it or not. The disciplinary action procedure will be initiated upon notification by Prometric to NERC that such activity had occurred.
- Any instances of cheating, or attempts to impersonate another candidate, will be dealt with through the disciplinary action procedure.

Cancellations and No-shows

You may cancel and reschedule an examination appointment either by calling Prometric at the toll free number listed in your ATT letter or through their website (http://www.prometric.com). Your request to cancel must be no later than noon, local test center time, two days (Monday–Saturday excluding local holidays) before the examination date. You may reschedule the examination date within your period of eligibility without paying an additional fee. If you are late in canceling your examination appointment, do not appear for it, or arrive late, you will be considered a no-show. All no-shows will have to reapply to take the examination and pay the full test fee. Refunds will not be issued to no-shows.

Minimum Time Between Examinations

Candidates who fail the examination must wait 42 days from the date of the failed examination to retest. Candidates who pass one of the NERC system operator Certification examinations may take the examination thirty-six months after the date they were last certified (this only applies to those certificates valid for five years that were issued prior to the implementation of Continuing Education Hours as a means of Credential Maintenance).

Special Accommodations/Disabilities

Allowance will be made for all documented requests for special testing conditions. Applicants must notify NERC by e-mail or telephone. The Certification coordinator will contact the applicant with further instructions. Disability requests must be supported by a letter (original copy) from a recognized health care provider and be signed by a physician or psychologist. All other requests must be similarly supported. NERC will review each request and provide appropriate accommodations. The decision will be included in the notice of eligibility/ registration approval sent to the applicant.

Note: All testing centers are in compliance with the regulations governing the Americans with Disabilities Act (ADA).

Withdrawal from Examination Process

As described in the *Eligibility Period* section of this Program Manual, the eligibility period is one year from the date the ATT number is issued. If a candidate wishes to withdraw from the process within the stated period for any reason, they must complete the candidate withdrawal request on the system operator Certification website on or before the last eligibility day. Candidates who submit the request within the time period will be reimbursed for the fees submitted to NERC less the withdrawal fee in effect at the time of the application. Failure to properly withdraw will result in the candidate forfeiting all submitted fees.

If you have already scheduled an appointment with Prometric to take the exam, you must first cancel that Prometric appointment or you will be charged a no-show fee.

To access the Exam Withdrawal
On the System Operator Certification Program homepage, logon to your NERC.net account:

- Enter User name and Password
- Click on Logon
- Click on Exam Withdrawal
- Select the exam you are registered to take and from which you wish to withdraw, then click on Submit

Examination Change Request

If a candidate wishes to change the examination (i.e., from BI to TO, or from RC to BIT, etc.) that they are registered to take, they must use the Program's website. An examination change request will not change the candidate's eligibility period. The eligibility period will remain valid for one year from the date that the original ATT number was issued. This change request must be submitted at least thirty days prior to the expiration of the candidate's eligibility period.

To access the Examination Change
On the System Operator Certification Program homepage, logon to your NERC.net account:

- Enter User Name and Password
- Click on Logon
- Click on Exam Change
- Select the exam for which you are authorized then click on Submit
- Select the desired exam from the drop-down list, then click on Submit

You will be issued a new ATT number with the original expiration date. After receiving your new ATT you must schedule/reschedule an appointment with Prometric to take the exam.

Results and Awarding of Certificates

Candidates can view pass/fail results on the computer screen when the examination is terminated. Before exiting the Prometric Testing Center, a copy of this display will be provided. This is an unofficial summary of the examination.

After grading and analysis of the examination results, NERC will mail an official summary. This will take about ten to twelve weeks. The official summary will include the grade achieved and the percentage of correctly answered questions in each content outline category.

Candidates who pass the examination will receive the appropriate NERC-certified system operator certificate based on the examination taken and signed by the President of NERC. The date on the certificate will be the day the candidate took the examination.

System Operator Certificate Numbering Convention

Numbering certificates for certified system operators follows a specific convention. There have been two numbering conventions used since the start of the program.

The original Credential, issued from 1998 into 2002, was the NERC certified system operator. These certificates were assigned the letter N followed by four digits indicating the year the candidate registered, followed by a four digit sequential number.

> Example: N19980109 = NERC certified system operator that registered in 1998 and was the 109th system operator registered in the program.

When the specialty Credentials were implemented in late 2002, a new numbering convention was implemented. The new numbering convention consists of a two-letter designation of the Credential type, followed by six digits that indicate year and month the Credential was awarded, followed by a three digit sequential number in that month.

> Example: RA200306109 = NERC certified reliability operator certified in June of 2003 and was the 109th system operator certified in that month.

Credential Designations

N/RA/RC	Reliability operator
BT	Combined balancing and interchange/transmission operator
BA	Balancing and interchange operator
TO	Transmission operator

Confirmation of Credential to Third Parties

NERC will confirm to an employer that an individual holds a valid NERC system operator certificate (including releasing the certificate number and the issuance date) in response to a written request, on the employer's letterhead (or e-mail), providing the name of the individual. NERC will release the certificate numbers and issuance dates for individuals holding a current NERC system operator certificate to the Regional Entity Compliance Staff or designated agents of those Regional Entities in which an individual's employer operates in response to a written request, submitted on organization letterhead (or e-mail), that provides the names of the individuals for whom information is sought. No further information will be provided.

NERC will confirm to an employment search firm, or a potential employer, whether an individual holds a valid NERC system operator certificate (including releasing the certificate number and the issuance date) if the search firm has a release from the individual. No further information will be provided.

Section II — Credential Maintenance

Effective Date: October 1, 2006

Overview

The System Operator Certification Program incorporates a requirement to use Continuing Education Hours (CE Hours) to maintain a Credential that is valid for three years. Successfully passing an examination earns a Credential and a certificate that is valid for three years. Accumulation of the proper number and type of CE Hours from NERC-approved learning activities within that three-year period maintains the validity of that Credential for the next three years. A new certificate is issued indicating the new expiration date.

The program provides that:

1. System operators seeking to obtain a Credential will have to pass an examination to earn a Credential.
2. A certificate, valid for three years, will be issued to successful candidates.
3. A certified system operator must accumulate a minimum number of CE Hours, in specific training topics, before their certificate expires to maintain their Credential. The minimum number of CE Hours is based on each Credential:
    a. 200 CE Hours for reliability operator
    b. 160 CE Hours for balancing, interchange, and transmission operator
    c. 140 CE Hours for balancing and interchange operator
    d. 140 CE Hours for transmission operator
4. A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.
5. A minimum of 30 CE Hours must be in simulations (i.e., table-top exercises, training simulators, emergency drills, practice emergency procedures, restoration, blackstart, etc.).
6. CE Hours can concurrently count for both NERC Reliability Standards and simulations but will only be counted once for the total CE Hours requirement.
    a. For example: A one-hour simulation learning activity that focuses on NERC Standards can count towards the requirements for both NERC Reliability Standards and simulation. However, the Credential holder will only be awarded a total of one CE Hour toward the total CE Hours requirement. In other words, the CE Hours will not be double counted.
7. Retaking the examination is not an option for Credential Maintenance.
8. If a certified system operator does not accumulate enough CE Hours to maintain their current Credential prior to the certificate expiration date, their Credential will be Suspended for a maximum of one year. At the end of the suspension period, their Credential will be Revoked.
9. If, prior to the end of the one-year suspension, the certified system operator accumulates the proper number and type of CE Hours, their Credential will be reinstated with the original expiration date (three years after the previous expiration date).

10. A system operator with a Revoked Credential will have to pass an examination to become certified.

When to Start Accumulating CE Hours

CE Hours earned (date of learning activity) in the six months prior to the implementation date will be recognized if they are earned from an approved learning activity that meets the Certification program requirements. Each learning activity will have to be approved for use for Credential Maintenance prior to the CE Hours being issued.

Specifics of the Credential Maintenance Program

Certified system operators are required to accumulate CE Hours through the NERC Continuing Education Program in recognized training topics for Credential Maintenance. See *Appendix A* for the list of recognized training topics. Described below are the requirements for each of the four Credentials:

Transmission Operator Certification
To maintain a valid transmission operator Credential, system operators must earn **140 CE Hours** within the 3-year period preceding the expiration date of their certificate.

The 140 CE Hours must include:

- A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.
- A minimum of 30 CE Hours must utilize simulations (i.e., table-top exercises, dispatcher/operator training simulators, emergency drills, or practice emergency procedures, restoration, blackstart or other reliability-based scenarios).

Balancing and Interchange Operator Certification
To maintain a valid balancing and interchange operator Credential, system operators must earn **140 CE Hours** within the 3-year period preceding the expiration date of their certificate.

The 140 CE Hours must include:

- A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.
- A minimum of 30 CE Hours must utilize simulations (i.e., table-top exercises, dispatcher/operator training simulators, emergency drills, or practice emergency procedures, restoration, blackstart or other reliability-based scenarios).

Balancing, Interchange, and Transmission Operator Certification
To maintain a valid balancing, interchange, and transmission operator Credential, system operators must earn **160 CE Hours** within the 3-year period preceding the expiration date of their certificate.

The 160 CE Hours must include:

- A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.

- A minimum of 30 CE Hours must utilize simulations (i.e., table-top exercises, dispatcher/operator training simulators, emergency drills, or practice emergency procedures, restoration, blackstart or other reliability-based scenarios).

Reliability Operator Certification
To maintain a valid reliability operator credential, system operators must earn **200 CE Hours** within the three-year period preceding the expiration date of their certificate.

The 200 CE Hours must include:

- A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.
- A minimum of 30 CE Hours must utilize simulations (i.e., table-top exercises, dispatcher/operator training simulators, emergency drills, or practice emergency procedures, restoration, blackstart or other reliability-based scenarios).

Certificate

System operators that have: 1) completed the Credential Maintenance application, 2) satisfied the CE Hours requirements, and 3) paid the required fee will be issued a certificate valid for three years.

Deficits of CE Hours for Credential Holders

The Credential of a certified system operator who does not accumulate the required number and balance of CE Hours within the three-year period will be Suspended. A system operator with a Suspended certificate cannot perform any task that requires an operator to be NERC-certified. The system operator with a Suspended Credential will have up to twelve months to acquire the necessary CE Hours.

During the time of suspension, the original anniversary date will be maintained. Therefore, should the system operator accumulate the required number of CE Hours within the twelve-month suspension period, they will be issued a certificate that will be valid for three years from the previous expiration date. The system operator will be required to accumulate the required number of CE Hours prior to the current expiration date.

At the end of the twelve-month suspension period, if the system operator has not accumulated the required number of CE Hours, the Credential will be Revoked and all CE Hours earned will be forfeited. After a Credential is Revoked, the system operator will be required to pass an examination to become certified.

For example, a system operator whose Credential expires on July 31, 2009 does not accumulate the required number of CE Hours prior to that date:

1. The Credential will be Suspended on August 1, 2009.
2. If the system operator then accumulates and submits the required number of CE Hours by March 1, 2010, the Credential will be reinstated on March 1, 2010, and will be valid until July 31, 2012.

3. The system operator will have to accumulate the required number of CE Hours prior to July 31, 2012 or the Credential will be Suspended again.
4. CE Hours previously used to maintain the Credential cannot be reused for Credential Maintenance.
5. A record of the suspension between August 1, 2009 and March 1, 2010 will be maintained.

Carry-Over Hours

For all Credentials, up to 30 CE Hours accumulated in the six months prior to the certificate expiration date and not used for Credential Maintenance may be carried over to the next three-year period.

CE Hours will be allocated on a first-in, first-out basis. In other words, CE Hours from a learning activity occurring first according to the calendar will be used to satisfy the CE Hours requirement first and continuing sequentially by the date of the learning activities.

Reporting of CE Hours Earned by Certified System Operators

Normally, the Providers will make the submittals of electronically into the NERC system operator Certification database. However, should some conflict occur, the certified system operator must be able to submit proof of having acquired the necessary CE Hours from the Continuing Education Program Provider's approved learning activities.

System operators will be able to track their status/progress towards maintaining their Credential through the NERC system operator Certification website. Certified system operators should review their CE Hours records at least 90 days before their certificate expiration date to allow sufficient time to acquire CE Hours prior to the system operator's certificate expiration date should there be a deficit.

If a Provider does not submit the CE Hours, the certified system operator must submit proof of sufficient CE Hours to the NERC Manager of Personnel Certification no less than 30 days before the system operator's certificate expiration date. NERC staff may be able to process/resolve discrepancies in Credential holder CE Hours records in less than 30 days; however, submissions received at NERC within the 30-day window may not be credited to the system operator's account in time to prevent the Credential from being Suspended. Suspended Credentials based on incomplete data will be reinstated retroactively once proof of completion is verified.

For system operators who meet the CE Hours requirements, and upon receipt of an application and necessary fees, NERC will issue a new certificate with an expiration date three years from the previous expiration date (a new certificate will be mailed to the address on record).

Application for Credential Maintenance

Procedure for applying for Credential Maintenance

Application procedure will be completed after the software is developed.

Hardship Clause

It is understood that, due to unforeseen events and extenuating circumstances, a certified system operator may be unable to accumulate the necessary CE Hours in the time frame required by the Program to maintain the Credential. In such an event, an individual must submit a written request containing a thorough explanation of the circumstance and supporting information to:

Manager–Personnel Certification
NERC
116-390 Village Boulevard
Princeton, New Jersey 08540

The PCGC retains the right to invoke this hardship clause and deviate from the Program rules, as it deems appropriate, to address such events or circumstances. Examples of extenuating circumstances would include, but not limited to, extended military service, extended illness of the system operator or within the system operator's immediate family, or system operator temporary disability that results in an extended period of time away from work.

Changing Certification Levels

Certified system operators that want to transition to a lower Credential can do so. Many system operators hold a reliability operator Credential but are not working in a reliability operator capacity. Those certified system operators could easily transition to a Credential that more closely matches the work they perform without taking an examination. However, system operators currently holding a transmission operator or balancing and interchange operator Credential will have to pass an examination to move to a higher Credential such as the combined balancing, interchange, and transmission operator Credential or the reliability operator Credential.

A certified system operator can change the type of their Credential by indicating their desire on their Credential Maintenance application. A system operator has the following options:

To change a Credential from:

- Balancing and interchange operator to any other NERC Credential: the system operator must pass the examination for that Credential.
- Transmission operator to any other NERC Credential: the system operator must pass the examination for that Credential.
- Balancing, interchange, and transmission operator to reliability operator: the system operator must pass the examination for that Credential.
- Reliability operator to any other NERC Credential: the system operator must submit the proper number and type of CE Hours for the new Credential.
- Balancing, interchange, and transmission operator to transmission operator or balancing and interchange operator: the system operator must submit proper number and type of CE Hours for the new Credential.

Transition Plan — 5-year Program to 3-year Program

A certified system operator whose certificate expires during the first three years after implementation of this Program has the option to either accumulate the required number of CE Hours according to the rules stated previously or pass the examination for the desired Credential. Certified system operators who accumulate the required number and balance of CE Hours will receive a certificate that will be valid for three years from the expiration date on their current certificate. System operators who pass an examination will receive a certificate valid for three years from the date they pass the examination.

Certified system operators whose certificate expires after the third anniversary of the implementation of this Program, must accumulate the required number of CE Hours prior to the expiration date of their certificate regardless of the issuance date of their certificate.

Section III — Program Rules

Rules for NERC-Certified System Operator

Recognized Learning Activities

CE Hours will be recognized for Credential Maintenance only for training topics/learning activities listed in *Appendix A* and where Providers have complied with the Continuing Education Program rules.

Provider Access to Database

Providers will be able to access the database to upload certified system operator CE Hours activity. The process for doing this will be determined after the database is developed.

System Operator Access to Database

Certified system operators will be able to access the database to track their CE Hour activity. The process for doing this will be determined after the database is developed.

Retain Documentation

The certified system operator is responsible for retaining appropriate documentation for proof of Credential Maintenance. Documentation includes:

- Name and contact information of the Provider
- Title and identification number of the learning activity and description of its content
- Date(s) of the learning activity
- Location (if applicable)
- Number and type of CE Hours
- System operator's NERC certificate number

Providers shall retain comparable documentation. Electronic forms of documentation are acceptable.

Learning Activity Credit Only Once Per Year

CE Hours for a particular course or learning activity will not be recognized for Credential Maintenance more than once a year based on the Credential anniversary. (i.e., during the twelve-month period preceding the system operator's Credential anniversary)

Exception: CE Hours for courses dealing with emergency operations will be recognized no more than two times per year based on the Credential anniversary. (i.e., during the 12-month period preceding the system operator's Credential anniversary)

Learning Activity Approved Status Revoked after CE Hours Granted

CE Hours granted for a course or learning activity that had been approved for Credential Maintenance will still be recognized if, subsequent to the system operator attending the course or learning activity, the approved status is Revoked.

Instructor Credits

For those instructors who are also certified system operators, 1.0 CE Hour for each CE Hours of a learning activity delivered will be recognized towards the instructor's system operator Credential Maintenance. CE Hours for a particular course or learning activity will not be recognized for Credential Maintenance more than once a year based on the Credential anniversary. (i.e., during the twelve-month period preceding the system operator's Credential anniversary)
Exception: CE Hours for courses dealing with emergency operations will be recognized no more than two times per year based on the Credential anniversary. (i.e., during the twelve-month period preceding the system operator's Credential anniversary)

Treatment of Disputes Between Certified System Operator and Providers

Disputes between a Provider and a certified system operator must be resolved between the Provider and the certified system operator. NERC will not become involved in resolving the dispute. Additionally, it is the obligation of the certified system operator to periodically review their CE Hours' records in the NERC system operator Certification database and to maintain their own training records to provide proof that CE Hour requirements have been achieved.

Fees

Fee Schedule**	
Application to test	$350
Application to maintain or change Credential using CE Hours	$350
Application to retest	$350
Application to withdraw	$50
Bad check/credit application	$25

**All funds must be payable in U.S. dollars.

The Program must be financially independent as well as not-for-profit. The on-going expenses to develop and maintain the examinations and the management and administrative costs associated with both the examination process and Credential Maintenance necessitate these fees. These fees will be periodically reviewed and adjusted accordingly.

Section IV — Dispute Resolution

1. Applicability

Any dispute arising under the NERC agreement establishing a *NERC System Operator Certification Program* or from the establishment of any NERC rules, policies, or procedures dealing with any segment of the Certification process shall be subject to the NERC system operator certification dispute resolution process (hereafter called the "Process"). The Process is for the use of persons who hold an operator Certification or persons wishing to be certified to dispute the validity of the examination, the content of the test, the content outlines, or the registration process. The Process is not for trainers or certified persons disputing CE Hours.

2. Dispute Resolution Process

The dispute resolution process consists of three steps.

a. **NERC System Operator Certification Program Staff**
The first step in the process is for the person with a dispute to contact the NERC System Operator Certification Program staff. Contact may be made by a phone call or e-mail to the program staff. This first step can usually resolve the issues without further actions. It is expected that most disputes will be resolved at this step.

Any dispute that requires resolution will first be brought to the NERC System Operator Certification Program staff. Should the issue(s) not be resolved to the satisfaction of the parties involved, the issue can be brought to the Personnel Certification Governance Committee (PCGC) Dispute Resolution Task Force.

b. **Personnel Certification Governance Dispute Resolution Task Force**
If the NERC staff did not resolve the issue(s) to the satisfaction of the parties involved, a written request should be submitted to the chairman of the PCGC through NERC staff explaining the issue(s) and requesting further action. Upon receipt of the letter, the PCGC chairman will present the request to the PCGC Dispute Resolution Task Force for action. This task force consists of three current members of the PCGC. The PCGC Dispute Resolution Task Force will investigate and consider the issue(s) presented and make a decision. This decision will then be communicated to the submitting party, the PCGC chairman, and the NERC staff within 45 calendar days of receipt of the request.

If a French-Canadian or Mexican party raises a dispute, the PCGC shall appoint a French-Canadian speaking or Spanish-speaking interpreter, respectively, as requested.

c. **Personnel Certification Governance Committee**
If the PCGC Dispute Resolution Task Force's decision did not resolve the issue(s) to the satisfaction of the parties involved, the final step in the process is for the issue(s) to be brought before the PCGC. The disputing party shall submit a written request to the PCGC chairman through NERC staff requesting that the issue(s) be brought before the

PCGC for resolution. The chairman shall see that the necessary documents and related data are provided to the PCGC members as soon as practicable. The PCGC will then meet or conference to discuss the issue(s) and make their decision within 60 calendar days of the chairman's receipt of the request. The decision will be provided to the person bringing the issue(s) and the NERC staff. The PCGC is the governing body of the Certification Program and its decision is final.

3. Process Expenses

All individual expenses associated with the Process, including salaries, meetings, or consultant fees, shall be the responsibility of the individual parties incurring the expense.

4. Decision Process

Robert's Rules of Order shall be used as a standard of conduct for the Process. A simple majority vote of the members present will decide all issues. The vote will be taken in a closed session. No one on the PCGC may participate in the dispute resolution process, other than as a party or witness, if he or she has an interest in the particular matter.

A stipulation of invoking the appeals process is that the entity requesting the appeal agrees that neither NERC (its Members, Board of Trustees, committees, subcommittees, and staff), any person assisting in the appeals process, nor any company employing a person assisting in the appeals process, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

Section V — Disciplinary Action

1. Purpose

This disciplinary action procedure is necessary to protect the integrity of the system operator Credential. Should an individual act in a manner that is inconsistent with expectations, this procedure describes the process to investigate and take action necessary to protect the Credential.

2. Grounds for Action

The following shall serve as grounds for disciplinary action:

a. Willful, gross, and/or repeated violation of the NERC Reliability Standards as determined by a NERC investigation.

   i. Both the organization and the certified system operator are bound by the NERC Reliability Standards. If a certified system operator, either in concert with the organization or on his or her own initiative, performs a willful, gross, and/or repeated violation of the NERC Reliability Standards, he or she is liable for those actions and disciplinary actions may be taken against him or her.

b. Willful, gross, and/or repeated negligence in performing the duties of a certified system operator as determined by a NERC investigation.

c. Intentional misrepresentation of information provided on a NERC application for a system operator Certification exam or to maintain a system operator Credential using CE Hours.

d. Intentional misrepresentation of identification in the exam process.

   i. This includes, but is not limited to, a person identifying himself or herself as another person to obtain Certification for the other person.

e. Any form of cheating during a Certification exam.

   i. This includes, but is not limited to, bringing unauthorized reference material in the form of notes, crib sheets, or other methods of cheating into the testing center.

f. A certified system operator's admission to or conviction of any felony or misdemeanor directly related to their duties as a system operator.

3. Hearing and Appeals Process

Upon report to NERC of a candidate's or certified system operator's alleged misconduct, the NERC Personnel Certification Governance Committee (PCGC) Credential Review Task Force will convene for the determination of facts. An individual, government agency, or other investigating authority can file reports.

Unless the task force initially determines that the report of alleged misconduct is without merit, the candidate or certified system operator will be given the right to notice of the allegation. A hearing will be held and the charged candidate or certified system operator will be given an opportunity to be heard and present further relevant information. The task force may seek out information from other involved parties. The hearing will not be open to the public, but it will be

open to the charged candidate or certified system operator and his or her representative. The task force will deliberate in a closed session, but the task force cannot receive any evidence during the closed session that was not developed during the course of the hearing. The task force's decision will be unanimous and will be in writing with inclusion of the facts and reasons for the decision. The task force's written decision will be delivered to the PCGC and by certified post to the charged candidate or certified system operator. In the event that the task force is unable to reach a unanimous decision, the matter shall be brought to the full committee for a decision.

The task force's decision will be one of the below:

a. No Action
Allegation of misconduct was determined to be unsubstantiated or inconsequential to the Credential.

b. Probation
A letter will be sent from NERC to the offender specifying:

i. The length of time of the probationary period (to be determined by the PCGC).

(a) Credential will remain valid during the probationary period.

(b) The probationary period does not affect the expiration date of the current certificate.

ii. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

(a) Extension of Probation,

(b) Revocation for cause, or

(c) Termination of Credential.

c. Revoke for Cause
A letter will be sent from NERC to the offender specifying:

i. The length of time of the revocation period (to be determined by the PCGC).

(a) Credential is no longer valid.

(b) Successfully passing an exam will be required to become certified.

(c) An exam will not be authorized until the revocation period expires.

d. Termination of Credential
A letter will be sent from NERC to the offender specifying:

i. Permanent removal of Credential.

4. Appeal Process

The decision of the task force may be appealed using the NERC system operator certification dispute resolution process.

5. Credential Review Task Force

The Credential Review Task Force shall be comprised of three active members of the PCGC assigned by the Chairman of the PCGC on an ad hoc basis. No one on the Credential Review Task Force may have an interest in the particular matter.

The task force will meet in a venue determined by the task force chairman.

If a French-Canadian or Mexican party raises a dispute, the PCGC shall appoint a French-Canadian speaking or Spanish-speaking interpreter, respectively, as requested.

Glossary

Capitalized terms used in this Appendix shall have the definitions set forth in Appendix 2 of the Rules of Procedure. For convenience of reference, definitions used in this Appendix are also set forth below:

G01. **Continuing Education Hour or CE Hour**: Sixty minutes of participation in a group, independent study, or self-study learning activity as approved by the NERC Continuing Education Program.

G02. **Continuing Education Program Provider or Provider**: The individual or organization offering a learning activity to participants and maintaining documentation required by these criteria.

G03. **Certification:** An official recognition that indicates the recipient has passed a NERC exam or completed a specified number of Continuing Education Hours.

G04. **Credential:** NERC designation that indicates the level of qualification achieved (i.e., reliability operator; balancing, interchange, and transmission operator; balancing and interchange operator; and transmission operator).

G05. **Credential Maintenance:** Meet NERC CE Hours' requirements to maintain a valid NERC-issued system operator Credential.

G06. **NERC-Approved Learning Activity**: Training that maintains or improves professional competence and has been approved by NERC for use in its Continuing Education Program.

G07. **Probation:** A step in the disciplinary process during which the certificate is still valid. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

G08. **Revoked:** A NERC certificate which has been Suspended for more than twelve months. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified. The certificate holder will be required to pass an exam to be certified again. Any CE Hours accumulated prior to or during the revocation period will not be counted towards Credential Maintenance.

G09. **Revoke for Cause:** A step in the disciplinary process during which the certificate is no longer valid and requiring successfully passing an exam to become certified. However, an exam will not be authorized until the revocation period expires. CE Hours earned before or during this revocation period will not be counted for maintaining a Credential.

G10. **Suspended:** Certificate status due to an insufficient number of CE Hours being submitted prior to the expiration of a certificate. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified.

G11. **Termination of Credential:** A step in the disciplinary process whereby a Credential is permanently Revoked.

G12. **Type of CE Hours:** NERC-Approved Learning Activity covering topics from Appendix A, NERC Reliability Standards and/or simulations for which there is a minimum requirement for Credential Maintenance.

Appendix A — Recognized Operator Training Topics

1. **Basic Concepts**
   a. Basic electricity including capacitance, inductance, impedance, Real and Reactive Power
   b. Single phase & three phase power systems
   c. Transmission line and transformer characteristics
   d. Substation layouts including the advantages and disadvantages of substation bus schemes

2. **Production & Transfer of Electric Energy**
   a. How generators produce electricity
   b. Types of generators including advantages and disadvantages of each type
   c. Economic operation of generators
   d. Real and Reactive Power flow

3. **System Protection**
   a. Transmission line, transformer, and bus protection principles
   b. Generator protection principles
   c. Types of relays used in different protection schemes
   d. The role of communication systems in system protection

4. **Interconnected Power System Operations**
   a. Voltage control
   b. Frequency control
   c. Power system stability
   d. Facility outage response
   e. Automatic generator control (AGC) including the different modes of AGC
   f. Extra high voltage (EHV) operation
   g. Energy accounting
   h. Inadvertent energy

5. **Emergency Operations**
   a. Loss of generation resource
   b. Operating reserves
   c. Contingency reserves
   d. Line loading relief
   e. Loop flow
   f. Load shedding
   g. Voltage and reactive flows during emergencies
   h. Loss of critical transmission facilities

6. **Power System Restoration**
   a. Restoration philosophies
   b. Facility restoration
   c. Blackstart restoration
   d. Load shedding
   e. Under-frequency Load shedding
   f. Under-voltage Load shedding

7. **Market Operations**
   a. Standards of conduct
   b. Tariffs
   c. Transmission reservations and transmission priorities
   d. Transaction tagging

8. **Tools**
   a. Supervisory control and data acquisition
   b. Automatic generation control application
   c. Power flow application
   d. State estimator application
   e. Contingency analysis application
   f. P-V curves
   g. Load forecasting application
   h. Energy accounting application
   i. OASIS application
   j. E-Tag application
   k. Voice and data communication systems

9. **Operator Awareness**
   a. Identifying loss of facilities
   b. Recognizing loss of communication facilities
   c. Recognizing telemetry problems
   d. Recognizing and identifying contingency problems
   e. Communication with appropriate entities including the Reliability Coordinator

10. **Policies & Procedures**
    a. NERC Reliability Standards
    b. ISO/RTO operational and emergency policies and procedures
    c. Regional operational and emergency policies and procedures
    d. Local & company specific policies and procedures
    e. Emergency operating plans
    f. Line loading relief procedures
    g. Physical and cyber sabotage procedures
    h. Outage management and switching procedures

11. **NERC Reliability Standards**
    a. Application and/or implementation of NERC Reliability Standards

Executive Summary

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires skilled, trained and qualified system operators. The System Operator Certification Program provides the mechanism to ensure system operators are provided the education and training necessary to obtain the essential knowledge and skills and are therefore qualified to operate the Bulk Electric System.

The System Operator Certification Program provides the framework for the examinations used to obtain initial Certification in one of four NERC Credentials: transmission operator, balancing and interchange operator, balancing, interchange and transmission operator, and reliability operator. A system operator Credential is a personal Credential issued to a person for successfully passing a NERC system operator Certification exam. The Credential is maintained by accumulating a specified number of Continuing Education Hours within a specified period of time. The program will allow system operators to maintain their Credential through continuing education rather than to recertify by retaking an examination.

The NERC Personnel Certification Governance Committee (PCGC) is the governing body that establishes the policies, sets fees, and monitors the performance of the System Operator Certification Program. As program administrator, NERC maintains databases, records, and applications, collects fees, maintains contracts with vendors, and provides reports on system operator Certification related activities. The PCGC is responsible for ensuring the program is not-for-profit and financially sound, and annually reviews the program to ensure that it is adequately funded.

Section I — Certification Examinations

Overview

The System Operator Certification Program awards Certification Credentials to those individuals who demonstrate that they have attained sufficient knowledge relating to NERC Reliability Standards as well as the basic principles of Bulk Power System operations by passing one of four specialty examinations. A certificate is issued to a candidate who successfully completes an examination. Certificates issued prior to the implementation of the new Continuing Education Hours requirement will be valid for five years. Certificates issued after the implementation of this requirement will be valid for three years.

The members of the Examination Working Group (EWG) represent each of the specialty areas tested in the examinations. The EWG develops the examinations under the guidance of a psychometric consultant. The examinations are based on content outlines that were developed through a job analysis. Prior to being used in the scoring process, each question is 'piloted' (not scored) for one full examination cycle (eighteen months), and the performance of each question is continually tracked. The direct involvement of system operators, supervisors, and trainers in the examination development process will remain a primary requirement of future NERC system operator Certification examinations.

Earning a Credential

Examinations

There are four specialty examinations: reliability operator, balancing and interchange operator, transmission operator, and balancing, interchange, and transmission operator. Each of the examinations has its own content outline that can be accessed from the Program's web page. The specifics of the individual examinations can be obtained from the table below. The individual content outlines for each of the specialty examinations can be obtained by clicking on the name of the exam.

Examination Title	Total Questions	Scored Questions	Passing Score (# of answers correct)	Passing Score (% of answers correct)
Reliability operator Certification examination	150	125	93	74.4
Balancing, interchange, and transmission operator Certification examination	150	125	93	74.4
Transmission operator Certification examination	125	100	76	76
Balancing and interchange operator Certification examination	125	100	76	76

Applying for Certification Examinations

1. You must first establish a NERC.net user account. Once you are registered, you can access the on-line application form.

   a. If you do not have a NERC.net user account, please click here (https://soc.nerc.net/registration/default.aspx) to set up your free account.

2. If you already have a NERC.net user account, please click here (https://soc.nerc.net/default.aspx) to sign-in to your NERC.net user account to access the on-line examination application form.

   a. If you have forgotten your user name or password, contact the NERC office at phone number (609) 452-8060 (Mon–Fri, 8:00 a.m.–4:00 p.m. Eastern).

3. Select *Exam Application Form*
4. Select the examination you wish to take then click *SUBMIT*
5. You may submit your payment either by selecting credit card (VISA or MasterCard only) or invoice for check payments. A copy of the invoice and check or money order must be mailed to NERC to complete your examination application process.

North American Electric Reliability Corporation
System Operator Certification Program
116-390 Village Boulevard
Princeton, New Jersey 08540-5731

Applications are accepted year round. Allow two weeks for the processing of your application and receipt of notification that you are approved to take the examination.

An application is considered complete and processed only when all required information is provided and fees are received. After the application is processed, the authorization-to-test (ATT) letter containing the assigned ATT number is sent to each eligible candidate by e-mail followed by regular mail.

Eligibility Period

Eligibility to take the examination remains in effect for one year from the date the ATT number is issued. Candidates are encouraged to schedule an appointment to sit for the examination promptly. If a candidate fails to schedule and take the examination during the one-year eligibility period, the candidate shall forfeit all payments made to NERC. Candidates who fail to take the examination within the one-year eligibility must submit a new application and pay the full fee to be considered for eligibility again.

Fees

Fee Schedule	
Application to test	$350
Application to retest	$350
Application to withdraw	$50
Bad check/credit	$25

**All funds shall be payable in U.S. dollars.

Before scheduling an examination, please do the following:

- Review all parts of this Program Manual.
- Complete and submit the application to NERC, along with the appropriate fee.
- Receive an ATT letter containing the assigned ATT number by e-mail and regular mail from NERC declaring that you are eligible to take the examination. The letter will also provide instructions on how you may arrange the location, date, and time of your examination. The ATT number will be needed when you contact Prometric to schedule your test appointment.

Scheduling an Examination

NERC will send you an ATT letter by e-mail and regular mail with instructions about the identification items to bring with you on the day of the examination. To select your examination location, date, and time go to the Prometric website at http://www.prometric.com. All attempts should be made to schedule your examination as soon as possible because testing center appointments are in high demand by other professions. Waiting to schedule your appointment may significantly limit the locations, dates, and times available. Examinations may be administered on any Monday through Saturday. Examinations may be taken on any day that accommodates your schedule and where and when examination space is available.

During the scheduling process, you will be required to confirm your ATT number and your first and last name. You will be advised of available testing locations, dates, and times.

Note: When you schedule your test date, you will receive a confirmation number from Prometric. Please retain this number, as it will be useful should you have to use Prometric's automated cancellation system or if there is a conflict with the test center appointment. Prometric will not mail you a confirmation notice.

Examination Content Outline

The computer-based examination consists of objective, multiple-choice questions. The questions are based on the published Content Outline for each of the NERC system operator Certification examinations.

Day of the Examination

Time at Testing Center — Plan to arrive at the testing center at least thirty minutes early to sign in. You should allocate at least four hours to accommodate the total time you might be at the testing center. This includes:

Examination Time Allocation	
Examination Stages	**Time Allocation**
Administration & Review of Candidate Identification	30 minutes
Computer-Based Tutorial	15 minutes
Examination	2 hours & 45 minutes
Post-Examination Survey	15 minutes
Total Time to be Allocated	**3 hours & 45 minutes**

Computer Familiarization — A fifteen-minute tutorial on operating instructions for the computer-based examination will be provided before the start of each examination. The tutorial is self-explanatory, and no prior computer knowledge is needed. You may bypass this feature if you wish (not recommended).

Computer-based testing allows you to skip questions, mark, and return to them at a later time. During the examination, you may change your answer to any question. A clock is on the screen at all times indicating the time remaining. Before exiting the examination, the computer will indicate any question(s) you have marked for review or those that remain unanswered.

Post-Examination Survey — At the completion of the examination, you will be invited to complete a brief questionnaire on your reactions to the examination experience and the quality of the testing center staff and services. ***This is also your opportunity to comment on the content of the examination and to challenge any particular examination questions or answers***.

Comments — Comments on the examination process or questions will be collected in the post-examination survey. All comments will be forwarded to NERC.

Testing Center Requirements

Required Methods of Identification — You will be required to show two forms of identification before being admitted to the examination. You will be required to show at least one primary form of identification and either another primary or a secondary form of identification.

- Primary identification — Primary identification is a government-issued form of identification and must have **both** your picture **and** your signature on it. Some examples of primary identification are: a driver's license (if it has both your picture and your signature), a passport, or a military ID.
- Secondary identification — Secondary identification must have **either** your picture **or** your signature **or** both. Acceptable forms of secondary ID are: a second government-issued ID as above, or an employment ID, or a credit card or debit card.

Identification(s) that have been altered or damaged will not be accepted at the Prometric Test Center. If there is any discrepancy between the name on the identification presented to the test center staff and the NERC registration, the candidate will not be admitted to test and will be marked as a no-show. All no-shows forfeit all funds paid – no refunds are granted to no-shows.

Testing Center Regulations

- Candidates who arrive late for the examination might not be seated for the examination, depending on the criteria established by that testing center. Late arrivals that are not permitted to take the examination will be considered a no-show and must reapply and pay the full test fee to take the examination.
- No reference materials, calculators, or recording equipment may be taken into the examination. Candidates will be provided a keyed locker to store personal items while taking the examination.
- No test materials, documents, notes, or scratch paper of any sort may be taken from the examination.
- Visitors are not permitted during the examination.
- Testing center staff is instructed to answer questions about testing procedures only. They cannot respond to inquiries regarding the examination's content.
- During the examination, candidates may use the rest rooms for a biological break; however, the examination clock will continue running during such times.
- Candidates may not leave the testing center until they have finished the examination.
- Smoking is not permitted in any testing center.
- Any candidate giving or receiving assistance, or making a disturbance, will be required to turn in their examination materials, exit the examination room, and leave the testing center. Your test will be scored whether you have completed it or not. The disciplinary action procedure will be initiated upon notification by Prometric to NERC that such activity had occurred.
- Any instances of cheating, or attempts to impersonate another candidate, will be dealt with through the disciplinary action procedure.

Cancellations and No-shows

You may cancel and reschedule an examination appointment either by calling Prometric at the toll free number listed in your ATT letter or through their website (http://www.prometric.com). Your request to cancel must be no later than noon, local test center time, two days (Monday–Saturday excluding local holidays) before the examination date. You may reschedule the examination date within your period of eligibility without paying an additional fee. If you are late in canceling your examination appointment, do not appear for it, or arrive late, you will be considered a no-show. All no-shows will have to reapply to take the examination and pay the full test fee. Refunds will not be issued to no-shows.

Minimum Time Between Examinations

Candidates who fail the examination must wait 42 days from the date of the failed examination to retest. Candidates who pass one of the NERC system operator Certification examinations may take the examination thirty-six months after the date they were last certified (this only applies to those certificates valid for five years that were issued prior to the implementation of Continuing Education Hours as a means of Credential Maintenance).

Special Accommodations/Disabilities

Allowance will be made for all documented requests for special testing conditions. Applicants must notify NERC by e-mail or telephone. The Certification coordinator will contact the applicant with further instructions. Disability requests must be supported by a letter (original copy) from a recognized health care provider and be signed by a physician or psychologist. All other requests must be similarly supported. NERC will review each request and provide appropriate accommodations. The decision will be included in the notice of eligibility/ registration approval sent to the applicant.

Note: All testing centers are in compliance with the regulations governing the Americans with Disabilities Act (ADA).

Withdrawal from Examination Process

As described in the *Eligibility Period* section of this Program Manual, the eligibility period is one year from the date the ATT number is issued. If a candidate wishes to withdraw from the process within the stated period for any reason, they must complete the candidate withdrawal request on the system operator Certification website on or before the last eligibility day. Candidates who submit the request within the time period will be reimbursed for the fees submitted to NERC less the withdrawal fee in effect at the time of the application. Failure to properly withdraw will result in the candidate forfeiting all submitted fees.

If you have already scheduled an appointment with Prometric to take the exam, you must first cancel that Prometric appointment or you will be charged a no-show fee.

To access the Exam Withdrawal
On the System Operator Certification Program homepage, logon to your NERC.net account:

- Enter User name and Password
- Click on Logon
- Click on Exam Withdrawal
- Select the exam you are registered to take and from which you wish to withdraw, then click on Submit

Examination Change Request

If a candidate wishes to change the examination (i.e., from BI to TO, or from RC to BIT, etc.) that they are registered to take, they must use the Program's website. An examination change request will not change the candidate's eligibility period. The eligibility period will remain valid for one year from the date that the original ATT number was issued. This change request must be submitted at least thirty days prior to the expiration of the candidate's eligibility period.

To access the Examination Change
On the System Operator Certification Program homepage, logon to your NERC.net account:

- Enter User Name and Password
- Click on Logon
- Click on Exam Change
- Select the exam for which you are authorized then click on Submit
- Select the desired exam from the drop-down list, then click on Submit

You will be issued a new ATT number with the original expiration date. After receiving your new ATT you must schedule/reschedule an appointment with Prometric to take the exam.

Results and Awarding of Certificates

Candidates can view pass/fail results on the computer screen when the examination is terminated. Before exiting the Prometric Testing Center, a copy of this display will be provided. This is an unofficial summary of the examination.

After grading and analysis of the examination results, NERC will mail an official summary. This will take about ten to twelve weeks. The official summary will include the grade achieved and the percentage of correctly answered questions in each content outline category.

Candidates who pass the examination will receive the appropriate NERC-certified system operator certificate based on the examination taken and signed by the President of NERC. The date on the certificate will be the day the candidate took the examination.

System Operator Certificate Numbering Convention

Numbering certificates for certified system operators follows a specific convention. There have been two numbering conventions used since the start of the program.

The original Credential, issued from 1998 into 2002, was the NERC certified system operator. These certificates were assigned the letter N followed by four digits indicating the year the candidate registered, followed by a four digit sequential number.

> Example: N19980109 = NERC certified system operator that registered in 1998 and was the 109th system operator registered in the program.

When the specialty Credentials were implemented in late 2002, a new numbering convention was implemented. The new numbering convention consists of a two-letter designation of the Credential type, followed by six digits that indicate year and month the Credential was awarded, followed by a three digit sequential number in that month.

> Example: RA200306109 = NERC certified reliability operator certified in June of 2003 and was the 109th system operator certified in that month.

Credential Designations

N/RA/RC	Reliability operator
BT	Combined balancing and interchange/transmission operator
BA	Balancing and interchange operator
TO	Transmission operator

Confirmation of Credential to Third Parties

NERC will confirm to an employer that an individual holds a valid NERC system operator certificate (including releasing the certificate number and the issuance date) in response to a written request, on the employer's letterhead (or e-mail), providing the name of the individual. NERC will release the certificate numbers and issuance dates for individuals holding a current NERC system operator certificate to the Regional Entity Compliance Staff or designated agents of those Regional Entities in which an individual's employer operates in response to a written request, submitted on organization letterhead (or e-mail), that provides the names of the individuals for whom information is sought. No further information will be provided.

NERC will confirm to an employment search firm, or a potential employer, whether an individual holds a valid NERC system operator certificate (including releasing the certificate number and the issuance date) if the search firm has a release from the individual. No further information will be provided.

Section II — Credential Maintenance

Effective Date: October 1, 2006

Overview

The System Operator Certification Program incorporates a requirement to use Continuing Education Hours (CE Hours) to maintain a Credential that is valid for three years. Successfully passing an examination earns a Credential and a certificate that is valid for three years. Accumulation of the proper number and type of CE Hours from NERC-approved learning activities within that three-year period maintains the validity of that Credential for the next three years. A new certificate is issued indicating the new expiration date.

The program provides that:

1. System operators seeking to obtain a Credential will have to pass an examination to earn a Credential.
2. A certificate, valid for three years, will be issued to successful candidates.
3. A certified system operator must accumulate a minimum number of CE Hours, in specific training topics, before their certificate expires to maintain their Credential. The minimum number of CE Hours is based on each Credential:
    a. 200 CE Hours for reliability operator
    b. 160 CE Hours for balancing, interchange, and transmission operator
    c. 140 CE Hours for balancing and interchange operator
    d. 140 CE Hours for transmission operator
4. A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.
5. A minimum of 30 CE Hours must be in simulations (i.e., table-top exercises, training simulators, emergency drills, practice emergency procedures, restoration, blackstart, etc.).
6. CE Hours can concurrently count for both NERC Reliability Standards and simulations but will only be counted once for the total CE Hours requirement.
    a. For example: A one-hour simulation learning activity that focuses on NERC Standards can count towards the requirements for both NERC Reliability Standards and simulation. However, the Credential holder will only be awarded a total of one CE Hour toward the total CE Hours requirement. In other words, the CE Hours will not be double counted.
7. Retaking the examination is not an option for Credential Maintenance.
8. If a certified system operator does not accumulate enough CE Hours to maintain their current Credential prior to the certificate expiration date, their Credential will be Suspended for a maximum of one year. At the end of the suspension period, their Credential will be Revoked.
9. If, prior to the end of the one-year suspension, the certified system operator accumulates the proper number and type of CE Hours, their Credential will be reinstated with the original expiration date (three years after the previous expiration date).

10. A system operator with a Revoked Credential will have to pass an examination to become certified.

When to Start Accumulating CE Hours

CE Hours earned (date of learning activity) in the six months prior to the implementation date will be recognized if they are earned from an approved learning activity that meets the Certification program requirements. Each learning activity will have to be approved for use for Credential Maintenance prior to the CE Hours being issued.

Specifics of the Credential Maintenance Program

Certified system operators are required to accumulate CE Hours through the NERC Continuing Education Program in recognized training topics for Credential Maintenance. See *Appendix A* for the list of recognized training topics. Described below are the requirements for each of the four Credentials:

Transmission Operator Certification
To maintain a valid transmission operator Credential, system operators must earn **140 CE Hours** within the 3-year period preceding the expiration date of their certificate.

The 140 CE Hours must include:

- A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.
- A minimum of 30 CE Hours must utilize simulations (i.e., table-top exercises, dispatcher/operator training simulators, emergency drills, or practice emergency procedures, restoration, blackstart or other reliability-based scenarios).

Balancing and Interchange Operator Certification
To maintain a valid balancing and interchange operator Credential, system operators must earn **140 CE Hours** within the 3-year period preceding the expiration date of their certificate.

The 140 CE Hours must include:

- A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.
- A minimum of 30 CE Hours must utilize simulations (i.e., table-top exercises, dispatcher/operator training simulators, emergency drills, or practice emergency procedures, restoration, blackstart or other reliability-based scenarios).

Balancing, Interchange, and Transmission Operator Certification
To maintain a valid balancing, interchange, and transmission operator Credential, system operators must earn **160 CE Hours** within the 3-year period preceding the expiration date of their certificate.

The 160 CE Hours must include:

- A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.

- A minimum of 30 CE Hours must utilize simulations (i.e., table-top exercises, dispatcher/operator training simulators, emergency drills, or practice emergency procedures, restoration, blackstart or other reliability-based scenarios).

Reliability Operator Certification
To maintain a valid reliability operator credential, system operators must earn **200 CE Hours** within the three-year period preceding the expiration date of their certificate.

The 200 CE Hours must include:

- A minimum of 30 CE Hours must focus on content and/or implementation of NERC Reliability Standards.
- A minimum of 30 CE Hours must utilize simulations (i.e., table-top exercises, dispatcher/operator training simulators, emergency drills, or practice emergency procedures, restoration, blackstart or other reliability-based scenarios).

Certificate

System operators that have: 1) completed the Credential Maintenance application, 2) satisfied the CE Hours requirements, and 3) paid the required fee will be issued a certificate valid for three years.

Deficits of CE Hours for Credential Holders

The Credential of a certified system operator who does not accumulate the required number and balance of CE Hours within the three-year period will be Suspended. A system operator with a Suspended certificate cannot perform any task that requires an operator to be NERC-certified. The system operator with a Suspended Credential will have up to twelve months to acquire the necessary CE Hours.

During the time of suspension, the original anniversary date will be maintained. Therefore, should the system operator accumulate the required number of CE Hours within the twelve-month suspension period, they will be issued a certificate that will be valid for three years from the previous expiration date. The system operator will be required to accumulate the required number of CE Hours prior to the current expiration date.

At the end of the twelve-month suspension period, if the system operator has not accumulated the required number of CE Hours, the Credential will be Revoked and all CE Hours earned will be forfeited. After a Credential is Revoked, the system operator will be required to pass an examination to become certified.

For example, a system operator whose Credential expires on July 31, 2009 does not accumulate the required number of CE Hours prior to that date:

1. The Credential will be Suspended on August 1, 2009.
2. If the system operator then accumulates and submits the required number of CE Hours by March 1, 2010, the Credential will be reinstated on March 1, 2010, and will be valid until July 31, 2012.

3. The system operator will have to accumulate the required number of CE Hours prior to July 31, 2012 or the Credential will be Suspended again.
4. CE Hours previously used to maintain the Credential cannot be reused for Credential Maintenance.
5. A record of the suspension between August 1, 2009 and March 1, 2010 will be maintained.

Carry-Over Hours

For all Credentials, up to 30 CE Hours accumulated in the six months prior to the certificate expiration date and not used for Credential Maintenance may be carried over to the next three-year period.

CE Hours will be allocated on a first-in, first-out basis. In other words, CE Hours from a learning activity occurring first according to the calendar will be used to satisfy the CE Hours requirement first and continuing sequentially by the date of the learning activities.

Reporting of CE Hours Earned by Certified System Operators

Normally, the Providers will make the submittals of electronically into the NERC system operator Certification database. However, should some conflict occur, the certified system operator must be able to submit proof of having acquired the necessary CE Hours from the Continuing Education Program Provider's approved learning activities.

System operators will be able to track their status/progress towards maintaining their Credential through the NERC system operator Certification website. Certified system operators should review their CE Hours records at least 90 days before their certificate expiration date to allow sufficient time to acquire CE Hours prior to the system operator's certificate expiration date should there be a deficit.

If a Provider does not submit the CE Hours, the certified system operator must submit proof of sufficient CE Hours to the NERC Manager of Personnel Certification no less than 30 days before the system operator's certificate expiration date. NERC staff may be able to process/resolve discrepancies in Credential holder CE Hours records in less than 30 days; however, submissions received at NERC within the 30-day window may not be credited to the system operator's account in time to prevent the Credential from being Suspended. Suspended Credentials based on incomplete data will be reinstated retroactively once proof of completion is verified.

For system operators who meet the CE Hours requirements, and upon receipt of an application and necessary fees, NERC will issue a new certificate with an expiration date three years from the previous expiration date (a new certificate will be mailed to the address on record).

Application for Credential Maintenance

Procedure for applying for Credential Maintenance

Application procedure will be completed after the software is developed.

Hardship Clause

It is understood that, due to unforeseen events and extenuating circumstances, a certified system operator may be unable to accumulate the necessary CE Hours in the time frame required by the Program to maintain the Credential. In such an event, an individual must submit a written request containing a thorough explanation of the circumstance and supporting information to:

Manager–Personnel Certification
NERC
116-390 Village Boulevard
Princeton, New Jersey 08540

The PCGC retains the right to invoke this hardship clause and deviate from the Program rules, as it deems appropriate, to address such events or circumstances. Examples of extenuating circumstances would include, but not limited to, extended military service, extended illness of the system operator or within the system operator's immediate family, or system operator temporary disability that results in an extended period of time away from work.

Changing Certification Levels

Certified system operators that want to transition to a lower Credential can do so. Many system operators hold a reliability operator Credential but are not working in a reliability operator capacity. Those certified system operators could easily transition to a Credential that more closely matches the work they perform without taking an examination. However, system operators currently holding a transmission operator or balancing and interchange operator Credential will have to pass an examination to move to a higher Credential such as the combined balancing, interchange, and transmission operator Credential or the reliability operator Credential.

A certified system operator can change the type of their Credential by indicating their desire on their Credential Maintenance application. A system operator has the following options:

To change a Credential from:

- Balancing and interchange operator to any other NERC Credential: the system operator must pass the examination for that Credential.
- Transmission operator to any other NERC Credential: the system operator must pass the examination for that Credential.
- Balancing, interchange, and transmission operator to reliability operator: the system operator must pass the examination for that Credential.
- Reliability operator to any other NERC Credential: the system operator must submit the proper number and type of CE Hours for the new Credential.
- Balancing, interchange, and transmission operator to transmission operator or balancing and interchange operator: the system operator must submit proper number and type of CE Hours for the new Credential.

Transition Plan — 5-year Program to 3-year Program

A certified system operator whose certificate expires during the first three years after implementation of this Program has the option to either accumulate the required number of CE Hours according to the rules stated previously or pass the examination for the desired Credential. Certified system operators who accumulate the required number and balance of CE Hours will receive a certificate that will be valid for three years from the expiration date on their current certificate. System operators who pass an examination will receive a certificate valid for three years from the date they pass the examination.

Certified system operators whose certificate expires after the third anniversary of the implementation of this Program, must accumulate the required number of CE Hours prior to the expiration date of their certificate regardless of the issuance date of their certificate.

Section III — Program Rules

Rules for NERC-Certified System Operator

Recognized Learning Activities

CE Hours will be recognized for Credential Maintenance only for training topics/learning activities listed in *Appendix A* and where Providers have complied with the Continuing Education Program rules.

Provider Access to Database

Providers will be able to access the database to upload certified system operator CE Hours activity. The process for doing this will be determined after the database is developed.

System Operator Access to Database

Certified system operators will be able to access the database to track their CE Hour activity. The process for doing this will be determined after the database is developed.

Retain Documentation

The certified system operator is responsible for retaining appropriate documentation for proof of Credential Maintenance. Documentation includes:

- Name and contact information of the Provider
- Title and identification number of the learning activity and description of its content
- Date(s) of the learning activity
- Location (if applicable)
- Number and type of CE Hours
- System operator's NERC certificate number

Providers shall retain comparable documentation. Electronic forms of documentation are acceptable.

Learning Activity Credit Only Once Per Year

CE Hours for a particular course or learning activity will not be recognized for Credential Maintenance more than once a year based on the Credential anniversary. (i.e., during the twelve-month period preceding the system operator's Credential anniversary)

Exception: CE Hours for courses dealing with emergency operations will be recognized no more than two times per year based on the Credential anniversary. (i.e., during the 12-month period preceding the system operator's Credential anniversary)

Learning Activity Approved Status Revoked after CE Hours Granted

CE Hours granted for a course or learning activity that had been approved for Credential Maintenance will still be recognized if, subsequent to the system operator attending the course or learning activity, the approved status is Revoked.

Instructor Credits

For those instructors who are also certified system operators, 1.0 CE Hour for each CE Hours of a learning activity delivered will be recognized towards the instructor's system operator Credential Maintenance. CE Hours for a particular course or learning activity will not be recognized for Credential Maintenance more than once a year based on the Credential anniversary. (i.e., during the twelve-month period preceding the system operator's Credential anniversary)
Exception: CE Hours for courses dealing with emergency operations will be recognized no more than two times per year based on the Credential anniversary. (i.e., during the twelve-month period preceding the system operator's Credential anniversary)

Treatment of Disputes Between Certified System Operator and Providers

Disputes between a Provider and a certified system operator must be resolved between the Provider and the certified system operator. NERC will not become involved in resolving the dispute. Additionally, it is the obligation of the certified system operator to periodically review their CE Hours' records in the NERC system operator Certification database and to maintain their own training records to provide proof that CE Hour requirements have been achieved.

Fees

Fee Schedule**	
Application to test	$350
Application to maintain or change Credential using CE Hours	$350
Application to retest	$350
Application to withdraw	$50
Bad check/credit application	$25

**All funds must be payable in U.S. dollars.

The Program must be financially independent as well as not-for-profit. The on-going expenses to develop and maintain the examinations and the management and administrative costs associated with both the examination process and Credential Maintenance necessitate these fees. These fees will be periodically reviewed and adjusted accordingly.

Section IV — Dispute Resolution

1. Applicability

Any dispute arising under the NERC agreement establishing a *NERC System Operator Certification Program* or from the establishment of any NERC rules, policies, or procedures dealing with any segment of the Certification process shall be subject to the NERC system operator certification dispute resolution process (hereafter called the "Process"). The Process is for the use of persons who hold an operator Certification or persons wishing to be certified to dispute the validity of the examination, the content of the test, the content outlines, or the registration process. The Process is not for trainers or certified persons disputing CE Hours.

2. Dispute Resolution Process

The dispute resolution process consists of three steps.

a. **NERC System Operator Certification Program Staff**
The first step in the process is for the person with a dispute to contact the NERC System Operator Certification Program staff. Contact may be made by a phone call or e-mail to the program staff. This first step can usually resolve the issues without further actions. It is expected that most disputes will be resolved at this step.

Any dispute that requires resolution will first be brought to the NERC System Operator Certification Program staff. Should the issue(s) not be resolved to the satisfaction of the parties involved, the issue can be brought to the Personnel Certification Governance Committee (PCGC) Dispute Resolution Task Force.

b. **Personnel Certification Governance Dispute Resolution Task Force**
If the NERC staff did not resolve the issue(s) to the satisfaction of the parties involved, a written request should be submitted to the chairman of the PCGC through NERC staff explaining the issue(s) and requesting further action. Upon receipt of the letter, the PCGC chairman will present the request to the PCGC Dispute Resolution Task Force for action. This task force consists of three current members of the PCGC. The PCGC Dispute Resolution Task Force will investigate and consider the issue(s) presented and make a decision. This decision will then be communicated to the submitting party, the PCGC chairman, and the NERC staff within 45 calendar days of receipt of the request.

If a French-Canadian or Mexican party raises a dispute, the PCGC shall appoint a French-Canadian speaking or Spanish-speaking interpreter, respectively, as requested.

c. **Personnel Certification Governance Committee**
If the PCGC Dispute Resolution Task Force's decision did not resolve the issue(s) to the satisfaction of the parties involved, the final step in the process is for the issue(s) to be brought before the PCGC. The disputing party shall submit a written request to the PCGC chairman through NERC staff requesting that the issue(s) be brought before the

PCGC for resolution. The chairman shall see that the necessary documents and related data are provided to the PCGC members as soon as practicable. The PCGC will then meet or conference to discuss the issue(s) and make their decision within 60 calendar days of the chairman's receipt of the request. The decision will be provided to the person bringing the issue(s) and the NERC staff. The PCGC is the governing body of the Certification Program and its decision is final.

3. Process Expenses

All individual expenses associated with the Process, including salaries, meetings, or consultant fees, shall be the responsibility of the individual parties incurring the expense.

4. Decision Process

Robert's Rules of Order shall be used as a standard of conduct for the Process. A simple majority vote of the members present will decide all issues. The vote will be taken in a closed session. No one on the PCGC may participate in the dispute resolution process, other than as a party or witness, if he or she has an interest in the particular matter.

A stipulation of invoking the appeals process is that the entity requesting the appeal agrees that neither NERC (its Members, Board of Trustees, committees, subcommittees, and staff), any person assisting in the appeals process, nor any company employing a person assisting in the appeals process, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

Section V — Disciplinary Action

1. Purpose

This disciplinary action procedure is necessary to protect the integrity of the system operator Credential. Should an individual act in a manner that is inconsistent with expectations, this procedure describes the process to investigate and take action necessary to protect the Credential.

2. Grounds for Action

The following shall serve as grounds for disciplinary action:

a. Willful, gross, and/or repeated violation of the NERC Reliability Standards as determined by a NERC investigation.

   i. Both the organization and the certified system operator are bound by the NERC Reliability Standards. If a certified system operator, either in concert with the organization or on his or her own initiative, performs a willful, gross, and/or repeated violation of the NERC Reliability Standards, he or she is liable for those actions and disciplinary actions may be taken against him or her.

b. Willful, gross, and/or repeated negligence in performing the duties of a certified system operator as determined by a NERC investigation.

c. Intentional misrepresentation of information provided on a NERC application for a system operator Certification exam or to maintain a system operator Credential using CE Hours.

d. Intentional misrepresentation of identification in the exam process.

   i. This includes, but is not limited to, a person identifying himself or herself as another person to obtain Certification for the other person.

e. Any form of cheating during a Certification exam.

   i. This includes, but is not limited to, bringing unauthorized reference material in the form of notes, crib sheets, or other methods of cheating into the testing center.

f. A certified system operator's admission to or conviction of any felony or misdemeanor directly related to their duties as a system operator.

3. Hearing and Appeals Process

Upon report to NERC of a candidate's or certified system operator's alleged misconduct, the NERC Personnel Certification Governance Committee (PCGC) Credential Review Task Force will convene for the determination of facts. An individual, government agency, or other investigating authority can file reports.

Unless the task force initially determines that the report of alleged misconduct is without merit, the candidate or certified system operator will be given the right to notice of the allegation. A hearing will be held and the charged candidate or certified system operator will be given an opportunity to be heard and present further relevant information. The task force may seek out information from other involved parties. The hearing will not be open to the public, but it will be

open to the charged candidate or certified system operator and his or her representative. The task force will deliberate in a closed session, but the task force cannot receive any evidence during the closed session that was not developed during the course of the hearing. The task force's decision will be unanimous and will be in writing with inclusion of the facts and reasons for the decision. The task force's written decision will be delivered to the PCGC and by certified post to the charged candidate or certified system operator. In the event that the task force is unable to reach a unanimous decision, the matter shall be brought to the full committee for a decision.

The task force's decision will be one of the below:

a. No Action
Allegation of misconduct was determined to be unsubstantiated or inconsequential to the Credential.

b. Probation
A letter will be sent from NERC to the offender specifying:

i. The length of time of the probationary period (to be determined by the PCGC).

(a) Credential will remain valid during the probationary period.

(b) The probationary period does not affect the expiration date of the current certificate.

ii. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

(a) Extension of Probation,

(b) Revocation for cause, or

(c) Termination of Credential.

c. Revoke for Cause
A letter will be sent from NERC to the offender specifying:

i. The length of time of the revocation period (to be determined by the PCGC).

(a) Credential is no longer valid.

(b) Successfully passing an exam will be required to become certified.

(c) An exam will not be authorized until the revocation period expires.

d. Termination of Credential
A letter will be sent from NERC to the offender specifying:

i. Permanent removal of Credential.

4. Appeal Process

The decision of the task force may be appealed using the NERC system operator certification dispute resolution process.

5. Credential Review Task Force

The Credential Review Task Force shall be comprised of three active members of the PCGC assigned by the Chairman of the PCGC on an ad hoc basis. No one on the Credential Review Task Force may have an interest in the particular matter.

The task force will meet in a venue determined by the task force chairman.

If a French-Canadian or Mexican party raises a dispute, the PCGC shall appoint a French-Canadian speaking or Spanish-speaking interpreter, respectively, as requested.

Glossary

Capitalized terms used in this Appendix shall have the definitions set forth in Appendix 2 of the Rules of Procedure. For convenience of reference, definitions used in this Appendix are also set forth below:

G01. **Continuing Education Hour or CE Hour**: Sixty minutes of participation in a group, independent study, or self-study learning activity as approved by the NERC Continuing Education Program.

G02. **Continuing Education Program Provider or Provider**: The individual or organization offering a learning activity to participants and maintaining documentation required by these criteria.

G03. **Certification:** An official recognition that indicates the recipient has passed a NERC exam or completed a specified number of Continuing Education Hours.

G04. **Credential:** NERC designation that indicates the level of qualification achieved (i.e., reliability operator; balancing, interchange, and transmission operator; balancing and interchange operator; and transmission operator).

G05. **Credential Maintenance:** Meet NERC CE Hours' requirements to maintain a valid NERC-issued system operator Credential.

G06. **NERC-Approved Learning Activity**: Training that maintains or improves professional competence and has been approved by NERC for use in its Continuing Education Program.

G07. **Probation:** A step in the disciplinary process during which the certificate is still valid. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

G08. **Revoked:** A NERC certificate which has been Suspended for more than twelve months. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified. The certificate holder will be required to pass an exam to be certified again. Any CE Hours accumulated prior to or during the revocation period will not be counted towards Credential Maintenance.

G09. **Revoke for Cause:** A step in the disciplinary process during which the certificate is no longer valid and requiring successfully passing an exam to become certified. However, an exam will not be authorized until the revocation period expires. CE Hours earned before or during this revocation period will not be counted for maintaining a Credential.

G10. **Suspended:** Certificate status due to an insufficient number of CE Hours being submitted prior to the expiration of a certificate. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified.

G11. **Termination of Credential:** A step in the disciplinary process whereby a Credential is permanently Revoked.

G12. **Type of CE Hours:** NERC-Approved Learning Activity covering topics from Appendix A, NERC Reliability Standards and/or simulations for which there is a minimum requirement for Credential Maintenance.

Appendix A — Recognized Operator Training Topics

1. **Basic Concepts**
   a. Basic electricity including capacitance, inductance, impedance, Real and Reactive Power ~~real and reactive power~~
   b. Single phase & three phase power systems
   c. Transmission line and transformer characteristics
   d. Substation layouts including the advantages and disadvantages of substation bus schemes
2. **Production & Transfer of Electric Energy**
   a. How generators produce electricity
   b. Types of generators including advantages and disadvantages of each type
   c. Economic operation of generators
   d. Real and Reactive Power ~~reactive power~~ flow
3. **System Protection**
   a. Transmission line, transformer, and bus protection principles
   b. Generator protection principles
   c. Types of relays used in different protection schemes
   d. The role of communication systems in system protection
4. **Interconnected Power System Operations**
   a. Voltage control
   b. Frequency control
   c. Power system stability
   d. Facility outage response
   e. Automatic generator control (AGC) including the different modes of AGC
   f. Extra high voltage (EHV) operation
   g. Energy accounting
   h. Inadvertent energy
5. **Emergency Operations**
   a. Loss of generation resource
   b. Operating reserves
   c. Contingency reserves
   d. Line loading relief
   e. Loop flow
   f. Load shedding
   g. Voltage and reactive flows during emergencies
   h. Loss of critical transmission facilities
6. **Power System Restoration**
   a. Restoration philosophies
   b. Facility restoration
   c. Blackstart restoration
   d. Load shedding
   e. Under-frequency Load~~load~~ shedding
   f. Under-voltage Load~~load~~ shedding

7. **Market Operations**
   a. Standards of conduct
   b. Tariffs
   c. Transmission reservations and transmission priorities
   d. Transaction tagging

8. **Tools**
   a. Supervisory control and data acquisition
   b. Automatic generation control application
   c. Power flow application
   d. State estimator application
   e. Contingency analysis application
   f. P-V curves
   g. Load forecasting application
   h. Energy accounting application
   i. OASIS application
   j. E-Tag application
   k. Voice and data communication systems

9. **Operator Awareness**
   a. Identifying loss of facilities
   b. Recognizing loss of communication facilities
   c. Recognizing telemetry problems
   d. Recognizing and identifying contingency problems
   e. Communication with appropriate entities including the Reliability Coordinator

10. **Policies & Procedures**
    a. NERC Reliability Standards
    b. ISO/RTO operational and emergency policies and procedures
    c. Regional operational and emergency policies and procedures
    d. Local & company specific policies and procedures
    e. Emergency operating plans
    f. Line loading relief procedures
    g. Physical and cyber sabotage procedures
    h. Outage management and switching procedures

11. **NERC Reliability Standards**
    a. Application and/or implementation of NERC Reliability Standards

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF REVISIONS TO ITS RULES OF PROCEDURE
TO ADOPT A BULK ELECTRIC SYSTEM EXCEPTION PROCEDURE

ATTACHMENT 8A

REVISED APPENDIX 8 OF THE RULES OF PROCEDURE,

NERC BLACKOUT AND DISTURBANCE RESPONSE PROCEDURES

CLEAN VERSION

Appendix 8

Proposed Revisions 1-9-2012
[Incorporates revisions filed with FERC on November 29, 2011]

NERC Blackout and Disturbance Response Procedures

Effective October 18, 2007

North American Electric Reliability Corporation

NERC Blackout and Disturbance Response Procedures

Introduction

NERC, through its professional staff and the Regional Entities and their members, provide the best source of technical and managerial expertise for responding to major events that affect the Bulk Power System.

NERC's role following a blackout or other major Bulk Electric System disturbance or emergency is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the event. Working closely with the Regional Entities and Reliability Coordinators, NERC will coordinate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

When responding to any event where physical or cyber security is suspected as a cause or contributing factor to an event, NERC will immediately notify appropriate government agencies and coordinate its analysis with them.

During the conduct of some NERC-level analyses, assistance may be needed from government agencies. Collaborative analysis with certain government agencies may be appropriate in some cases; e.g., collaborating with the Nuclear Regulatory Commission technical staff when a system event involves a nuclear unit. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; analyses related to possible criminal or terrorist involvement in the event; resources for initial data gathering immediately after the event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies. If a federal or multi-national government analysis is called for, government agencies should work in primarily an oversight and support role, in close coordination with the NERC analysis.

It is critical to establish, up front, a clear delineation of roles, responsibilities, and coordination requirements among industry and government for the analysis and reporting of findings, conclusions, and recommendations related to major blackouts, disturbances, or other emergencies affecting the Bulk Power System.

Depending on the severity and of the event and the area impacted, the event analysis may be conducted either by NERC or by the impacted Regional Entity. If the analysis is conducted by the Regional Entity, NERC staff, at least one member of the NERC Event Analysis Working Group (in addition to the Event Analysis Working Group member from the impacted Regional Entity), and other appropriate technical experts from the NERC community will participate as members of the Regional Entity analysis team.

A Regional Entity may request NERC to elevate an analysis to a NERC-level. In such cases, all team responsibilities will shift to NERC, and the Regional Entity may continue to participate in the analysis on appropriate teams.

These procedures do not represent a "cookbook" to be followed blindly. They provide a framework to guide NERC's response to events that may have multiregional, national, or

international implications. Experienced industry leadership would still be required to tailor the response to the specific circumstances of the event.

Responding to major blackouts and other system disturbances can be divided into four phases:

1. situation assessment and communications;
2. situation tracking and communications;
3. data collection, investigation, analysis and reporting; and
4. follow-up on recommendations.

Phase 1 — Situation Assessment and Communications

NERC's primary roles in Phase 1 are to:

- conduct an initial situation assessment;
- call for the collection of and analyze necessary initial data and information for the event;
- assist the Regional Entity-lead analysis with determining the need for supplemental technical expertise from the NERC community;
- issue initial findings, conclusions, and recommendations;
- maintain detailed data records (not subject to Freedom of Information Act);
- assist government agencies in criminal analyses when relevant;
- provide technical expertise for modeling and analyzing the event; and
- follow up on recommendations.

While conducting its initial situation assessment, NERC will make an early determination as to whether the cause of the event may be related to physical or cyber security, and communicate as appropriate with government agencies.

Notice of a event is typically received by the NERC Electricity Sector Information Sharing and Analysis Center (ESISAC) person on duty and relayed to other appropriate NERC personnel.[1] NERC performs an initial situation assessment by contacting the appropriate Reliability Coordinator(s), and makes a decision on whether to activate its crisis communications plan. At the initial stage in gathering information about an incident, it is critical to minimize interference with Bulk Electric System operators who are in the process of restoring the system. To minimize interference with their work, NERC, in its capacity as the ESISAC, should serve as the primary communications link with government agencies.

The ESISAC Concept of Operations (ConOps) specifies the operations plan, communications procedures, and logistics NERC will follow during normal conditions, emergencies, and national security special events. The ConOps includes the primary points of contact (24x7) for the Federal Energy Regulatory Commission, U.S. Department of Energy, U.S. Department of Homeland Security, U.S. Nuclear Regulatory Commission, and Public Safety and Emergency Preparedness Canada.

It is important that during these early hours the ESISAC, in coordination with government agencies, determine whether this event was caused by the actions of criminal or terrorist parties. The results of this criminal assessment are essential to operators because if there is a possibility that the "attack" is still ongoing, restoration and response actions would need to be tailored to

[1] NERC maintains 24x7 contact information for its key personnel to facilitate such contacts.

these circumstances. If NERC and government agencies deem it necessary for further criminal analyses, NERC will issue a formal notice to affected systems to retain all relevant information gathered during this and subsequent phases of an analysis.

The specific criteria for reporting disturbances and other events are described in NERC Reliability Standard EOP-004-1. These criteria and procedures are intended to provide a common basis for consistent reporting of abnormal system conditions and events that occur in North America. All entities responsible for the reliability of Bulk Power Systems in North America must ensure that sufficient information is submitted to NERC within the time frame required. Reliability Coordinators will use the Reliability Coordinator Information System (RCIS) as the primary method of communications to NERC. The ESISAC duty person is responsible for monitoring the RCIS for such notifications.

Depending on the scope and magnitude of the event, NERC will issue media advisories through its crisis communications plan.

Phase 2 — Situation Tracking and Communications

Based on the nature and severity of the event, in Phase 2 NERC will continue to track progress in restoring the Bulk Power System and service to customers, and keep industry, government agencies, and the public informed. The most important thing to recognize in this phase is that the primary focus of Reliability Coordinators and Transmission Operators is the prompt restoration of the Bulk Electric System. NERC will coordinate requests by government agencies for information from Reliability Coordinators and Transmission Operators, and serve as a conduit and coordinator between industry and government for regular status reports on the restoration.

As events continue, NERC will determine whether a detailed analysis of the event should be conducted, and start to identify manpower requirements, data collection and retention requirements, and at what level the analysis should be conducted. If the event is localized within a Region, NERC will participate in the event analysis of the Regional Entity.

Phase 3 — Data Collection, Investigation, Analysis, and Reporting

Based on the scope, magnitude, and impact of an event, during Phase 3 NERC may:

1. perform an overview analysis of system and generator response;
2. rely on one of its Regional Entities to conduct the analysis and monitor the analysis results;
3. work with a Regional Entity in its analysis; or
4. conduct a NERC-level analysis.

The NERC CEO will decide, based on the initial situation assessment and consultation with the NERC technical committee officers[2], if a NERC-level analysis is warranted. If a NERC-level analysis is to be conducted, the NERC CEO will appoint the Director of Events Analysis and Information Exchange to lead the analysis and assemble a high-level technical steering group to provide guidance and support throughout the analysis.

[2] NERC will maintain a list of 24x7 contact information for its technical committee officers.

NERC reserves the right to elevate or augment an analysis performed by a Regional Entity pending the results of the Regional Entity analysis. Additional requests for analyses or supporting data may be made by NERC at any time in the investigation process.

A Regional Entity may request NERC to elevate an analysis to a NERC-level. In such cases, all team responsibilities will shift to NERC, and the Regional Entity may continue to participate in the analysis on appropriate teams.

If the analysis is to be led by one of the Regional Entities, a member of the NERC staff, at least one member of the NERC Event Analysis Working Group (in addition to an Event Analysis Working Group member from the impacted Regional Entity), and other appropriate technical experts from the NERC community will participate as a triage team. The triage team will participate as members of the Regional Entity analysis team. The triage team will also will assist the Regional Entity with determining if additional technical expertise from the NERC community are needed for the analysis.

For NERC-level analyses, the first task of the Director of Events Analysis and Information Exchange would be to identify what technical and other resources and data would be needed from staff, the industry, and government, and to issue those requests immediately. This task will include identification of any special managerial, forensic, or engineering skills needed for the analysis. Secondly, the Director of Events Analysis and Information Exchange must issue requests for those resources and information. Third, the Director of Events Analysis and Information Exchange must organize the teams that will conduct and report on the analysis.

The teams needed for a particular analysis will vary with the nature and scope of the event. Attachment A describes the typical teams that would be required for a NERC-level analysis, and Attachment B provides suggested guidelines for the NERC-level analysis team scopes. Individuals that participate on these teams will be expected to sign an appropriate confidentiality agreement. NERC uses a standard (pro forma) confidentiality agreement (Attachment C) for participants in event analyses, which it will adapt for specific analyses.

The Blackout and Disturbance Analysis Objectives, Approach, Schedule, and Status (Attachment D) and Guidelines for NERC Reports on Blackouts and Disturbances (Attachment E) are used to guide and manage analysis and reporting on major blackouts and disturbances.

A NERC-level analysis will comprise (a) collecting pertinent event data; (b) constructing a detailed sequence of events leading to and triggering the disturbance; (c) assembling system models and data and conducting detailed system analysis to simulate pre- and post-event conditions; and (d) issuing findings, conclusions, and recommendations. The details of these four phases of the analysis are:

a. Collecting Pertinent Event Data

- Collect all pertinent event logs, disturbance recorders, operator transcripts, and other system data.

b. Detailed Sequence of Events

- Construct a detailed sequence of events leading to and triggering the event. Reconcile event logs, disturbance recorders, operator transcripts, and other system data to create an accurate sequence of events.
- Enter and preserve all data in a secure data warehouse.

c. Detailed System Analysis

- Assess the sequence of events to determine critical times for study.
- Assemble the necessary system models and data from Regional Entity and operating entities to accurately model (with power flow and dynamic simulations) the pre-event conditions.[3] Determine pre-event conditions at critical times prior to event initiation, including an assessment of reliability margins in the pre-event time frame.
- Analyze data from phasor measurement units, high-speed data recorders, digital fault recorders, digital relays, and system relay targets.[4]
- Analyze generator and Load performance, including underfrequency and undervoltage relay actions.
- Use the model information and sequence of events to dynamically model the trigger events and the outage sequence. Identify the system phenomena that propagated the failure. Provide graphical results showing the nature of the cascade. Conduct additional analyses as initial findings identify the need for further study.

d. Findings, Conclusions, and Recommendations

- Identify and assess failures contributing to the event, including possible instability conditions, system protection mis-operations, generator actions, etc.
- Either identify or rule out man-made/criminal cyber or physical attacks on the electric system.
- Determine if the system was being operated within equipment and system design criteria at the time of the outage.
- Assess the qualifications, training, SCADA/EMS tools, and communications available to system operators and Reliability Coordinators, and how effective these were leading up to and during the event.
- Assess the adequacy of communications system and communications among system operators.
- Identify any issues regarding maintenance or equipment conditions that may have contributed to the outage.
- Determine whether system restoration procedures were available and adequate. Identify any issues that caused unexpected delays in the restoration of generators and Loads.
- Identify the root causes[5] and contributing factors of the Cascading outage.

---

[3] NERC is developing standards for data and model validation that will facilitate modeling activities in future blackout analyses.

[4] NERC is developing standards for dynamic monitoring equipment and the deployment of such equipment at critical locations in the Bulk Electric System.

[5] NERC will rely on root cause analysis experts, both from within the industry and outside consultants, to conduct these analyses.

- Recommend actions to prevent Cascading outages in the future and to improve system reliability.
- Determine whether the system is adequately designed.
- All compliance issues will be referred to the NERC Director of Compliance.

Phase 4 — Follow-up on Recommendations

For Phase 4 NERC and the Regional Entities will follow up on specific recommendations coming from all analyses, whether done at the Regional Entity or NERC level. In certain cases, where government agencies have taken a direct role in the analysis, reports will be made to those agencies on progress in addressing the recommendations.

Attachment A

Typical Team Assignments for Analysis of Blackouts or Disturbances[6]

Fact-Finding Teams

- Physical and/or cyber security (if needed)
- On-site interviews
- System data collection (frequency, voltages, generation and Loads)[7]
- System protection and control information
- System restoration
- Coordination with Regional Entity teams

Assessment and Analysis Teams

- Performance of generation and transmission Protection Systems
- Frequency analysis
- Equipment maintenance
- SCADA/EMS/Tools
- Operator training
- Reliability Standards compliance
- System planning
- System operation
- System restoration
- Root cause analysis
- System simulation
- Interregional coordination
- Vegetation management
- Recommendations for future actions
- Security and law enforcement liaison

Data Management Teams

- Data requests
- Data collection
- Data warehouse – entry, logging, retention, and maintenance[8]
- Data release[9]

Report Writing Teams

- Text
- Graphics
- Presentations

---

[6] The analysis team leader will specify the tasks required of each team.
[7] Standard forms and procedures for the collection of data and information will be adapted for particular circumstances.
[8] Experience with data warehousing and access procedures gained during the investigation of the August 2003 blackout will be used in future investigations.
[9] Data release procedures will prevent inappropriate disclosure of information.

Communications Teams

- Press releases
- Interface with government agencies
- Interviews

Attachment B

NERC Blackout and Disturbance Response Procedures
Guidelines for Analysis Team Scopes

Each blackout or disturbance is unique and will therefore demand a customized approach to its analysis. The following guidelines for analysis team scopes are suggestive rather than definitive. Not all the teams listed may be needed for a particular analysis.

Data Requests and Management — This team organizes large volumes of raw data and value-added information produced by analysts in support of the blackout analysis into a data warehouse. The team issues data requests from affected entities, catalogs and stores all data received, and provides secure and confidential access to teams and personnel supporting the analysis. The team serves as the single point for issuing data requests, receiving and storing data, and managing data queries by the analysts, and is responsible for assuring consistency, security, and confidentiality of the data and minimizing redundant data requests.

Sequence of Events — A precise, accurate sequence of events is a building block for all other aspects of the analysis, and is a starting point for the root cause analysis. It is the basis for developing computer models to simulate system conditions and evaluate steady state and stability conditions in the period leading to blackout. The sequence of events is the foundation of facts upon which all other aspects of the analysis can proceed.

System Modeling and Simulation Analysis — System modeling and simulation allows the investigators to replicate system conditions leading up to the blackout. While the sequence of events provides a precise description of discrete events, it does not describe the overall state of the electric system and how close it was to various steady state, voltage stability, and power angle stability limits. An accurate computer model of the system, benchmarked to actual conditions at selected critical times, allows analysts to conduct a series of sensitivity studies to determine if the system was stable and within limits at each point in time leading up to the blackout, and at what point the system became unstable. It also allows analysts to test different solutions to prevent Cascading. Although it is not possible recreate the entire blackout sequence, simulation methods will reveal the mode(s) of failure initiating the blackout and propagating through the system.

Root Cause Analysis — Root cause analysis guides the overall analysis process by providing a systematic approach to evaluating root causes and contributing factors leading to the blackout or disturbance. This team works closely with the technical analysis teams and draws on other data sources as needed to record verified facts regarding conditions and actions (or inactions) that contributed to the blackout or disturbance. The root cause analysis guides the overall analysis by indicating areas requiring further inquiry and other areas that may be of interest regarding lessons learned, but are not causal to the blackout. Root cause analysis enables the analysis process develop a factual record leading to logical and defensible conclusions in the final report regarding the causes of the blackout.

Operations Tools, SCADA/EMS, Communications, and Operations Planning — This team will assess the observability of the electric system to operators and Reliability Coordinators, and the availability and effectiveness of operational (real-time and day-ahead)

reliability assessment tools, including redundancy of views and the ability to observe the "big picture" regarding Bulk Electric System conditions. The team also investigates the operating practices and effectiveness of those practices of operating entities and Reliability Coordinators in the affected area. This team investigates all aspects of the blackout related to operator and Reliability Coordinator knowledge of system conditions, action or inactions, and communications.

Frequency/ACE — This team will analyze potential frequency anomalies that may have occurred, as compared to typical interconnection operations, to determine if there were any unusual issues with control performance and frequency and any effects they may have had related to the blackout.

System Planning, Design, and Studies — This team will analyze the responsibilities, procedures, and design criteria used in setting System Operating Limits, and compare them to good utility practice. The team will review the actual limits in effect on day of the blackout and whether these limits were being observed. The team will review voltage schedules and guides, and reactive management practices in the affected areas, including use of static and dynamic reactive reserves. The team will analyze the tagged and scheduled transactions to determine if inter-regional transfer limits were understood and observed. The team will analyze system planning and design studies completed in the affected areas to determine if operating conditions were consistent with the assumptions of those studies and whether the planning and design studies were sufficient and effective.

Transmission System Performance, Protection, Control, Maintenance, and Damage — This team investigates the causes of all transmission Facility automatic operations (trips and reclosures) leading up to the blackout on all Facilities greater than 100 kV. This review includes relay protection and remedial action schemes, identifying the cause of each operation, and any misoperations that may have occurred. The team also assesses transmission Facility maintenance practices in the affected area as compared to good utility practice and identifies any transmission equipment that was damaged in any way as a result of the blackout. The team will assess transmission line rating practices and the impact that ambient temperature and wind speeds had on the transmission line performance in terms of the design temperature of the transmission conductors. The team shall report any patterns and conclusions regarding what caused transmission Facilities to trip; why the blackout extended as far as it did and not further into other systems; why the transmission separated where it did; any misoperations and the effect those misoperations had on the blackout; and any transmission equipment damage. The team will also report on the transmission Facility maintenance practices of entities in the affected area compared to good utility practice. Vegetation management practices are excluded here and covered in a different team.

Generator Performance, Protection, Controls, Maintenance and Damage — This team will investigate the cause of generator trips for all generators with a 10 MW or greater nameplate rating leading to and through the end of the blackout. The review shall include the cause for the generator trips, relay targets, unit power runbacks, and voltage/Reactive Power excursions. The team shall report any generator equipment that was damaged as a result of the blackout. The team shall report on patterns and conclusions regarding what caused generation Facilities to trip. The team shall identify any unexpected performance anomalies or unexplained events. The team shall assess generator maintenance practices in the affected area as compared

to good utility practice. The team will analyze the coordination of generator under-frequency settings with transmission settings, such as under-frequency Load shedding. The team will gather and analyze data on affected nuclear units and work with the Nuclear Regulatory Commission to address nuclear unit issues.

Vegetation/ROW — This team investigates the practices of transmission Facility owners in the affected areas for vegetation management and ROW maintenance. These practices will be compared with accepted utility practices in general, and with NERC Reliability Standards. The team will evaluate whether the affected parties were within their defined procedures at the time of the blackout and will investigate historical patterns in the area related to outages caused by contact with vegetation.

Analysis Process and Procedures Review — This team will review the process and procedures used in the analysis of the blackout, make recommendations for improvement, and develop recommendations for appropriate processes, procedures, forms, etc. to guide and expedite future analyses including coordination and cooperation between NERC, its Regional Entities, and government agencies.

Restoration Review — All entities operating portions of the Bulk Electric System in North America are required by NERC Reliability Standards to maintain system restoration plans and black start plans, and Reliability Coordinators are required to coordinate the implementation of those plans. This team will review the appropriateness and effectiveness of the restoration plans implemented and the effectiveness of the coordination of these plans.

NERC and RE Standards/Procedures and Compliance — This team reviews the adequacy of NERC Reliability Standards, Regional Reliability Standards and Regional Entity procedures, and the Compliance Monitoring and Enforcement Program to address issues leading to the blackout. The team also reviews the compliance of the affected operating entities with Reliability Standards. For less significant event analyses, this team may not be needed. However, all compliance issues will be referred to the NERC Director of Compliance.

Attachment C

NERC CONFIDENTIALITY AGREEMENT
FOR
ANALYSIS OF BLACKOUTS AND DISTURBANCES

This Confidentiality Agreement ("Agreement"), dated _____, is between the North American Electric Reliability Corporation ("NERC"), and

_____, a member of the NERC Event Analysis Team ("Team Member")(collectively referred to as "Parties").

WHEREAS, NERC is conducting an analysis of the power event that occurred in _____ on _____ and related matters ("Event"); and

WHEREAS, NERC has established a team to carry out that analysis ("Event Analysis Team"); and

WHEREAS, in order for the Event Analysis Team to fulfill its objectives, it is necessary for the Event Analysis Team have access to confidential or business sensitive information from operating entities within the _____ and to be able to conduct open and unconstrained discussions among team members,

The Parties therefore agree as follows:

1. The term "Event Analysis Information" means all information related in any way to the Event that operating entities within the _____ or their representatives have furnished or are furnishing to NERC in connection with NERC's analysis of the Event, whether furnished before or after the date of this Agreement, whether tangible or intangible, and in whatever form or medium provided (including, without limitation, oral communications), as well as all information generated by the Event Analysis Team or its representatives that contains, reflects or is derived from the furnished Event Analysis Information; provided, however, the term "Event Analysis Information" shall not include information that (i) is or becomes generally available to the public other than as a result of acts by the undersigned Parties or anyone to whom the undersigned Parties supply the Information, or (ii) is known to or acquired by the Team Member separate from receiving the information from the Event Analysis Team.

2. The Team Member understands and agrees that the Event Analysis Information is being made available solely for purposes of the Event Analysis and that the Event Analysis Information shall not be used in any manner to further the commercial interests of any person or entity. The Team Member further understands and agrees that he or she will not disclose Event Analysis Information to any person who has not signed this Agreement except as such disclosure may be required by law or judicial or regulatory order.

3. If Team Member's employing organization has signed the NERC Confidentiality Agreement for Electric System Security Data ("NERC Security Data Agreement"), paragraph 2 shall not be deemed to prohibit Team Member from disclosing Event Analysis Information to

other employees of that organization, but only to the extent that "security data" as defined in the NERC Security Data Agreement is shared within the organization.

4. The Parties expressly agree that Event Analysis Information shall otherwise only be disclosed through official releases and reports as authorized by NERC.

5. It shall not be a violation of the NERC Confidentiality Agreement for Electric System Security Data for a Reliability Coordinator to furnish Event Analysis Information to an Event Analysis Team Member who has signed this Agreement.

6. This Agreement shall be for sole benefit of the parties hereto. This Agreement may be modified or waived only by a separate writing signed by the Parties. If any clause or provision of this Agreement is illegal, or unenforceable, then it is the intention of the Parties hereto that the remainder of this Agreement shall not be affected thereby, and it is also the intention of the Parties that in lieu of each clause or provision that is illegal, invalid or unenforceable, there be added as part of this Agreement a clause or provision as similar in terms to such illegal, invalid or unenforceable clause or provision as may be possible and be legal, valid and enforceable. This Agreement will be governed and construed in accordance with the laws of the State of New Jersey, except for any choice of law requirement that otherwise may apply the law from another jurisdiction.

7. This Agreement shall have a term of two (2) years from the date hereof, except that the obligations of paragraphs 2, 3, and 4 shall continue for five (5) years from the date hereof.

Attachment D

NERC Blackout and Disturbance Analysis Objectives, Analysis Approach, Schedule, and Status

Analysis Objective	Analysis Approach	Schedule	Status
Pre-Event Conditions			
1. What was the precursor sequence of events leading to the event?	• Assemble data/alarm logs and time-stamped sequence information. • Develop and maintain an expanding database of log and time-stamped sequence information. • Develop a precursor sequence of high-level, events relevant to, and leading to event initiation. • Reconcile the precursor sequence of events with those emerging from Regional Entities, RTOs, and operating entities.		
2. What time frames are relevant for pre-event assessment of system conditions? What points in time should be used to establish a baseline set of study conditions when the system was last known to be stable and within normal operating criteria?	• Referencing precursor sequence of events, determine relevant times to develop base case conditions (stable and within normal operating criteria). • Verify relevant time horizons and availability of system data at those times with Regional Entities, RTOs, and operating entities.		
3. What models and data can best simulate system conditions prior to and during the event? What is the relevant scope of the system for detailed study (what is considered the boundary of the study system and what is considered neighboring or external systems?)	• Identify up-to-date power system model(s) appropriate for powerflow and transient and dynamic simulations (determine if detailed eastern Interconnection model is needed or multi-regional model(s) are needed. • Identify what models are available in Regional Entities, RTOs, and operating entities. • Identify who will actually perform power flow, transient and dynamic simulations; hire contractor(s) as needed. • Identify and assemble data required for these models. • Develop and maintain a system data repository.		

Analysis Objective	Analysis Approach	Schedule	Status
4. What system conditions existed in the precursor time horizon leading up to the event (at the times identified in 1.)?	• Obtain and manage data for powerflow: system configuration, planned and unplanned outages, unit commitment and dispatch, interchange schedules, congestion conditions, reserves, Loads, state estimator snapshots, deratings and limitations, frequency, etc. Identify who will maintain and run powerflow simulations. • Work with Regional Entities, RTOs, and operating entities to develop powerflow cases defining the base conditions for each relevant time, ensuring the powerflows model each critical juncture leading up to the event. • Identify and review results of additional studies completed by Reliability Coordinators, RTOs and operating entities. • Assess the powerflow results with respect to steady state operating criteria (was the system within all known limits at each precursor time)?		
5. Were there any prior-existing abnormalities, instabilities, reliability criteria violations, or reliability issues in the precursor sequence time horizon? Prior to event initiation were there any latent instability conditions that would suggest the system was at risk? Were the precursor conditions ones that had been previously studied by the entities involved? Were there adequate reserves with effective distribution? Were planned outages effectively coordinated?	• Work with Regional Entities, RTOs, and operating entities to obtain and manage transient and dynamic models for simulations. • Identify who will conduct transient and dynamic simulations and if external contractor(s) are required. • Conduct transient and dynamic simulations at each of the precursor study times. • Assess the stability of the system at each of these times and identify any latent reliability issues prior to blackout initiation. • Consider creating a visual map of system conditions. • Document the limitations and assumptions of simulations affecting the certainty of the simulation results.		
Blackout Sequence of Events			
6. What was the sequence of system events leading to and directly triggering the blackout?	• Evaluate data logs, fault recorder data disturbance recorder data, and synchro-phasor measurement to establish a detailed sequence of events that initiated the event. • Identify the sequence of events that directly led to the event. • Review and reconcile these trigger events with Regional Entities, RTOs, and operating entity analyses.		

Analysis Objective	Analysis Approach	Schedule	Status
7. What was the sequence of events during the event?	• Evaluate logs and disturbance recorder data to establish sequence during the blackout. (The event sequence may follow multiple tracks.) • Review and reconcile this sequence with those constructed by Regional Entities, RTOs, and operating entities. • Consider developing 3-D, time-lapse visualization of the blackout (U. of Minnesota and/or U. of Wisconsin).		
8. What was the cause of the event in terms of electrical conditions and other related events? Generally describe any system breakups, islanding, etc. Were there conditions of voltage or frequency collapse, or unstable oscillations? Was the sequence strictly a sequential "domino" effect of Facility trips? What were the system conditions (snapshots) at key points during the event?	• Assess triggering sequence and blackout sequence to establish the causes for the blackout in terms of electrical conditions and events. • Select key points in sequence for simulation that are relevant for study and that can be accurately modeled. (It may not be possible to reconcile data sufficiently to recreate system conditions during the blackout.) • To the extent possible, conduct simulations and assess results at each point during the blackout. • Review and reconcile results with Regional Entities, and operating entities.		
9. Why did the event extend as far as it did? What arrested the event from extending further into other systems?	• Using advanced analysis techniques, assess where and why the event was arrested.		
10. How did affected non-nuclear generators respond during the event? Were trips as expected and required by procedures and standards? Did non-nuclear generators remain connected and support the power system in the manner they should have? Did any generator action, generator control functions, or generator protection systems contribute to the event?	• Prepare a table of affected generators and actions they made leading up to and during the event, including time-stamped unit trips, relays initiating unit trips, MW and MVar outputs, voltages, and frequency, etc. • Analyze the automatic (including relay trips) and operator-initiated actions of non-nuclear generators to determine whether actions were correct under the conditions or not. • Reconcile non-nuclear generator data and analysis with that of the Regional Entities, RTOs, and operating entities.		
11. How did nuclear generators respond leading up to and during the blackout? Were trips as expected and required by procedures and standards? Were there any nuclear safety issues identified?	• Work with NRC to develop a table of sequence of actions and issues regarding affected nuclear generators (both ones that tripped and those that did not). • Refer nuclear issues to NRC for analysis, assisting in their analyses where appropriate.		
12. What was the sequence and amount of Load lost? What directly caused Load loss (e.g. under-frequency Load shed, loss of transmission source, voltage collapse, relay actions, under/over frequency protection or stalls, etc.)	• Work Regional Entities, RTOs, and operating entities to develop a description of Load lost/impacted, by area. • Analyze and report the cause for Load loss in each area.		

Analysis Objective	Analysis Approach	Schedule	Status
13. How did system protection and automated controls operate during the event? Did they operate correctly or not?	• Assess each automatic trip of a transmission or generator Facility for proper or improper relay actions. • Assemble and review Regional Entity and operating entity reviews of logs, disturbance reports, and relay targets/logs and reconcile with NERC data.		
14. Was any equipment damaged during the event?	• Request information from Regional Entities, and companies on equipment damage, as appropriate. • Assess any transmission or generation Facilities sustaining damage during the event, and extent of damage.		
15. Did SCADA/EMS and data communications systems operate correctly during the event? What problems were noted?	• Request information from Regional Entities, and companies. • Identify and analyze any problems with SCADA/EMS and data communications at regional and company levels.		
Reliability Standards/Procedures			
16. What NERC Reliability Standards were applicable to the event? What violations occurred? Were NERC Reliability Standards and policies sufficient?	• Compliance Staff review NERC Reliability Standards relevant to the event and perform a compliance review.		
17. What Regional Reliability Standards were applicable to the event? What violations occurred? Were Regional Reliability Standards and Regional Entity policies sufficient?	• Request Regional Entities to review applicable Regional Reliability Standards and report compliance with those Regional Reliability Standards during the event.		
18. Were any special operating procedures or other operating guidelines in effect and being observed leading up to the event? Were these procedures sufficient?	• Review and analyze loop flow procedures with involved Regional Entities and companies, and report analysis results.		
19. What other RTO, Transmission Owner, CA procedures were applicable? What violations occurred? Were the procedures sufficient?	• Request RTOs, Transmission Owners, CAs to review applicable Reliability Standards and compliance with existing reliability procedures and Reliability Standards during the event, and report results.		
Maintenance			
20. Are there any indications that maintenance of transmission or generation Facilities may have contributed to the event?	• Assess whether equipment or maintenance issues (e.g. tree trimming) contributed to the blackout and investigate specifics in areas of concern. • Review Regional Entity assessments of maintenance issues that may have contributed to the event.		

Personnel, Procedures, and Communications			
21. What conditions were operators and Reliability Coordinators aware of leading up to and during the event? What information did they have to warn them of unsafe system conditions? What problems or concerns did they have? What did they observe during the event? Were human errors made that contributed to the event? If there were, what were the causes of the errors?	• Develop an interview guide to address procedural and operational issues. • Conduct onsite interviews with operating personnel and Reliability Coordinators involved. • Analyze interview data to corroborate with technical data and report conclusions.		
22. Were lines of authority clearly understood and respected in the time leading up to and during the event, as well as during the restoration period?	• Identify critical instructions given and evaluate results. • Review documentation and effectiveness of assignments of operating and reliability authorities.		
23. What communications occurred among operating entities?	• Review voice communications logs. • Evaluate logs relevant to the blackout and identify key interactions. Report conclusions.		
24. What were the qualifications (including Certification status) and training of all operating personnel involved in the event and their supervisors?	• Request Certification status of all operating personnel from involved operating entities. • Conduct onsite review of training materials and records. • Conduct onsite review of operating procedures and tools		
25. Was the role and performance of the Reliability Coordinators as expected?	• Review the adequacy of reliability plans for the affected Regional Entities. • Review the actions of the affected Reliability Coordinators to determine if they performed according to plans. • Assess whether inter-area communications were effective, both at the control area and Reliability Coordinator levels.		
System Restoration			
26. Were blackstart and restoration procedures available and adequate in each area? Were they followed and were they adequate to the restoration task? Were pre-defined authorities respected during the restoration?	• Onsite audit of blackstart and restoration procedures and plans. • Analyze whether the plans and procedures were used and whether they were sufficient for this outage.		
27. What issues were encountered in the restoration that created unexpected challenges or delays? What lessons were learned in the restoration (both things that went well and things that did not).	• Solicit information from operating entities and Regional Entities regarding unexpected challenges and delays in restoration, and lessons learned. • Analyze what worked well and what did not in the restoration.		

System Planning and Design			
28. Were the conditions leading up to the event within the design and planning criteria for the transmission systems involved?	• Request Transmission Owners and Regional Entities involved to report any violations of design or planning criteria prior to or leading up to the blackout.		
Conclusions and Recommendations			
29. From a technical perspective, what are the root causes of this event? What additional technical factors contributed to making the event possible?	• Conduct a root cause analysis on the findings and data. Categorize results as "root cause" or "contributing factor". Focus on technical aspects.		
30. What are the significant findings and lessons learned resulting from the analysis regarding technical failures leading to the event? What actions are recommended to avoid similar future events and improve Bulk Electric System reliability? What issues may be inconclusive and require future analysis?	• Draft report of significant findings, lessons learned, and recommendations.		
31. Final Report	• Prepare and coordinate publication of final report.		

Attachment E

Guidelines for NERC Reports on Blackouts and Disturbances[10]

Introduction and Purpose

Executive Summary of Blackout or Disturbance

Conclusions & Recommendations

Actions to Minimize the Possibility of Future Blackouts and Disturbances

Detailed Analysis of Event

1. Sequence of Events

1.1. Sequence of transmission and generation events
- 1.1.1. Reasons for each trip
- 1.1.2. Sequence of loss of Load
- 1.1.3. Description of Cascading and islanding

2. System Modeling

2.1. Model and assumptions
- 2.1.1. Equipment ratings and limits
- 2.1.2. Steady state, system dynamics, and other analyses
- 2.1.3. Degree of simulation success
- 2.1.4. Simulation results
- 2.1.5. Conclusions and lessons learned

2.2. Pre-event Conditions
- 2.2.1. Load levels
  - 2.2.1.1.Forecast vs. Actual
  - 2.2.1.2.Comparison with planning and operational models
- 2.2.2. Generation dispatch
  - 2.2.2.1.Forecast vs. actual
  - 2.2.2.2.Comparison with day ahead studies
  - 2.2.2.3.Reporting of scheduled and forced outages
- 2.2.3. Reserve capacity
  - 2.2.3.1.Location of MW reserves
  - 2.2.3.2.Planned vs. actual
- 2.2.4. Transmission configurations
  - 2.2.4.1.Planned vs. actual
  - 2.2.4.2.Comparison with day ahead studies
  - 2.2.4.3.Reporting of scheduled and forced outages

[10] Each blackout or disturbance is unique and will therefore demand a customized approach to its investigation and reporting. These guidelines for NERC reports are suggestive rather than definitive. Not all investigations and reports will require covering all of these topics.

2.2.5. Interregional transactions
2.2.5.1.Calculated transfer limits
2.2.5.2.Basis for limits – thermal, voltage, and stability
2.2.5.3.Seasonal assessments – Assumptions vs. actual
2.2.5.4.Actual schedules vs. Tagged schedules
2.2.5.4.1. AIE Survey
2.2.5.4.2. Tag Survey
2.2.6. System voltages (profile) and reactive supplies
2.2.6.1.Coordination of reactive supplies and voltage schedules
2.2.6.2.Reactive supply with power transfers

2.3. Event Key Parameters
2.3.1. System voltages (profile) and reactive supplies
2.3.2. Power flows and equipment loadings
2.3.3. System dynamic effects

3. Transmission system performance
3.1. Equipment ratings
3.2. Protective relay actions
3.3. Equipment maintenance
3.4. Equipment damage

4. Generator performance
4.1. Generator control actions
4.2. Generator protection
4.2.1. Underfrequency
4.2.2. Overspeed
4.2.3. Excitation systems
4.2.4. Other systems
4.3. Equipment maintenance
4.4. Equipment protection
4.5. Dynamic effects of generators

5. System frequency
5.1. Frequency excursions – pre event
5.1.1. Analysis of frequency anomalies
5.1.2. Effect of time error correction
5.2. Frequency analysis of the event
5.2.1. Remaining interconnection
5.2.2. Islands remaining

6. Operations
6.1. Operational visibility and actions
6.1.1. Reliability Coordinators
6.1.1.1.Delegation and authority
6.1.1.2.Monitoring capabilities
6.1.1.2.1. Scope of coverage and system visibility

6.1.1.2.2. Monitoring tools
6.1.1.2.3. Data availability and use
6.1.1.3.Operations planning capability
6.1.1.3.1. Operational planning tools
6.1.1.3.2. Coordination
6.1.1.4.Operating procedures
6.1.1.4.1. Emergency operations
6.1.1.4.2. Loss of monitoring system or components
6.1.1.4.3. Communication procedures
6.1.1.5.Operating qualifications and training
6.1.1.5.1. Qualification of operators
6.1.1.5.2. Training provided
6.1.1.5.3. Simulation of emergencies
6.1.2. Transmission Operators
6.1.2.1.Authority to take action
6.1.2.2.Monitoring capabilities
6.1.2.2.1. Scope of coverage and system visibility
6.1.2.2.2. Monitoring tools
6.1.2.2.3. Data availability and use
6.1.2.3.Operations planning capability
6.1.2.3.1. Operational planning tools
6.1.2.3.2. Coordination
6.1.2.4.Operating procedures
6.1.2.4.1. Emergency operations
6.1.2.4.2. Loss of monitoring system or components
6.1.2.4.3. Communication procedures
6.1.2.5.Operating qualifications and training
6.1.2.5.1. Qualification of operators
6.1.2.5.2. Training provided
6.1.2.5.3. Simulation of emergencies

7. System Planning and Design

7.1. Establishing operating limits
7.1.1. Responsibility for setting limits
7.1.2. ATC and TTC calculations
7.1.3. Planning studies
7.1.3.1.·Wide-Area simultaneous transfer limits
7.1.3.1.1. Determination of limits
7.1.3.1.2. Monitoring of limits
7.1.3.1.3. Basis for limits – thermal, voltage, and stability
7.1.3.1.4. Regional Entity assessments
7.1.3.1.5. Other system studies in affected areas
7.1.3.2.Reactive planning
7.1.3.2.1. Reactive reserve planning
7.1.3.2.2. Active vs. static resources
7.1.3.2.3. Voltage stability analysis

7.1.3.3.Regional Criteria and/or NERC Reliability Standards used for planning
7.1.3.3.1. Compliance to these planning Regional Criteria and/or Reliability Standards

8. Reliability Standards and Compliance

8.1. Audits
8.1.1. Reliability Coordinators
8.1.1.1.Previous audits and results
8.1.1.1.1. Compliance with NERC Reliability Standards
8.1.1.2.Updated findings based on analysis
8.1.1.3.Post blackout audit results and findings
8.1.1.4.Recommendations for future audits
8.1.2. Balancing Authorities
8.1.2.1.Regional Entity audits
8.1.2.1.1. Compliance with NERC Reliability Standards and Regional Reliability Standards
8.1.2.2.Updated findings based on analysis
8.1.2.3.Post blackout audit results and findings
8.1.2.4.Recommendations for future audits
8.2. Regional Criteria and/or NERC Reliability Standards used for operations
8.2.1. Compliance to these operating Regional Criteria and/or Reliability Standards
8.3. Reliability Standards
8.3.1. Improvements needed
8.3.2. Potential new Reliability Standards

9. Actions to Minimize the Possibility of Future Widespread Events

9.1. Reliability Standards and compliance to Reliability Standards
9.2. Availability of planned Facilities as scheduled
9.3. Automatic Load shedding programs
9.4. Controlled separation and islanding
9.5. Improved data collection and system monitoring
9.6. Studies of impacts of severe events

10. Restoration of Service

10.1. Restoration procedures
10.1.1. RTOs and ISOs
10.1.2. Transmission Operators
10.1.3. Generator Operators
10.1.4. Distribution Providers

10.2. Restoring service
10.2.1. Transmission line restoration
10.2.1.1. Within control area/ISO/RTO
10.2.1.2. Interarea tie lines
10.2.1.3. Impediments and other issues

10.2.2. Generation restoration
10.2.2.1. Utility-owned generation
10.2.2.2. Independent generation
10.2.2.3. Fuel supply adequacy
10.2.2.4. Fossil units
10.2.2.5. Nuclear units
10.2.2.6. Capacity reserves
10.2.2.7. Coordination with transmission
10.2.2.8. Coordination with Load and other generation
10.2.2.9. Impediments and other issues
10.2.3. Coordination and communications
10.2.3.1. Within control area/ISO/RTO
10.2.3.2. With outside control areas/ISOs/RTOs
10.2.3.3. Wide-Area coverage
10.2.3.4. Impediments and other issues

10.3. Review of restoration procedures
10.3.1. Time to restore customers
10.3.2. Need for modifications
10.3.3. Availability of procedures to necessary participants
10.3.4. Need for training and practice drills
10.3.5. Comparison with other control areas/ISOs/RTOs

11. Analysis Process

11.1. Description of process
11.1.1. Organization
11.1.2. Coordination with US-Canada task force
11.1.3. Coordination with Regional Entities and RTOs
11.1.4. Recommended process improvements
11.1.4.1. Use for other events – near misses, etc.
11.2. Data management
11.2.1. Data collection processes
11.2.1.1. Data request process
11.2.1.2. Data forms used
11.2.2. Data received
11.2.2.1. Quality and usefulness of data
11.2.3. Data warehousing
11.2.3.1. Data warehouse structure
11.2.3.2. Accessibility of data
11.2.4. Data forms and process for future analyses

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF REVISIONS TO ITS RULES OF PROCEDURE
TO ADOPT A BULK ELECTRIC SYSTEM EXCEPTION PROCEDURE

REVISED APPENDIX 3D OF THE RULES OF PROCEDURE

NERC BLACKOUT AND DISTURBANCE RESPONSE PROCEDURES

REDLINED VERSION

Appendix 8

Proposed Revisions 1-9-2012
[Incorporates revisions filed with FERC on November 29, 2011]

NERC Blackout and Disturbance Response Procedures

Effective October 18, 2007

North American Electric Reliability Corporation

NERC Blackout and Disturbance Response Procedures

Introduction

NERC, through its professional staff and the Regional Entities and their members, provide the best source of technical and managerial expertise for responding to major events that affect the Bulk Power System.

NERC's role following a blackout or other major Bulk Electric System disturbance or emergency is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the event. Working closely with the Regional Entities and Reliability Coordinators, NERC will coordinate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

When responding to any event where physical or cyber security is suspected as a cause or contributing factor to an event, NERC will immediately notify appropriate government agencies and coordinate its analysis with them.

During the conduct of some NERC-level analyses, assistance may be needed from government agencies. Collaborative analysis with certain government agencies may be appropriate in some cases; e.g., collaborating with the Nuclear Regulatory Commission technical staff when a system event involves a nuclear unit. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; analyses related to possible criminal or terrorist involvement in the event; resources for initial data gathering immediately after the event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies. If a federal or multi-national government analysis is called for, government agencies should work in primarily an oversight and support role, in close coordination with the NERC analysis.

It is critical to establish, up front, a clear delineation of roles, responsibilities, and coordination requirements among industry and government for the analysis and reporting of findings, conclusions, and recommendations related to major blackouts, disturbances, or other emergencies affecting the Bulk Power System.

Depending on the severity and of the event and the area impacted, the event analysis may be conducted either by NERC or by the impacted Regional Entity. If the analysis is conducted by the Regional Entity, NERC staff, at least one member of the NERC Event Analysis Working Group (in addition to the Event Analysis Working Group member from the impacted Regional Entity), and other appropriate technical experts from the NERC community will participate as members of the Regional Entity analysis team.

A Regional Entity may request NERC to elevate an analysis to a NERC-level. In such cases, all team responsibilities will shift to NERC, and the Regional Entity may continue to participate in the analysis on appropriate teams.

These procedures do not represent a "cookbook" to be followed blindly. They provide a framework to guide NERC's response to events that may have multiregional, national, or

international implications. Experienced industry leadership would still be required to tailor the response to the specific circumstances of the event.

Responding to major blackouts and other system disturbances can be divided into four phases:

1. situation assessment and communications;
2. situation tracking and communications;
3. data collection, investigation, analysis and reporting; and
4. follow-up on recommendations.

Phase 1 — Situation Assessment and Communications

NERC's primary roles in Phase 1 are to:

- conduct an initial situation assessment;
- call for the collection of and analyze necessary initial data and information for the event;
- assist the Regional Entity-lead analysis with determining the need for supplemental technical expertise from the NERC community;
- issue initial findings, conclusions, and recommendations;
- maintain detailed data records (not subject to Freedom of Information Act);
- assist government agencies in criminal analyses when relevant;
- provide technical expertise for modeling and analyzing the event; and
- follow up on recommendations.

While conducting its initial situation assessment, NERC will make an early determination as to whether the cause of the event may be related to physical or cyber security, and communicate as appropriate with government agencies.

Notice of a event is typically received by the NERC Electricity Sector Information Sharing and Analysis Center (ESISAC) person on duty and relayed to other appropriate NERC personnel.[1] NERC performs an initial situation assessment by contacting the appropriate Reliability Coordinator(s), and makes a decision on whether to activate its crisis communications plan. At the initial stage in gathering information about an incident, it is critical to minimize interference with Bulk Electric System operators who are in the process of restoring the system. To minimize interference with their work, NERC, in its capacity as the ESISAC, should serve as the primary communications link with government agencies.

The ESISAC Concept of Operations (ConOps) specifies the operations plan, communications procedures, and logistics NERC will follow during normal conditions, emergencies, and national security special events. The ConOps includes the primary points of contact (24x7) for the Federal Energy Regulatory Commission, U.S. Department of Energy, U.S. Department of Homeland Security, U.S. Nuclear Regulatory Commission, and Public Safety and Emergency Preparedness Canada.

It is important that during these early hours the ESISAC, in coordination with government agencies, determine whether this event was caused by the actions of criminal or terrorist parties. The results of this criminal assessment are essential to operators because if there is a possibility that the "attack" is still ongoing, restoration and response actions would need to be tailored to

[1] NERC maintains 24x7 contact information for its key personnel to facilitate such contacts.

these circumstances. If NERC and government agencies deem it necessary for further criminal analyses, NERC will issue a formal notice to affected systems to retain all relevant information gathered during this and subsequent phases of an analysis.

The specific criteria for reporting disturbances and other events are described in NERC Reliability Standard EOP-004-1. These criteria and procedures are intended to provide a common basis for consistent reporting of abnormal system conditions and events that occur in North America. All entities responsible for the reliability of Bulk Power Systems in North America must ensure that sufficient information is submitted to NERC within the time frame required. Reliability Coordinators will use the Reliability Coordinator Information System (RCIS) as the primary method of communications to NERC. The ESISAC duty person is responsible for monitoring the RCIS for such notifications.

Depending on the scope and magnitude of the event, NERC will issue media advisories through its crisis communications plan.

Phase 2 — Situation Tracking and Communications

Based on the nature and severity of the event, in Phase 2 NERC will continue to track progress in restoring the Bulk Power System and service to customers, and keep industry, government agencies, and the public informed. The most important thing to recognize in this phase is that the primary focus of Reliability Coordinators and Transmission Operators is the prompt restoration of the Bulk Electric System. NERC will coordinate requests by government agencies for information from Reliability Coordinators and Transmission Operators, and serve as a conduit and coordinator between industry and government for regular status reports on the restoration.

As events continue, NERC will determine whether a detailed analysis of the event should be conducted, and start to identify manpower requirements, data collection and retention requirements, and at what level the analysis should be conducted. If the event is localized within a Region, NERC will participate in the event analysis of the Regional Entity.

Phase 3 — Data Collection, Investigation, Analysis, and Reporting

Based on the scope, magnitude, and impact of an event, during Phase 3 NERC may:

1. perform an overview analysis of system and generator response;
2. rely on one of its Regional Entities to conduct the analysis and monitor the analysis results;
3. work with a Regional Entity in its analysis; or
4. conduct a NERC-level analysis.

The NERC CEO will decide, based on the initial situation assessment and consultation with the NERC technical committee officers[2], if a NERC-level analysis is warranted. If a NERC-level analysis is to be conducted, the NERC CEO will appoint the Director of Events Analysis and Information Exchange to lead the analysis and assemble a high-level technical steering group to provide guidance and support throughout the analysis.

[2] NERC will maintain a list of 24x7 contact information for its technical committee officers.

NERC reserves the right to elevate or augment an analysis performed by a Regional Entity pending the results of the Regional Entity analysis. Additional requests for analyses or supporting data may be made by NERC at any time in the investigation process.

A Regional Entity may request NERC to elevate an analysis to a NERC-level. In such cases, all team responsibilities will shift to NERC, and the Regional Entity may continue to participate in the analysis on appropriate teams.

If the analysis is to be led by one of the Regional Entities, a member of the NERC staff, at least one member of the NERC Event Analysis Working Group (in addition to an Event Analysis Working Group member from the impacted Regional Entity), and other appropriate technical experts from the NERC community will participate as a triage team. The triage team will participate as members of the Regional Entity analysis team. The triage team will also will assist the Regional Entity with determining if additional technical expertise from the NERC community are needed for the analysis.

For NERC-level analyses, the first task of the Director of Events Analysis and Information Exchange would be to identify what technical and other resources and data would be needed from staff, the industry, and government, and to issue those requests immediately. This task will include identification of any special managerial, forensic, or engineering skills needed for the analysis. Secondly, the Director of Events Analysis and Information Exchange must issue requests for those resources and information. Third, the Director of Events Analysis and Information Exchange must organize the teams that will conduct and report on the analysis.

The teams needed for a particular analysis will vary with the nature and scope of the event. Attachment A describes the typical teams that would be required for a NERC-level analysis, and Attachment B provides suggested guidelines for the NERC-level analysis team scopes. Individuals that participate on these teams will be expected to sign an appropriate confidentiality agreement. NERC uses a standard (pro forma) confidentiality agreement (Attachment C) for participants in event analyses, which it will adapt for specific analyses.

The Blackout and Disturbance Analysis Objectives, Approach, Schedule, and Status (Attachment D) and Guidelines for NERC Reports on Blackouts and Disturbances (Attachment E) are used to guide and manage analysis and reporting on major blackouts and disturbances.

A NERC-level analysis will comprise (a) collecting pertinent event data; (b) constructing a detailed sequence of events leading to and triggering the disturbance; (c) assembling system models and data and conducting detailed system analysis to simulate pre- and post-event conditions; and (d) issuing findings, conclusions, and recommendations. The details of these four phases of the analysis are:

a. Collecting Pertinent Event Data

- Collect all pertinent event logs, disturbance recorders, operator transcripts, and other system data.

b. Detailed Sequence of Events

- Construct a detailed sequence of events leading to and triggering the event. Reconcile event logs, disturbance recorders, operator transcripts, and other system data to create an accurate sequence of events.
- Enter and preserve all data in a secure data warehouse.

c. Detailed System Analysis

- Assess the sequence of events to determine critical times for study.
- Assemble the necessary system models and data from Regional Entity and operating entities to accurately model (with power flow and dynamic simulations) the pre-event conditions.[3] Determine pre-event conditions at critical times prior to event initiation, including an assessment of reliability margins in the pre-event time frame.
- Analyze data from phasor measurement units, high-speed data recorders, digital fault recorders, digital relays, and system relay targets.[4]
- Analyze generator and Load~~load~~ performance, including underfrequency and undervoltage relay actions.
- Use the model information and sequence of events to dynamically model the trigger events and the outage sequence. Identify the system phenomena that propagated the failure. Provide graphical results showing the nature of the cascade. Conduct additional analyses as initial findings identify the need for further study.

d. Findings, Conclusions, and Recommendations

- Identify and assess failures contributing to the event, including possible instability conditions, system protection mis-operations, generator actions, etc.
- Either identify or rule out man-made/criminal cyber or physical attacks on the electric system.
- Determine if the system was being operated within equipment and system design criteria at the time of the outage.
- Assess the qualifications, training, SCADA/EMS tools, and communications available to system operators and Reliability Coordinators, and how effective these were leading up to and during the event.
- Assess the adequacy of communications system and communications among system operators.
- Identify any issues regarding maintenance or equipment conditions that may have contributed to the outage.
- Determine whether system restoration procedures were available and adequate. Identify any issues that caused unexpected delays in the restoration of generators and Loads~~loads~~.
- Identify the root causes[5] and contributing factors of the Cascading outage.

---

[3] NERC is developing standards for data and model validation that will facilitate modeling activities in future blackout analyses.
[4] NERC is developing standards for dynamic monitoring equipment and the deployment of such equipment at critical locations in the Bulk Electric System.
[5] NERC will rely on root cause analysis experts, both from within the industry and outside consultants, to conduct these analyses.

- Recommend actions to prevent Cascading outages in the future and to improve system reliability.
- Determine whether the system is adequately designed.
- All compliance issues will be referred to the NERC Director of Compliance.

Phase 4 — Follow-up on Recommendations

For Phase 4 NERC and the Regional Entities will follow up on specific recommendations coming from all analyses, whether done at the Regional Entity or NERC level. In certain cases, where government agencies have taken a direct role in the analysis, reports will be made to those agencies on progress in addressing the recommendations.

Attachment A

Typical Team Assignments for Analysis of Blackouts or Disturbances[6]

Fact-Finding Teams

- Physical and/or cyber security (if needed)
- On-site interviews
- System data collection (frequency, voltages, generation and Loads ~~loads~~)[7]
- System protection and control information
- System restoration
- Coordination with Regional Entity teams

Assessment and Analysis Teams

- Performance of generation and transmission Protection Systems
- Frequency analysis
- Equipment maintenance
- SCADA/EMS/Tools
- Operator training
- Reliability Standards compliance
- System planning
- System operation
- System restoration
- Root cause analysis
- System simulation
- Interregional coordination
- Vegetation management
- Recommendations for future actions
- Security and law enforcement liaison

Data Management Teams

- Data requests
- Data collection
- Data warehouse – entry, logging, retention, and maintenance[8]
- Data release[9]

Report Writing Teams

- Text
- Graphics
- Presentations

---

[6] The analysis team leader will specify the tasks required of each team.
[7] Standard forms and procedures for the collection of data and information will be adapted for particular circumstances.
[8] Experience with data warehousing and access procedures gained during the investigation of the August 2003 blackout will be used in future investigations.
[9] Data release procedures will prevent inappropriate disclosure of information.

Communications Teams

- Press releases
- Interface with government agencies
- Interviews

Attachment B

NERC Blackout and Disturbance Response Procedures
Guidelines for Analysis Team Scopes

Each blackout or disturbance is unique and will therefore demand a customized approach to its analysis. The following guidelines for analysis team scopes are suggestive rather than definitive. Not all the teams listed may be needed for a particular analysis.

Data Requests and Management — This team organizes large volumes of raw data and value-added information produced by analysts in support of the blackout analysis into a data warehouse. The team issues data requests from affected entities, catalogs and stores all data received, and provides secure and confidential access to teams and personnel supporting the analysis. The team serves as the single point for issuing data requests, receiving and storing data, and managing data queries by the analysts, and is responsible for assuring consistency, security, and confidentiality of the data and minimizing redundant data requests.

Sequence of Events — A precise, accurate sequence of events is a building block for all other aspects of the analysis, and is a starting point for the root cause analysis. It is the basis for developing computer models to simulate system conditions and evaluate steady state and stability conditions in the period leading to blackout. The sequence of events is the foundation of facts upon which all other aspects of the analysis can proceed.

System Modeling and Simulation Analysis — System modeling and simulation allows the investigators to replicate system conditions leading up to the blackout. While the sequence of events provides a precise description of discrete events, it does not describe the overall state of the electric system and how close it was to various steady state, voltage stability, and power angle stability limits. An accurate computer model of the system, benchmarked to actual conditions at selected critical times, allows analysts to conduct a series of sensitivity studies to determine if the system was stable and within limits at each point in time leading up to the blackout, and at what point the system became unstable. It also allows analysts to test different solutions to prevent Cascading. Although it is not possible recreate the entire blackout sequence, simulation methods will reveal the mode(s) of failure initiating the blackout and propagating through the system.

Root Cause Analysis — Root cause analysis guides the overall analysis process by providing a systematic approach to evaluating root causes and contributing factors leading to the blackout or disturbance. This team works closely with the technical analysis teams and draws on other data sources as needed to record verified facts regarding conditions and actions (or inactions) that contributed to the blackout or disturbance. The root cause analysis guides the overall analysis by indicating areas requiring further inquiry and other areas that may be of interest regarding lessons learned, but are not causal to the blackout. Root cause analysis enables the analysis process develop a factual record leading to logical and defensible conclusions in the final report regarding the causes of the blackout.

Operations Tools, SCADA/EMS, Communications, and Operations Planning — This team will assess the observability of the electric system to operators and Reliability Coordinators, and the availability and effectiveness of operational (real-time and day-ahead)

reliability assessment tools, including redundancy of views and the ability to observe the "big picture" regarding Bulk Electric System conditions. The team also investigates the operating practices and effectiveness of those practices of operating entities and Reliability Coordinators in the affected area. This team investigates all aspects of the blackout related to operator and Reliability Coordinator knowledge of system conditions, action or inactions, and communications.

Frequency/ACE — This team will analyze potential frequency anomalies that may have occurred, as compared to typical interconnection operations, to determine if there were any unusual issues with control performance and frequency and any effects they may have had related to the blackout.

System Planning, Design, and Studies — This team will analyze the responsibilities, procedures, and design criteria used in setting System Operating Limits, and compare them to good utility practice. The team will review the actual limits in effect on day of the blackout and whether these limits were being observed. The team will review voltage schedules and guides, and reactive management practices in the affected areas, including use of static and dynamic reactive reserves. The team will analyze the tagged and scheduled transactions to determine if inter-regional transfer limits were understood and observed. The team will analyze system planning and design studies completed in the affected areas to determine if operating conditions were consistent with the assumptions of those studies and whether the planning and design studies were sufficient and effective.

Transmission System Performance, Protection, Control, Maintenance, and Damage — This team investigates the causes of all transmission Facility automatic operations (trips and reclosures) leading up to the blackout on all Facilities greater than 100 kV. This review includes relay protection and remedial action schemes, identifying the cause of each operation, and any misoperations that may have occurred. The team also assesses transmission Facility maintenance practices in the affected area as compared to good utility practice and identifies any transmission equipment that was damaged in any way as a result of the blackout. The team will assess transmission line rating practices and the impact that ambient temperature and wind speeds had on the transmission line performance in terms of the design temperature of the transmission conductors. The team shall report any patterns and conclusions regarding what caused transmission Facilities to trip; why the blackout extended as far as it did and not further into other systems; why the transmission separated where it did; any misoperations and the effect those misoperations had on the blackout; and any transmission equipment damage. The team will also report on the transmission Facility maintenance practices of entities in the affected area compared to good utility practice. Vegetation management practices are excluded here and covered in a different team.

Generator Performance, Protection, Controls, Maintenance and Damage — This team will investigate the cause of generator trips for all generators with a 10 MW or greater nameplate rating leading to and through the end of the blackout. The review shall include the cause for the generator trips, relay targets, unit power runbacks, and voltage/Reactive Power~~reactive power~~ excursions. The team shall report any generator equipment that was damaged as a result of the blackout. The team shall report on patterns and conclusions regarding what caused generation Facilities to trip. The team shall identify any unexpected performance anomalies or unexplained events. The team shall assess generator maintenance practices in the

affected area as compared to good utility practice. The team will analyze the coordination of generator under-frequency settings with transmission settings, such as under-frequency Load~~load~~ shedding. The team will gather and analyze data on affected nuclear units and work with the Nuclear Regulatory Commission to address nuclear unit issues.

Vegetation/ROW — This team investigates the practices of transmission Facility owners in the affected areas for vegetation management and ROW maintenance. These practices will be compared with accepted utility practices in general, and with NERC Reliability Standards. The team will evaluate whether the affected parties were within their defined procedures at the time of the blackout and will investigate historical patterns in the area related to outages caused by contact with vegetation.

Analysis Process and Procedures Review — This team will review the process and procedures used in the analysis of the blackout, make recommendations for improvement, and develop recommendations for appropriate processes, procedures, forms, etc. to guide and expedite future analyses including coordination and cooperation between NERC, its Regional Entities, and government agencies.

Restoration Review — All entities operating portions of the Bulk Electric System in North America are required by NERC Reliability Standards to maintain system restoration plans and black start plans, and Reliability Coordinators are required to coordinate the implementation of those plans. This team will review the appropriateness and effectiveness of the restoration plans implemented and the effectiveness of the coordination of these plans.

NERC and RE Standards/Procedures and Compliance — This team reviews the adequacy of NERC Reliability Standards, Regional Reliability Standards and Regional Entity procedures, and the Compliance Monitoring and Enforcement Program to address issues leading to the blackout. The team also reviews the compliance of the affected operating entities with Reliability Standards. For less significant event analyses, this team may not be needed. However, all compliance issues will be referred to the NERC Director of Compliance.

Attachment C

NERC CONFIDENTIALITY AGREEMENT
FOR
ANALYSIS OF BLACKOUTS AND DISTURBANCES

This Confidentiality Agreement ("Agreement"), dated _____, is between the North American Electric Reliability Corporation ("NERC"), and

_____, a member of the NERC Event Analysis Team ("Team Member")(collectively referred to as "Parties").

WHEREAS, NERC is conducting an analysis of the power event that occurred in _____ on _____ and related matters ("Event"); and

WHEREAS, NERC has established a team to carry out that analysis ("Event Analysis Team"); and

WHEREAS, in order for the Event Analysis Team to fulfill its objectives, it is necessary for the Event Analysis Team have access to confidential or business sensitive information from operating entities within the _____ and to be able to conduct open and unconstrained discussions among team members,

The Parties therefore agree as follows:

1. The term "Event Analysis Information" means all information related in any way to the Event that operating entities within the _____ or their representatives have furnished or are furnishing to NERC in connection with NERC's analysis of the Event, whether furnished before or after the date of this Agreement, whether tangible or intangible, and in whatever form or medium provided (including, without limitation, oral communications), as well as all information generated by the Event Analysis Team or its representatives that contains, reflects or is derived from the furnished Event Analysis Information; provided, however, the term "Event Analysis Information" shall not include information that (i) is or becomes generally available to the public other than as a result of acts by the undersigned Parties or anyone to whom the undersigned Parties supply the Information, or (ii) is known to or acquired by the Team Member separate from receiving the information from the Event Analysis Team.

2. The Team Member understands and agrees that the Event Analysis Information is being made available solely for purposes of the Event Analysis and that the Event Analysis Information shall not be used in any manner to further the commercial interests of any person or entity. The Team Member further understands and agrees that he or she will not disclose Event Analysis Information to any person who has not signed this Agreement except as such disclosure may be required by law or judicial or regulatory order.

3. If Team Member's employing organization has signed the NERC Confidentiality Agreement for Electric System Security Data ("NERC Security Data Agreement"), paragraph 2 shall not be deemed to prohibit Team Member from disclosing Event Analysis Information to

other employees of that organization, but only to the extent that "security data" as defined in the NERC Security Data Agreement is shared within the organization.

4. The Parties expressly agree that Event Analysis Information shall otherwise only be disclosed through official releases and reports as authorized by NERC.

5. It shall not be a violation of the NERC Confidentiality Agreement for Electric System Security Data for a Reliability Coordinator to furnish Event Analysis Information to an Event Analysis Team Member who has signed this Agreement.

6. This Agreement shall be for sole benefit of the parties hereto. This Agreement may be modified or waived only by a separate writing signed by the Parties. If any clause or provision of this Agreement is illegal, or unenforceable, then it is the intention of the Parties hereto that the remainder of this Agreement shall not be affected thereby, and it is also the intention of the Parties that in lieu of each clause or provision that is illegal, invalid or unenforceable, there be added as part of this Agreement a clause or provision as similar in terms to such illegal, invalid or unenforceable clause or provision as may be possible and be legal, valid and enforceable. This Agreement will be governed and construed in accordance with the laws of the State of New Jersey, except for any choice of law requirement that otherwise may apply the law from another jurisdiction.

7. This Agreement shall have a term of two (2) years from the date hereof, except that the obligations of paragraphs 2, 3, and 4 shall continue for five (5) years from the date hereof.

Attachment D

NERC Blackout and Disturbance Analysis Objectives, Analysis Approach, Schedule, and Status

Analysis Objective	Analysis Approach	Schedule	Status
Pre-Event Conditions			
1. What was the precursor sequence of events leading to the event?	• Assemble data/alarm logs and time-stamped sequence information. • Develop and maintain an expanding database of log and time-stamped sequence information. • Develop a precursor sequence of high-level, events relevant to, and leading to event initiation. • Reconcile the precursor sequence of events with those emerging from Regional Entities, RTOs, and operating entities.		
2. What time frames are relevant for pre-event assessment of system conditions? What points in time should be used to establish a baseline set of study conditions when the system was last known to be stable and within normal operating criteria?	• Referencing precursor sequence of events, determine relevant times to develop base case conditions (stable and within normal operating criteria). • Verify relevant time horizons and availability of system data at those times with Regional Entities, RTOs, and operating entities.		
3. What models and data can best simulate system conditions prior to and during the event? What is the relevant scope of the system for detailed study (what is considered the boundary of the study system and what is considered neighboring or external systems?)	• Identify up-to-date power system model(s) appropriate for powerflow and transient and dynamic simulations (determine if detailed eastern Interconnection model is needed or multi-regional model(s) are needed. • Identify what models are available in Regional Entities, RTOs, and operating entities. • Identify who will actually perform power flow, transient and dynamic simulations; hire contractor(s) as needed. • Identify and assemble data required for these models. • Develop and maintain a system data repository.		

Analysis Objective	Analysis Approach	Schedule	Status
4. What system conditions existed in the precursor time horizon leading up to the event (at the times identified in 1.)?	• Obtain and manage data for powerflow: system configuration, planned and unplanned outages, unit commitment and dispatch, interchange schedules, congestion conditions, reserves, Loads~~loads~~, state estimator snapshots, deratings and limitations, frequency, etc. Identify who will maintain and run powerflow simulations. • Work with Regional Entities, RTOs, and operating entities to develop powerflow cases defining the base conditions for each relevant time, ensuring the powerflows model each critical juncture leading up to the event. • Identify and review results of additional studies completed by Reliability Coordinators, RTOs and operating entities. • Assess the powerflow results with respect to steady state operating criteria (was the system within all known limits at each precursor time)?		
5. Were there any prior-existing abnormalities, instabilities, reliability criteria violations, or reliability issues in the precursor sequence time horizon? Prior to event initiation were there any latent instability conditions that would suggest the system was at risk? Were the precursor conditions ones that had been previously studied by the entities involved? Were there adequate reserves with effective distribution? Were planned outages effectively coordinated?	• Work with Regional Entities, RTOs, and operating entities to obtain and manage transient and dynamic models for simulations. • Identify who will conduct transient and dynamic simulations and if external contractor(s) are required. • Conduct transient and dynamic simulations at each of the precursor study times. • Assess the stability of the system at each of these times and identify any latent reliability issues prior to blackout initiation. • Consider creating a visual map of system conditions. • Document the limitations and assumptions of simulations affecting the certainty of the simulation results.		
Blackout Sequence of Events			
6. What was the sequence of system events leading to and directly triggering the blackout?	• Evaluate data logs, fault recorder data disturbance recorder data, and synchro-phasor measurement to establish a detailed sequence of events that initiated the event. • Identify the sequence of events that directly led to the event. • Review and reconcile these trigger events with Regional Entities, RTOs, and operating entity analyses.		

Analysis Objective	Analysis Approach	Schedule	Status
7. What was the sequence of events during the event?	• Evaluate logs and disturbance recorder data to establish sequence during the blackout. (The event sequence may follow multiple tracks.) • Review and reconcile this sequence with those constructed by Regional Entities, RTOs, and operating entities. • Consider developing 3-D, time-lapse visualization of the blackout (U. of Minnesota and/or U. of Wisconsin).		
8. What was the cause of the event in terms of electrical conditions and other related events? Generally describe any system breakups, islanding, etc. Were there conditions of voltage or frequency collapse, or unstable oscillations? Was the sequence strictly a sequential "domino" effect of Facility trips? What were the system conditions (snapshots) at key points during the event?	• Assess triggering sequence and blackout sequence to establish the causes for the blackout in terms of electrical conditions and events. • Select key points in sequence for simulation that are relevant for study and that can be accurately modeled. (It may not be possible to reconcile data sufficiently to recreate system conditions during the blackout.) • To the extent possible, conduct simulations and assess results at each point during the blackout. • Review and reconcile results with Regional Entities, and operating entities.		
9. Why did the event extend as far as it did? What arrested the event from extending further into other systems?	• Using advanced analysis techniques, assess where and why the event was arrested.		
10. How did affected non-nuclear generators respond during the event? Were trips as expected and required by procedures and standards? Did non-nuclear generators remain connected and support the power system in the manner they should have? Did any generator action, generator control functions, or generator protection systems contribute to the event?	• Prepare a table of affected generators and actions they made leading up to and during the event, including time-stamped unit trips, relays initiating unit trips, MW and MVar outputs, voltages, and frequency, etc. • Analyze the automatic (including relay trips) and operator-initiated actions of non-nuclear generators to determine whether actions were correct under the conditions or not. • Reconcile non-nuclear generator data and analysis with that of the Regional Entities, RTOs, and operating entities.		
11. How did nuclear generators respond leading up to and during the blackout? Were trips as expected and required by procedures and standards? Were there any nuclear safety issues identified?	• Work with NRC to develop a table of sequence of actions and issues regarding affected nuclear generators (both ones that tripped and those that did not). • Refer nuclear issues to NRC for analysis, assisting in their analyses where appropriate.		
12. What was the sequence and amount of Load~~load~~ lost? What directly caused Load~~load~~ loss (e.g. under-frequency Load~~load~~ shed, loss of transmission source, voltage collapse, relay actions, under/over frequency protection or stalls, etc.)	• Work Regional Entities, RTOs, and operating entities to develop a description of Load~~load~~ lost/impacted, by area. • Analyze and report the cause for Load~~load~~ loss in each area.		

Analysis Objective	Analysis Approach	Schedule	Status
13. How did system protection and automated controls operate during the event? Did they operate correctly or not?	• Assess each automatic trip of a transmission or generator Facility for proper or improper relay actions. • Assemble and review Regional Entity and operating entity reviews of logs, disturbance reports, and relay targets/logs and reconcile with NERC data.		
14. Was any equipment damaged during the event?	• Request information from Regional Entities, and companies on equipment damage, as appropriate. • Assess any transmission or generation Facilities sustaining damage during the event, and extent of damage.		
15. Did SCADA/EMS and data communications systems operate correctly during the event? What problems were noted?	• Request information from Regional Entities, and companies. • Identify and analyze any problems with SCADA/EMS and data communications at regional and company levels.		
Reliability Standards/Procedures			
16. What NERC Reliability Standards were applicable to the event? What violations occurred? Were NERC Reliability Standards and policies sufficient?	• Compliance Staff review NERC Reliability Standards relevant to the event and perform a compliance review.		
17. What Regional Reliability Standards were applicable to the event? What violations occurred? Were Regional Reliability Standards and Regional Entity policies sufficient?	• Request Regional Entities to review applicable Regional Reliability Standards and report compliance with those Regional Reliability Standards during the event.		
18. Were any special operating procedures or other operating guidelines in effect and being observed leading up to the event? Were these procedures sufficient?	• Review and analyze loop flow procedures with involved Regional Entities and companies, and report analysis results.		
19. What other RTO, Transmission Owner, CA procedures were applicable? What violations occurred? Were the procedures sufficient?	• Request RTOs, Transmission Owners, CAs to review applicable Reliability Standards and compliance with existing reliability procedures and Reliability Standards during the event, and report results.		
Maintenance			
20. Are there any indications that maintenance of transmission or generation Facilities may have contributed to the event?	• Assess whether equipment or maintenance issues (e.g. tree trimming) contributed to the blackout and investigate specifics in areas of concern. • Review Regional Entity assessments of maintenance issues that may have contributed to the event.		

Personnel, Procedures, and Communications			
21. What conditions were operators and Reliability Coordinators aware of leading up to and during the event? What information did they have to warn them of unsafe system conditions? What problems or concerns did they have? What did they observe during the event? Were human errors made that contributed to the event? If there were, what were the causes of the errors?	• Develop an interview guide to address procedural and operational issues. • Conduct onsite interviews with operating personnel and Reliability Coordinators involved. • Analyze interview data to corroborate with technical data and report conclusions.		
22. Were lines of authority clearly understood and respected in the time leading up to and during the event, as well as during the restoration period?	• Identify critical instructions given and evaluate results. • Review documentation and effectiveness of assignments of operating and reliability authorities.		
23. What communications occurred among operating entities?	• Review voice communications logs. • Evaluate logs relevant to the blackout and identify key interactions. Report conclusions.		
24. What were the qualifications (including Certification status) and training of all operating personnel involved in the event and their supervisors?	• Request Certification status of all operating personnel from involved operating entities. • Conduct onsite review of training materials and records. • Conduct onsite review of operating procedures and tools		
25. Was the role and performance of the Reliability Coordinators as expected?	• Review the adequacy of reliability plans for the affected Regional Entities. • Review the actions of the affected Reliability Coordinators to determine if they performed according to plans. • Assess whether inter-area communications were effective, both at the control area and Reliability Coordinator levels.		
System Restoration			
26. Were blackstart and restoration procedures available and adequate in each area? Were they followed and were they adequate to the restoration task? Were pre-defined authorities respected during the restoration?	• Onsite audit of blackstart and restoration procedures and plans. • Analyze whether the plans and procedures were used and whether they were sufficient for this outage.		
27. What issues were encountered in the restoration that created unexpected challenges or delays? What lessons were learned in the restoration (both things that went well and things that did not).	• Solicit information from operating entities and Regional Entities regarding unexpected challenges and delays in restoration, and lessons learned. • Analyze what worked well and what did not in the restoration.		

System Planning and Design			
28. Were the conditions leading up to the event within the design and planning criteria for the transmission systems involved?	• Request Transmission Owners and Regional Entities involved to report any violations of design or planning criteria prior to or leading up to the blackout.		
Conclusions and Recommendations			
29. From a technical perspective, what are the root causes of this event? What additional technical factors contributed to making the event possible?	• Conduct a root cause analysis on the findings and data. Categorize results as "root cause" or "contributing factor". Focus on technical aspects.		
30. What are the significant findings and lessons learned resulting from the analysis regarding technical failures leading to the event? What actions are recommended to avoid similar future events and improve Bulk Electric System reliability? What issues may be inconclusive and require future analysis?	• Draft report of significant findings, lessons learned, and recommendations.		
31. Final Report	• Prepare and coordinate publication of final report.		

Attachment E

Guidelines for NERC Reports on Blackouts and Disturbances[10]

Introduction and Purpose

Executive Summary of Blackout or Disturbance

Conclusions & Recommendations

Actions to Minimize the Possibility of Future Blackouts and Disturbances

Detailed Analysis of Event

1. Sequence of Events

1.1. Sequence of transmission and generation events
- 1.1.1. Reasons for each trip
- 1.1.2. Sequence of loss of Load~~load~~
- 1.1.3. Description of Cascading and islanding

2. System Modeling

2.1. Model and assumptions
- 2.1.1. Equipment ratings and limits
- 2.1.2. Steady state, system dynamics, and other analyses
- 2.1.3. Degree of simulation success
- 2.1.4. Simulation results
- 2.1.5. Conclusions and lessons learned

2.2. Pre-event Conditions
- 2.2.1. Load levels
  - 2.2.1.1.Forecast vs. Actual
  - 2.2.1.2.Comparison with planning and operational models
- 2.2.2. Generation dispatch
  - 2.2.2.1.Forecast vs. actual
  - 2.2.2.2.Comparison with day ahead studies
  - 2.2.2.3.Reporting of scheduled and forced outages
- 2.2.3. Reserve capacity
  - 2.2.3.1.Location of MW reserves
  - 2.2.3.2.Planned vs. actual
- 2.2.4. Transmission configurations
  - 2.2.4.1.Planned vs. actual
  - 2.2.4.2.Comparison with day ahead studies
  - 2.2.4.3.Reporting of scheduled and forced outages

[10] Each blackout or disturbance is unique and will therefore demand a customized approach to its investigation and reporting. These guidelines for NERC reports are suggestive rather than definitive. Not all investigations and reports will require covering all of these topics.

2.2.5. Interregional transactions
2.2.5.1.Calculated transfer limits

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF REVISIONS TO ITS RULES OF PROCEDURE
TO ADOPT A BULK ELECTRIC SYSTEM EXCEPTION PROCEDURE

ATTACHMENT 9

"THE DEVELOPMENT PROCESS AND BASIS FOR THE RoP TEAM'S

RECOMMENDED PROVISIONS – HOW STAKEHOLDER COMMENTS WERE

CONSIDERED AND ADDRESSED"

PREPARED BY THE BES RULES OF PROCEDURE TEAM

The development process and basis for the RoP Team's recommended provisions--including how stakeholder comments were considered and addressed

Background

On November 18, 2010, the Federal Energy Regulatory Commission ("FERC" or the "Commission") issued an Order (No. 743) directing NERC to revise the definition of Bulk Electric System to address the Commission's technical and other concerns as identified in the Order. Concurrent with the development of the revised Bulk Electric System definition, NERC was also directed to develop a process for granting specific facilities exemptions from the Bulk Electric System definition. FERC subsequently clarified certain aspects of its directives in Order No. 743-A.

The goal of the combined efforts was to develop a definition and exemption process sufficient to ensure that all facilities necessary for operating an interconnected electric transmission network are included in the bulk electric system under Section 215 authority. In the Orders, the Commission described in large part its technical and other concerns as:

- Inconsistencies and ambiguities exist across 8 regions with respect to the definition of the Bulk Electric System
- A backstop review process does not exist for resolving such inconsistencies and ambiguities
- Facilities exist that could significantly affect reliability but that because of inconsistencies in the definition are not subject to mandatory reliability rules, and thus the ERO lacks authority to require such entities to mitigate reliability risks

Through Orders 743 and 743-A the Commission proposed to:

- Eliminate regional discretion
- Maintain a bright-line definition of the Bulk Electric System as including facilities operating at 100kV and above
- Establish an exemption process and criteria that was NERC developed and FERC approved

NERC was given the latitude to develop a solution as effective as or more effective than the Commission's proposal in the Order.

Executive Summary

A team of industry stakeholders[1], with participation from NERC and regional staff, was assigned the task[2] to develop a process for granting exceptions to the definition of the Bulk Electric System. This Rules of Procedure (or "RoP") team was to coordinate closely with the standards

[1] The RoP roster is listed at: http://www.nerc.com/docs/standards/dt/BESROP_ROSTER_08312011.pdf . The team was selected from stakeholder names submitted for participation on the Project 2010-017, standard drafting team to bring a good mixture of technical, policy, and industry views.

[2] Standards Announcement: Bulk Electric System Definition Revision Status - http://www.nerc.com/docs/standards/dt/Project_2010-17_Standards_Announcement_040611.pdf

development efforts of the drafting team and, through stakeholder participation, propose a modification to the NERC Rules of Procedure that could be filed with the Commission for approval in response to the directives in Orders 743 and 743-A.

Believing that the set of electrical elements that comprise the Bulk Electric System generally will be appropriately determined through a hierarchical application of the newly proposed definition which includes detailed inclusions and exclusions to provide additional bright-line specificity beyond just the originally proposed 100kV threshold, the team expects that a practical exceptions process for specific facilities mischaracterized by the definition should be less frequently invoked and therefore less burdensome administratively than was envisioned by the Commission's original proposal for exemptions from a more broad-brush 100kV approach.[3] The exceptions process is intended to be consistent, repeatable, and verifiable while allowing sufficient flexibility for circumstances specific to each case to dictate the proper outcome in the interest of reliability.

Interested stakeholders were provided multiple opportunities to participate in the development of the process through open meetings as well as extensive use of e-mail,[4] web postings,[5] and informational and question-and-answer presentations held jointly with the definition drafting team[6]. Members of the Rules of Procedure team worked with Canadian entities to address consistent treatment of transmission lines that cross the border to address FERC's stated concerns and to alleviate Canadian concerns about a "one-size-fits-all" approach.

Several process attributes considered by the team during development were:

- Maintain the exemption for facilities used in the local distribution of electric energy as well as radial facilities
- The exception procedure including the criteria[7] for allowing exceptions should be clear, objective, transparent, and uniformly applicable
- The process should allow any registered entity to utilize the process to seek an exception either for its own facilities or for others' facilities with respect to which it has ERO-related reliability responsibilities
- NERC should be the ultimate decision-maker in order to retain facility-by-facility oversight of the objective and uniform application of the exception criteria
- The process should provide a procedure for revoking a previously granted exception if a facility no longer qualifies for such special treatment
- The records of all exception requests should be ready-for-audit by Commission staff

[4] The RoP e-mail distribution list was combined with the Project 2010-017 drafting team roster and any interested participant was allowed to join a "plus" list that was used extensively.

[5] A project team webpage was created and hyperlinked to the standards under development webpage for information.

[6] The NERC Members Representatives Committee was briefed on several occasions throughout 2011, two joint NERC Webinars with Q&A were presented, and one joint presentation at a NERC Standards workshop.

[7] The leadership of the BES Definition SDT and of the Rules of Procedure team met with the leadership of the Standards Program and the Standards Committee and determined that the BES Definition SDT would assume responsibility for working with stakeholders to identify what evidence will be needed to support a request for an exception to the BES definition.

Several significant issues were identified during the development of the process that needed to be addressed. The issues were not considered to be intractable nor threatening to reliability, but nonetheless were important to the stakeholders. The issues generally fell into the following categories:

- Who is eligible to initiate and/or participate in the process by which an Exception is granted? What is the role of state regulators?
- What should be the scope of the Elements that can be contained in a single Request?
- Should an entity unable to determine the status of an element by applying the bright line BES definition be able to obtain a determination of its status through the exception process?
- What is the appropriate balance between allowing open access to the process and ensuring administrative time is spent analyzing and processing valid, permissible requests?
- What is the appropriate balance between facility-by-facility case-specific flexibility and an appropriate level of consistency, respecting the varied roles and proper exercise of discretion by each participant?
- How transparent should the process be? Should entities other than the Regional Entity, NERC, FERC, or Canadian Provincial authorities be allowed access to facility-specific Exception-related information filed by an entity?
- What should be the status for compliance purposes of an Element during the pendency of the request?

Summary of the Development Process

The Rules of Procedure Exceptions process was developed through stakeholder participation as described in the executive summary. Additionally, interested stakeholders were asked to provide feedback on the proposed amendments through a special electronic comment form on two separate occasions.

A 30 day posting for comment was held from May 10, 2011 through June 10, 2011, in conjunction with the first posting of the draft definition. There were 70 sets of comments on this first posting, including comments from more than 176 different people from approximately 131 companies representing 10 of the 10 Industry Segments.

After considering all comments received from the first posting, the team made substantial revisions to the proposed amendments, and a second posting with a 45-day public comment period was conducted from September 13, 2011 through October 27, 2011, in conjunction with the second posting and initial ballot of the draft definition. There were 72 sets of comments on this second posting, including comments from more than 134 different people from approximately 86 companies representing 9 of the 10 Industry Segments.

After consideration of this second set of comments, the Rules of Procedure team made further revisions, mostly to clarify and fine-tune the process. Many of the comments received expressed concerns about the outside edges of the process which represented a worst-case scenario. While such a scenario certainly must be considered, it is important to note that such provisions were included in the exception process in order to anticipate situations that might be encountered occasionally or even infrequently during the administration of the process (e.g., uncorrectable insufficiencies in the form of a Request), but that most requests are not expected

to present such situations and therefore will be processed to a definitive conclusion in fewer steps but still in a fair, efficient and effective manner. Additional information may be found at: http://www.nerc.com/filez/standards/Rules_of_Procedure-BES.html

Some commenters noted, with appreciation, that the development process for these amendments offered them more opportunity for review and comment than has traditionally been available for revisions to the Rules of Procedure. Additionally, commenters expressed that communication outreach efforts by the team such as through webinars was very helpful. The RoP team also has benefited from the additional input afforded by the two-step process.

Proposal

The RoP Team believes that the proposed process establishes a fair and efficient resolution to a majority of the Exception Requests that will be presented, yet provides the necessary processes to address special circumstances that may arise in the process of arriving at a technically sound determination. In essence, in most circumstances, the process is a fairly simple and direct process of discrete steps:

1. An entity applies the definition to an element, but nonetheless believes that an element should either be included in or excluded from the Bulk Electric System contrary to its characterization by the definition, and therefore submits an Exception Request to the region where the Element is located.
2. The region receives the request, and
    a. The region conducts an initial screening looking for three items to determine if it is a valid request for processing:
        - Is the request from an eligible submitter?
        - Is the request for an exception to the Definition?
        - Is the required information provided with the request?

    If the initial answer to each question is yes, the request is moved forward to a substantive review. If not, the submitter has an opportunity to fix the request before the region rejects the request as deficient.
    b. The region substantively evaluates the request and makes a recommendation to NERC.
3. NERC reviews the request and all information developed at the regional level, and either approves or disapproves the exception request.
4. The Entity either accepts or appeals NERC's decision.

Additional checks and balances exist to address special situations, such as when a region itself submits an Exception Request or when a region either intends to reject a request as insufficient or recommend to NERC that an exception request be denied. In such circumstances, measures to give extra consideration to the submitter's or owner's position necessarily create additional levels of complexity, but they also provide important safeguards to ensure the best technical result for reliability.

The RoP team believes the proposed amendments represent a process that:

- Balances the need for effective and efficient reliability administration with due process and clarity of expectations.
- Is consistent, repeatable, and verifiable.
- Supports consistent treatment of transmission lines that cross international borders.
- Helps alleviate concerns about a "one-size fits all" approach.
- Allowed commenters to raise and address a number of their substantive concerns.

Consideration of Comments

Effective and efficient reliability administration vs. due process and clarity of expectations

Commenters were divided on how successfully the proposed procedure achieves this balance and on what procedural elements need to be added or should be eliminated. The RoP Team wishes to emphasize that the industry, the regions, and NERC each have responsibilities under the proposed process, and while these responsibilities do revolve around the processing of a single request, they are distinct and different steps that are discrete and manageable. The process sets a framework by which entities exercise their responsibilities together to effectively analyze a request and produce a technically justified conclusion. Where specific work-product or deliverables are detailed in the process, it is done to ensure consistency. It is expected that each participant in the process use its discretion where appropriate to maximize the efficiency and effectiveness of its individual obligations in the process.

A two-stage review (screening and substantive review) is included to ensure that requests are appropriately submitted prior to accepting them into the process of detailed technical review. In practice, a properly submitted request will flow through the initial review and on into substantive review without delay, and the minor administrative action of screening is more than counterbalanced by the time and resource savings gained by focusing technical work only on those requests that are complete and ready for substantive review. The process should not result in properly submitted exception requests being denied a technical review, and in the unlikely case of an improper rejection on arbitrary grounds, a process exists for a submitter to turn to NERC, which can direct the substantive review of a request.

Status of an Element for compliance purposes

There continues to be a desire among some commenters for a reduction in the exposure to compliance monitoring and enforcement activities during the pendency of exception requests. The RoP team notes that the Commission has already addressed this issue[8] and the team has provided a mechanism for ongoing transition issues to be identified and addressed in consultation with the Regional Entity as necessary in the exceptions process.

The concept of "commercial operations" was included in section 10.2(a) to provide a reference point in future time from which to judge exception requests for newly planned but not yet constructed elements. In addition, although the BES definition implementation plan proposes a 24 month implementation period for application of the definition, Section 10.2(b) addresses the circumstance where an exception request is not resolved by the end of the "bright line" implementation period. The intent of both provisions is that for a new element (or for one which is not currently within the BES for compliance) which would be included under the new definition, if the owner believes it should be granted an exception from inclusion, the request for that exception should be submitted in sufficient time prior to its being placed into service (or

---

[8] From Order No. 743:
132. While the Commission is sensitive to commenters' concerns regarding non-compliance during the transition period, the Commission will not provide a trial period, as we declined to do in Order No. 693, with respect to those facilities that are subject to Commission-approved Reliability Standards for the first time. We expect that the transition periods will be long enough for exemption requests to be processed and to allow entities to bring newly-included facilities into compliance prior to the mandatory enforcement date. Additionally, the ERO and Regional Entities may exercise their enforcement discretion during the transition period.

prior to the end of the implementation period) that a decision can be reached, a negative decision can be mitigated, and the element brought into compliance without requiring what might have been unnecessary compliance expenses to be incurred in advance.

Some commenters expressed concern about a situation in which a new standard requirement could begin to apply to an element that was the subject of an exception request, thereby causing the owner to incur additional compliance costs. The team declined to address this case because the standards development process allows significant opportunity to address applicability and effective dates, and this is not unlike the situation already addressed by the Commission in Order 693 concerning the transition to ERO enforcement of mandatory reliability standards generally.

Composition and selection of panels of experts

The composition and selection of panels of experts at different points in the process was questioned by some commenters, and the RoP team has made some clarifying adjustments in its proposed procedure. The composition and selection of the regional-level Technical Review Panel (in section 5.3) was adjusted from a minimum of 5 to a minimum of 3 in order to allow for more efficient utilization of technical resources. A minimum of three persons was still considered necessary in order to allow the possibility of a minority view to be expressed without grid-locking the panel. Additionally, the RoP team gave the Regional Entity senior executive (President, General Manager, CEO, etc.) the authority to appoint the technical review panel without being constrained to particular membership criteria as long as technical expertise and independence is honored. For example, the regional executives may collectively choose, for consistency and peer collaboration, to assign the role of the Technical Review Panel to a group made up of other regional staff responsible for processing another region's individual regional exception requests. Such a group also could provide a standing pool of peer experts providing this service to each region and promote consistent recommendations to NERC. The intent is that the Technical Review Panel will render an independent opinion on any request for which the region intends to issue a Rejection or a recommendation of disapproval. Such an opinion would be part of the record for NERC to consider in its evaluation, so a staff member of the RE that is making the recommendation should not be a member of the panel reviewing their own recommendation or rejection.

Region acting as a Submitting Entity

In response to a variety of comments expressing concern and some confusion over the situation in which the region was itself submitting an exception request, the RoP provided additional detail regarding those elements of the procedure at the regional level that would continue to be applicable in order to protect the owner's due process, enable the development of a complete factual record for NERC's evaluation, and allow the expertise and distinct roles the region and NERC each have in processing exception requests to be followed.

Transparency and participation in the process

Several commenters expressed concern about the appropriate degree of transparency in the process, especially when an exception decision might become precedence for decisions made on later requests --- including requests in other regions. Some commenters even expressed an interest in allowing expanded participation by third parties (such as state regulators, trade associations, neighboring utilities, etc.) in the processing of individual exception requests.

The RoP team continues to believe that the exception process should be one based on the technical reliability issues of the specific case presented and that consistency in application of the process is most enhanced by having a single decision-making entity, NERC, whose expertise is in electric reliability. As stated before[9], the RoP Team believes that if there were no limitation on interventions, the exception process may not be effective and efficient and could be lengthy. To establish a procedure that encouraged or even only invited multi-party filings would unduly complicate the process without any concomitant benefit in reliability.

The team specifically provided that (1) detailed notice of any request would be provided to every Registered Entity with reliability oversight obligation for the Element subject to the Request and (2) general information about the request will be publicly posted. The RoP team believes that it has achieved sufficient balance between the protection of CEII and other confidential information and the need to have a process as transparent as possible to ensure consistency. The RoP Team believes that third parties (including state regulatory agencies) will have adequate opportunity to provide comments regarding the request without formally participating in the process.

In response to comments about access to the record, the RoP team clarified that the Submitting Entity or Owner will have access to the information upon which NERC's final decision is based and otherwise ensured that a full record will be created and maintained for later audit and/or appeal.

Inability to provide supporting information

A comment was received regarding the ability of a submitting entity to obtain and provide the Section III, Required Information to support its request. The procedure is designed such that the submitting entity has the burden to establish a compelling argument that an element should be considered in or out of the BES contrary to the definition because the element is or is not, as the case may be, necessary for the reliable operation of the interconnected transmission network. However, the RoP Team concurs with the response used by the SDT pertaining to the concept of a base case and what to do if there is difficulty gaining access to needed data to support an Exception Request:

> In response to the comment about an appropriate Base Case, the SDT expects the entity seeking an exception to supply an appropriate base case that the Regional Entity will acknowledge as appropriate. Not indicating the explicit types of studies or base cases to be provided and how to interpret the information in the application process does not fail to provide a basis for the Regional Entity to determine what constitutes an acceptable submittal.
>
> The SDT recommends that each submitting entity work with its Regional Entity to resolve issues with information availability or access and, in the event such information is not available, whether suitable replacement data is acceptable. The SDT further recommends that where information is unavailable, the submitting entity state such in the comment area and provide the reason for this unavailability. This will signal the Regional Entity that an issue concerning information availability will need to be resolved as part of the review process.

[9] Consideration of Comments located at: http://www.nerc.com/docs/standards/sar/Project_2010-17_BES_ROP_Consideration_of_Comments.pdf

Consistency of results

Several commenters expressed concern with the consistency of the exceptions process, largely because of the heavy involvement of regions in performing a substantive review and issuing a recommendation. However, Order 743 recognized that differences properly may exist across North America with respect to a particular type of element and its effect on reliable operations, and directed the ERO to develop an exceptions process at least in part to address such differences.

The RoP team considered that not only how an element is connected to the bulk power system but also how it's use impacts reliable operation. To a large extent, therefore, the **Detailed information to Support an Exception Request** can best be evaluated in context and developed at a regional level. Such regionally developed information then will be used along with its separate engineering judgment by a single decider (NERC) to arrive at a technically sound determination. Undoubtedly, clarity and effectiveness of the process will improve with use. The RoP Team concurs with the SDT revisions to Section III of the **Detailed information to Support an Exception Request** and notes their response to comments regarding concerns that there may be insufficient technical or other criteria to determine whether varying results are arbitrary or based on meaningful distinctions.

> The SDT understands the concerns raised by the commenters in not receiving hard and fast [technical] guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments.
>
> There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn't been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel...Moreover, Appendix 5C of the proposed NERC Rules of Procedure, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request.
>
> On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that the explicit types of studies to be provided and how to interpret the information aren't shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and

fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn't been handled before by either party and there is a great deal of professional experience involved on both the submitter's and the Regional Entity's side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication.

Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal.

The RoP team also notes that the draft SAR for Phase II of this Project 2010-017 calls for a review of the process after 12 months of experience. If at that time, experience has shown that additional elements have been consistently useful factors, they can be added as additional detail to the process.

The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase I of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem.

Start-up issues

The RoP team suggests that NERC and the regions develop and share with the industry, as needed, some guideline and tools to help them administrate the Exception Process during start-up. This should include regular reporting of exceptions considered and either approved or disapproved, with as much detail as appropriate for public posting. It should be understood, however, that the outcome of what may be perceived to be similar requests may be different due to the specific operating facts and circumstances involved, and BES reliability remains the final goal of the whole process.

Some commenters requested that the Exception Process be postponed until Phase II of the definition process has been concluded. The RoP team does not agree and recommends to move forward with the proposed Exception Process in coordination with the implementation of the revised definition. The only alternative would appear to be to apply the Definition without any exceptions for some period of time, which would result in unnecessary inclusions and undesirable exclusions of elements from the BES, neither of which would benefit reliability.

In response to comments suggesting procedures for the tracking of Exceptions as they are processed, the RoP team believes this to be an administrative matter for NERC and the regions to address.

Recertification of Exceptions

Some question was raised regarding the frequency with which an Exception which has been granted must be recertified, with some commenters proposing 3 or 5 years rather than the 2 years in the proposed procedure. The continued application of an exception to a facility for which an exception is no longer warranted could have negative effects on reliability, so a shorter rather than longer time between reviews seems warranted. Moreover, the certification process being proposed on this schedule is more of an information update than anything especially onerous. Only if NERC obtains information suggesting the Exception may no longer be appropriate is a more detailed substantive review conducted.

Consistency with existing procedures

Some commenters expressed a concern about consistency with the existing NERC RoP. However, in drafting the exception process, the team leveraged existing administrative rules where possible. Particularly, the appeals process is drafted to parallel the appeals process for PRC-023 in Section 1702. This process efficiency takes advantage of existing industry time and resources expended in understanding and commenting on an administrative process and increases the predictability and consistency of NERC procedures. The team also notes that the Exception Process may be amended as appropriate upon the adoption of any related changes elsewhere in the Rules of Procedure or in the Definition or the **Detailed information to Support an Exception Request**, whether under Phase II of the standards development project 2010-017 or thereafter.

Consider the whole record

Some commenters requested that the expression “No single piece of evidence should be dispositive” should be removed from the description of NERC’s consideration of the request. The RoP Team agreed and changed the wording consistent with the SDT comments to allow an entity to submit any additional information it feels relevant. Because the definition provides bright-line threshold criteria for exclusions and inclusions, the exception process will likely use a blend of quantitative and qualitative thresholds encompassed in engineering judgment to arrive at a determination. With respect to the jurisdictional boundary between distribution and transmission, the team notes that Rules of Procedure at Section 314 already addresses Conflicts with Statutes, Regulations, and Orders and that the exception process should focus on facilities necessary for the reliable operation of the interconnected bulk-power system.

Lines that cross international borders

The RoP team adopted new language in Section 1.2 that we believe address the stated concerns.

Conclusion

The RoP team believes the process as proposed will enable fair yet efficient and effective determinations with respect to requests that specific elements be excepted from application of the BES Definition. In order to accomplish this, we believe the procedure needs to be approved and put into place concurrently with the effective date of the new definition, with sufficient lead time before compliance obligations are imposed on newly included elements to allow exception requests properly and thoroughly to be considered. The two year implementation period proposed by the SDT seems to be sufficient in most cases to allow industry participants to identify possible exceptions and prepare requests and for the regions and NERC to follow the procedure proposed here to completion.

The exception procedure proposed here is not intended to be a frequently utilized method for determining the status of great numbers of elements or facilities across the country. Nor should it need to be in light of the detailed Inclusions and Exclusions that are part of the Bulk Electric System definition, which should clearly and appropriately serve to characterize the vast majority of elements and facilities. Only the tough cases will need to be reviewed through this process, and it is for those tough cases that the procedure has been designed to provide sufficient procedural detail to be consistent, repeatable and verifiable, yet also to allow the flexibility to evaluate the technical issues presented by each request in context. Opinions can and do differ regarding the best balance between the countervailing interests in a speedy, decisive process (which may risk over-simplicity) and full consideration of sometimes complex technical issues (which may risk unnecessarily expanding steps and slowing down the process), but the RoP team believes its proposal presents a framework in which those requests that can be decided straightforwardly will be decided quickly and efficiently but those more difficult requests can receive the attention they need and deserve in order to reach the best decision for reliability.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

PROJECT 2010-17 DEFINITION OF BES (PHASE 2)

Meeting Notes

Administration

1. **Introduction**
   The Chair brought the meeting to order at 8:00 a.m. on Tuesday, January 24, 2012 at the offices of Nevada Energy in Las Vegas, NV. Meeting participants were:

Members		
Jennifer Dering, NYPA	Brian Evans-Mongeon, Utility Services	Phil Fedora, NPCC
Ajay Garg, Hydro One	Pete Heidrich, FRCC, Chair	John Hughes, ELCON
Barry Lawson, NRECA, Vice Chair	Jeff Mitchell, RFC	Rich Salgo, Sierra Pacific
Jason Snodgrass, GTC	Jonathan Sykes, PG&E	Ed Dobrowolski, NERC Coordinator
Observers		
Richard Dearman, TVA	Tom Duffy, Central Hudson	Jeff Gindling, Duke
Bill Harm, PJM	Jonathan Hayes, SPP	Bill Hughes, City of Redding
Marcus Lotto, SCE	Russ Noble, Cowlitz	David O'Connor, FERC
Alain Pageau, HQ	Ken Shortt, Pacificorp	Tim Soles, Occidental
Bob Stroh, FERC	Phil Tatro, NERC	

2. **Determination of Quorum**
   Quorum was achieved for this meeting.
3. **NERC Antitrust Compliance Guidelines and Public Announcement**
   The NERC Antitrust Compliance Guidelines and conference call warning were delivered.
4. **Membership Changes and Roster Updates**
   Joel Mickey, ERCOT, will be unable to continue with the Phase 2 efforts due to a change in job responsibilities. ERCOT has stated that they are comfortable following Phase 2 through the comment process so Joel will not be replaced on the SDT.
5. **Review Meeting Agenda and Objectives**

No changes were made to the agenda. The objectives of this meeting were to start work on the guidance document and to make assignments for responding to the SAR comments.

Agenda

1. **Update on Phase 2 SAR – Pete Heidrich**

   The SAR was posted on schedule and the comment period will close on February 3, 2012. Comments will be addressed at the next meeting.

   The NERC Board of Trustees approved the SDT's Phase 1 work on January 18, 2012 and the FERC filing for Phase 1 was made on time on January 25, 2012.

2. **Update on NERC OC/PC Assistance with Phase 2 – Pete Heidrich**

   A conference call has been scheduled for February 3, 2012 between the SDT leadership and the NERC Operating and Planning Committee leadership. On this call, Pete and Barry will define the scope of activities that the SDT wants the committees to provide assistance with. Comments on the SAR aren't due until after this call so some flexibility will need to be present as to the final assignments. However, it is not anticipated that any major changes in these assignments will take place due to comments. Goals will need to be clear in order to direct the analysis.

   Four members of the SDT are also members of the NERC Planning Committee so natural liaisons exist. However, the SDT wants to embed SDT members in whatever group works on the assignments.

   It needs to be clear to all concerned that Phase 2 is not about re-defining the BES. It is about justifications for variables and thresholds which could in some cases support possible revisions to the BES definition. It also needs to be understood that the actual definition could be altered by FERC rulings on the filing.

   Responding to FERC comments and the mandatory review of the effectiveness of the exception form will be part of the SDT workload and will affect the actual work on Phase 2.

   The SDT will work exclusively with the Operating and Planning Committees (OC/PC) and will depend on those committees to reach out to any other groups such as the North American Transmission Forum for additional assistance. All official studies will be conducted by the Operating and Planning Committees.

   The SDT reviewed the items in the SAR to determine which of them should be allocated to the Operating and Planning Committees:

   - Thresholds for Real and Reactive Power – This item will be turned over to the OC/PC. It is obvious from the preliminary work done by the SDT and from received comments that this is a complex task best left to those who do this type of work on a regular basis.

- Contiguity of the BES – The SDT feels that it can handle this item.
- Associated equipment supporting the BES – The terminology is used in the definition of Transmission and is open to interpretation. The SDT will need to clear this up. The bullet in the SAR should be revised to clear up any confusion as to what the SDT is going to do. This item will be handled by the SDT.
- Automatic interrupting devices in Exclusions E1 and E3 – The industry needs to know the demarcation point. The guidance document may help with that issue. This item will be handled by the SDT for now but may need to be farmed out to the OC/PC as more information is gathered.
- Blackstart Resources and Cranking Paths – The issue is whether Blackstart Resources need to be included in the BES since they are only utilized in that role during restoration and not normal operations. The inclusion of Cranking Paths could fall out of the contiguity discussions. This item will be handled by the SDT.
- 100 kV bright-line – OC/PC support will be requested for this item but it is hard to visualize what type of studies could help with this discussion. There should be no initial bias to the 100 kV limit as it has never been justified. There is a possibility that the correct answer to this question could be different on an Interconnection basis. Another way to look at this is to question whether kV is the correct measure or whether any threshold is needed with the inclusions and exclusions in the revised definition.
- Power flow out of local networks – There could be a need for a time element in this exclusion and OC/PC assistance will be needed to analyze this.

3. **Develop Guidance Document for Phase 1**

This document is not a technical justification. It is for clarification and explanation. It is based on the filed definition so it may have to be changed once FERC issues a final ruling. It will be illustrative and non-binding and the list of diagrams will not be exhaustive.

FRCC did some work in this area earlier and Pete supplied several diagrams that can be used as a template moving forward.

The SDT guidance must be consistent with the information provided during Phase 1 so comment responses should be a primary source of information for this document.

This document will represent a consensus of the SDT.

The SDT was divided into sub-groups to work on the document text and diagrams for each inclusion and exclusion.

Inclusion I1 – Jeff Mitchell and Ken Shortt

Changes were requested to the radial configuration diagram to provide additional clarity. The BES box in figure 1 is not needed but a non-BES box on the tertiary winding

is required. It was pointed out that Exclusion E3 will need to show both > 300 kV and < 300 kV examples.

Inclusion I2 – Jennifer Dering, Bill Harm, and, Ajay Garg

There is a need to clarify the single site concept and to add a note for the switchyard. Example 4 needs to be expanded for < 75 MVA. The protocol is to review single units for inclusion first and then to go to the aggregate review. Therefore, any single unit > 20 MVA is in the BES regardless of whether it is a single unit at a single site or if it is part of a multiple unit aggregation at a site. This means that if multiple units at a site aggregate < 75 MVA but one of the aggregated units is > 20 MVA, that >20 MVA unit is in the BES while the other units at the site are not. When aggregating units, only those units with a step-up transformer connected at 100 kV or greater are counted. For purposes of applying the BES definition, the 'step-up transformer' is the first transformer a generator connects to.

Inclusion I3 – This item will not appear in the guidance document as it is straightforward and no additional information is required.

Inclusion I4 – Phil Fedora, Brian Evans-Mongeon, Russ Noble

Transmission is not included, just the resources. Reference to the interconnection agreements might help to simplify this issue.

Inclusion I5 – Jason Snodgrass and Jeff Gindling

Need to show a non-BES example as well as the BES example. An example is needed for a dynamic device. All options must be explained in text.

Exclusion E1 – Jonathan Sykes, Marcus Lotto, Barry Lawson, Alain Pageau

The point of emanation is where the radial starts. The tap does not break the continuity of the BES line or bus. In the diagram, the closed switch must be located on < 100 kV [facilities or elements] . Examples for a normally open switch are needed as well as a normally closed switch above the transformers.

Exclusion E2 – John Hughes and Tim Soles

Need to show the meter in the diagram. The first diagram should show that it qualifies for the exclusion as it is < 75 MVA. A second diagram should be added to show an example where it does not qualify since it is > 75 MVA. Need to define that the demarcation is customer-owned equipment.

Exclusion E3 – Rich Salgo, Richard Dearman, and Bill Hughes

The diagrams need to be clear without the use of colors. Diagram 1 needs to have a box showing the local network. The text should point to the arrows indicating flow into the local network. Voltage levels internal to the local network should be provided. Voltages on both sides of transformers need to be shown. Diagram 2 shows that the exclusion can't be utilized due to the size of the generation. The 30 MVA units shown in the diagram is not a BES unit since no power leaves the local network. Need to adapt diagram 1 by flipping one arrow to show flow leaving the local network and thus it doesn't qualify for the exclusion.

Exclusion E4 – Pete Heidrich, Jonathan Hayes, and Tom Duffy

This item needs to align with Exclusion E2 and should mirror the diagrams there but with a reactive device shown. The device can be on the supply side.

4. **Next Steps**

   a. Assignments and Schedule to Continue Work on Guidance Document

   Additional work is needed by the sub-teams on Inclusions I2, I4, and I5 and for Exclusions E1 and E3. All others are considered to be complete.

   Pete will take the text and diagrams and put them in the correct format. They will then be placed in a formatted document for SDT review.

   b. Assignments and Schedule to Develop Draft Responses for Phase 2 SAR

   Questions will be handled the same way they were done in Phase 1. Each question will be assigned to an SDT member. That member will review the comments and prepare draft responses. Those responses needing group discussion will be presented at the next meeting. Following the meeting, members will be given one week to finalize responses based on the meeting comments. They will then publish the responses through the e-mail list and members will have one week to comment. Every attempt will be made to reconcile those comments via e-mail. Assignments were made as follows:

   - Q1 - Brian Evans-Mongeon
   - Q2 – Jennifer Dering
   - Q3 – Jeff Mitchell

- Q4 – Jason Snodgrass
- Q5 – Jonathan Sykes
- Q6 – Phil Fedora
- Q7 – Ajay Garg
- Q8 – Rich Salgo
- Q9 – Barry Lawson
- Q10 – Pete Heidrich
- Q11 – Ed Dobrowolski

Several of the questions contain a second part on technical justification. Any comments received on the second part of the questions will be treated as information only and the SDT is not required to provide individual responses to each comment.

5. **Phase 2 Schedule**

   The SDT feels that an 18 month schedule starting at SAR approval should be reasonable. However, SAR comments might change that idea. For the discussions with the NERC Operating and Planning Committees, the 18 month concept will be utilized. Based on that timeframe, the committees will be asked to complete their work by the end of the calendar year.

6. **Future meeting**

   The next meeting will be Tuesday, February 21, 2012 at 1:00 p.m. through Thursday, February 23, 2012 at 5:00 p.m. in the PG&E offices in San Francisco, CA. Details will follow. Due to room size limitations, only 10 observers will be allowed to attend this meeting. Given the attendance at this meeting, it is anticipated that this will not be a problem.

7. **Action Item Review**

   Sub-team leaders will forward their items to Ed Dobrowolski no later than Friday, February 3, 2012.

8. **Adjourn**

   The Chair thanked Nevada Energy for their hospitality and adjourned the meeting at 12:00 p.m. on Thursday, January 26, 2012.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

PROJECT 2010-17 DEFINITION OF BES (PHASE 2)

Conference Call Notes

Project 2010-17 Definition of BES (Phase 2)

Administrative

1. **Introduction**

   Pete Heidrich called the group to order at 10:00 a.m. on Friday, February 3, 2012. Call participants were:

   From the DBESSDT – Pete Heidrich, FRCC, Chair; Barry Lawson, NRECA, Vice Chair; and Ed Dobrowolski, NERC Staff Coordinator

   From the NERC Operating Committee – Tom Bowe, PJM, Chair; and Jim Castle, NYISO, Vice Chair

   From the NERC Planning Committee – Jeff Mitchell, RFC, Chair; and Ben Crisp, Progress Energy Florida, Vice Chair

   From NERC – Mark Lauby

2. **NERC Antitrust Compliance Guidelines and Public Announcement**

   Ed Dobrowolski delivered the NERC Antitrust Compliance Guideline and open conference call warnings.

3. **Review Meeting Agenda and Objectives**

   No changes were made to the agenda.

   The objective of the call was to set up a preliminary plan for addressing the BES definition technical justification issue for Phase 2 of the BES Definition Project.

Agenda

1. **Update on Phase 2 SAR – Pete Heidrich**

   The Phase 2 SAR is posted and comments are due by close of business today. It is possible that industry comments will cause a change in what is to be done in Phase 2 but the big ticket items mentioned in item 2 below are not expected to change. A similar problem could occur once FERC rules on the proposed definition. Therefore, the groups in question will need to anticipate some degree in flexibility with their assignments.

Phase 2 is not looking to change the proposed framework of the core definition or the inclusions/exclusions. It is designed to solely address the variables embedded in the definition (core definition, inclusions and exclusions) to date. The scope and timing of Phase 1 did not allow the SDT to address those issues. When such discussions did take place during Phase 1, it was clear that all parties concerned, from FERC to the NERC Board of Trustees to the NERC Standards Committee, were going to insist on compelling technical justifications before they would entertain any thoughts of allowing changes to be made. And that technical justification must show that the over-all reliability of the BES could not be lessened by the changes. The SDT is looking to the committees for assistance in performing the needed studies to provide the technical justifications. It was noted that interconnection differences would probably be allowed as long as they are part of the established definition and not submitted as regional variances.

There is no Commission deadline for Phase 2 but the SDT wants to complete it in a timely fashion. Ideally, it should be complete before the two year implementation plan for Phase 1 comes to pass. The SDT wants to avoid any compliance confusion similar to what occurred with the multiple versions of the CIP standards.

2. **Technical Justification Issues**

Pete reviewed the four basic issues that the SDT is looking to the committees for assistance with:

- 100 kV bright-line
- Generation thresholds (Inclusions I2 and I4):
    i. Single vs. multiple units
    ii. MW values
    iii. Voltage levels
- Reactive Power sizing parameters (Inclusion I5)
- Maximum value of Power flow out of local networks (Exclusion E3)

3. **Determine the Appropriate Method of Answering the Issue**

The group agreed that it is too early in the process to determine how to answer the questions. The SDT leadership needs to create a problem statement outlining what the SDT needs for each issue. Then the Operating and Planning Committees can organize their sub-groups appropriately and determine the best method for moving forward.

4. **Determine the Parameters/Assumptions Required**

The aforementioned problem statement should provide this information.

5. **Determine the Appropriate Committee to Perform Analysis**

   Once the problem statement is complete, the Operating and Planning Committees can meet to decide which committee will lead the work effort for each issue. It is hoped that this can be accomplished during the joint committee meetings in March 2012.

   SDT members are ready to volunteer to join the various sub-groups working on this effort.

   Mark Lauby will draft an outline for the study work once he has received the problem statement.

6. **Next Steps**

   Pete and Barry will draft a problem statement and distribute it to the group by February 17, 2012. Mark will then draft an outline for the study work and distribute it to the Operating Committee/Planning Committee for discussion at their next joint meeting in March 2012. Following that meeting, the leadership of the affected groups will determine the next course of action.

7. **Future meeting**

   No future meetings were scheduled at this time. Once the Operating Committee/Planning Committee joint meeting has been held, the leadership can decide if, and when, to hold a meeting or conference call. In general, meetings or calls will be held on an as needed basis as decided by the leadership. Everyone was encouraged to include all of the participants in this call on any e-mail threads on the topic. It is important that we all stay on the same page moving forward and that there is only one story being put forth on the topic.

8. **Action Item Review**

   The following action items were developed during the call:

   - Pete and Barry will provided a problem statement detailing the information that the Operating Committee and Planning Committee will need to decide on how to proceed with the assignments. This is due by February 17, 2012.

   - Mark will develop an outline for the study work required to complete the assignment. This will be distributed to the Operating and Planning Committees for discussion at their joint meeting in March 2012.

9. **Adjourn**

   Pete Heidrich adjourned the meeting at 11:15 a.m.

Subject: Joint Leadership Conference Call - DBES SDT, OC & PC Meeting Minutes

Ladies and Gentlemen,

Attached you will find the meeting minutes from the February 3rd Joint Leadership (DBES SDT, NERC OC & PC) conference call. It is important to note that the meeting was very productive in establishing the expectations of everyone involved. We have developed to framework of a collaborative effort to address these issues with technical justification. I will be covering the call in more detail at the next SDT meeting.

Thank you,

Peter A. Heidrich

Subject: NERC Announcement: Standards Bulletin - December 5-11, 2011
Date: Monday, December 05, 2011 11:49:55 AM

Standards Bulletin
December 5-11, 2011

This weekly bulletin compiles a list of current and upcoming standards, interpretations, and CANs posted for comment, industry review, or ballot, along with a list of upcoming standards-related postings and events. The bulletin is being piloted for the next few weeks, so any feedback on its effectiveness, content, and format is welcome. Please email Monica Benson with questions about standards commenting and balloting, Caroline Clouse with questions about CANs, and Mallory Huggins with feedback on this bulletin.

Now available on the Standards Under Development page.

STANDARDS ITEMS

Current Ballots for Proposed Standards or Interpretations (ballot periods close at 8 p.m. Eastern)

- Project 2007-12: Frequency Response (BAL-003-1) – Open November 30 - December 8, 2011 (Initial Ballot and Non-Binding Poll)

- Project 2009-01: Disturbance and Sabotage Reporting (EOP-004-2) – Open December 2-12, 2011 (Initial Ballot and Non-Binding Poll)

Proposed Standards and Interpretations Posted for Comment (comment periods close at 8 p.m. Eastern)

- Regional Reliability Standard VAR-001-2 WECC Variance – Posted October 20 -

December 5, 2011 (Comment Form)

- Project 2007-12: Frequency Response (BAL-003-1) – Posted October 25 - December 8, 2011 (Comment Form)

- Project 2009-01: Disturbance and Sabotage Reporting (EOP-004-2) – Posted October 28 - December 12, 2011 (Comment Form)

- Regional Reliability Standard PRC-006-NPCC-01 UFLS – Posted November 22 - December 22, 2011 (Comment Form)

- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Posted November 7, 2011 - January 6, 2012 (Comment Form)

Join Ballot Pools (ballot pool windows close at 8 a.m. Eastern)

- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Open November 7, 2011 - December 15, 2011 (Join Ballot Pool)

Pending Ballots for Proposed Standards or Interpretations (ballot periods close at 8 p.m. Eastern)

- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Open December 16, 2011 - January 6, 2012 (Initial Ballots)

Standard Drafting Team Vacancies

- Any industry stakeholder meeting the indicated qualifications for one of the following vacant appointments may submit a self-nomination form to sarcomm@nerc.com. Further instructions can be found on the Drafting Team Vacancies page on NERC's website.

    - Project 2007-06 System Protection Coordination: Seeking an individual from a Canadian entity with experience in coordination of protection systems (new installations and revisions).

    - Project 2007-12 Frequency Response: Seeking an individual representing Transmission Dependent Utilities with experience in analyzing or modeling

frequency response.

OTHER ITEMS

Compliance Application Notices (CANs) Posted for Industry Review

- Comments due by December 14, 2011 to cancomments@nerc.net using the CAN Comment Form:
  - CAN-0027 TOP-003 R2 Coordination of Scheduled Outages (Clean Draft)

Proposed Changes to the NERC Rules of Procedure and Associated Appendices Posted for Comment

- Comments on changes to Sections 100-1600 and associated Appendices 4B, 4C, 5A, and 8 and deletion of Appendices 3C and 6 are posted on NERC's Rules of Procedure webpage – Due by December 22, 2011 to ROPcomments@nerc.net

UPCOMING EVENTS

Compliance Workshop

2011 Compliance Workshop, Atlanta, GA – December 6, 2011, all day (Register)

Standards Committee Meetings

Standards Committee Meeting, Atlanta, GA – December 7, 2011, 8 a.m.-noon (Register)

Standards Committee and Compliance and Certification Committee Combined Meeting, Atlanta, GA – December 7, 2011, noon-5 p.m. (Register)

- Project 2009-01: Disturbance and Sabotage Reporting (EOP-004-2) – Posted October 28

- December 12, 2011 (Comment Form)

- Regional Reliability Standard PRC-006-NPCC-01 UFLS – Posted November 22 - December 22, 2011 (Comment Form)

- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Posted November 7, 2011 - January 6, 2012 (Comment Form)

Join Ballot Pools (ballot pool windows close at 8 a.m. Eastern)

- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Open November 7, 2011 - December 15, 2011 (Join Ballot Pool)

Standard Drafting Team Vacancies

- Any industry stakeholder meeting the indicated qualifications for one of the following vacant appointments may submit a self-nomination form to sarcomm@nerc.com. Further instructions can be found on the Drafting Team Vacancies page on NERC's website.

    - Project 2007-06 System Protection Coordination: Seeking an individual from a Canadian entity with experience in coordination of protection systems (new installations and revisions).

    - Project 2007-12 Frequency Response: Seeking an individual representing Transmission Dependent Utilities with experience in analyzing or modeling frequency response.

    - Project 2010-07 Generator Requirements at the Transmission Interface: Seeking an individual who is a NERC-certified System Operator (preferably for a Transmission Operator or Reliability Coordinator function), or an individual with equivalent experience. The candidate should also be familiar with the history of the GOTO Ad Hoc Group, recent registration activity, and the work of the Project 2010-07 SDT.

OTHER ITEMS

Compliance Application Notices (CANs) Posted for Industry Review

- Comments due by December 14, 2011 to cancomments@nerc.net using the CAN Comment Form:

    - CAN-0027 TOP-003 R2 Coordination of Scheduled Outages (Clean Draft)

Proposed Changes to the NERC Rules of Procedure and Associated Appendices Posted for Comment

- Comments on changes to Sections 100-1600 and associated Appendices 4B, 4C, 5A, and 8 and deletion of Appendices 3C and 6 are posted on NERC's Rules of Procedure webpage – Due by December 22, 2011 to ROPcomments@nerc.net

UPCOMING EVENTS

Webinars

Project 2008-06: Cyber Security Order 706 – December 13, 2011, 1-2 p.m. Eastern (Register)

Project 2009-22: Interpretation of COM-002-2 (Communications and Coordination for the ISO/RTO Council) – December 13, 2011, 1-4:30 p.m. Eastern (Register), December 14, 2011, 10 a.m.-3:30 p.m. Eastern (Register)

Subject: NERC: Standards Bulletin - December 19-26, 2011
Date: Monday, December 19, 2011 10:46:17 AM

Standards Bulletin
December 19-26, 2011

This weekly bulletin compiles a list of current and upcoming standards, interpretations, and CANs posted for comment, industry review, or ballot, along with a list of upcoming standards-related postings and events. The bulletin is being piloted for the next few weeks, so any feedback on its effectiveness, content, and format is welcome. Please email Monica Benson with questions about standards commenting and balloting, Caroline Clouse with questions about CANs, and Mallory Huggins with feedback on this bulletin.

The bulletin is also available on the Standards Under Development page. Note that next week's bulletin will be released on Tuesday morning rather than Monday morning. Happy holidays from all of us at NERC!

STANDARDS ITEMS

Current Ballots for Proposed Standards or Interpretations (ballot periods close at 8 p.m. Eastern)

- Project 2008-10: Interpretation of CIP-006-1 R1.1 for Progress Energy – Open December 9-19, 2011 (Recirculation Ballot)
- Interpretation 2011-INT-01: Revision of MOD-028 to address FPL Request for Interpretation – Open December 12-22, 2011 (Recirculation Ballot)
- Project 2009-22: Interpretation of COM-002-2 R2 by the IRC – Open December 14-23, 2011 (Recirculation Ballot)
- Project 2010-07: Generator Requirements at the Transmission Interface (FAC-001-1, FAC-003-X, FAC-003-X, and PRC-004-2.1) – Open December 14-23, 2011 (Recirculation Ballot)
- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Open December

16, 2011 - January 6, 2012 (Initial Ballots)

Proposed Standards and Interpretations Posted for Comment (comment periods close at 8 p.m. Eastern)

- Regional Reliability Standard PRC-006-NPCC-01 UFLS – Posted November 22 - December 22, 2011 (Comment Form)

- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Posted November 7, 2011 - January 6, 2012 (Comment Form)

- Project 2007-03: Real-time Transmission Operations (TOP-001-2, TOP-002-3, and TOP-003-2) – Open December 14, 2011 - January 12, 2012 (Comment Form)

Pending Ballots for Proposed Standards or Interpretations (ballot periods close at 8 p.m. Eastern)

- Project 2007-03: Real-time Transmission Operations (TOP-001-2, TOP-002-3, and TOP-003-2) – Open January 3-12, 2012 (Successive Ballots and Non-Binding Polls)

Standard Drafting Team Vacancies

- Any industry stakeholder meeting the indicated qualifications for one of the following vacant appointments may submit a self-nomination form to sarcomm@nerc.com. Further instructions can be found on the Drafting Team Vacancies page on NERC's website.

    - Project 2007-06 System Protection Coordination: Seeking an individual from a Canadian entity with experience in coordination of protection systems (new installations and revisions).

    - Project 2007-12 Frequency Response: Seeking an individual representing Transmission Dependent Utilities with experience in analyzing or modeling frequency response.

    - Project 2010-07 Generator Requirements at the Transmission Interface: Seeking an individual who is a NERC-certified System Operator (preferably for a

Transmission Operator or Reliability Coordinator function), or an individual with equivalent experience. The candidate should also be familiar with the history of the GOTO Ad Hoc Group, recent registration activity, and the work of the Project 2010-07 SDT.

OTHER ITEMS

Compliance Application Notices (CANs) Posted for Industry Review

- None at this time.

Standards Bulletin: February 6-12, 2012

This weekly bulletin compiles a list of current and upcoming standards, interpretations and CANs posted for comment, industry review or ballot, along with a list of upcoming standards-related postings and events. Feedback on the bulletin's effectiveness, content, and format is welcome. Please email Monica Benson with questions about standards commenting and balloting, Caroline Clouse with questions about CANs, and Mallory Huggins with feedback on this bulletin.

The bulletin is available on the Standards Under Development page.

If you would like to be added to the distribution list for a particular standards project to stay informed about drafting team meetings and calls, please email Mallory Huggins.

STANDARDS ITEMS

Current Standards Ballots (ballot periods close at 8 p.m. Eastern)

- Project 2006-06: Reliability Coordination (COM-001-2, COM-002-3, and IRO-001-3) – Open January 30, 2012 - February 8, 2012 (Successive Ballots and Non-Binding Polls)

Proposed Standards Items Posted for Comment (comment periods close at 8 p.m. Eastern)

- Order 754: Request for Data or Information in accordance with NERC Rule of Procedure 1600 – Open December 22, 2011 - February 6, 2012 (Comment Form)
- Project 2006-06: Reliability Coordination (COM-001-2, COM-002-3, and IRO-001-3) – Open January 9, 2012 - February 8, 2012 (Comment Form)
- Regional Reliability Standard BAL-001-0.1a WECC Variance (Real Power Balancing Control Performance) – Open January 23, 2012 - March 9, 2012 (Comment Form)
- Regional Reliability Standard BAL-004-WECC-02 (Automatic Time Error Correction) – Open January 23, 2012 - March 9, 2012 (Comment Form)

Standard Drafting Team Vacancies

- Any industry stakeholder meeting the indicated qualifications for one of the following vacant appointments may submit a self-nomination form to sarcomm@nerc.com. Further instructions can be found on the Drafting Team Vacancies page on NERC's website.
  - Project 2007-06 System Protection Coordination: Seeking an individual from a Canadian entity with experience in coordination of protection systems (new installations and revisions).
  - Project 2007-12 Frequency Response: Seeking an individual representing Transmission Dependent Utilities with experience in analyzing or modeling frequency response.

Glossary of Terms Update

On February 3, 2012, FERC issued an order approving a modified definition of Protection System. The Glossary of Terms will be updated this week to reflect this change.

UPCOMING EVENTS

Member Representatives Committee Meeting, Phoenix, AZ – February 8, 2012, 1:00-5:00 p.m. Mountain (Agenda)

Board of Trustees Meeting, Phoenix, AZ – February 9, 2012, 8:00 a.m.-1:00 p.m. Mountain (Public Agenda)

From:	Guy V. Zito

Cc:	tfsp
Subject:	RE: FERC Acceptance for Filing in RM12-6-000
Date:	Monday, January 30, 2012 12:38:22 PM

Hi Irene,

I will include this as a discussion item at the joint RSC CC meeting. The CEAP is something done only for new regional standards brought before the stakeholders and Board of Directors at NPCC. I would not advise anyone to not proceed with an aggressive implementation of the Regional Standard, and also consider in that implementation, the potential FERC acceptance of the applicablity of the 100 kV BES Brite Line to this and all standards. I will report the discussion with the joint RSC CC meeting to the TFSP for their information.

Best Regards,

Guy

Subject: RE: FERC Acceptance for Filing in RM12-6-000

Hi Guy,

Thank you.

Do you still suggest us to hold on it? And do you think we still should consider a cost-effective study (support for technical justification) at this time?

TFSP,

See below. The NERC BES filing has been completed so the approach we discussed regarding the NPCC-PRC-002 will have to change. Based on our discussions I was hoping to be able to work with NERC to clarify implementation issues and the applicability issue in this filing.

In March the RSC will meet with the CC to discuss compliance and other

issues pertaining to this standard further, as well as the Directory issue.

Thank you Daren and all for allowing me to attend the meeting and participate. I found the TFSP to be an expecially dedicated and passionate group of professionals and found the meeting very worthwhile. I look forward to working more closely with TFSP in the future to address standards and directory related issues in what certainly will prove to continue to deliver ever increasing challenges and opportunities to us all.

Thanks,

Guy V. Zito

Acceptance for Filing

The FERC Office of the Secretary has accepted the following electronic submission for filing (Acceptance for filing does not constitute approval of any application or self-certifying notice):

-Accession No.: 201201255142

-Docket(s) No.: RM12-6-000

-Filed By: North American Electric Reliability Corporation -Signed By: Owen MacBride -Filing Type: Reliability Std. -approval, remand, or modification -Filing Desc: Petition of the North American Electric Reliability Corporation for Approval of a Revised Definition of "Bulk Electric System" in the NERC Glossary of Terms Used in Reliability Standards -Submission Date/Time: 1/25/2012 1:04:36 PM -Filed Date: 1/25/2012 1:04:36 PM

Your submission is now part of the record for the above Docket(s) and available in FERC's eLibrary system at:

http://elibrary.ferc.gov/idmws/file_list.asp?accession_num=20120125-5142

If you would like to receive e-mail notification when additional documents are added to the above docket(s), you can eSubscribe by docket at:

NPCC

REGIONAL RELIABILITY STANDARDS PROCESS MANUAL

TABLE OF CONTENTS

I.

I. EXECUTIVE SUMMARY

The purpose of the Northeast Power Coordinating Council, Inc. ("NPCC"), is to enhance the reliability of the international, interconnected bulk power system in Northeastern North America through the development of more stringent and specific regional reliability standards and compliance assessment and enforcement of continent-wide and regional reliability standards pursuant to the execution and implementation of a Regional Delegation Agreement with the Electric Reliability Organization ("ERO") and applicable Canadian Memoranda of Understanding that are backstopped by the Federal Energy Regulatory Commission ("FERC") and Canadian Provincial authorities. In the development and enforcement of Regional Reliability Standards, NPCC, to the extent possible, facilitates attainment of fair, effective, efficient, and competitive electric markets.

Comment: Either bulk power system, or bulk electric system should be used throughout the document. The appropriate terminology should be used consistently.

General Membership in NPCC is voluntary and is open to any person or entity, including any entity participating in the Registered Ballot Body of the ERO that has an interest in the reliable operation of the Northeastern North American Bulk Electric System.

This NPCC Regional Reliability Standards Process Manual describes the procedures, policies and practices approved by NPCC members and implemented to ensure an "open, fair, and inclusive" process for the transparent initiation, development, implementation and revision of NPCC Regional Reliability Standards necessary for the reliable operation of the international and interconnected Bulk Electric System in Northeast North America. These Standards will, in all cases, not be inconsistent with or less stringent than any requirements of the North American Electric Reliability Council/Electric Reliability Organization (NERC/ERO) Reliability Standards. Each regional reliability standard shall enable or support one or more NERC/ERO reliability principles[1], thereby ensuring that each standard serves a purpose in support of the reliability of the regional Bulk Electric System. Each standard shall also be consistent with all ~~of~~ pertinent reliability principles~~,~~, thereby ensuring that no standard undermines reliability ~~-~~as an unintended consequence.

II. REGIONAL RELIABILITY STANDARDS PROCESS

1. CHARACTERISTIC ATTRIBUTES

The NPCC Regional Reliability Standards Process is:

- **Open** — The NPCC Regional Reliability Standards Process provides any person or entity that is directly and materially affected by the reliability of the NPCC's Bulk Electric System~~=~~ the ability to participate in the development

1. Available on the NERC Website: www.nerc.com.

and approval of reliability standards. Comments ~~can~~may be submitted by any person or entity. NPCC utilizes a Website to accomplish this. Online posting and review of standards and the real time sharing of comments uploaded to the Website allow complete transparency. There are no undue financial barriers to participation. Participation in the open comment process is not ~~=~~restricted on the basis of technical qualifications or other such requirements.

- **Inclusive** — The NPCC Regional Reliability Standards~~=~~ Process provides any person with a direct and material interest the right to participate by expressing an opinion and its basis; have that position considered; and, in the event they are not satisfied with the response to their opinion, ~~=~~appeal the response through an established appeals process if desired.

- **Balanced** — The NPCC Regional Reliability Standards~~=~~ Process seeks to achieve a balance of interests; ~~=~~shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter. This will be accomplished through the NPCC Bylaws[2] which define six sectors (categories) for voting. All individuals and entities that are directly and materially affected by the reliability of the NPCC's bulk power system are welcome to participate

- **Fair Due Process** — The NPCC Regional Reliability Standards ~~=~~Process provides for reasonable notice and opportunity for public comment. ~~=~~The procedure includes public notice of the intent to develop a standard; a 45 calendar day public comment period on the proposed standard request or standard; due consideration of those public comments; and responses to those comments to be posted on the NPCC Website. A final draft of the notice of intent to develop the standard or the draft standard itself (both the clean and redline versions) along with the responses to comments will be posted for a 30 calendar day pre-balloting period, after which a ballot of NPCC Members will be conducted. ~~Voting is open to NPCC members only.~~ Upon approval by the NPCC Members, the NPCC Board then votes to approve submittal of the Regional Reliability Standard to NERC.

- **Transparent** — All actions material to the development of Regional Reliability Standards are transparent and information regarding the progress of a standards development action is made available to the public through postings on the NPCC Website as well as~~=~~ through E-mail lists.

In as much as NPCC is one of several regional entities within the Eastern Interconnection of North America, there will be **no** *presumption of validity* by the ERO for any NPCC Regional Reliability Standard. In order to receive the approval of the ERO, the NPCC Reliability Standards Development Process must also achieve the following objectives:

2. Available on the NPCC Website: www.npcc.org

- **No Adverse Impact on Reliability of the Interconnection** —A NPCC Regional Reliability Standard provides a level of Bulk Electric System reliability that is necessary and adequate to protect public health, safety, welfare, and North American security and will not have an adverse impact on the reliability of the Interconnection or other Regions within the Interconnection.

- **Justifiable Difference** — A NPCC Regional Reliability Standard is based on justifiable differences between Regions, such as different electrical systems or facilities, sensitivity of load to disruptions, sensitivity of generation to disruptions, frequency and voltage sensitivity, system operating limit development and facilities ratings process, electrical system interactions, etc. Comment: Given the new 100kV BES definition, will some of these differences persist?
- **Uniformity**- NPCC Regional Reliability Standards shall provide for as much uniformity as possible with reliability standards across the interconnected bulk power system of the North American continent. A NPCC Reliability Standard shall be more stringent than a continent-wide (or interconnection wide?) reliability standard; may include a regional variation that addresses matters that the continent-wide reliability standard does not; or shall be justified by a regional difference necessitated by a physical or operating(?) difference in the northeast's Bulk Electric System[3].

- **No Undue Adverse Impact on Commerce** — An NPCC Regional Reliability Standard will not cause any undue adverse impact on business activities that are not necessary for reliability of the Region and its interconnected Regions. All regional reliability standards shall be consistent with NERC's market principles[4].

Other provisions of the NPCC Regional Reliability Standards Process include:

- **Maintenance of Regional Reliability Standards**-NPCC Regional Reliability Standards will be posted for open process review by the RSC for possible revision at least once every five (5) years after the first regulatory approval and follow the same process as in the case of a new standard. If no changes are warranted, the Regional Standards Committee (RSC) shall recommend to the NPCC Board that the standard be reaffirmed. If the review indicates a need to revise or withdraw a regional standard, a Regional Standard Authorization Request shall be prepared by the RSC and submitted in accordance with the NPCC Regional Reliability Standards Process. The existing, approved standard subject to revision will remain in effect until such

3. The interpretation of the phrase "physical difference" will be consistent with FERC's Order, issued September 22, 2004, Granting Request For Clarification regarding Docket No. PL04-5-000, Policy Statement on Matters Related to bulk Power System Reliability.

4. Available on the NERC Website: www.nerc.com

time as the revised version has received FERC or applicable Canadian Regulatory Authority approvals, as appropriate , at which ~~point~~time it will be retired in accordance with any applicable implementation plan associated with the newly approved regional standard. (Comment: Why can't RSC make errata changes as allowed by NERC for continent-wide reliability standards?)

- **Maintenance of the Regional Reliability Standards Process**-This NPCC Regional Reliability Standards Process will be reviewed for possible revision at least once every five (5) years, or more frequently, if needed, and subject to the same procedure as applies to ~~-~~the development of a regional reliability standard. All such revisions shall be subject to approval by the NPCC Board, NERC, FERC, and ~~could~~may be subject to approval, if required, by applicable authorities in Canada. Comment: Why can't RSC make 'errata' changes as allowed by NERC for continent-wide reliability standards or in regional reliability standards, (see page 9)?

- **Interpretation of Standards**- All persons who are directly and materially affected by the NPCC's Bulk Electric System reliability shall be permitted to request an interpretation of a NPCC regional reliability standard. The person requesting an interpretation shall send a~~-~~ written request to the Manager of Reliability Standards, as noted on the NPCC Website, explaining the specific circumstances surrounding the request and what clarifications are required as applied to those circumstances. The request shall indicate the direct and material impact to the requesting party or others caused by the lack of clarity or a possibly incorrect interpretation of the regional standard. The Manager of Reliability Standards along with guidance from the RSC will forward the request to the~~-~~ Task Force/Drafting Team ~~to whom responsibility was~~ originally assigned ~~for~~to ~~-~~draft~~ing~~ that regional reliability standard. If the original Task Force/Drafting Team is no longer available or assembled, then a new Task Force/Drafting Team shall be assembled and assigned responsibility by the RSC. Through a written response, ~~The~~the Task Force/Drafting Team will address~~, through a written response,~~ the request for clarification as soon as practical, but not more than 45 business days from its receipt by the Task Force. This written interpretation will be posted along with the final approved and adopted regional standard for a 45 day comment period. The Task Force/Drafting Team will respond to the comments and forward the recommendation to the RSC. This recommendation will be either a proposal for revising the standard with an interim~~-temporary~~ clarification, or a clarification. The clarification or interim~~temporary~~ clarification~~-~~ will stand until such time as the regional standard is revised through the normal RSAR process, at which time the regional standard will be modified to incorporate the interim clarifications provided by the interpretation.

2. ELEMENTS OF A REGIONAL RELIABILITY STANDARD

- **Style and Content Elements of a Regional Reliability Standard**
To ensure uniformity of regional reliability standards and avoid inconsistency with NERC continent-wide standards, a regional reliability standard shall consist of the style and content elements identified in this section of the

procedure. These style and content elements are intended to apply a systematic discipline in the development and revision of regional standards. This discipline is necessary for achieving regional standards that are measurable, enforceable, and consistent as well as results oriented;[5,6] i.e.

- Performance-based,
- Risk-based, and
- Capability-based.

The Standard Drafting Team (SDT) should strive to achieve a portfolio of performance, risk, and capability-based mandatory reliability requirements that support an effective defense-in-depth strategy. Each requirement should identify a clear and measurable expected outcome, such as: a) a stated level of reliability performance, b) a reduction in a specified reliability risk, or c) a necessary competency.

a) **Performance-based** - defines a specific reliability objective or outcome that has a direct, observable effect on the reliability of the NPCC bulk power system, i.e. an effect that can be measured using power system data or trends.

b) **Risk-based** - defines actions of entities that reduce a stated risk to the reliability of the NPCC bulk power system and can be measured by evaluating a particular product or outcome resulting from the required actions.

c) **Capability-based** - defines capabilities needed to perform reliability functions and can be measured by demonstrating that the capability exists as required.

Each regional reliability standard shall enable or support one or more of the reliability principles as identified in the most recent set posted on the NERC website. Each reliability standard shall also be consistent with all of the reliability principles. The intent of the set of NPCC regional reliability standards is to deliver an Adequate Level of Reliability as defined by NERC.

Recognizing that Bulk Electric System reliability and electricity markets are inseparable and mutually interdependent, all regional reliability standards shall be consistent with the most recent set of Market Interface Principles as posted on the NERC website. Consideration of the Market Interface Principles is intended to ensure that regional reliability standards are written such that they achieve their reliability objective without ~~causing~~placing undue restrictions or causing adverse impacts on competitive electricity markets.

- **Sections ~~Elements~~ of a Regional Reliability Standard**

5. Results-based Standards see http:www.nerc.com/filez/standards/Project2010-06_Results-based_Reliability_Standards.html.
6. Results-based Standards presentation: http://www.nerc.com/files/Results-Based-Standards-102010.pdf .

A regional reliability standard includes several components designed to work collectively to identify what entities must do to meet their reliability-related obligations as an owner, operator or user of the NPCC bulk power system facilities. The components of a regional reliability standard include mandatory and enforceable sections and informational sections of the standard.

Mandatory and Enforceable Sections of a Standard ~~typically~~ include the following:

Title: A brief, descriptive phrase identifying the topic of the standard.
Number: A unique identification number assigned by NPCC in accordance with a published classification system to facilitate tracking and reference to the standards.
Purpose: The reliability outcome achieved through compliance with the requirements of the standard.
Applicability: (See Applicability Section and Implementation Plan below)
Effective Dates: Identification of when each requirement becomes effective in each jurisdiction.
Requirement: An explicit statement that identifies the functional entity responsible, the action or outcome that must be achieved, any conditions achieving the action or outcome, and the reliability-related benefit of the action or outcome. Each requirement shall be a statement for which compliance is mandatory
Measure: Provides identification of the evidence or types of evidence needed to demonstrate compliance with the associated requirement. Each requirement shall have at least one measure. Each measure shall clearly refer to the requirement(s) to which it applies. Comment: Measures are not enforceable. Auditors do not consider Measures during audits.
Evidence Retention: Identification, for each requirement in the standard, of the entity that is responsible for retaining evidence to demonstrate compliance, and the duration for retention of that evidence.
Variance: A requirement (to be applied in the place of the continent-wide requirement), and its associated measure and compliance information, that is applicable to a specific geographic area or to a specific set of functional entities.

Informational Sections of a Standard

Application Guidelines: Guidelines to support the implementation of the associated standard.
Procedures: Procedures to support implementation of the associated standard.
Time Horizon: The time period an entity has to mitigate an instance of violating the associated requirement.~~4~~
Compliance Enforcement Authority: The entity that is responsible for assessing performance or outcomes to determine if an entity is compliant with the associated standard.

Compliance Monitoring and Assessment Processes: Identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated standard.
Additional Compliance Information: Any other information related to assessing compliance such as the criteria or periodicity for filing specific reports.

Compliance Elements Associated with a Standard

Violation Risk Factors and Violation Severity Levels: Violation risk factors (VRFs) and violation severity levels (VSLs) are used as factors when determining the size of a penalty or sanction associated with the violation of a requirement in an approved reliability standard. Each requirement in each regional standard has an associated VRF and a set of VSLs. VRFs and VSLs are developed by the drafting team, working with NPCC staff, at the same time as the associated regional standard, but are not part of the regional standard. The NPCC Board of Directors is responsible for approving VRFs and VSLs.

Violation Risk Factors
VRFs identify the potential reliability significance of non-compliance with each requirement. Each requirement is assigned a VRF in accordance with the latest approved set of VRF criteria.

Violation Severity Levels
VSLs define the degree to which compliance with a requirement was not achieved. Each requirement shall have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of non-compliant performance and may have only one, two, or three VSLs. Each requirement is assigned one or more VSLs in accordance with the latest approved set of VSL criteria.

The most current version of the approved NERC Reliability Standard template and its associated elements as or if applicable, will be used at the time of the development of the NPCC Regional Reliability Standard to ensure all essential elements are contained therein to achieve consistency and uniformity and meet all statutory requirements.

Applicability Section and Implementation Plan
A regional reliability standard may have either or both of an Applicability Section, with applicability phase-in dates, and as an option an Implementation Plan. The applicability phase-in dates and Implementation Plan shall include effective dates for all of the regional reliability standard's requirements.

Guidance Document(s) and White Papers
A regional reliability standard may have either or both of a Guidance Document and supporting White Paper(s). The purpose of the Guidance Document should be to include added details relating to the requirements and

compliance thereto. Any White Paper(s) may provide technical justifications and explanations supportive of the regional reliability standard.

3. KEY PARTICIPANTS, ROLES, TERMS AND FUNCTIONS

COMMENT: There is no mention of who is to perform aquality review. Need to add this to the appropriate body's role. Is it the RSC's role?

- **NPCC Board of Directors ~~(BOD, Board)~~** - The NPCC Board Of Directors shall consider for adoption regional reliability standards, definitions, variances, interpretations and associated implementation plans that have been processed according to the processes identified in this manual. In addition, the Board shall consider for approval, VRFs and VSLs, Implementation Plans, Guidance Documents and White Papers associated with each member approved regional standard. Once the Board Of Directors adopts a regional reliability standard, definition, variance, interpretation or implementation plan and or White Paper, or once the Board Of Directors approves separate VRFs or VSLs, the Board of Directors shall direct NPCC staff to submit the document(s) for approval ~~by~~to the NERC Board of Trustees.

- **NPCC Members -** The ballot body is comprised of all entities or individuals that qualify for one of the stakeholder sectors within NPCC as stated in ~~-~~the NPCC Bylaws. All General and Full Members of NPCC can participate in the balloting of regional standards. Any entity or person may submit comments during comment periods for standards including non-NPCC members.

- **Regional Standards Committee (RSC)**—A NPCC Board Of Directors appointed committee charged with management and oversight of the NPCC Regional Reliability Standards Process for development of regional standards, VRFs, VSLs, definitions, variances, interpretations, ~~and~~ implementation plans and supporting White Papers in accordance with this manual, under the sector based voting structure described in the NPCC Bylaws.

  RSC membership is open to NPCC members and consists of a balance of stakeholder interests that provide for or are materially impacted by the reliability of the Bulk Electric System. Its responsibilities are defined in detail in the NPCC RSC Scope posted on the NPCC Website

- ~~-~~The NPCC RSC will consider requests for new or revised regional reliability standards and be available ~~for advisement~~ to advise the NPCC Board Of Directors on the regional standards, and standards related issues in general.

  The RSC may not itself modify mandatory and enforceable sections of a regional~~-~~ standard except in the event of minor corrections of a standard such

as errata. The RSC may make revisions to the sections of the regional standard that are not mandatory and enforceable.

The RSC is responsible for ensuring that the regional standards, VRFs, VSLs definitions, variances, interpretations, ~~and~~ implementation plans, and White Papers developed by drafting teams are developed in accordance with the processes in this manual and meet NERC's and FERC's benchmarks for reliability standards including criteria for all governmental approvals.

The RSC disposition regarding the Regional Standard Authorization Request (RSAR), which will in all cases be within 60 calendar days of receipt of a completed RSAR, shall be one ~~fo~~of the following:

- Accept the standard request as a candidate for development of a new standard, revision of an existing standard, or deletion of an existing standard. The RSC may, at its discretion, expand or narrow the scope of the standard request under consideration. The RSC shall prioritize the development of standards in relation to other proposed standards, as may be required based on the volume of requests and resources.

- Reject the standard request. If the RSC rejects a standard request, a written explanation for rejection will be delivered to the requester within 30 calendar days of the decision.

- Remand the standard request back to the requester for additional work. The NPCC standards staff will make reasonable efforts to assist the requester in addressing the deficiencies identified by the RSC. The requester may then resubmit the modified standard request using the process above. The requester may choose to withdraw the standard request from further consideration prior to acceptance by the RSC.

The NPCC Standard Process responsibilities of the RSC include:

- Oversight of all Drafting Team activities. ~~The Drafting Team, a~~After it is assigned by the RCC, the Drafting Team shall report to the RSC.
- Review of NPCC Draft Standards (for such factors as completeness, sufficient detail, rational result, and compatibility with existing NERC and other Regional standards), and clarify standard development issues not specified in this procedure. Under no circumstance will the RSC unilaterally make any substantive changes to the ~~mandatory~~mandatory and enforceable sections of a draft standard.
- Ensure that the drafting team has given due consideration to the comments of all stakeholders ~~and minority objections,~~ in approving a proposed regional reliability standard which is to go to ballot.
- Approve posting of draft standards for pre-ballot ~~posting~~review under a sector based voting structure as described later in the NPCC Bylaws; or
- Remand the draft regional standard back to the Task Force acting as the drafting team for further work or recommend a change in those participating in the drafting team (i.e. a new drafting team).

- **NPCC Standards Staff** — The standards staff, led by the Assistant Vice-President of Standards, is responsible for assisting the RSC in administering NPCC's Regional Reliability Standards Processes in accordance with this manual. The standards staff provides support to the RSC in managing the standards processes and in supporting the work of all regional drafting teams. The standards staff works to ensure the integrity of the standards processes and consistent quality and completeness of the regional standards, through drafting team support and conducting quality reviews. The standards staff facilitates all steps in the development of regional standards, definitions, variances, interpretations and associated implementation plans. The standards staff works with drafting teams in developing VRFs and VSLs for each regional standard.

  The standards staff is responsible for presenting members' approved regional standards, definitions, variances, interpretations and associated implementation plans to the NPCC Board Of Directors for adoption. When presenting standards-related documents to the NPCC Board Of Directors for adoption or approval, the standards staff shall report the results of the associated stakeholder ballot, including identification of unresolved stakeholder objections and an assessment of the documents' practicality and enforceability as well as any polling information obtained during standard development.

- **Reliability Coordinating Committee (RCC)** —The RCC, will support the standards development process through the assignment of NPCC Task Forces to serve as the foundation for Drafting Team formation. The RCC may also perform a technical advisory role in the Regional Reliability Standards process through comments and recommendations.

- **Requester**— A Requester is any individual or an entity (organization, company, government authority, including the RSC, etc.) that submits a completed request for development, revision, or withdrawal of a regional standard. Any person or an entity that is directly and materially affected by an existing standard or the need for a new standard may submit a request for a new standard or revision to a standard. The Requester is assisted by the RSAR drafting team (if one is appointed by the RSC) or NPCC standards staff to complete the drafting of the RSAR prior to it being forwarded to the RSC with a request to draft a regional standard. The Requester is responsible for the RSAR, assisted by the RSAR drafting team or NPCC standards staff, until such time the RSC authorizes development of the standard. The Requester has the option at any time to allow the RSAR drafting team to assume full responsibility for the RSAR. The Requester may choose to participate in subsequent standard drafting efforts related to the RSAR.

- **Task Forces and Working Groups,**—The committees, task forces and working groups within NPCC , serve an active role in the standards process as follows:

• Identify the need for new or modified regional standards.
• Initiate NPCC Standards actions by developing Regional Standard Authorization Requests (RSARs).
• Develop comments (views and objections) to standards actions.
• Participate in NPCC Standard drafting.
• Provide technical oversight in response to changing industry conditions and ERO Requirements.
• Conduct Field Tests, as required

- **NPCC Compliance Committee (CC)**
  - Provide compliance review of technical requirements.
  - Assist the Drafting Team with the development of VSLs and VRFs.
  - Participate in a standard's quality review.

- **Compliance Monitoring and Enforcement Program -** The NERC ~~c~~Compliance ~~m~~Monitoring and ~~e~~Enforcement ~~p~~Program (CMEP) may be used to manage~~s~~ and enforce~~s~~ compliance with approved regional and NERC reliability standards. The compliance program area shall provide feedback to drafting teams during the standards development process to ensure the compliance enforcement program can be practically implemented for the standards under development.

  The ~~c~~ComplianceMontoring and ~~e~~Enforcement ~~p~~Program may be used to conduct field tests or data collection related to compliance elements of proposed standards and may provide assistance with field tests or data collection when requested. The compliance enforcement program shares its observations regarding the need for new or modified requirements with the standards staff for use in identifying the need for new standards projects.

4. PROCEDURE DESCRIPTION

COMMENT: The procedure does not address how someone requests the withdrawal of an existing standard or part thereof.

STEP 1 : REQUEST TO DEVELOP A NEW REGIONAL STANDARD

A Requester may request ~~-~~the development of~~-~~ a new Regional Reliability Standard or revision of an existing standard by submitting a Regional Standard Authorization Request (RSAR) form ~~-~~to the NPCC Manager of Reliability Standards, who will promptly acknowledge receipt. The RSAR is a description of the new or revised regional standard in sufficient detail to clearly define its scope, purpose, and importance~~-~~, impacted parties and other relevant information. A "needs" statement will provide the justification for the development of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard. The Manager of Reliability Standards~~-~~ shall retain the RSAR form and make it available electronically on the NPCC Website.

The RSAR, as a minimum, shall contain the following information in order to be qualified for consideration. The NPCC Manager of Reliability Standards will assist the Requester to ensure all required information is submitted (on the RSAR):

1. Proposed Title and Date of New RSAR.
2. Requester's Name and Contact Information.
3. Purpose of the Regional Standard.
4. Description of Industry Need.
5. Provide a Brief Description of the Standard.
6. Identification of the Entities in the Functional Model as being responsible to adhere to the standard.
7. Necessary information to assist the drafting the team, to the extent feasible, to allow them to draft the standard.
8. Any existing known cross references to NPCC or NERC documents.
9. Technical background for the RSAR to properly address the need for the standard.

In addition a Cost Benefit Analysis (CBA) for the proposed standard will be performed in accordance with the NPCC Cost Effectiveness Analysis Procedure (CEAP) and be made available for presentation with the RSAR to the RSC.

The Manager of Reliability Standards shall forward all properly completed RSARs and cost benefit information to the RSC. The RSC shall meet at established intervals to review all pending RSARs. The frequency of this review process will depend on workload, but in no case shall a properly completed RSAR wait for RSC action more than 60 calendar days from the date of receipt. The RSC may take one of the following actions:

- Remand the RSAR back to the Manager of Reliability Standards for additional work. In this case, the Manager of Reliability Standards may request additional information or clarification for the RSAR from the Requester and/or RSAR Drafting Team.
- Accept the RSAR as a candidate for a new or revised standard. The Manager of Reliability Standards shall, within 60 calendar days of acceptance, post notification of intent to develop a standard on the NPCC Website, notify the ERO to post the notification on its Website, and notify the requester of the acceptance.
- Reject the RSAR. In this case, the RSC will provide its determination to the Manager of Reliability Standards, who will then provide a written explanation for rejection to the Requester within 60 calendar days of the rejection decision.

STEP 2: RSC ACCEPTS RSAR AND RCC ASSIGNS TF TO DRAFT NEW OR REVISED STANDARD

A RSAR that is accepted by the RSC shall be submitted to the RCC who shall assign the development of the regional standard to a Task Force within 60 calendar days. The Manager of Reliability Standards shall oversee solicitation and recommendation of a list

of additional candidates for appointment to the Drafting Team, and shall submit the list to the RSC. This list shall include the Requester. The RSC may select other individuals to serve in drafting the Standard. The Drafting Team shall consist of a group of people who collectively have the necessary technical expertise and work process skills to effectively and efficiently produce a quality standard. ~~t~~The Drafting Team reports to the RSC. The Drafting Team shall remain in place until such time as the NERC Board Of Trustees adopts the regional standard. Inquiries arising after a standard's development shall be directed by the RSC to the Task Force to which the drafting of the standard was assigned.

Concurrent with the formation of the Drafting Team, a technical group, or individuals may develop a first draft of the standard. This first draft ~~could~~may be posted early in the standards development process for comment to gain industry insights and input early in the standards development process.
Comment: There needs to be closure by indicating when will the role of the technical group or individuals ends and the Drafting Team takes over. There may also be a need to indicate who is to respond to comments from the initial posting--not the technical group or individuals, but the DT.

The Manager of Reliability Standards shall serve, coordinate or assign NPCC staff to assist in the drafting of the standard including compliance measures, process and elements. The drafting of measures and compliance administration aspects of the standard will be coordinated with the NPCC Compliance Staff. When a drafting team begins its work, either in refining an RSAR or in developing or revising a proposed standard, the drafting team shall develop a project schedule and report its progress against that schedule to the RSC as requested, through the Manager of Reliability Standards.

Once the Drafting Team has produced a draft of the regional standard, VRFs, VSLs, variances and its associated implementation plan, NPCC standards staff shall coordinate Quality Review of the draft standard, consisting of technical writing, legal and compliance reviews prior to submission to RSC.

STEP 3: SOLICIT PUBLIC COMMENTS ON DRAFT REGIONAL STANDARD

Once a draft standard has been verified by the RSC to be within the scope and purpose of the RSAR, the ~~m~~Manager of Reliability Standards will post the draft standard for the purpose of soliciting public comments. The posting of the draft standard will be linked to the RSAR for reference by its title. In addition to the standard, an implementation plan shall be posted to provide additional details to the public and aid in their commenting and decision process. This implementation plan will be drafted and posted with draft standards upon the availability of sufficient information, data or targeted survey results to determine a realistic schedule for implementation. Comments on the draft standard will be accepted for a 45 calendar day period from the public notice of posting. Comments will be accepted on-line using the NPCC Open Process web-based application.
Comment: Will VSL's and VRF's, Guidance Documents, etc. also be posted at this time? If not, why not, and when? Response: A draft standard does not necessarily need to include the VRFs and VSLs. A statement should be included to answer this question.

The ~~m~~Manager of Reliability Standards will notify NERC to concurrently post the draft standard and all associated documents~~=~~ on the ERO Website for comments.

STEP 4: OPEN PROCESS POSTING AND ANALYSIS OF THE COMMENTS

The Manager of Reliability Standards~~-~~ will assemble the comments on the new draft standard and associated documents and distribute those comments to the ~~-~~Drafting Team. The Drafting Team shall give prompt consideration to the written views and comments of all participants. All submitted ~~-~~comments shall be addressed, and each commenter shall be advised of the disposition of their comments and the reasons therefore. The Manager of Reliability Standards shall ~~-~~publicly post all of the Drafting Team's responses to stakeholder comments on the NPCC Website.

The ~~-~~Drafting Team shall take one of the following actions:

- Submit the draft standard for RCC endorsement as it stands, along with the comments received and responses to the comments. Based on the comments received, the Drafting Team may include revisions that are not substantive. A substantive change is one that directly and materially affects the application of the standard, including, for example: changing "shall" to "should," changing "should" to "shall"; adding, deleting, or revising requirements; or adding, deleting, or revising measures for which compliance is mandatory.
- Make substantive revisions to the draft standard and reposts it for further open review and comment.
- Drafting Team may recommend~~s~~ Field Testing if necessary, to the RSC.

Requester or the RSC ~~-~~may withdraw the request for the development of the regional standard at any time during the Regional Reliability Standards Process.

Comment: And then what happens? The RSC may want to continue with development of the standard and the Requester may want to appeal the decision not to proceed.

Upon receipt, the RCC submits the proposed regional standard to the RSC along with its recommendation~~-~~, Drafting Team statements and any field test results.

STEP 5: RSC APPROVES OF THE NEW OR REVISED STANDARD FOR POSTING

If the RSC, ~~-~~utilizing the composite sector voting structure, ~~,~~ votes to post the draft regional standard for approval, the draft standard, all comments received, and the responses to those comments shall be posted publicly by the Manager of Reliability Standards on the NPCC Website (www.npcc.org) for a 30 calendar day "pre-ballot review" to be followed by a NPCC member approval ballot. If the RSC decides more work is needed, the draft standard will be remanded back to the Drafting Team. All actions of the RCC, Drafting Teams, and the RSC will be recorded in regular minutes of the group(s) and posted on the NPCC Website. Once the notice for a ballot has been issued, no substantive modifications may be made to the proposed standard unless the revisions are posted and a new notice of the vote is issued.

The Drafting Team, in coordination with the RSC, will determine when no further postings of the standard are required.

Prior to a "pre-ballot" review of a standard, a quality review and a cost effectiveness analysis will be ~~done.~~performed and submitted to the RSC for approval.
Comment: Who will do the cost effectiveness analysis? Who does the quality review?

The Drafting Team working with CC members shall develop draft VSLs and VRFs prior to the quality review.

STEP 6: BALLOT OF STANDARD

Upon notification of a ballot, the Members of NPCC's ~~-~~ballot body will cast their vote consistent with the NPCC Bylaws. This ballot shall commence no sooner than 15 calendar days and no later than 30 calendar days following the notification of ballot. All members of the NPCC are eligible to participate in the voting on proposed, standard revisions or deletions of regional standards. The ballot period will typically begin immediately following the 30 calendar day pre-ballot posting and will last at least 10 business days.

In order for a NPCC Regional Standard to be approved;

- A quorum must be established by at least 50% of the NPCC Members of at least 60% of the Voting Sectors on the roster of Members maintained by NPCC.
- A two-thirds majority of the total weighted sector votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions, and non-responses. Weighted sector vote will be calculated as follows;
  - Affirmative votes cast in each sector will be divided by the sum of affirmative and negative votes cast, in that same sector, to determine the fractional affirmative vote for each sector. Abstentions and non-responses will not be counted for the purposes of determining the fractional affirmative vote for a sector.
  - The sum of the fractional affirmative votes from all sectors divided by the number of sectors voting will be used to determine if a two-thirds majority has been achieved. (A sector will be considered as "voting" if any member of the sector in the ballot pool casts either an affirmative or a negative vote.)
  - A standard will be approved if the sum of fractional affirmative votes from all sectors divided by the number of voting sectors is at least 2/3.

Ballots will be cast electronically and alternatives are as follows;

- Affirmative
- Affirmative with Comments
- Negative
- Negative with Comments
- Abstain Comment: Could a member vote "Abstain", yet still submit comments?

The ~~-~~Manager of Reliability Standards~~-~~ shall post the final outcome of the ballot process. If the regional standard is ~~rejected~~not approved, it may be withdrawn by either the RSC or the Requester, or the standard may be remanded by the RSC back to the Drafting

Team to address the balloters' comments. In the event the proposed regional standard is withdrawn all comments submitted during the process will be posted and archived for consideration when redrafting the standard ~~upon~~under review.

Once the member ballot approves the regional standard, the Manager of Reliability Standards shall ~~-~~recommend final Regional approval to the NPCC Board. The NPCC BOD may not make substantive modifications to the standard. If the NPCC BOD does not approve the standard it will be remanded back to the RSC and the Drafting Team to address its comments.

STEP 7: IMPLEMENTATION OF THE NPCC REGIONAL STANDARD

Upon approval by the NPCC BOD~~-~~, the Manager of Reliability Standards shall submit the regional standard~~-~~ to the NERC/ERO for approval(s) and subsequent filing with FERC and applicable Canadian Governmental and/or Regulatory Authorities for adoption.

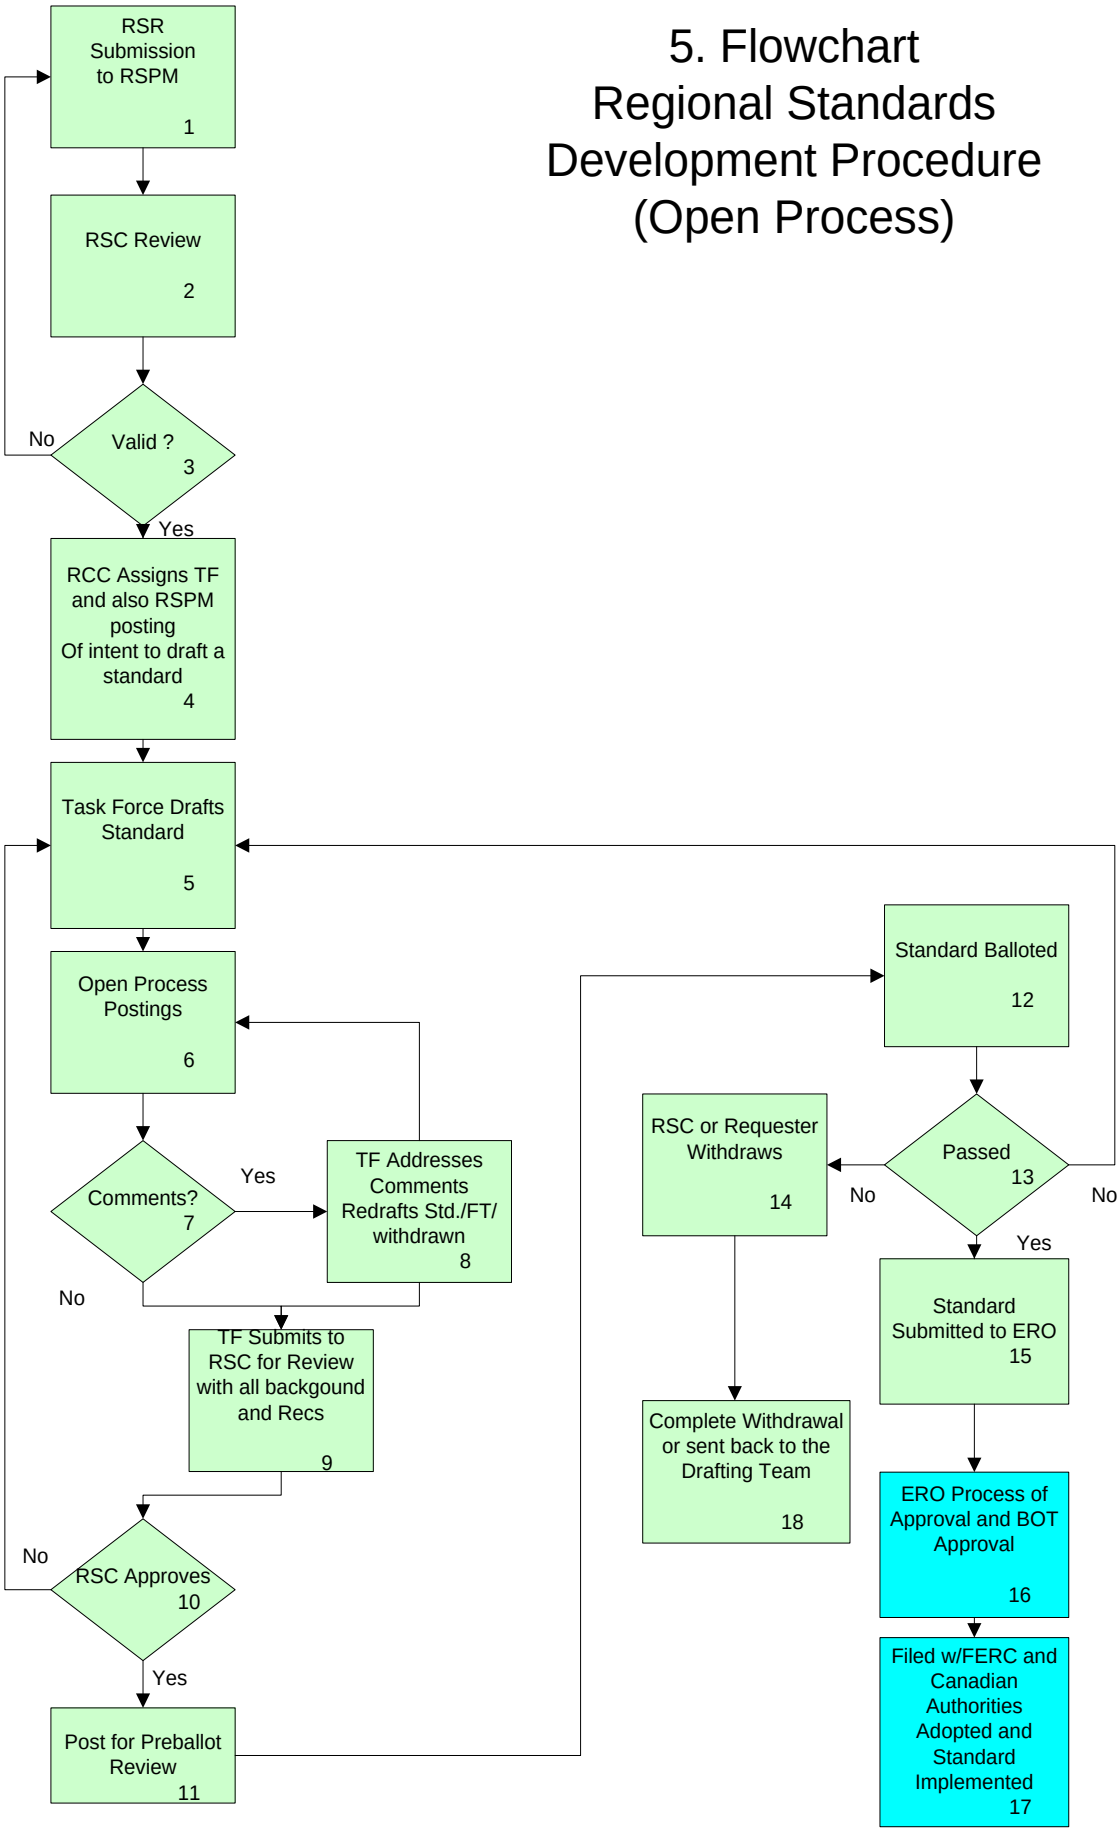
Once a reliability standard is adopted and made effective, all users, owners, planners, and operators of the Bulk Electric ~~-~~System in the NPCC geographic area of the Northeast are required to comply with the standard. The NERC/ERO Board of Trustees has established its ~~Compliance Monitoring and Enforcement Program~~CMEP,~~-~~ administered in the Northeast by NPCC~~-~~, to measure compliance with reliability standards and administer sanctions as appropriate. After adoption of a NPCC Regional Standard, the standard will be included in the NERC/ERO CMEP~~ompliance Monitoring Enforcement Program~~.

STEP 8: WITHDRAWAL OR REMAND OF A REGIONAL STANDARD

The RSC may elect to withdraw the proposed standard or remand it back to the Drafting Team for further work for situations such as ballot failure, cost considerations, etc. (Comment: Should this be a specific, finite list of valid reasons for remand?) The Assistant Vice President-Standards will inform NERC and the industry of the actions taken.

The following flow chart will be revised for the final draft.

5. Flowchart Regional Standards Development Procedure (Open Process)



6. ERO and Regulatory Process and Approvals

- **NERC/ERO Comment Period** — Concurrent with regional posting of final drafts, the final drafts will be forwarded to NERC for posting on the NERC website to ensure full industry awareness of the standard and expedite and coordinate all commenting. NERC/ERO shall publicly notice and request comment on the NPCC Regional Reliability Standard and associated implementation plan, as specified by NERC for comment on NERC's website and actively notify all adjoining Regions. All comments will be responded to electronically by the Drafting Team through a posted response on the NPCC Website or a link on the NERC Website. NPCC shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the posting for comment; revise the NPCC Regional Reliability Standard and request another posting for comment, or re-submit the NPCC Regional Reliability Standard along with a response to any objections received, for approval by NERC.

- **NERC/ERO Approval of NPCC Regional Reliability Standards** — Proposed regional reliability standards shall be subject to approval by the NERC/ERO who shall have a process to evaluate and recommend whether a proposed non-Interconnection-wide NPCC Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether NPCC has considered and addressed stakeholder objections. NPCC BOD, having been notified of the results of the regional ballot concerning a NPCC Regional Reliability Standard, shall vote to submit the Standard to the NERC/ERO Board Of Trustees for approval as a NERC Reliability Standard. The NERC/ERO Board Of Trustees shall consider NPCC's request, the scope and implications of the Standard, the recommendation for action on the Standard, any unresolved stakeholder comments, and NPCC's consideration of comments and unresolved issues, if any, in determining whether to approve the NPCC Regional Reliability Standard as a NERC Reliability Standard.

- **Regulatory Authority Approval** — A NPCC Regional Reliability Standard that has been approved by the NERC/ERO Board Of Trustees shall be filed with FERC and applicable Canadian Governmental and/or Regulatory Authorities for approval and shall become effective and enforceable within the U.S., per Section 215 of the Federal Power Act, only when adopted by FERC in accordance with any associated implementation plan, and within individual Canadian Provinces, only when adopted by applicable Canadian Governmental and/or Regulatory Authorities in accordance with any associated implementation plan. The regional reliability standard, once adopted will be made part of the body of NERC reliability standards and shall be mandatory and enforceable on all applicable bulk power system owners, operators, and users within the NPCC Region in accordance with any associated implementation plan, regardless of membership status.

7. Appeals

- Persons who have directly and materially affected interests and who have been or will be adversely affected by any substantive or procedural action or inaction related to the ~~=~~approval, revision, reaffirmation, or withdrawal of a regional reliability standard (appellant) shall have the right to appeal. This appeals process applies only to the regional reliability standards process as defined in this procedure.

  The burden of proof to show adverse effect shall be on the appellant. Appeals shall be made within 30 calendar days of the date of the action purported to cause the adverse effect, except appeals for inaction, which may be made at any time. In all cases, the request for appeal must be made prior to the next step in the process.

  The final decisions of any appeal shall be documented in writing and made public.

  The appeals process provides two levels, with the goal of expeditiously resolving the issue to the satisfaction of the participants:

  - Level 1 Appeal

  Level 1 is the required first step in the appeals process. The appellant submits a complaint in writing to the Regional Standards Process Manager (RSPM) that describes the substantive or procedural action or inaction associated with a reliability standard or the standards process. The appellant describes in the complaint the actual or potential adverse impact to the appellant. Assisted by any necessary staff and committee resources, the RSPM shall prepare a written response addressed to the appellant as soon as practical, but not more than 45 calendar days after receipt of the complaint. If the appellant accepts the response as a satisfactory resolution of the issue, both the complaint and response will be made a part of the public record associated with the standard and posted with the standard.

  - Level 2 Appeal

  If after the Level 1 Appeal the appellant remains unsatisfied with the resolution, as indicated by the appellant in writing to the RSPM~~egional Standards Process Manager~~, the RSPM shall convene a Level 2 Appeals Panel. This panel shall consist of five members total appointed by the NPCC's Board of Directors.

  In all cases, Level 2 Appeals Panel members shall have no direct affiliation with the participants in the appeal.

  The RSPM shall post the complaint and other relevant materials and provide at least 30 calendar days notice of the meeting of the Level 2 Appeals Panel. In addition to the appellant, any person that is directly and materially affected by the substantive or procedural action or inaction referenced in the complaint shall be heard by the panel. The panel shall not consider any expansion of the scope of the appeal that was not presented in the Level 1 Appeal. The panel

may in its decision find for the appellant and remand the issue to the RSC with a statement of the issues and facts in regard to which unfair and/or inequitable action was ~~not~~ taken, or which fair and/or equitable action was not taken. The panel may find for or against the appellant with a specific statement of the facts that demonstrate fair and equitable treatment of the appellant and the appellant's objections. The panel may not, however, revise, approve, disapprove, or adopt a reliability standard. The actions of the Level 2 Appeals Panel shall be publicly posted.

In addition to the foregoing, a procedural objection that has not been resolved may be submitted to the NPCC Board of Directors for consideration at the time the Board decides whether to adopt a particular reliability standard. The objection must be in writing, signed by an officer of the objecting entity, and contain a concise statement of the relief requested and a clear demonstration of the facts that justify that relief. The objection must be filed no later than 30 calendar days after the announcement of the vote on the standard in question.

Terms Defined in the Directory

There are no new terms defined in this Revision. The definitions of terms found in this Directory appearing in bold typeface, can be found in the NPCC *Glossary of Terms.*

A. Introduction

1. **Title:** Verification of Generator Gross and Net Reactive Power Capability

2. **Directory #:** 10

3. **Objective:**

   This Directory presents the minimum criteria requirements for verifying the **Gross Reactive Power Capability** and **Net Reactive Power Capability** of generators or generating facilities.

   Compliance to the criteria requirements set forth in this Directory by each applicable entity assures accuracy of information used in the steady-state models to assess the reliability of the NPCC bulk power system.

   This Directory has been developed to ensure that the requirements specified in NERC Standard MOD-025-1, "Verification of Generator Gross and Net Reactive Power Capability" are met by NPCC and its applicable members responsible for meeting the NERC Reliability Standards.

4. **Effective Date:** **December 22, 2008**

5. **Background:**

   This Directory was developed from the draft NPCC A-14 Verification of Generator Gross and Net Reactive Power Capability Criteria document whose technical content was approved by the Reliability Coordinating Committee on March 5, 2008 for conversion into a Directory. Version 0 of the Directory became effective on December 22, 2008.

6. **Applicability:**
   6.1 Functional Entities (Responsible Entities)
   - Generator Owners
   - Transmission Operators (in whose area the generator or generation facility resides)

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

B. NERC ERO Reliability Standard Requirements

The NERC ERO Reliability Standards containing requirements that are associated with this Directory include, but may not be limited to:

- MOD-025-1 -Verification of Generator Gross and Net Reactive Power Capability
- TOP-002-2 - Normal Operations Planning
- FAC-008-1 - Facility Ratings Methodology
- FAC-009-1 - Establish and Communicate Facility Ratings

C. NPCC Regional Reliability Standard Requirements

None.

D. NPCC "Full Member" More Stringent Criteria Requirements

1. Requirements

1.1 Developing the List of Generators or Generation Facilities to be Verified

R1. Transmission Operators shall develop and maintain documentation of those generators or generation facilities that must verify the **Gross Reactive Power Capability** and **Net Reactive Power Capability** for the summer and winter capability seasons. The documentation maintained by the Transmission Operator shall include the following:

R1.1 All generators or generation facilities **Declared Gross Reactive Power Capability** and **Declared Net Reactive Power Capability** and seasonal auxiliary load reactive power requirements. (Reference Appendix B).

R1.2 All generators or generation facilities **Verified Gross Reactive Power Capability** and **Verified Net Reactive Power Capability**, verification date and method of verification.

R1.3 Discrepancies between a Generator Owner's declared and verified **Gross Reactive Power Capability** and **Net Reactive Power Capability**, the reason for such discrepancies and the Generator Owner's plan to address the discrepancies.

R1.4 Generator Owner supplied **Gross Reactive Power Capability** and **Net Reactive Power Capability** testing, manufacturer data,

performance tracking or operating historical data, certification documentation, as specified by the Transmission Operator.

R1.5. Generators or generation facilities exempted from the verification requirements and the basis for their exemption (see Section 1.5).

1.2 Establishing the Generator Reactive Power Capability Verification Program

R2. The Transmission Operator shall establish and document a program to periodically verify the **Gross Reactive Power Capability** and **Net Reactive Power Capability** of all generators and generation facilities that are subject to periodic seasonal **Gross Reactive Power Capability** and **Net Reactive Power Capability** verification.

R3. The Transmission Operator shall provide any changes to its verification process to the Generator Owners within 30 calendar days of issue.

R4. The Transmission Operator shall establish and document requirements for a Generator Owner to notify the Transmission Operator within a specified time period when its generator or generation facility cannot achieve the **Declared Gross Reactive Power Capability** or **Declared Net Reactive Power Capability** because of equipment issues.

R5. The Transmission Operator shall establish and document a time frame for the Generator Owner to address equipment issues that result in a generator or generation facility not achieving the **Declared** Gross Reactive Power Capability and **Declared** Net Reactive Power Capability.

R6. The Transmission Operator shall establish and document the real power level at which the verification shall be performed, recognizing that the verification of lagging and leading reactive power capabilities should normally be performed during on-peak and off-peak hours, respectively.

R7. The Transmission Operator shall establish and document those intermittent or small generating units whose capability may be represented by verification results of a single generating unit.

1.3 Implementing the Generator Reactive Power Capability Verification Program

R8. The Transmission Operator shall request Generator Owners to verify the seasonal **Gross Reactive Power Capability** and **Net Reactive Power Capability** of their generators or generation facilities that are subject to periodic seasonal **Gross Reactive Power Capability** and **Net Reactive**

Power Capability verification every five (5) years or more frequently as required by the Transmission Operator. The two (2) capability seasons are defined as summer and winter as specified by the Transmission Operator.

R9. If a Transmission Operator determines that only one seasonal generating capability value is required for NPCC Bulk Power System reliability analysis, then periodic verification will be required only for that particular season.

R10. If a Transmission Operator determines that the difference between the **Declared Gross Reactive Power Capability** and the **Declared Net Reactive Power Capability** of a generator or generation facility is insignificant for NPCC Bulk Power System reliability analysis, then periodic verification will be required for only one numerical value.

R11. If a Transmission Operator determines that only the lagging or leading **Gross Reactive Power** Capability and **Net Reactive Power Capability** of a generator or generation facility is required for NPCC Bulk Power System reliability analysis, then periodic verification will be required only for that specific reactive power capability value.

R12. The Generator Owner shall provide generator or generation facility **Declared Gross Reactive Power Capability** and **Declared Net Reactive Power Capability** to the Transmission Operator.

R13. The Generator Owner shall provide evidence, upon request, to the Transmission Operator that the generator or generation facility **Gross Reactive Power Capability** and **Net Reactive Power Capability** have been verified.

R14. The Generator Owner shall report to the Transmission Operator any discrepancies between Declared and Verified **Gross Reactive Power Capability** and **Net Reactive Power Capability** within a time frame specified by the Transmission Operator and develop and implement a plan to resolve the discrepancies.

R15. The Generator Owner shall determine and report to the Transmission Operator the generator or generation facility reactive power seasonal auxiliary loads (including common station loads).

1.4 Verification Criteria for Generator and Generation Facility Reactive Power Capability

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

R16. The Generator Owner shall comply with Transmission Operator requests for periodic verification of **Gross Reactive Power Capability** and **Net Reactive Power Capability** of their generators or generation facilities.

R17. The Generator Owner shall verify the **Gross Reactive Power Capability** and **Net Reactive Power Capability** of their generators or generation facilities according to their types. As specified by the Transmission Operator, the verification shall include any of the following:

- Testing,
- Use of operating historical data,
- Commissioning data (for new generators only),
- Performance tracking data acquired during the same seasonal capability period.

R18. The Generator Owner shall verify the Gross Reactive Power Capability and Net Reactive Power Capability of Thermal Generators, Internal Combustion Generators, Gas Turbine Generators, Combined Cycle and Hydro Generators or generators operated as a synchronous condenser on the average leading reactive power output for at least a 15 consecutive minute period and average lagging reactive power output for at least a 60 consecutive minute period.

R19. The Generator Owner shall verify the Gross Reactive Power Capability and Net Reactive Power Capability of Intermittent power resources (wind, tidal or geo-thermal generators) on performance tracking data. Manufacturers' data or commissioning data can be used until sufficient performance tracking data is available to verify generator or generation facilities lagging and leading reactive capabilities.

R20. The Generator Owner shall verify the Gross Reactive Power Capability and Net Reactive Power Capability for multiple generator facilities when limited by common elements on the reactive power capability of the facility and not the sum of the capabilities of the individual generators.

R21. The Generator Owner shall identify any equipment or other factor that will limit the capability of the generator or generation facility to meet its **Declared Gross Reactive Power Capability** or **Declared Net Reactive Power Capability**.

1.5 Exemption of Generators or Generation Facilities from Seasonal Verification Testing

R22. The Generator Owner shall notify the Transmission Operator and request an exemption if it cannot conduct seasonal capability testing of a generator or generation facility for any of the reasons listed below.

- Adverse impact on transmission system reliability
- Potential damage to transmission system or generator equipment
- Environment conditions
- Governmental regulatory or operating license limitations
- An extended outage to the generator or generation facility

R23. The Transmission Operator shall, within 30 calendar days of receiving notification from a Generator Owner that it is requesting an exemption because it cannot perform verification for the required seasonal period, notify the Generator Owner whether its generator will be exempted from the seasonal capability testing. Where the exemption is approved, the Transmission Operator shall coordinate with the Generator Owner to reschedule the verification for the next seasonal verification period.

R24. The Generator Owner for a generator or generation facility exempted from seasonal capability testing shall submit the following to the Transmission Operator:

- For existing generators, generator operation records, manufacturer data, or performance tracking for the previous applicable seasonal verification period for this generator or generation facility.
- Engineering analysis in conjunction with performance tracking data to justify any difference between a generator's or generation facility's **declared capability** and previous applicable seasonal performance tracking data.
- For new generators only, commissioning data.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

E. Compliance

1. Compliance Monitoring Process

Compliance with the requirements set forth in this Directory will be in accordance with the NPCC Criteria Compliance and Enforcement Program. (CCEP).

Measures and corresponding Levels of Non Compliance for these requirements are contained within the compliance template associated with this Directory.

2. Data Retention

Responsible Entities shall keep evidence of compliance for a minimum of five years. A Responsible Entity found non-compliant shall keep information related to the non-compliance until found compliant.

Prepared by:	Task Force on Coordination of Operation
Review and Approval:	Revision to any portion of this Directory will be posted by the lead Task Force in the NPCC Open Process for a 45 day review and comment period. U pon satisfactorily addressing all the comments in this forum, the Directory document will be sent to the remaining Task Forces for their recommendation to seek RCC approval. Upon approval of the RCC, this Directory will be sent to the Full Member Representatives for their final approval if sections pertaining to the Requirements and Criteria portion have been revised. All voting and approvals will be conducted according to the most current "NPCC. Bylaws" in effect at the time the ballots are cast. Revisions pertaining to the Appendices or any other portion of the document such as links, glossary terms, etc., only RCC Members will need to conduct the final approval ballot of the document. This Directory will be updated at least once every three years and as often as necessary to keep it current and consistent with NERC, Regional Reliability Standards and other NPCC documents.

Appendix B - Generator Reactive Capability Form

GENERATOR REACTIVE CAPABILITY DATA FORM

1. Data Preparation Documentation*

Generator Facility Name	Unit No.	Facility ID	Generator Owner	Primary Contact
Big Generator Station	1	12234	Big Power	Jim Smith
Prepared By	**Date prepared:**	**Effective Date**	**Contact Tel**	**Contact e-mail**
John Doe	01/05/2007	01/10/2007	XXX-XXX-XXXX	john@bigpower.com

Auxiliary Reactive Power Requirements	Summer MVAR	Winter MVAR
	20	15

Reactive Data*

Seasonal Data	Declared Real and Reactive Capability						Verified Reactive Capability and Season			Verification Method (T, P,C** as applicable)	Date Verified
	Summer			Winter			Winter				Date
	Gross MW	Gross MVAR	Net MVAR	Gross MW	Gross MVAR	Net MVAR	Gross MW	Gross MVAR	Net MVAR		
Lagging Capability	500	120	120	525	100	100	520	110	110	P	03/15/2007
Leading Capability	500	250	230	525	240	225	525	200 (1)	185(1)	T	01/25/2007

Data inputted for illustration purposes,* * T- Testing; P- Performance Tracking; C-Commissioning data*

Notes and Limitations:	(1) Full MVAR capability could not be achieved because of system voltage restriction. Engineering analysis was provided to demonstrate unit was capable of declared values.

Generating unit capability curve. *Please attach a .jpg image from the generating unit capability D curve*

Terms Defined in the Directory

There are no new terms defined in this Revision. The definitions of terms found in this Directory appearing in bold typeface, can be found in the NPCC *Glossary of Terms.*

A. Introduction

1. **Title:** Verification of Generator Gross and Net Real Power Capability

2. **Directory #:** 9

3. **Objective:**

   This Directory presents the minimum criteria requirements for verifying the **Gross Real Power Capability** and **Net Real Power Capability** of generators or generating facilities.

   Compliance to the criteria requirements set forth in this Directory by each applicable entity assures accuracy of information used in the steady-state models to assess the reliability of the NPCC bulk power system.

   This Directory has been developed to ensure that the requirements specified in NERC Standard MOD-024-1, "Verification of Generator Gross and Net Real Power Capability" are met by NPCC and its applicable members responsible for meeting the NERC Reliability Standards.

4. **Effective Date: 12/22/2008**

5. **Background:**
   This Directory was developed from the draft NPCC A-13 Verification of Generator Gross and Net Real Power Capability Criteria document whose technical content was approved by the Reliability Coordinating Committee on March 5, 2008 for conversion into a Directory. Version 0 of the Directory became effective on December 22, 2008.

6. **Applicability:**

   6.1 Functional Entities (Responsible Entities)
   - Generator Owners
   - Transmission Operators (in whose area the generator or generation facility resides)

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

B. NERC ERO Reliability Standard Requirements

The NERC ERO Reliability Standards containing requirements that are associated with this Directory include, but may not be limited to:

- MOD-024-1 -Verification of Generator Gross and Net Real Power Capability
- TOP-002-2 - Normal Operations Planning
- FAC-008-1 - Facility Ratings Methodology
- FAC-009-1 - Establish and Communicate Facility Ratings

C. NPCC Regional Reliability Standard Requirements

None.

D. NPCC "Full Member" More Stringent Criteria Requirements

1. Requirements

1.1 Developing the List of Generators or Generation Facilities to be verified

R1. The Transmission Operator shall develop and maintain documentation of those generators or generation facilities that must verify the **Gross Real Power Capability** and **Net Real Power Capability** for the summer and winter capability seasons. The documentation maintained by the Transmission Operator shall include the following:

R1.1 All generators or generation facilities **Declared Gross Real Power Capability** and **Declared Net Real Power Capability**.

R1.2 All generators or generation facilities **Verified Gross Real Power Capability** and **Verified Net Real Power Capability**, verification date and method of verification.

R1.3 Discrepancies between a Generator Owner's declared and verified **Gross Real Power Capability** and **Net Real Power Capability**, the reason for such discrepancies and the Generator Owner's plan to address the discrepancies.

R1.4 Generator Owner supplied **Gross Real Power Capability** and **Net Real Power Capability** testing, manufacturer data, performance tracking or operating historical data, certification documentation, as specified by the Transmission Operator.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

R1.5. All generators or generation facilities exempted from the verification requirements and the basis for their exemption (see Section 1.5).

1.2 Establishing the Generator Real Power Capability Verification Program

R2. The Transmission Operator shall establish and document a program to periodically verify the **Gross Real Power Capability** and **Net Real Power Capability** of all generators and generation facilities that are subject to periodic seasonal **Gross Real Power Capability** and **Net Real Power Capability** verification.

R3. The Transmission Operator shall provide any changes to its verification process to the Generator Owners within 30 calendar days of issue.

R4. The Transmission Operator shall establish and document requirements for a Generator Owner to notify the Transmission Operator within a specified time period when its generator or generation facility cannot achieve the **Declared Gross Real Power Capability** or **Declared Net Real Power Capability** because of equipment issues.

R5. The Transmission Operator shall establish and document a time frame for the Generator Owner to address equipment issues that result in a generator or generation facility not achieving the **Declared Gross Real Power Capability** or **Declared Net Real Power Capability**.

R6. The Transmission Operator shall establish and document the ambient conditions that correspond to the summer and winter capability seasons for which the **Gross Real Power Capability** and **Net Real Power Capability** are verified.

R7. The Transmission Operator shall establish and document those intermittent or small generating units whose capability may be represented by verification results of a single generating unit.

1.3 Implementing the Generator Real Power Capability Verification Program

R8. The Transmission Operator shall request Generator Owners to verify the seasonal **Gross Real Power Capability** and **Net Real Power Capability** of their generators or generation facilities that are subject to periodic seasonal **Gross Real Power Capability** and **Net Real Power Capability** verification every three (3) years or more frequently as required by the Transmission Operator. The two (2) capability seasons are defined as summer and winter as specified by the Transmission Operator.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

R9. If a Transmission Operator determines that only one seasonal generating capability value is required for NPCC Bulk Power System reliability analysis, then periodic verification will be required only for that particular season.

R10. If a Transmission Operator determines that the difference between the **Declared Gross Real Power** and **Declared Net Real Power Capability** of a generator or generation facility is insignificant for NPCC Bulk Power System reliability analysis, then periodic verification will be required for only one numerical value.

R11. The Generator Owner shall provide generator or generation facility **Declared Gross Real Power Capability** and **Declared Net Real Power Capability** to the Transmission Operator.

R12. The Generator Owner shall provide evidence, upon request, to the Transmission Operator that the generator or generation facility **Gross Real Power Capability** and **Net Real Power Capability** have been verified.

R13. The Generator Owner shall report to the Transmission Operator any discrepancies between declared and verified **Gross Real Power Capability** or **Net Real Power Capability** within a time frame specified by the Transmission Operator and develop and implement a plan to resolve the discrepancies.

R14. The Generator Owner shall determine and report to the Transmission Operator the generator or generation facility real power seasonal auxiliary loads (including common station loads).

1.4 Verification Criteria for Generator and Generation Facility Real Power Capability

R15. The Generator Owner shall comply with Transmission Operator requests for periodic verification of **Gross Real Power Capability** and **Net Real Power Capability** of their generators or generation facilities.

R16. The Generator Owner shall verify the **Gross Real Power Capability** and **Net Real Power Capability** of thermal generators on the basis of operation for no less than one hour.

R16.1. The verification of thermal generator's capability shall include any of the following:

- Testing,

- Use of operating historical data,
- Commissioning data (for new generators only)**,**
- Performance tracking data acquired during the same seasonal capability period.

R17. The Generator Owner shall verify the **Gross Real Power Capability** and **Net Real Power Capability** of internal combustion generators and gas turbine generators. The verification shall correspond to operation for no less than one hour under the ambient conditions established in R6 for which the **Gross Real Power Capability** and **Net Real Power Capability** are being claimed.

R17.1. The verification of internal combustion and gas turbine generators capability shall include any of the following:

- Testing,
- Use of operating historical data,
- Commissioning data (for new generators only),
- Performance tracking data acquired during the same seasonal capability period.

R18. The Generator Owner shall verify the **Gross Real Power Capability** and **Net Real Power Capability** of hydro generators either on a generation facility or on an individual generator basis. The **Gross Real Power Capability** and **Net Real Power Capability** shall be determined on the basis of the availability of sufficient water at an adequate head to provide the output for no less than one hour.

R18.1. The verification of hydro generator's capability shall include any of the following:

- Testing,
- Use of operating historical data,
- Commissioning data (for new generators only),
- Performance tracking data acquired during the same seasonal capability period.

R19. The Generator Owner shall verify the **Gross Real Power Capability** and **Net Real Power Capability** of combined cycle generators on a generation facility, individual generator or on a generator stage basis for no less than one hour under the ambient conditions established by the Transmission Operator in R6 for which the **Gross Real Power Capability** and **Net Real Power Capability** are being claimed.

R19.1 The verification of a combined cycle generator's capability shall include any of the following:

- Testing,

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

- Use of operating historical data,
- Commissioning data (for new generators only),
- Performance tracking data acquired during the same seasonal capability period.

R20**.** The Generator Owner shall verify the **Gross Real Power Capability** and **Net Real Power Capability** of intermittent power resources (wind, solar, tidal geo-thermal, etc.) using any of the following:

- Manufacturer's data,
- Performance tracking,
- Operating historical data

R21. The Generator Owner shall verify the **Gross Real Power Capability** and **Net Real Power Capability** of multiple generator facilities when limited by common elements based on the real power capability of the facility and not the sum of the capabilities of the individual generators.

R22. The Generator Owner shall identify any equipment or other factor that will limit the capability of the generator or generation facility to meet its **Declared Gross Real Power Capability** or **Declared Net Real Power Capability**.

1.5 Exemption of Generators or Generation Facilities from Verification Testing

R23. The Generator Owner shall notify the Transmission Operator and request an exemption if it cannot conduct seasonal capability testing of a generator or generation facility for any of the reasons listed below.

- Adverse impact on transmission system reliability
- Potential damage to transmission system or generator equipment
- Environment conditions
- Governmental regulatory or operating license limitations
- An extended outage to the generator or generation facility

R24. The Transmission Operator shall, within 30 calendar days of receiving notification from a Generator Owner that it is requesting an exemption because it cannot perform verification for the required seasonal period, notify the Generator Owner whether its generator will be exempted from the seasonal capability testing. Where the exemption is approved, the Transmission Operator shall coordinate with the Generator Owner to reschedule the verification for the next seasonal verification period.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

R25. The Generator Owner for a generator or generation facility exempted from seasonal capability testing shall submit the following to the Transmission Operator:

- For existing generators, generator operation records, manufacturer data, or performance tracking for the previous applicable seasonal verification period for this generator or generation facility.
- Engineering analysis in conjunction with performance tracking data to justify any difference between a generators or generation facilities declared capability and previous applicable seasonal performance tracking data.
- For new generators only, commissioning data.

E. Compliance

1. Compliance Monitoring Process

Compliance with the requirements set forth in this Directory will be in accordance with the NPCC Criteria Compliance and Enforcement Program (CCEP).

Measures and corresponding Levels of Non Compliance for these requirements are contained within the compliance template associated with this Directory.

2. Data Retention

Responsible Entities shall keep evidence of compliance for a minimum of three years. A Responsible Entity found non-compliant shall keep information related to the non-compliance until found compliant.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Prepared by:	Task Force on Coordination of Operation
Review and Approval:	Revision to any portion of this Directory will be posted by the lead Task Force in the NPCC Open Process for a 45 day review and comment period. Upon satisfactorily addressing all the comments in this forum, the Directory document will be sent to the remaining Task Forces for their recommendation to seek RCC approval. Upon approval of the RCC, this Directory will be sent to the Full Member Representatives for their final approval if sections pertaining to the Requirements and Criteria portion have been revised. All voting and approvals will be conducted according to the most current "NPCC. Bylaws" in effect at the time the ballots are cast. Revisions pertaining to the Appendices or any other portion of the document such as links, glossary terms, etc., only RCC Members will need to conduct the final approval ballot of the document. This Directory will be updated at least once every three years and as often as necessary to keep it current and consistent with NERC, Regional Reliability Standards and other NPCC documents.

To:	general
Subject:	NPCC Regional Reliability Directory#9 Verification of Gross and Net Real Power and Regional Reliability Directory #10 Verification of Gross and Net Reactive Power----Criteria Section Reformatted (Phase2)---Approved by Full Member Committee
Date:	Wednesday, December 28, 2011 4:13:42 PM

NPCC Members,

On December 28, 2011 the Full Member Committee of NPCC approved revised versions of NPCC Regional Reliability Directory#9 *Verification of Gross and Net Real Power* and Regional Reliability Directory #10 *Verification of Gross and Net Reactive Power* each of which was reformatted in accordance with Phase 2 of the NPCC Directory project.

Phase 2 has been initiated in order to reorganize the criteria section of each Directory into NERC style requirement format which will promote the criteria as more specific or more stringent and also facilitate the NPCC Criteria Compliance Enforcement Program (CCEP).

The revision of both Directories was managed by the Task Force on Coordination of Operation (TFCO) and are the first NPCC Directories to be revised in this manner.

NPCC Directories provide a consistent and comprehensive set of reliability requirements for the Northeast while consolidating related information for NPCC criteria, guidelines, procedures and regional standards into one document.

The revised versions of Directories #9 and #10 as well as the Full Member vote count may be found at:

https://www.npcc.org/Standards/Directories/Forms/Public%20List.aspx

Respectfully,

Gerry Dunbar

Subject: ReliabilityFirst Board Action - December 1, 2011 Board Standards Related Highlights
Date: Friday, December 09, 2011 4:46:55 PM

ANNOUNCEMENT: December 1, 2011 Board Standards Related Highlights

The following are the highlights of Standards related action taken during the December 1, 2011 Reliability*First* Board of Directors (Board) meeting in Washington DC:

1. **Concurrence with MOD-024-RFC.1.1 modified Violation Severity Levels (VSLs)** - The Board unanimously concurred with the MOD-024-RFC.1.1 modified Violation Severity Levels (VSLs) as approved by the Ballot Pool back on September 8, 2011. The MOD-024-RFC.1.1 standard with the modified VSLs included can be found on the Reliability*First* RSVP website.

2. **Concurrence with Version 4 of the Reliability Standards Development Procedure (Standards Development Procedure)** - On September 16, 2011, the Standards Committee determined that it is appropriate and in the best interests of Reliability*First* to make a minor change to the Standards Development Procedure to cure inconsistencies with the amended definition of "Regional Reliability Standard" contained within the proposed amended Bylaws and Certificate of Incorporation of Reliability*First*. The amended definition of "Regional Reliability Standard" specifically states that a Regional Reliability Standard is not binding upon any Member or Registered Entity, nor is it effective or enforceable, until the Regional Reliability Standard has been adopted by NERC and approved by the Commission. The Board unanimously concurred with a minor change to Version 4 of the Reliability*First* Standards Development Procedure consistent with the Standards Committee's recommendation. Version 4 of the Standards Development Procedure will be submitted to the NERC Board of Trustees with subsequent filing with the Commission. Version 4 of the Standards Development Procedure along with a background document can be found on the Reliability*First* RSVP website (Please note that Version 4 will not be effective until Commission approval).

3. **Suspension of Regional Standards Drafting Efforts** - The Board unanimously suspended all Reliability*First* regional standards efforts. The Board directed Reliability*First* staff to perform a thorough review of each proposed and existing standard and report back during the Board's February meeting. The focus of the Board's discussion centered more on the need for Regional Standards from an overall Reliability*First* policy perspective rather than technical need for any particular Regional standard.

Thank you and have a great weekend.

Regards,

Anthony Jablonski
Standards Process Manager
