$$G_O = \frac{CFO_S}{500 \cdot D} = \frac{737.7}{(500) \cdot (1.535)} = 0.961 \tag{13}$$

$$m = 1.25 \cdot G_O(G_O - 0.2) = 1.25 \cdot 0.961(0.961 - 0.2) = 0.915 \tag{14}$$

$$V_m = 0.85 \cdot k_w \cdot k_g \cdot \delta^m \cdot \frac{3400}{1 + \frac{8}{D}} = (0.85)(1.037)(1.3)(0.78)^{0.915}\left(\frac{3400}{1 + \frac{8}{1.535}}\right) = 499.8kV \tag{15}$$

The calculated V_m is less than 629 kV; thus, the clearance distance must be increased. A few iterations using (2)-(5) and (8) are required until the computed $V_m \geq$ 629 kV. For this case it was found that D = 1.978 m (6.49 feet) yielded V_m = 629.3 kV. Using this clearance distance the following values were computed for the final iteration.

$$CFO_S = k_w \cdot k_g \cdot \frac{3400}{1+\frac{8}{D}} = 1.037 \cdot 1.3 \cdot \frac{3400}{1+\frac{8}{1.978}} = 908.5kV \quad (16)$$

$$\delta = e^{-\frac{A}{8.6}} = e^{-\frac{2.134}{8.6}} = 0.78 \quad (17)$$

$$G_O = \frac{CFO_S}{500 \cdot D} = \frac{908.5}{(500)\cdot(1.978)} = 0.919 \quad (18)$$

$$m = 1.25 \cdot G_O(G_O - 0.2) = 1.25 \cdot 0.919(0.919 - 0.2) = 0.825 \quad (19)$$

$$V_m = 0.85 \cdot k_w \cdot k_g \cdot \delta^m \cdot \frac{3400}{1+\frac{8}{D}} = (0.85)(1.037)(1.3)(0.78)^{0.825}\left(\frac{3400}{1+\frac{8}{1.978}}\right) = 629.3kV \quad (20)$$

Therefore, the minimum vegetation clearance distance for a maximum line to line ac operating voltage of 550 kV at 7000 feet above sea level is 1.978 m (6.49 feet). Table 1 provides calculated distances for various altitudes and maximum system operating ac voltages.

Re: *North American Electric Reliability Corporation*
Docket No. RD12-___-000

Dear Ms. Bose:

The North American Electric Reliability Corporation ("NERC") hereby submits this petition in accordance with Section 215(d) (1) of the Federal Power Act ("FPA") and Part 39.5 of the Federal Energy Regulatory Commission's ("FERC") regulations seeking approval of proposed Regional Reliability Standard IRO-006-TRE-1 — IROL and SOL Mitigation on the ERCOT Interconnection, associated Violation Severity Levels ("VSL") and Violation Risk Factors ("VRF"), and the implementation plan for IRO-006-TRE-1.

The proposed Regional Reliability Standard was developed by the Texas Reliability Entity ("Texas RE") and approved by the NERC Board of Trustees during its November 4, 2011, meeting. NERC requests the standard become effective upon the first day of the first calendar quarter following the effective date of a Final Rule in this docket.

This petition consists of the following:

- this transmittal letter;
- a table of contents for the entire petition;
- a narrative description explaining how the proposed Regional Reliability Standard meets FERC's requirements;
- Regional Reliability Standard IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection and Implementation Plan, submitted for approval (**Exhibit A**);
- the NERC Board of Trustees' Resolution approving IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection and directing it be filed with FERC (**Exhibit B**);
- the complete Development Record of the proposed Regional Reliability Standard (**Exhibit C**);
- the Standard Drafting Team roster (**Exhibit D**); and
- the Violation Severity Level and Violation Risk Factor Guideline Analysis (**Exhibit E**).

Please contact the undersigned if you have any questions.

Respectfully submitted,

/s/ Andrew M. Dressel

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC")[1] hereby requests the Federal Energy Regulatory Commission ("FERC") to approve, in accordance with Section 215(d)(1) of the Federal Power Act ("FPA")[2] and Section 39.5 of FERC's regulations, 18 C.F.R. § 39.5, proposed Regional Reliability Standard IRO-006-TRE-1 included in **Exhibit A**.

This petition is the first request by NERC for FERC approval of this proposed Regional Reliability Standard. The Regional Reliability Standard proposed will be in effect only for applicable registered entities within the jurisdiction of the Texas Reliability Entity ("Texas RE") in the Electric Reliability Council of Texas ("ERCOT") Interconnection. This Regional Reliability Standard was developed to provide and execute transmission loading relief procedures that can be used to avoid and mitigate System Operating Limits ("SOL") or Interconnection Reliability Operating Limits ("IROL") exceedences for the purpose of maintaining the reliable operation of the bulk electric system in the ERCOT region. Additionally, this standard will provide enforceable requirements to support the NERC continent-wide standard IRO-006-5 — Transmission Loading Relief in the ERCOT Region. NERC continent-wide Reliability Standards do not presently address the issues covered in this proposed Regional Reliability Standard.

On November 4, 2011, the NERC Board of Trustees approved IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection. NERC requests that FERC approve this Regional Reliability Standard and make it effective upon FERC approval.

[1] NERC has been certified by FERC as the Electric Reliability Organization ("ERO") authorized by Section 215 of the Federal Power Act. FERC certified NERC as the ERO in its order issued July 20, 2006 in Docket No. RR06-1-000. 116 FERC ¶ 61,062 (2006) ("ERO Certification Order").
[2] 16 U.S.C. 824o.

Exhibit A to this filing sets forth the proposed Regional Reliability Standard and Implementation Plan. **Exhibit B** is the NERC Board of Trustees' resolution to approve the proposed Regional Reliability Standard. **Exhibit C** contains the complete record of development for the proposed Regional Reliability Standard. **Exhibit D** includes the standard drafting team roster. **Exhibit E** is the Violation Severity Level ("VSL") and Violation Risk Factor ("VRF") guideline analysis.

III. BACKGROUND

a. Regulatory Framework

By enacting the Energy Policy Act of 2005,[4] Congress entrusted FERC with the duties of approving and enforcing rules to ensure the reliability of the Nation's Bulk

[3] Persons to be included on FERC's service list are indicated with an asterisk. NERC requests waiver of FERC's rules and regulations to permit the inclusion of more than two people on the service list

Power System ("BPS"), and with the duties of certifying an ERO that would be charged with developing and enforcing mandatory Reliability Standards, subject to FERC approval. Section 215 of the FPA states that all users, owners and operators of the BPS in the United States will be subject to FERC-approved Reliability Standards.

b. Basis for Approval of Proposed Regional Reliability Standard

Section 39.5(a) of FERC's regulations requires the ERO to file with FERC for its approval each Reliability Standard that the ERO proposes to become mandatory and enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes to be made effective. FERC has the regulatory responsibility to approve standards that protect the reliability of the BPS. In discharging its responsibility to review, approve, and enforce mandatory Reliability Standards, FERC is authorized to approve those proposed Reliability Standards that meet the criteria detailed by Congress:

> FERC may approve, by rule or order, a proposed reliability standard or modification to a reliability standard if it determines that the standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest.[5]

When evaluating proposed Reliability Standards, FERC is expected to give "due weight" to the technical expertise of the ERO and to the technical expertise of a Regional Entity *organized on an Interconnection-wide basis* with respect to a Reliability Standard to be applicable within that Interconnection.[6] Order No. 672 provides guidance on the

[4] 16 U.S.C. § 824o.
[5] 16 U.S.C. § 824o(d)(2).
[6] *Rules Concerning Certification of the Electric Reliability Organization; Procedures for the Establishment, Approval and Enforcement of Electric Reliability Standards,* FERC Stats. & Regs., ¶ 31,204 (2006) ("Order No. 672") at P 344, *order on reh'g,* FERC Stats. & Regs. ¶ 31,212 (2006) ("Order No. 672-A").

factors FERC will consider when determining whether proposed Reliability Standards meet the statutory criteria.[7]

A Regional Reliability Standard proposed by a Regional Entity must meet the same standards that NERC's Reliability Standards must meet, *i.e.*, the Regional Reliability Standard must be shown to be just, reasonable, not unduly discriminatory or preferential, and in the public interest.[8] FERC's Order No. 672 also requires additional criteria that a Regional Reliability Standard must satisfy: A regional difference from a continent-wide Reliability Standard must either be (1) more stringent than the continent-wide Reliability Standard (which includes a regional standard that addresses matters that the continent-wide Reliability Standard does not), or (2) a Regional Reliability Standard that is necessitated by a physical difference in the Bulk Power System.[9]

Texas RE is an "interconnection-wide" Regional Entity, and its standards are intended to apply to the ERCOT Interconnection. As discussed in the *Texas Reliability Entity Standards Development Process*,[10] Texas RE's standards are developed according to the following characteristic attributes:

- Developed in a fair and open process that provides an opportunity for all interested parties to participate;
- Does not have an adverse impact on commerce that is not necessary for reliability;
- Provides a level of BPS reliability that is adequate to protect public health, safety, welfare, and national security and does not have a significant adverse impact on reliability; and

[10] The Texas Reliability Entity Standards Development Process is available at http://texasre.org/CPDL/Texas%20Reliability%20Entity%20Standards%20Development%20Process.pdf.

- Based on a justifiable difference between regions or between sub-regions within the Regional geographic area.

Proposed Texas RE standards are subject to approval by NERC, as the ERO, and FERC before becoming mandatory and enforceable under Section 215 of the FPA.[11] The Texas RE Regional Reliability Standard was developed in an open, transparent, and inclusive fashion. NERC Reliability Standards and the Texas RE Regional Reliability Standards are both enforced through the Texas RE Compliance Program.

As previously noted, Texas RE is a Regional Entity that is organized on an Interconnection-wide basis, with jurisdiction to enforce Reliability Standards throughout the ERCOT Region. Therefore, NERC is required to rebuttably presume the proposed standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest. The proposed Regional Reliability Standard was developed using the *Texas Reliability Entity Standards Development Process*[12] that enables all parties with an interest in the standard to participate in its development. NERC's public posting of this proposed Regional Reliability Standard did not elicit any significant procedural or technical objections. NERC has determined that the proposed standard meets the criteria for consideration and approval as a Regional Reliability Standard.

IV. JUSTIFICATION FOR APPROVAL OF PROPOSED REGIONAL RELIABILITY STANDARD

This section summarizes the development of the proposed Regional Reliability Standard IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection; describes the reliability objectives to be achieved by the Regional Reliability Standard;

[11] 16 U.S.C. 824o.
[12] The Texas Reliability Entity *Texas Reliability Entity Standards Development Process* is available at http://texasre.org/CPDL/Texas%20Reliability%20Entity%20Standards%20Development%20Process.pdf

explains the development history of the Regional Reliability Standard; and demonstrates how the standard meets the FERC criteria for approval. In its analysis and approval of the proposed Regional Reliability Standard, NERC determined that the standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest.

The complete development record for the proposed Regional Reliability Standard is provided in **Exhibit C** and includes the development and approval process, comments received during the industry comment period, responses to those comments, ballot information, and NERC's evaluation of the proposed standard.

a. Basis and Purpose of Standard IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

The proposed regional standard, IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection, builds upon the Texas RE's existing transmission loading relief procedure (congestion management procedures) that FERC described as superior to the continent-wide standard.[13] The proposed standard also addresses the FERC directive in Paragraph 964 of Order 693 in which the Commission directed the ERO "to modify the … ERCOT procedures to ensure consistency with the standard form of the Reliability Standards including Requirements, Measures and Levels of Non-Compliance.[14] This standard is intended to integrate with NERC standard IRO-006-5, which recently became effective.[15] The existing ERCOT congestion management procedures are set forth in the ERCOT Nodal Protocols,[16] Operating Guides,[17] and Operating Procedures.[18]

b. Order No. 672 Criteria

In Order No. 672, FERC identified criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standards have met or exceeded the criteria:

1. Proposed Reliability Standards must be designed to achieve a specified reliability goal.

> Order No. 672 at P 321. The proposed Reliability Standard must address a reliability concern that falls within the requirements of section 215 of the FPA. That is, it must provide for the reliable operation of Bulk-Power System facilities. It may not extend beyond reliable operation of such facilities or apply to other facilities. Such facilities include all those necessary for operating an interconnected electric energy transmission network, or any portion of that network, including control systems. The proposed Reliability Standard may apply to any design of planned additions or modifications of such facilities that is necessary to provide for reliable operation. It may also apply to Cybersecurity protection.

The proposed Regional Reliability Standard, IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection, is designed to ensure that the Reliability Coordinator ("RC") has the tools and authority needed to identify and mitigate congestion on critical transmission facilities. This standard will provide fully enforceable requirements associated with existing ERCOT transmission load relief (congestion management) procedures.

2. Proposed Reliability Standards must be applicable to users, owners, and operators of the bulk power system, and not others.

> Order No. 672 at P 322. The proposed Reliability Standard may impose a requirement on any user, owner, or operator of such facilities, but not on others.

The proposed Regional Reliability Standard is only applicable to the Reliability Coordinator functional entity, which is ERCOT.

3. Proposed Reliability Standards must contain a technically sound method to achieve the goal.

> Order No. 672 at P 324. The proposed Reliability Standard must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve this goal. Although any person may propose a topic for a Reliability Standard to the ERO, in the ERO's process, the specific proposed Reliability Standard should be developed initially by persons within the electric power industry and community with a high level of technical expertise and be based on sound technical and engineering criteria. It should be based on actual data and lessons learned from past operating incidents, where appropriate. The process for ERO approval of a proposed Reliability Standard should be fair and open to all interested persons.

The proposed Regional Reliability Standard contains a technically sound means to achieve the reliability goal described above, by requiring the Reliability Coordinator have and implement procedures to provide Transmission Loading Relief for critical transmission facilities. Congestion is ordinarily managed in the ERCOT Interconnection by automatically re-dispatching supply resources to respect transmission system operating limits. This standard requires ERCOT to have procedures for managing congestion in rare situations where automatic action of the ERCOT Nodal market operations system will not solve the problem. Such procedures already exist as part of Section 5 of the ERCOT Nodal Protocols (and related operational documents), which prescribes the procedures for managing congestion on the ERCOT Region transmission system.

4. Proposed Reliability Standards must be clear and unambiguous as to what is required and who is required to comply.

> Order No. 672 at P 325. The proposed Reliability Standard should be clear and unambiguous regarding what is required and who is required to

> comply. Users, owners, and operators of the Bulk-Power System must know what they are required to do to maintain reliability.

The proposed Regional Reliability Standard clearly and unambiguously states what is required from the Reliability Coordinator. In particular, the scope of the standard is clear in that it applies only to IROLs and SOLs, and when "automatic action of the ERCOT Nodal market operations system" will not effectively manage congestion.

5. Proposed Reliability Standards must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.

> Order No. 672 at P 326. The possible consequences, including range of possible penalties, for violating a proposed Reliability Standard should be clear and understandable by those who must comply.

The proposed Regional Reliability Standard includes a Violation Risk Factor ("VRF") and Violation Severity Level ("VSL") for each requirement. The ranges of penalties for violations will be based on the applicable VRF and VSL and will be administered based on the sanctions table and supporting penalty determination process described in the FERC-approved NERC Sanction Guidelines.[19]

Texas RE developed the VSLs and VRFs proposed for assignment to IRO-006-TRE-1 following applicable NERC and FERC guidance. **Exhibit E** to this filing contains the VSL and VRF guideline analysis for IRO-006-TRE-1.

6. A proposed Reliability Standard must identify clear and objective criterion or measure for compliance, so that it can be enforced in a consistent and non-preferential manner.

> Order No. 672 at P 327. There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.

[19] NERC Rules of Procedure Appendix 4B. Available at: http://www.nerc.com/files/NERC_Rules_of_Procedure_EFFECTIVE_20110101.pdf.

Each requirement of IRO-006-TRE-1 has an associated measure of compliance that will assist those enforcing the standard in enforcing it in a consistent and non-preferential manner. The proposed measures are as follows:

M1. The RC shall provide evidence including documentation of procedures to identify and mitigate exceedances of identified IROLs and SOLs to demonstrate compliance with Requirement R1.

M2. To demonstrate compliance with Requirement R2, the RC shall provide evidence, such as system logs, voice recordings, or operating messages that shows that it acted to identify and to mitigate exceedances of IROLs and SOLs in accordance with the procedures required by R1.

M1.

7. Proposed Reliability Standards should achieve a reliability goal effectively and efficiently — but do not necessarily have to reflect "best practices" without regard to implementation cost.

> Order No. 672 at P 328. The proposed Reliability Standard does not necessarily have to reflect the optimal method, or "best practice," for achieving its reliability goal without regard to implementation cost or historical regional infrastructure design. It should however achieve its reliability goal effectively and efficiently

Regional Reliability Standard IRO-006-TRE-1 achieves its reliability goal effectively and efficiently, by making the ERCOT congestion-relief procedures enforceable under the NERC system. These existing procedures have proven to be effective and efficient, and the ERCOT Reliability Coordinator is familiar with applying these procedures when necessary. This standard ensures that these procedures will be maintained in the future so that no reliability gap will occur.

8. Proposed Reliability Standards cannot be "lowest common denominator," i.e., cannot reflect a compromise that does not adequately protect bulk power system reliability.

> Order No. 672 at P 329. The proposed Reliability Standard must not simply reflect a compromise in the ERO's Reliability Standard development process based on the least effective North American practice — the so-called "lowest common denominator" — if such practice does not adequately protect Bulk-Power System reliability. Although [FERC]

> will give due weight to the technical expertise of the ERO, [FERC] will not hesitate to remand a proposed Reliability Standard if [FERC is] convinced it is not adequate to protect reliability.

The IRO-006-TRE-1 Regional Reliability Standard does not represent a "lowest common denominator" approach. The ERCOT procedures have been recognized by FERC in Order 693 to be superior to other standards that address similar risks.[20]

9. Proposed Reliability Standards may consider costs to implement for smaller entities but not at consequence of less than excellence in operating system reliability.

> Order No. 672 at P 330. A proposed Reliability Standard may take into account the size of the entity that must comply with the Reliability Standard and the cost to those entities of implementing the proposed Reliability Standard. However, the ERO should not propose a "lowest common denominator" Reliability Standard that would achieve less than excellence in operating system reliability solely to protect against reasonable expenses for supporting this vital national infrastructure. For example, a small owner or operator of the Bulk-Power System must bear the cost of complying with each Reliability Standard that applies to it.

This Regional Reliability Standard does not impose any implementation expense on smaller entities. The new requirements will only apply to the Reliability Coordinator.

10. Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one area or approach.

> Order No. 672 at P 331. A proposed Reliability Standard should be designed to apply throughout the interconnected North American Bulk-Power System, to the maximum extent this is achievable with a single Reliability Standard. The proposed Reliability Standard should not be based on a single geographic or regional model but should take into account geographic variations in grid characteristics, terrain, weather, and other such factors; it should also take into account regional variations in the organizational and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.

[20] Order No. 693 at P 964.

The proposed Regional Reliability Standard was developed on a regional basis and will only apply to the Texas RE region. It is not intended to be applied throughout North America. The proposed IRO-006-TRE-1 Regional Standard is part of a comprehensive set of standards designed to cover transmission loading relief. NERC Project 2006-08 developed the continent-wide standard IRO-006-5 Reliability Standard, which provides a requirement for all Interconnections in North America. There are corresponding standards that address similar reliability objectives in the Eastern and Western Interconnections.[21]

11. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid.

> Order No. 672 at P 332. As directed by section 215 of the FPA, [FERC] itself will give special attention to the effect of a proposed Reliability Standard on competition. The ERO should attempt to develop a proposed Reliability Standard that has no undue negative effect on competition. Among other possible considerations, a proposed Reliability Standard should not unreasonably restrict available transmission capability on the Bulk-Power System beyond any restriction necessary for reliability and should not limit use of the Bulk-Power System in an unduly preferential manner. It should not create an undue advantage for one competitor over another.

The proposed Regional Reliability Standard will not cause any negative effects on competition or restriction of the grid. Because this standard will be applied equally across the ERCOT region, IRO-006-TRE-1 will not negatively affect competition, or restrict available transmission capability within the ERCOT footprint. The Regional Reliability Standard does not cause negative effects on competition or restriction of the grid, because it does not require any changes to current operating procedures. Furthermore, this standard does not affect the ordinary operation of the ERCOT market-

[21] *See* IRO-006-EAST-1 and IRO-006-WECC-1.

based dispatch system. It will only apply when the normal operating systems are unable to resolve congestion on IROLs and SOLs (such as under certain emergency conditions).

12. The implementation time for the proposed Reliability Standards must be reasonable.

> Order No. 672 at P 333. In considering whether a proposed Reliability Standard is just and reasonable, [FERC] will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.

The short implementation time of the proposed Reliability Standard is reasonable because this standard does not require any new transmission loading relief procedures to be developed or implemented.

13. The Reliability Standard development process must be open and fair.

> Order No. 672 at P 334. Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its [FERC]-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by [FERC].

Texas RE develops Regional Reliability Standards in accordance with **Exhibit C** (*Texas Reliability Entity Standards Development Process*) of its FERC-approved Regional Delegation Agreement with NERC. The development process is open to any person or entity with a legitimate interest in the reliability of the BPS. Texas RE considers the comments of all stakeholders during the development process. A stakeholder ballot is conducted, and the Texas RE Board of Directors must approve a Regional Reliability Standard for submission to NERC and FERC.

The proposed Regional Reliability Standard was developed and approved by industry stakeholders using Texas RE's *Texas Reliability Entity Standards Development Process*. The standard was endorsed by unanimous stakeholder ballot, and approved by the Texas RE Board of Directors on June 28, 2011. The standard was subsequently presented to and approved by the NERC Board of Trustees on November 4, 2011. Therefore, Texas RE has utilized its standard development process in good faith and in a manner that is open and fair. No commenters disagreed with the open and fair implementation of the Texas RE process.

14. Proposed Reliability Standards must be balanced against other vital public interests.

> Order No. 672 at P 335. Finally, we understand that at times development of a proposed Reliability Standard may require that a particular reliability goal must be balanced against other vital public interests, such as environmental, social and other goals. We expect the ERO to explain any such balancing in its application for approval of a proposed Reliability Standard.

Neither NERC nor Texas RE believes there are competing public interests with the request for approval of this proposed Regional Reliability Standard. No comments were received that indicated the proposed standard conflicts with other vital public interests.

15. Proposed Reliability Standards must not conflict with prior FERC Rules or Orders.

> Order No. 672 at P 444. A potential conflict between a Reliability Standard under development and a Transmission Organization function, rule, order, tariff, rate schedule, or agreement accepted, approved, or ordered by the Commission should be identified and addressed during the ERO's Reliability Standard Development Process.

The proposed IRO-006-TRE-1 Regional Reliability Standard does not conflict with any prior FERC Rules or Orders, and it adequately addresses the directives identified in FERC Order No. 693.

16. Proposed Reliability Standards must consider any other relevant factors.

> Order No. 672 at P 323. In considering whether a proposed Reliability Standard is just and reasonable, we will consider the following general factors, as well as other factors that are appropriate for the particular Reliability Standard proposed.

All comments and concerns were addressed using the *Texas Reliability Entity Standards Development Process* which is consensus-based, technically sound, and open to the public and bordering entities that may be impacted by a Regional Reliability Standard. No other factors were identified as necessary for consideration by the standard drafting team in the development of the proposed Regional Reliability Standard.

c. Additional Order No. 672 Criteria for Regional Reliability Standards

FERC's Order No. 672 also establishes additional criteria that a Regional Reliability Standard must satisfy: "A regional difference from a continent-wide Reliability Standard must either be (1) more stringent than the continent-wide Reliability Standard including a regional difference that addresses matters the continent-wide Reliability Standard does not, or (2) a Regional Reliability Standard that is necessitated by a physical difference in the Bulk-Power System."[22] The proposed standard satisfies these additional criteria.

The proposed Regional Reliability Standard is more stringent than the continent-wide Reliability Standard, because it addresses a matter that the continent-wide Reliability Standard does not. The existing NERC continent-wide standard, IRO-006-5 Reliability Coordination — Transmission Loading Relief (TLR) only addresses Interchange Transactions that cross Interconnection boundaries. The proposed Regional Reliability Standard is part of a set of such standards – one for each Interconnection –

[22] Order No. 672 at P 291.

that support IRO-006-5 by providing requirements relating to transmission loading relief within each Interconnection.[23] The proposed standard, IRO-006-TRE-1, supports reliability within the ERCOT Interconnection by providing enforceable requirements relating to transmission loading relief (congestion management) procedures within the ERCOT Interconnection. Those procedures already exist in the ERCOT Nodal Protocols, Operating Guides, and related documents, and this Regional Reliability Standard will require the Reliability Coordinator to continue to maintain and implement those procedures.

V. SUMMARY OF THE REGIONAL RELIABILITY STANDARD DEVELOPMENT PROCEEDINGS

Texas RE Regional Reliability Standards Development:

The Texas RE standard development project that resulted in proposed Regional Reliability Standard IRO-006-TRE-1 began with the submission of a Standards Authorization Request ("SAR") dated June 4, 2010, by the ERCOT Independent System Operator ("ISO"). The SAR was initiated at the request of NERC staff in connection with their work on NERC Standard IRO-006-5. NERC staff asked Texas RE to prepare a regional standard to address the directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission load relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.[24]

A Standard Drafting Team ("SDT") was formed in August 2010, which included balanced representation from various industry segments. The SDT met several times

[23] *See* IRO-006-EAST-1 and IRO-006-WECC-1.
[24] Order No.693 at P 964.

from August 2010 to March 2011 to develop the Regional Reliability Standard and to address comments received. The resulting standard was unanimously approved by stakeholder ballot in May 2011, after being posted for pre-ballot review for at least 30 days. The Texas RE Board of Directors approved the Regional Reliability Standard on June 28, 2011.

Additional details are provided in **Exhibit C**, the Record of Development of IRO-006-TRE-1.

NERC Evaluation: On July 6, 2011, Texas RE submitted the proposed Regional Reliability Standard for evaluation and approval to NERC in accordance with NERC's *Rules of Procedure* and *Regional Reliability Standards Evaluation Procedure,*[25] which was approved by NERC's Regional Reliability Standards Working Group. NERC provided its evaluation of the proposed IRO-006-TRE-1 standard to Texas RE as comments during the 45-day public posting by NERC, included as **Exhibit C**. In this report, NERC staff made two observations: The phrase "shall act to identify and mitigate" was ambiguous, and R1 and R2 could be combined to state that the RC shall "document and implement procedures." Texas RE replied that Requirements R1 and R2 are two independent tasks intended to require different, yet interrelated, activities by the RC. Developing and maintaining a procedure is a separate task, involving different personnel at a different time, than acting to implement the procedure in real-time. Significantly, each Requirement has a different VRF and time horizon. The phrase "shall act to identify and mitigate" in R2 is intended to be non-prescriptive, so that the RC has the flexibility to define specific actions in the procedure required by R1.

[25] Regional Reliability Standards Evaluation Procedure, Version 1 (2009). Available at: http://www.nerc.com/docs/sac/rrswg/NERC_Regional_Reliability_Evaluation_Procedure.pdf.

Key Issues:

There were no minority issues raised during the comment periods that have not been resolved.

The standard was approved by an ERCOT Region stakeholder ballot with twelve votes in favor, zero votes against, and one abstention. All industry segments participated in the ballot. The proposed VRFs and VSLs were approved in a non-binding poll with seven votes in favor and zero votes against.

Violation Risk Factors and Violation Severity Levels

The VRFs and VSLs for this standard were developed and reviewed for consistency with NERC and FERC guidelines.[26] Analyses of the assigned VRFs and VSLs to this standard are included in **Exhibit E**.

VI. CONCLUSION

For the reasons stated above, NERC respectfully requests that FERC approve the proposed IRO-006-TRE-1 Regional Reliability Standard, the associated proposed definitions, and the associated Implementation Plan included in **Exhibit A** to this filing in accordance with Section 215(d)(1) of the FPA and Part 39.5 of FERC's regulations. NERC requests that these approvals be made effective in accordance with the Implementation Plan for IRO-006-TRE-1 included in **Exhibit A** to this filing.

Exhibit A

Proposed Regional Reliability Standard IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection and Implementation Plan for Approval

Effective Dates

This standard becomes effective on the first day of the first calendar quarter after applicable regulatory approval.

Requirement	Jurisdiction									
	Alberta	British Columbia	Manitoba	New Brunswick	Newfound-land	Nova Scotia	Ontario	Quebec	Saskatch-ewan	USA
R1 and R2	NA	NA	NA	NA	NA	NA	NA	NA	NA	TBD

Introduction

1. Title: IROL and SOL Mitigation in the ERCOT Region

2. Number: IRO-006-TRE-1

3. Purpose: To provide and execute transmission loading relief procedures that can be used to mitigate SOL or IROL exceedances for the purpose of maintaining reliable operation of the bulk electric system in the ERCOT Region.

4. Applicability:

4.1 Functional Entities:
Reliability Coordinator

5. Effective Date: The first day of the first calendar quarter after applicable regulatory approval.

Requirements and Measures

R1. The RC shall have procedures to identify and mitigate exceedances of identified Interconnection Reliability Operating Limits (IROL) and System Operating Limits (SOL) that will not be resolved by the automatic actions of the ERCOT Nodal market operations system. The procedures shall address, but not be limited to, one or more of the following:

- redispatch of generation;
- reconfiguration of the Transmission system;
- controlled load reductions (including both firm and non-firm load shedding).

[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M1. The RC shall provide evidence including documentation of procedures to identify and mitigate exceedances of identified IROLs and SOLs to demonstrate compliance with Requirement R1.

R2. The RC shall act to identify and mitigate exceedances of identified Interconnection Reliability Operating Limits and System Operating Limits that will not be resolved by the automatic actions of the ERCOT Nodal market operations system, in accordance with the procedures required by R1.

[Violation Risk Factor: High] [Time Horizon: Real Time Operations]

M2. To demonstrate compliance with Requirement R2, the RC shall provide evidence, such as system logs, voice recordings, or operating messages that shows that it acted to identify and to mitigate exceedances of IROLs and SOLs in accordance with the procedures required by R1.

Compliance

Compliance Enforcement Authority

- Texas Reliability Entity, Inc.

Compliance Monitoring and Assessment Processes

- Compliance Audits
- Self-Certifications
- Spot Checks
- Compliance Violation Investigations
- Self-Reporting
- Complaints

Evidence Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain evidence to show compliance with requirements R1 and R2 for the period since it became subject to these requirements or since its last compliance audit, whichever is shorter.

- If a Reliability Coordinator is found non-compliant, it shall retain all evidence for the period in which it was non-compliant until it is found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Additional Compliance Information

None.

Time Horizons, Violation Risk Factors, and Violation Severity Levels

Table 1						
R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Operations Planning	Medium	N/A	N/A	N/A	The RC did not have procedures to identify and mitigate exceedances of identified IROLs and SOLs.
R2	Real-time Operations	High	N/A	N/A	The RC failed to follow its procedures in identifying and mitigating an exceedance of an SOL.	The RC failed to follow its procedures in identifying and mitigating an exceedance of an IROL.

Guideline and Technical Basis

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from each of the rationale text boxes was moved to this section.

Rationale for R1:
The methodology for identifying IROLs and SOLs is addressed in FAC standards, including FAC-014.

Rationale for R2:
IRO-005-2a (Requirements 3 and 5) calls for relieving IROL violations in no longer than 30 minutes.

Version History

Version	Date	Action	Change Tracking
1	June 28, 2011	Texas RE Board Approval	
1	November 3, 2011	Adopted by NERC Board of Trustees	

Implementation Plan for IRO-006-TRE-1

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

IRO-006-TRE-1 – IROL and SOL Mitigation in the ERCOT Region

Revisions to Sections of Approved Standards and Definitions
There are no proposed revisions to requirements in other already approved standards.

Compliance with Standard
The standard applies to Reliability Coordinator.

Effective Date
The effective date is the date entities are expected to meet the performance identified in this standard.

The first day of the first calendar quarter after applicable regulatory approval.

Exhibit B

NERC Board of Trustees' Resolution on the IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection Regional Reliability Standard

FURTHER RESOLVED, that the board approves the associated implementation plan, which provides the following **(Exhibit J)**:

(a) Upon regulatory approval, the standard will be mandatory and enforceable (with monetary penalties for non-compliance) to all applicable NERC registered entities within the Reliability*First* footprint;

FURTHER RESOLVED, that the board approves the Violation Risk Factors and the Violation Severity Levels for the proposed MOD-025-1-RFC-1 – Reactive Power Capability Reliability Standard **(Exhibit K)**;

FURTHER RESOLVED, that NERC Staff shall make the appropriate filings with ERO governmental authorities.

Reliability Standards: IRO-006-TRE-1: IRO and SOL Mitigation in the ERCOT Interconnection
On motion of Paul Barber, the board approved the following resolutions:

RESOLVED, that the board approves the IRO-006-TRE-1: IRO and SOL Mitigation in the ERCOT Interconnection Regional Reliability Standard **(Exhibit L)**;

FURTHER RESOLVED, that the board approves the associated implementation plan, which provides the following **(Exhibit M)**:

(a) An effective date of the first day of the first calendar quarter after applicable regulatory approval.

FURTHER RESOLVED, that the board approves the Violation Risk Factors and the Violation Severity Levels for the proposed IRO-006-TRE-1: IRO and SOL Mitigation in the ERCOT Interconnection Regional Reliability Standard d **(Exhibit N)**;

FURTHER RESOLVED, that NERC Staff shall make the appropriate filings with ERO governmental authorities.

Reliability Standards: PRC-006-SERC-1: Automatic Underfrequency Load Shedding (UFLS) Requirements
On motion of Paul Barber , the board approved the following resolutions:

RESOLVED, that the board approves the PRC-006-SERC-01 – Automatic Underfrequency Load Shedding (UFLS) Requirements Regional Reliability Standard **(Exhibit O)**;

FURTHER RESOLVED, that the board approves the associated implementation plan, which provides the following **(Exhibit P)**:

Consideration of Comments on Regional Reliability Standards IRO-006-TRE-1

Texas Reliability Entity and NERC thank all commenters who submitted comments on the Regional Reliability Standard IRO-006-TRE-1, IROL and SOL Mitigation in the ERCOT Region. These standards were posted for a 45-day public comment period from July 7, 2011 through August 22, 2011. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 4 sets of comments, including comments from approximately 7 different people from 5 companies representing 5 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/regional_standards/regional_reliability_standards_under_development.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. Was the proposed standard developed in a fair and open process, using the associated Regional Reliability Standards Development Procedure?

Summary Consideration: No negative comments were received. One comment was received from an entity in the ERCOT Region confirming that appropriate procedures were followed. Note that ERCOT, as RC, is the only entity that has responsibilities under this Regional Standard.

Organization	Yes or No	Question 1 Comment
Bonneville Power Administration		BPA has no concerns or comments.
NERC Staff Technical Review	Yes	
American Electric Power	Yes	
ERCOT	Yes	The Texas RE regional standards development procedure was followed. A SAR was received and processed. The Texas RE Reliability Standards Committee reviewed the process and approved the project to proceed. A standard drafting team was assigned in accordance with the procedure, and the drafting team met numerous times, iterated through several drafts, and posted the draft for comments. The drafting responded to the minimal comments received and requested approval to proceed to ballot. The Texas RE Reliability Standards Committee approved for the ballot to proceed and the proposed standard was approved by ballot. The Texas RE then submitted the standard to the Texas RE Board of Directors and it was approved there. The Texas RE then submitted the standard to NERC for NERC's process.
Response: Thank you for providing your observation that Texas RE followed all steps required in our Regional Reliability Standard Development Process.		

2. Does the proposed standard pose an adverse impact to reliability or commerce in a neighboring region or interconnection?

Summary Consideration: No adverse impacts to reliability or commerce were identified.

Organization	Yes or No	Question 2 Comment
Bonneville Power Administration		BPA has no concerns or comments.
NERC Staff Technical Review	No	
American Electric Power	No	AEP is not aware of any potential adverse impact to reliability or commerce in a neighboring region or interconnection that would be caused by the proposed standard.
Response: Thank you for your comment.		
ERCOT	No	The standard establishes requirements designed to improve reliability and coordinates with processes required by other NERC reliability standards which require transmission loading management.
Response: Thank you for your comment.		

3. Does the proposed standard pose a serious and substantial threat to public health, safety, welfare, or national security?

Summary Consideration: No threats were identified.

Organization	Yes or No	Question 3 Comment
Bonneville Power Administration		BPA has no concerns or comments.
NERC Staff Technical Review	No	
American Electric Power	No	
ERCOT	No	The standard requires action which will improve congestion management in rare instances when ERCOT nodal market-based congestion management actions do not resolve congestion. The effect of this is to relieve potential threat to the public health, safety, welfare, or national security which may accompany congestion management which could occur if limit exceedances were allowed to persist to violation.
Response: Thank you for your comment.		

4. Does the proposed standard pose a serious and substantial burden on competitive markets within the interconnection that is not necessary for reliability?

Summary Consideration: No burdens on competitive markets were identified.

Organization	Yes or No	Question 4 Comment
Bonneville Power Administration		BPA has no concerns or comments.
NERC Staff Technical Review	No	
American Electric Power	No	
ERCOT	No	The standard contains requirements that are used when the ERCOT nodal market-based actions do not resolve congestion completely, thus the actions are outside and in addition to the competitive market actions.
Response: Thank you for your comment.		

5. Does the proposed regional reliability standard meet at least one of the following criteria?

- **The proposed standard has more specific criteria for the same requirements covered in a continent-wide standard**
- **The proposed standard has requirements that are not included in the corresponding continent-wide reliability standard**
- **The proposed regional difference is necessitated by a physical difference in the bulk power system.**

Summary Consideration: This proposed Regional Reliability Standard is intended to complement a continent-wide standard, in order to provide enforceable requirements associated with existing ERCOT transmission load relief (congestion management) procedures. The comments confirm that the proposed regional standard contains more specific criteria than the continent-wide standards.

Organization	Yes or No	Question 5 Comment
Bonneville Power Administration		BPA has no concerns or comments.
NERC Staff Technical Review	Yes	
American Electric Power		
ERCOT	Yes	The standard gives more specific criteria for congestion management when additional actions are needed following ERCOT nodal market-based congestion management activities. Although the requirement to resolve congestion is redundant with actions required by reliability standard IRO-009, the specific criteria strengthens required actions within the ERCOT Interconnection.
Response: Thank you for your comment.		

6. If you have any other comments that you have not already provided in the response to the prior questions, please provide them here.

Summary Consideration: The Standard Drafting Team views Requirements R1 and R2 to be two independent tasks intended to require different, yet interrelated, activities by the RC. Developing and maintaining a procedure is a separate task, involving different personnel at a different time, than acting to implement the procedure. Significantly, each Requirement has a different VRF and time horizon. The phrase "shall act to identify and mitigate" is intended to be non-prescriptive, so that the RC has the flexibility to define appropriate specific actions in the procedure required by R1.

Organization	Yes or No	Question 7 Comment
Bonneville Power Administration		BPA has no concerns or comments.
NERC Staff Technical Review		A few observations: The phrase "shall act to identify and mitigate" is somewhat ambiguous. It appears that the intent of Requirement R2 is to implement R1. It appears that R1 and R2 could be combined to say that the RC shall "document and implement procedures."R2 restricts the action of the RC to only the procedures identified in R1. There may be times that the RC's actions are not specified in the procedures in R1, but may be the right thing to do for reliability. Those exceptions could be noted and provided in a feedback loop to R1 to modify the procedures for the next occurrence.
Response: Thank you for your comments. The Standard Drafting Team views Requirements R1 and R2 to be two independent tasks intended to require different, yet interrelated, activities by the RC. Developing and maintaining a procedure is a separate task, involving different personnel at a different time, than acting to implement the procedure in real-time. Significantly, each Requirement has a different VRF and time horizon. The phrase "shall act to identify and mitigate" in R2 is intended to be non-prescriptive, so that the RC has the flexibility to define specific actions in the procedure required by R1.		
American Electric Power		
ERCOT		ERCOT believes that the requirements in the regional standard IRO-006-1-TRE exceed the FERC directive in Paragraph 964 of FERC Order 693. The nature of congestion management procedures within the ERCOT Interconnection and the absence of a transmission service market make these requirements redundant to IRO-009. However, since these requirements are designed to be used when other congestion management processes implemented with nodal market-based products do not mitigate the congestion, ERCOT supports this standard.

Organization	Yes or No	Question 7 Comment
Response: Thank you for your comment. The NERC Transmission Loading Relief drafting team requested ERCOT to address the FERC directive (Paragraph 964 of Order 693) regarding the ERCOT Interconnection-wide congestion management process. This proposed Regional Standard is responsive to that request.

The Texas RE regional standards development procedure was followed. A SAR was received and processed. The Texas RE Reliability Standards Committee reviewed the process and approved the project to proceed. A standard drafting team was assigned in accordance with the procedure, and the drafting team met numerous times, iterated through several drafts, and posted the draft for comments. The drafting responded to the minimal comments received and requested approval to proceed to ballot. The Texas RE Reliability Standards Committee approved for the ballot to proceed and the proposed standard was approved by ballot. The Texas RE then submitted the standard to the Texas RE Board of Directors and it was approved there. The Texas RE then submitted the standard to NERC for NERC's process.
No
The standard establishes requirements designed to improve reliability and coordinates with processes required by other NERC reliability standards which require transmission loading management.
No
The standard requires action which will improve congestion management in rare instances when ERCOT nodal market-based congestion management actions do not resolve congestion. The effect of this is to relieve potential threat to the public health, safety, welfare, or national security which may accompany congestion management which could occur if limit exceedances were allowed to persist to violation.
No
The standard contains requirements that are used when the ERCOT nodal market-based actions do not resolve congestion completely, thus the actions are outside and in addition to the competitive market actions.
Yes
The standard gives more specific criteria for congestion management when additional actions are needed following ERCOT nodal market-based congestion management activities. Although the requirement to resolve congestion is redundant with actions required by reliability standard IRO-009, the specific criteria strengthens required actions within the ERCOT Interconnection.
ERCOT believes that the requirements in the regional standard IRO-006-1-TRE exceed the FERC directive in Paragraph 964 of FERC Order 693. The nature of congestion management procedures within the ERCOT Interconnection and the absence of a transmission service market make these requirements redundant to IRO-009. However, since these requirements are designed to be used when other congestion management processes implemented with nodal market-based products do not mitigate the congestion, ERCOT supports this standard.

Implementation Plan for IRO-006-TRE-1

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

IRO-006-TRE-1 – IROL and SOL Mitigation in the ERCOT Region

Revisions to Sections of Approved Standards and Definitions
There are no proposed revisions to requirements in other already approved standards.

Compliance with Standard
The standard applies to Reliability Coordinator.

Effective Date
The effective date is the date entities are expected to meet the performance identified in this standard.

The first day of the first calendar quarter after applicable regulatory approval.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR-009 SDT Kickoff Call (August 12, 2010).
2. SAR-009 SDT meeting; designated target date at meeting (August 17, 2010).
3. SAR-009 SDT meeting (September 20, 2010).
4. SAR-009 SDT meeting (October 11, 2010).
5. SAR-009 SDT meeting (November 8, 2010).
6. SAR-009 SDT meeting (January 20, 2011).
7. Standard IRO-006-TRE-1 was posted on the Texas RE Standards Tracking site for a 30-day public comment period. (February 3-March 7, 2011).
8. SAR-009 SDT meeting (March 17, 2011 - teleconference).
9. Standard approved by SDT for submission to RSC for approval to post for ballot (March 28, 2011).
10. RSC approved posting regional standard IRO-006-TRE-1 for ballot (April 6, 2011)
11. Standard IRO-006-TRE-1 was posted for a pre-ballot review and 15-day ballot period. (April 11-May 26, 2011).
12. RSC approved the ballot results and forwarded the standard to the Texas RE BoD (June 10, 2011).
13. Presented IRO-006-TRE-1 Regional Standard and supporting documents to the Texas RE BoD for approval to submit to NERC (June 28, 2011).

---

1. RSM accepted SAR as revised (July 1, 2010)
2. SAR posted for comment (posted July 2, comments accepted July 6 to July 20, 2010).
3. RSC approved SDT members and authorized moving the SAR forward to standard development (August 4, 2010).

Proposed Action Plan and Description of Current Draft

This is the first draft of the proposed Regional Standard, which is coordinated with the continent-wide revisions to IRO-006.

Future Development Plan:

Anticipated Actions	Anticipated Date
Texas RE Board of Directors Approval	June 2011
Submit to NERC/FERC	July 2011

Introduction

1. Title: **IROL and SOL Mitigation in the ERCOT Region**

2. Number: IRO-006-TRE-1

3. Purpose: To provide and execute transmission loading relief procedures that can be used to mitigate SOL or IROL exceedances for the purpose of maintaining reliable operation of the bulk electric system in the ERCOT Region.

4. Applicability:

4.1 Functional Entities:
Reliability Coordinator

5. Effective Date: The first day of the first calendar quarter after applicable regulatory approval.

6. Background (Will not be included in Standard):

NERC Reliability Standards require the establishment of Operating Plans, monitoring of the system, and mitigation of limit exceedances by operational actions which may include implementing re-dispatch of system resources and facilities. The ERCOT regional congestion management process is used to achieve this purpose in the ERCOT Region. The requirements and responsibilities for the process are described in the ERCOT Nodal Protocols (Protocols) and Nodal Operating Guides. The Protocols and Nodal Operating Guides are binding documents established by the ERCOT Nodal electricity market.

The ERCOT Nodal electricity market construct provides for meeting reliability requirements through a robust system of operating actions that use ancillary services in dispatch actions by the ERCOT Independent System Operator (ISO). The ancillary services are procured and deployed through a comprehensive market system to ensure reliable operations in accordance with the NERC Reliability Standards, as well as with the Protocols and Nodal Operating Guides. ERCOT uses a centralized energy dispatch process as described in the Protocols and applies Equipment Operating Ratings and Limits as described in the Protocols.

ERCOT market dispatch is done using the energy dispatch process according to the Protocols. Market-based congestion management techniques are embedded in a Security Constrained Economic Dispatch (SCED) process. This IRO-006-TRE-1 Regional Standard is not intended to apply to routine system dispatch using SCED. This standard applies when an IROL or SOL exceedance is identified (or anticipated), and extraordinary transmission loading relief procedures (non-market dispatch) are required to mitigate (or avoid) the exceedance.

For the purposes of this standard, the following are considered to be part of routine system dispatch and are not subject to this standard: (1) dispatch under normal SCED operation; (2) redispatch using manual SCED operation; (3) remedial action plans; and (4) pre-contingency action plans.

Situations where the Market system fails to reach a solution are addressed as failure(s) of the SCED process and are considered reason for an Emergency Notice. Typically, actions taken for transmission loading relief which would be subject to this standard would be taken within the context of an Emergency Notice. Such actions may include, for example: (1) system reconfiguration (pre- and

post-contingency); (2) non-synchronous transfer of load to other systems not within the ERCOT Interconnection; and (3) reduction of interruptible or firm load.

This proposed ERCOT regional standard provides enforceable requirements and measures relating to the process that is used in the ERCOT Interconnection to effect transmission loading relief. NERC Project 2006-08 includes the continent-wide standard IRO-006-5, which prescribes a requirement for all Interconnections in the North American continent, and regional standard IRO-006-EAST-1, which prescribes Interconnection-wide requirements for the Eastern Interconnection. A corresponding WECC Regional Standard was recently approved by FERC. The NERC Transmission Loading Relief drafting team requested ERCOT to address the FERC directive (Paragraph 964 of Order 693) regarding the description of the ERCOT Interconnection-wide congestion management process. This Regional Standard is responsive to that request.

Requirements and Measures

R1. The RC shall have procedures to identify and mitigate exceedances of identified Interconnection Reliability Operating Limits (IROL) and System Operating Limits (SOL) that will not be resolved by the automatic actions of the ERCOT Nodal market operations system. The procedures shall address, but not be limited to, one or more of the following:

The methodology for identifying IROLs and SOLs is addressed in FAC standards, including FAC-014.

- redispatch of generation;
- reconfiguration of the Transmission system;
- controlled load reductions (including both firm and non-firm load shedding).

[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M1. The RC shall provide evidence including documentation of procedures to identify and mitigate exceedances of identified IROLs and SOLs to demonstrate compliance with Requirement R1.

R2. The RC shall act to identify and mitigate exceedances of identified Interconnection Reliability Operating Limits and System Operating Limits that will not be resolved by the automatic actions of the ERCOT Nodal market operations system, in accordance with the procedures required by R1.

IRO-005-2a (Requirements 3 and 5) calls for relieving IROL violations in no longer than 30 minutes.

[Violation Risk Factor: High] [Time Horizon: Real Time Operations]

M2. To demonstrate compliance with Requirement R2, the RC shall provide evidence, such as system logs, voice recordings, or operating messages that shows that it acted to identify and to mitigate exceedances of IROLs and SOLs in accordance with the procedures required by R1.

Compliance

Compliance Enforcement Authority

- Texas Reliability Entity, Inc.

Compliance Monitoring and Assessment Processes

- Compliance Audits
- Self-Certifications
- Spot Checks
- Compliance Violation Investigations
- Self-Reporting
- Complaints

Evidence Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain evidence to show compliance with requirements R1 and R2 for the period since it became subject to these requirements or since its last compliance audit, whichever is shorter.

- If a Reliability Coordinator is found non-compliant, it shall retain all evidence for the period in which it was non-compliant until it is found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Additional Compliance Information

None.

Time Horizons, Violation Risk Factors, and Violation Severity Levels

Table 1						
R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Operations Planning	Medium	N/A	N/A	N/A	The RC did not have procedures to identify and mitigate exceedances of identified IROLs and SOLs.
R2	Real-time Operations	High	N/A	N/A	The RC failed to follow its procedures in identifying and mitigating an exceedance of an SOL.	The RC failed to follow its procedures in identifying and mitigating an exceedance of an IROL.

Unofficial Comment Form for Regional Reliability Standard IRO-006-TRE-1

Please **DO NOT** use this form. Please use the electronic form located at the link below to submit comments on the Regional Reliability Standard **IROL and SOL Mitigation in the ERCOT Region IRO-006-TRE-1.** Comments must be submitted by **August 22, 2011.** If you have questions please contact Howard Gugel at howard.gugel@nerc.net or Barb Nutter at barbara.nutter@nerc.net.

http://www.nerc.com/filez/regional_standards/regional_reliability_standards_under_development.html

Background Information
A regional reliability standard shall be: (1) a regional reliability standard that is more stringent than the continent-wide reliability standard, including a regional standard that addresses matters that the continent-wide reliability standard does not; or (2) a regional reliability standard that is necessitated by a physical difference in the bulk power system. Regional reliability standards shall provide for as much uniformity as possible with reliability standards across the interconnected bulk power system of the North American continent. Regional reliability standards, when approved by FERC and applicable authorities in Mexico and Canada shall be made part of the body of NERC reliability standards and shall be enforced upon all applicable bulk power system owners, operators, and users within the applicable area, regardless of membership in the region.

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with the existing ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 or Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Each Texas Reliability Entity Regional Reliability Standard shall enable or support one or more of the NERC reliability principles, thereby ensuring that each standard serves a purpose in support of the reliability of the regional bulk electric system. Each of those standards shall also be consistent with all of the NERC reliability principles, thereby ensuring that no standard undermines reliability through an unintended consequence. The NERC reliability principles supported by this standard are the following:

- **Reliability Principle 1** — Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
- **Reliability Principle 2** — The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
- **Reliability Principle 3** — Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

The proposed Texas Reliability Entities Regional Reliability Standard is not inconsistent with, or less stringent than established NERC Reliability Standards. Once approved by the appropriate authorities, the TRE Regional Reliability Standard obligates the TRE to monitor and enforce compliance, apply sanctions, if any, consistent with any regional agreements and the NERC rules.

The TRE IRO-006-TRE-1 standard contains two main requirements for application entities within the Texas Reliability Entities geographic area. The standard contains the following:

Requirement 1

The RC shall have procedures to identify and mitigate exceedances of identified Interconnection Reliability Operating Limits (IROL) and System Operating Limits (SOL) that will not be resolved by the automatic actions of the ERCOT Nodal market operations system. The procedures shall address, but not be limited to, one or more of the following:

- redispatch of generation;
- reconfiguration of the Transmission system;
- controlled load reductions (including both firm and non-firm load shedding).

Requirement 2

The RC shall act to identify and mitigate exceedances of identified Interconnection Reliability Operating Limits and System Operating Limits that will not be resolved by the automatic actions of the ERCOT Nodal market operations system, in accordance with the procedures required by R1.

The approval process for a regional reliability standard requires NERC to publicly notice and request comment on the proposed standard. Comments shall be permitted only on the following criteria (technical aspects of the standard are vetted through the regional standards development process):

Unfair or Closed Process — The regional reliability standard was not developed in a fair and open process that provided an opportunity for all interested parties to participate. Although a NERC-approved regional reliability standards development procedure shall be presumed to be fair and open, objections could be raised regarding the implementation of the procedure.

Adverse Reliability or Commercial Impact on Other Interconnections — The regional reliability standard would have a significant adverse impact on reliability or commerce in other interconnections.

Deficient Standard — The regional reliability standard fails to provide a level of reliability of the bulk power system such that the regional reliability standard would be likely to cause a serious and substantial threat to public health, safety, welfare, or national security.

Adverse Impact on Competitive Markets within the Interconnection — The regional reliability standard would create a serious and substantial burden on competitive markets within the interconnection that is not necessary for reliability.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Regional Reliability Standards Announcement

Comment Period Open for IRO-006-TRE-1
July 7- August 22, 2011

Now available at:
http://www.nerc.com/filez/regional_standards/regional_reliability_standards_under_development.html

Proposed Standard for the Texas Reliability Entity (TRE)
Texas Reliability Entity has requested NERC to post regional reliability standard IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection for a 45-day industry review as permitted by the NERC Rules of Procedure.

Instructions
Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at Monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the regional standards development page:
http://www.nerc.com/filez/regional_standards/regional_reliability_standards_under_development.html

Background
NERC Reliability Standards require the establishment of Operating Plans, monitoring of the system, and mitigation of limit exceedances by operational actions which may include implementing re-dispatch of system resources and facilities. The ERCOT regional congestion management process is used to achieve this purpose in the ERCOT Region. The requirements and responsibilities for the process are described in the ERCOT Nodal Protocols (Protocols) and Nodal Operating Guides. The Protocols and Nodal Operating Guides are binding documents established by the ERCOT Nodal electricity market.

The ERCOT Nodal electricity market construct provides for meeting reliability requirements through a robust system of operating actions that use ancillary services in dispatch actions by the ERCOT Independent System Operator (ISO). The ancillary services are procured and deployed through a comprehensive market system to ensure reliable operations in accordance with the NERC Reliability Standards, as well as with the Protocols and Nodal Operating Guides. ERCOT uses a centralized energy dispatch process as described in the Protocols and applies Equipment Operating Ratings and Limits as described in the Protocols.

ERCOT market dispatch is done using the energy dispatch process according to the Protocols. Market-based congestion management techniques are embedded in a Security Constrained Economic Dispatch (SCED) process. This IRO-006-TRE-1 Regional Standard is not intended to apply to routine system dispatch using SCED. This standard applies when an IROL or SOL exceedance is identified (or anticipated), and extraordinary transmission loading relief procedures (non-market dispatch) are required to mitigate (or avoid) the exceedance.

For the purposes of this standard, the following are considered to be part of routine system dispatch and are not subject to this standard: (1) dispatch under normal SCED operation; (2) redispatch using manual SCED operation; (3) remedial action plans; and (4) pre-contingency action plans.

Situations where the Market system fails to reach a solution are addressed as failure(s) of the SCED process and are considered reason for an Emergency Notice. Typically, actions taken for transmission loading relief which would be subject to this standard would be taken within the context of an Emergency Notice. Such actions may include, for example: (1) system reconfiguration (pre- and post-contingency); (2) non-synchronous transfer of load to other systems not within the ERCOT Interconnection; and (3) reduction of interruptible or firm load.

This proposed ERCOT regional standard provides enforceable requirements and measures relating to the process that is used in the ERCOT Interconnection to effect transmission loading relief. NERC Project 2006-08 includes the continent-wide standard IRO-006-5, which prescribes a requirement for all Interconnections in the North American continent, and regional standard IRO-006-EAST-1, which prescribes Interconnection-wide requirements for the Eastern Interconnection. A corresponding WECC Regional Standard was recently approved by FERC. The NERC Transmission Loading Relief drafting team requested ERCOT to address the FERC directive (Paragraph 964 of Order 693) regarding the description of the ERCOT Interconnection-wide congestion management process. This Regional Standard is responsive to that request.

Regional Reliability Standards Development Process

Section 300 of the *Rules of Procedure for the Electric Reliability Organization* governs the regional reliability standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson, Standards Process Administrator at monica.benson@nerc.net or at 404-446-2560.

Regional Standard Drafting Team for IRO-006-TRE-1

Name and Title Affiliation Contact Info	Relevant Education and Experience
Sathibabu Chakka (Babu) Manager Market Analysis and Planning Energy Market Operations Austin Energy Phone: 512-322-6010 Sathibabu.Chakka@austinenergy.com Municipal Utility	**Babu Chakka** is the Manager for Energy Market Analysis Group in the Energy Market Wholesale and Operations division of Austin Energy since 2009. He is responsible for the Energy Market Operations including energy marketing and dispatching, resource planning, Wholesale market analysis, fuel procurement, energy supply and sales. He also oversees the integration of renewable generation resources, primarily wind and Solar, into the Austin Energy footprint. He is an Austin Energy representative at the Wholesale Market Subcommittee of ERCOT. Prior to joining Austin Energy, Mr. Chakka worked at the Midwest ISO where he oversaw the Congestion Management, Seams Agreements between neighboring entities, Reliability Coordination and Transmission assets management functions. He has more than 11 years of experience in the operation of electrical power systems, and he is skilled at identifying and implementing best practices in Energy Markets. Mr. Chakka earned a Master's degree in Electrical Power Systems from Arizona State University and is a registered Professional Engineer from the State of Ohio. He is also a member of IEEE.
Adrian Pieniazek Director of Market Policy – ERCOT Region NRG Energy Phone: 512-844-9888 Adrian.Pieniazek@nrgenergy.com Generation	**Adrian Pieniazek** is the Director of Market Policy – ERCOT Region for NRG Energy, Inc. He manages regulatory matters for NRG Texas with an emphasis on wholesale market design and policy in ERCOT. He is a member of the ERCOT Technical Advisory Committee, the market participant group responsible for making recommendations to the board regarding ERCOT policies and procedures. Adrian has over 28 years of experience in the electric industry. Prior to his current position, he was the Director of Asset Management for Reliant Energy HL&P. In that position he was responsible for real-time dispatch operations, fuel procurement, and energy trading functions for a 14,000 megawatt generation portfolio. Adrian has also served as the Director of Generation Planning for CPS Energy in San Antonio, TX, and in various engineering roles at several large coal and gas-fired power plants. Adrian holds a Bachelor of Science in Mechanical Engineering from Texas A&M University, a Masters of Business Administration from Our Lady of the Lake University in San Antonio, TX, and is a registered professional engineer in Texas.

Bill Blevins Manager Operations Support ERCOT Phone: (512) 248-6691 bblevins@ercot.com System Planning & Coordination	**Bill Blevins**, the Manager of Operations Support for ERCOT since 2008, is responsible for the Operations Engineering and Advanced Network Applications support for day-to-day operations. Prior to joining ERCOT, Mr. Blevins worked at NERC as Manager of Interchange and Manger of Business Practices. His responsibilities included facilitating the NERC and NAESB standards, NERC Interchange Subcommittee, e-tagging, Transmission System information Network, Functional Model and the Join Interface Committee. Bill has over 24 years of electrical system operations experience including managerial roles at Duke Energy where he was responsible for Control Area Operations. In addition, he has worked as a day-ahead planner at Houston Lighting and Power, a system operator at South Texas Nuclear Power Plant, and in the nuclear engineering department for the U.S. Navy. Mr. Blevins is a graduate of the U.S. Navy Nuclear power engineering program.
Jeremy Carpenter Director of Operations Tenaska Power Services Co. Phone: (817) 303-1869 jcarpenter@tnsk.com Load Serving & Marketing	**Jeremy Carpenter** is the Director of Operations for Tenaska Power Services Co., and is responsible for overseeing TPS's day-ahead and real-time QSE operations in ERCOT as well as operations in other power markets. As a QSE, Tenaska Power Services provides QSE services to a diverse group of wholesale market participants including traditional fossil fueled generators, wind powered generators, retail electric providers, and large industrial load resources. Through his work as the Director of Operations, Mr. Carpenter has gained experience and understanding of reliability standards and how they affect different types of market participants and has played an integral role in developing company procedures to ensure the compliance with such standards. Prior to joining the TPS Operations group, Mr. Carpenter worked in other related groups at TPS including Asset Management, Long Term Development Forecasting, and Risk Management. Mr. Carpenter received his B.S. of Industrial Engineering from Texas A&M University.

Leo H. Haas, Jr. Sr. Transmission Policy Consultant CenterPoint Energy Phone: (713) 207-6022 leo.haas@centerpointenergy.com Transmission & Distribution	**Leo H. Haas, Jr.** has over thirty-eight years of transmission and distribution related experience. His current responsibilities in Transmission Policy and Compliance at CenterPoint Energy include all aspects of NERC/FERC compliance and participation in NERC processes. This work includes Interfacing with subject matter experts from Transmission, Substation, and Distribution to establish and coordinate training programs related to the NERC Standards. Previously, Leo was responsible for relay protective schemes and other devices for distribution feeders, and for construction standards and material specifications for over 19,000 miles of overhead and underground distribution system facilities. He also coordinated West Region Distribution Planning activities, and he worked on coordinating infrastructure needs with Substation Projects, System Analysis, and Transmission Project divisions. He has provided expert technical evaluation and analysis for Planning Design Criteria and problem analysis for operational problems. Mr. Haas received a Bachelor of Science in Electrical Engineering degree from the University of Houston in 1984. In addition, he is a Registered Professional Engineer (PE) in the State of Texas. He is also a member of the Institute of Electrical & Electric Engineers and was a member of the National Fire Protection Association and principal representative on the National Electric Code Panel 11 from 1998 through 2008.
Marguerite Wagner Director, Market Policy & Regulatory Affairs Edison Mission Marketing Phone: (617) 529-3127 mwagner@edisonmission.com Generation	**Marguerite Wagner** has worked in the electric industry for 20 years in varied positions in multiple NERC Regions. Her roles have included environmental permitting & compliance for fossil resources, engineering & IT project management, electric market design, regulatory interaction with Utility Commissions and ISOs, and ISO and market participant support in both reliability and commercial operations. In these roles, she has led implementation of multiple projects, including implementation of Continuing Emission Monitoring programs, and boiler retrofits for NOx Compliance, and development of ISO IT projects. Ms. Wagner supported implementation of both ERCOT zonal and nodal markets and has worked with both fossil and renewable resources. Working within the regulatory processes, she has been instrumental in the ongoing development of requirements in ERCOT to reliably integrate renewable resources. Ms. Wagner earned a Bachelor's Degree in Applied Math from Michigan State University, and Master of Science Degrees in Probability & Statistics and Technology and Policy from MIT.

Brenda Hampton Senior Project Manager Luminant Phone: (512) 349-6415 Brenda.hampton@luminant.com Generation	**Brenda Hampton** is a Senior Project Manager in Luminant's Regulatory Affairs group. She joined Luminant in December 2009, after 19 years of experience with Ameren (Saint Louis, MO). She has held positions in nuclear, coal-fired, and gas-fueled generating plants and led fleet-wide initiatives. Brenda has worked in the utility industry for the past 21 years. She has engineering experience associated with Materials Procurement and Safety Related Systems at a nuclear power plant. She has held leadership positions in Business Planning and Development and Refueling Outage planning and implementation at a Nuclear Plant. Brenda has also served as Superintendent at coal and natural gas power plants, and as a Quality Management Consultant leading a fleet-wide Project Management initiative. Brenda has a Bachelor's degree in Mechanical Engineering from the University of Missouri Columbia, and a Masters in Engineering Management from the University of Missouri Rolla (now Missouri University of Science and Technology).

Exhibit E

IRO-006-TRE-1 – Violation Severity Level and Violation Risk Factor Analysis

Violation Risk Factor, Violation Severity Level, and Time Horizons Assignments

This document provides the drafting team's justification for assignment of violation risk factors (VRFs), violation severity levels (VSLs), and Time Horizons for each requirement in IRO-006-TRE-1 – IROL and SOL Mitigation in the ERCOT Region.

Each primary requirement is assigned a VRF, Time Horizon, and a set of one or more VSLs. These elements support the determination of initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Violation Risk Factors

The Standard Drafting Team (SDT) applied the following NERC criteria when proposing VRFs for the requirements in IRO-006-TRE-1:

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric

system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:

Guideline 1 — Consistency with the Conclusions of the Final Blackout Report
The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

Guideline 2 — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline 3 — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline 4 — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline 4 was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VSL Guidelines 2 through 5.

There are 2 requirements in IRO-006-TRE-1. Requirement R1 was assigned a "Medium" VRF, and Requirement R2 was assigned a "High" VRF.

Justification of VRFs for IRO-006-TRE-1, Requirements R1 and R2:

Req. #	NERC Criteria and FERC Guideline 4 Consistency with NERC's Definition of a VRF.	FERC Guideline 2 Consistency within a Reliability Standard.	FERC Guideline 3 Consistency among Reliability Standards.	FERC Guideline 5 Treatment of Requirements that Co-mingle More Than One Objective.
R1	***Medium:*** Failure to have the required procedures, which are associated with a planning time frame, may adversely affect the ability to effectively monitor or control the bulk electric system, but it is unlikely to lead to bulk electric system instability, separation, or cascading failures.	The requirement has no sub-requirements so only one VRF was assigned. The VRF for this requirement is consistent with others in this standard with regard to relative risk; therefore, there is no conflict.	The Medium VRF assigned to this requirement is consistent with other standards that require an entity to have procedures in place. See, e.g., IRO-002-2 (R2) and IRO-014-2 (R1).	This requirement has a single objective, that is, to have the required procedures.
R2	***High:*** Failure to act as required could directly cause, contribute to, or place the system at risk of bulk electric system instability, separation, or a cascading sequence of failures.	The requirement has no sub-requirements so only one VRF was assigned. The VRF for this requirement is consistent with others in this standard with regard to relative risk; therefore, there is no conflict.	The High VRF assigned to this requirement is the same as is assigned to R1 of IRO-006-5, which also relates to real-time actions required for transmission loading relief.	This requirement is assigned a single risk-level, and the High VRF level is consistent with the most severe potential violation, that is, failure to act to mitigate an exceedance of an IROL.

Violation Severity Levels

In developing the VSLs for the IRO standard, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria.

Lower	Moderate	High	Severe
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in IRO-006-TRE-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

> Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

> A violation of a "binary" type requirement must be a "Severe" VSL. Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

> VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

> . . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

Requirement #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1				The RC did not have procedures to identify and mitigate exceedances of identified IROLs and SOLs.
R2			The RC failed to follow its procedures in identifying and mitigating an exceedance of an SOL.	The RC failed to follow its procedures in identifying and mitigating an exceedance of an IROL.

Justification of VSLs for IRO-006-TRE-1, Requirements R1 and R2:

Req. #	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Levels Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	Guideline 3 Violation Severity Level Assignment Should be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should be Based on a Single Violation, Not on a Cumulative Number of Violations.
R1	Requirement 1 is assigned a "Severe" VSL because it is considered to be a "binary" requirement and anything less than a complete set of procedures is considered to be a failure to comply.	This is a new requirement which will increase the reliability of the BES.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. In accordance with FERC guidelines, this "binary" requirement is assigned a Severe VSL.	The proposed VSL uses the similar terminology as used in the associated requirement, and does not expand on the requirement.	The VSL is based on a single violation and not on cumulative violations.

R2	Requirement 2 has multiple possible degrees of noncompliant performance. This requirement is assigned a “High” VSL for failure to act on an SOL exceedances, and a “Severe” VSL for failure to act on an IROL exceedances, which is considered to be a significantly more serious violation due to the potential risk to the BES.	This is a new requirement which will increase the reliability of the BES.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. The distinction between SOLs and IROLs is well-established and will not be subject to dispute in case of a violation.	The proposed VSLs use similar terminology as is used in the associated requirement, and the VSLs do not expand on the requirement.	The VSLs are based on distinct instances of noncompliant performance and not on a cumulative number of violations.

Time Horizons

The SDT based its assignment of Time Horizons on the following NERC Criteria:

Long-term Planning — a planning horizon of one year or longer.

Operations Planning — operating and resource plans from day-ahead up to and including seasonal.

Same-day Operations — routine actions required within the timeframe of a day, but not real-time.

Real-time Operations — actions required within one hour or less to preserve the reliability of the bulk electric system.

Operations Assessment — follow-up evaluations and reporting of real time operations.

Justification of Time Horizons for IRO-006-TRE-1, Requirements R1 and R2:

R1 is assigned an “Operations Planning” time horizon because the required procedures should be in place and updated so that they reflect current system conditions on at least a seasonal basis.

R2 is assigned a “Real-time Operations” time horizon because action to identify and mitigate exceedances of IROL and SOL may be required within one hour or less to prevent instability, uncontrolled separation, or cascading outages.

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

Re: *North American Electric Reliability Corporation*
Docket No. RD12-___-000

Dear Ms. Bose:

The North American Electric Reliability Corporation ("NERC") hereby submits this petition in accordance with Section 215(d) (1) of the Federal Power Act ("FPA") and Part 39.5 of the Federal Energy Regulatory Commission's ("FERC") regulations seeking approval of proposed Regional Reliability Standard PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements ("UFLS") in the Southeastern Electric Reliability Council ("SERC") Region, associated Violation Severity Levels ("VSL") and Violation Risk Factors ("VRF"), and the implementation plan for PRC-006-SERC-01.

The proposed Regional Reliability Standard was approved by the NERC Board of Trustees during its November 3, 2011, meeting. NERC requests the standard become effective over a 30-month window following the effective date of a Final Rule in this

docket as provided in the implementation plan to allow entities to respond to any changes in UFLS settings.[1]

This petition consists of the following:

- this transmittal letter;
- a table of contents for the entire petition;
- a narrative description explaining how the proposed Regional Reliability Standard meets FERC's requirements;
- Regional Reliability Standard PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements and Implementation Plan, submitted for approval (**Exhibit A**);
- the NERC Board of Trustees' Resolution approving PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements and directing it be filed with FERC (**Exhibit B**);
- the complete Development Record of the proposed Regional Reliability Standard (**Exhibit C**);
- the Standard Drafting Team roster (**Exhibit D**); and
- the Violation Severity Level and Violation Risk Factor Guideline Analysis (**Exhibit E**).

Please contact the undersigned if you have any questions.

Respectfully submitted,

/s/ Willie L Phillips
Willie L. Phillips
Attorney for North American Electric Reliability Corporation

[1] The implementation date of Requirement R1 is dependent on FERC adoption of the continent-wide standard PRC-006-1, which is pending in Docket No. RM11-20-000, available at: http://www.nerc.com/files/Final_PRC-006-1_EOP-003-2_2011.03.31.pdf.

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC")[2] hereby requests the Federal Energy Regulatory Commission ("FERC" or "Commission") to approve, in accordance with Section 215(d)(1) of the Federal Power Act ("FPA")[3] and Section 39.5 of FERC's regulations, 18 C.F.R. § 39.5, proposed Regional Reliability Standard, PRC-006-SERC-01 – Automatic Underfrequency Load Shedding Requirements included in **Exhibit A**.

This petition is the first request for FERC approval of this proposed Regional Reliability Standard. The Regional Reliability Standard proposed will be in effect only for applicable registered entities within the SERC region. NERC continent-wide Reliability Standards do not presently address the issues covered in this proposed Regional Reliability Standard.

On November 3, 2011, the NERC Board of Trustees approved PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements for the SERC region. NERC requests that this Regional Reliability Standard be made effective upon FERC approval. **Exhibit A** to this filing sets forth the proposed Regional Reliability Standard and Implementation Plan. **Exhibit B** is the NERC Board of Trustees' resolution to approve the proposed Regional Reliability Standard. **Exhibit C** contains the complete record of development for the proposed Regional Reliability Standard. **Exhibit D** includes the standard drafting team roster. **Exhibit E** is the Violation Severity Level ("VSL") and Violation Risk Factor ("VRF") guideline analysis.

[2] NERC has been certified by FERC as the Electric Reliability Organization ("ERO") authorized by Section 215 of the Federal Power Act. FERC certified NERC as the ERO in its order issued July 20, 2006 in Docket No. RR06-1-000. 116 FERC ¶ 61,062 (2006) ("ERO Certification Order).

*Persons to be included on FERC's service list are indicated with an asterisk. NERC requests waiver of FERC's rules and regulations to permit the inclusion of more than two people on the service list.

III. BACKGROUND

a. Regulatory Framework

By enacting the Energy Policy Act of 2005,[4] Congress entrusted FERC with the duties of approving and enforcing rules to ensure the reliability of the Nation's Bulk Power System, and with the duties of certifying an ERO that would be charged with developing and enforcing mandatory Reliability Standards, subject to FERC approval. Section 215 of the FPA states that all users, owners and operators of the Bulk Power System in the United States will be subject to FERC-approved Reliability Standards.

[4] 16 U.S.C. § 824o.

b. Basis for Approval of Proposed Regional Reliability Standard

Section 39.5(a) of FERC's regulations requires the ERO to file with FERC for its approval each Reliability Standard that the ERO proposes to become mandatory and enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes to be made effective. FERC has the regulatory responsibility to approve standards that protect the reliability of the Bulk Power System. In discharging its responsibility to review, approve, and enforce mandatory Reliability Standards, FERC is authorized to approve those proposed Reliability Standards that meet the criteria detailed by Congress:

> FERC may approve, by rule or order, a proposed reliability standard or modification to a reliability standard if it determines that the standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest.[5]

Order No. 672 provides guidance on the factors FERC will consider when determining whether proposed Reliability Standards meet the statutory criteria. [6] A Regional Reliability Standard proposed by a Regional Entity must meet the same standards that NERC's Reliability Standards must meet, *i.e.*, the Regional Reliability Standard must be shown to be just, reasonable, not unduly discriminatory or preferential, and in the public interest.[7] FERC's Order No. 672 also requires additional criteria that a Regional Reliability Standard must satisfy: A regional difference from a continent-wide Reliability Standard must either be (1) more stringent than the continent-wide Reliability Standard (which includes a regional standard that addresses matters that the continent-

[5] 16 U.S.C. § 824o(d)(2).
[6] *See Rules Concerning Certification of the Electric Reliability Organization; Procedures for the Establishment, Approval and Enforcement of Electric Reliability Standards*, FERC Stats. & Regs., ¶ 31,204 (2006) ("Order No. 672") at P 344, *order on reh'g*, FERC Stats. & Regs. ¶ 31,212 (2006) ("Order No. 672-A").
[7] Section 215(d)(2) of the FPA and 18 C.F.R. §39.5(a).

wide Reliability Standard does not), or (2) necessitated by a physical difference in the Bulk Power System.[8]

As noted in the *SERC Regional Standards Development Procedure,* SERC's standards are developed according to the following characteristic attributes: [9]

- Openness – Participation in the development of a SERC Regional Reliability Standard shall be open to all organizations that are directly and materially affected by the SERC bulk power system reliability.

- Balance – The SERC Regional Reliability Standards Development Procedure strives to have an appropriate balance of interests and shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter.

- Inclusive – Any entity (person, organization, company, government agency, individual, etc.) with a direct and material interest in the bulk power system in the SERC area shall have a right to participate.

- Fair due process – The SERC Regional Reliability Standards Development Procedure provides for reasonable notice and opportunity for public comment.

- Transparent – All actions material to the development of SERC Regional Reliability Standards are transparent and information regarding the progress is posted on the SERC website as well as through extensive email lists.

- Due Course – Does not unnecessarily delay development of the proposed SERC Regional Reliability Standard.

SERC Regional Standards are subject to approval by NERC, as the ERO, and FERC before becoming mandatory and enforceable under Section 215 of the FPA.[10] NERC Reliability Standards and the SERC Regional Reliability Standards are both enforced through the SERC Compliance Program.

[8] Order No. 672 at P 291.
[9] The *SERC Regional Standards Development Process* is available at: http://www.serc1.org/Documents/SERC%20Standards%20Committee/SERC%20DA%20Exhibit%20C%20-%20Regional%20Standards%20Development%20Procedure%20(1-3-09).pdf.
[10] 16 U.S.C. 824o.

The proposed SERC Regional Reliability Standard was developed in an open, transparent, and inclusive fashion. Specifically, the proposed Regional Reliability Standard was developed using the *SERC Regional Standards Development Procedure*[11] that enables all parties with an interest in the standard to participate in its development. NERC's public posting of this proposed Regional Reliability Standard did not elicit any significant technical objection. In addition, NERC has determined that the proposed standard meets the criteria for consideration and approval as a Regional Reliability Standard.

IV. JUSTIFICATION FOR APPROVAL OF PROPOSED REGIONAL RELIABILITY STANDARD

This section summarizes the development of the proposed Regional Reliability Standard PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements; describes the reliability objectives to be achieved by the Regional Reliability Standard; explains the development history of the Regional Reliability Standard; and demonstrates how the standard meets the FERC criteria for approval. NERC, in its analysis and approval of the proposed Regional Reliability Standard, determined that the standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest.

The complete development record for the proposed Regional Reliability Standard is provided in **Exhibit C** and includes the development and approval process, comments received during the industry-wide comment period, responses to those comments, ballot information, and NERC's evaluation of the proposed standard.

[11] The SERC *Regional Standards Development Procedure* is available at: http://www.serc1.org/Documents/SERC%20Standards%20Committee/SERC%20DA%20Exhibit%20C%20-%20Regional%20Standards%20Development%20Procedure%20(1-3-09).pdf.

a. Basis and Purpose of Standard PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

The proposed Regional Reliability Standard, PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements provides regional underfrequency load shedding ("UFLS") requirements for registered entities in the SERC Region. UFLS requirements had been in place at a continent-wide level and within SERC for many years prior to implementation of FERC-approved Reliability Standards in 2007. The SERC regional UFLS standard has been developed to be consistent with the NERC UFLS standard. The purpose of the standard is to establish consistent and coordinated requirements for the design, implementation, and analysis of automatic UFLS schemes among all applicable entities within the SERC Region.

b. Order No. 672 Criteria

In Order No. 672, FERC identified criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Regional Reliability Standard has met or exceeded the criteria:

1. Proposed Reliability Standards must be designed to achieve a specified reliability goal.

> Order No. 672 at P 321. The proposed Reliability Standard must address a reliability concern that falls within the requirements of section 215 of the FPA. That is, it must provide for the reliable operation of Bulk-Power System facilities. It may not extend beyond reliable operation of such facilities or apply to other facilities. Such facilities include all those necessary for operating an interconnected electric energy transmission network, or any portion of that network, including control systems. The proposed Reliability Standard may apply to any design of planned additions or modifications of such facilities that is necessary to provide for reliable operation. It may also apply to Cybersecurity protection.

The proposed Regional Reliability Standard, PRC-006-SERC-01, is designed to ensure that automatic UFLS protection schemes designed by Planning Coordinators and implemented by applicable Distribution Providers and Transmission Owners in the SERC region are coordinated so they may effectively mitigate the consequences of an underfrequency event.

2. Proposed Reliability Standards must be applicable to users, owners, and operators of the bulk power system, and not others.

> Order No. 672 at P 322. The proposed Reliability Standard may impose a requirement on any user, owner, or operator of such facilities, but not on others.

The proposed Regional Reliability Standard is only applicable to Generator Owners, Planning Coordinators, and UFLS entities in the SERC region. The term "UFLS entities" (as noted in NERC standard PRC-006-1) means all entities that are responsible for the ownership, operation, or control of automatic UFLS equipment as required by the UFLS program established by the Planning Coordinators.[12] Such entities may include Distribution Providers and Transmission Owners.

3. Proposed Reliability Standards must consider any other relevant factors.

> Order No. 672 at P 323. In considering whether a proposed Reliability Standard is just and reasonable, we will consider the following general factors, as well as other factors that are appropriate for the particular Reliability Standard proposed.

Exhibit C presents an overview of the issues raised in consideration of the proposed standard that demonstrates how industry comments are addressed in this standard development project. All comments and concerns were addressed using the *SERC Regional Standards Development Procedure* which is consensus-based, technically

[12] *See* NERC Reliability Standard PRC-006-1, available at: http://www.nerc.com/files/PRC-006-1.pdf.

sound, and open to the public and bordering entities that may be impacted by a Regional Reliability Standard. No other factors were identified as necessary for consideration by the standard drafting team in the development of the proposed Regional Reliability Standard.

4. Proposed Reliability Standards must contain a technically sound method to achieve the goal.

> Order No. 672 at P 324. The proposed Reliability Standard must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve this goal. Although any person may propose a topic for a Reliability Standard to the ERO, in the ERO's process, the specific proposed Reliability Standard should be developed initially by persons within the electric power industry and community with a high level of technical expertise and be based on sound technical and engineering criteria. It should be based on actual data and lessons learned from past operating incidents, where appropriate. The process for ERO approval of a proposed Reliability Standard should be fair and open to all interested persons.

The proposed Regional Reliability Standard contains a technically sound means to achieve this goal as it adds specificity for development and implementation of UFLS schemes in the SERC Region that is not contained in the NERC UFLS Reliability Standard, PRC-006-1.

5. Proposed Reliability Standards must be clear and unambiguous as to what is required and who is required to comply.

> Order No. 672 at P 325. The proposed Reliability Standard should be clear and unambiguous regarding what is required and who is required to comply. Users, owners, and operators of the Bulk-Power System must know what they are required to do to maintain reliability.

- The proposed Regional Reliability Standard establishes clear and unambiguous requirements for all applicable entities, as it detailed below:

  Requirement 1 requires Planning Coordinators to include its SERC

subregion as an identified island when developing criteria for selecting portions of the Bulk Power System that may form islands.

- Requirement 2 requires the Planning Coordinator to select or develop an automatic UFLS scheme (percent of load to be shed, frequency set points, and time delays) for implementation by UFLS entities within its area that meets the specified minimum requirements.
- Requirement 3 requires the Planning Coordinator to conduct simulations of its UFLS scheme for an imbalance between load and generation of 13%, 22%, and 25% for all identified islands.
- Requirement 4 requires each UFLS entity that has a total load of 100 MW or greater in a Planning Coordinator area in the SERC Region to implement the UFLS scheme developed by their Planning Coordinator within specified tolerances.
- Requirement 5 requires each UFLS entity that has a total load less than 100 MW in a Planning Coordinator area in the SERC Region to implement the UFLS scheme developed by their Planning Coordinator within specified tolerances, but specifies that those entities shall not be required to have more than one UFLS step.
- Requirement 6 requires each UFLS entity in the SERC Region to implement changes to the UFLS scheme which involve frequency settings, relay time delays, or changes to the percentage of load in the scheme within 18 months of notification by the Planning Coordinator.

- Requirement 7 requires each Planning Coordinator to provide specified information concerning their UFLS scheme to SERC according to the schedule specified by SERC.
- Requirement 8 requires each Generator Owner to provide specified generator underfrequency and overfrequency protection information within 30 days of a request by SERC to facilitate post-event analysis of frequency disturbances.

6. Proposed Reliability Standards must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.

> Order No. 672 at P 326. The possible consequences, including range of possible penalties, for violating a proposed Reliability Standard should be clear and understandable by those who must comply.

The proposed Regional Reliability Standard includes a VRF and VSL for each requirement. The ranges of penalties for violations will be based on the applicable VRFs and VSLs and will be administered based on the sanctions table and supporting penalty determination process described in the FERC-approved NERC Sanction Guidelines.[13]

SERC developed the VSLs and VRFs proposed for assignment to PRC-006-SERC-01 in accordance with applicable NERC and FERC guidance. **Exhibit E** to this filing contains the VSL and VRF guideline analysis for PRC-006-SERC-01.

7. A proposed Reliability Standard must identify clear and objective criterion or measure for compliance, so that it can be enforced in a consistent and non-preferential manner.

> Order No. 672 at P 327. There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of

[13] NERC Rules of Procedure Appendix 4B, available at: http://www.nerc.com/files/NERC_Rules_of_Procedure_EFFECTIVE_20111117.pdf.

compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.

Each requirement of PRC-006-SERC-01 has an associated measure of compliance that will assist those enforcing the standard in enforcing it in a consistent and non-preferential manner. The proposed measures are as follows:

> **M1.** Each Planning Coordinator shall have evidence such as a methodology, procedure, report, or other documentation indicating that its criteria included selection of its SERC subregion(s) as an island per Requirement R1.
>
> **M2.** Each Planning Coordinator shall have evidence such as reports or other documentation that the UFLS scheme for its area meets the design requirements specified in Requirement R2.
>
> **M3.** Each Planning Coordinator shall have evidence such as reports or other documentation that it performed the simulations of its UFLS scheme as required in Requirement R3.
>
> **M4.** Each UFLS entity that has a total load of 100 MW or greater in a Planning Coordinator area in the SERC Region shall have evidence such as reports or other documentation demonstrating that its implementation of the UFLS scheme on May 1 of each calendar year meets the requirements of Requirement R4 (including all the data elements in Parts 4.1, 4.2, and 4.3) unless scheme changes per Requirement R6 are in process.
>
> **M5.** Each UFLS entity that has a total load less than 100 MW in a Planning Coordinator area in the SERC Region shall have evidence such as reports or other documentation demonstrating that its implementation of the UFLS scheme on May 1 of each calendar year meets the requirements of Requirement R5 (including all the data elements in Parts 5.1and 5.2) unless scheme changes per Requirement R6 are in process.
>
> **M6.** Each UFLS entity shall have evidence such as reports or other documentation demonstrating that it has made the appropriate scheme changes within 18 months per Requirement R6. Such evidence is only required if the Planning Coordinator makes changes to the UFLS scheme as specified in Requirement R6.

M7. Each Planning Coordinator shall have evidence such as reports or other documentation that data specified in Requirement R7 was provided to SERC in accordance with the schedule.

M8. Each Generator Owner shall have evidence such as reports or other documentation that data specified in Requirement R8 was provided to SERC as requested.

8. Proposed Reliability Standards should achieve a reliability goal effectively and efficiently — but do not necessarily have to reflect "best practices" without regard to implementation cost.

> Order No. 672 at P 328. The proposed Reliability Standard does not necessarily have to reflect the optimal method, or "best practice," for achieving its reliability goal without regard to implementation cost or historical regional infrastructure design. It should however achieve its reliability goal effectively and efficiently.

Regional Reliability Standard PRC-006-SERC-01 achieves its reliability goal effectively and efficiently. The proposed standard sets minimum automatic UFLS design requirements which are equivalent to the design requirements in the SERC UFLS program that has been in effect since September 3, 1999. The one change is the addition of a minimum time delay requirement to prevent spurious operations. This will allow Planning Coordinators to use current UFLS schemes if those schemes meet the performance requirements specified in the NERC UFLS standard. That will in turn require applicable Distribution Providers and Transmission Owners to make minimal changes to implement their portions of the UFLS schemes.

9. Proposed Reliability Standards cannot be "lowest common denominator," *i.e.*, cannot reflect a compromise that does not adequately protect bulk power system reliability.

> Order No. 672 at P 329. The proposed Reliability Standard must not simply reflect a compromise in the ERO's Reliability Standard development process based on the least effective North American practice — the so-called "lowest common denominator" — if such practice does not adequately protect Bulk-Power System reliability. Although [FERC] will give due weight to the technical expertise of the ERO, [FERC] will

> not hesitate to remand a proposed Reliability Standard if [FERC is] convinced it is not adequate to protect reliability.

This proposed Regional Reliability Standard does not reflect a "lowest common denominator" approach. PRC-006-SERC-01 achieves its reliability goal of providing for the last resort system preservation measures. The standard was designed to be consistent with the NERC automatic UFLS standard, while adding specificity not contained in the NERC standard for the development, coordination, implementation, and analysis of UFLS schemes in the SERC Region.

10. Proposed Reliability Standards may consider costs to implement for smaller entities but not at consequence of less than excellence in operating system reliability.

> Order No. 672 at P 330. A proposed Reliability Standard may take into account the size of the entity that must comply with the Reliability Standard and the cost to those entities of implementing the proposed Reliability Standard. However, the ERO should not propose a "lowest common denominator" Reliability Standard that would achieve less than excellence in operating system reliability solely to protect against reasonable expenses for supporting this vital national infrastructure. For example, a small owner or operator of the Bulk-Power System must bear the cost of complying with each Reliability Standard that applies to it.

The cost to implement for smaller entities was considered during the development of the proposed Regional Reliability Standard, PRC-006-SERC-01. The NERC automatic UFLS standard (PRC-006-1) requires the Planning Coordinator to identify which entities will participate in their UFLS scheme, including the number of steps and percent load an entity will shed. The SERC UFLS standard drafting team recognized that UFLS entities with a load of less than 100 MW may have difficulty in implementing more than one UFLS step and in meeting a tight tolerance.

Accordingly, Requirement R5 states that such entities shall not be required to have more than one UFLS step, and sets their implementation tolerance to a wider level.

This should limit any additional cost required of smaller entities to comply with the standard, but with minimal consequence to operating system reliability.

11. Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one area or approach.

> Order No. 672 at P 331. A proposed Reliability Standard should be designed to apply throughout the interconnected North American Bulk-Power System, to the maximum extent this is achievable with a single Reliability Standard. The proposed Reliability Standard should not be based on a single geographic or regional model but should take into account geographic variations in grid characteristics, terrain, weather, and other such factors; it should also take into account regional variations in the organizational and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.

The proposed Regional Reliability Standard is designed on a regional basis and will only apply to the SERC region. It is not intended to be applied throughout North America.

12. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid.

> Order No. 672 at P 332. As directed by section 215 of the FPA, [FERC] itself will give special attention to the effect of a proposed Reliability Standard on competition. The ERO should attempt to develop a proposed Reliability Standard that has no undue negative effect on competition. Among other possible considerations, a proposed Reliability Standard should not unreasonably restrict available transmission capability on the Bulk-Power System beyond any restriction necessary for reliability and should not limit use of the Bulk-Power System in an unduly preferential manner. It should not create an undue advantage for one competitor over another.

This proposed Regional Reliability Standard does not cause undue negative effects on competition or restriction of the grid. Because this standard will be applied

equally across the SERC region, PRC-006-SERC-01 will not negatively affect competition, or restrict available transmission capability within the SERC footprint.

13. The implementation time for the proposed Reliability Standards must be reasonable.

> Order No. 672 at P 333. In considering whether a proposed Reliability Standard is just and reasonable, [FERC] will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.

The proposed Reliability Standard will become fully effective 30 months after the first day of the first quarter following regulatory approval. The implementation time for the proposed Reliability Standard is reasonable, as it balances the need for reliability with the practicability of implementation, as detailed below:

- Requirement R1 shall become effective 12 months after the first day of the first quarter following regulatory approval, but no sooner than 12 months following regulatory approval of NERC PRC-006-1. This 12-month period is consistent with the effective date of R2 of PRC-006-1.
- Requirement R2 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for entities to ensure a minimum time delay of six cycles on existing automatic UFLS relays as specified in part 2.6.
- Requirements R3 shall become effective 18 months after the first day of the first quarter following regulatory approval. This additional six-month period is needed to allow time to perform and coordinate studies necessary

to assess the overall effectiveness of the UFLS schemes in the SERC Region.

- Requirements R4, R5, and R6 shall become effective 30 months after the first day of the first quarter following regulatory approval. This additional 18 months is needed to allow time for any necessary changes to be made to the existing UFLS schemes in the SERC Region.
- Requirement R7 shall become effective six months following the effective date of R8 of the NERC standard PRC-006-1, but no sooner than one year following the first day of the first calendar quarter after applicable regulatory approval of PRC-006-SERC-01. R8 of the NERC standard requires each UFLS entity to provide UFLS data to the Planning Coordinator. R7 of the SERC standard requires the Planning Coordinator to provide this data to SERC.
- Requirement R8 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for Generator Owners to collect and make an initial data filing.

14. The Reliability Standard development process must be open and fair.

> Order No. 672 at P 334. Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its [FERC]-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by [FERC].

SERC develops Regional Reliability Standards in accordance with **Exhibit C** (*SERC Regional Standards Development Procedure*), which is part of SERC's Regional Delegation Agreement with NERC. The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk Power System. SERC considers the comments of all stakeholders and an affirmative vote of the stakeholders and the SERC Board of Directors are both required to approve a Regional Reliability Standard for submission to NERC and FERC.

The proposed Regional Reliability Standard has been developed and approved by industry stakeholders using SERC's *Regional Standards Development Procedure* and was approved by the Executive Committee of the SERC Board of Directors on September 19, 2011. The standard was subsequently presented to, and approved by the NERC Board of Trustees November 3, 2011. Therefore, SERC has utilized its standard development process in good faith and in a manner that is open and fair. No commenters disagreed with the open and fair implementation of the SERC process.

15. Proposed Reliability Standards must be balanced against other vital public interests.

> Order No. 672 at P 335. Finally, we understand that at times development of a proposed Reliability Standard may require that a particular reliability goal must be balanced against other vital public interests, such as environmental, social and other goals. We expect the ERO to explain any such balancing in its application for approval of a proposed Reliability Standard.

There are no competing public interests with the request for approval of this proposed Regional Reliability Standard. No comments were received that indicated the proposed standard conflicts with other vital public interests. Therefore, it is not

necessary to balance this Reliability Standard against any other competing public interests.

16. Proposed Reliability Standard must not conflict with prior FERC Rules or Orders.

> Order No. 672 at P 444. A potential conflict between a Reliability Standard under development and a Transmission Organization function, rule, order, tariff, rate schedule, or agreement accepted, approved, or ordered by the Commission should be identified and addressed during the ERO's Reliability Standard Development Process.

The proposed PRC-006-SERC-01 Regional Reliability Standard does not conflict with any other prior FERC Rules or Orders and adequately addresses the directives identified in FERC Order No. 693.

c. Additional Order No. 672 Criteria for Regional Reliability Standards

FERC Order No. 672 also establishes additional criteria that a Regional Reliability Standard must satisfy: "A regional difference from a continent-wide Reliability Standard must either be (1) more stringent than the continent-wide Reliability Standard including a regional difference that addresses matters the continent-wide Reliability Standard does not, or (2) a Regional Reliability Standard that is necessitated by a physical difference in the Bulk-Power System."[14] The proposed standard satisfies these additional criteria.

The existing NERC continent-wide standard, PRC-006-1 applies only to Planning Coordinators, Transmission Owners, and Distribution Providers. The proposed SERC standard, PRC-006-SERC-01, adds specificity not contained in the NERC UFLS standard for UFLS schemes in the SERC Region. Specifically, it is designed to work in conjunction with the NERC standard to effectively mitigate the consequences of an

[14] Order No. 672 at P 291.

underfrequency event, while accommodating differences in system transmission and distribution topology among SERC Planning Coordinators due to historical design criteria, makeup of load demands, and generation resources.

V. SUMMARY OF THE REGIONAL RELIABILITY STANDARD DEVELOPMENT PROCEEDINGS

On June 24, 2011, SERC submitted the proposed Regional Reliability Standard for evaluation and approval to NERC in accordance with NERC's *Rules of Procedure* and *Regional Reliability Standards Evaluation Procedure* that was approved by NERC's Regional Reliability Standards Working Group. [15] NERC provided its evaluation of the proposed PRC-006-SERC-01 standard to SERC on July 11, 2011, included in **Exhibit C**. In this report, NERC provided minor formatting and wording suggestions to several requirements. SERC modified the proposed standard in response to NERC's suggestions.

A. Key Issues

During the 45-day NERC posting, three key issues were raised. One entity commented that they were concerned that PRC-006-SERC-001, R2, is too prescriptive and may not allow Planning Coordinators the flexibility and discretion needed to ensure reliability. SERC responded that 18 different schemes are already being used within the SERC footprint. Removing the requirements specified in R2 may lead to even more diverse schemes and increase the probability of non-coordination within SERC. The requirements specified in R2 are presently included within approved SERC Regional Criteria. These requirements allow for a high degree of flexibility in developing a UFLS scheme while promoting proper coordination among neighboring schemes both within

[15] *Regional Reliability Standards Evaluation Procedure, Version 1* (2009). Available at: http://www.nerc.com/docs/sac/rrswg/NERC_Regional_Reliability_Evaluation_Procedure.pdf.

and outside SERC. There should be no coordination issues with schemes in other regions since all of the schemes have to meet the performance characteristics in the NERC continent-wide Standard PRC-006-1.

Another entity commented that it was not clear that the criteria proposed in this standard are really more specific than the performance criteria proposed in the NERC Standard PRC-006-1. It was not apparent to the commenter that there is an issue particular to the SERC Region that is different than the rest of the Eastern Interconnection. SERC responded that the primary purpose of the SERC regional Standard was to provide region specific requirements for the implementation of NERC standard PRC-006-1 requirements with the goal of adding clarity and providing consistency. The requirements already included in the NERC UFLS standard were not repeated in the SERC standard. In addition to providing regional consistency and coordination, the requirements of the SERC Standard also are more stringent than the national standard.

Finally, one entity commented that Generator Owners will only be subject to PRC-006-SERC-01 Requirement R8 and its three sub-requirements. These requirements and sub-requirements call for Generator Owners to provide SERC with their generator frequency relay set points, clearing times, and maximum MW that could be separated from the system; within 30 days of a request. Requirement R8 further qualifies the reliability need is to "facilitate post-event analysis of frequency disturbances." However, the commenter noted that SERC already has the authority to gather disturbance-related information from Generator Operators under EOP-004-1. If this is not sufficient, the commenter argued, MOD-010-0 and MOD-012-0 require Generator Owners to provide

static and dynamic generator modeling data in accordance with the Regional Entity's specification. Thus, it would seem that SERC's specification could be modified to accommodate frequency relay data without creating any new enforceable reliability requirements.

SERC responded that, while Attachment 1-EOP-004 NERC Disturbance Report Form requires a report to be filed in response to an event where frequency or voltage goes "below the under-frequency or under-voltage load shed" set points, the form does not include the requirement to report the information spelled out in requirement R8 of PRC-006-SERC-01. In addition, the MOD-010-0, MOD-012-0, and associated SERC regional criteria, do not require that generator underfrequency and overfrequency protective setpoints be provided. The inclusion of this requirement in the proposed standard ensures that the SERC region receives necessary information. Including this requirement in the standard also provides adequate notification to entities regarding providing specific data upon request to facilitate post-event analysis of frequency disturbances.

B. Violation Risk Factors and Violation Severity Levels

The VRFs and VSLs for this standard were developed and reviewed for consistency with NERC and FERC guidelines.[16] Analyses of the assigned VRFs and VSLs to this standard are included in **Exhibit E**.

[16] *See Order on Violation Risk Factors*, 119 FERC ¶ 61,145 (2007) and *Order on Violation Severity Levels Proposed by the Electric Reliability Organization*, 123 FERC ¶ 61,284 (2008).

VI. CONCLUSION

For the reasons stated above, NERC respectfully requests that FERC approve the proposed PRC-006-SERC-01 Regional Reliability Standard, the associated proposed definitions, and the associated Implementation Plan included in **Exhibit A** to this filing in accordance with Section 215(d)(1) of the FPA and Part 39.5 of FERC's regulations. NERC requests that these approvals be made effective in accordance with the Implementation Plan for PRC-006-SERC-01 included in **Exhibit A** to this filing.

Respectfully submitted,

Exhibit A

Proposed Regional Reliability Standard PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements and Implementation Plan for Approval

Effective Dates

Requirement	Jurisdiction									
	Alberta	British Columbia	Manitoba	New Brunswick	Newfound-land	Nova Scotia	Ontario	Quebec	Saskatch-ewan	USA
R1	NA	NA	NA	NA	NA	NA	NA	NA	NA	TBD
R2	NA	NA	NA	NA	NA	NA	NA	NA	NA	TBD
R3	NA	NA	NA	NA	NA	NA	NA	NA	NA	TBD
R4, R5, and R6	NA	NA	NA	NA	NA	NA	NA	NA	NA	TBD
R7	NA	NA	NA	NA	NA	NA	NA	NA	NA	TBD
R8	NA	NA	NA	NA	NA	NA	NA	NA	NA	TBD

Requirement R1 shall become effective 12 months after the first day of the first quarter following regulatory approval, but no sooner than 12 months following regulatory approval of NERC PRC-006-1. This 12-month period is consistent with the effective date of R2 of PRC-006-1.

Requirement R2 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for entities to ensure a minimum time delay of six cycles on existing UFLS relays as specified in part 2.6.

Requirements R3 shall become effective 18 months after the first day of the first quarter following regulatory approval. This additional six-month period is needed to allow time to perform and coordinate studies necessary to assess the overall effectiveness of the UFLS schemes in the SERC Region.

Requirements R4, R5, and R6 shall become effective 30 months after the first day of the first quarter following regulatory approval. This additional 18 months is needed to allow time for any necessary changes to be made to the existing UFLS schemes in the SERC Region.

Requirement R7 shall become effective six months following the effective date of R8 of the NERC standard PRC-006-1, but no sooner than one year following the first day of the first calendar quarter after applicable regulatory approval of PRC-006-SERC-01. R8 of the NERC standard requires each UFLS entity to provide UFLS data to the Planning Coordinator (PC). R7 of the SERC standard requires the PC to provide this data to SERC.

Requirement R8 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for Generator Owners (GO) to collect and make an initial data filing.

Introduction

1. **Title:** Automatic Underfrequency Load Shedding Requirements

2. **Number:** PRC-006-SERC–01

3. **Purpose:** To establish consistent and coordinated requirements for the design, implementation, and analysis of automatic underfrequency load shedding (UFLS) programs among all SERC applicable entities.

4. **Applicability:**
   - **4.1** Planning Coordinators
   - **4.2** UFLS entities shall mean all entities that are responsible for the ownership, operation, or control of UFLS equipment as required by the UFLS program established by the Planning Coordinators. Such entities may include one or more of the following:
     - 4.2.1 Transmission Owners
     - 4.2.2 Distribution Providers
   - **4.3** Generator Owners

5. **Background**

   The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

   When reliability standards were implemented in 2007, the Federal Energy Regulatory Commission ("FERC"), which is the government body with regulatory responsibility for electric reliability, issued FERC Order 693, recognizing 83 NERC Reliability Standards as enforceable by FERC and applicable to users, owners, and operators of the bulk power system (BPS). FERC did not approve the NERC UFLS standard, PRC-006-0 in Order 693. FERC's reason for not approving PRC-006-0 was that it recognized PRC-006-0 as a "fill-in the blank standard," and regional procedures associated with the standard were not submitted along with the standard. FERC's ruling in Order 693 required Regional Entities to provide the regional requirements necessary for completing the UFLS standard.

   In 2008, SERC commenced work on PRC-006-SERC-01. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the NERC UFLS standard.

   PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. The regional standard adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Requirements and Measures

R1. Each Planning Coordinator shall include its SERC subregion as an identified island in the criteria (required by the NERC PRC standard on UFLS) for selecting portions of the BPS that may form islands. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1 A Planning Coordinator may adjust island boundaries to differ from subregional boundaries where necessary for the sole purpose of producing a contiguous subregional island more suitable for simulation.

M1. Each Planning Coordinator shall have evidence such as a methodology, procedure, report, or other documentation indicating that its criteria included selection of its SERC subregion(s) as an island per Requirement R1.

R2. Each Planning Coordinator shall select or develop an automatic UFLS scheme (percent of load to be shed, frequency set points, and time delays) for implementation by UFLS entities within its area that meets the following minimum requirements: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. Have the capability of shedding at least 30 percent of the Peak Demand (MW) served from the Planning Coordinator's transmission system.

2.2. Shed load with a minimum of three frequency set points.

2.3. The highest frequency set point for relays used to arrest frequency decline shall be no lower than 59.3 Hz and not higher than 59.5 Hz.

2.3.1 This does not apply to UFLS relays with time delay of one second or longer and a higher frequency setpoint applied to prevent the frequency from stalling at less than 60 Hz when recovering from an underfrequency event.

2.4. The lowest frequency set point shall be no lower than 58.4 Hz.

2.5. The difference between frequency set points shall be at least 0.2 Hz but no greater than 0.5 Hz.

2.6. Time delay (from frequency reaching the set point to the trip signal) shall be at least six cycles.

M2. Each Planning Coordinator shall have evidence such as reports or other documentation that the UFLS scheme for its area meets the design requirements specified in Requirement R2.

R3. Each Planning Coordinator, when performing design assessments specified in the NERC PRC standard on UFLS, shall conduct simulations of its UFLS scheme for an imbalance between load and generation of 13%, 22%, and 25% for all identified island(s) where such imbalance equals [(load minus actual generation output) / load]. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

M3. Each Planning Coordinator shall have evidence such as reports or other documentation that it performed the simulations of its UFLS scheme as required in Requirement R3.

R4. Each UFLS entity that has a total load of 100 MW or greater in a Planning Coordinator area in the SERC Region shall implement the UFLS scheme developed by their Planning Coordinator. UFLS entities may implement the UFLS scheme developed by the Planning Coordinator by coordinating with other UFLS entities. The UFLS scheme shall meet the following requirements on May 1 of each calendar year. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1. The percent of load shedding to be implemented shall be based on the actual or estimated distribution substation or feeder demand (including losses) of the UFLS entities at the time coincident with the previous year actual Peak Demand.

4. 2. The amount of load in each load shedding step shall be within -1.0 and +3.0 of the percentage specified by the Planning Coordinator (for example, if the specified percentage step load shed is 12%, the allowable range is 11 to 15%).

4. 3. The amount of total UFLS load of all steps combined shall be within -1.0 and +5.0 of the percentage specified by the Planning Coordinator for the total UFLS load in the UFLS scheme.

M4. Each UFLS entity that has a total load of 100 MW or greater in a Planning Coordinator area in the SERC Region shall have evidence such as reports or other documentation demonstrating that its implementation of the UFLS scheme on May 1 of each calendar year meets the requirements of Requirement R4 (including all the data elements in Parts 4.1, 4.2, and 4.3) unless scheme changes per Requirement R6 are in process.

R5. Each UFLS entity that has a total load less than 100 MW in a Planning Coordinator area in the SERC Region shall implement the UFLS scheme developed by their Planning Coordinator, but shall not be required to have more than one UFLS step. UFLS entities may implement the UFLS scheme developed by the Planning Coordinator by coordinating with other UFLS entities. The UFLS scheme shall meet the following requirements on May 1 of each calendar year. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

5.1. The percent of load shedding to be implemented shall be based on the actual or estimated distribution substation or feeder demand (including losses) of the UFLS entities at the time coincident with the previous year actual Peak Demand.

5.2. The amount of total UFLS load shall be within ± 5.0 of the percentage specified by the Planning Coordinator for the total UFLS load in the UFLS scheme.

M5. Each UFLS entity that has a total load less than 100 MW in a Planning Coordinator area in the SERC Region shall have evidence such as reports or other documentation demonstrating that its implementation of the UFLS scheme on May 1 of each calendar year meets the requirements of Requirement R5 (including all the data elements in Parts 5.1and 5.2) unless scheme changes per Requirement R6 are in process.

R6. Each UFLS entity shall implement changes to the UFLS scheme which involve frequency settings, relay time delays, or changes to the percentage of load in the scheme within 18 months of notification by the Planning Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each UFLS entity shall have evidence such as reports or other documentation demonstrating that it has made the appropriate scheme changes within 18 months per Requirement R6. Such evidence is only required if the Planning Coordinator makes changes to the UFLS scheme as specified in Requirement R6.

R7. Each Planning Coordinator shall provide the following information to SERC according to the schedule specified by SERC. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1. Underfrequency trip set points (Hz)

7.2. Total clearing time associated with each set point (sec). This includes the time from when frequency reaches the set point and ends when the breaker opens.

7.3. Amount of previous year actual or estimated load associated with each set point, both in percent and in MW. The percentage and the Load demand (MW) shall be based on the time coincident with the previous year actual Peak Demand.

M7. Each Planning Coordinator shall have evidence such as reports or other documentation that data specified in Requirement R7 was provided to SERC in accordance with the schedule.

R8. Each Generator Owner shall provide the following information within 30 days of a request by SERC to facilitate post-event analysis of frequency disturbances. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1. Generator protection automatic underfrequency and overfrequency trip set points (Hz).

8.2. Total clearing time associated with each set point (sec). This is defined as the time that begins when frequency reaches the set point and ends when the breaker opens. If inverse time underfrequency relays are used, provide the total clearing time at 59.0, 58.5, 58.0, and 57.0 Hz.

8.3. Maximum generator net MW that could be tripped automatically due to an underfrequency or overfrequency condition.

M8. Each Generator Owner shall have evidence such as reports or other documentation that data specified in Requirement R8 was provided to SERC as requested.

Compliance

Compliance enforcement authority

SERC Reliability Corporation

Compliance monitoring and assessment process

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Violation Investigation
- Self-Reporting
- Complaint

Evidence retention

Each Planning Coordinator, UFLS Entity and Generator Owner shall keep data or evidence to show compliance as identified below unless directed by SERC to retain specific evidence for a longer period of time as part of an investigation.

Each Planning Coordinator, UFLS Entity and Generator Owner shall retain the current evidence of each Requirement and Measure as well as any evidence necessary to show compliance since the last compliance audit.

If a Planning Coordinator, UFLS Entity or Generator Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the retention period specified above, whichever is longer.

The compliance enforcement authority shall keep the last audit records and all requested and submitted subsequent audit records.

Time Horizons, Violation Risk Factors, and Violation Severity Levels

Table 1						
R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Long-term Planning	Medium	N/A	N/A	N/A	The Planning Coordinator did not have evidence that its criteria included selection of its SERC subregion(s) as an island, with or without adjusted boundaries.
R2	Long-term Planning	Medium	The Planning Coordinator's scheme did not meet one of the UFLS system design requirements identified in 2.2 through 2.6	The Planning Coordinator's scheme did not meet two of the UFLS system design requirements identified in 2.2 through 2.6.	The Planning Coordinator's scheme did not meet three of the UFLS system design requirements identified in 2.2 through 2.6.	The Planning Coordinator's scheme did not meet 2.1 **OR** Four or more of the UFLS system design requirements identified in 2.2 through 2.6.
R3	Long-term Planning	High	N/A	The Planning Coordinator failed to conduct one of the required simulations of its UFLS scheme.	N/A	The Planning Coordinator failed to conduct two of the required simulations of its UFLS scheme.
R4	Operations Planning	Medium	The UFLS entity's implemented UFLS scheme had one load shedding step outside the range specified in 4.	The UFLS entity's implemented UFLS scheme had two load shedding steps outside the range specified in 4.	The UFLS entity's implemented UFLS scheme had three or more load shedding steps outside the range	The UFLS entity's implemented UFLS scheme had three or more load shedding steps outside the range

Interpretations

None

Guideline and Technical Basis

1. **Existing UFLS schemes**
   Each Planning Coordinator should consider the existing UFLS programs which are in place and should consider input from the UFLS entities in developing the UFLS scheme.

2. **Basis for SERC standard requirements**
   SERC Standard PRC-006-SERC-01 is not a stand-alone standard, but was written to be followed in conjunction with NERC Standard PRC-006-1. The primary focus of SERC Standard PRC-006-SERC-01 was to provide region-specific requirements for the implementation of the higher tier NERC standard requirements with the goals of a) adding clarity and b) providing for consistency and a coordinated UFLS scheme for the SERC region as a whole. Generally speaking, requirements already in the NERC standard were not repeated in the SERC standard. Therefore, both the NERC and SERC standards must be followed to ensure full compliance.

3. **Basis for applying a percentage load shedding value to Forecast Load versus Actual Load**
   The Planning Coordinator will develop a UFLS scheme to meet the performance requirements of NERC Standard PRC-006-1 Requirement R3 and SERC Standard PRC-006-SERC-01 Requirement R2. This development will result in certain percentages of load for each UFLS entity in the Planning Coordinator's area for which automatic under frequency load shedding must be implemented. The Planning Coordinator develops these percentages based on forecast peak load demand. However, the UFLS entity implements these percentages based on the previous year's actual peak demand. Applying the same percentage to these different base values was intentional to ensure that both the Planning Coordinator and UFLS entities had a clear, measurable value to use in performing their respective roles in meeting the standard. Planning Coordinators typically use forecast demands in their work. Whereas the previous year's actual (or estimated) demand is typically more available to UFLS entities. Additionally, the use of percentages based on these different base values tends to minimize the error due to the time lag between design and actual field implementation. Since a percentage is provided by the Planning Coordinator to the UFLS entities, any differences between the design values (i.e., forecast load) and the implemented values (i.e., previous year's actual) would naturally tend to match up reasonably well. For example, if the total planning area load in MW for which UFLS was installed during the time of implementation was slightly higher or lower than the MW value used in the design by the Planning Coordinator, multiplying by the specified percentage would result in an implemented load shedding scheme that also had a reasonably similar higher or lower MW value.

4. **Basis for May 1 and 18 month time frames**
   Each UFLS entity must annually review that the amount of UFLS load shedding implemented is within a certain tolerance as specified by SERC Standard PRC-006-SERC-01 Requirement R4 or Requirement R5 by May 1 of the current year. May 1 was chosen to allow sufficient time after the previous year's peak occurred to make adjustments in the field to the implementation if necessary to meet the tolerances specified in Requirement R4 or Requirement R5. Therefore, the May 1 date applies only to implementation of the existing percentages of load shedding specified by the Planning Coordinator. On the other hand, the 18-month time frame specified in PRC-006-SERC-01 Requirement R6 is intended to allow sufficient budgeting, procurement, and installation time for additional equipment, or for significant setting changes to existing equipment necessary to meet a revised load shedding scheme design that has been specified by the Planning Coordinator. During this 18-month transition period, the May 1 measurement of R4 or Requirement R5 would not apply.

5. **Basis for smaller entity threshold of 100 MW**
   Most distribution substations have transformers rated in the range of 10 to 40 MVA. Usually most transformers would serve 1 to 4 feeders and each feeder will normally carry between 8 and 10 MVA. In general, assuming that each feeder would carry 10 MW, an entity with a load slightly greater than 100 MW would have at least 10 feeders available. For a program with three 10 % steps, only 3 feeders would be required to have under frequency load shed capabilities. The 100 MW threshold seems to provide adequate flexibility for implementing load shedding in three steps for entities slightly greater than 100 MW.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from each of the rationale text boxes was moved to this section.

Rationale for R1:

Studying the Region as an island is required by the NERC standard. Most regions have only one or a few different UFLS schemes. Where there is more than one scheme, studying this island demonstrates that the schemes are coordinated and performing adequately. Because there are so many different UFLS schemes in SERC (18 different schemes were represented in the 2007 SERC UFLS study), the SDT believes that applying the schemes to each subregion as an island is a necessary additional test of the coordination of the various UFLS schemes. Without this additional test, a poorly performing scheme may be masked by the large number of good performing schemes in the Region. A subregion island study, which would have a smaller number of schemes, would be more likely to uncover the poorly performing scheme and therefore get it fixed. This approach will result in a much better overall performance of the UFLS programs in SERC. The SDT recognized that there may be simulation problems due to opening the ties to utilities outside the subregion. Therefore, the subregion island boundaries are allowed to be adjusted to produce an island more suitable for simulation.

(Note: The SERC Subregions are identified in paragraph 4.2 of the SERC Reliability Corporation Bylaws: "The Region is currently geographically divided into five subregions that are identified as Southeastern, Central, VACAR, Delta, and Gateway.")

Rationale for R2:
These requirements for the UFLS schemes in SERC have been in place for many years (except 2.6). The SDT believes that these requirements are still needed to ensure consistency for the various schemes which are used in SERC. Part 2.6 is designed to prevent spurious operations due to transient frequency swings.

Rationale for R3:
R4 of the NERC standard PRC-006-1 requires the PC to conduct assessments of UFLS schemes through dynamic simulations to verify that they meet performance requirements for generation/load imbalances of up to 25%. This requirement defines specific imbalances that are to be studied within SERC. The 13% and 22% levels were determined from simulations of the worst case frequency overshoot for the UFLS schemes in SERC.

Rationale for R4:
The SDT believes it is necessary to put a requirement on how well the UFLS scheme is implemented. This requirement specifies how close the actual load shedding amounts must be to the percentage of load called for in the scheme. A 4 percentage point range is allowed for each individual step, but the allowed range for all steps combined is 6 percentage points.

Rationale for R5:
The SDT believes it is necessary to put a requirement on how well the UFLS scheme is implemented. This requirement specifies how close the actual load shedding amounts must be to the percentage of load called for in the scheme. The SDT recognizes that UFLS entities with a load of less than 100 MW may have difficulty in implementing more than one UFLS step and in meeting a tight tolerance. The basis of the 100 MW comes from typical feeder load dropped by UFLS relays, and the use of a 100 MW threshold in other regional UFLS standards.

Rationale for R6:
The SDT believes it is necessary to put a requirement on how quickly changes to the scheme should be made. This requirement specifies that changes must be made within 18 months of notification by the PC. The 18 month interval was chosen to give a reasonable amount of time for making changes in the field. All of the SERC region has existing UFLS schemes which, based on periodic simulations, have provided reliable protection for years. Events which result in islanding and an activation of the UFLS schemes are extremely rare. Therefore, the SDT does not believe that changes to an existing UFLS scheme will be needed in less than 18 months. However, if a PC desires that changes to the UFLS scheme be made faster than that, then the PC may request the implementation to be done sooner than 18 months. The UFLS entity may oblige but will not be required to do so.

Rationale for R7:
The NERC standard requires that a UFLS database be maintained by the Planning Coordinator. This requirement specifies what data must be reported to SERC. A SERC UFLS database is needed to facilitate data sharing across the SERC Region, with other regions, and with NERC.

Rationale for R8:
The SDT believes that generator over and under frequency tripping data is needed to supplement the UFLS data provided by the Planning Coordinator for post-event analysis of frequency disturbances. This requirement states what data must be reported to SERC by the Generator Owners.
Since the inverse time curve cannot easily be placed into the SERC database, four clearing times based on data from the curve are requested. These clearing times are intended to cover a range of frequencies needed for event replication as well as provide information about generators that trip at a higher frequency than is allowed by the NERC standard.

Implementation Plan for Standard PRC-006-SERC-01
Automatic Underfrequency Load Shedding (UFLS) Requirements

Summary
The SERC UFLS Standard was developed to establish consistent and coordinated requirements for the design, implementation, and analysis of automatic underfrequency load shedding (UFLS) programs among all SERC applicable entities.

Prerequisite approvals
None

Modified standards
None

Compliance with standards
This standard is applicable to the Planning Coordinator (PC), Generator Owner (GO), and UFLS entities. UFLS entities shall mean all entities that are responsible for the ownership, operation, or control of UFLS equipment as required by the UFLS program established by the Planning Coordinators. Such entities may include Transmission Owners (TO) and Distribution Providers (DP).

Proposed effective dates
Requirement R1 shall become effective 12 months after the first day of the first quarter following regulatory approval, but no sooner than 12 months following regulatory approval of NERC PRC-006-1. This 12-month period is consistent with the effective date of R2 of PRC-006-1.

Requirement R2 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for entities to ensure a minimum time delay of six cycles on existing UFLS relays as specified in part 2.6.

Requirements R3 shall become effective 18 months after the first day of the first quarter following regulatory approval. This additional six-month period is needed to allow time to perform and coordinate studies necessary to assess the overall effectiveness of the UFLS schemes in the SERC Region.

Requirements R4, R5, and R6 shall become effective 30 months after the first day of the first quarter following regulatory approval. This additional 18 months is needed to allow time for any necessary changes to be made to the existing UFLS schemes in the SERC Region.

Requirement R7 shall become effective six months following the effective date of R8 of the NERC standard PRC-006-1, but no sooner than one year following the first day of the first calendar quarter after applicable regulatory approval of PRC-006-SERC-1. R8 of the NERC standard requires each UFLS entity to provide UFLS data to the Planning Coordinator (PC). R7 of the SERC standard requires the PC to provide this data to SERC.

Requirement R8 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for Generator Owners (GO) to collect and make an initial data filing.

Retired standards

Exhibit B

The NERC Board of Trustees' Resolution on the PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements Regional Reliability Standard

FURTHER RESOLVED, that the board approves the associated implementation plan, which provides the following **(Exhibit J)**:

(a) Upon regulatory approval, the standard will be mandatory and enforceable (with monetary penalties for non-compliance) to all applicable NERC registered entities within the Reliability*First* footprint;

FURTHER RESOLVED, that the board approves the Violation Risk Factors and the Violation Severity Levels for the proposed MOD-025-1-RFC-1 – Reactive Power Capability Reliability Standard **(Exhibit K)**;

FURTHER RESOLVED, that NERC Staff shall make the appropriate filings with ERO governmental authorities.

Reliability Standards: IRO-006-TRE-1: IRO and SOL Mitigation in the ERCOT Interconnection
On motion of Paul Barber, the board approved the following resolutions:

RESOLVED, that the board approves the IRO-006-TRE-1: IRO and SOL Mitigation in the ERCOT Interconnection Regional Reliability Standard **(Exhibit L)**;

FURTHER RESOLVED, that the board approves the associated implementation plan, which provides the following **(Exhibit M)**:

(a) An effective date of the first day of the first calendar quarter after applicable regulatory approval.

FURTHER RESOLVED, that the board approves the Violation Risk Factors and the Violation Severity Levels for the proposed IRO-006-TRE-1: IRO and SOL Mitigation in the ERCOT Interconnection Regional Reliability Standard d **(Exhibit N)**;

FURTHER RESOLVED, that NERC Staff shall make the appropriate filings with ERO governmental authorities.

Reliability Standards: PRC-006-SERC-1: Automatic Underfrequency Load Shedding (UFLS) Requirements
On motion of Paul Barber , the board approved the following resolutions:

RESOLVED, that the board approves the PRC-006-SERC-01 – Automatic Underfrequency Load Shedding (UFLS) Requirements Regional Reliability Standard **(Exhibit O)**;

FURTHER RESOLVED, that the board approves the associated implementation plan, which provides the following **(Exhibit P)**:

(b) The implementation is staged over a 30-month window to allow entities to respond to any changes in UFLS settings due to this standard. In addition, the implementation date of Requirement R1 is dependent on FERC adoption of the continent-wide standard PRC-006-1.

FURTHER RESOLVED, that the board approves the Violation Risk Factors and the Violation Severity Levels for the proposed PRC-006-SERC-01 – Automatic Underfrequency Load Shedding (UFLS) Requirements Regional Reliability Standard **(Exhibit Q)**;

FURTHER RESOLVED, that NERC Staff shall make the appropriate filings with ERO governmental authorities.

NERC Rules of Procedure Nonsubstantive Capitalization and Definition Changes
Rebecca Michael, associate general counsel, presented for approval the nonsubstantive capitalization and definition changes to NERC's Rules of Procedure.

On motion of Bruce Scherr , the board approved the following resolutions:

RESOLVED, that the board approves the proposed revisions to the NERC Rules of Procedure as set out in Agenda Item 7 to the board's November 3, 2011 agenda **(Exhibit R);**

FURTHER RESOLVED, that the board approves the proposed changes to all existing Appendices to the Rules of Procedure (Appendices 3A, 3B, 3C, 4A, 4B, 4C, 4D, 4E, 5A, 5B, 6, and 8) **(Exhibit S)**;

FURTHER RESOLVED, that the board approves the proposed new Appendix 2, Definitions of Terms Used in the Rules of Procedure **(Exhibit T)**;

FURTHER RESOLVED, that NERC Staff shall make the appropriate filings with ERO governmental authorities.

At the conclusion of this presentation, Chair Anderson invited discussion regarding the recommended substantive changes to the Rules of Procedure following the discussion occurring the previous day at the Member Representatives Committee meeting. No trustee responded.

Reinstatement of NERC Rules of Procedure Section 402.1.3.2
Ms. Michael reviewed and requested board approval for the reinstatement of NERC Rules of Procedure Section 402.1.3.2

On motion of Dave Goulding, the board approved the following resolution:

WHEREAS, the October 7, 2011 order of the Federal Energy Regulatory Commission ("FERC") denied NERC's request to remove Section 402.1.3.2 from NERC's Rules of Procedure and directed NERC to reinstate Section 402.1.3.2; and

Consideration of Comments on Regional Reliability Standard Automatic Underfrequency Load Shedding - PRC-006-SERC-01

The Regional Reliability Standards Working Group thanks all commenter's who submitted comments on the Regional Reliability Standard Automatic Underfrequency Load Shedding. These standards were posted for a 45-day public comment period from June 29, 2011 through August 15, 2011. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 9 sets of comments, including comments from 15 different people from approximately 13 companies representing 5 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/regional_standards/regional_reliability_standards_under_development.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

Index to Questions, Comments, and Responses

1. Was the proposed standard developed in a fair and open process, using the associated Regional Reliability Standards Development Procedure? 5
2. Does the proposed standard pose an adverse impact to reliability or commerce in a neighboring region or interconnection? 6
3. Does the proposed standard pose a serious and substantial threat to public health, safety, welfare, or national security? 8
4. Does the proposed standard pose a serious and substantial burden on competitive markets within the interconnection that is not necessary for reliability? 9
5. Does the proposed regional reliability standard meet at least one of the following criteria? 10
   - The proposed standard has more specific criteria for the same requirements covered in a continent-wide standard
   - The proposed standard has requirements that are not included in the corresponding continent-wide reliability standard
   - The proposed regional difference is necessitated by a physical difference in the bulk power system.
6. If you have any other comments that you have not already provided in the response to the prior questions, please provide them here. 13

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. Was the proposed standard developed in a fair and open process, using the associated Regional Reliability Standards Development Procedure?

Summary Consideration:

Organization	Yes or No	Question 1 Comment
LG&E and KU Energy	Yes	
Dominion	Yes	
NERC Staff Technical Review	Yes	
Duke Energy	Yes	
Exelon	Yes	
South Carolina Electric and Gas	Yes	
Georgia Transmission Corporation	Yes	
MISO		
Occidental Chemical Corporation	Yes	

2. Does the proposed standard pose an adverse impact to reliability or commerce in a neighboring region or interconnection?

Summary Consideration:

Organization	Yes or No	Question 2 Comment
LG&E and KU Energy	No	
Dominion	No	
NERC Staff Technical Review	No	
Duke Energy	No	
Exelon		
South Carolina Electric and Gas	No	
Georgia Transmission Corporation	No	
MISO		MISO is concerned that PRC-006-SERC-001 R2 is too prescriptive and may not allow Planning Coordinators the flexibility and discretion needed to ensure reliability. The Planning Coordinator is tasked with designing the UFLS system and coordinating that system with neighboring systems. PRC-006-SERC-001 R2 specifies acceptable ranges and limits in R2.3, R2.4, R2.5 and R2.6 for the UFLS design. The standard makes no provisions to accommodate a determination by a PC that the best performing design does not fit in with the specified set points and ranges in the standard. As noted in the standard, the set points specified in R2 reflect historic practice, but there may be sound technical justification to deviate from the set points scheme PRC-006-SERC-001 R2 proscribes. It is possible that effective coordination with neighboring systems may require a different approach (e.g. entities in MRO are investigating the reliability benefits of setting the frequency set point blocks at

Organization	Yes or No	Question 2 Comment
		less than 0.2 Hz apart to create finer system control). The explicit set point requirements in R2 would prohibit innovation/coordination of system design that deviated from standard without regard to the reliability benefits of deviating from historic practice.
Response: This is a technical comment that was previously addressed. **Based on the 2007 UFLS study there are already 18 different schemes being used within the SERC footprint. Removing the requirements specified in R2 may lead to even more diverse schemes and increase the probability of non-coordination within SERC. The requirements specified in R2 are presently included within approved SERC Regional Criteria. These SDT believes these requirements allow for a high degree of flexibility in developing a UFLS scheme while promoting proper coordination among neighboring schemes both within and outside SERC. The SDT does not believe there will be coordination issues with schemes in other regions since all of the schemes have to meet the performance characteristics in the NERC Standard.**		
Occidental Chemical Corporation	No	

3. Does the proposed standard pose a serious and substantial threat to public health, safety, welfare, or national security?

Summary Consideration:

Organization	Yes or No	Question 3 Comment
LG&E and KU Energy	No	
Dominion	No	
NERC Staff Technical Review	No	
Duke Energy	No	
Exelon	No	
South Carolina Electric and Gas	No	
Georgia Transmission Corporation	No	
MISO		
Occidental Chemical Corporation	No	

4. Does the proposed standard pose a serious and substantial burden on competitive markets within the interconnection that is not necessary for reliability?

Summary Consideration:

Organization	Yes or No	Question 4 Comment
LG&E and KU Energy	No	
Dominion	No	
NERC Staff Technical Review	No	
Duke Energy	No	
Exelon		
South Carolina Electric and Gas	No	
Georgia Transmission Corporation	No	
MISO		
Occidental Chemical Corporation	No	

5. Does the proposed regional reliability standard meet at least one of the following criteria?

- **The proposed standard has more specific criteria for the same requirements covered in a continent-wide standard**
- **The proposed standard has requirements that are not included in the corresponding continent-wide reliability standard**
- **The proposed regional difference is necessitated by a physical difference in the bulk power system.**

Summary Consideration:

Organization	Yes or No	Question 5 Comment
LG&E and KU Energy	Yes	
Dominion	Yes	
NERC Staff Technical Review	Yes	
Duke Energy	Yes	
Exelon	No	**[A]** This regional standard is not necessary for GOs due to the work that is being done under NERC Project 2007-09, PRC-024, "Generator Performance During Frequency and Voltage Excursions," and therefore suggest that the SERC UFLS Standard remove GOs from applicability section. **[B]** It is not clear that the criteria proposed in this standard are really more specific than the performance criteria proposed in the NERC Standard PRC-006,"Development and Documentation of Regional UFLS Programs," currently at the FERC. The intent of the threshold for additional Regional Standards is to address a Regional issue. There doesn't appear to be a particular issue to the SERC Region that is different than the rest of the Eastern Interconnection. Changing a setpoint value that already is an outcome of the performance criteria doesn't necessarily provide additional specificity. For a Region to have requirements that are not included in the continent-wide Standard

Organization	Yes or No	Question 5 Comment
		is problematic, there should be some geographic or electric justification for such a difference, otherwise the Requirements should be incorporated into the continent-wide Standard. Simply adding a Requirement that is not in the pending NERC Standard does not make the Regional Standard necessary. It is not clear that there is a physical difference between the power system of the SERC Region as compared with the rest of the Eastern Interconnection.
Response: This same concern was previously addressed. **A. Requirement R7 of the SERC UFLS standard requires additional generator data be provided to SERC above what is included in the current draft of PRC-024. The SDT feels this additional data is needed to adequately perform post event analysis of frequency disturbances. The SDT therefore believes that this standard should be applicable to GO's** **B. The primary purpose of the SERC regional Standard was to provide region specific requirements for the implementation of NERC standard PRC-006-1 requirements with the goal of adding clarity and providing consistency. The requirements already in the NERC standard were not repeated in the SERC standard. Not only do the requirements of the SERC Standard provide regional consistency and coordination, they also are more stringent than the national standard.**		
South Carolina Electric and Gas	Yes	The proposed standard has more specific criteria for the same requirements covered in a continent-wide standard
Response: Thank you for your comments.		
Georgia Transmission Corporation	Yes	
MISO		
Occidental Chemical Corporation	Yes	As a Generator Owner, Occidental Chemical will only be subject to PRC-006-SERC-01 Requirement R8 and its three sub-requirements. These call for GOs to provide SERC their generator frequency relay set points, clearing times, and maximum MW that could be separated from the system; within 30 days of a request. R8 further qualifies the reliability need is to "facilitate post-event analysis of frequency disturbances."However, SERC already has the authority to gather

Organization	Yes or No	Question 5 Comment
		disturbance-related information from Generator Operators under EOP-004-1. As with many Generator Owners, Occidental Chemical is also registered as a GOP, and would have to provide such information in support of Regional disturbance investigations. However, even organizations which do not support both functions would have to coordinate with each other to supply any system event-related information requests from SERC. If this is not sufficient, MOD-010-0 and MOD-012-0 require Generator Owners to provide static and dynamic generator modeling data in accordance with the Regional Entity's specification. It would seem that SERC's specification could be modified to accommodate frequency relay data without creating any new enforceable reliability requirements. We understand that the proposed requirements are not onerous and the data can be easily supplied. However, Occidental Chemical is uneasy about applying a Standard related to underfrequency Load shedding to generation. It implies a connection with other entities that does not exist and a protective function that serves a very different purpose.

Response:

The SDT disagrees. While Attachment 1-EOP-004 NERC Disturbance Report Form requires a report to be filed in response to an event where frequency or voltage goes "below the under-frequency or under-voltage load shed" set points, the form does not include the requirement to report the information spelled out in requirement R7 of PRC-006-SERC-01.

The MOD-010, MOD-012, and associated SERC regional criteria do not require that generator underfrequency and overfrequency protective setpoints be provided. Inclusion of this requirement in the standard ensures that the region receives necessary information. The SDT believes that including this requirement in the standard provides adequate notification to entities regarding providing specific data upon request to facilitate post-event analysis of frequency disturbances.

The SDT believes that this connection between generator underfrequency and overfrequency protection and UFLS protection does exist. While the generator protective function may serve a very different purpose, protection of the generating unit versus protecting the transmission system, both must be coordinated since units that trip offline during an under frequency event remove generation which may aggravate the event.

6. If you have any other comments that you have not already provided in the response to the prior questions, please provide them here.

Summary Consideration:

Organization	Yes or No	Question 6 Comment
LG&E and KU Energy		In R8, LG&E and KU Energy's GO would recommend 45 days, rather than 30 days, simply because while a Company is performing their post-event analysis it normally takes longer than 30 days to collect data with appropriate approvals. As an example, if an event happened in early December of a given year, it might prove difficult to get the appropriate agreement/approvals on data to submit within 30 days in a month that typically has personnel on holiday/vacations. Providing for a 45-day response would minimize this possible occurrence without harming overall system reliability.
Response: **The SDT feels that 30 days is adequate for the Generator Owner to provide the information required in R8.1, R8.2 and R8.3. This information should be readily available from the GO and does not require the GO to perform a post event analysis. In the event of an actual frequency disturbance it is imperative that SERC receives this information in a timely manner in order to perform an event analysis within the 90 day requirement specified by NERC.**		
Dominion		
NERC Staff Technical Review		We support the following observations made during the Quality Review: General Observations **[A]** o The standard references the SERC sub-region but it is not defined. **[B]** o The SERC Region is referenced in the requirements. The RE is not normally referenced in each of the requirements. **[C]** Requirement R1: 1.1 should be a bullet since it is not a requirement.

Organization	Yes or No	Question 6 Comment
		[D] Requirement R2: Is (percent of load to be shed, frequency set points, and time delays) needed in the main requirement since they are spelled out in the sub-requirements? **[E]** 2.3.1 is not a sub-requirement because it is an exclusion. Consider making it the last sentence in 2.3 Requirement **[F]** R3: Imbalance is used two times. Consider referring back to first imbalance and clarifying second imbalance by adding 'such' before the second imbalance. **[G]** R3 references a specific NERC standard and requirement within that standard - it is generally best not to have a specific reference to another standard. If the referenced standard changes then the standard making the references needs to be updated. **[H]** General observation: Since the SERC standard does not replace the NERC standard and it is noted in the Guideline and Technical Basis that both the SERC and NERC standards must be followed to ensure full compliance does R3 have the potential for double jeopardy? Requirement **[I]** R4: 'Shall be responsible for implementing' is passive - consider changing to 'shall implement'. Requirement **[J]** R5: 'Shall be responsible for implementing' is passive - consider changing to 'shall implement'. Requirement **[K]** R6: The requirement lists 'which involve frequency settings, relay time delays, and changes'. Are there settings that do not involve the above? Since the above was listed are there settings that do not have to be changed within 18 months? The requirement reads like those are the only settings that will need changes within 18 months. Is the intent to limit it to these parameters or are they examples? **[L]** Requirement R7: Is it clear to the PC who within SERC this requirement is referencing? Should this be more specific about what department or area in SERC? Requirement **[M]** R8: General Observation: This is the only requirement that references the Generator Owner. The GO only has to provide information and does not have not to make any changes. Is there another standard that provides the responsibilities of the GO other than providing information?
Response: **A. A note on subregions was added to the text box for R1 referencing the SERC Bylaws.**		

Organization	Yes or No	Question 6 Comment
B. The phrase "in the SERC Region" does not appear in R1 and R8, but did appear and has been deleted from R2, R3, R6, and R7. The phrase is needed in R4 and R5 since a UFLS Entity may have load in more than one Regional Entity. C. Part 1.1 was changed to a bullet. D. The phrase was added to provide clarity for what is meant by "the UFLS scheme." E. Part 2.3.1 was the last sentence of 2.3 in Draft 7, but was separated into a separate part based on a recommendation from a quality review by SERC Legal. The concern was that this exclusion distracted from the main focus of 2.3, and caused some confusion. Part 2.3.1 was changed to a bullet to make it consistent with R1. F. The word "such" was added before the second 'imbalance." G. References to the specific requirement and the NERC standard number was removed for the requirement and added to the text box for R3. H. The SDT was concerned with possible double jeopardy and tried to avoid any such issues in the design of the SERC standard. However, the SDT also felt strongly that more specificity was needed on what addressed the "up to" 25% imbalance requirement in R3 of the NERC standard. By specifying the three imbalance levels that are to be simulated, R3 of the SERC standard defines what is required in the SERC region to meet the "up to" requirement in R3 of the NERC standard. However, R3 was revised to clarify the intent. I. The phrase has been changed to "shall implement." Other revisions were made to R4 to clarify the intent. J. The phrase has been changed to "shall implement." Other revisions were made to R5 to clarify the intent. K. These three parameters generally define a UFLS scheme. Typically a UFLS Entity annually only needs to make changes to a few UFLS relays due to load growth to ensure both the load shed per step and total load shed is within scheme tolerances. However, if the PC makes changes to frequency settings, relay time delays, and/or changes to the percentage of load in the scheme, it typically could require the UFLS Entities to make field adjustments to a majority of their UFLS relays, and may require installation of addition UFLS relaying. This could be a significant effort which would require much more time to complete than that allowed in R4 and R5. L. This should not be a problem for the PC. SERC has data reporting processes which involve entity notification of data requirements and data submittal through SERC portal forms or bulk upload templates. SERC stakeholders currently report this same UFLS data through a SERC compliance data reporting process. M. SERC has no other standards and no current plans to develop additional standards. While the GO has only a data reporting requirement in this standard, it is felt that this standard is the appropriate place to document that requirement.		

Organization	Yes or No	Question 6 Comment
Duke Energy		
Exelon		**[A]** For GOs there needs to be close integration with Standards being developed by NERC. Similar to other Regions, SERC PRC-006-01 should be suspended until NERC Project 2007-09 and NERC Project 2007-01 are complete. PRC-006-FRCC-01 is currently on hold in the FRCC Region with the status "pending the completion of the NERC Reliability Standard Development Project 2007-01 "Underfrequency Load Shedding."PRC-006-MRO-01 is currently on hold in the MRO Region with the status "suspended."PRC-006-TRE-01 is also currently on hold in the TRE Region with the status "following the progress of the NERC UFLS SDT."Exelon suggests that the SERC SDT also suspend progress on SERC PRC-006-01 and similarly follow the progress of NERC Projects 2007-09 and 2007-01. At that time SERC should reevaluate if additional Regional guidance is necessary. **[B]** Consideration should be given to ensure that Planning Coordinators not be given the ability to develop defacto NERC Requirements without due process. For example; the Planning Coordinator will have the sole discretion to determine what an island is, determine needed remediation, and determine the UFLS scheme in general without a process for stakeholders to formally interact. **[C]** For SERC PRC-006-01 the settings should align with the pending NERC Standard PRC-006-1, for the load shedding setting the error bandwidth is too broad and the criteria determination for an island is not clear. As stated previously, Exelon does not see the need for Regional Standard when a NERC Standard will likely be approved by FERC.

Response:

A. While some regions have suspended work on their regional UFLS standards, other regions (e.g. RFC, SPP, and NPCC) are proceeding. The SDT believes that the current NERC PRC-006-1 standard is sufficiently well developed such that moving forward with SERC Standard PRC-006-SERC-01 is beneficial, even though the NERC standard, which was Board Approved November 10, 2010, is still in the final regulatory approval process. SERC Standard PRC-006-SERC-01 provides additional clarity and specificity to the requirements stated in the NERC UFLS standard that the SDT believes are necessary for effective implementation of UFLS within the SERC Region (as is stated in the Guideline and Technical Basis item #1 of PRC-006-SERC-01). The guidance and direction provided in SERC Standard PRC-006-SERC-01 is beneficial. With respect to the comment that "For GOs there needs to be close coordination," the SERC UFLS standard imposes a reporting only requirement for a limited number of existing generator parameters.

Organization	Yes or No	Question 6 Comment
B. The SERC UFLS standard does not give the Planning Coordinator the ability to develop defacto NERC (or SERC) requirements. The SERC UFLS standard simply provides more specific guidance on how the Planning Coordinator is to execute its essential responsibilities, which have been assigned by the NERC UFLS standard. **C. The NERC UFLS standard does not specify any bandwidth for the amount of load to be shed by various UFLS entities. SERC Standard PRC-006-SERC-01 attempts to provide a reasonable margin for the amount of load to enable for UFLS, with additional margin given to smaller UFLS entities which may have difficulty in achieving a precise load percentage due to a limited number of loads and/or feeders. The SDT believes that the bandwidths specified are reasonable, given the practical considerations of implementing the settings in the field. The criteria for determining islands are addressed in the NERC PRC-006-1 standard.**		
South Carolina Electric and Gas		
Georgia Transmission Corporation		**1.** R1 seems to have subject/verb confusion as written and the terms "when developing criteria" suggests that the PC would only have to comply ever so often "when developing criteria". The measurement and VSL suggests the intent of the requirement is for each PC to "develop criteria". The following is suggested: R1. Each Planning Coordinator shall develop criteria for selecting portions of the BPS that may form islands. The criteria shall: 1.1 include its SERC subregion as an identified island 1.1.1 A Planning Coordinator may adjust island boundaries to differ from subregional boundaries where necessary for the sole purpose of producing a contiguous subregional island more suitable for simulation. **2.** M4 identifies a specific target implementation date of "May 1 of each calendar year" which is not identified in the requirement. **3.** Should R2 identify a time qualifier to compliment M4...such as "the PC shall annually select or develop an automatic UFLS scheme"? **4.** There is circular confusion within M4 and R5. It appears that the PC will develop a UFLS scheme on an annual basis and expect the UFLS entity to implement it. The UFLS entity could then implement it by May 1 according to M4, or recognize it as a change from the previous year's scheme and implement it within 18 months according to R5. Additionally, It seems based on M4, that the annually developed UFLS scheme target date of May 1 could come before a previously

Organization	Yes or No	Question 6 Comment
		"changed" UFLS scheme with an 18 month target date.
Response: **1. The requirement to develop criteria for selecting portions of the BPS that may form islands is in NERC Standard PRC-006-1. The SERC Requirement R1 says that the criteria must include the subregion as an island. The SDT revised R1 to provide additional clarity.** **2. May 1 is the date that the implementation of the UFLS scheme will be measured each year. The SDT revised R4 and R5 to provide additional clarity.** **3. No. It is not anticipated that the UFLS scheme will change annually. R2 requires the PC's UFLS scheme to meet certain requirements. The scheme does not have to be updated annually. The implementation of the scheme will be checked annually as indicated by R4 and R5.** **4. The PC will not annually develop a UFLS scheme. Changes to the scheme will be rare. As indicated in M4, if scheme changes are in progress (the 18 month period), the requirements of R4 do not have to be met. A more detailed explanation is provided in item # 4 of the Guideline and Technical Basis section located at the end of the standard.**		
MISO		MISO believes that the prescriptive requirements for setting frequency set points in PRC-006-SERC-001 are inconsistent with NERC Standard PRC-006-1. The NERC standard requires each Planning Coordinator to develop a UFLS program for its area, and gives the PC substantial discretion to devise specific frequency set points and UFLS block schemes to achieve system condition or performance goals. PRC-006-SERC-001 R2 usurps this grant of discretion by mandating that frequency set points be within a prescriptive range that limits not only the highest and lowest points, but also the number and range of set point blocks that a PC can establish without regard to unique system conditions or coordination with neighboring systems.

This regional standard is not necessary for GOs due to the work that is being done under NERC Project 2007-09, PRC-024, "Generator Performance During Frequency and Voltage Excursions," and therefore suggest that the SERC UFLS Standard remove GOs from applicability section. It is not clear that the criteria proposed in this standard are really more specific than the performance criteria proposed in the NERC Standard PRC-006,"Development and Documentation of Regional UFLS Programs," currently at the FERC. The intent of the threshold for additional Regional Standards is to address a Regional issue. There doesn't appear to be a particular issue to the SERC Region that is different than the rest of the Eastern Interconnection. Changing a setpoint value that already is an outcome of the performance criteria doesn't necessarily provide additional specificity. For a Region to have requirements that are not included in the continent-wide Standard is problematic, there should

be some geographic or electric justification for such a difference, otherwise the Requirements should be incorporated into the continent-wide Standard. Simply adding a Requirement that is not in the pending NERC Standard does not make the Regional Standard necessary. It is not clear that there is a physical difference between the power system of the SERC Region as compared with the rest of the Eastern Interconnection.
For GOs there needs to be close integration with Standards being developed by NERC. Similar to other Regions, SERC PRC-006-01 should be suspended until NERC Project 2007-09 and NERC Project 2007-01 are complete. PRC-006-FRCC-01 is currently on hold in the FRCC Region with the status "pending the completion of the NERC Reliability Standard Development Project 2007-01 "Underfrequency Load Shedding." PRC-006-MRO-01 is currently on hold in the MRO Region with the status "suspended." PRC-006-TRE-01 is also currently on hold in the TRE Region with the status "following the progress of the NERC UFLS SDT." Exelon suggests that the SERC SDT also suspend progress on SERC PRC-006-01 and similarly follow the progress of NERC Projects 2007-09 and 2007-01. At that time SERC should reevaluate if additional Regional guidance is necessary. Consideration should be given to ensure that Planning Coordinators not be given the ability to develop defacto NERC Requirements without due process. For example; the Planning Coordinator will have the sole discretion to determine what an island is, determine needed remediation, and determine the UFLS scheme in general without a process for stakeholders to formally interact. For SERC PRC-006-01 the settings should align with the pending NERC Standard PRC-006-1, for the load shedding setting the error bandwidth is too broad and the criteria determination for an island is not clear. As stated previously, Exelon does not see the need for Regional Standard when a NERC Standard will likely be approved by FERC.

Individual
Kelsey Colvin
MISO
MISO is concerned that PRC-006-SERC-001 R2 is too prescriptive and may not allow Planning

Coordinators the flexibility and discretion needed to ensure reliability. The Planning Coordinator is tasked with designing the UFLS system and coordinating that system with neighboring systems. PRC-006-SERC-001 R2 specifies acceptable ranges and limits in R2.3, R2.4, R2.5 and R2.6 for the UFLS design. The standard makes no provisions to accommodate a determination by a PC that the best performing design does not fit in with the specified set points and ranges in the standard. As noted in the standard, the set points specified in R2 reflect historic practice, but there may be sound technical justification to deviate from the set points scheme PRC-006-SERC-001 R2 proscribes. It is possible that effective coordination with neighboring systems may require a different approach (e.g. entities in MRO are investigating the reliability benefits of setting the frequency set point blocks at less than 0.2 Hz apart to create finer system control). The explicit set point requirements in R2 would prohibit innovation/coordination of system design that deviated from standard without regard to the reliability benefits of deviating from historic practice.

MISO believes that the prescriptive requirements for setting frequency set points in PRC-006-SERC-001 are inconsistent with NERC Standard PRC-006-1. The NERC standard requires each Planning Coordinator to develop a UFLS program for its area, and gives the PC substantial discretion to devise specific frequency set points and UFLS block schemes to achieve system condition or performance goals. PRC-006-SERC-001 R2 usurps this grant of discretion by mandating that frequency set points be within a prescriptive range that limits not only the highest and lowest points, but also the number and range of set point blocks that a PC can establish without regard to unique system conditions or coordination with neighboring systems.

No

Yes

We support the following observations made during the Quality Review: General Observations • The standard references the SERC sub-region but it is not defined. • The SERC Region is referenced in the requirements. The RE is not normally referenced in each of the requirements. Requirement R1: 1.1 should be a bullet since it is not a requirement. Requirement R2: Is (percent of load to be shed, frequency set points, and time delays) needed in the main requirement since they are spelled out in the sub-requirements? 2.3.1 is not a sub-requirement because it is an exclusion. Consider making it the last sentence in 2.3 Requirement R3: Imbalance is used two times. Consider referring back to first imbalance and clarifying second imbalance by adding ‘such’ before the second imbalance. R3 references a specific NERC standard and requirement within that standard – it is generally best not to have a specific reference to another standard. If the referenced standard changes then the standard making the references needs to be updated. General observation: Since the SERC standard does not replace the NERC standard and it is noted in the Guideline and Technical Basis that both the SERC and NERC standards must be followed to ensure full compliance does R3 have the potential for double jeopardy? Requirement R4: ‘Shall be responsible for implementing’ is passive – consider changing to ‘shall implement’. Requirement R5: ‘Shall be responsible for implementing’ is passive – consider changing to ‘shall implement’. Requirement R6: The requirement lists ‘which involve frequency settings, relay time delays, and changes’. Are there settings that do not involve the above? Since the above was listed are there settings that do not have to be changed within 18 months? The

requirement reads like those are the only settings that will need changes within 18 months. Is the intent to limit it to these parameters or are they examples? Requirement R7: Is it clear to the PC who within SERC this requirement is referencing? Should this be more specific about what department or area in SERC? Requirement R8: General Observation: This is the only requirement that references the Generator Owner. The GO only has to provide information and does not have not to make any changes. Is there another standard that provides the responsibilities of the GO other than providing information?

No
Yes
As a Generator Owner, Occidental Chemical will only be subject to PRC-006-SERC-01 Requirement R8 and its three sub-requirements. These call for GOs to provide SERC their generator frequency relay set points, clearing times, and maximum MW that could be separated from the system; within 30 days of a request. R8 further qualifies the reliability need is to “facilitate post-event analysis of frequency disturbances.” However, SERC already has the authority to gather disturbance-related information from Generator Operators under EOP-004-1. As with many Generator Owners, Occidental Chemical is also registered as a GOP, and would have to provide such information in support of Regional disturbance investigations. However, even organizations which do not support both functions would have to coordinate with each other to supply any system event-related information requests from SERC. If this is not sufficient, MOD-010-0 and MOD-012-0 require Generator Owners to provide static and dynamic generator modeling data in accordance with the Regional Entity’s specification. It would seem that SERC’s specification could be modified to accommodate frequency relay data without creating any new enforceable reliability requirements. We understand that the proposed requirements are not onerous and the data can be easily supplied. However, Occidental Chemical is uneasy about applying a Standard related to underfrequency Load shedding to generation. It implies a connection with other entities that does not exist and a protective function that serves a very different purpose.

Implementation Plan for Standard PRC-006-SERC-01
Automatic Underfrequency Load Shedding (UFLS) Requirements

Summary
The SERC UFLS Standard was developed to establish consistent and coordinated requirements for the design, implementation, and analysis of automatic underfrequency load shedding (UFLS) programs among all SERC applicable entities.

Prerequisite approvals
None

Modified standards
None

Compliance with standards
This standard is applicable to the Planning Coordinator (PC), Generator Owner (GO), and UFLS entities. UFLS entities shall mean all entities that are responsible for the ownership, operation, or control of UFLS equipment as required by the UFLS program established by the Planning Coordinators. Such entities may include Transmission Owners (TO) and Distribution Providers (DP).

Proposed effective dates
Requirement R1 shall become effective 12 months after the first day of the first quarter following regulatory approval, but no sooner than 12 months following regulatory approval of NERC PRC-006-1. This 12-month period is consistent with the effective date of R2 of PRC-006-1.

Requirement R2 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for entities to ensure a minimum time delay of six cycles on existing UFLS relays as specified in part 2.6.

Requirements R3 shall become effective 18 months after the first day of the first quarter following regulatory approval. This additional six-month period is needed to allow time to perform and coordinate studies necessary to assess the overall effectiveness of the UFLS schemes in the SERC Region.

Requirements R4, R5, and R6 shall become effective 30 months after the first day of the first quarter following regulatory approval. This additional 18 months is needed to allow time for any necessary changes to be made to the existing UFLS schemes in the SERC Region.

Requirement R7 shall become effective six months following the effective date of R8 of the NERC standard PRC-006-1, but no sooner than one year following the first day of the first calendar quarter after applicable regulatory approval of PRC-006-SERC-1. R8 of the NERC standard requires each UFLS entity to provide UFLS data to the Planning Coordinator (PC). R7 of the SERC standard requires the PC to provide this data to SERC.

Requirement R8 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for Generator Owners (GO) to collect and make an initial data filing.

Retired standards
None

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development steps completed:

1. SAR accepted by SERC Standards Committee (February 27, 2008).
2. SAR approved by EC Executive Committee (April 25, 2008).
3. SAR posted for comment (April 25, 2008 through May 27, 2008).
4. Revised SAR and response to comments approved by EC Executive Committee (June 16, 2008).
5. SDT appointed on (June 19, 2008).
6. Draft 1 of proposed standard posted (September 19, 2008 through October 20, 2008).
7. Draft 2 of proposed standard posted (November 21, 2008 through December 22, 2008).
8. Draft 3 of proposed standard posted for information (February 9, 2009).
9. Draft 3a of proposed standard posted (September 15, 2009 through October 15, 2009).
10. Draft 4 of proposed standard posted for a 15-day pre-ballot review (October 27, 2009 through November 10, 2009).
11. Draft 4 of proposed standard ballot open (November 13 through 23, 2009). Ballot made quorum with 92.9% votes (minimum of 66.7%). Approval of 48.5% (minimum of 66.7% of weighted sector votes required). Standard was not approved.
12. Draft 5 of proposed standard posted (September 21, 2010 through October 21, 2010).
13. Draft 6 of proposed standard posted for a 15-day pre-ballot review (November 22, 2010 through December 8, 2010).
14. Draft 6 ballot open December 9 through 20, 2010: Quorum count of 65.7% (minimum of 66.7% of ballot pool votes required, 23 of a possible 35 votes received, did not make quorum). Approval vote of 61.1% (minimum of 66.7% of weighted sector votes required, standard would not have been approved).
15. Draft 7 of proposed standard posted (February 22 through March 24, 2011).
16. Draft 8 of proposed standard posted for pre-ballot review (April 29 through May 23, 2011).
17. Draft 8 ballot open May 24 through June 6, 2011: Quorum count of 91.2% (minimum of 66.7% of ballot pool votes required) 31 of a possible 34 votes received, made quorum. Approval vote of 77.2% (minimum of 66.7% of weighted sector votes required). Standard was approved.

Proposed action plan and description of current draft:
This is Draft 8 of the proposed standard which received Ballot Pool approval on June 6, 2011.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Request NERC to review and post for comments.	June 22, 2011
2. Resolve comments from NERC posting.	August 26, 2011
3. SERC Board Executive Committee adopts standard.	September 21, 2011
4. Submit request to NERC for approval and filing with FERC.	September 29, 2011
5. NERC files standard with FERC.	To be determined.

Effective dates:

Requirement R1 shall become effective 12 months after the first day of the first quarter following regulatory approval, but no sooner than 12 months following regulatory approval of NERC PRC-006-1. This 12-month period is consistent with the effective date of R2 of PRC-006-1.

Requirement R2 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for entities to ensure a minimum time delay of six cycles on existing UFLS relays as specified in part 2.6.

Requirements R3 shall become effective 18 months after the first day of the first quarter following regulatory approval. This additional six-month period is needed to allow time to perform and coordinate studies necessary to assess the overall effectiveness of the UFLS schemes in the SERC Region.

Requirements R4, R5, and R6 shall become effective 30 months after the first day of the first quarter following regulatory approval. This additional 18 months is needed to allow time for any necessary changes to be made to the existing UFLS schemes in the SERC Region.

Requirement R7 shall become effective six months following the effective date of R8 of the NERC standard PRC-006-1, but no sooner than one year following the first day of the first calendar quarter after applicable regulatory approval of PRC-006-SERC-1. R8 of the NERC standard requires each UFLS entity to provide UFLS data to the Planning Coordinator (PC). R7 of the SERC standard requires the PC to provide this data to SERC.

Requirement R8 shall become effective 12 months after the first day of the first quarter following regulatory approval. This 12-month period is needed to allow time for Generator Owners to collect and make an initial data filing.

Revision History

Version	Date	Action	Change Tracking
Draft 1	September 19 2008 thru October 20, 2008	Posted for 1st comment period	Initial version
Draft 2	November 21, 2008 thru December 22, 2008	Posted for 2nd comment period	Revised to address comments received on Draft 1 and to include measures and compliance sections
Draft 3	February 9, 2009	Posted for information	Revised to address comments received on Draft 2
Draft 3a	September 15, 2009 thru October 15, 2009	Posted for 3rd comment period	Revised to make consistent with Draft 2 of NERC continent-wide standard
Draft 4	October 27, 2009 thru November 10, 2009	Posted for pre-ballot review	Revised to address comments received on Draft 3a
Draft 5	September 21, 2010 thru October 21, 2010	Posted for 30-day comment period	Revised to address comments received on Draft 4 ballot and to make consistent with latest draft of NERC continent-wide standard
Draft 6	November 23, 2010 thru December 8, 2010	Posted for pre-ballot review	Revised to address comments received on Draft 5
Draft 7	February 22 thru March 24, 2011	Posted for 30-day comment period	Revised to address comments received on ballot of Draft 6
Draft 8	April 29, 2011 thru May 23, 2011	Posted for pre-ballot review	Revised to address comments received on Draft 7

Definitions of terms used in standard

This section includes all newly-defined or revised terms used in the proposed standard. Terms already defined in the NERC Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

Introduction

1. **Title:** Automatic Underfrequency Load Shedding Requirements

2. **Number:** PRC-006-SERC–01

3. **Purpose:** To establish consistent and coordinated requirements for the design, implementation, and analysis of automatic underfrequency load shedding (UFLS) programs among all SERC applicable entities.

4. **Applicability:**
   - 4.1 Planning Coordinators
   - 4.2 UFLS entities shall mean all entities that are responsible for the ownership, operation, or control of UFLS equipment as required by the UFLS program established by the Planning Coordinators. Such entities may include one or more of the following:
     - 4.2.1 Transmission Owners
     - 4.2.2 Distribution Providers
   - 4.3 Generator Owners

5. **Background**

   The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

   When reliability standards were implemented in 2007, the Federal Energy Regulatory Commission ("FERC"), which is the government body with regulatory responsibility for electric reliability, issued FERC Order 693, recognizing 83 NERC Reliability Standards as enforceable by FERC and applicable to users, owners, and operators of the bulk power system (BPS). FERC did not approve the NERC UFLS standard, PRC-006-0 in Order 693. FERC's reason for not approving PRC-006-0 was that it recognized PRC-006-0 as a "fill-in the blank standard," and regional procedures associated with the standard were not submitted along with the standard. FERC's ruling in Order 693 required Regional Entities to provide the regional requirements necessary for completing the UFLS standard.

   In 2008, SERC commenced work on PRC-006-SERC-01. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the NERC UFLS standard.

   PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. The regional standard adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Requirements and Measures

R1. Each Planning Coordinator shall include its SERC subregion as an identified island when developing criteria for selecting portions of the BPS that may form islands. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1 A Planning Coordinator may adjust island boundaries to differ from subregional boundaries where necessary for the sole purpose of producing a contiguous subregional island more suitable for simulation.

M1. Each Planning Coordinator shall have evidence such as a methodology, procedure, report, or other documentation indicating that its criteria included selection of its SERC subregion(s) as an island per Requirement R1.

Studying the Region as an island is required by the NERC standard. Most regions have only one or a few different UFLS schemes. Where there is more than one scheme, studying this island demonstrates that the schemes are coordinated and performing adequately. Because there are so many different UFLS schemes in SERC (18 different schemes were represented in the 2007 SERC UFLS study), the SDT believes that applying the schemes to each subregion as an island is a necessary additional test of the coordination of the various UFLS schemes. Without this additional test, a poorly performing scheme may be masked by the large number of good performing schemes in the Region. A subregion island study, which would have a smaller number of schemes, would be more likely to uncover the poorly performing scheme and therefore get it fixed. This approach will result in a much better overall performance of the UFLS programs in SERC. The SDT recognized that there may be simulation problems due to opening the ties to utilities outside the subregion. Therefore, the subregion island boundaries are allowed to be adjusted to produce an island more suitable for simulation.

R2. Each Planning Coordinator in the SERC Region shall select or develop an automatic UFLS scheme (percent of load to be shed, frequency set points, and time delays) for implementation by UFLS entities within its area that meets the following minimum requirements: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. Have the capability of shedding at least 30 percent of the Peak Demand (MW) served from the Planning Coordinator's transmission system.

2.2. Shed load with a minimum of three frequency set points.

2.3. The highest frequency set point for relays used to arrest frequency decline shall be no lower than 59.3 Hz and not higher than 59.5 Hz.

2.3.1 This does not apply to UFLS relays with time delay of one second or longer and a higher frequency setpoint applied to prevent the frequency from stalling at less than 60 Hz when recovering from an underfrequency event.

2.4. The lowest frequency set point shall be no lower than 58.4 Hz.

2.5. The difference between frequency set points shall be at least 0.2 Hz but no greater than 0.5 Hz.

2.6. Time delay (from frequency reaching the set point to the trip signal) shall be at least six cycles.

M2. Each Planning Coordinator shall have evidence such as reports or other documentation that the UFLS scheme for its area meets the design requirements specified in Requirement R2.

These requirements for the UFLS schemes in SERC have been in place for many years (except 2.6). The SDT believes that these requirements are still needed to ensure consistency for the various schemes which are used in SERC. Part 2.6 is designed to prevent spurious operations due to transient frequency swings.

R3. Each Planning Coordinator in the SERC Region shall conduct simulations of its UFLS scheme for an imbalance between load and generation of 13%, 22%, and 25% for all identified island(s) where imbalance equals [(load minus actual generation output) / load]. These simulation requirements apply to the UFLS assessments specified in R4 of the NERC UFLS standard PRC-006-1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

M3. Each Planning Coordinator shall have evidence such as reports or other documentation that it performed the simulations of its UFLS scheme as required in Requirement R3.

The NERC standard requires that schemes meet performance requirements for generation/load imbalances of up to 25%. This requirement defines specific imbalances that are to be studied within SERC. The 13% and 22% levels were determined from simulations of the worst case frequency overshoot for the UFLS schemes in SERC.

R4. Each UFLS entity that has a total load of 100 MW or greater in a Planning Coordinator area in the SERC Region shall be responsible for implementing the UFLS scheme developed by their Planning Coordinator. UFLS entities may coordinate with other UFLS entities to implement the UFLS scheme developed by the Planning Coordinator responsible for their collective systems. The UFLS scheme shall meet the following requirements. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1. The percent of load shedding to be implemented shall be based on the actual or estimated distribution substation or feeder demand (including losses) of the UFLS entities at the time coincident with the previous year actual Peak Demand.

4. 2. The amount of load in each load shedding step shall be within -1.0 and +3.0 of the percentage specified by the Planning Coordinator (for example, if the specified percentage step load shed is 12%, the allowable range is 11 to 15%).

4. 3. The amount of total UFLS load of all steps combined shall be within -1.0 and +5.0 of the percentage specified by the Planning Coordinator for the total UFLS load in the UFLS scheme.

M4. Each UFLS entity that has a total load of 100 MW or greater in a Planning Coordinator area in the SERC Region shall have evidence such as reports or other documentation demonstrating that its implementation of the UFLS scheme on May 1 of each calendar year meets the requirements of Requirement R4 unless scheme changes per Requirement R6 are in process.

The SDT believes it is necessary to put a requirement on how well the UFLS scheme is implemented. This requirement specifies how close the actual load shedding amounts must be to the percentage of load called for in the scheme. A 4 percentage point range is allowed for each individual step, but the allowed range for all steps combined is 6 percentage points.

R5. Each UFLS entity that has a total load less than 100 MW in a Planning Coordinator area in the SERC Region shall be responsible for implementing the UFLS scheme developed by their Planning Coordinator, but shall not be required to have more than one UFLS step. UFLS entities may coordinate with other UFLS entities to implement the UFLS scheme developed by the Planning Coordinator responsible for their collective systems. The UFLS scheme shall meet the following requirements. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

.

5.1. The percent of load shedding to be implemented shall be based on the actual or estimated distribution substation or feeder demand (including losses) of the UFLS entities at the time coincident with the previous year actual Peak Demand.

5.2. The amount of total UFLS load shall be within ± 5.0 of the percentage specified by the Planning Coordinator for the total UFLS load in the UFLS scheme.

M5. Each UFLS entity that has a total load less than 100 MW in a Planning Coordinator area in the SERC Region shall have evidence such as reports or other documentation demonstrating that its implementation of the UFLS scheme on May 1 of each calendar year meets the requirements of Requirement R5 unless scheme changes per Requirement R6 are in process.

The SDT believes it is necessary to put a requirement on how well the UFLS scheme is implemented. This requirement specifies how close the actual load shedding amounts must be to the percentage of load called for in the scheme. The SDT recognizes that UFLS entities with a load of less than 100 MW may have difficulty in implementing more than one UFLS step and in meeting a tight tolerance. The basis of the 100 MW comes from typical feeder load dropped by UFLS relays, and the use of a 100 MW threshold in other regional UFLS standards.

R6. Each UFLS entity in the SERC Region shall implement changes to the UFLS scheme which involve frequency settings, relay time delays, or changes to the percentage of load in the scheme within 18 months of notification by the Planning Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each UFLS entity shall have evidence such as reports or other documentation demonstrating that it has made the appropriate scheme changes within 18 months per Requirement R6.

The SDT believes it is necessary to put a requirement on how quickly changes to the scheme should be made. This requirement specifies that changes must be made within 18 months of notification by the PC. The 18 month interval was chosen to give a reasonable amount of time for making changes in the field. All of the SERC region has existing UFLS schemes which, based on periodic simulations, have provided reliable protection for years. Events which result in islanding and an activation of the UFLS schemes are extremely rare. Therefore, the SDT does not believe that changes to an existing UFLS scheme will be needed in less than 18 months. However, if a PC desires that changes to the UFLS scheme be made faster than that, then the PC may request the implementation to be done sooner than 18 months. The UFLS entity may oblige but will not be required to do so.

R7. Each Planning Coordinator in the SERC Region shall provide the following information to SERC according to the schedule specified by SERC. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1. Underfrequency trip set points (Hz)

7.2. Total clearing time associated with each set point (sec). This includes the time from when frequency reaches the set point and ends when the breaker opens.

7.3. Amount of previous year actual or estimated load associated with each set point, both in percent and in MW. The percentage and the Load demand (MW) shall be based on the time coincident with the previous year actual Peak Demand.

M7. Each Planning Coordinator shall have evidence such as reports or other documentation that data specified in Requirement R7 was provided to SERC in accordance with the schedule.

The NERC standard requires that a UFLS database be maintained by the Planning Coordinator. This requirement specifies what data must be reported to SERC. A SERC UFLS database is needed to facilitate data sharing across the SERC Region, with other regions, and with NERC.

R8. Each Generator Owner shall provide the following information within 30 days of a request by SERC to facilitate post-event analysis of frequency disturbances. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1. Generator protection automatic underfrequency and overfrequency trip set points (Hz).

8.2. Total clearing time associated with each set point (sec). This is defined as the time that begins when frequency reaches the set point and ends when the breaker opens. If inverse time underfrequency relays are used, provide the total clearing time at 59.0, 58.5, 58.0, and 57.0 Hz.

8.3. Maximum generator net MW that could be tripped automatically due to an underfrequency or overfrequency condition.

M8. Each Generator Owner shall have evidence such as reports or other documentation that data specified in Requirement R8 was provided to SERC as requested.

The SDT believes that generator over and under frequency tripping data is needed to supplement the UFLS data provided by the Planning Coordinator for post-event analysis of frequency disturbances. This requirement states what data must be reported to SERC by the Generator Owners.

Since the inverse time curve cannot easily be placed into the SERC database, four clearing times based on data from the curve are requested. These clearing times are intended to cover a range of frequencies needed for event replication as well as provide information about generators that trip at a higher frequency than is allowed by the NERC standard.

Compliance

Compliance enforcement authority

SERC Reliability Corporation

Compliance monitoring and assessment process

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Violation Investigation
- Self-Reporting
- Complaint

Evidence retention

Each Planning Coordinator, UFLS Entity and Generator Owner shall keep data or evidence to show compliance as identified below unless directed by SERC to retain specific evidence for a longer period of time as part of an investigation.

Each Planning Coordinator, UFLS Entity and Generator Owner shall retain the current evidence of each Requirement and Measure as well as any evidence necessary to show compliance since the last compliance audit.

If a Planning Coordinator, UFLS Entity or Generator Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the retention period specified above, whichever is longer.

Time Horizons, Violation Risk Factors, and Violation Severity Levels

Table 1						
R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Long-term Planning	Medium	N/A	N/A	N/A	The Planning Coordinator did not have evidence that its criteria included selection of its SERC subregion(s) as an island, with or without adjusted boundaries.
R2	Long-term Planning	Medium	The Planning Coordinator's scheme did not meet one of the UFLS system design requirements identified in 2.2 through 2.6	The Planning Coordinator's scheme did not meet two of the UFLS system design requirements identified in 2.2 through 2.6.	The Planning Coordinator's scheme did not meet three of the UFLS system design requirements identified in 2.2 through 2.6.	The Planning Coordinator's scheme did not meet 2.1 **OR** Four or more of the UFLS system design requirements identified in 2.2 through 2.6.
R3	Long-term Planning	High	N/A	The Planning Coordinator failed to conduct one of the required simulations of its UFLS scheme.	N/A	The Planning Coordinator failed to conduct two of the required simulations of its UFLS scheme.
R4	Operations Planning	Medium	The UFLS entity's implemented UFLS scheme had one load shedding step outside the range specified in 4. 2.	The UFLS entity's implemented UFLS scheme had two load shedding steps outside the range specified in 4. 2.	The UFLS entity's implemented UFLS scheme had three or more load shedding steps outside the range specified in 4.2.	The UFLS entity's implemented UFLS scheme had three or more load shedding steps outside the range specified in 4.2.

Table 1						
R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
					OR The UFLS entity's implemented UFLS scheme had a total load outside the range specified in 4.3.	**AND** The UFLS entity's implemented UFLS scheme had a total load outside the range specified in 4.3.
R5	Operations Planning	Medium	N/A	N/A	N/A	The UFLS entity's implemented UFLS scheme had a total load outside the range specified in 5.2.
R6	Long-term Planning	Medium	The UFLS entity implemented required scheme changes but made them 1 to 30 days after the scheduled date.	The UFLS entity implemented required scheme changes but made them 31 to 40 days after the scheduled date.	The UFLS entity implemented required scheme changes but made them 41 to 50 days after the scheduled date.	The UFLS entity implemented required scheme changes but made them more than 50 days after the scheduled date OR The UFLS entity failed to implement the required scheme changes.
R7	Long-term Planning	Lower	The Planning Coordinator provided the data required in R6 to SERC 1 to 10 days after the scheduled submittal date.	The Planning Coordinator provided the data required in R6 to SERC 11 to 20 days after the scheduled submittal date.	The Planning Coordinator provided the data required in R6 to SERC 21 to 30 days after the scheduled submittal date.	The Planning Coordinator provided the data required in R6 to SERC more than 30 days after the scheduled submittal date.

Table 1						
R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
				OR The Planning Coordinator did not provide to SERC one piece of information listed in R7.	**OR** The Planning Coordinator did not provide to SERC two pieces of information listed in R7.	**OR** The Planning Coordinator did not provide to SERC any of the information listed in R7.
R8	Long-term Planning	Lower	The Generator Owner provided the data required in R7 to SERC 1 to 10 days after the requested submittal date.	The Generator Owner provided the data required in R7 to SERC 11 to 20 days after the requested submittal date. **OR** The Generator Owner did not provide to SERC one piece of information listed in R8.	The Generator Owner provided the data required in R6 to SERC 21 to 30 days after the requested submittal date. **OR** The Generator Owner did not provide to SERC two pieces of information listed in R8.	The Generator Owner provided the data required in R7 to SERC more than 30 days after the requested submittal date. **OR** The Generator Owner did not provide to SERC any of the information listed in R8.

Administrative Procedure

Regional Variances

None

Interpretations

None

Guideline and Technical Basis

1. **Existing UFLS schemes**
   Each Planning Coordinator should consider the existing UFLS programs which are in place and should consider input from the UFLS entities in developing the UFLS scheme.

2. **Basis for SERC standard requirements**
   SERC Standard PRC-006-SERC-01 is not a stand-alone standard, but was written to be followed in conjunction with NERC Standard PRC-006-1. The primary focus of SERC Standard PRC-006-SERC-01 was to provide region-specific requirements for the implementation of the higher tier NERC standard requirements with the goals of a) adding clarity and b) providing for consistency and a coordinated UFLS scheme for the SERC region as a whole. Generally speaking, requirements already in the NERC standard were not repeated in the SERC standard. Therefore, both the NERC and SERC standards must be followed to ensure full compliance.

3. **Basis for applying a percentage load shedding value to Forecast Load versus Actual Load**
   The Planning Coordinator will develop a UFLS scheme to meet the performance requirements of NERC Standard PRC-006-1 Requirement R3 and SERC Standard PRC-006-SERC-01 Requirement R2. This development will result in certain percentages of load for each UFLS entity in the Planning Coordinator's area for which automatic under frequency load shedding must be implemented. The Planning Coordinator develops these percentages based on forecast peak load demand. However, the UFLS entity implements these percentages based on the previous year's actual peak demand. Applying the same percentage to these different base values was intentional to ensure that both the Planning Coordinator and UFLS entities had a clear, measurable value to use in performing their respective roles in meeting the standard. Planning Coordinators typically use forecast demands in their work. Whereas the previous year's actual (or estimated) demand is typically more available to UFLS entities. Additionally, the use of percentages based on these different base values tends to minimize the error due to the time lag between design and actual field implementation. Since a percentage is provided by the Planning Coordinator to the UFLS entities, any differences between the design values (i.e., forecast load) and the implemented values (i.e., previous year's actual) would naturally tend to match up reasonably well. For example, if the total planning area load in MW for which UFLS was installed during the time of implementation was slightly higher or lower than the MW value used in the design by the Planning Coordinator, multiplying by the specified percentage would result in an implemented load shedding scheme that also had a reasonably similar higher or lower MW value.

4. Basis for May 1 and 18 month time frames

Each UFLS entity must annually review that the amount of UFLS load shedding implemented is within a certain tolerance as specified by SERC Standard PRC-006-SERC-01 Requirement R4 or Requirement R5 by May 1 of the current year. May 1 was chosen to allow sufficient time after the previous year's peak occurred to make adjustments in the field to the implementation if necessary to meet the tolerances specified in Requirement R4 or Requirement R5. Therefore, the May 1 date applies only to implementation of the existing percentages of load shedding specified by the Planning Coordinator. On the other hand, the 18-month time frame specified in PRC-006-SERC-01 Requirement R6 is intended to allow sufficient budgeting, procurement, and installation time for additional equipment, or for significant setting changes to existing equipment necessary to meet a revised load shedding scheme design that has been specified by the Planning Coordinator. During this 18-month transition period, the May 1 measurement of R4 or Requirement R5 would not apply.

5. Basis for smaller entity threshold of 100 MW

Most distribution substations have transformers rated in the range of 10 to 40 MVA. Usually most transformers would serve 1 to 4 feeders and each feeder will normally carry between 8 and 10 MVA. In general, assuming that each feeder would carry 10 MW, an entity with a load slightly greater than 100 MW would have at least 10 feeders available. For a program with three 10 % steps, only 3 feeders would be required to have under frequency load shed capabilities. The 100 MW threshold seems to provide adequate flexibility for implementing load shedding in three steps for entities slightly greater than 100 MW.

Unofficial Comment Form for Regional Reliability Standard PRC-006-SERC-01

Please **DO NOT** use this form. Please use the electronic form located at the link below to submit comments on the Regional Reliability Standard **Automatic Underfrequency Load Shedding PRC-006-SERC-01**. Comments must be submitted by **August 15, 2011.** If you have questions please contact Howard Gugel at howard.gugel@nerc.net or Barb Nutter at barbara.nutter@nerc.net.

http://www.nerc.com/filez/regional_standards/regional_reliability_standards_under_development.html

Background Information
A regional reliability standard shall be: (1) a regional reliability standard that is more stringent than the continent-wide reliability standard, including a regional standard that addresses matters that the continent-wide reliability standard does not; or (2) a regional reliability standard that is necessitated by a physical difference in the bulk power system. Regional reliability standards shall provide for as much uniformity as possible with reliability standards across the interconnected bulk power system of the North American continent. Regional reliability standards, when approved by FERC and applicable authorities in Mexico and Canada shall be made part of the body of NERC reliability standards, and shall be enforced upon all applicable bulk power system owners, operators, and users within the applicable area, regardless of membership in the region.

PRC-006-SERC-1 was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

Each SERC Regional Reliability Standard shall enable or support one or more of the NERC reliability principles, thereby ensuring that each standard serves a purpose in support of the reliability of the regional bulk electric system. Each of those standards shall also be consistent with all of the NERC reliability principles, thereby ensuring that no standard undermines reliability through an unintended consequence. The NERC reliability principles supported by this standard are the following:

- **Reliability Principle 1** — Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
- **Reliability Principle 2** — The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
- **Reliability Principle 3** — Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

The proposed SERC Regional Reliability Standard is not inconsistent with, or less stringent than established NERC Reliability Standards. Once approved by the appropriate authorities,

the SERC Regional Reliability Standard obligates the SERC to monitor and enforce compliance, apply sanctions, if any, consistent with any regional agreements and the NERC rules.

The SERC PRC-006-SERC-01 standard contains eight main requirements for applicable entities within the SERC geographic area. The standard contains the following:

> **Requirement 1** Each Planning Coordinator shall include its SERC subregion as an identified island when developing criteria for selecting portions of the BPS that may form islands.
>
> **Requirement 2** Each Planning Coordinator in the SERC Region shall select or develop an automatic UFLS scheme (percent of load to be shed, frequency set points, and time delays) for implementation by UFLS entities within its area that meets the following minimum requirements.
>
> **Requirement 3** Each Planning Coordinator in the SERC Region shall conduct simulations of its UFLS scheme for an imbalance between load and generation of 13%, 22%, and 25% for all identified island(s) where imbalance equals [(load minus actual generation output) / load]. These simulation requirements apply to the UFLS assessments specified in R4 of the NERC UFLS standard PRC-006-1.
>
> **Requirement 4** Each UFLS entity that has a total load of 100 MW or greater in a Planning Coordinator area in the SERC Region shall be responsible for implementing the UFLS scheme developed by their Planning Coordinator. UFLS entities may coordinate with other UFLS entities to implement the UFLS scheme developed by the Planning Coordinator responsible for their collective systems. The UFLS scheme shall meet the following requirements.
>
> **Requirement 5** Each UFLS entity that has a total load less than 100 MW in a Planning Coordinator area in the SERC Region shall be responsible for implementing the UFLS scheme developed by their Planning Coordinator, but shall not be required to have more than one UFLS step. UFLS entities may coordinate with other UFLS entities to implement the UFLS scheme developed by the Planning Coordinator responsible for their collective systems. The UFLS scheme shall meet the following requirements.
>
> **Requirement 6** Each UFLS entity in the SERC Region shall implement changes to the UFLS scheme which involve frequency settings, relay time delays, or changes to the percentage of load in the scheme within 18 months of notification by the Planning Coordinator.
>
> **Requirement 7** Each Planning Coordinator in the SERC Region shall provide the following information to SERC according to the schedule specified by SERC.
>
> **Requirement 8** Each Generator Owner shall provide the following information within 30 days of a request by SERC to facilitate post-event analysis of frequency disturbances.

The approval process for a regional reliability standard requires NERC to publicly notice and request comment on the proposed standard. Comments shall be permitted only on the following criteria (technical aspects of the standard are vetted through the regional standards development process):

Unfair or Closed Process — The regional reliability standard was not developed in a fair and open process that provided an opportunity for all interested parties to participate. Although a NERC-approved regional reliability standards development procedure shall be presumed to be fair and open, objections could be raised regarding the implementation of the procedure.

Adverse Reliability or Commercial Impact on Other Interconnections — The regional reliability standard would have a significant adverse impact on reliability or commerce in other interconnections.

Deficient Standard — The regional reliability standard fails to provide a level of reliability of the bulk power system such that the regional reliability standard would be likely to cause a serious and substantial threat to public health, safety, welfare, or national security.

Adverse Impact on Competitive Markets within the Interconnection — The regional reliability standard would create a serious and substantial burden on competitive markets within the interconnection that is not necessary for reliability.

1. **Was the proposed standard developed in a fair and open process, using the associated Regional Reliability Standards Development Procedure?**

   ☐ Yes

   ☐ No

   Comments:

2. **Does the proposed standard pose an adverse impact to reliability or commerce in a neighboring region or interconnection?**

   ☐ Yes

   ☐ No

   Comments:

3. **Does the proposed standard pose a serious and substantial threat to public health, safety, welfare, or national security?**

   ☐ Yes
   ☐ No

   Comments:

4. **Does the proposed standard pose a serious and substantial burden on competitive markets within the interconnection that is not necessary for reliability?**

   ☐ Yes

   ☐ No

   Comments:

5. **Does the proposed regional reliability standard meet at least one of the following criteria?**

- **The proposed standard has more specific criteria for the same requirements covered in a continent-wide standard**
- **The proposed standard has requirements that are not included in the corresponding continent-wide reliability standard**
- **The proposed regional difference is necessitated by a physical difference in the bulk power system.**

☐ Yes

☐ No

Comments:

6. If you have any other comments that you have not already provided in the response to the prior questions, please provide them here.

Regional Reliability Standards Announcement

Comment Period Open for PRC-006-SERC-01
June 29-August 15, 2011

Now available at:
http://www.nerc.com/filez/regional_standards/regional_reliability_standards_under_development.html

Proposed Standard for the SERC Reliability Corporation (SERC)

SERC has requested NERC to post regional reliability standard PRC-006-SERC-01 — Automatic Underfrequency Load Shedding for a 45-day industry review as permitted by the NERC Rules of Procedure.

Instructions
Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the regional standards development page:
http://www.nerc.com/filez/regional_standards/regional_reliability_standards_under_development.html

Background
The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

When reliability standards were implemented in 2007, the Federal Energy Regulatory Commission ("FERC"), which is the government body with regulatory responsibility for electric reliability, issued FERC Order 693, recognizing 83 NERC Reliability Standards as enforceable by FERC and applicable to users, owners, and operators of the bulk power system (BPS). FERC did not approve the NERC UFLS standard, PRC-006-0 in Order 693. FERC's reason for not approving PRC-006-0 was that it recognized PRC-006-0 as a "fill-in the blank standard," and regional procedures associated with the standard were not submitted along with the standard. FERC's ruling in Order 693 required Regional Entities to provide the regional requirements necessary for completing the UFLS standard.

In 2008, SERC commenced work on PRC-006-SERC-01. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the NERC UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. The regional standard adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Regional Reliability Standards Development Process
Section 300 of the *Rules of Procedure for the Electric Reliability Organization* governs the regional reliability standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

SERC UFLS Standard Drafting Team Biographies

Rick Foster: Rick has a MSEE from University of Missouri (Rolla Campus) and an MBA from Illinois State University. He is licensed as a Professional Engineer in the State of Illinois. He worked for Illinois Power Company in Decatur, Illinois from 1983 through 2004 in the System Planning, Bulk Power Marketing and Operations Groups. In 2004 he joined Ameren Services where he is currently a Transmission Planning Consulting Engineer. Rick has over 28 years of experience in the Planning and Bulk Power Marketing area and is actively involved in several SERC subcommittees and working groups. His main areas of interest are power system planning and voltage, steady state, small signal and transient stability.

Venkat (Sharma) Kolluri: Sharma has a MSEE from West Virginia University, Morgantown and an MBA from University of Dayton. He worked for AEP Service Corporation in Columbus, Ohio from 1977 through 1984 in the Bulk Transmission Planning Group. In 1984 he joined Entergy Services Inc., where he is currently the Manager of Transmission Planning. Sharma has over 25 years of experience in Planning and Operations area and is actively involved in several IEEE subcommittees, NERC Standards Development Task Forces, and CIGRE working groups. His main areas of interest are power system planning and operations, voltage and dynamic stability, and reactive power planning. Sharma was recently selected as IEEE Fellow for innovative contributions to the stability area.

Greg Davis: Greg received a Bachelor of Science in Electrical Engineering from North Carolina Agricultural & Technical State University, Greensboro NC in 1996. He has worked for Georgia Transmission Corporation (GTC) from 2000 to the present. From 2000-2003 Greg began his career as a Test Engineer working in Substation Maintenance. In 2004 he started working in the System Protection Department, working as a regional Protection Engineer. Greg is currently the ERO Compliance Specialist for the P&C Department, where he serves as the subject matter expert for PRC standards and represents the Corporation on internal and external teams, committees and industry groups.

Ernesto Paon: Ernesto has a BSEE from the University of Illinois, Champaign-Urbana, Illinois, and completed graduate work towards MSEE from Iowa State University, Ames, Iowa. He worked for Illinois Power Company from 1975 through 1985 in the substation design and system protection departments. He worked for LEMCO / Y&A Consulting Engineers in St. Louis, Missouri from 1985 through 1988 as a project engineer. In 1988 he joined the Municipal Electric Authority of Georgia where he is currently the Manager of System Protection and Testing. Ernesto has over 33 years experience in protection & control. He is a member of IEEE.

John O'Connor: John O'Connor has over 30 years of experience in the operation, maintenance and engineering of electric power systems. He graduated from N.C. State University with a BS in Electrical Engineering, is a registered professional engineer in North Carolina, and holds an electrical contractor license. John is currently a Principal Engineer in Progress Energy Carolinas' Transmission Planning group, where he is responsible for stability studies.

Bob Jones: Bob is currently the Planning Manager for Stability and Special Studies in the Transmission Planning Department at Southern Company Services. Bob obtained a BSEE degree from the University of Alabama in 1973 and an MSEE degree from University of Alabama – Birmingham in 1978. He has worked for 38 years for Southern Company Services. Earlier in his career, Bob was involved in transient voltage analysis, harmonics studies, power quality, and surge protection. For the last 17 years, he has worked in Transmission Planning and has been responsible for stability studies for the Southern Company.

Jonathan Glidewell: Jonathan is currently a Project Manager in Transmission Planning with Southern Company Services. Jonathan began working in the Transmission Planning Department as an Engineer in 2001. He has worked in Transmission Planning since 2001 except for one year during 2008 – 2009 where he worked in Operations Planning. His main areas of interest are power system planning and operations, voltage and dynamic stability, and reactive power planning. Jonathan received a Bachelor of Science in Electrical and Computer Engineering from the University of Alabama at Birmingham in 2001 and is a registered Professional Engineer in the state of Alabama.

Tom Cain: Tom obtained a BS in Engineering Physics at Cornell University and then an MSEE degree from Georgia Tech. Tom worked for GM and the Southwest Research Institute before coming to TVA in 1994. Tom has been working in the Transmission Planning Department since in 1999 where he has been responsible for stability studies.

Andrew Fusco: Andrew is the Manager of Planning at ElectriCities of North Carolina, Inc. In his role at ElectriCities, Andrew is responsible resource planning, load forecasting, transmission planning, renewable energy strategy, and compliance with NERC Reliability Standards. He has 10 years of electric utility experience and 18 years of professional experience, which includes experience with nuclear facilities at Los Alamos National Laboratory. Andrew has served on a number of NERC and SERC Committees including the NERC Planning Committee, the NERC Compliance and Certification Committee, the SERC Engineering Committee, and the SERC Reliability Review Subcommittee. Andrew holds Bachelor and Master of Science Degrees from the Massachusetts Institute of Technology and a Master of Business Administration from Duke University.

Anthony Williams: Anthony is a Senior Engineer at Duke Energy where he specializes in dynamic studies and transmission system reactive power studies. He is a registered Professional Engineer with 12 years Transmission Planning experience and over 20 years of power system experience. Anthony has served in various positions on several inter-utility groups including the SERC Dynamics Review Subcommittee, the SERC Intra-Regional Dynamics Study Group and the VACAR Stability Working Group. During his Transmission Planning career, Anthony provided project leadership and technical expertise on several large projects including generator testing, SVC sizing studies, and automating transmission study processes.

Pat Huntley: Pat is currently the Manager, Reliability Standards with SERC Reliability Corporation. Pat joined SERC in 2000 and provided support to the Engineering Committee for seven years. Pat had the lead in drafting the SERC Regional Reliability Standards Development Procedure, which became part of the Regional Entity delegation between SERC and NERC. Pat

moved to his current position when SERC transitioned to a Regional Entity. He serves as the SERC representative on the ERO Regional Standards Group and serves on the Communications and Planning Subcommittee of the NERC Standards Committee. Prior to joining SERC, Pat worked for Duke Energy for 30 years and retired in 1999. He started in field transmission operations and served in a number of positions including transmission power quality supervisor, System Operating engineer, and Manager of Transmission Planning. Pat received a Bachelor of Science in Electrical Engineering from Clemson University in 1968, a Master of Engineering in Electrical Engineering in 1979, and is a registered Professional Engineer in the states of NC and SC.

Exhibit E

PRC-006-SERC-01 – Violation Severity Level and Violation Risk Factor Analysis

SERC Regional UFLS Standard (PRC-006-SERC-01)
VRF and VSL Justification

This document provides the justification for assignment of VRFs and VSLs, identifying how each proposed VRF and VSL meets NERC's criteria and FERC's Guidelines. NERC's criteria for setting VRFs and VSLs; FERC's five guidelines (G1 – G5) for approving VRFs; and FERC's four guidelines (G1-G4) for setting VSLs are provided at the end of this document.

VRF and VSL Justifications		
R1	Proposed VRF	Medium
	NERC VRF Discussion	*Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead directly to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.* *This requirement specifies that the Planning Coordinator shall include its SERC subregion(s) as an identified island in the design of its UFLS scheme. This in turn requires simulation of the subregion to verify that it meets the performance characteristics specified in R3 of PRC-006-1. Failure to comply with this requirement could allow a poorly performing UFLS scheme or a UFLS scheme that does not coordinate well with others in the subregion to go undetected.*
	FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report *The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs and therefore concentrated its approach on the reliability impact of the requirements.*
	FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard *This guideline is not applicable since this requirement does not have sub-requirement VRF assignments.*
	FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards *The VRF assigned to this requirement is consistent with the VRF assignment to R2 (part 2.3) of PRC-006-1 which addresses a similar reliability goal.*
	FERC VRF G4	Guideline 4- Consistency with NERC Definitions of VRFs

	Discussion	*Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead directly to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.*
	FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation *This requirement does not comingle a higher risk reliability objective and a lesser risk reliability objective.*
	Proposed Lower VSL	N/A
	Proposed Moderate VSL	N/A
	Proposed High VSL	N/A
	Proposed Severe VSL	The Planning Coordinator did not have evidence that its criteria included selection of its SERC subregion(s) as an island, with or without adjusted boundaries.
	VSL Discussion	*This is a binary requirement. Therefore, the VSL is Severe for failure to perform.*
	FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	*The VSL assignment complies with Guideline 1 because it does not have the unintended consequence of lowering the current or historic level of compliance.*
	FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level	*This is a binary requirement. The VSL for failure to perform is Severe in compliance with Guideline 2A. The VSL is written in clear and unambiguous language in compliance with Guideline 2B.*

	Assignments that Contain Ambiguous Language	
	FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	*The VSL aligns with the language of the requirement, and does not add to nor take away from it. The VSL does not redefine or undermine the requirement's reliability goal. In accordance with Guideline 3, the VSL assignment is consistent with the requirement and the degree of compliance can be determined objectively and with certainty.*
	FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	*The VSL assignment complies with Guideline 4, because it is based on a single violation of a Reliability Standard and is not based on a cumulative number of violations of the same requirement over a period of time.*

VRF and VSL Justifications		
R2	Proposed VRF	Medium
	NERC VRF Discussion	*Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead directly to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.* *This requirement sets minimum requirements for the Planning Coordinator UFLS scheme. Failure to comply with this requirement could result in a lack of consistency and poor coordination for the various UFLS schemes which are used in SERC*
	FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report *The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs and therefore concentrated its approach on the reliability impact of the requirements.*
	FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard *This guideline is not applicable since this requirement does not have sub-requirement VRF assignments.*
	FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards *The VRF assigned to this requirement is consistent with the VRF assignment to R5 of PRC-006-1 which addresses a similar reliability goal.*
	FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs *Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead directly to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.*

	FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation *This requirement does not comingle a higher risk reliability objective and a lesser risk reliability objective.*
	Proposed Lower VSL	The Planning Coordinator's scheme did not meet one of the UFLS system design requirements identified in 2.2 through 2.6
	Proposed Moderate VSL	The Planning Coordinator's scheme did not meet two of the UFLS system design requirements identified in 2.2 through 2.6.
	Proposed High VSL	The Planning Coordinator's scheme did not meet three of the UFLS system design requirements identified in 2.2 through 2.6.
	Proposed Severe VSL	The Planning Coordinator's scheme did not meet 2.1 **OR** Four or more of the UFLS system design requirements identified in 2.2 through 2.6.
	VSL Discussion	*This requirement has multiple parts. Part 2.1 is considered to be more important and Parts 2.2 through 2.6 contribute relatively equally to meeting the requirement. Therefore, the VSLs are based on the number of parts missing. Missing one of Parts 2.2 through 2.6 is Lower. Missing two of Parts 2.2 through 2.6 is Moderate. Missing three of Parts 2.2 through 2.6 is High. Missing Part 2.1 or four or more of Parts 2.1 through 2.6 is Severe.*
	FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	*The VSL assignments comply with Guideline 1 because they do not have the unintended consequence of lowering the current or historic level of compliance.*
	FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous	*This is not a binary requirement, therefore Guideline 2A does not apply. The VSL is written in clear and unambiguous language in compliance with Guideline 2B.*

	Language	
	FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	*The VSL aligns with the language of the requirement, and does not add to nor take away from it. The VSL does not redefine or undermine the requirement's reliability goal. In accordance with Guideline 3, the VSL assignment(s) are consistent with the requirement and the degree of compliance can be determined objectively and with certainty.*
	FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	*The VSL assignments comply with Guideline 4, because they are based on a single violation of a Reliability Standard and are not based on a cumulative number of violations of the same requirement over a period of time.*

VRF and VSL Justifications		
R3	Proposed VRF	High
	NERC VRF Discussion	*Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.* *This requirement specifies simulation of the UFLS scheme that the Planning Coordinator must conduct to satisfy R4 of PRC-006-1. Failure to comply with this requirement could result in a UFLS scheme that does not meet the performance requirements specified in R3 of the NERC UFLS standard (PRC-001-1) for all imbalance conditions between load and generation of up to 25%.*
	FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report *The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs and therefore concentrated its approach on the reliability impact of the requirements.*
	FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard *This guideline is not applicable since this requirement does not have sub-requirements.*
	FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards *The VRF assigned to this requirement is consistent with the VRF assignment to R3 of PRC-006-1 which addresses a similar reliability goal.*
	FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs *Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.*
	FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation *This requirement comingles a higher risk reliability objective (High for 25% imbalance simulation) and lesser risk reliability objectives (Medium for 13% and 22% imbalance simulations).*

	Proposed Lower VSL	N/A
	Proposed Moderate VSL	The Planning Coordinator failed to conduct one of the required simulations of its UFLS scheme.
	Proposed High VSL	N/A
	Proposed Severe VSL	The Planning Coordinator failed to conduct two of the required simulations of its UFLS scheme.
	VSL Discussion	*There are at least six simulations required - a minimum of two islands and three imbalance levels. Each simulation contributes relatively equally to meeting the requirement. Therefore, the VSLs are based on the number of simulations missing. Missing one simulation is considered to be Moderate. Missing two or more simulations is considered to be Severe.*
	FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	*The VSL assignments comply with Guideline 1 because they do not have the unintended consequence of lowering the current or historic level of compliance.*
	FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	*This is not a binary requirement, therefore Guideline 2A does not apply. The VSL is written in clear and unambiguous language in compliance with Guideline 2B.*
	FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	*The VSL aligns with the language of the requirement, and does not add to nor take away from it. The VSL does not redefine or undermine the requirement's reliability goal. In accordance with Guideline 3, the VSL assignment(s) are consistent with the requirement and the degree of compliance can be determined objectively and with certainty.*

	FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	*The VSL assignments comply with Guideline 4, because they are based on a single violation of a Reliability Standard and are not based on a cumulative number of violations of the same requirement over a period of time.*

VRF and VSL Justifications		
R4	Proposed VRF	Medium
	NERC VRF Discussion	*Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead directly to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.* *This requirement specifies the tolerances for implementation of the UFLS scheme by UFLS entities that have a total load of 100 MW or greater in a Planning Coordinator area in the SERC Region. Failure to comply with this requirement could result in a degradation of the expected performance of the UFLS scheme.*
	FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report *The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs and therefore concentrated its approach on the reliability impact of the requirements.*
	FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard *This guideline is not applicable since this requirement does not have sub-requirement VRF assignments.*
	FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards *This requirement is consistent with R9 of PRC-006-1 which addresses a similar reliability goal and has a VRF of "High." However, while R9 of PRC-006-1 requires implementation, this requirement only addresses the tolerance for implementation. It is therefore assigned a "Medium" VRF.*
	FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs *Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead directly to bulk electric system instability,*

		separation, or cascading failures, nor to hinder restoration to a normal condition.
	FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation *This requirement does not comingle a higher risk reliability objective and a lesser risk reliability objective.*
	Proposed Lower VSL	The UFLS entity's implemented UFLS scheme had one load shedding step outside the range specified in 4.2.
	Proposed Moderate VSL	The UFLS entity's implemented UFLS scheme had two load shedding steps outside the range specified in 4.2.
	Proposed High VSL	The UFLS entity's implemented UFLS scheme had three or more load shedding steps outside the range specified in 4.2. **OR** The UFLS entity's implemented UFLS scheme had a total load outside the range specified in 4.3.
	Proposed Severe VSL	The UFLS entity's implemented UFLS scheme had three or more load shedding steps outside the range specified in 4.2. **AND** The UFLS entity's implemented UFLS scheme had a total load outside the range specified in 4.3.
	VSL Discussion	*There are ranges set for the three load shedding steps required and for the total amount of load. The ranges on the three steps contribute relatively equally to meeting the requirement. The range on the total amount of load is considered to be more important. Therefore, having one step out of range is considered to be Lower. Having two steps out of range is considered to be Moderate. Having three steps out of range or the total amount out of range is considered to be High. Having three steps out of range and the total amount out of range is considered to be Severe.*
	FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	*The VSL assignments comply with Guideline 1 because they do not have the unintended consequence of lowering the current or historic level of compliance.*
	FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation	*This is not a binary requirement, therefore Guideline 2A does not apply. The VSL is written in clear and unambiguous language in compliance with Guideline 2B.*

	Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
	FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	*The VSL aligns with the language of the requirement, and does not add to nor take away from it. The VSL does not redefine or undermine the requirement's reliability goal. In accordance with Guideline 3, the VSL assignment(s) are consistent with the requirement and the degree of compliance can be determined objectively and with certainty.*
	FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	*The VSL assignments comply with Guideline 4, because they are based on a single violation of a Reliability Standard and are not based on a cumulative number of violations of the same requirement over a period of time.*

VRF and VSL Justifications		
R5	Proposed VRF	Medium
	NERC VRF Discussion	*Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead directly to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.* *This requirement specifies the tolerances for implementation of the UFLS scheme by UFLS entities that have a total load less than 100 MW in a Planning Coordinator area in the SERC Region. Failure to comply with this requirement could result in some degradation of the expected performance of the UFLS scheme.*
	FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report *The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs and therefore concentrated its approach on the reliability impact of the requirements.*
	FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard *This guideline is not applicable since this requirement does not have sub-requirement VRF assignments.*

	Proposed Lower VSL	N/A
	Proposed Moderate VSL	N/A
	Proposed High VSL	N/A
	Proposed Severe VSL	The UFLS entity's implemented UFLS scheme had a total load outside the range specified in 5.2.
	VSL Discussion	*This is a binary requirement. Therefore, the VSL is Severe for failure to perform.*
	FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	*The VSL assignment complies with Guideline 1 because it does not have the unintended consequence of lowering the current or historic level of compliance.*
	FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	*This is a binary requirement. The VSL for failure to perform is Severe in compliance with Guideline 2A. The VSL is written in clear and unambiguous language in compliance with Guideline 2B.*
	FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	*The VSL aligns with the language of the requirement, and does not add to nor take away from it. The VSL does not redefine or undermine the requirement's reliability goal. In accordance with Guideline 3, the VSL assignment is consistent with the requirement and the degree of compliance can be determined*

	Corresponding Requirement	*objectively and with certainty.*
	FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	*The VSL assignment complies with Guideline 4, because it is based on a single violation of a Reliability Standard and is not based on a cumulative number of violations of the same requirement over a period of time.*

VRF and VSL Justifications		
R6	Proposed VRF	Medium
	NERC VRF Discussion	*Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.* *This requirement specifies the maximum time for a UFLS entity to complete implementation of a major change in a Planning Coordinator's UFLS scheme. Failure to comply with this requirement could result in degradation of the expected performance of the UFLS scheme.*
	FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report *The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs and therefore concentrated its approach on the reliability impact of the requirements.*
	FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard *This guideline is not applicable since this requirement does not have sub-requirements.*
	FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards *This requirement is consistent with R9 of PRC-006-1 which addresses a similar reliability goal. However, while R9 of PRC-006-1 addresses UFLS scheme implementation and has a VRF of "High," this requirement only addresses the timing of implementation. It therefore is assigned a "Medium" VRF.*
	FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs *Violation of this requirement could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a*

		normal condition.
	FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation *This requirement does comingle a higher risk reliability objective and a lesser risk reliability objective.*
	Proposed Lower VSL	The UFLS entity implemented required scheme changes but made them 1 to 30 days after the scheduled date.
	Proposed Moderate VSL	The UFLS entity implemented required scheme changes but made them 31 to 40 days after the scheduled date.
	Proposed High VSL	The UFLS entity implemented required scheme changes but made them 41 to 50 days after the scheduled date.
	Proposed Severe VSL	The UFLS entity implemented required scheme changes but made them more than 50 days after the scheduled date **OR** The UFLS entity failed to implement the required scheme changes.
	VSL Discussion	*This requirement is based on meeting a schedule. Therefore, the VSLs are based on number of days late. Missing the schedule by up to 30 days is Lower. Missing the schedule by 31 - 40 days is Moderate. Missing the schedule by 41 - 50 days is High. Missing the schedule by more than 50 days or failed to implement the required scheme changes is Severe.*
	FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	*The VSL assignments comply with Guideline 1 because they do not have the unintended consequence of lowering the current or historic level of compliance.*
	FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous	*This is not a binary requirement, therefore Guideline 2A does not apply. The VSL is written in clear and unambiguous language in compliance with Guideline 2B.*

	Language	
	FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	*The VSL aligns with the language of the requirement, and does not add to nor take away from it. The VSL does not redefine or undermine the requirement's reliability goal. In accordance with Guideline 3, the VSL assignment(s) are consistent with the requirement and the degree of compliance can be determined objectively and with certainty.*
	FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	*The VSL assignments comply with Guideline 4, because they are based on a single violation of a Reliability Standard and are not based on a cumulative number of violations of the same requirement over a period of time.*

VRF and VSL Justifications		
R7	Proposed VRF	Lower
	NERC VRF Discussion	*Violation of this requirement would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. This is a planning requirement that is administrative in nature.* *This requirement specifies UFLS implementation data that the Planning Coordinator must supply to SERC. This will be used to maintain a database for post-event analysis of frequency disturbances. Failure to comply with this requirement could result in a delay in performing post-event analysis of frequency disturbances.*
	FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report *The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs and therefore concentrated its approach on the reliability impact of the requirements.*
	FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard *This guideline is not applicable since this requirement does not have sub-requirement VRF assignments.*
	FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards *The VRF assigned to this requirement is consistent with the VRF assignment to R6, R7, and R8 of PRC-006-1 which addresses a similar reliability goal.*
	FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs *Violation of this requirement would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. This is a planning requirement that is administrative in nature.*
	FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation *This requirement does not comingle a higher risk reliability objective and a lesser risk reliability objective.*
	Proposed Lower VSL	The Planning Coordinator provided the data required in R7 to SERC 1 to 10 days after the scheduled submittal date.
	Proposed Moderate	The Planning Coordinator provided the data required in R7 to

	VSL	SERC 11 to 20 days after the scheduled submittal date. **OR** The Planning Coordinator did not provide to SERC one piece of information listed in R7.
	Proposed High VSL	The Planning Coordinator provided the data required in R7 to SERC 21 to 30 days after the scheduled submittal date. **OR** The Planning Coordinator did not provide to SERC two pieces of information listed in R7.
	Proposed Severe VSL	The Planning Coordinator provided the data required in R7 to SERC more than 30 days after the scheduled submittal date. **OR** The Planning Coordinator did not provide to SERC any of the information listed in R7.
	VSL Discussion	*This requirement has timing elements associated with meeting it and has multiple parts that contribute relatively equally to meeting it. Therefore, the VSLs have one component based on number of days late and it has another component based on the number of parts missing. The SDT thought that missing one part was more significant than being up to 10 days late. Therefore, missing the schedule by up to 10 days is Lower. Missing one part or missing the schedule by 11 - 20 days is Moderate. Missing two parts or missing the schedule by 21 - 30 days is High. Missing all three parts or missing the schedule by more than 30 days is Severe.*
	FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	*The VSL assignments comply with Guideline 1 because they do not have the unintended consequence of lowering the current or historic level of compliance.*
	FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level	*This is not a binary requirement, therefore Guideline 2A does not apply. The VSL is written in clear and unambiguous language in compliance with Guideline 2B.*

	Assignments that Contain Ambiguous Language	
	FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	*The VSL aligns with the language of the requirement, and does not add to nor take away from it. The VSL does not redefine or undermine the requirement's reliability goal. In accordance with Guideline 3, the VSL assignment(s) are consistent with the requirement and the degree of compliance can be determined objectively and with certainty.*
	FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	*The VSL assignments comply with Guideline 4, because they are based on a single violation of a Reliability Standard and are not based on a cumulative number of violations of the same requirement over a period of time.*

VRF and VSL Justifications		
R8	Proposed VRF	Lower
	NERC VRF Discussion	*Violation of this requirement would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. This is a planning requirement that is administrative in nature.* *This requirement specifies generator underfrequency and overfrequency protection data that the Generator Owner must supply to SERC. This will be to facilitate post-event analysis of frequency disturbances. Failure to comply with this requirement could result in a delay in performing post-event analysis of frequency disturbances.*
	FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report *The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs and therefore concentrated its approach on the reliability impact of the requirements.*

	FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	*The VSL assignments comply with Guideline 4, because they are based on a single violation of a Reliability Standard and are not based on a cumulative number of violations of the same requirement over a period of time.*

NERC's VRF Criteria:

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC's VRF Guidelines:
VRF G1 – Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. From footnote 15 of the May 18, 2007 Order, FERC's list of critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System includes:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings

- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

VRF G2 – Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

VRF G3 – Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

VRF G4 – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

VRF G5 –Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC's Criteria for VSLs:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC's VSL Guidelines:
VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance (Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.)

VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties (A violation of a "binary" type requirement must be a "Severe" VSL. Avoid using ambiguous terms such as "minor" and "significant" to describe noncompliant performance.)

VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement (VSLs should not expand on what is required in the requirement.)

VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations (. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.)

FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 40

[Docket No. RM10-5-000; Order No. 758]

Interpretation of Protection System Reliability Standard

(Issued February 3, 2012)

AGENCY: Federal Energy Regulatory Commission

ACTION: Final Rule

SUMMARY: On November 17, 2009, the North American Electric Reliability Corporation (NERC) submitted a petition (Petition) requesting approval of NERC's interpretation of Requirement R1 of Commission-approved Reliability Standard PRC-005-1 (Transmission and Generation Protection System Maintenance and Testing). On December 16, 2010, the Commission issued a Notice of Proposed Rulemaking (NOPR). in the NOPR, the Commission proposed to accept the NERC proposed interpretation of Requirement R1 of Reliability Standard PRC-005-1, and proposed to direct NERC to develop modifications to the PRC-005-1 Reliability Standard through its Reliability Standards development process to address gaps in the Protection System maintenance and testing standard that were highlighted by the proposed interpretation. As a result of the comments received in response to the NOPR, in this order the Commission adopts the NOPR proposal to accept NERC's proposed interpretation. In addition, as discussed below, the Commission accepts, in part, NERC's commitment to address the concerns in the Protection System maintenance and testing standard that were identified by the NOPR

within the Reliability Standards development process, and directs, in part, that the concerns identified by the NOPR with regard to reclosing relays be addressed within the reinitiated PRC-005 revisions.

EFFECTIVE DATE: This rule will become effective 30 days after publication in the FEDERAL REGISTER.

Interpretation of Protection System Reliability Standard Docket No. RM10-5-000

ORDER NO. 758

FINAL RULE

(Issued February 3, 2012)

1. On November 17, 2009, NERC submitted the Petition requesting approval of NERC's interpretation of Requirement R1 of Commission-approved Reliability Standard PRC-005-1 (Transmission and Generation Protection System Maintenance and Testing). NERC developed the interpretation in response to a request for interpretation submitted to NERC by the Regional Entities Compliance Monitoring Processes Working Group (Working Group).[1] In a December 16, 2010 Notice of Proposed Rulemaking (NOPR),[2] the Commission proposed to accept the NERC proposed interpretation of Requirement R1 of Reliability Standard PRC-005-1, and proposed to direct NERC to develop modifications to the PRC-005-1 Reliability Standard through its Reliability Standards

[1] The Working Group is a subcommittee of the Regional Entity Management Group which consists of the executive management of the eight Regional Entities.

[2] *Interpretation of Protection System Reliability Standard*, Notice of Proposed Rule Making, 75 FR 81,152 (Dec. 27, 2010), FERC Stats. & Regs. ¶ 32,669 (2010).

development process to address gaps in the Protection System maintenance and testing standard highlighted by the proposed interpretation. As a result of the comments received in response to the NOPR, in this order the Commission adopts the NOPR proposal to accept NERC's proposed interpretation. In addition, the Commission accepts, in part, NERC's commitments to address the concerns in the Protection System maintenance and testing standard that were identified by the NOPR within the Reliability Standards development process, and directs, in part, that the concerns identified by the NOPR with regard to reclosing relays be addressed within the reinitiated PRC-005 revisions.

I. Background

2. Section 215 of the Federal Power Act (FPA) requires a Commission-certified Electric Reliability Organization (ERO) to develop mandatory and enforceable Reliability Standards, which are subject to Commission review and approval.[3] Specifically, the Commission may approve, by rule or order, a proposed Reliability Standard or modification to a Reliability Standard if it determines that the Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest.[4]

[3] 16 U.S.C. 824 (2006).

[4] *Id.* 824o(d)(2).

Once approved, the Reliability Standards may be enforced by the ERO, subject to Commission oversight, or by the Commission independently.[5]

3. Pursuant to section 215 of the FPA, the Commission established a process to select and certify an ERO,[6] and subsequently certified NERC.[7] On April 4, 2006, NERC submitted to the Commission a petition seeking approval of 107 proposed Reliability Standards. On March 16, 2007, the Commission issued a Final Rule, Order No. 693,[8] approving 83 of the 107 Reliability Standards, including Reliability Standard PRC-005-1. In addition, pursuant to section 215(d)(5) of the FPA,[9] the Commission directed NERC to develop modifications to 56 of the 83 approved Reliability Standards, including PRC-005-0.[10]

---

[9] 16 U.S.C. 824o(d)(5).

[10] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 1475.

4. NERC's Rules of Procedure provide that a person that is "directly and materially affected" by Bulk-Power System reliability may request an interpretation of a Reliability Standard.[11] In response, the ERO will assemble a team with relevant expertise to address the requested interpretation and also form a ballot pool. NERC's Rules of Procedure provide that, within 45 days, the team will draft an interpretation of the Reliability Standard and submit it to the ballot pool. If approved by the ballot pool and subsequently by the NERC Board of Trustees (Board), the interpretation is appended to the Reliability Standard and filed with the applicable regulatory authorities for approval.

II. Reliability Standard PRC-005-1

5. The purpose of PRC-005-1 is to "ensure all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested." In particular, Requirement R1, requires that:

R1. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation Protection System shall have a Protection System maintenance and testing program for Protection Systems that affect the reliability of the BES. The program shall include:

R1.1. Maintenance and testing intervals and their basis.

[11] NERC Rules of Procedure, Appendix 3A, Reliability Standards Development Procedure, Version 6.1, at 26-27 (2007).

R1.2. Summary of maintenance and testing procedures.

6. NERC currently defines "Protection System" as follows: "Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry."[12]

III. NERC Proposed Interpretation

7. In the NERC Petition, NERC explains that it received a request from the Working Group for an interpretation of Reliability Standard PRC-005-1, Requirement R1, addressing five specific questions. Specifically, the Working Group questions and NERC proposed interpretations include:

Request 1: "Does R1 require a maintenance and testing program for the battery chargers for the 'station batteries' that are considered part of the Protection System?"

Response: "While battery chargers are vital for ensuring 'station batteries' are available to support Protection System functions, they are not identified within the definition of

[12] In Docket No. RD11-13-000, NERC has proposed to revise the definition of Protection System effective on the first day of the first calendar quarter twelve months from approval. The Commission is approving this revision in an order issued concurrently with this order. *See North American Electric Reliability Corp.*, 138 FERC ¶ 61,095 (2012).

'Protection Systems.' Therefore, PRC-005-1 does not currently require maintenance and testing of battery chargers."[13]

Request 2: "Does R1 require a maintenance and testing program for auxiliary relays and sensing devices? If so, what types of auxiliary relays and sensing devices? (i.e., transformer sudden pressure relays)."

Response: "The existing definition of 'Protection System' does not include auxiliary relays; therefore, maintenance and testing of such devices is not explicitly required. Maintenance and testing of such devices is addressed to the degree that an entity's maintenance and testing program for DC control circuits involves maintenance and testing of imbedded auxiliary relays. Maintenance and testing of devices that respond to quantities other than electrical quantities (for example, sudden pressure relays) are not included within Requirement R1."

Request 3: "Does R1 require maintenance and testing of transmission line re-closing relays?"

Response: "No. 'Protective Relays' refer to devices that detect and take action for

[13] The revised definition of Protection System accepted in Docket No. RD11-13-000 includes battery chargers as an element of the Protection System and, as a result of that change, battery chargers must be maintained and tested. Thus, the modified definition of Protection System approved in Docket No. RD11-13-000, when effective, shall supersede the interpretation of Requirement R1 of Reliability Standard PRC-005-1 approved in this order.

abnormal conditions. Automatic restoration of transmission lines is not a 'protective' function."

Request 4: "Does R1 require a maintenance and testing program for the DC circuitry that is just the circuitry with relays and devices that control actions on breakers, etc., or does R1 require a program for the entire circuit from the battery charger to the relays to circuit breakers and all associated wiring?"

Response: "PRC-005-1 requires that entities 1) address DC control circuitry within their program, 2) have a basis for the way they address this item, and 3) execute the program. Specific additional requirements relative to the scope and/or methods are not established."

Request 5: "For R1, what are examples of 'associated communications systems' that are part of 'Protection Systems' that require a maintenance and testing program?"

Response: "Associated communication systems" refer to communication systems used to convey essential Protection System tripping logic, sometimes referred to as pilot relaying or teleprotection. Examples include the following:

- communications equipment involved in power-line-carrier relaying;
- communications equipment involved in various types of permissive protection system applications;
- direct transfer-trip systems;
- digital communication systems ... ."

8. In its Petition requesting that the Commission accept the proposed interpretation, NERC recognized that greater clarity to the requirement language in PRC-005-1a is necessary to provide a complete framework for maintenance and testing of equipment necessary to ensure the reliability of the Bulk Power System. In its Petition, NERC also stated that this activity is already underway in the scope of Project 2007-17 – Protection System Maintenance and Testing, coupled with the revised definition of Protection System.

IV. Commission NOPR

9. In the NOPR, the Commission proposed to accept the NERC proposed interpretation of Requirement R1 of Reliability Standard PRC-005-1. In addition, the Commission proposed to direct NERC to develop modifications to the PRC-005-1 Reliability Standard through its Reliability Standards development process to address gaps in the Protection System maintenance and testing standard that were highlighted by the proposed interpretation. The specific modifications are discussed below.

V. Comments

10. Comments on the Commission's proposed interpretation were received by the NERC, Edison Electric Institute (EEI), ISO/RTO Council (IRC), American Public Power Association (APPA), National Rural Electric Cooperative Association (NRECA), Transmission Access Policy Study Group (TAPS), Cities of Anaheim and Riverside,

California (Joint Cities), Northwest Commenters,[14] International Transmission Company (ITC), PSEG Companies,[15] and MidAmerican Energy Holdings Company (MidAmerican), Constellation/CENG,[16] and Manitoba Hydro (Manitoba). In general, commenters support NERC's proposed interpretation, and oppose the further directives in the NOPR. Commenters also state that modifications to the Reliability Standards should be addressed within the NERC standards development process and that certain of the modifications are currently being addressed.

VI. Discussion

11. As a result of the comments received in response to the proposal, the Commission adopts the NOPR proposal to accept NERC's proposed interpretation. As discussed below,[17] the Commission accepts, in part, NERC's commitments to address the concerns

[14] Lincoln People's Utility District, Columbia River People's Utility District, Inland Power and Light Company, Northwest Public Power Association, Northwest Requirements Utilities, Pacific Northwest Generating Cooperative, Public Power Council, Public Utility District No. 1 of Snohomish County, and Tillamook People's Utility District.

[15] Public Service Electric and Gas Company, PSEG Fossil LLC, and PSEG Nuclear LLC.

[16] Constellation Energy Group, Inc., Baltimore Gas & Electric Company, Constellation Energy Commodities Group, Inc., Constellation Energy Control and Dispatch, LLC, Constellation NewEnergy, Inc., and Constellation Power Source Generation, Inc. (together, Constellation) and Constellation Energy Nuclear Group, LLC (CENG).

[17] *See infra*, P 15, P 18, P 20.

in the Protection System maintenance and testing standard that were identified by the NOPR within the Reliability Standards development process, and directs, in part, that the concerns identified by the NOPR with regard to reclosing relays be addressed within the reinitiated PRC-005 revisions.

A. Maintenance and Testing of Auxiliary and Non-Electrical Sensing Relays

12. In the NOPR, the Commission noted a concern that the proposed interpretation may not include all components that serve in some protective capacity.[18] The Commission's concerns included the proposed interpretation's exclusion of auxiliary and non-electrical sensing relays. The Commission proposed to direct NERC to develop a modification to the Reliability Standard to include any component or device that is designed to detect defective lines or apparatuses or other power system conditions of an abnormal or dangerous nature, including devices designed to sense or take action against any abnormal system condition that will affect reliable operation, and to initiate appropriate control circuit actions.

13. In their comments NERC, EEI, Joint Cities, Manitoba, NRECA, ITC, MidAmerican, and PSEG expressed varying levels of disagreement with the NOPR's proposed directive. The disagreements are based on a concern that the proposed directive

[18] NOPR at P 11-14.

will create an increase in scope that will capture many items not used in BES protection. NERC is concerned the scope of this proposed directive is so broad that any device that is installed on the Bulk-Power System to monitor conditions in any fashion may be included. [19] NERC states that many of these devices are advisory in nature and should not be reflected within NERC Reliability Standards if they do not serve a necessary reliability purpose.[20] NERC does not believe it is necessary for the Commission to issue a directive to address this issue. Instead, NERC proposes to develop, either independently or in association with other technical organizations such as IEEE, one or more technical documents which:

1. describe the devices and functions (to include sudden pressure relays which trip for fault conditions) that should address FERC's concern; and

2. propose minimum maintenance activities for such devices and maximum maintenance intervals, including the technical basis for each.[21]

14. NERC states that these technical documents will address those protective relays that are necessary for the reliable operation of the Bulk-Power System and will allow for differentiation between protective relays that detect faults from other devices that monitor

[19] NERC February 25, 2011 Comments at 7.

[20] *Id.*

[21] *Id.*

the health of the individual equipment and are advisory in nature (e.g., oil temperature). Following development of the above-referenced document(s), NERC states that it will "propose a new or revised standard (e.g. PRC-005) using the NERC Reliability Standards development process to include maintenance of such devices, including establishment of minimum maintenance activities and maximum maintenance intervals."[22] Accordingly, NERC proposes to "add this issue to the Reliability Standards issues database for inclusion in the list of issues to address the next time the PRC-005 standard is revised."[23]

15. The Commission accepts NERC's proposal, and directs NERC to file, within sixty days of publication of this Final Rule, a schedule for informational purposes regarding the development of the technical documents referenced above, including the identification of devices that are designed to sense or take action against any abnormal system condition that will affect reliable operation. NERC shall include in the informational filing a schedule for the development of the changes to the standard that NERC stated it would propose as a result of the above-referenced documents.[24] NERC should update its schedule when it files its annual work plan.

---

[22] *Id.*

[23] *Id.*

[24] *Id.* at 7, 8.

B. Reclosing Relays

16. In the NOPR, the Commission noted that while a reclosing relay is not identified as a specific component of the Protection System, if it either is used in coordination with a Protection System to achieve or meet system performance requirements established in other Commission–approved Reliability Standards, or can exacerbate fault conditions when not properly maintained and coordinated, then excluding the maintenance and testing of these reclosing relays will result in a gap in the maintenance and testing of relays affecting the reliability of the Bulk-Power System.[25] Accordingly, the Commission proposed that NERC modify the Reliability Standard to include the maintenance and testing of reclosing relays affecting the reliability of the Bulk-Power System.

17. NERC, EEI, IRC, ITC MidAmerican, NRECA, and PSEG opposed the NOPR's directive to include reclosing relays. In general, commenters state that reclosing relays used for stability purposes are already included in maintenance and testing programs, and that reclosing relays that are primarily used to minimize customer outages times and maximize availability of system components should not be included. PSEG and MidAmerican contend that the NERC standards development process should be utilized

[25] NOPR at P 15.

to determine the maintenance and testing of those reclosing relays that affect the reliability of the Bulk-Power System.

18. ISO/RTO contends that the primary purpose of reclosing relays is to allow more expeditious restoration of lost components of the system, not to maintain the reliability of the Bulk-Power System. Therefore, ISO/RTO maintains that automatic reclosing relays should not be subject to the NERC Reliability Standard for relay maintenance and testing. MidAmerican states that there are only limited circumstances when a reclosing relay can actually affect the reliability of the Bulk-Power System. MidAmerican contends that it would be overbroad for the Commission to direct a modification to the standard that encompasses all reclosing relays that can "exacerbate fault conditions when not properly maintained and coordinated," as this would improperly include many types of reclosing relays that do not necessarily affect the reliability of the Bulk-Power System.

19. ITC agrees with the Commission's proposal that reclosing relays that are required for system stability should be maintained and tested under Requirement R1 of PRC-005-1. However, ITC contends that since most bulk electric system automatic reclosing relay systems are applied to minimize customer outage times and to maximize availability of system components, only some "high speed" reclosing relays will affect the reliability of the Bulk-Power System. Therefore, ITC proposes that the Commission should direct NERC to draft specific requirements or selection criteria that should be used in

identifying the types of re-closing relays for maintenance and testing under Requirement R1 of PRC-005-1.[26]

20. While NRECA notes that reclosing relays operate to restore, not protect a system, NRECA also notes that there are reclosing schemes that directly affect and are required for automatic stability control of the system, but that such schemes are already covered under Special Protection Schemes that are subject to reliability standards. NRECA, notes that some transmission operators do not allow reclosing relays on the bulk power system to remove the possibility of reclosing in on a permanent fault, thus avoiding further potential damage to the bulk power system.[27]

21. Similarly, NERC comments that in most cases reclosing relays cannot be relied on to meet system performance requirements because of the need to consider the impact of auto-reclosing into a permanent fault; however, NERC states that applications that may exist in which automatic restoration is used to meet system performance requirements following temporary faults. NERC comments that where reclosing relays are applied to meet performance requirements in approved NERC Reliability Standards, or where automatic restoration of service is fundamental to derivation of an Interconnection Reliability Operating Limit (IROL), it is reasonable to require maintenance and testing of

[26] ITC Comments at 7.

[27] NRECA Comments at 13-14.

auto-reclosing relays.[28] However, NERC does not believe it is necessary for the Commission to issue a directive.[29] NERC states that the proposed revisions to Reliability Standard PRC-005-1 that are under development include maintenance of reclosing devices that are part of Special Protection Systems.[30] NERC proposes "to add the remaining concerns relating to this issue to the Reliability Standards issues database for inclusion in the list of issues to address the next time Reliability Standard PRC-005 is revised."[31]

22. As NERC and other commenters point out, reclosing relays are used in a broad range of applications; e.g., meet system performance requirements in approved Reliability Standards, derivation of IROLs, maintain system stability, minimize customer outage times, to maximize availability of system components, etc. While commenters acknowledge that reclosing relays have several applications, commenters also appear to be divided on which applications, if any, should be included in a maintenance and testing program.

---

[28] NERC February 25, 2011 Comments at 9.

[29] TAPs urges the Commission to use its authority pursuant to section 215(d)(5) in circumstances where there is a clear need for such a directive.

[30] *Id.*

[31] *Id.*

23. The NOPR raised a concern that excluding the maintenance and testing of reclosing relays that can exacerbate fault conditions when not properly maintained and coordinated will result in a gap affecting Bulk-Power System reliability.[32] We agree with MidAmerican that while there are only limited circumstances when a reclosing relay can actually affect the reliability of the Bulk-Power System, there are some reclosing relays, e.g., whose failure to operate or that misoperate during an event due to lack of maintenance and testing, may negatively impact the reliability of the Bulk-Power System.[33] We agree with NERC that where reclosing relays are applied to meet performance requirements in approved NERC Reliability Standards, or where automatic restoration of service is fundamental to derivation of an Interconnection Reliability Operating Limit (IROL), it is reasonable to require maintenance and testing of auto-reclosing relays.

24. In the NOPR we stated that a misoperating or miscoordinated reclosing relay may result in the reclosure of a Bulk-Power System element back onto a fault or that a misoperating or miscoordinated reclosing relay may fail to operate after a fault has been cleared, thus failing to restore the element to service. As a result, the reliability of the

[32] NOPR at P 15, noting one such outage resulting in the loss of over 4,000 MW of generation and multiple 765 kV lines.

[33] MidAmerican Comments at 6.

Bulk-Power System would be affected. In addition, misoperated or miscoordinated relays may result in damage to the Bulk-Power System. For example, a misoperation or miscoordination of a reclosing relay causing the reclosing of Bulk-Power System facilities into a permanent fault can subject generators to excessive shaft torques and winding stresses and expose circuit breakers to systems conditions less than optimal for correct operation, potentially damaging the circuit breaker.[34]

25. While some commenters argue that reclosing relays do not affect the reliability of the Bulk-Power System, the record supports our concern. For example, we note NERC's concern regarding the "… need to consider the impact of autoreclosing into a permanent fault." We also note NRECA's comments that "… some transmission operators do not allow reclosing on the bulk electric system facilities to remove the opportunity of closing in on a permanent fault" and "… by its [automatic reclosing] use a utility understands the potential for further damage that may occur by reclosing."[35] Because the misoperation or miscommunication of reclosing relays can exacerbate fault conditions, we find that

[34] NERC System Protection and Control Subcommittee, "Advantages and Disadvantages of EHV Automatic Reclosing, "December 9, 2009, p. 14.

[35] NRECA Comments at 13.

reclosing relays that may affect the reliability of the Bulk-Power System should be maintained and tested.[36]

26. For the reasons discussed above, we conclude that it is important to maintain and test reclosing relays that may affect the reliability of the Bulk-Power System. We agree with ITC that specific requirements or selection criteria should be used to identify reclosing relays that affect the reliability of the Bulk-Power System. As MidAmerican suggests, the standard should be modified, through the Reliability Standards development process, to provide the Transmission Owner, Generator Owner, and Distribution Provider with the discretion to include in a Protection System maintenance and testing program only those reclosing relays that the entity identifies as having an affect on the reliability of the Bulk-Power System.

27. We note that the original project to revise Reliability Standard PRC-005 failed a recirculation ballot in July of 2011. The project was subsequently reinitiated to continue the efforts to develop Reliability Standard PRC-005-2. Given that the project to draft proposed revisions to Reliability Standard PRC-005-1 continues in this reinitiated effort, and the importance of maintaining and testing reclosing relays, we direct NERC to include maintenance and testing of reclosing relays that can affect the reliable operation

[36] As NERC notes, there may be applications of reclosing relays where the misoperation or miscommunication may does not have a detrimental effect on the reliability of the Bulk-Power System.

of the Bulk-Power System, as discussed above, within these reinitiated efforts to revise Reliability Standard PRC-005.[37]

C. DC Control Circuitry and Components

28. In the NOPR, the Commission explained its understanding that a maintenance and testing program for DC control circuitry would include all components of DC control circuitry necessary for ensuring Reliable Operation of the Bulk-Power System, and that not establishing the specific requirements of such a maintenance and testing program results in a gap in the maintenance and testing of Protection System components.[38]

29. Joint Cities, MidAmerican, and NRECA expressed concern that the NOPR's directive is too broad and unnecessarily burdensome. NERC agrees that maintenance and testing should be required for all DC control circuitry.[39] NERC further stated that draft standard PRC-005-2 being developed in Project 2007-17 "includes extensive, specific maintenance activities (with maximum maintenance intervals) related to the DC control

[37] On December 13, 2011, NERC submitted its Standards Development Plan for 2012-2014. NERC estimates that Project 2007-17 will be completed in the second quarter of 2012. By July 30, 2012, NERC should submit to the Commission either the completed project which addresses the remaining issues consistent with this order, or an informational filing that provides a schedule for how NERC will address such issues in the Project 2007-17 reinitiated efforts.

[38] NOPR at P 16.

[39] NERC February 25, 2011 Comments at 10.

circuits."[40] The Commission accepts NERC's commitment to include the development of specific requirements of such a maintenance and testing program described above in Project 2007-17.[41]

VII. Information Collection Statement

30. The Office of Management and Budget (OMB) regulations require that OMB approve certain reporting and recordkeeping (collections of information) imposed by an agency.[42] The Commission submits reporting and recording keeping requirements to OMB under section 3507 of the Paperwork Reduction Act of 1995.[43]

31. As stated above, the Commission previously approved, in Order No. 693, the Reliability Standard that is the subject of the current Final Rule. This Final Rule accepts an interpretation of the currently approved Reliability Standard. The interpretation of the current Reliability Standard at issue in this final rule is not expected to change the reporting burden or the information collection requirements. The informational filing

[40] *Id.*

[41] As previously noted, NERC estimates that Project 2007-17 will be completed by the second quarter of 2012. By July 30, 2012, NERC should submit to the Commission either the completed project which addresses the remaining issues consistent with this order, or an informational filing that provides a schedule for how NERC will address such issues in the Project 2007-17 reinitiated efforts.

[42] 5 CFR 1320.

[43] 44 U.S.C. 3507.

required of NERC is part of currently active collection FERC-725 and does not require additional approval by OMB.

32. We will submit this final rule to OMB for informational purposes only.

VIII. Environmental Analysis

33. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[44] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[45] The actions proposed herein fall within this categorical exclusion in the Commission's regulations.

IX. Regulatory Flexibility Act

34. The Regulatory Flexibility Act of 1980 (RFA) generally requires a description and analysis of final rules that will have significant economic impact on a substantial number of small entities.[46] The RFA mandates consideration of regulatory alternatives that

---

[44] *Regulations Implementing the National Environmental Policy Act of 1969*, Order No. 486, FERC Stats. & Regs. ¶ 30,783 (1987).

[45] 18 CFR 380.4(a)(2)(ii).

[46] 5 U.S.C. 601-612.

accomplish the stated objectives of a proposed rule and that minimize any significant economic impact on a substantial number of small entities. The Small Business Administration's (SBA) Office of Size Standards develops the numerical definition of a small business.[47] The SBA has established a size standard for electric utilities, stating that a firm is small if, including its affiliates, it is primarily engaged in the transmission, generation and/or distribution of electric energy for sale and its total electric output for the preceding twelve months did not exceed four million megawatt hours.[48] The RFA is not implicated by this Final Rule because the interpretation accepted herein does not modify the existing burden or reporting requirements. Because this Final Rule accepts an interpretation of the currently approved Reliability Standard, the Commission certifies that this Final Rule will not have a significant economic impact on a substantial number of small entities.

X. Document Availability

35. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through FERC's Home Page (http://www.ferc.gov) and in FERC's Public Reference Room during normal business

[47] 13 CFR 121.201.

hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington, DC 20426.

36. From FERC's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

37. User assistance is available for eLibrary and the FERC's website during normal business hours from FERC Online Support at 202-502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

XI. Effective Date and Congressional Notification

38. This Final Rule is effective 30 days from publication in Federal Register. The Commission has determined, with the concurrence of the Administrator of the Office of Information and Regulatory Affairs of OMB that this rule is not a "major rule" as defined in section 351 of the Small Business Regulatory Enforcement Fairness Act of 1996.

II. MOTION FOR LEAVE TO FILE REPLY COMMENTS

NERC respectfully moves for leave to file reply comments in the above-captioned docket. NERC has an interest in the subject of the Notice of Proposed Rulemaking ("NOPR") issued in this docket on September 15, 2011 pursuant to Section 215 (d)(2) of the Federal Power Act ("FPA"), wherein the Commission proposed to approve the CIP Version 4 Reliability Standards, which were submitted by NERC for approval on February 10, 2011.

The Associated Electric Cooperative, Inc. ("Associated Electric"), Basin Electric Power Cooperative ("Basin Electric"), and Tri-State Generation and Transmission Association, Inc. ("Tri-State") (collectively, the "G&T Cooperatives") filed comments in response to the NOPR, asserting that NERC no longer appears to have intended that the CIP Version 4 standards go into effect in advance of the CIP Version 5 standards.[1] Based on this assertion, the G&T Cooperatives requested that the Commission issue an order approving the CIP Version 4 standards for guidance purposes only, but delay implementation so that Version 4 will be superseded by the CIP Version 5 standards.[2] NERC hereby provides these reply comments to correct the G&T Cooperatives' misunderstanding of NERC's position.

NERC submits that the acceptance of these reply comments will assist the Commission in its decision-making process by clarifying the issues under consideration, helping to develop a complete and accurate record, and correcting the misunderstanding contained in the comments filed by the G&T Cooperatives. While the Commission's rules generally do not permit the filing of reply comments unless otherwise permitted by the Commission,[3] the Commission has granted motions to leave to file such responses if they will clarify issues in dispute, ensure a complete and accurate record, or otherwise provide information to assist the Commission in its decision-making making process.[4] NERC's Reply Comments will help clarify certain matters regarding

implementation of the CIP Version 4 Reliability Standards now before the Commission in this docket. Therefore, NERC respectfully requests permission to submit these Reply Comments.

III. REPLY COMMENTS

The G&T Cooperatives suggest that NERC no longer appears to have intended that the CIP Version 4 standards should go into effect in advance of Version 5. As a basis for the suggestion, the G&T Cooperatives mistakenly link together NERC's statement that the CIP Version 4 standards were to be an interim measure setting up bright-line criteria for identifying assets to be subject to the CIP standards and NERC's posting for public comment of the CIP Version 5 Implementation Plan on November 7, 2011. The G&T Cooperatives assert that NERC never intended that Version 4 was to become effective.[5]

That assertion is wrong. NERC continues to request that the Commission approve CIP Version 4 to be effective as proposed. As noted in NERC's CIP NOPR Comments, NERC is aware of concerns from some in the industry that implementation of the CIP Version 4 standards may be so close in time to implementation of the CIP Version 5 standards that it could create difficulties for industry participants to implement both versions of the standards. For this reason, the CIP Version 5 standard drafting team is assessing in the proposed CIP Version 5 Implementation Plan whether there is an opportunity to suggest an extension of Version 3 until Version 5 can be implemented, thereby eliminating the need for implementation of Version 4. However, until CIP Version 5 and an appropriate implementation plan is fully vetted and approved by the industry, the NERC Board of Trustees, and FERC, there is no basis to determine at this juncture that the CIP Version 4 standards should not be implemented.

Ordering Compliance Filings, 117 FERC ¶ 61,091, at P 18 (2006) (same); *North American Electric Reliability Corporation*, 119 FERC ¶ 61,248 (2007) at P 6 (same).

[5] G&T NOPR Comments at pp. 4-5.

Assuming a favorable industry ballot and NERC Board of Trustees approval, NERC anticipates filing the CIP Version 5 standards by the third quarter of 2012. Many factors could delay this schedule, thus requiring FERC to carefully consider whether the arguments that implementation of CIP Version 4 and CIP Version 5 are too close in time merit a delay in implementation of CIP Version 4. For example, the development schedule for the CIP Version 5 standards depends on the timing of the formal postings, the number of comments received, and the number of changes that may need to be made to the language in the standards as a result of these comments. Ultimately a favorable outcome on the proposed standards is in the hands of the registered ballot body which will, in turn, affect the final delivery of the proposed CIP Version 5 standards to FERC for approval.

Because NERC cannot predict the time it will take to reach industry consensus on the CIP Version 5 standards, and because the timing necessary for FERC to approve the CIP version 5 standards is uncertain, NERC purposefully did not state or suggest that its intention was that the CIP Version 4 standards should never go into effect. In fact, NERC specifically stated in its NOPR comments that the "suggestion [to delay implementation of Version 4] is not being made now, and it could be considered only if the industry moves promptly on Version 5."[6] NERC additionally stated that "[i]f Version 5 is not approved by the industry, filed by NERC, and approved by the Commission within that anticipated schedule, or reasonably thereafter, it is unlikely that Version 3 could be extended in a manner that eliminates the need for implementation of Version 4."[7]

[6] *Version 4 Critical Infrastructure Protection Reliability Standards*, Comments of the North American Electric Reliability Corporation in Response to Notice of Proposed Rulemaking, Docket No. RM11-11-000, November 21, 2011, p. 10 ("NERC CIP NOPR Comments").
[7] *Id.*

NERC has stated that Commission approval of the proposed CIP Version 4 standards, will help eliminate ambiguity in the identification of Critical Assets. The "bright-line" criteria for the identification of Critical Assets that will replace the currently-effective CIP Version 3 standards, which allow Critical Assets to be determined based on an entity's risk-based assessment methodology, is a substantial improvement to the CIP standards. For these reasons, NERC states in its NOPR comments that it agrees with FERC's proposal to approve the proposed Implementation Plan for the CIP Version 4 Reliability Standards as filed. Should it be determined through the development of the CIP Version 5 standards that implementation of the CIP Version 4 and CIP Version 5 standards close in time creates a burden on registered entities, NERC will re-evaluate and address implementation options as a part of the CIP Version 5 filing with FERC.

IV. CONCLUSION

For the foregoing reasons, NERC respectfully requests that the Commission grant this motion for leave to file reply comments, consider its comments herein, and approve the proposed CIP Version 4 Reliability Standards based on the filings submitted by NERC in this proceeding.

Respectfully submitted,

/s/ Holly A. Hawkins

December 5, 2011

1. Reply Comments of NERC in Response to NOPR on CIP Version 4 Reliability Standards (RM11-11)

On December 5, 2011, NERC submitted reply comments to FERC in response to the NOPR on CIP Version 4 Reliability Standards. Associated Electric, Basin Electric, Tri-State Generation and Transmission Association, Inc. filed comments in response to the NOPR, asserting that NERC no longer appears to have intended that the CIP Version 4 standards go into effect in advance of the CIP Version 5 standards. NERC's comments state that NERC continues to request that the Commission approve CIP Version 4 to be effective as proposed. NERC is aware of concerns that the implementation of the CIP Version 4 standards may be so close in time to implementation of the CIP Version 5 standards that it could create difficulties for industry participants to implement both versions of the standards. The CIP Version 5 standard drafting team is assessing in the proposed CIP Version 5 implementation plan whether there is an opportunity to suggest an extension of Version 3 until Version 5 can be implemented, thereby eliminating the need for implementation of Version 4.

http://elibrary.ferc.gov/idmws/File_list.asp?document_id=13976777

BACKGROUND: *On November 21, 2011, The ISO/RTO ("IRC") Council submitted comments in response to the September 15, 2011 Notice of Proposed Rulemaking. The IRC's comments center on proposed standard CIP-002-4, and in particular Attachment 1 of that Standard. Attachment 1 provides criteria for identifying Critical Assets on the Bulk Electric System. As described in the NOPR, the Attachment 1 Criteria are intended to establish uniform, bright-line tests for identifying Critical Assets. The IRC stated that Version 4 CIP-002-4 warrants additional clarification and direction to ensure uniform implementation. To the extent that the Commission approves Standard CIP-002-4, additional guidance or direction to NERC on how to exercise discretion on enforcement and implementation issues given the potential overlap and possible conflict with impending Version 5 of the standard is needed.*

http://elibrary.ferc.gov/idmws/File_list.asp?document_id=13973063

On September 15, 2011, FERC issued a Notice of Proposed Rulemaking ("NOPR") to approve eight modified Critical Infrastructure Protection (CIP) Reliability Standards, CIP-002-4 through CIP-009-4, developed and submitted to the Commission for approval by NERC. Proposed Reliability Standard

CIP-002-4 requires the identification and documentation of Critical Cyber Assets associated with Critical Assets that support the reliable operation of the Bulk-Power System. The "Version 4" CIP Reliability Standards propose to modify CIP-002-4 to include "bright line" criteria for the identification of Critical Assets. The proposed Version 4 CIP Reliability Standards would replace the currently effective Version 3 CIP Reliability Standards. The Commission also proposes to approve the related Violation Risk Factors Docket No. RM11-11-000 ii and Violation Severity Levels with modifications, the implementation plan, and effective date proposed by NERC.

On January 18, 2008, the Commission issued Order No. 706 approving eight CIP Reliability Standards proposed by NERC. The Commission directed NERC to develop modifications to the CIP Reliability Standards to address various concerns discussed in the Final Rule. In relevant part, the Commission directed the ERO to address the following issues regarding CIP-002-1: (1) need for ERO guidance regarding the risk-based assessment methodology for identifying Critical Assets; (2) scope of Critical Assets and Critical Cyber Assets; (3) internal, management, approval of the risk-based assessment; (4) external review of Critical Assets identification; and (5) interdependency between Critical Assets of the Bulk-Power System and other critical infrastructures. Subsequently, the Commission approved Version 2 and Version 3 of the CIP Reliability Standards, each version including changes responsive to some but not all of the directives in Order No. 706. On February 10, 2011, NERC filed a petition seeking Commission approval of proposed Reliability Standards CIP-002-4 to CIP-009-4 and requesting the concurrent retirement of the currently effective Version 3 CIP Reliability Standards, CIP-002-3 to CIP-009-3.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION RELIABILITY STANDARDS DEVELOPMENT PLAN 2012-2014 INFORMATIONAL FILING PURSUANT TO SECTION 310 OF THE NERC RULES OF PROCEDURE

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC") hereby submits to the Federal Energy Regulatory Commission ("FERC") for informational purposes its revised Reliability Standards Development Plan in accordance with Section 310 of the NERC Rules of Procedure. The *Reliability Standards Development Plan: 2012–2014* ("2012 Development Plan"), is included as **Exhibit A**. Stakeholder[1] comments received regarding the draft 2012 Development Plan during the open comment period, as well as summaries of those comments, are included as **Exhibit B.** The NERC Board of Trustees approved the 2012 Development Plan on November 3, 2011.

[1] The NERC stakeholders comprise representatives of small and large end-use customers and governmental authorities as well as representatives such as Transmission Owners; Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs); Load-Serving Entities (LSEs); Transmission Dependent Utilities (TDUs); Electric Generators; Electricity Brokers, Aggregators, and Marketers; Large Electricity End Users; Small Electricity Users; Federal, State, and Provincial Regulatory or other Government Entities; and Regional Entities.

III. BACKGROUND

In 2006, NERC developed an initial version of the plan for Reliability Standards development entitled the *Reliability Standards Development Plan: 2007–2009*. NERC has since updated the plan annually, and the 2012–2014 version of the plan is presented in this filing. The 2012 Development Plan serves as a management tool to guide and coordinate the development of Reliability Standards and provide benchmarks for assessing progress. The 2012 Development Plan also serves as a communications tool for coordinating standards development work with applicable governmental agencies in the United States and Canada and for engaging stakeholders in standards development activities. The 2012 Development Plan further provides a base for developing annual plans and budgets for the NERC standards program. Consistent with the four previous versions of the plan, the 2012 Development Plan is filed for informational purposes. No specific FERC action is requested at this time. The 2012 Development Plan builds upon the foundation established by the previous plans and identifies the current plans and priorities for

development and modification of NERC Reliability Standards in the immediate three-year time horizon.

Similar to the 2011 Development Plan, the 2012 Development Plan has benefited from a prioritization process developed through NERC's Standard Committee. The Standards Committee used a prioritization tool to assist in the determination of the relative priorities of projects within the NERC Standards Development portfolio. This tool considered various factors, including reliability impact, time-sensitivity, and practicality, as well as project logistics. Assisted by that prioritization tool, the Standards Committee identified a set of projects to which the majority of NERC and industry resources are expected to be assigned over the next three years.

NERC anticipates this prioritization of projects and resultant standards development work will be dynamic, and will be updated periodically as projects are completed or as new needs are identified and projects considered. NERC also recognizes that new priorities may be created as our experience grows and as new risks are identified that will require flexibility in work planning to ensure the activities most in the interest of bulk power system reliability are given appropriate resources and priority. The 2012 Development Plan is included as **Exhibit A**. A summary of Stakeholder comments received and the comments received on the draft 2012 Development Plan during the open comment period are included as **Exhibit B.**

By this filing, NERC informs FERC and other interested parties of the significant changes to the content of the *Reliability Standards Development Plan: 2011–2013* ("2011 Development Plan") that led to the creation of the 2012 Development Plan. NERC identifies changes in project timelines and completion dates that are reflected in the 2012 Development Plan and presents a summary of stakeholder comments that were considered during the development of the final 2012 Development Plan.

A. Summary of 2012 Development Plan

i. Project Prioritization and Work Plan

The 2012 Development Plan was developed in part in reliance on a prioritization tool created by the NERC's Standards Committee and its subcommittees. The prioritization tool was modified from the version used in the development of the 2011 Development Plan in response to comments received from stakeholders. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the *NERC President's Top Priority Issues for Bulk Power System Reliability*,[2] and trial testing of a new metric that accounts for "cost considerations." In addition, the Tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the Standards Committee to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources. Additional details regarding the prioritization tool can be found in Attachment 1 of the 2012 Development Plan.

The tool calculates rankings for a project based on the following criteria:

- The project's alignment with issues identified in the *NERC President's Top Priority Issues for Bulk Power System Reliability;*
- Whether the project's deliverables will fill an identified gap in reliability;
- The subjective magnitude of the improvements to existing standards expected from the project's completion;
- The time-sensitivity of the project (if any) relative to regulatory deadlines or other similar delivery commitments;

[2] Available at: http://www.nerc.com/news_pr.php?npr=723.

- Stakeholder and staff compliance experiences with the subject standards;
- Interpretations related to the subject standards; and
- Other factors, as deemed to be necessary by the Standards Committee.

NERC and the Standards Committee used the prioritization tool to assist in the prioritization of the projects identified in the 2012 Development Plan. The 2012 Development Plan assumed an overall throughput capacity of thirteen projects in concurrent development, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.
- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, reducing the cost or burden of demonstrating compliance, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The following projects from 2011 are expected to continue in 2012:[3]

- 2006-06 Reliability Coordination
- 2007-02 Operating Personnel Communication Protocols
- 2007-03 Real-time Transmission Operations

[3] 2007-07 Vegetation Management is included in the 2012 Plan as a project continuing in 2012. At the time of the 2012 Plan's submission to the NERC Board of Trustees for approval, it was not clear if 2007-07 would be moving forward in 2011 or continuing into 2012. However, it has subsequently been determined that the project will complete in 2011.

- 2007-06 Protection System Coordination
- 2007-09 Generator Verification
- 2007-12 Frequency Response
- 2007-17 Protection System Maintenance and Testing
- 2008-06 Cyber Security – Order 706
- 2009-01 Disturbance and Sabotage Reporting
- 2010-05.1 Phase 1 of Protection Systems: Misoperations
- 2010-07 Generator Requirements at the Transmission Interface
- 2010-14.1 Phase 1 of Balancing Authority Reliability- based Controls: Reserves
- 2010-17 Definition of Bulk Electric System

NERC intends to initiate development of the following additional projects in 2012.

- 2008-02 Undervoltage Load Shedding
- 2009-02 Real-time Monitoring and Analysis Capabilities
- 2009-03 Emergency Operations
- 2010-01 Support Personnel Training
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS
- 2010-13.2 Phase 2 of Relay Loadability: Generation

These projects have been assigned based on priority, but constrained by the need to have a limited number of projects under active development at any given time. Additionally, Project 2010-05.2 is not scheduled to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. Project 2012-04 is not scheduled to start until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

Additional detail regarding subsequent years is included in the 2012 Development Plan, as well as general updates on the ERO overall. The 2012 Development Plan also includes updates on regional standards development.

While the 2012 Development Plan presents a reasonable approach to Standards development, it cannot account for unforeseen events. The 2012 Development Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and other factors, such as new or emerging reliability risks to the Bulk Electric System. Changes to the 2012 Development Plan during its execution are not only possible, but likely, and should be expected. Additionally, such changes must be developed following the steps outlined in the NERC *Standard Processes Manual*,[4] which ensures an open and inclusive process through adherence to ANSI standards development principles.

ii. General Revisions

This section provides a summary of significant revisions to the 2012 Development Plan as compared to the 2011 Development Plan. The number of projects proposed in this plan (48) is more than the 35 projects listed in the 2011 Development Plan. The difference was created due to several factors:

The following seven projects identified in the 2011 Development Plan were completed and removed from this revised plan:

- 2006-02 Assess Transmission and Future Needs
- 2007-04 Certifying System Operators
- 2008-06 Cyber Security Order 706 Version 4
- 2009-06 Facility Ratings

[4] Available at: http://www.nerc.com/files/Appendix_3A_Standard_Processes_Manual_20110825.pdf.

- 2010-10 FAC 729
- 2010-11 TPL Table 1 Footnote B
- 2010-13 Relay Loadability Order Phase 1

Twelve new projects were added based on stakeholder suggestions:

- 2012-03 PRC-004 VSLs
- 2012-04 Protection System Commissioning Testing
- 2012-05 ATC Revisions – Order 729
- 2012-06 Generator Capabilities
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis
- 2012-15 Flow Limited Paths

Four projects were separated into multiple phases, which were treated as individual projects in order to provide the Standards Committee with more flexibility during prioritization. In general, projects with multiple phases will have a numerical suffix indicating the phase appended to their project number.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2010.05.1 Phase 1 of Protection Systems: Misoperations
- 2010.05.1 Phase 2 of Protection Systems: SPS and RAS
- 2010-14.1 Phase 1 of Balancing Authority Reliability Based Controls - Reserves

- 2010-14.1 Phase 2 of Balancing Authority Reliability Based Controls – Time Error, AGC, and Inadvertent
- 2010-13.3 Phase 3 of Relay Loadability: Generation
- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

The 2012 Development Plan identifies the standards development projects that are currently expected to be worked on in the immediate three-year time horizon. NERC will make every attempt to bring as many projects to completion as possible; however, NERC will not complete all of the projects identified in this plan in the immediate three-year time horizon.

iii. Project Schedule and Timeline Updates

This section summarizes the progress made on the active projects identified in the 2011 Development Plan, changes in project timelines, and factors contributing to those changes.

2006-02 Assess Transmission and Future Needs

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the second quarter of 2012. However, the project was completed in the fourth quarter of 2011, and will not be worked on in 2012.

2006-06 Reliability Coordination

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the fourth quarter of 2011. Scheduling conflicts and the quantity of work to be completed have led to delays in the project. At this time, NERC expects this project to complete in the second quarter of 2012.

2007-02 Operating Personnel Communications Protocols

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the fourth quarter of 2012. Scheduling conflicts and the quantity of work to be completed have led to a modest delay in the project. Additionally, focus on a related interpretation has led to delay as well. At this time, NERC expects this project to complete in the first quarter of 2013.

2007-03 Real-time Transmission Operations

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the third quarter of 2012. Potential modifications to the scope of the project and associated discussion and debate have led to delays in the project. At this time, NERC expects this project to complete in Q1 of 2013.

2007-06 System Protection Coordination

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in 2013. Consistent with this, a review of the project estimates this project will complete in the first quarter of 2013.

2007-07 Vegetation Management

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the second quarter of 2011. However, as part of the project prioritization, resources were withdrawn from the project, and the drafting team was asked to work independently to continue their efforts. This added additional time as the team continued its work without formal facilitation. However, the project was completed in the fourth quarter of 2011, and will not be worked on in 2012.

2007-09 Generator Verification

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the fourth quarter of 2011. Scheduling conflicts and the quantity of work to be completed have led to delays in the project. At this time, NERC expects this project to complete in the fourth quarter of 2012.

2007-12 Frequency Response

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the second quarter of 2012. NERC is not anticipating any change in the delivery date of this project.

2007-17 Protection System Maintenance & Testing

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the first quarter of 2012. However, it has been difficult to build consensus around the associated standard. A failed recirculation ballot has led to delays. It is estimated this project will complete in the second quarter of 2012.

2008-06 Cyber Security - Order 706

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the second quarter of 2012. Working to ensure consensus through outreach and other initiatives has led to a modest delay in this project. It is estimated this project will complete in the third quarter of 2012.

2009-01 Disturbance and Sabotage Reporting

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the first quarter of 2012. Scheduling conflicts and the quantity of work to be completed have led to delays in the project. At this time, NERC expects this project to complete in the third quarter of 2012.

2010-05 Protection Systems

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in 2013, but noted that options were being considered for accelerating this delivery. This project was split into two phases (as discussed previously), the first of which is now expected to complete in the third quarter of 2012. Additional work is underway to determine if this project can be delivered sooner.

2010-07 Generator Requirements at the Transmission Interface

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in 2013. Consistent with this, a review of the project estimates this project will complete in the first quarter of 2013.

2010-15 Remote Access Urgent Action

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the third quarter of 2011, but noted that the project might be absorbed into Project 2008-06 Cyber Security Order 706. In fact, this was the approach taken, and the project is no longer active, as it has been absorbed by Project 2008-06 Cyber Security Order 706.

2010-17 Definition of Bulk Electric System

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the first quarter of 2012. However, the drafting team identified additional issues that it felt needed to be addressed. As a result, the project has two delivery dates. The first part of this project, which is expected to be responsive to Commission directives, is expected to complete in the first quarter of 2012 and filed by January 25, 2012. The remainder of this project, which will address the expanded scope, is estimated to complete in the second quarter of 2013.

B. NERC Stakeholders Input

To support the development of the 2012 Development Plan, NERC sought stakeholder input during an open comment period, which took place from September 12 through September 26, 2011. In addition, NERC solicited input from the NERC technical committees and from subject matter experts on the NERC staff. NERC received a total of 15 sets of comments during the open stakeholder comment periods. Comments were received from 63 different people from 38 companies representing all 10 of the 10 Industry Segments.

Stakeholder comments received on the draft 2012 Development Plan during the open comment period, as well as summaries of those comments, are included as **Exhibit B.** Changes to the prioritization and scores used in that effort were suggested in some of comments, resulting in minor modifications to the prioritization, but without any significant modification to the 2012 Development Plan itself.

IV. CONCLUSION

NERC respectfully requests that FERC accept this informational filing in compliance with Section 310 of the NERC Rules of Procedure.

Respectfully submitted,

/s/ Holly A. Hawkins

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and the implementation of projects in general
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 shows the Regional Work Plan in Gantt chart form
- Appendix 4 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President of Standards and Training

To: NERC's Board of Trustees, Stakeholders, Regulatory Authorities, and other interested parties

NERC is committed to the development of clear, technically excellent standards for the reliable planning and operation of the North American bulk power system. NERC's industry-based standard development process strives to leverage the knowledge and experience of subject-matter experts to develop stakeholder consensus in support of standards that achieve reliability objectives and are responsive to regulatory directives, balanced against the burdens and costs of compliance imposed upon the more than 1,900 entities that are now subject to these standards. No single standard can ensure this outcome. Rather, NERC strives to develop and enhance a portfolio of performance, risk-mitigation, and competency-based reliability standards that achieve a consistent defense in depth against credible events that may lead to cascading, uncontrolled separation, or instability and ensure prompt system restoration when extreme events occur.

Achieving this balance is intrinsically difficult. Just as the management of the reliability "bar" through enforceable standards is an ongoing and evolving process, the process for developing standards needs to evolve as well, in response to the learning that has occurred in the period since passage of the Energy Policy Act of 2005 and the initial enforcement of NERC standards in June 2007. We would like to use this message to highlight current achievements in the standards arena and our plans for 2012-2014, as well as certain emerging factors and concerns.

NERC's Reliability Standards Development Plan delivered the following results in 2011:

- As of November 1, 2011, 20 new or revised standards have been approved by the Board of Trustees, and are either filed or in the process of being filed with the FERC.
- Results Based Standard development principles were used for all new standards projects.
- The Standards Committee worked with NERC staff to prioritize standards development resources on twelve high priority projects. There has been no specific redirection of this effort relative to the selected priorities by regulatory authorities.
- Stakeholder-driven Quality Review has been integrated into the standards development process to assure the best quality standards from a compliance and implementation perspective.
- NERC undertook a first effort to develop a standard on a Rapid Development basis utilizing the new Standard Processes Manual.

- To balance the resources committed to the development of new standards versus the interpretation of existing standards, the Standards Committee has limited the number of interpretations under active development to three projects at any one time, while pursuing new procedural options such as "rapid revision" to correct deficiencies in the underlying standard.

The 2012-14 Reliability Standards Development Plan described in this report builds on recent experience by proposing an achievable yet ambitious plan of standards development. The 2012-14 Plan provides for:

- Continuation of ongoing standards projects with sufficient resources to ensure timely completion.
- Project priorities were established using a more comprehensive model with scores and explanatory inputs from the Standards Committee, NERC staff and industry stakeholders.
- Projects have been ranked for development priority along three tracks, based on consideration of Reliability Benefits, Time Sensitivity, and Practicality.
- As ongoing projects are completed, we are scheduling follow-on projects based on the availability of subject-matter experts and the completion of technical input, research, and industry outreach conducted by NERC's standing committees and subcommittees.
- Finally, the 2012-14 Plan incorporates a more comprehensive integration of the regional standards effort into this process. For the first time a complete project management process is being applied to regional standards development.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, a wide variety of electric system events and emerging risks to bulk power system reliability may necessitate deviations from this plan. In order to respond to such threats and initiate development of new or revised standards, the actual deployment of resources to staff this plan may shift. Additionally, the estimated times listed for project completion may change as more is learned about a given project.

NERC currently is investigating the following "emerging issues," each of which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Not every issue is addressable or best addressed through development of a new industry standard; the issues outlined above illustrate that truism. But where a standards related response is indicated, we will be ready to reprioritize and adjust.

The Standards Committee and NERC staff also recognize that major standards process efficiencies are still necessary if we are to make efficient use of NERC and industry resources, while meeting external expectations for the timely development and approval of technically excellent reliability standards. In 2012, we need to ask ourselves once again, "is there a better way to develop reliability standards?"

We achieve the past results and plan for the future results only with your support, and greatly appreciate that the industry has accepted the evolving prioritization process. Our efforts to effectively manage and balance the many conflicting demands placed upon both the industry and NERC staff resources has provided this next plan, which we hope you will endorse.

Each of us, day in and day out, is driven to do the "right" thing, and your ERO's reputation will be enhanced through your active support for completion of NERC's 2012-14 Reliability Standards Development Plan.

Sincerely,

Allen Mosher
Senior Director of Policy Analysis and Reliability, American Public Power Association
Chair, NERC Standards Committee

Herb Schrayshuen
Vice President of Standards and Training, NERC

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of interest to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come;
- Status updates regarding standards and related projects currently in development;
- A forecast of Standards Development work scheduled for the next three years; and
- An overview of the process used to prioritize work and assign resources to Standards development projects.

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels initially identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, other priorities may necessitate deviations from this plan. As new technologies are discovered or new threats to reliability identified, the actual deployment of resources to staff this plan may shift. Similarly, the estimated times listed for project completion may change as more is learned about a given project.

NERC is currently investigating the following "emerging issues," which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process, Standards Development, and Regional Standards teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development

- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 continent-wide Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

[1] The data included in this paragraph does not include Regional Reliability Standards.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year in accordance with Section 321.6 of the NERC Rules of Procedure ("Rule 321") that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Regional Standards Development

Regional standards work within NERC and the Regions has seen a great deal of development and implementation of new initiatives since the beginning of 2011. First, the Regional Reliability Standards Working Group (RRSWG) transitioned into the Regional Standards Group (RSG). Comprised of the NERC Vice President of Standards and Training and the Standards Managers from each of the eight Regional Entities, the RSG reports to the ERO Executive Management Group (EMG). Its purpose is to provide process and policy recommendations in the execution of the Regional Entity delegation agreements and the NERC Rules of Procedure. An overarching objective is to coordinate the development of Regional and continent-wide standards to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners and operators.

In support of this purpose and this objective, a primary initiative of the RSG is to create and sustain viable standards development coordination processes to obtain consistency and uniformity, where appropriate, across the ERO enterprise – NERC and the Regional Entities – while ensuring efficient and effective use of resources in executing the statutory responsibilities of the ERO as the reliability standards development authority. To that end, the RSG developed a combined list of all regional standards and variances in the development process in order to prioritize these projects continent-wide. This will allow NERC to coordinate the necessary resources through the development and ultimate filing of these standards and variances with applicable regulatory authorities. Project information for each of those regional standards and variances in the development process is provided in this Plan, along with a high-level overview of the project timeline.

Rapid Development and Rapid Revision Projects

NERC's Standards Committee (SC) tentatively has identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010-05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can address an interpretation request more effectively than an interpretation can alone, the team may propose to the requester that the team instead make such changes and submit them with an associated SAR. If agreed to by the requester, and following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its Rules of Procedure, NERC has committed to review each of its standards for modification once every five years. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. While not giving the appearance of being onerous, this obligation has proved challenging to meet. The work load of the ERO remains high, and maintaining focus on those projects that are most beneficial to reliability has resulted in a delay of the work required for these five-year reviews (except when already associated with a project of significant reliability value). Using current assumptions, the five-year review obligation will not be met for a number of standards. NERC and the SC are working together with the NERC Board of Trustees to evaluate options for addressing this issue.

Product Quality

As NERC's and the industry's experience with standards has evolved, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and efficiently. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress

in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global "portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity. Additionally, the plan was developed with the use of a subjective review of the implications of cost. NERC believes this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the Tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standards based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capacity of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems generally were not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Regulatory Submission - Following adoption by NERC's Board of Trustees, the standards are submitted to regulatory authorities.

- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any necessary supplemental regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). The Regional Work Plan is included as Appendix 3. A detailed summary of projects, including regional projects, is included as Appendix 4.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active Projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact all three of these areas in some way, this is intended to illustrate the primary consideration driving each project's development priority.

Existing Active Projects:

- 2006-06 Reliability Coordination.
- 2007-02 Operating Personnel Communication Protocols.
- 2007-03 Real-time Transmission Operations.
- 2007-06 Protection System Coordination.
- 2007-07 Vegetation Management. This project is expected to be completed in early 2012, but at the time of this document's finalization, it has not yet been formally completed.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response.
- 2007-17 Protection System Maintenance and Testing.
- 2008-06 Cyber Security – Order 706.
- 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-07 Generator Requirements at the Transmission Interface.
- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves.
- 2010-17 Definition of Bulk Electric System.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited

number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such as new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project is currently in informal development.
- 2009-03 Emergency Operations. This project is currently in informal development.
- 2010-01 Support Personnel Training. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project is currently in informal development. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization.
- 2012-04 Protection System Commissioning Testing. This project is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.

NERC intends to initiate development of the following projects in 2013. As noted above, these projects generally have been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is currently in informal development.
- 2008-01 Voltage and Reactive Planning and Control. This project is currently in informal development.
- 2008-12 Coordinate Interchange Standards. This project is currently in informal development.
- 2009-07 Reliability of Protection Systems. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until after the completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is currently in informal development.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project requires research prior to initiation, which is expected to be completed in the latter part of 2012.
- 2012-06 Generator Capabilities. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project requires research prior to initiation, which is expected to be completed in 2013.
- 2009-05 Resource Adequacy Assessments.
- 2010-03 Modeling Data. This project requires research prior to initiation, which is expected to be completed in the latter part of 2013.
- 2010-04 Demand Data. This project requires research prior to initiation, which is expected to be completed in 2014.
- 2010-08 Functional Glossary Model Revisions.

- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is expected to not start until completion of the previous phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator.
- 2012-05 ATC Revisions - Order 729.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority. There also is some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan that follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	7	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	6	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	2	29
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	3	7
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	14	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	11	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	12	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	9	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	19	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	37	41
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	4	3
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	16	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	15	25
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	8	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	20	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	22	20
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	41	43
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	10	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	17	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	18	19
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	36	40

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	40	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	42	44
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	13	31
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	38	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	39	24
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	21	33
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	32
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12

STANDARDS COMMITTEE Reliability Standard Project Prioritization

TIME SENSITIVITY SORT

Project Number and Name	Short Description	(E) Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	(F) Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	(K) Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	14	25
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	16	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	17	20
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	18	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	19
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	31
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	41
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	43
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	40
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative, BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

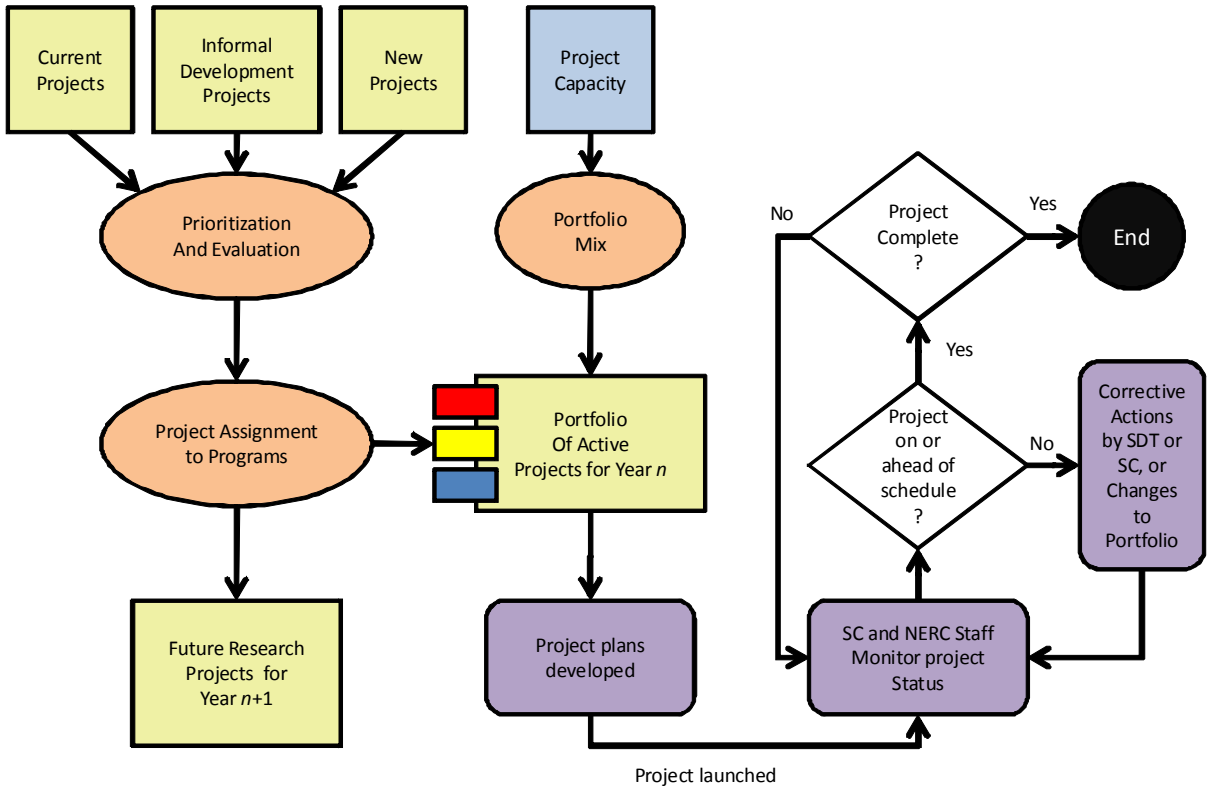
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

ID	Task Name

Split | Milestone | Project Summary | External Milestone

Appendix 4 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity;
- Move the requirement (into another project or Standard, or to the certification process); or
- Eliminate the requirement (because it is redundant or does not support BPS reliability).

This project ranked #13 in Reliability Priority.

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. No estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to real-time operating states and protocols for issuing and responding to operating directives.

This project ranked #5 in Reliability Priority.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Due to focusing on other priorities, this team was temporarily put on hold. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

This project ranked #5 in Practicality Priority.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to other standards as appropriate through coordination with project 2006-06 Reliability Coordination.

This project ranked #4 in Reliability Priority.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, which were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltage transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It also will ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were posted most recently for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained within the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It also will ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

This project is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

This project ranked #3 in Reliability Priority.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

This project ranked #3 in practicality.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery will be reviewed and addressed.

This project ranked #14 in Reliability Priority.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

This project ranked #2 in Reliability Priority.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator, or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project also will consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

This project ranked #8 in Reliability Priority.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

This project ranked #1 in Practicality Priority.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

This project ranked #4 in Practicality Priority.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

This project ranked #1 in Reliability Priority.

Standards affected:

New

Status:

This project has an initial draft of a SAR that was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

This project ranked #15 in Reliability Priority.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

This project ranked #7 in Reliability Priority.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

This project ranked #11 in Reliability Priority.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

This project ranked #12 in Reliability Priority, #13 in Practicality Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARs associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

This project ranked #10 in Reliability Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings, and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

This project ranked #9 in Reliability Priority,

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

This project ranked #6 in Reliability Priority

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision that, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE DEVELOPMENT

PRC-002-FRCC-1 — FRCC Regional Disturbance Monitoring and Reporting Requirements

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Disturbance Monitoring Equipment" (revision dated June, 2006) into a new Regional Reliability Standard that complies with the requirements of NERC Reliability Standard, PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements.

Standards affected:

PRC-002-1

Status:

This Regional project is currently on "hold." Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-11 Disturbance Monitoring being classified as a "Project in Informal Development," FRCC staff will be re-evaluating the current status of the regional project to determine whether to proceed with the Regional Reliability Standard development or to revise the current FRCC Regional Criteria document "FRCC Requirements for Disturbance Monitoring Equipment."

FUTURE DEVELOPMENT

PRC-003-FRCC-1 — FRCC Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems

Summary:

FRCC plans to convert the existing handbook document "FRCC Requirements for Analysis of Protection Misoperations & Corrective Actions Reporting" (revision dated October, 2003) into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

Standards affected:

PRC-003-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC has revised Regional Criteria documents ("FRCC Requirements for Analysis of Protection Misoperations and Corrective Actions Reporting," revision dateed December 2, 2010) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

FUTURE DEVELOPMENT

PRC-006-FRCC-1 — FRCC Automatic Underfrequency Load Shedding Program

Summary:

FRCC is developing a Regional Reliability Standard to provide last resort system preservation measures by implementing an Underfrequency Load Shedding (UFLS) program. Additional requirements may be needed due to FRCC peninsular geography and limited ties to the north. Operating experience and decades of studies by the FRCC and its predecessor reliability organizations have resulted in a well-developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. The standard development project will effectively use the proven high performance characteristics of the existing FRCC UFLS program and refine its requirements and coordination procedures to comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

Standards affected:

PRC-006-1

Status:

PRC-006-FRCC-1 FRCC Automatic Underfrequency Load Shedding Program has been approved by the FRCC Registered Ballot Body and the FRCC Board of Directors. Based on concerns identified by NERC standards staff and the pending Commission (FERC) approval of the NERC Continent-Wide Reliability Standard PRC-006-1 Automatic Underfrequency Load Shedding and associated Regional variances, the Regional project has been placed on “hold.” The FRCC has since revised Regional Criteria documents (FRCC Automatic Underfrequency Load Shedding Program, revision date: April 7, 2011) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

FUTURE DEVELOPMENT

PRC-024-FRCC-1 — FRCC Regional Generator Performance During Frequency and Voltage Excursions

Summary:

FRCC is developing a standard to establish "ride through" requirements for generators in the FRCC Region with respect to temporary grid voltage or frequency deviations from their normal range. The Standard should address time duration limits for operation of generator protection for

1) frequencies outside of the 59.5 - 60.5 hertz range,
2) voltages outside of the 95% - 105% range, and
3) generator stator current overloads.

The Standard should address exemption criteria and mitigation measures available for resolving apparent conflicts between generator capabilities and the coordination requirements. Considerable knowledge of grid frequency and voltage excursions and the time limited capabilities of generators to sustain these conditions has been gained through operating experience and previous reliability studies. This standards development project should effectively use this knowledge to define coordination requirements and procedures that comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Standards affected:

PRC-024-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-09 Generator Verification being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC is actively revising Regional Criteria documents (FRCC Generator Coordination Requirements) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

2012 DEVELOPMENT

PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Program

Summary:

The purpose of this Standard is to establish the requirements for NPCC and its members to operate and maintain a coordinated Regional Underfrequency load shedding (UFLS) program. The NPCC's UFLS program will meet the requirements contained in NERC standards, and provide those entities to which it is applicable the guidance necessary to implement it. This standard will also mandate that coordination with neighboring Regional Underfrequency load shedding programs be developed when necessary. The unique character, dispersion, sensitivity and density of the NPCC regional loads emphasize the need for this Standard.

The NPCC regional UFLS standard shall apply to all applicable entities within the Region and sub-regional areas that are both synchronous and asynchronous to the Eastern Interconnection. Quebec UFLS has different parameters, and these are included in the standard and fully coordinated within the Region.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. NPCC expects to complete the drafting of this standard in 2011 and conduct a ballot of stakeholders in the first quarter of 2012. Submission to the NERC Board of Trustees and subsequent filing with FERC is expected to occur in 2012.

FUTURE DEVELOPMENT

PRC-012-NPCC-1 — Special Protection Systems

Summary:

To support and enhance bulk power system reliability, this Standard will establish the criteria for the minimum design objectives and practices for special protection systems (the purpose of which are to detect abnormal system conditions, and take corrective actions other than the isolation of faulted elements to maintain the stability and security of the bulk power system). This Standard will also establish the requirements for close coordination between system planning, design, operating, maintenance and protection functions to ensure that the impacts of special protection system operations do not result in a significant adverse impact.

The proposed Standard will describe the requirements for the design and approval of Special Protection Systems and the technical criteria required to support its implementation. The Standard will also identify the need for close coordination among various parties to ensure that the Special Protection Systems are implemented correctly, and triggers and resulting actions are made known and communicated in an on-line database.

Standards affected:

PRC-012-0

Status:

This Regional project is currently on “hold” pending the completion of the NERC Reliability Standard Development Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS, and the outcome of the work by the NERC SPCS on the definition of SPS.

2011 DEVELOPMENT

MOD-024-RFC-1 — Verification and Data Reporting of Generator Gross and Net Real Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Real Power capability to support NERC Reliability Standard MOD-024. The objective of the regional standard is to ensure accurate information on generator gross and net Real (MWs) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-024-1

Status:

This Regional standard has been approved by the Reliability*First* Board. Currently, VRFs and VSLs are in development. Reliability*First* expects to complete the drafting of the VRFs and VSLs in 2011, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2011 DEVELOPMENT

MOD-025-RFC-1 — Verification and Data Reporting of Gen Gross and Net Reactive Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Reactive Power capability to support NERC Reliability Standard MOD-025. The objective of this standard is to ensure that accurate information on generator gross and net Reactive (MVAR) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-025-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with the FERC is expected to occur in 2012.

2011 DEVELOPMENT

PRC-002-RFC-1 — Disturbance Monitoring and Reporting Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for Disturbance monitoring and reporting to support NERC Reliability Standard PRC-002.

Standards affected:

PRC-002-1

Status:

Reliability*First* is currently working on the technical justification for the locational requirements for DME equipment. This Regional standard has been approved by the Reliability*First* Board. Reliability*First* expects submission of this standard to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2012 DEVELOPMENT

PRC-006-RFC-1 — Automatic Under Frequency Load Shedding Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency and assist in the recovery of frequency following underfrequency events, providing last resort system preservation measures. The standard goes beyond the NERC PRC-006-1 standard and prescribes with more certainty aspects that the Planning Coordinator's UFLS program must contain, further details on certain procedural matters with respect to how islands are addressed, and assessment of UFLS program implementation as well as program design. This standard also attempts further consolidating requirements of the Reliability*First* legacy underfrequency load shedding programs, permitting retirement of legacy documents to ensure appropriate coordination among the Reliability*First* legacy regional UFLS programs.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur later in 2012.

2012 DEVELOPMENT

PRC-012-RFC-1 — Special Protection System Requirements

Summary:

To purpose of the standard is to establish Reliability*First* requirements for the review, development and application of Special Protection Systems (SPS).

Standards affected:

PRC-012-0

Status:

This Regional project is currently in the initial drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur early in 2013.

2011 DEVELOPMENT

PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

Summary:

The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

In 2008, SERC commenced work on PRC-006-SERC-1. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the continent-wide UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. This regional standard PRC-006-SERC-1 adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Standards affected:

PRC-006-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011, and subsequent filing with FERC is expected to occur in 2012.

2012 DEVELOPMENT

PRC-006-SPP-1 — Under Frequency Load Shedding

Summary:

PRC-006 (Development and Documentation of Regional UFLS programs) has been identified by NERC as one of the Regional "Fill-in-the Blank" Standards. At a minimum, the requirements developed in this standard need to meet the requirements for the Regional Program as identified in NERC's PRC-006-0. Operating experience and regional studies have resulted in a well developed UFLS program that is very resilient to frequency excursions resulting from severe and extreme contingencies. This standards development effort intends to effectively use the proven high performance characteristics of the existing SPP UFLS program and refine its requirements and coordination procedures through an open process as described in the SPP Standard Development Process Manual.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. SPP expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

Summary:

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with certain existing non-routine ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Standards affected:

IRO-006-5 (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of IRO-006-5.)

Status:

This Regional Standard was approved by the Texas RE Board of Directors on June 28, 2011, and it will be submitted to the NERC Board of Trustees in November 2011. Subsequent filing with FERC is expected to occur in 2012.

2011 DEVELOPMENT

BAL-001-TRE-1 — Primary Frequency Response in the ERCOT Region

Summary:

This Regional Standard is intended to support reliability by ensuring adequate primary frequency response performance in the ERCOT Interconnection. The standard addresses frequency response at the Interconnection level, as well as by individual generating units and facilities. Specific maximum governor droop and deadband settings are provided, along with primary frequency response performance standards (initial and sustained) that allow actual unit-specific performance to be measured.

In 2002, NERC approved a regional difference for ERCOT that made it exempt from Requirement R2 in BAL-001-0 (CPS2), because of ERCOT's lack of synchronous connection to other control areas and the nature of the ERCOT energy market. FERC approved the ERCOT regional difference, finding that ERCOT's practice of (a) determining the minimum frequency response needed for reliability, and (b) requiring generators to have specific governor droop, to be a more stringent practice than Requirement R2 in BAL-001-0. FERC directed NERC to file a modification of the ERCOT regional difference to include the requirements concerning frequency response contained in section 5 of the ERCOT protocols. This Regional Standard is responsive to that directive.

Standards affected:

BAL-001-0.1a (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of the continent-wide standard.)

Status:

This project has been approved by the Texas RE Board of Directors, with expected submission to the NERC Board of Trustees in 2011 and subsequent filing with FERC to occur in 2012.

2012 DEVELOPMENT

BAL-002-WECC-1 — Contingency Reserves

Summary:

On Oct. 21, 2010, FERC found that BAL-002-WECC-1 did not meet the statutory criteria for approval and remanded the regional standard to NERC/WECC for further modification (RM09-15-000; Order 740). FERC held that BAL-002-WECC-1's less stringent requirements had not been supported by the technical data provided.

On remand, the Commission instructed WECC to modify the regional reliability standard to include a number of specific items contained in Order 740. This Request is submitted with the specific and narrow purpose of addressing only those issues mandated for modification in the October 2010 Oder 740.

Standards affected:

BAL-002-WECC-1

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2012 DEVELOPMENT

BAL-004-WECC-1 — Automatic Time Error Correction

Summary:

In the order approving BAL-004-WECC-1 the FERC directed WECC to make several clarifying modifications to the standard. FERC directed WECC to use the FERC-approved Process for Developing and Approving WECC standards to make these clarifying modifications

In addition, the WECC staff has identified the opportunity to make additional modifications to the existing standard to clarify the intent without changing the requirements.

There is also confusion regarding the R3 requirement that the ACE used for NERC reports shall be the same ACE as the AGC operating mode in use. This seems to conflict with the NERC response to NOPR comments that entities may use ATEC ACE for control but should use Raw ACE for reporting. WECC is developing a proposed regional variance to BAL-001-0.1a to address this apparent conflict.

Standards affected:

BAL-004-WECC-1
BAL-001-0.1a

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

VAR-001-WECC-1 — Voltage and Reactive Control

Summary:

The current draft has been converted from a Standard into a Regional Variance to the NERC VAR-001-2 Standard. The format incorporates the NERC Standard into the document with minor additions to address the scope of the variance. The regional variance specifics are included as Section E of the proposed document (see hyperlink above), and in this case, are intended to replace NERC VAR-001-2 requirements R3 and R4 as noted at the beginning of Section E.

The purpose of this regional variance to a NERC Reliability Standard is to ensure that voltage levels are within limits in real time to protect equipment and the reliable operation of the Western Interconnection. The "Rules of Procedure of the North American Electric Reliability Corporation" (Appendix 3A, page 31) permits the development of a regional variance to a NERC reliability standard on an Interconnection-wide basis when the Regional Reliability Organization has valid justification and when the variance is not inconsistent with or less stringent than the NERC Reliability Standard. The variance is an alternative method for obtaining the same reliability objective as the continent standard and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the electric reliability organization governmental authority, shall be enforced within the applicable Regional Entity(ies) pursuant to delegated authority.

Standards affected:

VAR-001-2

Status:

This Regional project has been approved by the WECC Board of Directors. WECC expects to submit the draft for the mandatory NERC 45-day comment period in the near future, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. Developing Projects Schedules

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

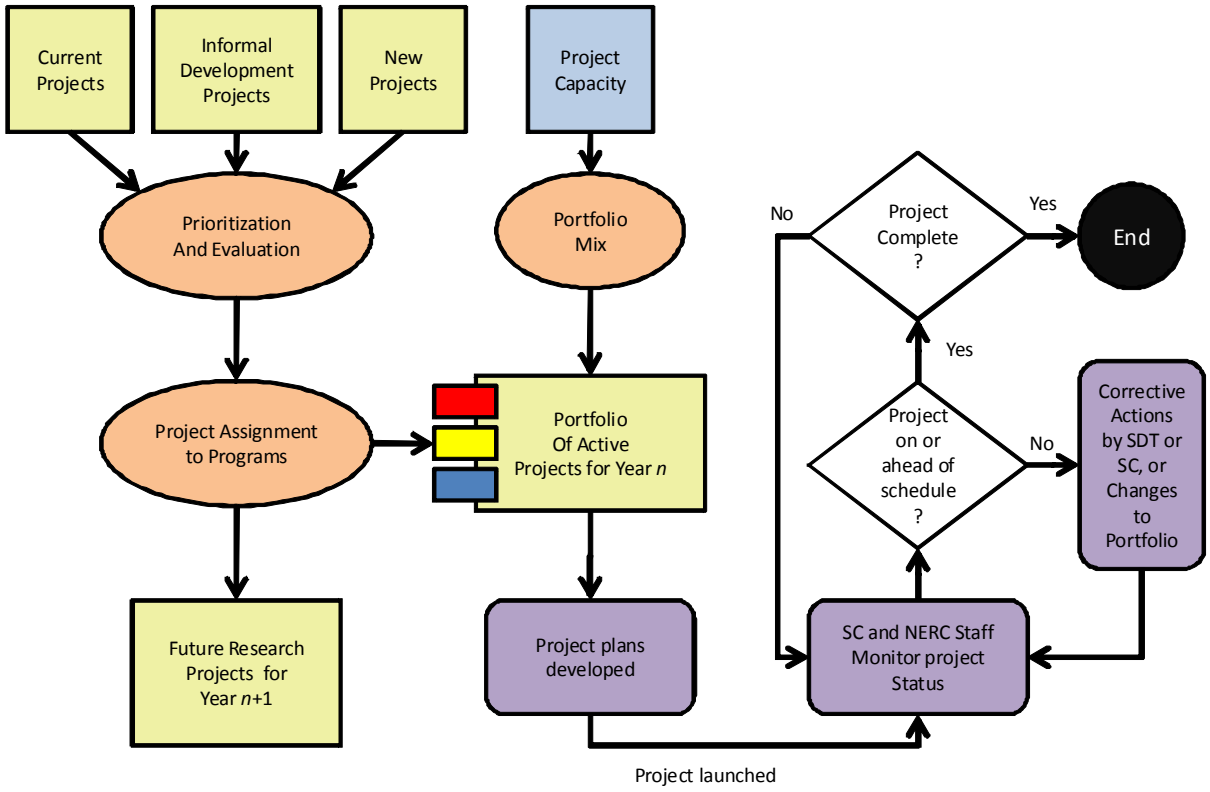
9. Monitoring Projects

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and he implementation of projects in general.
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards

<to be added>

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of information to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come
- Status updates regarding standards and related projects currently in development
- A forecast of Standards Development work scheduled for the next three years
- An overview of the process used to prioritize work and assign resources to Standards development projects

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process and Standards Development teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2007-07 Vegetation Management [**projection as of September 2011**]

- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information.

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development
- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

[1] The data included in this paragraph does not include Regional Reliability Standards.

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year consistent with in accordance with Section 321.6 of the NERC Rules of Procedure (“Rule 321”) that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Rapid Development and Rapid Revision Projects

NERC’s Standards Committee (SC) has tentatively identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010.05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can more effectively address an interpretation request than an interpretation can alone, the team may elect to make such changes and submit them with an associated SAR. Following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its ANSI accreditation, NERC has committed to review each of its standards for modification once every five years. While not giving the appearance of being onerous, this obligation has proven challenging to meet. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. However, the work load of the ERO remains high, and prioritization has resulted in a deferral f the work required for these five-year reviews except when already associated with a project of reliability value.

Product Quality

As NERC's and the industry's experience with standards has continued, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and regularly. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global

"portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity, all while making sure to consider the implications of cost. NERC believes this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standard based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capability of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research, and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems were generally not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any associated regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). A detailed summary of projects is included as Appendix 3.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact al three of these areas in some way, this is intended to illustrate the primary consideration driving its consideration.

Existing Active Projects:

- 2006-06 Reliability Coordination. This project ranked #13 in Reliability Priority.
- 2007-02 Operating Personnel Communication Protocols. This project ranked #5 in Reliability Priority.
- 2007-03 Real-time Transmission Operations. This project ranked #4 in Practicality Priority.
- 2007-06 Protection System Coordination. This project ranked #4 in Reliability Priority.
- 2007-07 Vegetation Management.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response. This project ranked #10 in Reliability Priority, and was tied for #2 in Time Sensitivity Priority.
- 2007-17 Protection System Maintenance and Testing. This project ranked #3 in Reliability Priority.
- 2008-06 Cyber Security – Order 706. This project ranked #1 in Reliability Priority.
- 2009-01 Disturbance and Sabotage Reporting. This project ranked #7 in Reliability Priority.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project ranked #8 in Reliability Priority.
- 2010-07 Generator Requirements at the Transmission Interface. This project ranked #13 in Practicality Priority, and was tied for #2 in Time Sensitivity Priority.
- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves. This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.

- 2010-17 Definition of Bulk Electric System. This project ranked #10 in Reliability Priority, and was tied for #2 in Time Sensitivity Priority.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding. This project ranked #14 in Reliability Priority, and is expected to be started upon the completion of 2006-06 Reliability Coordination.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project ranked #1 in Practicality Priority, and is expected to be started upon the completion of 2007-03 Real-time Transmission Operations.
- 2009-03 Emergency Operations. This project ranked #3 in Practicality Priority, and is expected to be started upon the completion of 2008-06 Cyber Security – Order 706.
- 2010-01 Support Personnel Training. This project ranked #15 in Reliability Priority, and is expected to be started upon the completion of 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project ranked #11 in Reliability Priority, and is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization. This project is expected to be started upon the completion of 2007-12 Frequency Response.
- 2012-04 Protection System Commissioning Testing. This project ranked #9 in Reliability Priority, and is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing

NERC intends to initiate development of the following projects in 2013. As noted above, these projects have generally been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is expected to start upon completion of 2010-17 Definition of Bulk Electric System.
- 2008-01 Voltage and Reactive Panning and Control. This project ranked #6 in practicality, and is expected to start upon completion of 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves
- 2008-12 Coordinate Interchange Standards. This project is expected to start upon completion of 2010-07 Generator Requirements at the Transmission Interface.
- 2009-07 Reliability of Protection Systems. This project ranked #2 in Reliability Priority, and is expected to start upon completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is expected to start upon completion of 2009-02 Real-time Monitoring and Analysis Capabilities.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project is expected to start upon completion of 2007-02 Operating Personnel Communication Protocols.
- 2012-06 Generator Capabilities. This project ranked #6 in Reliability Priority, and is expected to start upon completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project is expected to start upon completion of 2009-03 Emergency Operations.

- 2009-05 Resource Adequacy Assessments. This project is expected to start upon completion of 2012-04 Protection System Commissioning Testing.
- 2010-03 Modeling Data. This project is expected to start upon completion of 2008-01 Voltage and Reactive Panning and Control.
- 2010-04 Demand Data. This project is expected to start upon completion of 2010-05.2 Phase 2 of Protection Systems: SPS and RAS.
- 2010-08 Functional Glossary Model Revisions. This project is expected to start upon completion of 2010-01 Support Personnel Training.
- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. This project is expected to start upon completion of the second phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator. This project is expected to start upon completion of 2012-04 Protection System Commissioning Testing.
- 2012-05 ATC Revisions - Order 729. This project is expected to start upon completion of 2008-12 Coordinate Interchange Standards.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. There is also some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review

- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity, and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan which follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			**220.8**	**52**	**22**	**91.6**	1	17	29	5
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	87.5	66.7	41.7	0	12.5	25			**220.8**	**66**	**0**	**37.5**	2	3	33	17
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			**200**	**60**	**94**	**70.8**	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			**195.8**	**61**	**94**	**54.2**	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			**195.8**	**74**	**94**	**4.2**	5	1	4	27
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			**191.7**	**60**	**0**	**0**	6	8	34	30
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	58.3	16.7	16.7	5	50	25			**175**	**73**	**94**	**75**	7	2	5	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			**175**	**64**	**94**	**75**	8	4	6	8
Project 2012-04 Protection System Commissioning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	50	70.8	41.7	50	0	0	0			**170.8**	**57**	**0**	**0**	9	9	35	31
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2			**162.5**	**52**	**94**	**66.7**	10	18	7	11
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	45.8	62.5	40	45	5	33.3	12.5			**158.3**	**56**	**94**	**45.8**	11	10	8	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			**150**	**54**	**94**	**58.3**	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			**150**	**56**	**94**	**29.2**	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			**150**	**42**	**94**	**0**	14	24	11	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			**145.8**	**42**	**0**	**0**	15	25	36	33
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	75	54.2	30	5	33.3	8.3	50	Addressing Reactive Requirements key to reliability of system. Length of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommittee.	**141.7**	**64**	**94**	**91.6**	16	5	12	6
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be significant cost savings to the industry if the revisions to BAL-001 were to be realized.	**137.5**	**56**	**100**	**94.1**	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	**133.4**	**33**	**42**	**67.5**	18	35	27	10
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	**129.2**	**51**	**94**	**63.4**	19	20	13	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			**129.2**	**52**	**94**	**10**	20	19	14	24
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			**129.2**	**42**	**82**	**0**	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the development of the tool required.	**125**	**38**	**57**	**97.5**	22	31	25	1
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	**112.5**	**40**	**94**	**50**	23	29	15	15
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a singe standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	37.5	70.8	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	**108.3**	**55**	**94**	**91.7**	24	13	16	3
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			**95.8**	**36**	**0**	**0**	25	34	37	35
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	70	75	66.7	5	0	0	25	High Regional Priority	**95**	**38**	**94**	**25**	26	32	17	20
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	45.8	33.3	33.3	5	0	0			**87.5**	**55**	**94**	**0**	27	14	18	36
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			**70.9**	**47**	**94**	**91.7**	28	21	19	4
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			**70.8**	**47**	**94**	**26.7**	29	22	20	19
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			**66.7**	**46**	**0**	**0**	30	23	38	37

Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			**58.3**	**38**	**0**	**0**	31	33	39	38
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			**54.1**	**20**	**0**	**0**	32	37	40	39
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	50	18.8	18.8	5	0	0			**50**	**53**	**94**	**0**	33	16	21	40
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0			**33.3**	**41**	**0**	**4.2**	34	27	41	28
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	10	Foundational piece of ERO	**29.2**	**41**	**0**	**10**	35	28	42	25
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			**25**	**40**	**94**	**0**	36	30	22	41
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			**25**	**19**	**0**	**0**	37	38	43	42
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			**25**	**13**	**0**	**0**	38	39	44	43
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			**4.2**	**26**	**94**	**25**	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			**0**	**0**	**57**	**0**	40	40	26	44
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			**0**	**0**	**17**	**25**	41	43	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			**0**	**0**	**12**	**25**	42	44	32	23
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			**0**	**0**	**37**	**0**	43	41	28	45
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			**0**	**0**	**20**	**0**	44	42	30	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			**0**	**0**	**0**	**8.3**	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0			**0**	**0**	**0**	**4.2**	46	46	46	29
2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											**0**	**0**	**0**	**0**	47	47	47	47
2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											**0**	**0**	**0**	**0**	48	48	48	48

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be significant cost savings to the industry if the revisions to BAL-001 were to be realized.	**137.5**	**56**	**100**	**94.1**	17	12	1	2
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			**195.8**	**74**	**94**	**4.2**	5	1	2	27
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	58.3	16.7	16.7	5	50	25			**175**	**73**	**94**	**75**	7	2	3	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			**175**	**64**	**94**	**75**	8	4	4	8
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	75	54.2	30	5	33.3	8.3	50	Addressing Reactive Requirements key to reliability of system. Length of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommittee.	**141.7**	**64**	**94**	**91.6**	16	5	5	6
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			**195.8**	**61**	**94**	**54.2**	4	6	6	14
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			**200**	**60**	**94**	**70.8**	3	7	7	9
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	45.8	62.5	40	45	5	33.3	12.5			**158.3**	**56**	**94**	**45.8**	11	10	8	16
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			**150**	**56**	**94**	**29.2**	13	11	9	18
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	37.5	70.8	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	**108.3**	**55**	**94**	**91.7**	24	13	10	3
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	45.8	33.3	33.3	5	0	0			**87.5**	**55**	**94**	**0**	27	14	11	36
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			**150**	**54**	**94**	**58.3**	12	15	12	13
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	50	18.8	18.8	5	0	0			**50**	**53**	**94**	**0**	33	16	13	40

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	87.5	66.7	41.7	0	12.5	25			**220.8**	**66**	**0**	**37.5**	2	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			**191.7**	**60**	**0**	**0**	6	8	34	30
Project 2012-04 Protection System Commissioning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	50	70.8	41.7	50	0	0	0			**170.8**	**57**	**0**	**0**	9	9	35	31
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			**66.7**	**46**	**0**	**0**	30	23	36	37
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			**145.8**	**42**	**0**	**0**	15	25	37	33
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0			**33.3**	**41**	**0**	**4.2**	34	27	38	28
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	10	Foundational piece of ERO	**29.2**	**41**	**0**	**10**	35	28	39	25
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			**58.3**	**38**	**0**	**0**	31	33	40	38
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			**95.8**	**36**	**0**	**0**	25	34	41	35
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			**54.1**	**20**	**0**	**0**	32	37	42	39
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			**25**	**19**	**0**	**0**	37	38	43	42
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			**25**	**13**	**0**	**0**	38	39	44	43
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			**0**	**0**	**0**	**8.3**	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0			**0**	**0**	**0**	**4.2**	46	46	46	29
2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											**0**	**0**	**0**	**0**	47	47	47	47
2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											**0**	**0**	**0**	**0**	48	48	48	48

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	**PRACTICALITY SORT**							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the development of the tool required.	**125**	**38**	**57**	**97.5**	22	31	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be significant cost savings to the industry if the revisions to BAL-001 were to be realized.	**137.5**	**56**	**100**	**94.1**	17	12	1	2
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	37.5	70.8	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	**108.3**	**55**	**94**	**91.7**	24	13	10	3
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			**70.9**	**47**	**94**	**91.7**	28	21	17	4
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	75	54.2	30	5	33.3	8.3	50	Addressing Reactive Requirements key to reliability of system. Length of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommittee.	**141.7**	**64**	**94**	**91.6**	16	5	5	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			**220.8**	**52**	**22**	**91.6**	1	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	58.3	16.7	16.7	5	50	25			**175**	**73**	**94**	**75**	7	2	3	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			**175**	**64**	**94**	**75**	8	4	4	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			**200**	**60**	**94**	**70.8**	3	7	7	9
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	**133.4**	**33**	**42**	**67.5**	18	35	27	10
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2			**162.5**	**52**	**94**	**66.7**	10	18	14	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	**129.2**	**51**	**94**	**63.4**	19	20	16	12
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			**150**	**54**	**94**	**58.3**	12	15	12	13

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

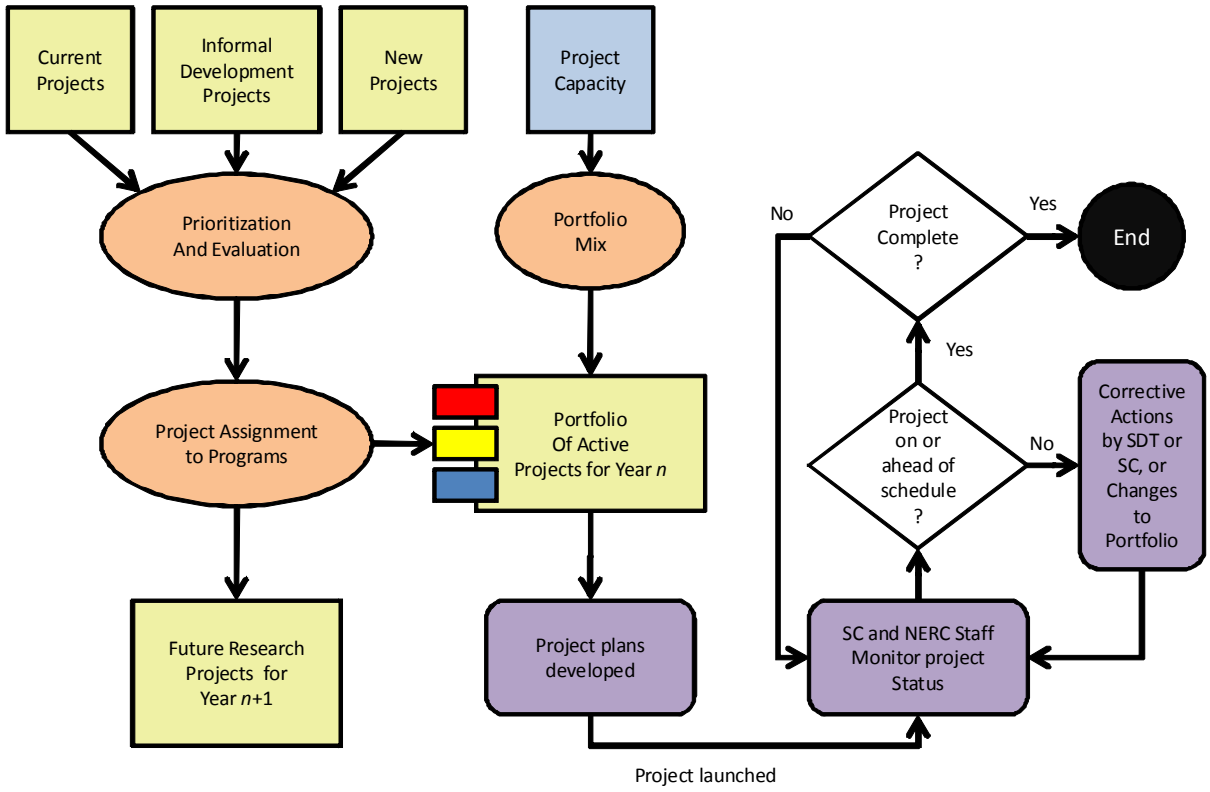
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

ID	Task Name

Appendix 3 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity
- Move the requirement (into another project or Standard, or to the certification process)
- Eliminate the requirement (because it is redundant or doesn't support BPS reliability).

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. At this time, no estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to realtime operating states and protocols for issuing and responding to operating directives.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Subsequently, this team was put on hold for an extended period of time. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in the several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as and other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to appropriate other standards through coordination with project 2006-06 Reliability Coordination.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, wchih were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltae transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It will also ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were most recently posted for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained with the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It will also ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also will address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery' will be reviewed and addressed.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project will also consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

Standards affected:

New

Status:

This project has an initial draft of a SAR which was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARS associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision which, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments

Reliability Standards Development Plan (Draft) 2012-2014

We would like to thank all commenters who submitted comments on the process of developing the 2012-2014 Reliability Standard Development Plan (the Plan). The Plan will be finalized over the coming months, and will provide status updates for projects in development, identify the next projects scheduled for initiation, designate projects for further research, and catalog all proposed projects for future development.

The 2012-2014 Reliability Standard Development Plan was posted for a 15-day public comment period from September 12, 2011 through September 26, 2011. Stakeholders were asked to provide feedback on the 2012-2014 Reliability Standard Development Plan through a special electronic comment form. There were 15 sets of comments received, including comments from approximately 63 different people from approximately 38 companies representing all 10 of the 10 Industry Segments as shown in the table on the following pages.

In general, commenters did not provide specific suggestions to modify the plan, instead usually indicating that a specific project should be "higher" or "lower" in priority. Because of the nature of the prioritization, those suggestions feel into one of three categories: those based the "improves one or more existing standards" score, those based on the "Addresses a reliability risk not covered by an existing standard" score, and those based on the "other practicality concern" score.

Absent specific suggestions, and recognizing that in all cases, the suggestions came from a small minority of the respondents, a simple scoring was applied such that each comment was given equal weight. Suggestions to rank a project "higher" were treated as suggestions to score the value in question at least one full "point range" higher. A similar approach was used for projects that were suggested for lower rankings. All other commenter's were assumed to have supported the existing scoring values.

For example:

- Assume the Prioritization showed project X as having a "improves one or more existing standards" score of 72.1.
- One entity submits a comment that X should be ranked higher.
- One entity submits a comment that X should be ranked lower.
- The other thirteen entities do not comment on X.
- The "higher" comment would be treated as a score of 100. (Scoring as 75 would not be a full point range higher, as the acceptable point ranges in the prioritization sheet are 0, 25, 50, 75, and 100. Choosing 75 would only be a fractional step higher).

- The “lower” comment would be treated as a score of 25. (Scoring as 50 would not be a full point range higher, as the acceptable point ranges in the prioritization sheet are 0, 25, 50, 75, and 100. Choosing 50 would only be a fractional step higher).
- The remaining thirteen comments would be treated as silent support for the current score of 58.2.
- (13 X 72.1) + (25) + (100) = 1062.3
- 1062.3 ÷ 15 = 70.8.

Based on this approach, the following project scores were modified:

Project 2007-11
Column G - One comment to raise (treated as 100) changed the G score from 70 to 72.
Column M - One comment to raise (treated as 50) changed the M score from 25 to 27

Project 2008-01
Column G - Two comments to raise (treated as 100) changed the G score from 75 to 78.

Project 2009-01
Column G - One comment to lower (treated as 25) changed the G score from 58.3 to 56.1.
Column M - One comment to lower (treated as 0) no change to the M score (0)

Project 2009-03
Column G - One comment to raise (treated as 100) changed the G score from 70.8 to 72.7.

Project 2009-07
Column G - One comment to raise (treated as 100) changed the G score from 87.5 to 88.3

Project 2010-03
Column G - One comment to raise (treated as 75) changed the G score from 45.8 to 47.7

Project 2010-04
Column G - One comment to raise (treated as 100) changed the G score to from 50 to 51.7

Project 2010-05.2
Column F - One comment to lower (treated as 0), changed the F score from 45.8 to 42.7
Column G - One comment to lower (treated as 25) changed the G score to from 62.5 to 60

Project 2010-08
Column M - Two comments to rasie (treated as 25) changed the M score from 10 to 12

Project 2010-16
Column M - Two comments to raise (treated as 25) changed the M score from 0 to 3.3

Project 2010-17
Column M - One comment to (treated as 25) changed the M score from 0 to 1.7

Project 2012-04
Column F - One comment to lower (treated as 25) changed the F score from 50 to 48.3
Column G - One comment to lower (treated as 25) changed the G score from 70.8 to 67.7

Project 2012-08
Column M - Two comments to raise (treated as 25) change the M score from 0 to 3.3

Additionally, there were some specific changes suggested in response to question 3. The same general procedure was used, as summarized below:

There were 15 total respondents. Six abstained from answering the question, leaving 9 entities indicating they had some sort of opinion. Absent a specific proposal to change a score, it was assumed the entity did not object to the specific score in question.

Project 2008-01
Column K - One suggestion to set the score to 50 changed the K score from 33.3 to 35.2

Project 2009-01
Column L - One suggestion to set the score to 50 changed the L score from 25 to 27.8

Project 2009-03
Column F - One suggestion to set the score to 50 and one suggestion to set the score to 100 changed the F score from 37.5 to 45.8

Project 2009-07
Column L - One suggestion to set the score to 0 and one suggestion to set the score to 50 (the entity actually requested 33, but 50 was the next valid score) resulted in no change to the L score

Project 2010-17
Column L - One suggestion to set the score to 0 and one suggestion to set the score to 50 changed the L score from 29.2 to 28.3

These changes resulted in slight reordering of project within the prioritization matrix. However, upon review, the small number of changes only impacted the Work Plan in later years, and only by one or two months. As such, no changes were made to the Work Plan, as such changes will be captured in the development of the 2013-2015 Plan.

In addition to the above, the Plan was updated to correct minor typographical errors and formatting concerns. Finally, the a section discussing Regional Standards was added to chapter 4, the Regional Work Plan was added as a new Appendix, and descriptions of the regional projects were added to the plan.

All documents developed as part of this Plan's creation can be viewed at the NERC's Reliability Standards Development Plan web page:

http://www.nerc.com/page.php?cid=2|247|290

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net.

Index to Questions, Comments, and Responses

1. Is there anything in the prioritization that is significantly below where it should be ranked? If yes, please explain. …. 7
2. Is there anything in the Plan we deferred that can't wait? If yes, please explain. …. 11
3. For six projects, the SC had disagreements regarding the appropriate score for certain key values. The projects are listed below. For specific information, see the projects, the referenced columns, and the specific cells (highlighted in red) in Appendix 1. Do you believe these projects and their associated priorities are adequately reflected in the Plan? If no, please explain. …..... 13
4. Please provide any additional comments you would care to offer. 17

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. Is there anything in the prioritization that is significantly below where it should be ranked? If yes, please explain.

Summary Consideration: In general, entities were supportive of the prioritization, but several had specific changes. These changes were incorporated into score changes as summarized in the "general summary" above. Some typographical errors were noted and corrected.

Organization	Yes or No	Question 1 Comment
NAESB Wholesale Electric Quadrant Standards Review Subcommittee		
Bonneville Power Administration		BPA thanks you for the opportunity to comment on 2012-2014 Reliability Standards Development Plan. BPA has no comments or concerns at this time.
Response: Thank you for your comment.		
Northeast Power Coordinating Council		
Imperial Irrigation District (IID)		
Electric Market Policy		Dominion appreciates the time NERC has devoated to capturing potential standard topics needing attention or revision. This standardization priority tool, in which input was taken from the industry members toward the ranking of these projects provides a good basis to collect opinion and creates some structure for comparision of one standard topic companied to another. It is obviously there was a great deal of work that went into calculating the reliability, time sensitivity, and practicticality priority that each of these projects have in the eyes of some and it is well presented

Organization	Yes or No	Question 1 Comment
		throughout the document. Below are some minor considerations: 1. Chapter 3, Page 7; last sentence. Add 'o'; in a deferral 'of' the work. 2. Formatting needs to be corrected for the page numbers at the bottom of each page.
Response: Thank you for your comment. We have corrected the typographical error, but it is unclear what is incorrect regarding the page number formatting.		
Florida Municipal Power Agency		It seems to FMPA that Project 2010-05.2 on SPS / RAS and Project 2012-04 on Protection System Commissioning Testing are ranked too high and can be delayed another year. It seems that the new PRC-005-2 reduces the importance of commissioning testing. FMPA believes the existing standards on SPSs are adequate and cannot find documentation on the reliability gap perceived. FMPA believes that Project 2009-07 is higher priority than both of these projects, both in light of the ambiguity of what "delayed clearing" means in the TPL standard and due to the recent FERC Order 754 on the TPL-002 interpretation and FERC's statement that: "We agree with the Trade Associations that there may be a system protection issue that merits further exploration by technical experts ... the Commission believes that there is an issue concerning the study of the non-operation of non-redundant primary protection systems; e.g., the study of a single point of failure on protection systems ... we direct Commission staff to meet with NERC and its appropriate subject matter experts to explore this reliability concern, including where it can best be addressed, and identify any additional actions necessary to address the matter." (para 19-20). Presumably, it is this project 2009-07 that would explore these "system protection issues" related to "single point of failure".

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. The SCD has revised the scores on these projects to account for your input.		
NERC	No	
Ingleside Cogeneration LP	Yes	It is clear that the lack of clarity in the Reliability Standards have led to inconsistencies in the compliance process. The gap is being addressed through Compliance Application Notices (CANs), but bypasses the strict review which is fundamental to the Standards Development process. Similarly, gray areas in the Functional Model have lead to forced registrations in certain Regions. These arbitrary actions can easily lead to a loss of confidence by the industry in the fairness and usefulness of regulatory oversight. As a result, Ingleside Cogeneration, LP believes that there are three related projects that should be rated far higher in the NERC priority scheme. These are Project 2010-08 "Functional Model Glossary Revisions", Project 2010-16 "Definition of System Operator", and Project 2012-08 "Glossary Updates."
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		
Consolidated Edison Co. of NY, Inc.	Yes	Project 2010-17 has now identified a Phase 2 to this project. This continuation of that effort is not mentioned, listed separately or prioritized. It should receive high priority in order to assure that several key issues identified for Phase 2 and impacting the Bulk Electric System Definition are resolved promptly, e.g., genertor threshold, point of demarcation, contiguous, etc.
Response: The Standards Committee has elected to not treat this as a separate project – rather, this second phase is being treated as a continuation of the existing project and the team's work. As such, the work plan reflects this project continuing through 2013.		

Organization	Yes or No	Question 1 Comment
ITC Holdings	Yes	Project 2007-11 Disturbance Monitoring priority should be at the point where it is in development mode and not held off for a minimum of 1½ additional years.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		
Clallam County PUD No.1	No	Process seems to have assigned reasonable priorities.
Response: Thank you for your comment.		
PSEG Services Corp	Yes	2010-03 Modeling Data should be higher. Modeling impacts standards such as TPL. It would also impact BES Definition exclusions and inclusions, which reference the TPL standards. Also, 2010-04 Demand Data is essential to 2010-03. Modeling data includes load data. These projects should be joined. 2008-01 is critical since its implementing a 2003 Blackout report, and 2009-03 is likewise critical regarding disturbance and sabotage reporting.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input. **At this time, the SC intends to keep 2010-03 and 2010-04 as separate projects, However, it will reconsidered that decision as these projects are analyzed further and move closer to development.**		
Progress Energy		
Wisconsin Electric Power Company	Yes	Since the glossary is the backbone of all the standards, it should be updated before 2015.
Response: Thank you for your comments. The SC has assumed that you are referring to the following projects: 2010-08, 2010-16, 2010-17, and 2012-08. The SC has revised the scores on these projects to account for your input.		

Organization	Yes or No	Question 1 Comment
Independent Electricity System Operator	No	

2. Is there anything in the Plan we deferred that can't wait? If yes, please explain.

Summary Consideration: In general, entities were supportive of the Plan, but two suggested specific changes. These changes were incorporated into score changes as summarized in the "general summary" above.

Organization	Yes or No	Question 2 Comment
NAESB Wholesale Electric Quadrant Standards Review Subcommittee	No	
Bonneville Power Administration		
Northeast Power Coordinating Council		
Imperial Irrigation District (IID)	No	
Electric Market Policy	No	
Florida Municipal Power Agency	No	
NERC	No	
Ingleside Cogeneration LP	Yes	See the response to Question 1 above.
Response: Thank you. Please see response to your question 1 comment.		
Consolidated Edison Co. of NY,		

Organization	Yes or No	Question 2 Comment
Inc.		
ITC Holdings	Yes	Project 2007-11 should not be delayed another 1 ½ years. This is due to issues with the existing fill in the blank standard PRC-002-1 which is non FERC approved and PRC-018-1 which is FERC approved. Entities are required to comply with PRC-018-1 but there is no enforcement for the regional entities to provide where DME is required to be installed. Besides being in development, at minimum entities should be provided the responses to the March 2009 comments.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input. **At such time as the project moves into formal development, the responses to comments will be reviewed, modified if necessary, and posted for the industry.**		
Clallam County PUD No.1	No	
PSEG Services Corp	No	
Progress Energy		
Wisconsin Electric Power Company	Yes	Since the glossary is the backbone of all the standards, it should be updated before 2015. Have all the standards received their "every five year" review?
Response: Thank you for your comments. The SC has assumed that you are referring to the following projects: 2010-08, 2010-16, 2010-17, and 2012-08. The SC has revised the scores on these projects to account for your input. **Several standards have not reviewed their "every five year review." Based on current assumptions, there will be a number in 2012 that do not meet this obligation. NERC and the SC are working together to evaluate options for addressing this issue.**		

Organization	Yes or No	Question 2 Comment
Independent Electricity System Operator	No	

3. For six projects, the SC had disagreements regarding the appropriate score for certain key values. The projects are listed below. For specific information, see the projects, the referenced columns, and the specific cells (highlighted in red) in Appendix 1. Do you believe these projects and their associated priorities are adequately reflected in the Plan? If no, please explain.

Project 2007-17 Protection System Maintenance and Testing (column L)
Project 2008-01 Voltage and Reactive Planning and Control (column K)
Project 2009-01 Disturbance and Sabotage Reporting (column L)
Project 2009-03 Emergency Operations (column F)
Project 2009-07 Reliability of Protection Systems (column L)
Project 2010-17 Definition of Bulk Electric System (column L)

Summary Consideration: Entities suggested score modifications for five of the six projects listed. These changes were incorporated into score changes as summarized in the "general summary" above.

Organization	Yes or No	Question 3 Comment
NAESB Wholesale Electric Quadrant Standards Review Subcommittee	Yes	
Bonneville Power Administration		
Northeast Power Coordinating Council		
Imperial Irrigation District (IID)	No	
Electric Market Policy	Yes	

Organization	Yes or No	Question 3 Comment
Florida Municipal Power Agency	No	The EOP standards (Project 2009-03) in general need a lot of work from a clarity / compliance / roles perspective, e.g., BA and TOP requirements are often intermingled, roles and responsibilities are not clear, etc. For instance, EOP-001 Attachment 1 does not identify what functional entity is responsible for each of the tasks. In EOP-002, if the BA is a separate entity from the LSE or DP, there is no requirement in the standards for LSEs to obey the directives of the BA in the same manner as to the RC (IRO-001) and the TOP (TOP-001). EOP-003 on Load Shedding has redundancies with UFLS and UVLS and assigns different functional entities to those systems. EOP-003 is unclear which requirements refer to automatic load shedding and which to manual load shedding. In EOP-005-2 it is unclear if an entity whose system is restored only after "a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage" is supposed to do anything. Etc. FMPA would rate column K at a 50 since the EOP standards in general are the least clear of all the standards as to roles, responsibilities, and interpretations of certain words (e.g., the failed interpretation of the word "simulation" as used in EOP-005-1 R7). The clarity around what is and what is not BES (Project 2010-17) is probably less than what the scoring indicates. FMPA would rate column L closer to 40. In addition, the clarity of the existing TPL standards is less than what the scoring indicates around the definition of "delayed clearing". FMPA would move this score to something like 33.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		
NERC	No	
Ingleside Cogeneration LP	No	Ingleside Cogeneration LP believes that priorities of Project 2007-17 "Protection System Maintenance and Testing", Project 2009-03 "Emergency Operations", and Project 2010-17 "Definition of the Bulk Electric System" are correctly reflected in the

Organization	Yes or No	Question 3 Comment
		plan. However, in our opinion, Project 2009-01 "Disturbance and Sabotage Reporting" should be taken out of the "Active" listing. There is already a significant overlap between this project and that of the Events Analysis Working Group (EAWG) - which should managed in one place or the other. Even beyond the duplication of effort, there is only a secondary reliability benefit in the dissemination of reporting information to regulatory bodies; which should not precedence over more pressing activities. Lastly, Project 2008-01 "Voltage and Reactive Planning and Control" and Project 2009-07 "Reliability of Protection Systems" are appropriately under consideration in the 2013 work plan. Ingleside Cogeneration LP believes that next year's prioritization process may drive their priority down as there is so much related Protection System and frequency control Standards development already underway. Once complete, there is a good chance that both of these projects will be less pressing
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		
Consolidated Edison Co. of NY, Inc.		
ITC Holdings		
Clallam County PUD No.1	Yes	
PSEG Services Corp	No	The SC should not be assiging scores to items that require a technical background. 2008-01 should be a 50 in col. K; 2009-01 should be a 50 in col. L; 2009-03 should be 100 in col. F. Bothe 2009-07 and 2010-17 should be NA (0) in col. L since that refers to interpretations. 2009-01 is a new std and 2010-17 is a new definition.

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input. **The SC members were asked to solicit input from colleagues within the industry segments they represented. Accordingly, while the SC members provided input, it was expected their input would represent the interests of those segments based on their collective segment expertise.**		
Progress Energy		
Wisconsin Electric Power Company		
Independent Electricity System Operator	No	We are somewhat surprised at the ranking of Project 2008-01, given the impact that deficiencies in reactive power resources had during the blackout and the fact that this project supports a blackout recommendation. We would have expected this to be started in 2012 and not 2013.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		

4. Please provide any additional comments you would care to offer.

Summary Consideration: Several entities did not suggest changes, but asked clarifying questions, which were answered. Some entities suggested specific prioritization or plan changes; these changes were incorporated into score changes as summarized in the "general summary" above. Some typographical errors were noted and corrected.

Organization	Yes or No	Question 4 Comment
NAESB Wholesale Electric Quadrant Standards Review Subcommittee		a) The WEQ SRS recommends that NAESB express no opinion regarding the ordering of projects as none of the projects in the list have an effect on NAESB activities.b) The WEQ SRS recommends that NAESB ask why BAL-003 is included in the Project 2010-14.1 summary section, but is not listed as an affected standard.
Response: Thank you for your comment. In the case of Project 2010-14.1, the project is will not be making changes to BAL-003, but the new standard being developed will have some impact on BAL-003. Accordingly, the description indicates that it will "support" BAL-003, but the project is not itself proposing changes to BAL-003.		
Bonneville Power Administration		
Northeast Power Coordinating Council		Editorial comments: Page 1--in the fourth bullet down, "he" should be replaced with "the". Page 7--in the paragraph entitled "Five-Year Review Obligation", fourth sentence, replace "f" with "of". Page 14--the second bullet under "Additional Projects in 2013:", replace "Panning" with "Planning".On page 4, in the section "Completed Standards Development Projects", 2007â€07 Vegetation Management should be removed if it hasn't been Board of Trustees approved.
Response: Thank you for your comments. Your suggested changes have been made.		

Organization	Yes or No	Question 4 Comment
Imperial Irrigation District (IID)		
Electric Market Policy		
Florida Municipal Power Agency		FMPA supports this approach and appreciates the work of the Standards Committee to set realistic priorities.
Response: Thank you for your comment.		
NERC		
Ingleside Cogeneration LP		The sheer magnitude of the number of Reliability Standards already in place and planned over the next few years should bring us all pause. Already, Ingleside Cogeneration LP expends significant dollars and resources to demonstrate compliance to requirements which we believe serves little to improve BES reliability in any significant manner.
Response: Thank you for your comment.		
Consolidated Edison Co. of NY, Inc.		Page 10: In the section on Project Implementation, the last step is the Closing. Should there be a step prior to Closing called Submission to and Approval by FERC? This may trigger in most cases additional work before the project can be Closed before it is actually over, and this is not being captured. Page 1: 4th bullet typo “the”Page 4: Vegetation Management Standard should be removed from list if not BOT approved. Page 7 typo “of” 3rd paragraphPage 14 type 2nd bullet “Planning”
Response:Thank you for your comments. The errors you noted have been corrected.		
ITC Holdings		

Organization	Yes or No	Question 4 Comment
Clallam County PUD No.1		No additional comments
PSEG Services Corp		2009-05 Resource Adequacy Assessments can be deleted. The Plannning Committee has implemented such assessments - discuss with Chair Jeff Mitchell; also Paul Kure who was the chair of the G&T Reliability Modeling Planning TF, and Kevan Jefferies who was the chair of the Resource Issues Subcommittee that is implementing the assessments. Ths plan itself is not very coherent. I would prefer to see a plan for each standards grouping - i.e., CIPC, TPL, etc. Those should be developed by the technical committees in conjunction with the SC. In my opinion, while the SC has members with excellent technical background, it is a process committee, and should defer to technical committees on technical matters, including filling in the scores on the prioritization work plan.
Response: Thank you for your comments. The SC will discuss your suggestion regarding 2009-05 with the Planning Committee chair as you have suggested. **Presenting a complex, multi-year plan can be done in a number of ways. The suggestions offered will be considered for the 2013-2015 Plan. Additionally, the Standards Committee will reach out to the technical committees earlier to solicit their assistance in the development of that plan.**		
Progress Energy		1. p. 7, Chapter 3 - General, ¶ 1: the Rapid Development acceleration approach is explained, and supposedly initial trial runs of the approach have yielded "useful lessons learned". What specifically has been learned? This approach to push through a new Standard directive needs a fair amount of review, scrutiny and appraisal by the industry. **Response: The Plan is intended only to provide a brief summary of the Standards programs efforts, and not an exhaustive review of all the lessons learned from the current test effort.** **As the body having oversight of the Standards Development Process, the SC agrees**

Organization	Yes or No	Question 4 Comment
		that appropriate levels of review, scrutiny, and appraisal are necessary. It should be recognized that everything within the Rapid Development approach was specifically designed to be s fully compliant with NERC's Standards Processes Manual (SPM). 2. p. 7, Chapter 3 - General, ¶ 2: the Rapid Revision acceleration approach is also explained, and it is stated that if "an interpretation drafting team identifies simple modifications to a standard that can more effectively address an interpretation request than an interpretation can alone, the team may elect to make such changes and submit them with an associated SAR". An interpretation is not asking for a Standard revision, it is asking for an interpretation, and nothing else. Using the revising of a Standard to give an interpretation will lead to new problems and new requests for interpretation of the newly-revised Standard. **Response: The Submitter of the Request for Interpretation must agree to the use of this new approach if it is to be used in place of an Interpretation. The text in the plan has been updated to indicate this.** 3. p. 7, Chapter 3 - General, ¶ on "Product Quality": Among other things, "enhanced training" is suggested for improving NERC's product quality. We suggest that the bulk of that training needs to be technical in nature, i.e. it needs to enhance drafting team members' knowledge of particular aspects of operating the Bulk Electric System. People can be trained to be the best writers in the world, but the product will still suffer if the technical knowledge is not there. We respectfully submit that this issue has not been adequately addressed by NERC. **Response: NERC assembles its drafting team members based on their experience, and does not believe it would be appropriate for NERC to explicitly seek to train drafting members in their areas of expertise as a function of standards development. To the extent that this is desired, the SC suggests that the commenter provide input into the development of NERC's Business Plan and Budget.**

Organization	Yes or No	Question 4 Comment
		4. p. 8, Chapter 3 - General, "Conclusion": NERC states that the "SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity, all while making sure to consider the implications of cost". We would respectfully submit that true cost of developing NERC Standards has not been adequately addressed from the following standpoints: a. Benefit to the ratepayers b. Benefit to future projects that have insufficiently defined scope at present c. Cost versus benefit **Response: This Plan does not assert that it has analyzed "true" cost. As described in Appendix 1, the "Cost Consideration" metric was used as a subjective review of industry cost and reliability benefit, with the intent of identifying any outliers in which the costs and benefits seemed unusually disproportionate. The SC agrees that this is not an extensive analysis, but it does represent the first such analysis that we are aware of. However, we have rewritten this sentence to reduce the chance of any similar misinterpretations.** 5. p. 9, Chapter 4 - Project Development Overview, ¶ 2: A statement is made that the Prioritization Tool includes "the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability". We respectfully submit that it is not appropriate for the NERC President to have such unilateral authority. **Response: This score demonstrates the manner in which the strategic leadership of NERC (though its president and Board of Trustees) is accounted for in this plan. The SC firmly believes that such coordination is both necessary and appropriate. It should be noted that, as stated in the president's document, the issues were "offered as a starting point for discussion with industry experts." It is the SC's understanding that those priorities will change over time based on such discussions.** 6. p. 10, Chapter 4 - Project Development Overview, 1st complete ¶: An example is

Organization	Yes or No	Question 4 Comment
		cited regarding work management that "projects related to protection systems were generally not started until another project related to protection systems was completed". This demonstrates one of our highest concerns: NERC is trying to take on too much at once. We understand and respect the underlying issues influencing this, but given that the work management struggle is being clearly addressed in this Plan we suggest that this needs to be given more serious consideration. **Response: This Plan is a short-term (1 to 3 year) strategy for addressing the most significant reliability threats we face. NERC and the SC are open to suggestions for alternative approaches.**
Response: Thank you for your comments. Please see embedded responses above.		
Wisconsin Electric Power Company		
Independent Electricity System Operator		The reliability score of Project 2007-11 also appears somewhat low, perhaps because it has no direct or immediate reliability impact. After the fact analysis based on the data captured by properly placed and sufficient number of DMEs will however prove invaluable in providing lessons learned and guiding future industry actions. We suggest that the scores for this project should be reviewed.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		

END OF REPORT

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and the implementation of projects in general.
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 shows the Regional Work Plan in Gantt chart form
- Appendix 4 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards

<to be added>

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of information to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come
- Status updates regarding standards and related projects currently in development
- A forecast of Standards Development work scheduled for the next three years
- An overview of the process used to prioritize work and assign resources to Standards development projects

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, other priorities may necessitate deviations from this plan. As new technologies are discovered or new threats to reliability identified, the actual deployment of resources to staff this plan may shift. Similarly, the estimated times listed for project completion may change as more is learned about a given project.

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process, Standards Development, and Regional Standards teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information.

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development
- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year consistent with in accordance with Section 321.6 of the NERC Rules of

[1] The data included in this paragraph does not include Regional Reliability Standards.

Procedure ("Rule 321") that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Regional Standards Development

Regional standards work within NERC and the Regions has seen a great deal of development and implementation of new initiatives since the beginning of 2011. First, the Regional Reliability Standards Working Group (RRSWG) transitioned into the Regional Standards Group (RSG). Comprised of the NERC Vice President and Director of Standards and the Standards Managers from each of the eight Regional Entities, the RSG reports to the ERO Executive Management Group (EMG). Its purpose is to provide process and policy recommendations in the execution of the Regional Entity delegation agreements and the NERC Rules of Procedure. An overarching objective is to coordinate the development of Regional and continent-wide standards to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners, and operators.

In support of this purpose and this objective, a primary initiative of the RSG is to create and sustain viable standards development coordination processes to obtain consistency and uniformity, where appropriate, across the ERO enterprise – NERC and the Regional Entities – while ensuring efficient and effective use of resources in executing the statutory responsibilities of the ERO as the reliability standards development authority. To that end, the RSG developed a combined list of all regional standards and variances in the development process in order to prioritize these projects continent-wide. This will allow NERC to coordinate the necessary resources through the development and ultimate filing of these standards and variances with applicable regulatory authorities. Project information for each of those regional standards and variances in the development process is provided in this Plan, along with a high-level overview of the project timeline.

Rapid Development and Rapid Revision Projects

NERC's Standards Committee (SC) has tentatively identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010.05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can more effectively address an interpretation request than an interpretation can alone, the team may propose to the requester that the team instead make such changes and submit them with an associated SAR. If agreed to be the requester, and following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its ANSI accreditation, NERC has committed to review each of its standards for modification once every five years. While not giving the appearance of being onerous, this obligation has proven challenging to meet. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. However, the work load of the ERO remains high, and prioritization has resulted in a deferral of the work required for these five-year reviews except when already associated with a project of reliability value. Using current assumptions, the five-year review obligation will not be met for a number of standards. NERC and the SC are working together to evaluate options for addressing this issue.

Product Quality

As NERC's and the industry's experience with standards has continued, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and regularly. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global "portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity. Additionally, the plan was developed with the use of a subjective review of the implications of cost. NERC believes altogether, this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standard based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capability of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research, and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems were generally not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Regulatory Submission - Following adoption by NERC's Board of Trustees, the stadnards are submitted to regulatory aurhorityt

- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any associated regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). The Regional Work Plan is included as Appendix 3. A detailed summary of projects, including regional projects, is included as Appendix 4.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact all three of these areas in some way, this is intended to illustrate the primary consideration driving its consideration.

Existing Active Projects:

- 2006-06 Reliability Coordination. This project ranked #13 in Reliability Priority.
- 2007-02 Operating Personnel Communication Protocols. This project ranked #5 in Reliability Priority.
- 2007-03 Real-time Transmission Operations. This project ranked #4 in Practicality Priority.
- 2007-06 Protection System Coordination. This project ranked #4 in Reliability Priority.
- 2007-07 Vegetation Management. This project is expected to complete in 2012, but at the time of this document's finalization, it has not yet been formally completed.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response. This project ranked #10 in Reliability Priority, and was tied for #2 in Time Sensitivity Priority.
- 2007-17 Protection System Maintenance and Testing. This project ranked #3 in Reliability Priority.
- 2008-06 Cyber Security – Order 706. This project ranked #2 in Reliability Priority.
- 2009-01 Disturbance and Sabotage Reporting. This project ranked #8 in Reliability Priority.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project ranked #7 in Reliability Priority.
- 2010-07 Generator Requirements at the Transmission Interface. This project ranked #13 in Practicality Priority, and was tied for #2 in Time Sensitivity Priority.

- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves. This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.
- 2010-17 Definition of Bulk Electric System. This project ranked #10 in Reliability Priority, and was tied for #2 in Time Sensitivity Priority.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding. This project ranked #14 in Reliability Priority, and is expected to be started upon the completion of 2006-06 Reliability Coordination.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project ranked #1 in Practicality Priority, and is expected to be started upon the completion of 2007-03 Real-time Transmission Operations.
- 2009-03 Emergency Operations. This project ranked #4 in Practicality Priority, and is expected to be started upon the completion of 2008-06 Cyber Security – Order 706.
- 2010-01 Support Personnel Training. This project ranked #15 in Reliability Priority, and is expected to be started upon the completion of 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project ranked #11 in Reliability Priority, and is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization. This project is expected to be started upon the completion of 2007-12 Frequency Response.

- 2012-04 Protection System Commissioning Testing. This project ranked #9 in Reliability Priority, and is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing

NERC intends to initiate development of the following projects in 2013. As noted above, these projects have generally been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is expected to start upon completion of 2010-17 Definition of Bulk Electric System.
- 2008-01 Voltage and Reactive Planning and Control. This project ranked #3 in practicality, and is expected to start upon completion of 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves
- 2008-12 Coordinate Interchange Standards. This project is expected to start upon completion of 2010-07 Generator Requirements at the Transmission Interface.
- 2009-07 Reliability of Protection Systems. This project ranked #1 in Reliability Priority, and is expected to start upon completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is expected to start upon completion of 2009-02 Real-time Monitoring and Analysis Capabilities.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project is expected to start upon completion of 2007-02 Operating Personnel Communication Protocols.
- 2012-06 Generator Capabilities. This project ranked #6 in Reliability Priority, and is expected to start upon completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project is expected to start upon completion of 2009-03 Emergency Operations.
- 2009-05 Resource Adequacy Assessments. This project is expected to start upon completion of 2012-04 Protection System Commissioning Testing.
- 2010-03 Modeling Data. This project is expected to start upon completion of 2008-01 Voltage and Reactive Panning and Control.
- 2010-04 Demand Data. This project is expected to start upon completion of 2010-05.2 Phase 2 of Protection Systems: SPS and RAS.
- 2010-08 Functional Glossary Model Revisions. This project is expected to start upon completion of 2010-01 Support Personnel Training.
- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. This project is expected to start upon completion of the second phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator. This project is expected to start upon completion of 2012-04 Protection System Commissioning Testing.
- 2012-05 ATC Revisions - Order 729. This project is expected to start upon completion of 2008-12 Coordinate Interchange Standards.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. There is also some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review

- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity, and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan which follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT

Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	7	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	6	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	2	29
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	3	7
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	14	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	11	16
Project 2010-07 Transmission Requirements at the Generator Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	12	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	9	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	19	32

Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	37	41
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	4	3
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	16	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	15	25
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	8	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	20	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	22	20
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	41	43
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	10	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	17	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	18	19
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	36	40

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	40	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	42	44
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	13	31
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	38	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	39	24
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	21	33
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2010-07 Transmission Requirements at the Generator Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	32
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12

STANDARDS COMMITTEE Reliability Standard Project Prioritization

TIME SENSITIVITY SORT

Project Number and Name	Short Description	(E) Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	(F) Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	(K) Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	14	25
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	16	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	17	20
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	18	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	19
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	31
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	41
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	43
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	40
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative, BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12
Project 2010-07 Transmission Requirements at the Generator Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

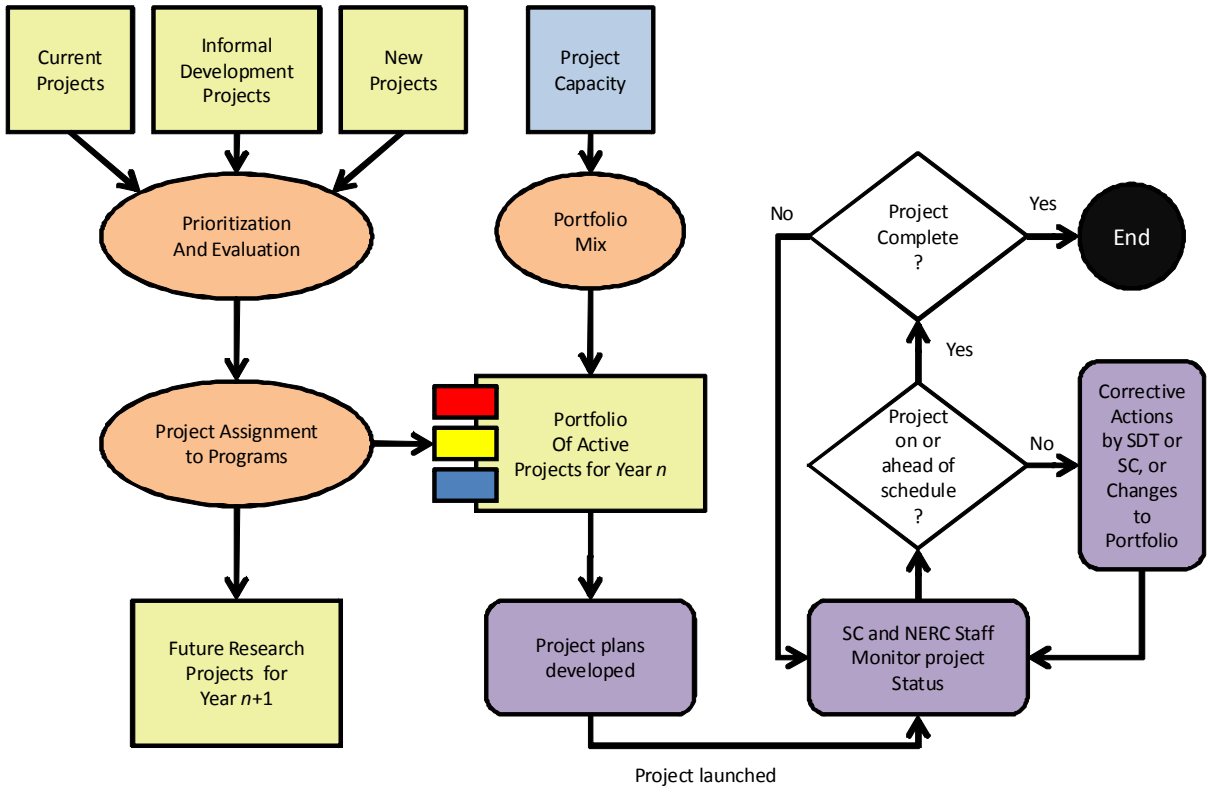
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

TOTAL RANKING	Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Total Score (0-600)	TOTAL RANKING	Relaibity Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Rnaking
1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

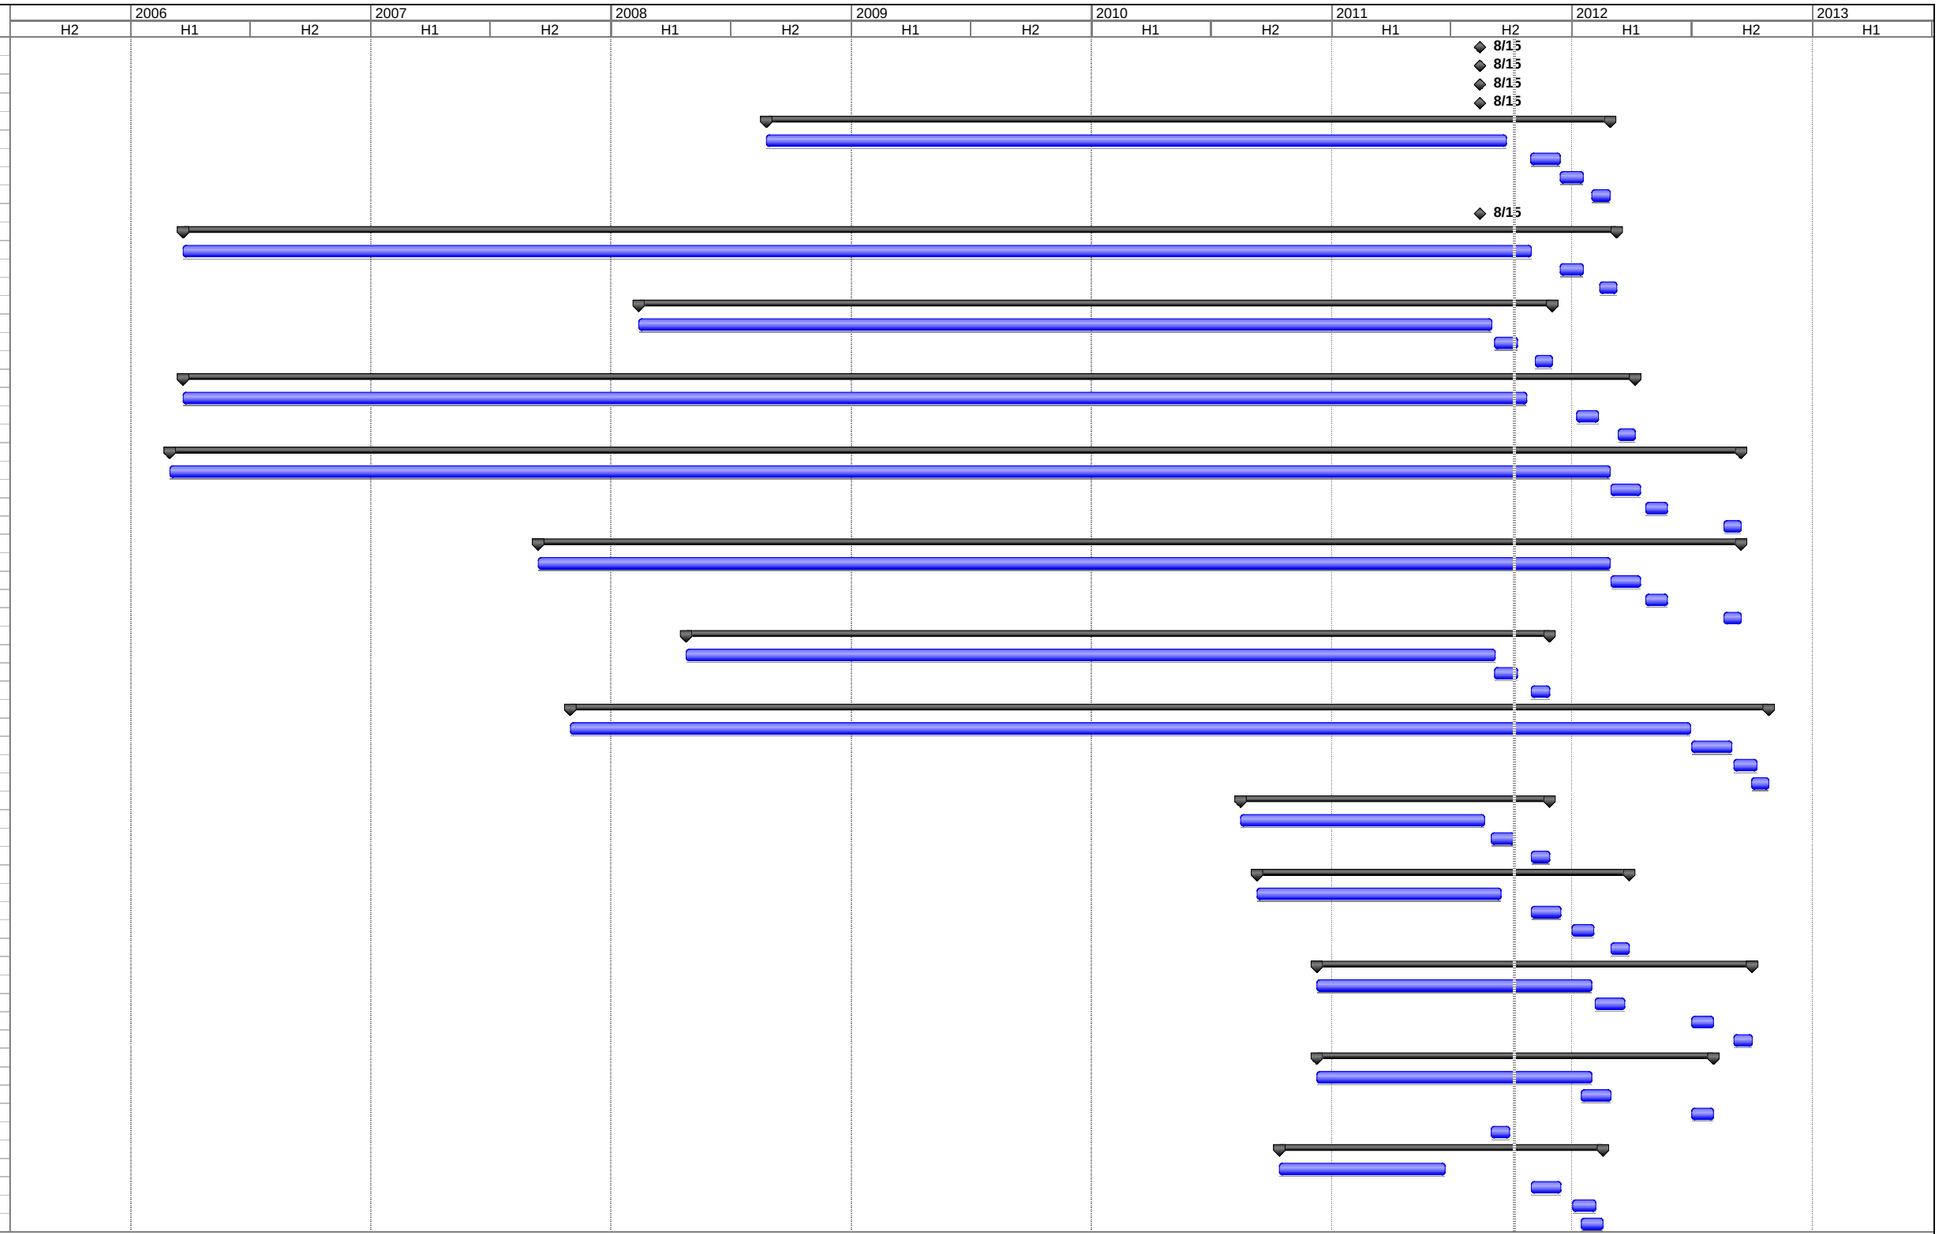
43	Regional standard development
44	Prepare BOT Material
45	Develop Initial Draft of Regulatory Filings
46	**BAL-001-TRE-1**
47	Regional standard development
48	Posting of Documents for process evaluation at NERC
49	Prepare BOT Material
50	Develop Initial Draft of Regulatory Filings
51	**BAL-002-WECC-1**
52	Regional standard development
53	Posting of Documents for process evaluation at NERC
54	Prepare BOT Material
55	Develop Initial Draft of Regulatory Filings
56	**BAL-004-WECC-1**
57	Regional standard development
58	Posting of Documents for process evaluation at NERC
59	Prepare BOT Material
60	Develop Initial Draft of Regulatory Filings
61	**VAR-001-WECC-1**
62	Regional standard development
63	Posting of Documents for process evaluation at NERC
64	Prepare BOT Material
65	Develop Initial Draft of Regulatory Filings



Project: Unified Regional Project Sche
Date: Wed 10/5/11

Task | Progress | Summary | External Tasks | Deadline
Split | Milestone | Project Summary | External Milestone

Appendix 4 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity
- Move the requirement (into another project or Standard, or to the certification process)
- Eliminate the requirement (because it is redundant or doesn't support BPS reliability).

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. At this time, no estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to realtime operating states and protocols for issuing and responding to operating directives.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Subsequently, this team was put on hold for an extended period of time. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in the several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as and other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to appropriate other standards through coordination with project 2006-06 Reliability Coordination.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, wchih were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltae transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It will also ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were most recently posted for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained with the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It will also ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also will address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery' will be reviewed and addressed.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project will also consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

Standards affected:

New

Status:

This project has an initial draft of a SAR which was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARS associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision which, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE DEVELOPMENT

PRC-002-FRCC-1 — FRCC Regional Disturbance Monitoring and Reporting Requirements

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Disturbance Monitoring Equipment", revision dated June, 2006 into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements.

Standards affected:

PRC-002-1

Status:

This Regional project is currently on 'hold'. Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-11 Disturbance Monitoring being classified as a 'Project in Informal Development', FRCC staff will be re-evaluating the current status of the regional project to determine whether to proceed with the Regional Reliability Standard development or to revise the current FRCC Regional Criteria document "FRCC Requirements for Disturbance Monitoring Equipment".

FUTURE DEVELOPMENT

PRC-003-FRCC-1 — FRCC Regional Procedure for Analysis of Mis-operations of Transmission and Generation Protection Systems

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Analysis of Protection Mis-operations & Corrective Actions Reporting", revision dated October 2003 into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Mis-operations of Transmission and Generation Protection Systems.

Standards affected:

PRC-003-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) being classified as a 'high priority' project in active development, the Regional project is currently on 'hold'. The FRCC has revised Regional Criteria documents (FRCC Requirements for Analysis of Protection Misoperations and Corrective Actions Reporting, revision date: December 2, 2010) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Mis-operations of Transmission and Generation Protection Systems.

FUTURE DEVELOPMENT

PRC-006-FRCC-1 — FRCC Automatic Underfrequency Load Shedding Program

Summary:

FRCC is developing a Regional Reliability Standard to provide last resort system preservation measures by implementing an Underfrequency Load Shedding (UFLS) program. Additional requirements may be needed due to FRCC peninsular geography and limited ties to the north. Operating experience and decades of studies by the FRCC and its predecessor reliability organizations have resulted in a well developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. The standard development project will effectively use the proven high performance characteristics of the existing FRCC UFLS program and refine its requirements and coordination procedures to comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

Standards affected:

PRC-006-1

Status:

PRC-006-FRCC-1 FRCC Automatic Underfrequency Load Shedding Program has been approved by the FRCC Registered Ballot Body and the FRCC Board of Directors. Based on concerns identified by NERC standards staff and the pending Commission (FERC) approval of the NERC Continent-Wide Reliability Standard PRC-006-1 Automatic Underfrequency Load Shedding and associated Regional variances, the Regional project has been placed on 'hold'. The FRCC has since revised Regional Criteria documents (FRCC Automatic Underfrequency Load Shedding Program, revision date: April 7, 2011) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

FUTURE DEVELOPMENT

PRC-024-FRCC-1 — FRCC Regional Generator Performance During Frequency and Voltage Excursions

Summary:

FRCC is developing a standard to establish “ride through” requirements for generators in the FRCC Region with respect to temporary grid voltage or frequency deviations from their normal range. The Standard should address time duration limits for operation of generator protection for 1) frequencies outside of the 59.5 - 60.5 hertz range, 2) voltages outside of the 95% - 105% range and 3) generator stator current overloads. The Standard should address exemption criteria and mitigation measures available for resolving apparent conflicts between generator capabilities and the coordination requirements. Considerable knowledge of grid frequency and voltage excursions and the time limited capabilities of generators to sustain these conditions have been gained through operating experience and previous reliability studies. This standards development project should effectively use this knowledge to define coordination requirements and procedures that comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Standards affected:

PRC-024-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-09 Generator Verification being classified as a ‘high priority’ project in active development, the Regional project is currently on ‘hold’. The FRCC is actively revising Regional Criteria documents (FRCC Generator Coordination Requirements) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

2012 DEVELOPMENT

PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Program

Summary:

The purpose of this Standard is to establish the requirements for NPCC and its members to operate and maintain coordinated a Regional Underfrequency load shedding (UFLS) program. The NPCC's UFLS program will meet the minimum requirements contained in NERC standards and provide those entities to which it is applicable, the guidance necessary to implement it. This standard will also mandate that, when necessary, coordination with neighboring Regional Underfrequency load shedding programs be developed. The unique character, dispersion, sensitivity and density of the NPCC regional loads emphasize the need for this Standard.

The NPCC regional UFLS standard shall apply to all applicable entities within the Region and sub-regional areas that are both synchronous and asynchronous to the eastern interconnection. Quebec has UFLS has different parameters and these are included in the standard and fully coordinated within the Region.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. NPCC expects to complete the drafting of this standard in 2011, conduct a ballot of stakeholders in the first quarter of 2012 and a submission to the NERC Board of Trustees and subsequent filing with FERC to occur in 2012.

FUTURE DEVELOPMENT

PRC-012-NPCC-1 — Special Protection Systems

Summary:

To support and enhance bulk power system reliability, this Standard will establish the criteria for the minimum design objectives and practices for special protection systems, the purpose of which are to detect abnormal system conditions, and take corrective actions other than the isolation of faulted elements to maintain the stability and security of the bulk power system. This Standard will also establish the requirements for close coordination between system planning, design, operating, maintenance and protection functions of areas to ensure that the impacts of special protection system operations do not result in a significant adverse impact.

The proposed Standard will describe the requirements for the design and approval of Special Protection Systems, and the technical criteria required to support its implementation. The Standard will also identify the need for close coordination among various parties to ensure that the Special Protection Systems are implemented correctly, and triggers and resulting actions are made known and communicated in an on-line database.

Standards affected:

PRC-012-0

Status:

This Regional project is currently on 'hold' pending the completion of the NERC Reliability Standard Development Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS and the outcome of the work by the NERC SPCS on the definition of SPS.

2011 DEVELOPMENT

MOD-024-RFC-1 — Verification and Data Reporting of Generator Gross and Net Real Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Real Power capability to support NERC Reliability Standard MOD-024. The objective of the regional standard is to ensure accurate information on generator gross and net Real (MWs) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-024-1

Status:

This Regional standard has been approved by the Reliability*First* Board. Currently, VRFs and VSLs are in development. Reliability*First* expects to complete the drafting of the VRFs and VSLs in 2011, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2011 DEVELOPMENT

MOD-025-RFC-1 — Verification and Data Reporting of Gen Gross and Net Reactive Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Reactive Power capability to support NERC Reliability Standard MOD-025. The objective of this standard is to ensure that accurate information on generator gross and net Reactive (MVAR) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-025-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with the FERC is expected to occur in 2012.

2011 DEVELOPMENT

PRC-002-RFC-1 — Disturbance Monitoring and Reporting Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for Disturbance monitoring and reporting to support NERC Reliability Standard PRC-002.

Standards affected:

PRC-002-1

Status:

Reliability*First* is currently working on the technical justification for the locational requirements for DME equipment. This Regional standard has been approved by the Reliability*First* Board. Reliability*First* expects submission of this standard to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2012 DEVELOPMENT

PRC-006-RFC-1 — Automatic Under Frequency Load Shedding Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency assist recovery of frequency following underfrequency events and provide last resort system preservation measures. The standard goes beyond the NERC PRC-006-1 standard and prescribes; with more certainty, aspects that the Planning Coordinator's UFLS program must contain, further details on certain procedural matters with respect to how islands are addressed, and assessment of UFLS program implementation as well as program design. This standard also attempts further consolidating requirements of the Reliability*First* legacy underfrequency load shedding programs, permitting retirement of legacy documents, to ensure appropriate coordination among the Reliability*First* legacy regional UFLS programs.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur later in 2012.

2012 DEVELOPMENT

PRC-012-RFC-1 — Special Protection System Requirements

Summary:

To purpose of the standard is to establish Reliability*First* requirements for the review, development and application of Special Protection Systems (SPS).

Standards affected:

PRC-012-0

Status:

This Regional project is currently in the initial drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur early in 2013.

2011 DEVELOPMENT

PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

Summary:

The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

In 2008, SERC commenced work on PRC-006-SERC-1. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the continent-wide UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. This regional standard PRC-006-SERC-1 adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Standards affected:

PRC-006-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with FERC is expected to occur in 2012.

2012 DEVELOPMENT

PRC-006-SPP-1 — Under Frequency Load Shedding

Summary:

PRC-006 (Development and Documentation of Regional UFLS programs) has been identified by NERC as one of the Regional (Fill-in-the Blank) Standards. The requirements developed in this standard at a minimum, need to meet the requirements for the Regional Program as identified in NERC's PRC-006-0. Operating experience and regional studies have resulted in a well developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. This standards development intends to effectively use the proven high performance characteristics of the existing SPP UFLS program and refine its requirements and coordination procedures through an open process as described in the SPP Standard Development Process Manual.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. SPP expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

Summary:

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with certain existing non-routine ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Standards affected:

IRO-006-5 (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of IRO-006-5.)

Status:

This Regional Standard was approved by the Texas RE Board of Directors on June 28, 2011, and it will be submitted to the NERC Board of Trustees in November 2011. Subsequent filing with FERC is expected to occur in 2012.

2011 DEVELOPMENT

BAL-001-TRE-1 — Primary Frequency Response in the ERCOT Region

Summary:

This Regional Standard is intended to support reliability by ensuring adequate primary frequency response performance in the ERCOT Interconnection. The standard addresses frequency response at the Interconnection level, as well as by individual generating units and facilities. Specific maximum governor droop and deadband settings are provided, along with primary frequency response performance standards (initial and sustained) that allow actual unit-specific performance to be measured.

In 2002, NERC approved a regional difference for ERCOT that made it exempt from Requirement R2 in BAL-001-0 (CPS2), because of ERCOT's lack of synchronous connection to other control areas and the nature of the ERCOT energy market. FERC approved the ERCOT regional difference, finding that ERCOT's practice of (a) determining the minimum frequency response needed for reliability, and (b) requiring generators to have specific governor droop, to be a more stringent practice than Requirement R2 in BAL-001-0. FERC directed NERC to file a modification of the ERCOT regional difference to include the requirements concerning frequency response contained in section 5 of the ERCOT protocols. This Regional Standard is responsive to that directive.

Standards affected:

BAL-001-0.1a (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of the continent-wide standard.)

Status:

This project is currently in the Regional Standard development stage, with a stakeholder ballot closing on September 23, 2011. Texas RE expects to submit this standard to its Board of Directors for approval in October, 2011, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur in 2012.

2012 DEVELOPMENT

BAL-002-WECC-1 — Contingency Reserves

Summary:

On Oct. 21, 2010, FERC found that BAL-002-WECC-1 did not meet the statutory criteria for approval and remanded the regional standard to NERC/WECC for further modification. (RM09-15-000; Order 740). FERC held that BAL-002-WECC-1's less stringent requirements had not been supported by the technical data provided.

On remand, the Commission instructed WECC to modify the regional reliability standard to include a number of specific items contained in Order 740. This Request is submitted with the specific and narrow purpose of addressing only those issues mandated for modification in the October 2010 Oder 740.

Standards affected:

BAL-002-WECC-1

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2012 DEVELOPMENT

BAL-004-WECC-1 — Automatic Time Error Correction

Summary:

In the order approving BAL-004-WECC-1 the FERC directed WECC to make several clarifying modifications to the standard. FERC directed WECC to use the FERC-approved Process for Developing and Approving WECC standards to make these clarifying modifications

In addition, the WECC staff has identified the opportunity to make additional modifications to the existing standard to clarify the intent without changing the requirements.

There is also confusion regarding the R3 requirement that the ACE used for NERC reports shall be the same ACE as the AGC operating mode in use. This seems to conflict with the NERC response to NOPR comments that entities may use ATEC ACE for control but should use Raw ACE for reporting. WECC is developing a proposed regional variance to BAL-001-0.1a to address this apparent conflict.

Standards affected:

BAL-004-WECC-1
BAL-001-0.1a

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

VAR-001-WECC-1 — Voltage and Reactive Control

Summary:

The current draft has been converted from a Standard into a Regional Variance to the NERC VAR-001-2 Standard. The format incorporates the NERC Standard into the document with minor additions to address the scope of the variance. The regional variance specifics are included as Section E of the proposed document (see hyperlink above), and in this case, are intended to replace NERC VAR-001-2 requirements R3 and R4 as noted at the beginning of Section E.

Variance

The purpose of this regional variance to a NERC Reliability Standard is to ensure that voltage levels are within limits in real time to protect equipment and the reliable operation of the Western Interconnection. The "Rules of Procedure of the North American Electric Reliability Corporation" (Appendix 3A, page 31) permits the development of a regional variance to a NERC reliability standard on an Interconnection-wide basis when the Regional Reliability Organization has valid justification and when the variance is not inconsistent with or less stringent than the NERC Reliability Standard. The variance is an alternative method for obtaining the same reliability objective as the continent standard and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the electric reliability organization governmental authority, shall be enforced within the applicable Regional Entity(ies) pursuant to delegated authority.

Standards affected:

VAR-001-2

Status:

This Regional project has been approved by the WECC Board of Directors. WECC expects to submit the draft for the mandatory NERC 45-day comment period in the near future, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and the implementation of projects in general
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 shows the Regional Work Plan in Gantt chart form
- Appendix 4 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President of Standards and Training

To: NERC's Board of Trustees, Stakeholders, Regulatory Authorities, and other interested parties

NERC is committed to the development of clear, technically excellent standards for the reliable planning and operation of the North American bulk power system. NERC's industry-based standard development process strives to leverage the knowledge and experience of subject-matter experts to develop stakeholder consensus in support of standards that achieve reliability objectives and are responsive to regulatory directives, balanced against the burdens and costs of compliance imposed upon the more than 1,900 entities that are now subject to these standards. No single standard can ensure this outcome. Rather, NERC strives to develop and enhance a portfolio of performance, risk-mitigation, and competency-based reliability standards that achieve a consistent defense in depth against credible events that may lead to cascading, uncontrolled separation, or instability and ensure prompt system restoration when extreme events occur.

Achieving this balance is intrinsically difficult. Just as the management of the reliability "bar" through enforceable standards is an ongoing and evolving process, the process for developing standards needs to evolve as well, in response to the learning that has occurred in the period since passage of the Energy Policy Act of 2005 and the initial enforcement of NERC standards in June 2007. We would like to use this message to highlight current achievements in the standards arena and our plans for 2012-2014, as well as certain emerging factors and concerns.

NERC's Reliability Standards Development Plan delivered the following results in 2011:

- As of November 1, 2011, 20 new or revised standards have been approved by the Board of Trustees, and are either filed or in the process of being filed with the FERC.
- Results Based Standard development principles were used for all new standards projects.
- The Standards Committee worked with NERC staff to prioritize standards development resources on twelve high priority projects. There has been no specific redirection of this effort relative to the selected priorities by regulatory authorities.
- Stakeholder-driven Quality Review has been integrated into the standards development process to assure the best quality standards from a compliance and implementation perspective.
- NERC undertook a first effort to develop a standard on a Rapid Development basis utilizing the new Standard Processes Manual.

- To balance the resources committed to the development of new standards versus the interpretation of existing standards, the Standards Committee has limited the number of interpretations under active development to three projects at any one time, while pursuing new procedural options such as "rapid revision" to correct deficiencies in the underlying standard.

The 2012-14 Reliability Standards Development Plan described in this report builds on recent experience by proposing an achievable yet ambitious plan of standards development. The 2012-14 Plan provides for:

- Continuation of ongoing standards projects with sufficient resources to ensure timely completion.
- Project priorities were established using a more comprehensive model with scores and explanatory inputs from the Standards Committee, NERC staff and industry stakeholders.
- Projects have been ranked for development priority along three tracks, based on consideration of Reliability Benefits, Time Sensitivity, and Practicality.
- As ongoing projects are completed, we are scheduling follow-on projects based on the availability of subject-matter experts and the completion of technical input, research, and industry outreach conducted by NERC's standing committees and subcommittees.
- Finally, the 2012-14 Plan incorporates a more comprehensive integration of the regional standards effort into this process. For the first time a complete project management process is being applied to regional standards development.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, a wide variety of electric system events and emerging risks to bulk power system reliability may necessitate deviations from this plan. In order to respond to such threats and initiate development of new or revised standards, the actual deployment of resources to staff this plan may shift. Additionally, the estimated times listed for project completion may change as more is learned about a given project.

NERC currently is investigating the following "emerging issues," each of which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Not every issue is addressable or best addressed through development of a new industry standard; the issues outlined above illustrate that truism. But where a standards related response is indicated, we will be ready to reprioritize and adjust.

The Standards Committee and NERC staff also recognize that major standards process efficiencies are still necessary if we are to make efficient use of NERC and industry resources, while meeting external expectations for the timely development and approval of technically excellent reliability standards. In 2012, we need to ask ourselves once again, "is there a better way to develop reliability standards?"

We achieve the past results and plan for the future results only with your support, and greatly appreciate that the industry has accepted the evolving prioritization process. Our efforts to effectively manage and balance the many conflicting demands placed upon both the industry and NERC staff resources has provided this next plan, which we hope you will endorse.

Each of us, day in and day out, is driven to do the "right" thing, and your ERO's reputation will be enhanced through your active support for completion of NERC's 2012-14 Reliability Standards Development Plan.

Sincerely,

Allen Mosher
Senior Director of Policy Analysis and Reliability, American Public Power Association
Chair, NERC Standards Committee

Herb Schrayshuen
Vice President of Standards and Training, NERC

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of interest to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come;
- Status updates regarding standards and related projects currently in development;
- A forecast of Standards Development work scheduled for the next three years; and
- An overview of the process used to prioritize work and assign resources to Standards development projects.

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels initially identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, other priorities may necessitate deviations from this plan. As new technologies are discovered or new threats to reliability identified, the actual deployment of resources to staff this plan may shift. Similarly, the estimated times listed for project completion may change as more is learned about a given project.

NERC is currently investigating the following "emerging issues," which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process, Standards Development, and Regional Standards teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development

- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 continent-wide Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

[1] The data included in this paragraph does not include Regional Reliability Standards.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year in accordance with Section 321.6 of the NERC Rules of Procedure ("Rule 321") that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Regional Standards Development

Regional standards work within NERC and the Regions has seen a great deal of development and implementation of new initiatives since the beginning of 2011. First, the Regional Reliability Standards Working Group (RRSWG) transitioned into the Regional Standards Group (RSG). Comprised of the NERC Vice President of Standards and Training and the Standards Managers from each of the eight Regional Entities, the RSG reports to the ERO Executive Management Group (EMG). Its purpose is to provide process and policy recommendations in the execution of the Regional Entity delegation agreements and the NERC Rules of Procedure. An overarching objective is to coordinate the development of Regional and continent-wide standards to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners and operators.

In support of this purpose and this objective, a primary initiative of the RSG is to create and sustain viable standards development coordination processes to obtain consistency and uniformity, where appropriate, across the ERO enterprise – NERC and the Regional Entities – while ensuring efficient and effective use of resources in executing the statutory responsibilities of the ERO as the reliability standards development authority. To that end, the RSG developed a combined list of all regional standards and variances in the development process in order to prioritize these projects continent-wide. This will allow NERC to coordinate the necessary resources through the development and ultimate filing of these standards and variances with applicable regulatory authorities. Project information for each of those regional standards and variances in the development process is provided in this Plan, along with a high-level overview of the project timeline.

Rapid Development and Rapid Revision Projects

NERC's Standards Committee (SC) tentatively has identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010-05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can address an interpretation request more effectively than an interpretation can alone, the team may propose to the requester that the team instead make such changes and submit them with an associated SAR. If agreed to by the requester, and following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its Rules of Procedure, NERC has committed to review each of its standards for modification once every five years. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. While not giving the appearance of being onerous, this obligation has proved challenging to meet. The work load of the ERO remains high, and maintaining focus on those projects that are most beneficial to reliability has resulted in a delay of the work required for these five-year reviews (except when already associated with a project of significant reliability value). Using current assumptions, the five-year review obligation will not be met for a number of standards. NERC and the SC are working together with the NERC Board of Trustees to evaluate options for addressing this issue.

Product Quality

As NERC's and the industry's experience with standards has evolved, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and efficiently. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress

in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global "portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity. Additionally, the plan was developed with the use of a subjective review of the implications of cost. NERC believes this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the Tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standards based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capacity of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems generally were not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Regulatory Submission - Following adoption by NERC's Board of Trustees, the standards are submitted to regulatory authorities.

- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any necessary supplemental regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). The Regional Work Plan is included as Appendix 3. A detailed summary of projects, including regional projects, is included as Appendix 4.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active Projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact all three of these areas in some way, this is intended to illustrate the primary consideration driving each project's development priority.

Existing Active Projects:

- 2006-06 Reliability Coordination.
- 2007-02 Operating Personnel Communication Protocols.
- 2007-03 Real-time Transmission Operations.
- 2007-06 Protection System Coordination.
- 2007-07 Vegetation Management. This project is expected to be completed in early 2012, but at the time of this document's finalization, it has not yet been formally completed.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response.
- 2007-17 Protection System Maintenance and Testing.
- 2008-06 Cyber Security – Order 706.
- 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-07 Generator Requirements at the Transmission Interface.
- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves.
- 2010-17 Definition of Bulk Electric System.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited

number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such as new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project is currently in informal development.
- 2009-03 Emergency Operations. This project is currently in informal development.
- 2010-01 Support Personnel Training. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project is currently in informal development. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization.
- 2012-04 Protection System Commissioning Testing. This project is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.

NERC intends to initiate development of the following projects in 2013. As noted above, these projects generally have been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is currently in informal development.
- 2008-01 Voltage and Reactive Planning and Control. This project is currently in informal development.
- 2008-12 Coordinate Interchange Standards. This project is currently in informal development.
- 2009-07 Reliability of Protection Systems. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until after the completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is currently in informal development.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project requires research prior to initiation, which is expected to be completed in the latter part of 2012.
- 2012-06 Generator Capabilities. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project requires research prior to initiation, which is expected to be completed in 2013.
- 2009-05 Resource Adequacy Assessments.
- 2010-03 Modeling Data. This project requires research prior to initiation, which is expected to be completed in the latter part of 2013.
- 2010-04 Demand Data. This project requires research prior to initiation, which is expected to be completed in 2014.
- 2010-08 Functional Glossary Model Revisions.

- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is expected to not start until completion of the previous phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator.
- 2012-05 ATC Revisions - Order 729.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority. There also is some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan that follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	7	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	6	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	2	29
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	3	7
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	14	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	11	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	12	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	9	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	19	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	37	41
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	4	3
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	16	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	15	25
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	8	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	20	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	22	20
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	41	43
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	10	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	17	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	18	19
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	36	40

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	40	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	42	44
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	13	31
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	38	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	39	24
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	21	33
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	32
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12

Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	19
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	31
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	41
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	43
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	40
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative, BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

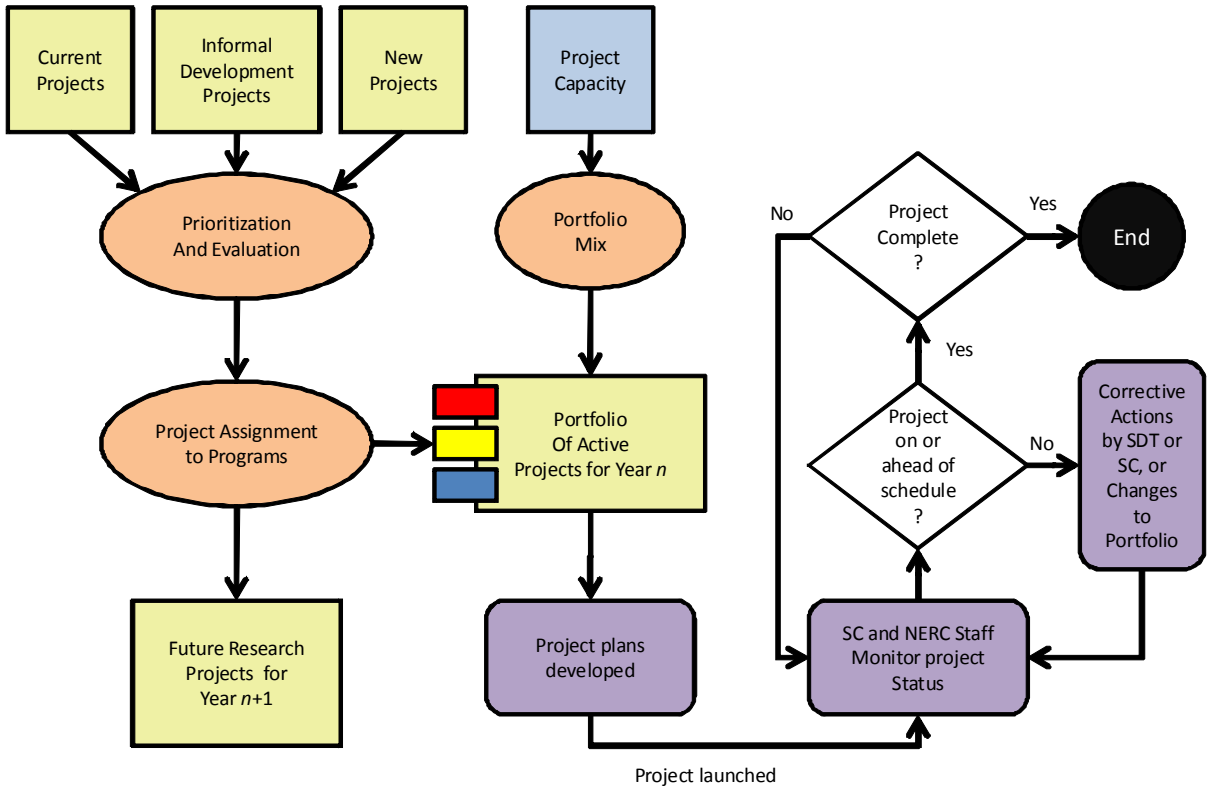
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

ID	Task Name

Split | Milestone | Project Summary | External Milestone

Appendix 4 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity;
- Move the requirement (into another project or Standard, or to the certification process); or
- Eliminate the requirement (because it is redundant or does not support BPS reliability).

This project ranked #13 in Reliability Priority.

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. No estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to real-time operating states and protocols for issuing and responding to operating directives.

This project ranked #5 in Reliability Priority.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Due to focusing on other priorities, this team was temporarily put on hold. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

This project ranked #5 in Practicality Priority.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to other standards as appropriate through coordination with project 2006-06 Reliability Coordination.

This project ranked #4 in Reliability Priority.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, which were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltage transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It also will ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were posted most recently for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained within the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It also will ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

This project is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

This project ranked #3 in Reliability Priority.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

This project ranked #3 in practicality.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery will be reviewed and addressed.

This project ranked #14 in Reliability Priority.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

This project ranked #2 in Reliability Priority.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator, or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project also will consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

This project ranked #8 in Reliability Priority.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

This project ranked #1 in Practicality Priority.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

This project ranked #4 in Practicality Priority.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

This project ranked #1 in Reliability Priority.

Standards affected:

New

Status:

This project has an initial draft of a SAR that was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

This project ranked #15 in Reliability Priority.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

This project ranked #7 in Reliability Priority.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

This project ranked #11 in Reliability Priority.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

This project ranked #12 in Reliability Priority, #13 in Practicality Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARs associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

This project ranked #10 in Reliability Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings, and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

This project ranked #9 in Reliability Priority,

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

This project ranked #6 in Reliability Priority

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision that, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE DEVELOPMENT

PRC-002-FRCC-1 — FRCC Regional Disturbance Monitoring and Reporting Requirements

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Disturbance Monitoring Equipment" (revision dated June, 2006) into a new Regional Reliability Standard that complies with the requirements of NERC Reliability Standard, PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements.

Standards affected:

PRC-002-1

Status:

This Regional project is currently on "hold." Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-11 Disturbance Monitoring being classified as a "Project in Informal Development," FRCC staff will be re-evaluating the current status of the regional project to determine whether to proceed with the Regional Reliability Standard development or to revise the current FRCC Regional Criteria document "FRCC Requirements for Disturbance Monitoring Equipment."

FUTURE DEVELOPMENT

PRC-003-FRCC-1 — FRCC Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems

Summary:

FRCC plans to convert the existing handbook document "FRCC Requirements for Analysis of Protection Misoperations & Corrective Actions Reporting" (revision dated October, 2003) into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

Standards affected:

PRC-003-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC has revised Regional Criteria documents ("FRCC Requirements for Analysis of Protection Misoperations and Corrective Actions Reporting," revision dateed December 2, 2010) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

FUTURE DEVELOPMENT

PRC-006-FRCC-1 — FRCC Automatic Underfrequency Load Shedding Program

Summary:

FRCC is developing a Regional Reliability Standard to provide last resort system preservation measures by implementing an Underfrequency Load Shedding (UFLS) program. Additional requirements may be needed due to FRCC peninsular geography and limited ties to the north. Operating experience and decades of studies by the FRCC and its predecessor reliability organizations have resulted in a well-developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. The standard development project will effectively use the proven high performance characteristics of the existing FRCC UFLS program and refine its requirements and coordination procedures to comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

Standards affected:

PRC-006-1

Status:

PRC-006-FRCC-1 FRCC Automatic Underfrequency Load Shedding Program has been approved by the FRCC Registered Ballot Body and the FRCC Board of Directors. Based on concerns identified by NERC standards staff and the pending Commission (FERC) approval of the NERC Continent-Wide Reliability Standard PRC-006-1 Automatic Underfrequency Load Shedding and associated Regional variances, the Regional project has been placed on “hold.” The FRCC has since revised Regional Criteria documents (FRCC Automatic Underfrequency Load Shedding Program, revision date: April 7, 2011) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

FUTURE DEVELOPMENT

PRC-024-FRCC-1 — FRCC Regional Generator Performance During Frequency and Voltage Excursions

Summary:

FRCC is developing a standard to establish "ride through" requirements for generators in the FRCC Region with respect to temporary grid voltage or frequency deviations from their normal range. The Standard should address time duration limits for operation of generator protection for

1) frequencies outside of the 59.5 - 60.5 hertz range,
2) voltages outside of the 95% - 105% range, and
3) generator stator current overloads.

The Standard should address exemption criteria and mitigation measures available for resolving apparent conflicts between generator capabilities and the coordination requirements. Considerable knowledge of grid frequency and voltage excursions and the time limited capabilities of generators to sustain these conditions has been gained through operating experience and previous reliability studies. This standards development project should effectively use this knowledge to define coordination requirements and procedures that comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Standards affected:

PRC-024-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-09 Generator Verification being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC is actively revising Regional Criteria documents (FRCC Generator Coordination Requirements) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

2012 DEVELOPMENT

PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Program

Summary:

The purpose of this Standard is to establish the requirements for NPCC and its members to operate and maintain a coordinated Regional Underfrequency load shedding (UFLS) program. The NPCC's UFLS program will meet the requirements contained in NERC standards, and provide those entities to which it is applicable the guidance necessary to implement it. This standard will also mandate that coordination with neighboring Regional Underfrequency load shedding programs be developed when necessary. The unique character, dispersion, sensitivity and density of the NPCC regional loads emphasize the need for this Standard.

The NPCC regional UFLS standard shall apply to all applicable entities within the Region and sub-regional areas that are both synchronous and asynchronous to the Eastern Interconnection. Quebec UFLS has different parameters, and these are included in the standard and fully coordinated within the Region.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. NPCC expects to complete the drafting of this standard in 2011 and conduct a ballot of stakeholders in the first quarter of 2012. Submission to the NERC Board of Trustees and subsequent filing with FERC is expected to occur in 2012.

FUTURE DEVELOPMENT

PRC-012-NPCC-1 — Special Protection Systems

Summary:

To support and enhance bulk power system reliability, this Standard will establish the criteria for the minimum design objectives and practices for special protection systems (the purpose of which are to detect abnormal system conditions, and take corrective actions other than the isolation of faulted elements to maintain the stability and security of the bulk power system). This Standard will also establish the requirements for close coordination between system planning, design, operating, maintenance and protection functions to ensure that the impacts of special protection system operations do not result in a significant adverse impact.

The proposed Standard will describe the requirements for the design and approval of Special Protection Systems and the technical criteria required to support its implementation. The Standard will also identify the need for close coordination among various parties to ensure that the Special Protection Systems are implemented correctly, and triggers and resulting actions are made known and communicated in an on-line database.

Standards affected:

PRC-012-0

Status:

This Regional project is currently on “hold” pending the completion of the NERC Reliability Standard Development Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS, and the outcome of the work by the NERC SPCS on the definition of SPS.

2011 DEVELOPMENT

MOD-024-RFC-1 — Verification and Data Reporting of Generator Gross and Net Real Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Real Power capability to support NERC Reliability Standard MOD-024. The objective of the regional standard is to ensure accurate information on generator gross and net Real (MWs) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-024-1

Status:

This Regional standard has been approved by the Reliability*First* Board. Currently, VRFs and VSLs are in development. Reliability*First* expects to complete the drafting of the VRFs and VSLs in 2011, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2011 DEVELOPMENT

MOD-025-RFC-1 — Verification and Data Reporting of Gen Gross and Net Reactive Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Reactive Power capability to support NERC Reliability Standard MOD-025. The objective of this standard is to ensure that accurate information on generator gross and net Reactive (MVAR) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-025-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with the FERC is expected to occur in 2012.

2011 DEVELOPMENT

PRC-002-RFC-1 — Disturbance Monitoring and Reporting Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for Disturbance monitoring and reporting to support NERC Reliability Standard PRC-002.

Standards affected:

PRC-002-1

Status:

Reliability*First* is currently working on the technical justification for the locational requirements for DME equipment. This Regional standard has been approved by the Reliability*First* Board. Reliability*First* expects submission of this standard to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2012 DEVELOPMENT

PRC-006-RFC-1 — Automatic Under Frequency Load Shedding Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency and assist in the recovery of frequency following underfrequency events, providing last resort system preservation measures. The standard goes beyond the NERC PRC-006-1 standard and prescribes with more certainty aspects that the Planning Coordinator's UFLS program must contain, further details on certain procedural matters with respect to how islands are addressed, and assessment of UFLS program implementation as well as program design. This standard also attempts further consolidating requirements of the Reliability*First* legacy underfrequency load shedding programs, permitting retirement of legacy documents to ensure appropriate coordination among the Reliability*First* legacy regional UFLS programs.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur later in 2012.

2012 DEVELOPMENT

PRC-012-RFC-1 — Special Protection System Requirements

Summary:

To purpose of the standard is to establish Reliability*First* requirements for the review, development and application of Special Protection Systems (SPS).

Standards affected:

PRC-012-0

Status:

This Regional project is currently in the initial drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur early in 2013.

2011 DEVELOPMENT

PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

Summary:

The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

In 2008, SERC commenced work on PRC-006-SERC-1. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the continent-wide UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. This regional standard PRC-006-SERC-1 adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Standards affected:

PRC-006-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011, and subsequent filing with FERC is expected to occur in 2012.

2012 DEVELOPMENT

PRC-006-SPP-1 — Under Frequency Load Shedding

Summary:

PRC-006 (Development and Documentation of Regional UFLS programs) has been identified by NERC as one of the Regional "Fill-in-the Blank" Standards. At a minimum, the requirements developed in this standard need to meet the requirements for the Regional Program as identified in NERC's PRC-006-0. Operating experience and regional studies have resulted in a well developed UFLS program that is very resilient to frequency excursions resulting from severe and extreme contingencies. This standards development effort intends to effectively use the proven high performance characteristics of the existing SPP UFLS program and refine its requirements and coordination procedures through an open process as described in the SPP Standard Development Process Manual.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. SPP expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

Summary:

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with certain existing non-routine ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Standards affected:

IRO-006-5 (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of IRO-006-5.)

Status:

This Regional Standard was approved by the Texas RE Board of Directors on June 28, 2011, and it will be submitted to the NERC Board of Trustees in November 2011. Subsequent filing with FERC is expected to occur in 2012.

2011 DEVELOPMENT

BAL-001-TRE-1 — Primary Frequency Response in the ERCOT Region

Summary:

This Regional Standard is intended to support reliability by ensuring adequate primary frequency response performance in the ERCOT Interconnection. The standard addresses frequency response at the Interconnection level, as well as by individual generating units and facilities. Specific maximum governor droop and deadband settings are provided, along with primary frequency response performance standards (initial and sustained) that allow actual unit-specific performance to be measured.

In 2002, NERC approved a regional difference for ERCOT that made it exempt from Requirement R2 in BAL-001-0 (CPS2), because of ERCOT's lack of synchronous connection to other control areas and the nature of the ERCOT energy market. FERC approved the ERCOT regional difference, finding that ERCOT's practice of (a) determining the minimum frequency response needed for reliability, and (b) requiring generators to have specific governor droop, to be a more stringent practice than Requirement R2 in BAL-001-0. FERC directed NERC to file a modification of the ERCOT regional difference to include the requirements concerning frequency response contained in section 5 of the ERCOT protocols. This Regional Standard is responsive to that directive.

Standards affected:

BAL-001-0.1a (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of the continent-wide standard.)

Status:

This project has been approved by the Texas RE Board of Directors, with expected submission to the NERC Board of Trustees in 2011 and subsequent filing with FERC to occur in 2012.

2012 DEVELOPMENT

BAL-002-WECC-1 — Contingency Reserves

Summary:

On Oct. 21, 2010, FERC found that BAL-002-WECC-1 did not meet the statutory criteria for approval and remanded the regional standard to NERC/WECC for further modification (RM09-15-000; Order 740). FERC held that BAL-002-WECC-1's less stringent requirements had not been supported by the technical data provided.

On remand, the Commission instructed WECC to modify the regional reliability standard to include a number of specific items contained in Order 740. This Request is submitted with the specific and narrow purpose of addressing only those issues mandated for modification in the October 2010 Oder 740.

Standards affected:

BAL-002-WECC-1

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2012 DEVELOPMENT

BAL-004-WECC-1 — Automatic Time Error Correction

Summary:

In the order approving BAL-004-WECC-1 the FERC directed WECC to make several clarifying modifications to the standard. FERC directed WECC to use the FERC-approved Process for Developing and Approving WECC standards to make these clarifying modifications

In addition, the WECC staff has identified the opportunity to make additional modifications to the existing standard to clarify the intent without changing the requirements.

There is also confusion regarding the R3 requirement that the ACE used for NERC reports shall be the same ACE as the AGC operating mode in use. This seems to conflict with the NERC response to NOPR comments that entities may use ATEC ACE for control but should use Raw ACE for reporting. WECC is developing a proposed regional variance to BAL-001-0.1a to address this apparent conflict.

Standards affected:

BAL-004-WECC-1
BAL-001-0.1a

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

VAR-001-WECC-1 — Voltage and Reactive Control

Summary:

The current draft has been converted from a Standard into a Regional Variance to the NERC VAR-001-2 Standard. The format incorporates the NERC Standard into the document with minor additions to address the scope of the variance. The regional variance specifics are included as Section E of the proposed document (see hyperlink above), and in this case, are intended to replace NERC VAR-001-2 requirements R3 and R4 as noted at the beginning of Section E.

The purpose of this regional variance to a NERC Reliability Standard is to ensure that voltage levels are within limits in real time to protect equipment and the reliable operation of the Western Interconnection. The "Rules of Procedure of the North American Electric Reliability Corporation" (Appendix 3A, page 31) permits the development of a regional variance to a NERC reliability standard on an Interconnection-wide basis when the Regional Reliability Organization has valid justification and when the variance is not inconsistent with or less stringent than the NERC Reliability Standard. The variance is an alternative method for obtaining the same reliability objective as the continent standard and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the electric reliability organization governmental authority, shall be enforced within the applicable Regional Entity(ies) pursuant to delegated authority.

Standards affected:

VAR-001-2

Status:

This Regional project has been approved by the WECC Board of Directors. WECC expects to submit the draft for the mandatory NERC 45-day comment period in the near future, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and the implementation of projects in general
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 shows the Regional Work Plan in Gantt chart form
- Appendix 4 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President of Standards and Training

To: NERC's Board of Trustees, Stakeholders, Regulatory Authorities, and other interested parties

NERC is committed to the development of clear, technically excellent standards for the reliable planning and operation of the North American bulk power system. NERC's industry-based standard development process strives to leverage the knowledge and experience of subject-matter experts to develop stakeholder consensus in support of standards that achieve reliability objectives and are responsive to regulatory directives, balanced against the burdens and costs of compliance imposed upon the more than 1,900 entities that are now subject to these standards. No single standard can ensure this outcome. Rather, NERC strives to develop and enhance a portfolio of performance, risk-mitigation, and competency-based reliability standards that achieve a consistent defense in depth against credible events that may lead to cascading, uncontrolled separation, or instability and ensure prompt system restoration when extreme events occur.

Achieving this balance is intrinsically difficult. Just as the management of the reliability "bar" through enforceable standards is an ongoing and evolving process, the process for developing standards needs to evolve as well, in response to the learning that has occurred in the period since passage of the Energy Policy Act of 2005 and the initial enforcement of NERC standards in June 2007. We would like to use this message to highlight current achievements in the standards arena and our plans for 2012-2014, as well as certain emerging factors and concerns.

NERC's Reliability Standards Development Plan delivered the following results in 2011:

- As of November 1, 2011, 20 new or revised standards have been approved by the Board of Trustees, and are either filed or in the process of being filed with the FERC.
- Results Based Standard development principles were used for all new standards projects.
- The Standards Committee worked with NERC staff to prioritize standards development resources on twelve high priority projects. There has been no specific redirection of this effort relative to the selected priorities by regulatory authorities.
- Stakeholder-driven Quality Review has been integrated into the standards development process to assure the best quality standards from a compliance and implementation perspective.
- NERC undertook a first effort to develop a standard on a Rapid Development basis utilizing the new Standard Processes Manual.

- To balance the resources committed to the development of new standards versus the interpretation of existing standards, the Standards Committee has limited the number of interpretations under active development to three projects at any one time, while pursuing new procedural options such as "rapid revision" to correct deficiencies in the underlying standard.

The 2012-14 Reliability Standards Development Plan described in this report builds on recent experience by proposing an achievable yet ambitious plan of standards development. The 2012-14 Plan provides for:

- Continuation of ongoing standards projects with sufficient resources to ensure timely completion.
- Project priorities were established using a more comprehensive model with scores and explanatory inputs from the Standards Committee, NERC staff and industry stakeholders.
- Projects have been ranked for development priority along three tracks, based on consideration of Reliability Benefits, Time Sensitivity, and Practicality.
- As ongoing projects are completed, we are scheduling follow-on projects based on the availability of subject-matter experts and the completion of technical input, research, and industry outreach conducted by NERC's standing committees and subcommittees.
- Finally, the 2012-14 Plan incorporates a more comprehensive integration of the regional standards effort into this process. For the first time a complete project management process is being applied to regional standards development.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, a wide variety of electric system events and emerging risks to bulk power system reliability may necessitate deviations from this plan. In order to respond to such threats and initiate development of new or revised standards, the actual deployment of resources to staff this plan may shift. Additionally, the estimated times listed for project completion may change as more is learned about a given project.

NERC currently is investigating the following "emerging issues," each of which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Not every issue is addressable or best addressed through development of a new industry standard; the issues outlined above illustrate that truism. But where a standards related response is indicated, we will be ready to reprioritize and adjust.

The Standards Committee and NERC staff also recognize that major standards process efficiencies are still necessary if we are to make efficient use of NERC and industry resources, while meeting external expectations for the timely development and approval of technically excellent reliability standards. In 2012, we need to ask ourselves once again, "is there a better way to develop reliability standards?"

We achieve the past results and plan for the future results only with your support, and greatly appreciate that the industry has accepted the evolving prioritization process. Our efforts to effectively manage and balance the many conflicting demands placed upon both the industry and NERC staff resources has provided this next plan, which we hope you will endorse.

Each of us, day in and day out, is driven to do the "right" thing, and your ERO's reputation will be enhanced through your active support for completion of NERC's 2012-14 Reliability Standards Development Plan.

Sincerely,

Allen Mosher
Senior Director of Policy Analysis and Reliability, American Public Power Association
Chair, NERC Standards Committee

Herb Schrayshuen
Vice President of Standards and Training, NERC

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of interest to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come;
- Status updates regarding standards and related projects currently in development;
- A forecast of Standards Development work scheduled for the next three years; and
- An overview of the process used to prioritize work and assign resources to Standards development projects.

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels initially identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, other priorities may necessitate deviations from this plan. As new technologies are discovered or new threats to reliability identified, the actual deployment of resources to staff this plan may shift. Similarly, the estimated times listed for project completion may change as more is learned about a given project.

NERC is currently investigating the following "emerging issues," which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process, Standards Development, and Regional Standards teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development

- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 continent-wide Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

[1] The data included in this paragraph does not include Regional Reliability Standards.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year in accordance with Section 321.6 of the NERC Rules of Procedure ("Rule 321") that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Regional Standards Development

Regional standards work within NERC and the Regions has seen a great deal of development and implementation of new initiatives since the beginning of 2011. First, the Regional Reliability Standards Working Group (RRSWG) transitioned into the Regional Standards Group (RSG). Comprised of the NERC Vice President of Standards and Training and the Standards Managers from each of the eight Regional Entities, the RSG reports to the ERO Executive Management Group (EMG). Its purpose is to provide process and policy recommendations in the execution of the Regional Entity delegation agreements and the NERC Rules of Procedure. An overarching objective is to coordinate the development of Regional and continent-wide standards to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners and operators.

In support of this purpose and this objective, a primary initiative of the RSG is to create and sustain viable standards development coordination processes to obtain consistency and uniformity, where appropriate, across the ERO enterprise – NERC and the Regional Entities – while ensuring efficient and effective use of resources in executing the statutory responsibilities of the ERO as the reliability standards development authority. To that end, the RSG developed a combined list of all regional standards and variances in the development process in order to prioritize these projects continent-wide. This will allow NERC to coordinate the necessary resources through the development and ultimate filing of these standards and variances with applicable regulatory authorities. Project information for each of those regional standards and variances in the development process is provided in this Plan, along with a high-level overview of the project timeline.

Rapid Development and Rapid Revision Projects

NERC's Standards Committee (SC) tentatively has identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010-05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can address an interpretation request more effectively than an interpretation can alone, the team may propose to the requester that the team instead make such changes and submit them with an associated SAR. If agreed to by the requester, and following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its Rules of Procedure, NERC has committed to review each of its standards for modification once every five years. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. While not giving the appearance of being onerous, this obligation has proved challenging to meet. The work load of the ERO remains high, and maintaining focus on those projects that are most beneficial to reliability has resulted in a delay of the work required for these five-year reviews (except when already associated with a project of significant reliability value). Using current assumptions, the five-year review obligation will not be met for a number of standards. NERC and the SC are working together with the NERC Board of Trustees to evaluate options for addressing this issue.

Product Quality

As NERC's and the industry's experience with standards has evolved, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and efficiently. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress

in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global "portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity. Additionally, the plan was developed with the use of a subjective review of the implications of cost. NERC believes this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the Tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standards based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capacity of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems generally were not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Regulatory Submission - Following adoption by NERC's Board of Trustees, the standards are submitted to regulatory authorities.

- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any necessary supplemental regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). The Regional Work Plan is included as Appendix 3. A detailed summary of projects, including regional projects, is included as Appendix 4.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active Projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact all three of these areas in some way, this is intended to illustrate the primary consideration driving each project's development priority.

Existing Active Projects:

- 2006-06 Reliability Coordination.
- 2007-02 Operating Personnel Communication Protocols.
- 2007-03 Real-time Transmission Operations.
- 2007-06 Protection System Coordination.
- 2007-07 Vegetation Management. This project is expected to be completed in early 2012, but at the time of this document's finalization, it has not yet been formally completed.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response.
- 2007-17 Protection System Maintenance and Testing.
- 2008-06 Cyber Security – Order 706.
- 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-07 Generator Requirements at the Transmission Interface.
- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves.
- 2010-17 Definition of Bulk Electric System.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited

number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such as new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project is currently in informal development.
- 2009-03 Emergency Operations. This project is currently in informal development.
- 2010-01 Support Personnel Training. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project is currently in informal development. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization.
- 2012-04 Protection System Commissioning Testing. This project is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.

NERC intends to initiate development of the following projects in 2013. As noted above, these projects generally have been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is currently in informal development.
- 2008-01 Voltage and Reactive Planning and Control. This project is currently in informal development.
- 2008-12 Coordinate Interchange Standards. This project is currently in informal development.
- 2009-07 Reliability of Protection Systems. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until after the completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is currently in informal development.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project requires research prior to initiation, which is expected to be completed in the latter part of 2012.
- 2012-06 Generator Capabilities. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project requires research prior to initiation, which is expected to be completed in 2013.
- 2009-05 Resource Adequacy Assessments.
- 2010-03 Modeling Data. This project requires research prior to initiation, which is expected to be completed in the latter part of 2013.
- 2010-04 Demand Data. This project requires research prior to initiation, which is expected to be completed in 2014.
- 2010-08 Functional Glossary Model Revisions.

- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is expected to not start until completion of the previous phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator.
- 2012-05 ATC Revisions - Order 729.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority. There also is some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan that follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	7	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	6	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	2	29
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	3	7
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	14	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	11	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	12	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	9	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	19	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	37	41
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	4	3
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	16	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	15	25
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	8	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	20	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	22	20
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	41	43
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	10	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	17	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	40	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	42	44
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	13	31
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	38	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	39	24
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	21	33
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	32
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	41
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	43
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	40
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative, BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

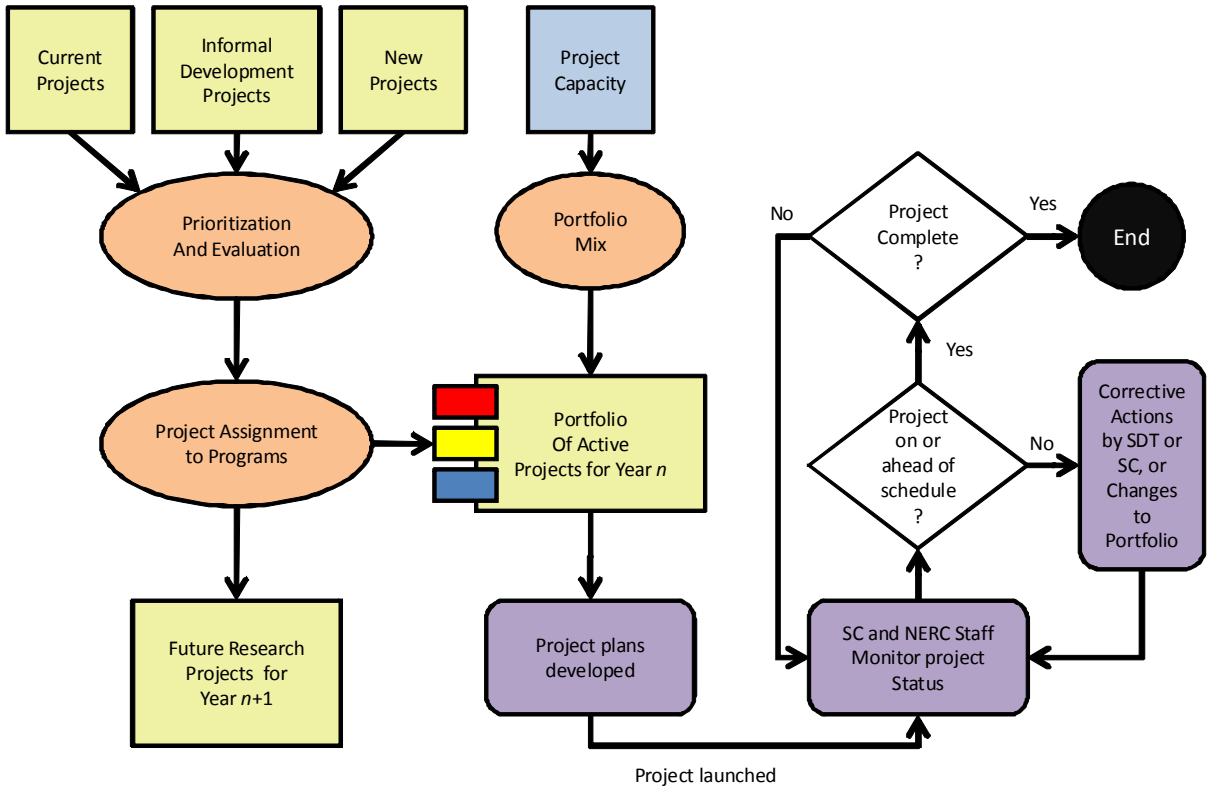
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

Attachment B: Prioritization Tool

1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

ID	Task Name
1	**Reliability Projects: 8 Slots**

Appendix 4 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity;
- Move the requirement (into another project or Standard, or to the certification process); or
- Eliminate the requirement (because it is redundant or does not support BPS reliability).

This project ranked #13 in Reliability Priority.

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. No estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to real-time operating states and protocols for issuing and responding to operating directives.

This project ranked #5 in Reliability Priority.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Due to focusing on other priorities, this team was temporarily put on hold. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

This project ranked #5 in Practicality Priority.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to other standards as appropriate through coordination with project 2006-06 Reliability Coordination.

This project ranked #4 in Reliability Priority.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, which were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltage transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It also will ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were posted most recently for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained within the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It also will ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

This project is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

This project ranked #3 in Reliability Priority.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

This project ranked #3 in practicality.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery will be reviewed and addressed.

This project ranked #14 in Reliability Priority.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

This project ranked #2 in Reliability Priority.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator, or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project also will consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

This project ranked #8 in Reliability Priority.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

This project ranked #1 in Practicality Priority.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

This project ranked #4 in Practicality Priority.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

This project ranked #1 in Reliability Priority.

Standards affected:

New

Status:

This project has an initial draft of a SAR that was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

This project ranked #15 in Reliability Priority.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

This project ranked #7 in Reliability Priority.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

This project ranked #11 in Reliability Priority.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

This project ranked #12 in Reliability Priority, #13 in Practicality Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARs associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

This project ranked #10 in Reliability Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings, and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

This project ranked #9 in Reliability Priority,

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

This project ranked #6 in Reliability Priority

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision that, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE DEVELOPMENT

PRC-002-FRCC-1 — FRCC Regional Disturbance Monitoring and Reporting Requirements

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Disturbance Monitoring Equipment" (revision dated June, 2006) into a new Regional Reliability Standard that complies with the requirements of NERC Reliability Standard, PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements.

Standards affected:

PRC-002-1

Status:

This Regional project is currently on "hold." Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-11 Disturbance Monitoring being classified as a "Project in Informal Development," FRCC staff will be re-evaluating the current status of the regional project to determine whether to proceed with the Regional Reliability Standard development or to revise the current FRCC Regional Criteria document "FRCC Requirements for Disturbance Monitoring Equipment."

FUTURE DEVELOPMENT

PRC-003-FRCC-1 — FRCC Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems

Summary:

FRCC plans to convert the existing handbook document "FRCC Requirements for Analysis of Protection Misoperations & Corrective Actions Reporting" (revision dated October, 2003) into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

Standards affected:

PRC-003-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC has revised Regional Criteria documents ("FRCC Requirements for Analysis of Protection Misoperations and Corrective Actions Reporting," revision dateed December 2, 2010) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

FUTURE DEVELOPMENT

PRC-006-FRCC-1 — FRCC Automatic Underfrequency Load Shedding Program

Summary:

FRCC is developing a Regional Reliability Standard to provide last resort system preservation measures by implementing an Underfrequency Load Shedding (UFLS) program. Additional requirements may be needed due to FRCC peninsular geography and limited ties to the north. Operating experience and decades of studies by the FRCC and its predecessor reliability organizations have resulted in a well-developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. The standard development project will effectively use the proven high performance characteristics of the existing FRCC UFLS program and refine its requirements and coordination procedures to comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

Standards affected:

PRC-006-1

Status:

PRC-006-FRCC-1 FRCC Automatic Underfrequency Load Shedding Program has been approved by the FRCC Registered Ballot Body and the FRCC Board of Directors. Based on concerns identified by NERC standards staff and the pending Commission (FERC) approval of the NERC Continent-Wide Reliability Standard PRC-006-1 Automatic Underfrequency Load Shedding and associated Regional variances, the Regional project has been placed on “hold.” The FRCC has since revised Regional Criteria documents (FRCC Automatic Underfrequency Load Shedding Program, revision date: April 7, 2011) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

FUTURE DEVELOPMENT

PRC-024-FRCC-1 — FRCC Regional Generator Performance During Frequency and Voltage Excursions

Summary:

FRCC is developing a standard to establish "ride through" requirements for generators in the FRCC Region with respect to temporary grid voltage or frequency deviations from their normal range. The Standard should address time duration limits for operation of generator protection for

1) frequencies outside of the 59.5 - 60.5 hertz range,
2) voltages outside of the 95% - 105% range, and
3) generator stator current overloads.

The Standard should address exemption criteria and mitigation measures available for resolving apparent conflicts between generator capabilities and the coordination requirements. Considerable knowledge of grid frequency and voltage excursions and the time limited capabilities of generators to sustain these conditions has been gained through operating experience and previous reliability studies. This standards development project should effectively use this knowledge to define coordination requirements and procedures that comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Standards affected:

PRC-024-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-09 Generator Verification being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC is actively revising Regional Criteria documents (FRCC Generator Coordination Requirements) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

2012 DEVELOPMENT

PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Program

Summary:

The purpose of this Standard is to establish the requirements for NPCC and its members to operate and maintain a coordinated Regional Underfrequency load shedding (UFLS) program. The NPCC's UFLS program will meet the requirements contained in NERC standards, and provide those entities to which it is applicable the guidance necessary to implement it. This standard will also mandate that coordination with neighboring Regional Underfrequency load shedding programs be developed when necessary. The unique character, dispersion, sensitivity and density of the NPCC regional loads emphasize the need for this Standard.

The NPCC regional UFLS standard shall apply to all applicable entities within the Region and sub-regional areas that are both synchronous and asynchronous to the Eastern Interconnection. Quebec UFLS has different parameters, and these are included in the standard and fully coordinated within the Region.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. NPCC expects to complete the drafting of this standard in 2011 and conduct a ballot of stakeholders in the first quarter of 2012. Submission to the NERC Board of Trustees and subsequent filing with FERC is expected to occur in 2012.

FUTURE DEVELOPMENT

PRC-012-NPCC-1 — Special Protection Systems

Summary:

To support and enhance bulk power system reliability, this Standard will establish the criteria for the minimum design objectives and practices for special protection systems (the purpose of which are to detect abnormal system conditions, and take corrective actions other than the isolation of faulted elements to maintain the stability and security of the bulk power system). This Standard will also establish the requirements for close coordination between system planning, design, operating, maintenance and protection functions to ensure that the impacts of special protection system operations do not result in a significant adverse impact.

The proposed Standard will describe the requirements for the design and approval of Special Protection Systems and the technical criteria required to support its implementation. The Standard will also identify the need for close coordination among various parties to ensure that the Special Protection Systems are implemented correctly, and triggers and resulting actions are made known and communicated in an on-line database.

Standards affected:

PRC-012-0

Status:

This Regional project is currently on “hold” pending the completion of the NERC Reliability Standard Development Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS, and the outcome of the work by the NERC SPCS on the definition of SPS.

2011 DEVELOPMENT

MOD-024-RFC-1 — Verification and Data Reporting of Generator Gross and Net Real Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Real Power capability to support NERC Reliability Standard MOD-024. The objective of the regional standard is to ensure accurate information on generator gross and net Real (MWs) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-024-1

Status:

This Regional standard has been approved by the Reliability*First* Board. Currently, VRFs and VSLs are in development. Reliability*First* expects to complete the drafting of the VRFs and VSLs in 2011, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2011 DEVELOPMENT

MOD-025-RFC-1 — Verification and Data Reporting of Gen Gross and Net Reactive Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Reactive Power capability to support NERC Reliability Standard MOD-025. The objective of this standard is to ensure that accurate information on generator gross and net Reactive (MVAR) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-025-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with the FERC is expected to occur in 2012.

2011 DEVELOPMENT

PRC-002-RFC-1 — Disturbance Monitoring and Reporting Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for Disturbance monitoring and reporting to support NERC Reliability Standard PRC-002.

Standards affected:

PRC-002-1

Status:

Reliability*First* is currently working on the technical justification for the locational requirements for DME equipment. This Regional standard has been approved by the Reliability*First* Board. Reliability*First* expects submission of this standard to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2012 DEVELOPMENT

PRC-006-RFC-1 — Automatic Under Frequency Load Shedding Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency and assist in the recovery of frequency following underfrequency events, providing last resort system preservation measures. The standard goes beyond the NERC PRC-006-1 standard and prescribes with more certainty aspects that the Planning Coordinator's UFLS program must contain, further details on certain procedural matters with respect to how islands are addressed, and assessment of UFLS program implementation as well as program design. This standard also attempts further consolidating requirements of the Reliability*First* legacy underfrequency load shedding programs, permitting retirement of legacy documents to ensure appropriate coordination among the Reliability*First* legacy regional UFLS programs.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur later in 2012.

2012 DEVELOPMENT

PRC-012-RFC-1 — Special Protection System Requirements

Summary:

To purpose of the standard is to establish Reliability*First* requirements for the review, development and application of Special Protection Systems (SPS).

Standards affected:

PRC-012-0

Status:

This Regional project is currently in the initial drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur early in 2013.

2011 DEVELOPMENT

PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

Summary:

The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

In 2008, SERC commenced work on PRC-006-SERC-1. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the continent-wide UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. This regional standard PRC-006-SERC-1 adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Standards affected:

PRC-006-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011, and subsequent filing with FERC is expected to occur in 2012.

2012 DEVELOPMENT

PRC-006-SPP-1 — Under Frequency Load Shedding

Summary:

PRC-006 (Development and Documentation of Regional UFLS programs) has been identified by NERC as one of the Regional "Fill-in-the Blank" Standards. At a minimum, the requirements developed in this standard need to meet the requirements for the Regional Program as identified in NERC's PRC-006-0. Operating experience and regional studies have resulted in a well developed UFLS program that is very resilient to frequency excursions resulting from severe and extreme contingencies. This standards development effort intends to effectively use the proven high performance characteristics of the existing SPP UFLS program and refine its requirements and coordination procedures through an open process as described in the SPP Standard Development Process Manual.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. SPP expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

Summary:

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with certain existing non-routine ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Standards affected:

IRO-006-5 (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of IRO-006-5.)

Status:

This Regional Standard was approved by the Texas RE Board of Directors on June 28, 2011, and it will be submitted to the NERC Board of Trustees in November 2011. Subsequent filing with FERC is expected to occur in 2012.

2011 DEVELOPMENT

BAL-001-TRE-1 — Primary Frequency Response in the ERCOT Region

Summary:

This Regional Standard is intended to support reliability by ensuring adequate primary frequency response performance in the ERCOT Interconnection. The standard addresses frequency response at the Interconnection level, as well as by individual generating units and facilities. Specific maximum governor droop and deadband settings are provided, along with primary frequency response performance standards (initial and sustained) that allow actual unit-specific performance to be measured.

In 2002, NERC approved a regional difference for ERCOT that made it exempt from Requirement R2 in BAL-001-0 (CPS2), because of ERCOT's lack of synchronous connection to other control areas and the nature of the ERCOT energy market. FERC approved the ERCOT regional difference, finding that ERCOT's practice of (a) determining the minimum frequency response needed for reliability, and (b) requiring generators to have specific governor droop, to be a more stringent practice than Requirement R2 in BAL-001-0. FERC directed NERC to file a modification of the ERCOT regional difference to include the requirements concerning frequency response contained in section 5 of the ERCOT protocols. This Regional Standard is responsive to that directive.

Standards affected:

BAL-001-0.1a (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of the continent-wide standard.)

Status:

This project has been approved by the Texas RE Board of Directors, with expected submission to the NERC Board of Trustees in 2011 and subsequent filing with FERC to occur in 2012.

2012 DEVELOPMENT

BAL-002-WECC-1 — Contingency Reserves

Summary:

On Oct. 21, 2010, FERC found that BAL-002-WECC-1 did not meet the statutory criteria for approval and remanded the regional standard to NERC/WECC for further modification (RM09-15-000; Order 740). FERC held that BAL-002-WECC-1's less stringent requirements had not been supported by the technical data provided.

On remand, the Commission instructed WECC to modify the regional reliability standard to include a number of specific items contained in Order 740. This Request is submitted with the specific and narrow purpose of addressing only those issues mandated for modification in the October 2010 Oder 740.

Standards affected:

BAL-002-WECC-1

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2012 DEVELOPMENT

BAL-004-WECC-1 — Automatic Time Error Correction

Summary:

In the order approving BAL-004-WECC-1 the FERC directed WECC to make several clarifying modifications to the standard. FERC directed WECC to use the FERC-approved Process for Developing and Approving WECC standards to make these clarifying modifications

In addition, the WECC staff has identified the opportunity to make additional modifications to the existing standard to clarify the intent without changing the requirements.

There is also confusion regarding the R3 requirement that the ACE used for NERC reports shall be the same ACE as the AGC operating mode in use. This seems to conflict with the NERC response to NOPR comments that entities may use ATEC ACE for control but should use Raw ACE for reporting. WECC is developing a proposed regional variance to BAL-001-0.1a to address this apparent conflict.

Standards affected:

BAL-004-WECC-1
BAL-001-0.1a

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

VAR-001-WECC-1 — Voltage and Reactive Control

Summary:

The current draft has been converted from a Standard into a Regional Variance to the NERC VAR-001-2 Standard. The format incorporates the NERC Standard into the document with minor additions to address the scope of the variance. The regional variance specifics are included as Section E of the proposed document (see hyperlink above), and in this case, are intended to replace NERC VAR-001-2 requirements R3 and R4 as noted at the beginning of Section E.

The purpose of this regional variance to a NERC Reliability Standard is to ensure that voltage levels are within limits in real time to protect equipment and the reliable operation of the Western Interconnection. The "Rules of Procedure of the North American Electric Reliability Corporation" (Appendix 3A, page 31) permits the development of a regional variance to a NERC reliability standard on an Interconnection-wide basis when the Regional Reliability Organization has valid justification and when the variance is not inconsistent with or less stringent than the NERC Reliability Standard. The variance is an alternative method for obtaining the same reliability objective as the continent standard and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the electric reliability organization governmental authority, shall be enforced within the applicable Regional Entity(ies) pursuant to delegated authority.

Standards affected:

VAR-001-2

Status:

This Regional project has been approved by the WECC Board of Directors. WECC expects to submit the draft for the mandatory NERC 45-day comment period in the near future, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION RELIABILITY STANDARDS DEVELOPMENT PLAN 2012-2014 INFORMATIONAL FILING PURSUANT TO SECTION 310 OF THE NERC RULES OF PROCEDURE

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC") hereby submits to the Federal Energy Regulatory Commission ("FERC") for informational purposes its revised Reliability Standards Development Plan in accordance with Section 310 of the NERC Rules of Procedure. The *Reliability Standards Development Plan: 2012–2014* ("2012 Development Plan"), is included as **Exhibit A**. Stakeholder[1] comments received regarding the draft 2012 Development Plan during the open comment period, as well as summaries of those comments, are included as **Exhibit B.** The NERC Board of Trustees approved the 2012 Development Plan on November 3, 2011.

[1] The NERC stakeholders comprise representatives of small and large end-use customers and governmental authorities as well as representatives such as Transmission Owners; Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs); Load-Serving Entities (LSEs); Transmission Dependent Utilities (TDUs); Electric Generators; Electricity Brokers, Aggregators, and Marketers; Large Electricity End Users; Small Electricity Users; Federal, State, and Provincial Regulatory or other Government Entities; and Regional Entities.

II. NOTICES AND COMMUNICATIONS

III. BACKGROUND

In 2006, NERC developed an initial version of the plan for Reliability Standards development entitled the *Reliability Standards Development Plan: 2007–2009*. NERC has since updated the plan annually, and the 2012–2014 version of the plan is presented in this filing. The 2012 Development Plan serves as a management tool to guide and coordinate the development of Reliability Standards and provide benchmarks for assessing progress. The 2012 Development Plan also serves as a communications tool for coordinating standards development work with applicable governmental agencies in the United States and Canada and for engaging stakeholders in standards development activities. The 2012 Development Plan further provides a base for developing annual plans and budgets for the NERC standards program. Consistent with the four previous versions of the plan, the 2012 Development Plan is filed for informational purposes. No specific FERC action is requested at this time. The 2012 Development Plan builds upon the foundation established by the previous plans and identifies the current plans and priorities for

development and modification of NERC Reliability Standards in the immediate three-year time horizon.

Similar to the 2011 Development Plan, the 2012 Development Plan has benefited from a prioritization process developed through NERC's Standard Committee. The Standards Committee used a prioritization tool to assist in the determination of the relative priorities of projects within the NERC Standards Development portfolio. This tool considered various factors, including reliability impact, time-sensitivity, and practicality, as well as project logistics. Assisted by that prioritization tool, the Standards Committee identified a set of projects to which the majority of NERC and industry resources are expected to be assigned over the next three years.

NERC anticipates this prioritization of projects and resultant standards development work will be dynamic, and will be updated periodically as projects are completed or as new needs are identified and projects considered. NERC also recognizes that new priorities may be created as our experience grows and as new risks are identified that will require flexibility in work planning to ensure the activities most in the interest of bulk power system reliability are given appropriate resources and priority. The 2012 Development Plan is included as **Exhibit A**. A summary of Stakeholder comments received and the comments received on the draft 2012 Development Plan during the open comment period are included as **Exhibit B.**

By this filing, NERC informs FERC and other interested parties of the significant changes to the content of the *Reliability Standards Development Plan: 2011–2013* ("2011 Development Plan") that led to the creation of the 2012 Development Plan. NERC identifies changes in project timelines and completion dates that are reflected in the 2012 Development Plan and presents a summary of stakeholder comments that were considered during the development of the final 2012 Development Plan.

A. Summary of 2012 Development Plan

i. Project Prioritization and Work Plan

The 2012 Development Plan was developed in part in reliance on a prioritization tool created by the NERC's Standards Committee and its subcommittees. The prioritization tool was modified from the version used in the development of the 2011 Development Plan in response to comments received from stakeholders. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the *NERC President's Top Priority Issues for Bulk Power System Reliability*,[2] and trial testing of a new metric that accounts for "cost considerations." In addition, the Tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the Standards Committee to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources. Additional details regarding the prioritization tool can be found in Attachment 1 of the 2012 Development Plan.

The tool calculates rankings for a project based on the following criteria:

- The project's alignment with issues identified in the *NERC President's Top Priority Issues for Bulk Power System Reliability;*
- Whether the project's deliverables will fill an identified gap in reliability;
- The subjective magnitude of the improvements to existing standards expected from the project's completion;
- The time-sensitivity of the project (if any) relative to regulatory deadlines or other similar delivery commitments;

[2] Available at: http://www.nerc.com/news_pr.php?npr=723.

- Stakeholder and staff compliance experiences with the subject standards;
- Interpretations related to the subject standards; and
- Other factors, as deemed to be necessary by the Standards Committee.

NERC and the Standards Committee used the prioritization tool to assist in the prioritization of the projects identified in the 2012 Development Plan. The 2012 Development Plan assumed an overall throughput capacity of thirteen projects in concurrent development, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.
- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, reducing the cost or burden of demonstrating compliance, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The following projects from 2011 are expected to continue in 2012:[3]

- 2006-06 Reliability Coordination
- 2007-02 Operating Personnel Communication Protocols
- 2007-03 Real-time Transmission Operations

[3] 2007-07 Vegetation Management is included in the 2012 Plan as a project continuing in 2012. At the time of the 2012 Plan's submission to the NERC Board of Trustees for approval, it was not clear if 2007-07 would be moving forward in 2011 or continuing into 2012. However, it has subsequently been determined that the project will complete in 2011.

- 2007-06 Protection System Coordination
- 2007-09 Generator Verification
- 2007-12 Frequency Response
- 2007-17 Protection System Maintenance and Testing
- 2008-06 Cyber Security – Order 706
- 2009-01 Disturbance and Sabotage Reporting
- 2010-05.1 Phase 1 of Protection Systems: Misoperations
- 2010-07 Generator Requirements at the Transmission Interface
- 2010-14.1 Phase 1 of Balancing Authority Reliability- based Controls: Reserves
- 2010-17 Definition of Bulk Electric System

NERC intends to initiate development of the following additional projects in 2012.

- 2008-02 Undervoltage Load Shedding
- 2009-02 Real-time Monitoring and Analysis Capabilities
- 2009-03 Emergency Operations
- 2010-01 Support Personnel Training
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS
- 2010-13.2 Phase 2 of Relay Loadability: Generation

These projects have been assigned based on priority, but constrained by the need to have a limited number of projects under active development at any given time. Additionally, Project 2010-05.2 is not scheduled to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. Project 2012-04 is not scheduled to start until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

Additional detail regarding subsequent years is included in the 2012 Development Plan, as well as general updates on the ERO overall. The 2012 Development Plan also includes updates on regional standards development.

While the 2012 Development Plan presents a reasonable approach to Standards development, it cannot account for unforeseen events. The 2012 Development Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and other factors, such as new or emerging reliability risks to the Bulk Electric System. Changes to the 2012 Development Plan during its execution are not only possible, but likely, and should be expected. Additionally, such changes must be developed following the steps outlined in the NERC *Standard Processes Manual*,[4] which ensures an open and inclusive process through adherence to ANSI standards development principles.

ii. General Revisions

This section provides a summary of significant revisions to the 2012 Development Plan as compared to the 2011 Development Plan. The number of projects proposed in this plan (48) is more than the 35 projects listed in the 2011 Development Plan. The difference was created due to several factors:

The following seven projects identified in the 2011 Development Plan were completed and removed from this revised plan:

- 2006-02 Assess Transmission and Future Needs
- 2007-04 Certifying System Operators
- 2008-06 Cyber Security Order 706 Version 4
- 2009-06 Facility Ratings

[4] Available at: http://www.nerc.com/files/Appendix_3A_Standard_Processes_Manual_20110825.pdf.

- 2010-10 FAC 729
- 2010-11 TPL Table 1 Footnote B
- 2010-13 Relay Loadability Order Phase 1

Twelve new projects were added based on stakeholder suggestions:

- 2012-03 PRC-004 VSLs
- 2012-04 Protection System Commissioning Testing
- 2012-05 ATC Revisions – Order 729
- 2012-06 Generator Capabilities
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis
- 2012-15 Flow Limited Paths

Four projects were separated into multiple phases, which were treated as individual projects in order to provide the Standards Committee with more flexibility during prioritization. In general, projects with multiple phases will have a numerical suffix indicating the phase appended to their project number.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2010.05.1 Phase 1 of Protection Systems: Misoperations
- 2010.05.1 Phase 2 of Protection Systems: SPS and RAS
- 2010-14.1 Phase 1 of Balancing Authority Reliability Based Controls - Reserves

- 2010-14.1 Phase 2 of Balancing Authority Reliability Based Controls – Time Error, AGC, and Inadvertent
- 2010-13.3 Phase 3 of Relay Loadability: Generation
- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

The 2012 Development Plan identifies the standards development projects that are currently expected to be worked on in the immediate three-year time horizon. NERC will make every attempt to bring as many projects to completion as possible; however, NERC will not complete all of the projects identified in this plan in the immediate three-year time horizon.

iii. Project Schedule and Timeline Updates

This section summarizes the progress made on the active projects identified in the 2011 Development Plan, changes in project timelines, and factors contributing to those changes.

2006-02 Assess Transmission and Future Needs

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the second quarter of 2012. However, the project was completed in the fourth quarter of 2011, and will not be worked on in 2012.

2006-06 Reliability Coordination

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the fourth quarter of 2011. Scheduling conflicts and the quantity of work to be completed have led to delays in the project. At this time, NERC expects this project to complete in the second quarter of 2012.

2007-02 Operating Personnel Communications Protocols

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the fourth quarter of 2012. Scheduling conflicts and the quantity of work to be completed have led to a modest delay in the project. Additionally, focus on a related interpretation has led to delay as well. At this time, NERC expects this project to complete in the first quarter of 2013.

2007-03 Real-time Transmission Operations

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the third quarter of 2012. Potential modifications to the scope of the project and associated discussion and debate have led to delays in the project. At this time, NERC expects this project to complete in Q1 of 2013.

2007-06 System Protection Coordination

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in 2013. Consistent with this, a review of the project estimates this project will complete in the first quarter of 2013.

2007-07 Vegetation Management

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the second quarter of 2011. However, as part of the project prioritization, resources were withdrawn from the project, and the drafting team was asked to work independently to continue their efforts. This added additional time as the team continued its work without formal facilitation. However, the project was completed in the fourth quarter of 2011, and will not be worked on in 2012.

2007-09 Generator Verification

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the fourth quarter of 2011. Scheduling conflicts and the quantity of work to be completed have led to delays in the project. At this time, NERC expects this project to complete in the fourth quarter of 2012.

2007-12 Frequency Response

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the second quarter of 2012. NERC is not anticipating any change in the delivery date of this project.

2007-17 Protection System Maintenance & Testing

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the first quarter of 2012. However, it has been difficult to build consensus around the associated standard. A failed recirculation ballot has led to delays. It is estimated this project will complete in the second quarter of 2012.

2008-06 Cyber Security - Order 706

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the second quarter of 2012. Working to ensure consensus through outreach and other initiatives has led to a modest delay in this project. It is estimated this project will complete in the third quarter of 2012.

2009-01 Disturbance and Sabotage Reporting

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the first quarter of 2012. Scheduling conflicts and the quantity of work to be completed have led to delays in the project. At this time, NERC expects this project to complete in the third quarter of 2012.

2010-05 Protection Systems

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in 2013, but noted that options were being considered for accelerating this delivery. This project was split into two phases (as discussed previously), the first of which is now expected to complete in the third quarter of 2012. Additional work is underway to determine if this project can be delivered sooner.

2010-07 Generator Requirements at the Transmission Interface

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in 2013. Consistent with this, a review of the project estimates this project will complete in the first quarter of 2013.

2010-15 Remote Access Urgent Action

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the third quarter of 2011, but noted that the project might be absorbed into Project 2008-06 Cyber Security Order 706. In fact, this was the approach taken, and the project is no longer active, as it has been absorbed by Project 2008-06 Cyber Security Order 706.

2010-17 Definition of Bulk Electric System

When the 2011 Development Plan was drafted, NERC anticipated this project to be completed in the first quarter of 2012. However, the drafting team identified additional issues that it felt needed to be addressed. As a result, the project has two delivery dates. The first part of this project, which is expected to be responsive to Commission directives, is expected to complete in the first quarter of 2012 and filed by January 25, 2012. The remainder of this project, which will address the expanded scope, is estimated to complete in the second quarter of 2013.

B. NERC Stakeholders Input

To support the development of the 2012 Development Plan, NERC sought stakeholder input during an open comment period, which took place from September 12 through September 26, 2011. In addition, NERC solicited input from the NERC technical committees and from subject matter experts on the NERC staff. NERC received a total of 15 sets of comments during the open stakeholder comment periods. Comments were received from 63 different people from 38 companies representing all 10 of the 10 Industry Segments.

Stakeholder comments received on the draft 2012 Development Plan during the open comment period, as well as summaries of those comments, are included as **Exhibit B.** Changes to the prioritization and scores used in that effort were suggested in some of comments, resulting in minor modifications to the prioritization, but without any significant modification to the 2012 Development Plan itself.

IV. CONCLUSION

NERC respectfully requests that FERC accept this informational filing in compliance with Section 310 of the NERC Rules of Procedure.

Respectfully submitted,

/s/ Holly A. Hawkins

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and the implementation of projects in general
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 shows the Regional Work Plan in Gantt chart form
- Appendix 4 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President of Standards and Training

To: NERC's Board of Trustees, Stakeholders, Regulatory Authorities, and other interested parties

NERC is committed to the development of clear, technically excellent standards for the reliable planning and operation of the North American bulk power system. NERC's industry-based standard development process strives to leverage the knowledge and experience of subject-matter experts to develop stakeholder consensus in support of standards that achieve reliability objectives and are responsive to regulatory directives, balanced against the burdens and costs of compliance imposed upon the more than 1,900 entities that are now subject to these standards. No single standard can ensure this outcome. Rather, NERC strives to develop and enhance a portfolio of performance, risk-mitigation, and competency-based reliability standards that achieve a consistent defense in depth against credible events that may lead to cascading, uncontrolled separation, or instability and ensure prompt system restoration when extreme events occur.

Achieving this balance is intrinsically difficult. Just as the management of the reliability "bar" through enforceable standards is an ongoing and evolving process, the process for developing standards needs to evolve as well, in response to the learning that has occurred in the period since passage of the Energy Policy Act of 2005 and the initial enforcement of NERC standards in June 2007. We would like to use this message to highlight current achievements in the standards arena and our plans for 2012-2014, as well as certain emerging factors and concerns.

NERC's Reliability Standards Development Plan delivered the following results in 2011:

- As of November 1, 2011, 20 new or revised standards have been approved by the Board of Trustees, and are either filed or in the process of being filed with the FERC.
- Results Based Standard development principles were used for all new standards projects.
- The Standards Committee worked with NERC staff to prioritize standards development resources on twelve high priority projects. There has been no specific redirection of this effort relative to the selected priorities by regulatory authorities.
- Stakeholder-driven Quality Review has been integrated into the standards development process to assure the best quality standards from a compliance and implementation perspective.
- NERC undertook a first effort to develop a standard on a Rapid Development basis utilizing the new Standard Processes Manual.

- To balance the resources committed to the development of new standards versus the interpretation of existing standards, the Standards Committee has limited the number of interpretations under active development to three projects at any one time, while pursuing new procedural options such as "rapid revision" to correct deficiencies in the underlying standard.

The 2012-14 Reliability Standards Development Plan described in this report builds on recent experience by proposing an achievable yet ambitious plan of standards development. The 2012-14 Plan provides for:

- Continuation of ongoing standards projects with sufficient resources to ensure timely completion.
- Project priorities were established using a more comprehensive model with scores and explanatory inputs from the Standards Committee, NERC staff and industry stakeholders.
- Projects have been ranked for development priority along three tracks, based on consideration of Reliability Benefits, Time Sensitivity, and Practicality.
- As ongoing projects are completed, we are scheduling follow-on projects based on the availability of subject-matter experts and the completion of technical input, research, and industry outreach conducted by NERC's standing committees and subcommittees.
- Finally, the 2012-14 Plan incorporates a more comprehensive integration of the regional standards effort into this process. For the first time a complete project management process is being applied to regional standards development.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, a wide variety of electric system events and emerging risks to bulk power system reliability may necessitate deviations from this plan. In order to respond to such threats and initiate development of new or revised standards, the actual deployment of resources to staff this plan may shift. Additionally, the estimated times listed for project completion may change as more is learned about a given project.

NERC currently is investigating the following "emerging issues," each of which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Not every issue is addressable or best addressed through development of a new industry standard; the issues outlined above illustrate that truism. But where a standards related response is indicated, we will be ready to reprioritize and adjust.

The Standards Committee and NERC staff also recognize that major standards process efficiencies are still necessary if we are to make efficient use of NERC and industry resources, while meeting external expectations for the timely development and approval of technically excellent reliability standards. In 2012, we need to ask ourselves once again, "is there a better way to develop reliability standards?"

We achieve the past results and plan for the future results only with your support, and greatly appreciate that the industry has accepted the evolving prioritization process. Our efforts to effectively manage and balance the many conflicting demands placed upon both the industry and NERC staff resources has provided this next plan, which we hope you will endorse.

Each of us, day in and day out, is driven to do the "right" thing, and your ERO's reputation will be enhanced through your active support for completion of NERC's 2012-14 Reliability Standards Development Plan.

Sincerely,

Allen Mosher
Senior Director of Policy Analysis and Reliability, American Public Power Association
Chair, NERC Standards Committee

Herb Schrayshuen
Vice President of Standards and Training, NERC

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of interest to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come;
- Status updates regarding standards and related projects currently in development;
- A forecast of Standards Development work scheduled for the next three years; and
- An overview of the process used to prioritize work and assign resources to Standards development projects.

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels initially identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, other priorities may necessitate deviations from this plan. As new technologies are discovered or new threats to reliability identified, the actual deployment of resources to staff this plan may shift. Similarly, the estimated times listed for project completion may change as more is learned about a given project.

NERC is currently investigating the following "emerging issues," which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process, Standards Development, and Regional Standards teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development

- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 continent-wide Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

[1] The data included in this paragraph does not include Regional Reliability Standards.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year in accordance with Section 321.6 of the NERC Rules of Procedure ("Rule 321") that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Regional Standards Development

Regional standards work within NERC and the Regions has seen a great deal of development and implementation of new initiatives since the beginning of 2011. First, the Regional Reliability Standards Working Group (RRSWG) transitioned into the Regional Standards Group (RSG). Comprised of the NERC Vice President of Standards and Training and the Standards Managers from each of the eight Regional Entities, the RSG reports to the ERO Executive Management Group (EMG). Its purpose is to provide process and policy recommendations in the execution of the Regional Entity delegation agreements and the NERC Rules of Procedure. An overarching objective is to coordinate the development of Regional and continent-wide standards to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners and operators.

In support of this purpose and this objective, a primary initiative of the RSG is to create and sustain viable standards development coordination processes to obtain consistency and uniformity, where appropriate, across the ERO enterprise – NERC and the Regional Entities – while ensuring efficient and effective use of resources in executing the statutory responsibilities of the ERO as the reliability standards development authority. To that end, the RSG developed a combined list of all regional standards and variances in the development process in order to prioritize these projects continent-wide. This will allow NERC to coordinate the necessary resources through the development and ultimate filing of these standards and variances with applicable regulatory authorities. Project information for each of those regional standards and variances in the development process is provided in this Plan, along with a high-level overview of the project timeline.

Rapid Development and Rapid Revision Projects

NERC's Standards Committee (SC) tentatively has identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010-05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can address an interpretation request more effectively than an interpretation can alone, the team may propose to the requester that the team instead make such changes and submit them with an associated SAR. If agreed to by the requester, and following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its Rules of Procedure, NERC has committed to review each of its standards for modification once every five years. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. While not giving the appearance of being onerous, this obligation has proved challenging to meet. The work load of the ERO remains high, and maintaining focus on those projects that are most beneficial to reliability has resulted in a delay of the work required for these five-year reviews (except when already associated with a project of significant reliability value). Using current assumptions, the five-year review obligation will not be met for a number of standards. NERC and the SC are working together with the NERC Board of Trustees to evaluate options for addressing this issue.

Product Quality

As NERC's and the industry's experience with standards has evolved, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and efficiently. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress

in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global "portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity. Additionally, the plan was developed with the use of a subjective review of the implications of cost. NERC believes this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the Tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standards based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capacity of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems generally were not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Regulatory Submission - Following adoption by NERC's Board of Trustees, the standards are submitted to regulatory authorities.

- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any necessary supplemental regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). The Regional Work Plan is included as Appendix 3. A detailed summary of projects, including regional projects, is included as Appendix 4.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active Projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact all three of these areas in some way, this is intended to illustrate the primary consideration driving each project's development priority.

Existing Active Projects:

- 2006-06 Reliability Coordination.
- 2007-02 Operating Personnel Communication Protocols.
- 2007-03 Real-time Transmission Operations.
- 2007-06 Protection System Coordination.
- 2007-07 Vegetation Management. This project is expected to be completed in early 2012, but at the time of this document's finalization, it has not yet been formally completed.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response.
- 2007-17 Protection System Maintenance and Testing.
- 2008-06 Cyber Security – Order 706.
- 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-07 Generator Requirements at the Transmission Interface.
- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves.
- 2010-17 Definition of Bulk Electric System.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited

number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such as new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project is currently in informal development.
- 2009-03 Emergency Operations. This project is currently in informal development.
- 2010-01 Support Personnel Training. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project is currently in informal development. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization.
- 2012-04 Protection System Commissioning Testing. This project is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.

NERC intends to initiate development of the following projects in 2013. As noted above, these projects generally have been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is currently in informal development.
- 2008-01 Voltage and Reactive Planning and Control. This project is currently in informal development.
- 2008-12 Coordinate Interchange Standards. This project is currently in informal development.
- 2009-07 Reliability of Protection Systems. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until after the completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is currently in informal development.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project requires research prior to initiation, which is expected to be completed in the latter part of 2012.
- 2012-06 Generator Capabilities. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project requires research prior to initiation, which is expected to be completed in 2013.
- 2009-05 Resource Adequacy Assessments.
- 2010-03 Modeling Data. This project requires research prior to initiation, which is expected to be completed in the latter part of 2013.
- 2010-04 Demand Data. This project requires research prior to initiation, which is expected to be completed in 2014.
- 2010-08 Functional Glossary Model Revisions.

- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is expected to not start until completion of the previous phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator.
- 2012-05 ATC Revisions - Order 729.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority. There also is some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan that follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization

RELIABILITY SORT

Project Number and Name	Short Description	(E) **Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	(F) **Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) **Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) **Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) **Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) **Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	(K) **Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) **Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) **Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) **Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	7	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	6	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	2	29
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	3	7
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	14	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	11	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	12	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	9	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	19	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	37	41
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	4	3
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	16	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	15	25
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	8	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	20	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	22	20
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	41	43
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	10	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	17	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	18	19
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	36	40

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	40	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	42	44
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	13	31
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	38	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	39	24
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	21	33
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	32
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12

STANDARDS COMMITTEE Reliability Standard Project Prioritization

TIME SENSITIVITY SORT

Project Number and Name	Short Description	(E) Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	(F) Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	(K) Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	14	25
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	16	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	17	20
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	18	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	19
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	31
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6

Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	41
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	43
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	40
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative, BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	16	15
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	17	19
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	20
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	14	25
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
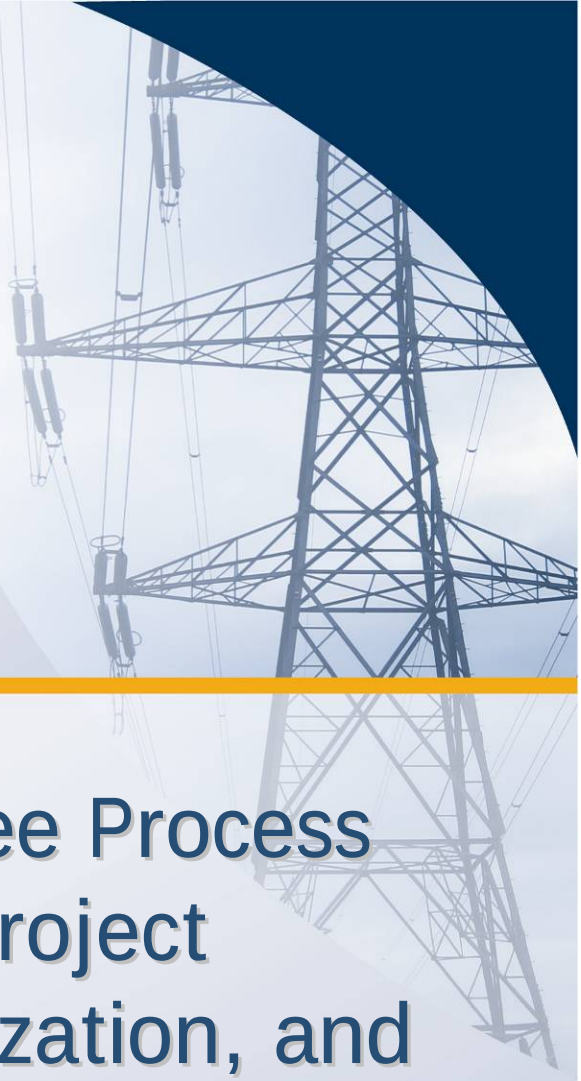
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	30
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	18	31
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	32
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	40
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	41
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	42
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	43
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

NERC

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION



Standards Committee Process for Standards Project Identification, Prioritization, and Monitoring

to ensure the reliability of the bulk power system

Revised July 2011

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

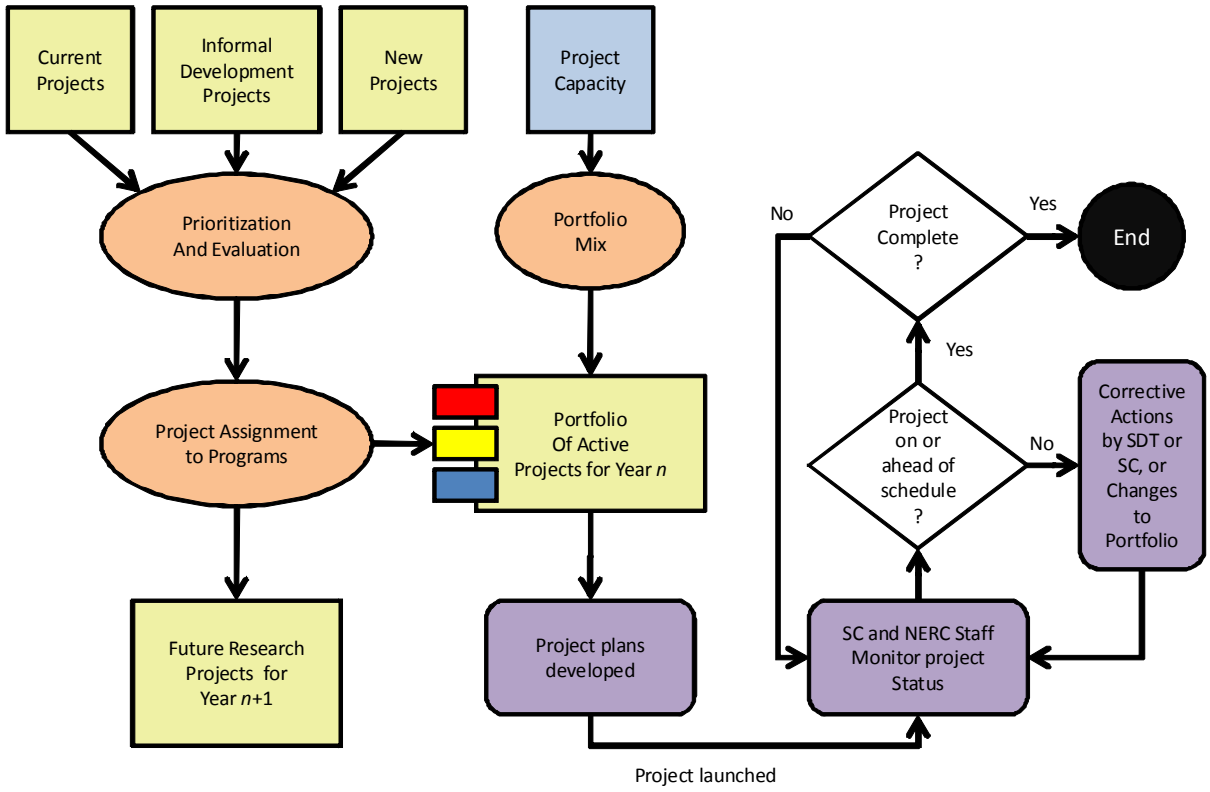
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

Attachment B: Prioritization Tool

STANDARDS COMMITTEE Reliability Standard Project Prioritization			(E) Click Here to Insert a Row	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	SUMMARY						7	25	3	3

TOTAL RANKING	Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Total Score (0-600)	TOTAL RANKING	Relaibity Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Rnaking
1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

Appendix 4 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity;
- Move the requirement (into another project or Standard, or to the certification process); or
- Eliminate the requirement (because it is redundant or does not support BPS reliability).

This project ranked #13 in Reliability Priority.

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. No estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to real-time operating states and protocols for issuing and responding to operating directives.

This project ranked #5 in Reliability Priority.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Due to focusing on other priorities, this team was temporarily put on hold. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

This project ranked #5 in Practicality Priority.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to other standards as appropriate through coordination with project 2006-06 Reliability Coordination.

This project ranked #4 in Reliability Priority.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, which were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltage transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It also will ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were posted most recently for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained within the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It also will ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

This project is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

This project ranked #3 in Reliability Priority.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

This project ranked #3 in practicality.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery will be reviewed and addressed.

This project ranked #14 in Reliability Priority.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

This project ranked #2 in Reliability Priority.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator, or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project also will consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

This project ranked #8 in Reliability Priority.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

This project ranked #1 in Practicality Priority.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

This project ranked #4 in Practicality Priority.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

This project ranked #1 in Reliability Priority.

Standards affected:

New

Status:

This project has an initial draft of a SAR that was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

This project ranked #15 in Reliability Priority.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

This project ranked #7 in Reliability Priority.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

This project ranked #11 in Reliability Priority.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

This project ranked #12 in Reliability Priority, #13 in Practicality Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARs associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

This project ranked #10 in Reliability Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings, and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

This project ranked #9 in Reliability Priority,

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

This project ranked #6 in Reliability Priority

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision that, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE DEVELOPMENT

PRC-002-FRCC-1 — FRCC Regional Disturbance Monitoring and Reporting Requirements

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Disturbance Monitoring Equipment" (revision dated June, 2006) into a new Regional Reliability Standard that complies with the requirements of NERC Reliability Standard, PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements.

Standards affected:

PRC-002-1

Status:

This Regional project is currently on "hold." Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-11 Disturbance Monitoring being classified as a "Project in Informal Development," FRCC staff will be re-evaluating the current status of the regional project to determine whether to proceed with the Regional Reliability Standard development or to revise the current FRCC Regional Criteria document "FRCC Requirements for Disturbance Monitoring Equipment."

FUTURE DEVELOPMENT

PRC-003-FRCC-1 — FRCC Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems

Summary:

FRCC plans to convert the existing handbook document "FRCC Requirements for Analysis of Protection Misoperations & Corrective Actions Reporting" (revision dated October, 2003) into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

Standards affected:

PRC-003-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC has revised Regional Criteria documents ("FRCC Requirements for Analysis of Protection Misoperations and Corrective Actions Reporting," revision dateed December 2, 2010) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

FUTURE DEVELOPMENT

PRC-006-FRCC-1 — FRCC Automatic Underfrequency Load Shedding Program

Summary:

FRCC is developing a Regional Reliability Standard to provide last resort system preservation measures by implementing an Underfrequency Load Shedding (UFLS) program. Additional requirements may be needed due to FRCC peninsular geography and limited ties to the north. Operating experience and decades of studies by the FRCC and its predecessor reliability organizations have resulted in a well-developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. The standard development project will effectively use the proven high performance characteristics of the existing FRCC UFLS program and refine its requirements and coordination procedures to comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

Standards affected:

PRC-006-1

Status:

PRC-006-FRCC-1 FRCC Automatic Underfrequency Load Shedding Program has been approved by the FRCC Registered Ballot Body and the FRCC Board of Directors. Based on concerns identified by NERC standards staff and the pending Commission (FERC) approval of the NERC Continent-Wide Reliability Standard PRC-006-1 Automatic Underfrequency Load Shedding and associated Regional variances, the Regional project has been placed on “hold.” The FRCC has since revised Regional Criteria documents (FRCC Automatic Underfrequency Load Shedding Program, revision date: April 7, 2011) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

FUTURE DEVELOPMENT

PRC-024-FRCC-1 — FRCC Regional Generator Performance During Frequency and Voltage Excursions

Summary:

FRCC is developing a standard to establish "ride through" requirements for generators in the FRCC Region with respect to temporary grid voltage or frequency deviations from their normal range. The Standard should address time duration limits for operation of generator protection for

1) frequencies outside of the 59.5 - 60.5 hertz range,
2) voltages outside of the 95% - 105% range, and
3) generator stator current overloads.

The Standard should address exemption criteria and mitigation measures available for resolving apparent conflicts between generator capabilities and the coordination requirements. Considerable knowledge of grid frequency and voltage excursions and the time limited capabilities of generators to sustain these conditions has been gained through operating experience and previous reliability studies. This standards development project should effectively use this knowledge to define coordination requirements and procedures that comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Standards affected:

PRC-024-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-09 Generator Verification being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC is actively revising Regional Criteria documents (FRCC Generator Coordination Requirements) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

2012 DEVELOPMENT

PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Program

Summary:

The purpose of this Standard is to establish the requirements for NPCC and its members to operate and maintain a coordinated Regional Underfrequency load shedding (UFLS) program. The NPCC's UFLS program will meet the requirements contained in NERC standards, and provide those entities to which it is applicable the guidance necessary to implement it. This standard will also mandate that coordination with neighboring Regional Underfrequency load shedding programs be developed when necessary. The unique character, dispersion, sensitivity and density of the NPCC regional loads emphasize the need for this Standard.

The NPCC regional UFLS standard shall apply to all applicable entities within the Region and sub-regional areas that are both synchronous and asynchronous to the Eastern Interconnection. Quebec UFLS has different parameters, and these are included in the standard and fully coordinated within the Region.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. NPCC expects to complete the drafting of this standard in 2011 and conduct a ballot of stakeholders in the first quarter of 2012. Submission to the NERC Board of Trustees and subsequent filing with FERC is expected to occur in 2012.

FUTURE DEVELOPMENT

PRC-012-NPCC-1 — Special Protection Systems

Summary:

To support and enhance bulk power system reliability, this Standard will establish the criteria for the minimum design objectives and practices for special protection systems (the purpose of which are to detect abnormal system conditions, and take corrective actions other than the isolation of faulted elements to maintain the stability and security of the bulk power system). This Standard will also establish the requirements for close coordination between system planning, design, operating, maintenance and protection functions to ensure that the impacts of special protection system operations do not result in a significant adverse impact.

The proposed Standard will describe the requirements for the design and approval of Special Protection Systems and the technical criteria required to support its implementation. The Standard will also identify the need for close coordination among various parties to ensure that the Special Protection Systems are implemented correctly, and triggers and resulting actions are made known and communicated in an on-line database.

Standards affected:

PRC-012-0

Status:

This Regional project is currently on “hold” pending the completion of the NERC Reliability Standard Development Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS, and the outcome of the work by the NERC SPCS on the definition of SPS.

2011 DEVELOPMENT

MOD-024-RFC-1 — Verification and Data Reporting of Generator Gross and Net Real Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Real Power capability to support NERC Reliability Standard MOD-024. The objective of the regional standard is to ensure accurate information on generator gross and net Real (MWs) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-024-1

Status:

This Regional standard has been approved by the Reliability*First* Board. Currently, VRFs and VSLs are in development. Reliability*First* expects to complete the drafting of the VRFs and VSLs in 2011, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2011 DEVELOPMENT

MOD-025-RFC-1 — Verification and Data Reporting of Gen Gross and Net Reactive Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Reactive Power capability to support NERC Reliability Standard MOD-025. The objective of this standard is to ensure that accurate information on generator gross and net Reactive (MVAR) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-025-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with the FERC is expected to occur in 2012.

2011 DEVELOPMENT

PRC-002-RFC-1 — Disturbance Monitoring and Reporting Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for Disturbance monitoring and reporting to support NERC Reliability Standard PRC-002.

Standards affected:

PRC-002-1

Status:

Reliability*First* is currently working on the technical justification for the locational requirements for DME equipment. This Regional standard has been approved by the Reliability*First* Board. Reliability*First* expects submission of this standard to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2012 DEVELOPMENT

PRC-006-RFC-1 — Automatic Under Frequency Load Shedding Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency and assist in the recovery of frequency following underfrequency events, providing last resort system preservation measures. The standard goes beyond the NERC PRC-006-1 standard and prescribes with more certainty aspects that the Planning Coordinator's UFLS program must contain, further details on certain procedural matters with respect to how islands are addressed, and assessment of UFLS program implementation as well as program design. This standard also attempts further consolidating requirements of the Reliability*First* legacy underfrequency load shedding programs, permitting retirement of legacy documents to ensure appropriate coordination among the Reliability*First* legacy regional UFLS programs.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur later in 2012.

2012 DEVELOPMENT

PRC-012-RFC-1 — Special Protection System Requirements

Summary:

To purpose of the standard is to establish Reliability*First* requirements for the review, development and application of Special Protection Systems (SPS).

Standards affected:

PRC-012-0

Status:

This Regional project is currently in the initial drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur early in 2013.

2011 DEVELOPMENT

PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

Summary:

The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

In 2008, SERC commenced work on PRC-006-SERC-1. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the continent-wide UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. This regional standard PRC-006-SERC-1 adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Standards affected:

PRC-006-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011, and subsequent filing with FERC is expected to occur in 2012.

2012 DEVELOPMENT

PRC-006-SPP-1 — Under Frequency Load Shedding

Summary:

PRC-006 (Development and Documentation of Regional UFLS programs) has been identified by NERC as one of the Regional "Fill-in-the Blank" Standards. At a minimum, the requirements developed in this standard need to meet the requirements for the Regional Program as identified in NERC's PRC-006-0. Operating experience and regional studies have resulted in a well developed UFLS program that is very resilient to frequency excursions resulting from severe and extreme contingencies. This standards development effort intends to effectively use the proven high performance characteristics of the existing SPP UFLS program and refine its requirements and coordination procedures through an open process as described in the SPP Standard Development Process Manual.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. SPP expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

Summary:

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with certain existing non-routine ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Standards affected:

IRO-006-5 (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of IRO-006-5.)

Status:

This Regional Standard was approved by the Texas RE Board of Directors on June 28, 2011, and it will be submitted to the NERC Board of Trustees in November 2011. Subsequent filing with FERC is expected to occur in 2012.

2011 DEVELOPMENT

BAL-001-TRE-1 — Primary Frequency Response in the ERCOT Region

Summary:

This Regional Standard is intended to support reliability by ensuring adequate primary frequency response performance in the ERCOT Interconnection. The standard addresses frequency response at the Interconnection level, as well as by individual generating units and facilities. Specific maximum governor droop and deadband settings are provided, along with primary frequency response performance standards (initial and sustained) that allow actual unit-specific performance to be measured.

In 2002, NERC approved a regional difference for ERCOT that made it exempt from Requirement R2 in BAL-001-0 (CPS2), because of ERCOT's lack of synchronous connection to other control areas and the nature of the ERCOT energy market. FERC approved the ERCOT regional difference, finding that ERCOT's practice of (a) determining the minimum frequency response needed for reliability, and (b) requiring generators to have specific governor droop, to be a more stringent practice than Requirement R2 in BAL-001-0. FERC directed NERC to file a modification of the ERCOT regional difference to include the requirements concerning frequency response contained in section 5 of the ERCOT protocols. This Regional Standard is responsive to that directive.

Standards affected:

BAL-001-0.1a (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of the continent-wide standard.)

Status:

This project has been approved by the Texas RE Board of Directors, with expected submission to the NERC Board of Trustees in 2011 and subsequent filing with FERC to occur in 2012.

2012 DEVELOPMENT

BAL-002-WECC-1 — Contingency Reserves

Summary:

On Oct. 21, 2010, FERC found that BAL-002-WECC-1 did not meet the statutory criteria for approval and remanded the regional standard to NERC/WECC for further modification (RM09-15-000; Order 740). FERC held that BAL-002-WECC-1's less stringent requirements had not been supported by the technical data provided.

On remand, the Commission instructed WECC to modify the regional reliability standard to include a number of specific items contained in Order 740. This Request is submitted with the specific and narrow purpose of addressing only those issues mandated for modification in the October 2010 Oder 740.

Standards affected:

BAL-002-WECC-1

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2012 DEVELOPMENT

BAL-004-WECC-1 — Automatic Time Error Correction

Summary:

In the order approving BAL-004-WECC-1 the FERC directed WECC to make several clarifying modifications to the standard. FERC directed WECC to use the FERC-approved Process for Developing and Approving WECC standards to make these clarifying modifications

In addition, the WECC staff has identified the opportunity to make additional modifications to the existing standard to clarify the intent without changing the requirements.

There is also confusion regarding the R3 requirement that the ACE used for NERC reports shall be the same ACE as the AGC operating mode in use. This seems to conflict with the NERC response to NOPR comments that entities may use ATEC ACE for control but should use Raw ACE for reporting. WECC is developing a proposed regional variance to BAL-001-0.1a to address this apparent conflict.

Standards affected:

BAL-004-WECC-1
BAL-001-0.1a

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

VAR-001-WECC-1 — Voltage and Reactive Control

Summary:

The current draft has been converted from a Standard into a Regional Variance to the NERC VAR-001-2 Standard. The format incorporates the NERC Standard into the document with minor additions to address the scope of the variance. The regional variance specifics are included as Section E of the proposed document (see hyperlink above), and in this case, are intended to replace NERC VAR-001-2 requirements R3 and R4 as noted at the beginning of Section E.

The purpose of this regional variance to a NERC Reliability Standard is to ensure that voltage levels are within limits in real time to protect equipment and the reliable operation of the Western Interconnection. The "Rules of Procedure of the North American Electric Reliability Corporation" (Appendix 3A, page 31) permits the development of a regional variance to a NERC reliability standard on an Interconnection-wide basis when the Regional Reliability Organization has valid justification and when the variance is not inconsistent with or less stringent than the NERC Reliability Standard. The variance is an alternative method for obtaining the same reliability objective as the continent standard and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the electric reliability organization governmental authority, shall be enforced within the applicable Regional Entity(ies) pursuant to delegated authority.

Standards affected:

VAR-001-2

Status:

This Regional project has been approved by the WECC Board of Directors. WECC expects to submit the draft for the mandatory NERC 45-day comment period in the near future, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

Table of Contents

Objective *3*

Changes in this Revision *3*

Background *4*

1. Identifying the List of Standards Projects 4
2. Identifying NERC Project Capacity 4
3. Identifying the Project Portfolio Mix 5
4. Evaluating Each Project 5
5. Determining Cost Considerations 6
6. Determining Projects for Each Program 6
7. Adding New Projects Intra-year and Adjusting Project Priority 6

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. Developing Projects Schedules

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

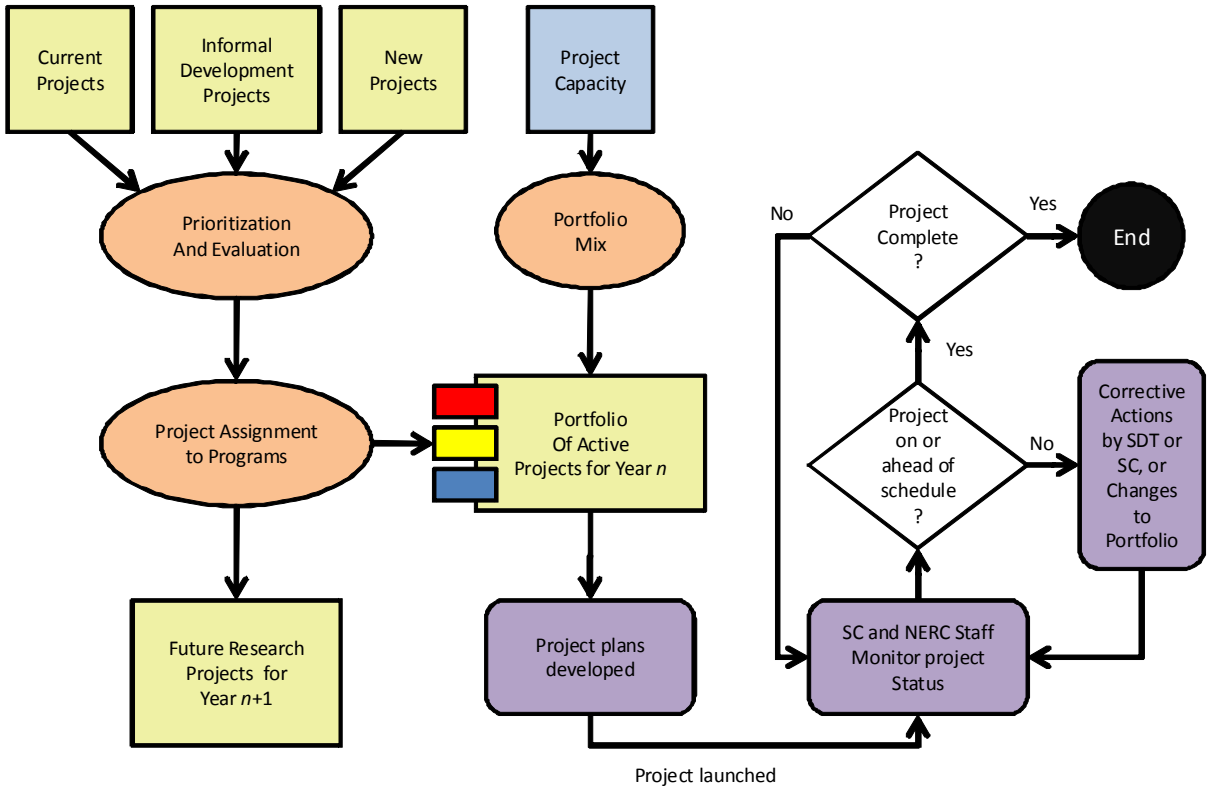
9. Monitoring Projects

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and he implementation of projects in general.
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards

<to be added>

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of information to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come
- Status updates regarding standards and related projects currently in development
- A forecast of Standards Development work scheduled for the next three years
- An overview of the process used to prioritize work and assign resources to Standards development projects

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process and Standards Development teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2007-07 Vegetation Management [**projection as of September 2011**]

- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information.

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development
- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

[1] The data included in this paragraph does not include Regional Reliability Standards.

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year consistent with in accordance with Section 321.6 of the NERC Rules of Procedure (“Rule 321”) that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Rapid Development and Rapid Revision Projects

NERC’s Standards Committee (SC) has tentatively identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010.05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can more effectively address an interpretation request than an interpretation can alone, the team may elect to make such changes and submit them with an associated SAR. Following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its ANSI accreditation, NERC has committed to review each of its standards for modification once every five years. While not giving the appearance of being onerous, this obligation has proven challenging to meet. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. However, the work load of the ERO remains high, and prioritization has resulted in a deferral f the work required for these five-year reviews except when already associated with a project of reliability value.

Product Quality

As NERC's and the industry's experience with standards has continued, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and regularly. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global

"portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity, all while making sure to consider the implications of cost. NERC believes this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standard based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capability of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research, and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems were generally not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any associated regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). A detailed summary of projects is included as Appendix 3.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact al three of these areas in some way, this is intended to illustrate the primary consideration driving its consideration.

Existing Active Projects:

- 2006-06 Reliability Coordination. This project ranked #13 in Reliability Priority.
- 2007-02 Operating Personnel Communication Protocols. This project ranked #5 in Reliability Priority.
- 2007-03 Real-time Transmission Operations. This project ranked #4 in Practicality Priority.
- 2007-06 Protection System Coordination. This project ranked #4 in Reliability Priority.
- 2007-07 Vegetation Management.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response. This project ranked #10 in Reliability Priority, and was tied for #2 in Time Sensitivity Priority.
- 2007-17 Protection System Maintenance and Testing. This project ranked #3 in Reliability Priority.
- 2008-06 Cyber Security – Order 706. This project ranked #1 in Reliability Priority.
- 2009-01 Disturbance and Sabotage Reporting. This project ranked #7 in Reliability Priority.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project ranked #8 in Reliability Priority.
- 2010-07 Generator Requirements at the Transmission Interface. This project ranked #13 in Practicality Priority, and was tied for #2 in Time Sensitivity Priority.
- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves. This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.

- 2010-17 Definition of Bulk Electric System. This project ranked #10 in Reliability Priority, and was tied for #2 in Time Sensitivity Priority.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding. This project ranked #14 in Reliability Priority, and is expected to be started upon the completion of 2006-06 Reliability Coordination.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project ranked #1 in Practicality Priority, and is expected to be started upon the completion of 2007-03 Real-time Transmission Operations.
- 2009-03 Emergency Operations. This project ranked #3 in Practicality Priority, and is expected to be started upon the completion of 2008-06 Cyber Security – Order 706.
- 2010-01 Support Personnel Training. This project ranked #15 in Reliability Priority, and is expected to be started upon the completion of 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project ranked #11 in Reliability Priority, and is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization. This project is expected to be started upon the completion of 2007-12 Frequency Response.
- 2012-04 Protection System Commissioning Testing. This project ranked #9 in Reliability Priority, and is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing

NERC intends to initiate development of the following projects in 2013. As noted above, these projects have generally been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is expected to start upon completion of 2010-17 Definition of Bulk Electric System.
- 2008-01 Voltage and Reactive Panning and Control. This project ranked #6 in practicality, and is expected to start upon completion of 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves
- 2008-12 Coordinate Interchange Standards. This project is expected to start upon completion of 2010-07 Generator Requirements at the Transmission Interface.
- 2009-07 Reliability of Protection Systems. This project ranked #2 in Reliability Priority, and is expected to start upon completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is expected to start upon completion of 2009-02 Real-time Monitoring and Analysis Capabilities.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project is expected to start upon completion of 2007-02 Operating Personnel Communication Protocols.
- 2012-06 Generator Capabilities. This project ranked #6 in Reliability Priority, and is expected to start upon completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project is expected to start upon completion of 2009-03 Emergency Operations.

- 2009-05 Resource Adequacy Assessments. This project is expected to start upon completion of 2012-04 Protection System Commissioning Testing.
- 2010-03 Modeling Data. This project is expected to start upon completion of 2008-01 Voltage and Reactive Panning and Control.
- 2010-04 Demand Data. This project is expected to start upon completion of 2010-05.2 Phase 2 of Protection Systems: SPS and RAS.
- 2010-08 Functional Glossary Model Revisions. This project is expected to start upon completion of 2010-01 Support Personnel Training.
- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. This project is expected to start upon completion of the second phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator. This project is expected to start upon completion of 2012-04 Protection System Commissioning Testing.
- 2012-05 ATC Revisions - Order 729. This project is expected to start upon completion of 2008-12 Coordinate Interchange Standards.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. There is also some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review

- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity, and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan which follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			**220.8**	**52**	**22**	**91.6**	1	17	29	5
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	87.5	66.7	41.7	0	12.5	25			**220.8**	**66**	**0**	**37.5**	2	3	33	17
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			**200**	**60**	**94**	**70.8**	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			**195.8**	**61**	**94**	**54.2**	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			**195.8**	**74**	**94**	**4.2**	5	1	4	27
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			**191.7**	**60**	**0**	**0**	6	8	34	30
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	58.3	16.7	16.7	5	50	25			**175**	**73**	**94**	**75**	7	2	5	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			**175**	**64**	**94**	**75**	8	4	6	8
Project 2012-04 Protection System Commissioning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	50	70.8	41.7	50	0	0	0			**170.8**	**57**	**0**	**0**	9	9	35	31
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2			**162.5**	**52**	**94**	**66.7**	10	18	7	11
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	45.8	62.5	40	45	5	33.3	12.5			**158.3**	**56**	**94**	**45.8**	11	10	8	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			**150**	**54**	**94**	**58.3**	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			**150**	**56**	**94**	**29.2**	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			**150**	**42**	**94**	**0**	14	24	11	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			**145.8**	**42**	**0**	**0**	15	25	36	33
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	75	54.2	30	5	33.3	8.3	50	Addressing Reactive Requirements key to reliability of system. Length of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommittee.	**141.7**	**64**	**94**	**91.6**	16	5	12	6
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be significant cost savings to the industry if the revisions to BAL-001 were to be realized.	**137.5**	**56**	**100**	**94.1**	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	**133.4**	**33**	**42**	**67.5**	18	35	27	10
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	**129.2**	**51**	**94**	**63.4**	19	20	13	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			**129.2**	**52**	**94**	**10**	20	19	14	24
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			**129.2**	**42**	**82**	**0**	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the development of the tool required.	**125**	**38**	**57**	**97.5**	22	31	25	1
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	**112.5**	**40**	**94**	**50**	23	29	15	15
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a singe standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	37.5	70.8	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	**108.3**	**55**	**94**	**91.7**	24	13	16	3
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			**95.8**	**36**	**0**	**0**	25	34	37	35
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	70	75	66.7	5	0	0	25	High Regional Priority	**95**	**38**	**94**	**25**	26	32	17	20
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	45.8	33.3	33.3	5	0	0			**87.5**	**55**	**94**	**0**	27	14	18	36
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			**70.9**	**47**	**94**	**91.7**	28	21	19	4
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			**70.8**	**47**	**94**	**26.7**	29	22	20	19
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			**66.7**	**46**	**0**	**0**	30	23	38	37

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			**58.3**	**38**	**0**	**0**	31	33	39	38
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			**54.1**	**20**	**0**	**0**	32	37	40	39
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	50	18.8	18.8	5	0	0			**50**	**53**	**94**	**0**	33	16	21	40
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0			**33.3**	**41**	**0**	**4.2**	34	27	41	28
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	10	Foundational piece of ERO	**29.2**	**41**	**0**	**10**	35	28	42	25
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			**25**	**40**	**94**	**0**	36	30	22	41
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			**25**	**19**	**0**	**0**	37	38	43	42
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			**25**	**13**	**0**	**0**	38	39	44	43
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			**4.2**	**26**	**94**	**25**	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			**0**	**0**	**57**	**0**	40	40	26	44
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			**0**	**0**	**17**	**25**	41	43	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			**0**	**0**	**12**	**25**	42	44	32	23
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			**0**	**0**	**37**	**0**	43	41	28	45
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			**0**	**0**	**20**	**0**	44	42	30	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			**0**	**0**	**0**	**8.3**	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0			**0**	**0**	**0**	**4.2**	46	46	46	29
2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											**0**	**0**	**0**	**0**	47	47	47	47
2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											**0**	**0**	**0**	**0**	48	48	48	48

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be significant cost savings to the industry if the revisions to BAL-001 were to be realized.	**137.5**	**56**	**100**	**94.1**	17	12	1	2
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			**195.8**	**74**	**94**	**4.2**	5	1	2	27
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	58.3	16.7	16.7	5	50	25			**175**	**73**	**94**	**75**	7	2	3	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			**175**	**64**	**94**	**75**	8	4	4	8
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	75	54.2	30	5	33.3	8.3	50	Addressing Reactive Requirements key to reliability of system. Length of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommittee.	**141.7**	**64**	**94**	**91.6**	16	5	5	6
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			**195.8**	**61**	**94**	**54.2**	4	6	6	14
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			**200**	**60**	**94**	**70.8**	3	7	7	9
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	45.8	62.5	40	45	5	33.3	12.5			**158.3**	**56**	**94**	**45.8**	11	10	8	16
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			**150**	**56**	**94**	**29.2**	13	11	9	18
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	37.5	70.8	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	**108.3**	**55**	**94**	**91.7**	24	13	10	3
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	45.8	33.3	33.3	5	0	0			**87.5**	**55**	**94**	**0**	27	14	11	36
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			**150**	**54**	**94**	**58.3**	12	15	12	13
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	50	18.8	18.8	5	0	0			**50**	**53**	**94**	**0**	33	16	13	40

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	**TIME SENSITIVITY SORT**							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2			**162.5**	**52**	**94**	**66.7**	10	18	14	11
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			**129.2**	**52**	**94**	**10**	20	19	15	24
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	**129.2**	**51**	**94**	**63.4**	19	20	16	12
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			**70.9**	**47**	**94**	**91.7**	28	21	17	4
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			**70.8**	**47**	**94**	**26.7**	29	22	18	19
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			**150**	**42**	**94**	**0**	14	24	19	32
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	**112.5**	**40**	**94**	**50**	23	29	20	15
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			**25**	**40**	**94**	**0**	36	30	21	41
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	70	75	66.7	5	0	0	25	High Regional Priority	**95**	**38**	**94**	**25**	26	32	22	20
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			**4.2**	**26**	**94**	**25**	39	36	23	21
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			**129.2**	**42**	**82**	**0**	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the development of the tool required.	**125**	**38**	**57**	**97.5**	22	31	25	1
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			**0**	**0**	**57**	**0**	40	40	26	44
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	**133.4**	**33**	**42**	**67.5**	18	35	27	10
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			**0**	**0**	**37**	**0**	43	43	28	45
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			**220.8**	**52**	**22**	**91.6**	1	17	29	5
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			**0**	**0**	**20**	**0**	44	44	30	46
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			**0**	**0**	**17**	**25**	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			**0**	**0**	**12**	**25**	42	42	32	23

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	87.5	66.7	41.7	0	12.5	25			**220.8**	**66**	**0**	**37.5**	2	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			**191.7**	**60**	**0**	**0**	6	8	34	30
Project 2012-04 Protection System Commissioning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	50	70.8	41.7	50	0	0	0			**170.8**	**57**	**0**	**0**	9	9	35	31
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			**66.7**	**46**	**0**	**0**	30	23	36	37
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			**145.8**	**42**	**0**	**0**	15	25	37	33
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0			**33.3**	**41**	**0**	**4.2**	34	27	38	28
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	10	Foundational piece of ERO	**29.2**	**41**	**0**	**10**	35	28	39	25
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			**58.3**	**38**	**0**	**0**	31	33	40	38
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			**95.8**	**36**	**0**	**0**	25	34	41	35
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			**54.1**	**20**	**0**	**0**	32	37	42	39
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			**25**	**19**	**0**	**0**	37	38	43	42
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			**25**	**13**	**0**	**0**	38	39	44	43
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			**0**	**0**	**0**	**8.3**	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0			**0**	**0**	**0**	**4.2**	46	46	46	29
2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											**0**	**0**	**0**	**0**	47	47	47	47
2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											**0**	**0**	**0**	**0**	48	48	48	48

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	**PRACTICALITY SORT**							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the development of the tool required.	**125**	**38**	**57**	**97.5**	22	31	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be significant cost savings to the industry if the revisions to BAL-001 were to be realized.	**137.5**	**56**	**100**	**94.1**	17	12	1	2
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	37.5	70.8	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	**108.3**	**55**	**94**	**91.7**	24	13	10	3
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			**70.9**	**47**	**94**	**91.7**	28	21	17	4
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	75	54.2	30	5	33.3	8.3	50	Addressing Reactive Requirements key to reliability of system. Length of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommittee.	**141.7**	**64**	**94**	**91.6**	16	5	5	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			**220.8**	**52**	**22**	**91.6**	1	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	58.3	16.7	16.7	5	50	25			**175**	**73**	**94**	**75**	7	2	3	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			**175**	**64**	**94**	**75**	8	4	4	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			**200**	**60**	**94**	**70.8**	3	7	7	9
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	**133.4**	**33**	**42**	**67.5**	18	35	27	10
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2			**162.5**	**52**	**94**	**66.7**	10	18	14	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	**129.2**	**51**	**94**	**63.4**	19	20	16	12
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			**150**	**54**	**94**	**58.3**	12	15	12	13

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			**195.8**	**61**	**94**	**54.2**	4	6	6	14
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	**112.5**	**40**	**94**	**50**	23	29	20	15
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	45.8	62.5	40	45	5	33.3	12.5			**158.3**	**56**	**94**	**45.8**	11	10	8	16
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	87.5	66.7	41.7	0	12.5	25			**220.8**	**66**	**0**	**37.5**	2	3	33	17
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			**150**	**56**	**94**	**29.2**	13	11	9	18
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			**70.8**	**47**	**94**	**26.7**	29	22	18	19
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	70	75	66.7	5	0	0	25	High Regional Priority	**95**	**38**	**94**	**25**	26	32	22	20
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			**4.2**	**26**	**94**	**25**	39	36	23	21
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			**0**	**0**	**17**	**25**	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			**0**	**0**	**12**	**25**	42	42	32	23
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			**129.2**	**52**	**94**	**10**	20	19	15	24
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	10	Foundational piece of ERO	**29.2**	**41**	**0**	**10**	35	28	39	25
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			**0**	**0**	**0**	**8.3**	45	45	45	26
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			**195.8**	**74**	**94**	**4.2**	5	1	2	27
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0			**33.3**	**41**	**0**	**4.2**	34	27	38	28
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0			**0**	**0**	**0**	**4.2**	46	46	46	29
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	45.8	33.3	33.3	5	0	0			**87.5**	**55**	**94**	**0**	27	14	11	30

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	**PRACTICALITY SORT**							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	50	18.8	18.8	5	0	0			**50**	**53**	**94**	**0**	33	16	13	31
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			**150**	**42**	**94**	**0**	14	24	19	32
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			**25**	**40**	**94**	**0**	36	30	21	33
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			**129.2**	**42**	**82**	**0**	21	26	24	34
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			**0**	**0**	**57**	**0**	40	40	26	35
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			**0**	**0**	**37**	**0**	43	43	28	36
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			**0**	**0**	**20**	**0**	44	44	30	37
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			**191.7**	**60**	**0**	**0**	6	8	34	38
Project 2012-04 Protection System Commissioning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	50	70.8	41.7	50	0	0	0			**170.8**	**57**	**0**	**0**	9	9	35	39
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			**66.7**	**46**	**0**	**0**	30	23	36	40
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			**145.8**	**42**	**0**	**0**	15	25	37	41
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			**58.3**	**38**	**0**	**0**	31	33	40	42
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			**95.8**	**36**	**0**	**0**	25	34	41	43
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			**54.1**	**20**	**0**	**0**	32	37	42	44
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			**25**	**19**	**0**	**0**	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			**25**	**13**	**0**	**0**	38	39	44	46
2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											**0**	**0**	**0**	**0**	47	47	47	47
2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											**0**	**0**	**0**	**0**	48	48	48	48

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

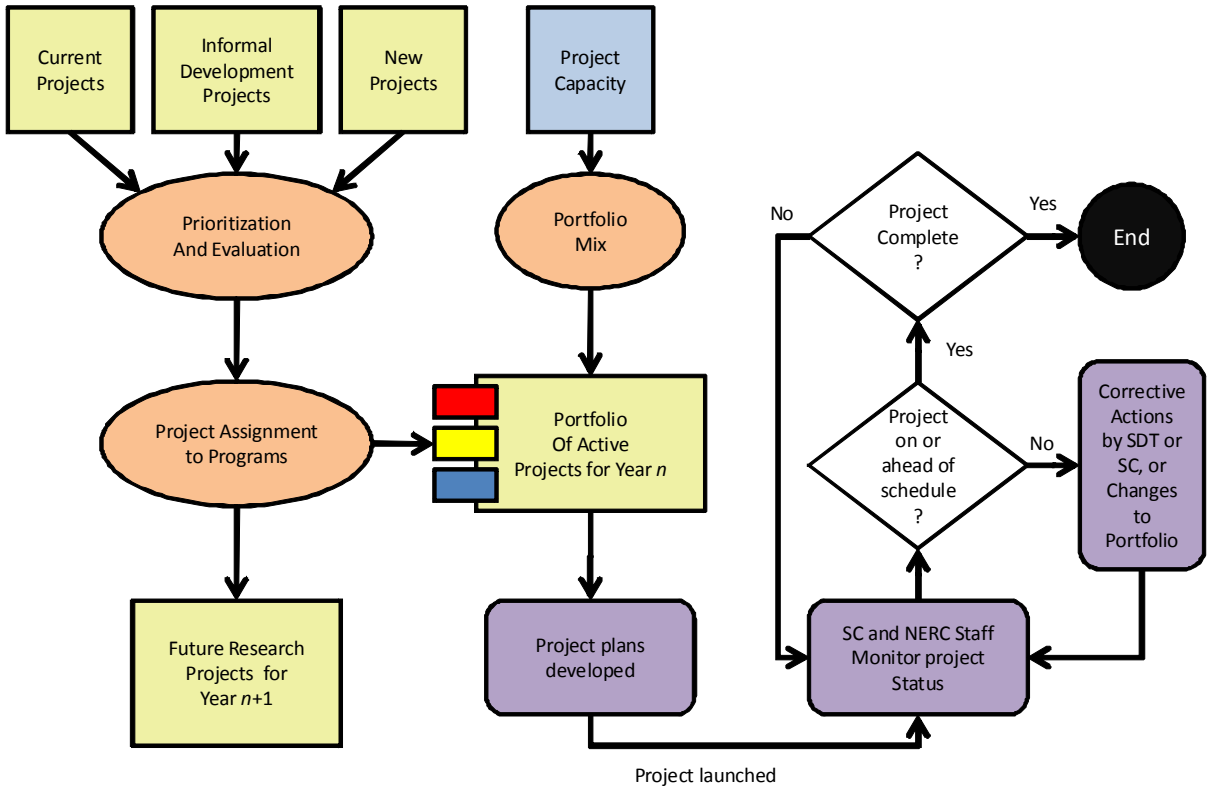
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

Appendix 3 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity
- Move the requirement (into another project or Standard, or to the certification process)
- Eliminate the requirement (because it is redundant or doesn't support BPS reliability).

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. At this time, no estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to realtime operating states and protocols for issuing and responding to operating directives.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Subsequently, this team was put on hold for an extended period of time. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in the several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as and other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to appropriate other standards through coordination with project 2006-06 Reliability Coordination.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, wchih were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltae transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It will also ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were most recently posted for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained with the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It will also ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also will address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery' will be reviewed and addressed.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project will also consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

Standards affected:

New

Status:

This project has an initial draft of a SAR which was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARS associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision which, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments

Reliability Standards Development Plan (Draft) 2012-2014

We would like to thank all commenters who submitted comments on the process of developing the 2012-2014 Reliability Standard Development Plan (the Plan). The Plan will be finalized over the coming months, and will provide status updates for projects in development, identify the next projects scheduled for initiation, designate projects for further research, and catalog all proposed projects for future development.

The 2012-2014 Reliability Standard Development Plan was posted for a 15-day public comment period from September 12, 2011 through September 26, 2011. Stakeholders were asked to provide feedback on the 2012-2014 Reliability Standard Development Plan through a special electronic comment form. There were 15 sets of comments received, including comments from approximately 63 different people from approximately 38 companies representing all 10 of the 10 Industry Segments as shown in the table on the following pages.

In general, commenters did not provide specific suggestions to modify the plan, instead usually indicating that a specific project should be "higher" or "lower" in priority. Because of the nature of the prioritization, those suggestions feel into one of three categories: those based the "improves one or more existing standards" score, those based on the "Addresses a reliability risk not covered by an existing standard" score, and those based on the "other practicality concern" score.

Absent specific suggestions, and recognizing that in all cases, the suggestions came from a small minority of the respondents, a simple scoring was applied such that each comment was given equal weight. Suggestions to rank a project "higher" were treated as suggestions to score the value in question at least one full "point range" higher. A similar approach was used for projects that were suggested for lower rankings. All other commenter's were assumed to have supported the existing scoring values.

For example:

- Assume the Prioritization showed project X as having a "improves one or more existing standards" score of 72.1.
- One entity submits a comment that X should be ranked higher.
- One entity submits a comment that X should be ranked lower.
- The other thirteen entities do not comment on X.
- The "higher" comment would be treated as a score of 100. (Scoring as 75 would not be a full point range higher, as the acceptable point ranges in the prioritization sheet are 0, 25, 50, 75, and 100. Choosing 75 would only be a fractional step higher).

- The “lower” comment would be treated as a score of 25. (Scoring as 50 would not be a full point range higher, as the acceptable point ranges in the prioritization sheet are 0, 25, 50, 75, and 100. Choosing 50 would only be a fractional step higher).
- The remaining thirteen comments would be treated as silent support for the current score of 58.2.
- (13 X 72.1) + (25) + (100) = 1062.3
- 1062.3 ÷ 15 = 70.8.

Based on this approach, the following project scores were modified:

Project 2007-11
Column G - One comment to raise (treated as 100) changed the G score from 70 to 72.
Column M - One comment to raise (treated as 50) changed the M score from 25 to 27

Project 2008-01
Column G - Two comments to raise (treated as 100) changed the G score from 75 to 78.

Project 2009-01
Column G - One comment to lower (treated as 25) changed the G score from 58.3 to 56.1.
Column M - One comment to lower (treated as 0) no change to the M score (0)

Project 2009-03
Column G - One comment to raise (treated as 100) changed the G score from 70.8 to 72.7.

Project 2009-07
Column G - One comment to raise (treated as 100) changed the G score from 87.5 to 88.3

Project 2010-03
Column G - One comment to raise (treated as 75) changed the G score from 45.8 to 47.7

Project 2010-04
Column G - One comment to raise (treated as 100) changed the G score to from 50 to 51.7

Project 2010-05.2
Column F - One comment to lower (treated as 0), changed the F score from 45.8 to 42.7
Column G - One comment to lower (treated as 25) changed the G score to from 62.5 to 60

Project 2010-08
Column M - Two comments to rasie (treated as 25) changed the M score from 10 to 12

Project 2010-16
Column M - Two comments to raise (treated as 25) changed the M score from 0 to 3.3

Project 2010-17
Column M - One comment to (treated as 25) changed the M score from 0 to 1.7

Project 2012-04
Column F - One comment to lower (treated as 25) changed the F score from 50 to 48.3
Column G - One comment to lower (treated as 25) changed the G score from 70.8 to 67.7

Project 2012-08
Column M - Two comments to raise (treated as 25) change the M score from 0 to 3.3

Additionally, there were some specific changes suggested in response to question 3. The same general procedure was used, as summarized below:

There were 15 total respondents. Six abstained from answering the question, leaving 9 entities indicating they had some sort of opinion. Absent a specific proposal to change a score, it was assumed the entity did not object to the specific score in question.

Project 2008-01
Column K - One suggestion to set the score to 50 changed the K score from 33.3 to 35.2

Project 2009-01
Column L - One suggestion to set the score to 50 changed the L score from 25 to 27.8

Project 2009-03
Column F - One suggestion to set the score to 50 and one suggestion to set the score to 100 changed the F score from 37.5 to 45.8

Project 2009-07
Column L - One suggestion to set the score to 0 and one suggestion to set the score to 50 (the entity actually requested 33, but 50 was the next valid score) resulted in no change to the L score

Project 2010-17
Column L - One suggestion to set the score to 0 and one suggestion to set the score to 50 changed the L score from 29.2 to 28.3

These changes resulted in slight reordering of project within the prioritization matrix. However, upon review, the small number of changes only impacted the Work Plan in later years, and only by one or two months. As such, no changes were made to the Work Plan, as such changes will be captured in the development of the 2013-2015 Plan.

In addition to the above, the Plan was updated to correct minor typographical errors and formatting concerns. Finally, the a section discussing Regional Standards was added to chapter 4, the Regional Work Plan was added as a new Appendix, and descriptions of the regional projects were added to the plan.

All documents developed as part of this Plan's creation can be viewed at the NERC's Reliability Standards Development Plan web page:

http://www.nerc.com/page.php?cid=2|247|290

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net.

1. Is there anything in the prioritization that is significantly below where it should be ranked? If yes, please explain.

Summary Consideration: In general, entities were supportive of the prioritization, but several had specific changes. These changes were incorporated into score changes as summarized in the "general summary" above. Some typographical errors were noted and corrected.

Organization	Yes or No	Question 1 Comment
NAESB Wholesale Electric Quadrant Standards Review Subcommittee		
Bonneville Power Administration		BPA thanks you for the opportunity to comment on 2012-2014 Reliability Standards Development Plan. BPA has no comments or concerns at this time.
Response: Thank you for your comment.		
Northeast Power Coordinating Council		
Imperial Irrigation District (IID)		
Electric Market Policy		Dominion appreciates the time NERC has devoated to capturing potential standard topics needing attention or revision. This standardization priority tool, in which input was taken from the industry members toward the ranking of these projects provides a good basis to collect opinion and creates some structure for comparision of one standard topic companied to another. It is obviously there was a great deal of work that went into calculating the reliability, time sensitivity, and practicticality priority that each of these projects have in the eyes of some and it is well presented

Organization	Yes or No	Question 1 Comment
		throughout the document. Below are some minor considerations: 1. Chapter 3, Page 7; last sentence. Add 'o'; in a deferral 'of' the work. 2. Formatting needs to be corrected for the page numbers at the bottom of each page.
Response: Thank you for your comment. We have corrected the typographical error, but it is unclear what is incorrect regarding the page number formatting.		
Florida Municipal Power Agency		It seems to FMPA that Project 2010-05.2 on SPS / RAS and Project 2012-04 on Protection System Commissioning Testing are ranked too high and can be delayed another year. It seems that the new PRC-005-2 reduces the importance of commissioning testing. FMPA believes the existing standards on SPSs are adequate and cannot find documentation on the reliability gap perceived. FMPA believes that Project 2009-07 is higher priority than both of these projects, both in light of the ambiguity of what "delayed clearing" means in the TPL standard and due to the recent FERC Order 754 on the TPL-002 interpretation and FERC's statement that: "We agree with the Trade Associations that there may be a system protection issue that merits further exploration by technical experts ... the Commission believes that there is an issue concerning the study of the non-operation of non-redundant primary protection systems; e.g., the study of a single point of failure on protection systems ... we direct Commission staff to meet with NERC and its appropriate subject matter experts to explore this reliability concern, including where it can best be addressed, and identify any additional actions necessary to address the matter." (para 19-20). Presumably, it is this project 2009-07 that would explore these "system protection issues" related to "single point of failure".

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. The SCD has revised the scores on these projects to account for your input.		
NERC	No	
Ingleside Cogeneration LP	Yes	It is clear that the lack of clarity in the Reliability Standards have led to inconsistencies in the compliance process. The gap is being addressed through Compliance Application Notices (CANs), but bypasses the strict review which is fundamental to the Standards Development process. Similarly, gray areas in the Functional Model have lead to forced registrations in certain Regions. These arbitrary actions can easily lead to a loss of confidence by the industry in the fairness and usefulness of regulatory oversight. As a result, Ingleside Cogeneration, LP believes that there are three related projects that should be rated far higher in the NERC priority scheme. These are Project 2010-08 "Functional Model Glossary Revisions", Project 2010-16 "Definition of System Operator", and Project 2012-08 "Glossary Updates."
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		
Consolidated Edison Co. of NY, Inc.	Yes	Project 2010-17 has now identified a Phase 2 to this project. This continuation of that effort is not mentioned, listed separately or prioritized. It should receive high priority in order to assure that several key issues identified for Phase 2 and impacting the Bulk Electric System Definition are resolved promptly, e.g., genertor threshold, point of demarcation, contiguous, etc.
Response: The Standards Committee has elected to not treat this as a separate project – rather, this second phase is being treated as a continuation of the existing project and the team's work. As such, the work plan reflects this project continuing through 2013.		

Organization	Yes or No	Question 1 Comment
ITC Holdings	Yes	Project 2007-11 Disturbance Monitoring priority should be at the point where it is in development mode and not held off for a minimum of 1½ additional years.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		
Clallam County PUD No.1	No	Process seems to have assigned reasonable priorities.
Response: Thank you for your comment.		
PSEG Services Corp	Yes	2010-03 Modeling Data should be higher. Modeling impacts standards such as TPL. It would also impact BES Definition exclusions and inclusions, which reference the TPL standards. Also, 2010-04 Demand Data is essential to 2010-03. Modeling data includes load data. These projects should be joined. 2008-01 is critical since its implementing a 2003 Blackout report, and 2009-03 is likewise critical regarding disturbance and sabotage reporting.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input. **At this time, the SC intends to keep 2010-03 and 2010-04 as separate projects, However, it will reconsidered that decision as these projects are analyzed further and move closer to development.**		
Progress Energy		
Wisconsin Electric Power Company	Yes	Since the glossary is the backbone of all the standards, it should be updated before 2015.
Response: Thank you for your comments. The SC has assumed that you are referring to the following projects: 2010-08, 2010-16, 2010-17, and 2012-08. The SC has revised the scores on these projects to account for your input.		

Organization	Yes or No	Question 1 Comment
Independent Electricity System Operator	No	

2. Is there anything in the Plan we deferred that can't wait? If yes, please explain.

Summary Consideration: In general, entities were supportive of the Plan, but two suggested specific changes. These changes were incorporated into score changes as summarized in the "general summary" above.

Organization	Yes or No	Question 2 Comment
NAESB Wholesale Electric Quadrant Standards Review Subcommittee	No	
Bonneville Power Administration		
Northeast Power Coordinating Council		
Imperial Irrigation District (IID)	No	
Electric Market Policy	No	
Florida Municipal Power Agency	No	
NERC	No	
Ingleside Cogeneration LP	Yes	See the response to Question 1 above.
Response: Thank you. Please see response to your question 1 comment.		
Consolidated Edison Co. of NY,		

Organization	Yes or No	Question 2 Comment
Inc.		
ITC Holdings	Yes	Project 2007-11 should not be delayed another 1 ½ years. This is due to issues with the existing fill in the blank standard PRC-002-1 which is non FERC approved and PRC-018-1 which is FERC approved. Entities are required to comply with PRC-018-1 but there is no enforcement for the regional entities to provide where DME is required to be installed. Besides being in development, at minimum entities should be provided the responses to the March 2009 comments.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input. **At such time as the project moves into formal development, the responses to comments will be reviewed, modified if necessary, and posted for the industry.**		
Clallam County PUD No.1	No	
PSEG Services Corp	No	
Progress Energy		
Wisconsin Electric Power Company	Yes	Since the glossary is the backbone of all the standards, it should be updated before 2015. Have all the standards received their "every five year" review?
Response: Thank you for your comments. The SC has assumed that you are referring to the following projects: 2010-08, 2010-16, 2010-17, and 2012-08. The SC has revised the scores on these projects to account for your input. **Several standards have not reviewed their "every five year review." Based on current assumptions, there will be a number in 2012 that do not meet this obligation. NERC and the SC are working together to evaluate options for addressing this issue.**		

Organization	Yes or No	Question 2 Comment
Independent Electricity System Operator	No	

3. For six projects, the SC had disagreements regarding the appropriate score for certain key values. The projects are listed below. For specific information, see the projects, the referenced columns, and the specific cells (highlighted in red) in Appendix 1. Do you believe these projects and their associated priorities are adequately reflected in the Plan? If no, please explain.

Project 2007-17 Protection System Maintenance and Testing (column L)
Project 2008-01 Voltage and Reactive Planning and Control (column K)
Project 2009-01 Disturbance and Sabotage Reporting (column L)
Project 2009-03 Emergency Operations (column F)
Project 2009-07 Reliability of Protection Systems (column L)
Project 2010-17 Definition of Bulk Electric System (column L)

Summary Consideration: Entities suggested score modifications for five of the six projects listed. These changes were incorporated into score changes as summarized in the "general summary" above.

Organization	Yes or No	Question 3 Comment
NAESB Wholesale Electric Quadrant Standards Review Subcommittee	Yes	
Bonneville Power Administration		
Northeast Power Coordinating Council		
Imperial Irrigation District (IID)	No	
Electric Market Policy	Yes	

Organization	Yes or No	Question 3 Comment
Florida Municipal Power Agency	No	The EOP standards (Project 2009-03) in general need a lot of work from a clarity / compliance / roles perspective, e.g., BA and TOP requirements are often intermingled, roles and responsibilities are not clear, etc. For instance, EOP-001 Attachment 1 does not identify what functional entity is responsible for each of the tasks. In EOP-002, if the BA is a separate entity from the LSE or DP, there is no requirement in the standards for LSEs to obey the directives of the BA in the same manner as to the RC (IRO-001) and the TOP (TOP-001). EOP-003 on Load Shedding has redundancies with UFLS and UVLS and assigns different functional entities to those systems. EOP-003 is unclear which requirements refer to automatic load shedding and which to manual load shedding. In EOP-005-2 it is unclear if an entity whose system is restored only after "a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage" is supposed to do anything. Etc. FMPA would rate column K at a 50 since the EOP standards in general are the least clear of all the standards as to roles, responsibilities, and interpretations of certain words (e.g., the failed interpretation of the word "simulation" as used in EOP-005-1 R7). The clarity around what is and what is not BES (Project 2010-17) is probably less than what the scoring indicates. FMPA would rate column L closer to 40. In addition, the clarity of the existing TPL standards is less than what the scoring indicates around the definition of "delayed clearing". FMPA would move this score to something like 33.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		
NERC	No	
Ingleside Cogeneration LP	No	Ingleside Cogeneration LP believes that priorities of Project 2007-17 "Protection System Maintenance and Testing", Project 2009-03 "Emergency Operations", and Project 2010-17 "Definition of the Bulk Electric System" are correctly reflected in the

Organization	Yes or No	Question 3 Comment
		plan. However, in our opinion, Project 2009-01 "Disturbance and Sabotage Reporting" should be taken out of the "Active" listing. There is already a significant overlap between this project and that of the Events Analysis Working Group (EAWG) - which should managed in one place or the other. Even beyond the duplication of effort, there is only a secondary reliability benefit in the dissemination of reporting information to regulatory bodies; which should not precedence over more pressing activities. Lastly, Project 2008-01 "Voltage and Reactive Planning and Control" and Project 2009-07 "Reliability of Protection Systems" are appropriately under consideration in the 2013 work plan. Ingleside Cogeneration LP believes that next year's prioritization process may drive their priority down as there is so much related Protection System and frequency control Standards development already underway. Once complete, there is a good chance that both of these projects will be less pressing
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		
Consolidated Edison Co. of NY, Inc.		
ITC Holdings		
Clallam County PUD No.1	Yes	
PSEG Services Corp	No	The SC should not be assiging scores to items that require a technical background. 2008-01 should be a 50 in col. K; 2009-01 should be a 50 in col. L; 2009-03 should be 100 in col. F. Bothe 2009-07 and 2010-17 should be NA (0) in col. L since that refers to interpretations. 2009-01 is a new std and 2010-17 is a new definition.

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input. **The SC members were asked to solicit input from colleagues within the industry segments they represented. Accordingly, while the SC members provided input, it was expected their input would represent the interests of those segments based on their collective segment expertise.**		
Progress Energy		
Wisconsin Electric Power Company		
Independent Electricity System Operator	No	We are somewhat surprised at the ranking of Project 2008-01, given the impact that deficiencies in reactive power resources had during the blackout and the fact that this project supports a blackout recommendation. We would have expected this to be started in 2012 and not 2013.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.		

4. Please provide any additional comments you would care to offer.

Summary Consideration: Several entities did not suggest changes, but asked clarifying questions, which were answered. Some entities suggested specific prioritization or plan changes; these changes were incorporated into score changes as summarized in the "general summary" above. Some typographical errors were noted and corrected.

Organization	Yes or No	Question 4 Comment
NAESB Wholesale Electric Quadrant Standards Review Subcommittee		a) The WEQ SRS recommends that NAESB express no opinion regarding the ordering of projects as none of the projects in the list have an effect on NAESB activities.b) The WEQ SRS recommends that NAESB ask why BAL-003 is included in the Project 2010-14.1 summary section, but is not listed as an affected standard.
Response: Thank you for your comment. In the case of Project 2010-14.1, the project is will not be making changes to BAL-003, but the new standard being developed will have some impact on BAL-003. Accordingly, the description indicates that it will "support" BAL-003, but the project is not itself proposing changes to BAL-003.		
Bonneville Power Administration		
Northeast Power Coordinating Council		Editorial comments: Page 1--in the fourth bullet down, "he" should be replaced with "the". Page 7--in the paragraph entitled "Five-Year Review Obligation", fourth sentence, replace "f" with "of". Page 14--the second bullet under "Additional Projects in 2013:", replace "Panning" with "Planning".On page 4, in the section "Completed Standards Development Projects", 2007â€07 Vegetation Management should be removed if it hasn't been Board of Trustees approved.
Response: Thank you for your comments. Your suggested changes have been made.		

Organization	Yes or No	Question 4 Comment
Imperial Irrigation District (IID)		
Electric Market Policy		
Florida Municipal Power Agency		FMPA supports this approach and appreciates the work of the Standards Committee to set realistic priorities.
Response: Thank you for your comment.		
NERC		
Ingleside Cogeneration LP		The sheer magnitude of the number of Reliability Standards already in place and planned over the next few years should bring us all pause. Already, Ingleside Cogeneration LP expends significant dollars and resources to demonstrate compliance to requirements which we believe serves little to improve BES reliability in any significant manner.
Response: Thank you for your comment.		
Consolidated Edison Co. of NY, Inc.		Page 10: In the section on Project Implementation, the last step is the Closing. Should there be a step prior to Closing called Submission to and Approval by FERC? This may trigger in most cases additional work before the project can be Closed before it is actually over, and this is not being captured. Page 1: 4th bullet typo “the”Page 4: Vegetation Management Standard should be removed from list if not BOT approved. Page 7 typo “of” 3rd paragraphPage 14 type 2nd bullet “Planning”
Response:Thank you for your comments. The errors you noted have been corrected.		
ITC Holdings		

Organization	Yes or No	Question 4 Comment
Clallam County PUD No.1		No additional comments
PSEG Services Corp		2009-05 Resource Adequacy Assessments can be deleted. The Plannning Committee has implemented such assessments - discuss with Chair Jeff Mitchell; also Paul Kure who was the chair of the G&T Reliability Modeling Planning TF, and Kevan Jefferies who was the chair of the Resource Issues Subcommittee that is implementing the assessments. Ths plan itself is not very coherent. I would prefer to see a plan for each standards grouping - i.e., CIPC, TPL, etc. Those should be developed by the technical committees in conjunction with the SC. In my opinion, while the SC has members with excellent technical background, it is a process committee, and should defer to technical committees on technical matters, including filling in the scores on the prioritization work plan.
Response: Thank you for your comments. The SC will discuss your suggestion regarding 2009-05 with the Planning Committee chair as you have suggested. **Presenting a complex, multi-year plan can be done in a number of ways. The suggestions offered will be considered for the 2013-2015 Plan. Additionally, the Standards Committee will reach out to the technical committees earlier to solicit their assistance in the development of that plan.**		
Progress Energy		1. p. 7, Chapter 3 - General, ¶ 1: the Rapid Development acceleration approach is explained, and supposedly initial trial runs of the approach have yielded "useful lessons learned". What specifically has been learned? This approach to push through a new Standard directive needs a fair amount of review, scrutiny and appraisal by the industry. **Response: The Plan is intended only to provide a brief summary of the Standards programs efforts, and not an exhaustive review of all the lessons learned from the current test effort.** **As the body having oversight of the Standards Development Process, the SC agrees**

Organization	Yes or No	Question 4 Comment
		that appropriate levels of review, scrutiny, and appraisal are necessary. It should be recognized that everything within the Rapid Development approach was specifically designed to be s fully compliant with NERC's Standards Processes Manual (SPM). 2. p. 7, Chapter 3 - General, ¶ 2: the Rapid Revision acceleration approach is also explained, and it is stated that if "an interpretation drafting team identifies simple modifications to a standard that can more effectively address an interpretation request than an interpretation can alone, the team may elect to make such changes and submit them with an associated SAR". An interpretation is not asking for a Standard revision, it is asking for an interpretation, and nothing else. Using the revising of a Standard to give an interpretation will lead to new problems and new requests for interpretation of the newly-revised Standard. **Response: The Submitter of the Request for Interpretation must agree to the use of this new approach if it is to be used in place of an Interpretation. The text in the plan has been updated to indicate this.** 3. p. 7, Chapter 3 - General, ¶ on "Product Quality": Among other things, "enhanced training" is suggested for improving NERC's product quality. We suggest that the bulk of that training needs to be technical in nature, i.e. it needs to enhance drafting team members' knowledge of particular aspects of operating the Bulk Electric System. People can be trained to be the best writers in the world, but the product will still suffer if the technical knowledge is not there. We respectfully submit that this issue has not been adequately addressed by NERC. **Response: NERC assembles its drafting team members based on their experience, and does not believe it would be appropriate for NERC to explicitly seek to train drafting members in their areas of expertise as a function of standards development. To the extent that this is desired, the SC suggests that the commenter provide input into the development of NERC's Business Plan and Budget.**

Organization	Yes or No	Question 4 Comment
		4. p. 8, Chapter 3 - General, "Conclusion": NERC states that the "SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity, all while making sure to consider the implications of cost". We would respectfully submit that true cost of developing NERC Standards has not been adequately addressed from the following standpoints: a. Benefit to the ratepayers b. Benefit to future projects that have insufficiently defined scope at present c. Cost versus benefit **Response: This Plan does not assert that it has analyzed "true" cost. As described in Appendix 1, the "Cost Consideration" metric was used as a subjective review of industry cost and reliability benefit, with the intent of identifying any outliers in which the costs and benefits seemed unusually disproportionate. The SC agrees that this is not an extensive analysis, but it does represent the first such analysis that we are aware of. However, we have rewritten this sentence to reduce the chance of any similar misinterpretations.** 5. p. 9, Chapter 4 - Project Development Overview, ¶ 2: A statement is made that the Prioritization Tool includes "the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability". We respectfully submit that it is not appropriate for the NERC President to have such unilateral authority. **Response: This score demonstrates the manner in which the strategic leadership of NERC (though its president and Board of Trustees) is accounted for in this plan. The SC firmly believes that such coordination is both necessary and appropriate. It should be noted that, as stated in the president's document, the issues were "offered as a starting point for discussion with industry experts." It is the SC's understanding that those priorities will change over time based on such discussions.** 6. p. 10, Chapter 4 - Project Development Overview, 1st complete ¶: An example is

Organization	Yes or No	Question 4 Comment
		cited regarding work management that "projects related to protection systems were generally not started until another project related to protection systems was completed". This demonstrates one of our highest concerns: NERC is trying to take on too much at once. We understand and respect the underlying issues influencing this, but given that the work management struggle is being clearly addressed in this Plan we suggest that this needs to be given more serious consideration. **Response: This Plan is a short-term (1 to 3 year) strategy for addressing the most significant reliability threats we face. NERC and the SC are open to suggestions for alternative approaches.**
Response: Thank you for your comments. Please see embedded responses above.		
Wisconsin Electric Power Company		
Independent Electricity System Operator		The reliability score of Project 2007-11 also appears somewhat low, perhaps because it has no direct or immediate reliability impact. After the fact analysis based on the data captured by properly placed and sufficient number of DMEs will however prove invaluable in providing lessons learned and guiding future industry actions. We suggest that the scores for this project should be reviewed.
Response: Thank you for your comments. The SC has revised the scores on these projects to account for your input.

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and the implementation of projects in general.
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 shows the Regional Work Plan in Gantt chart form
- Appendix 4 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards

<to be added>

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of information to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come
- Status updates regarding standards and related projects currently in development
- A forecast of Standards Development work scheduled for the next three years
- An overview of the process used to prioritize work and assign resources to Standards development projects

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, other priorities may necessitate deviations from this plan. As new technologies are discovered or new threats to reliability identified, the actual deployment of resources to staff this plan may shift. Similarly, the estimated times listed for project completion may change as more is learned about a given project.

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process, Standards Development, and Regional Standards teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information.

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development
- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year consistent with in accordance with Section 321.6 of the NERC Rules of

[1] The data included in this paragraph does not include Regional Reliability Standards.

Procedure ("Rule 321") that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Regional Standards Development

Regional standards work within NERC and the Regions has seen a great deal of development and implementation of new initiatives since the beginning of 2011. First, the Regional Reliability Standards Working Group (RRSWG) transitioned into the Regional Standards Group (RSG). Comprised of the NERC Vice President and Director of Standards and the Standards Managers from each of the eight Regional Entities, the RSG reports to the ERO Executive Management Group (EMG). Its purpose is to provide process and policy recommendations in the execution of the Regional Entity delegation agreements and the NERC Rules of Procedure. An overarching objective is to coordinate the development of Regional and continent-wide standards to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners, and operators.

In support of this purpose and this objective, a primary initiative of the RSG is to create and sustain viable standards development coordination processes to obtain consistency and uniformity, where appropriate, across the ERO enterprise – NERC and the Regional Entities – while ensuring efficient and effective use of resources in executing the statutory responsibilities of the ERO as the reliability standards development authority. To that end, the RSG developed a combined list of all regional standards and variances in the development process in order to prioritize these projects continent-wide. This will allow NERC to coordinate the necessary resources through the development and ultimate filing of these standards and variances with applicable regulatory authorities. Project information for each of those regional standards and variances in the development process is provided in this Plan, along with a high-level overview of the project timeline.

Rapid Development and Rapid Revision Projects

NERC's Standards Committee (SC) has tentatively identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010.05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can more effectively address an interpretation request than an interpretation can alone, the team may propose to the requester that the team instead make such changes and submit them with an associated SAR. If agreed to be the requester, and following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its ANSI accreditation, NERC has committed to review each of its standards for modification once every five years. While not giving the appearance of being onerous, this obligation has proven challenging to meet. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. However, the work load of the ERO remains high, and prioritization has resulted in a deferral of the work required for these five-year reviews except when already associated with a project of reliability value. Using current assumptions, the five-year review obligation will not be met for a number of standards. NERC and the SC are working together to evaluate options for addressing this issue.

Product Quality

As NERC's and the industry's experience with standards has continued, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and regularly. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global "portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity. Additionally, the plan was developed with the use of a subjective review of the implications of cost. NERC believes altogether, this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standard based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capability of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research, and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems were generally not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Regulatory Submission - Following adoption by NERC's Board of Trustees, the stadnards are submitted to regulatory aurhorityt

- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any associated regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). The Regional Work Plan is included as Appendix 3. A detailed summary of projects, including regional projects, is included as Appendix 4.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact all three of these areas in some way, this is intended to illustrate the primary consideration driving its consideration.

Existing Active Projects:

- 2006-06 Reliability Coordination. This project ranked #13 in Reliability Priority.
- 2007-02 Operating Personnel Communication Protocols. This project ranked #5 in Reliability Priority.
- 2007-03 Real-time Transmission Operations. This project ranked #4 in Practicality Priority.
- 2007-06 Protection System Coordination. This project ranked #4 in Reliability Priority.
- 2007-07 Vegetation Management. This project is expected to complete in 2012, but at the time of this document's finalization, it has not yet been formally completed.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response. This project ranked #10 in Reliability Priority, and was tied for #2 in Time Sensitivity Priority.
- 2007-17 Protection System Maintenance and Testing. This project ranked #3 in Reliability Priority.
- 2008-06 Cyber Security – Order 706. This project ranked #2 in Reliability Priority.
- 2009-01 Disturbance and Sabotage Reporting. This project ranked #8 in Reliability Priority.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project ranked #7 in Reliability Priority.
- 2010-07 Generator Requirements at the Transmission Interface. This project ranked #13 in Practicality Priority, and was tied for #2 in Time Sensitivity Priority.

- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves. This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.
- 2010-17 Definition of Bulk Electric System. This project ranked #10 in Reliability Priority, and was tied for #2 in Time Sensitivity Priority.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding. This project ranked #14 in Reliability Priority, and is expected to be started upon the completion of 2006-06 Reliability Coordination.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project ranked #1 in Practicality Priority, and is expected to be started upon the completion of 2007-03 Real-time Transmission Operations.
- 2009-03 Emergency Operations. This project ranked #4 in Practicality Priority, and is expected to be started upon the completion of 2008-06 Cyber Security – Order 706.
- 2010-01 Support Personnel Training. This project ranked #15 in Reliability Priority, and is expected to be started upon the completion of 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project ranked #11 in Reliability Priority, and is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization. This project is expected to be started upon the completion of 2007-12 Frequency Response.

- 2012-04 Protection System Commissioning Testing. This project ranked #9 in Reliability Priority, and is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing

NERC intends to initiate development of the following projects in 2013. As noted above, these projects have generally been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is expected to start upon completion of 2010-17 Definition of Bulk Electric System.
- 2008-01 Voltage and Reactive Planning and Control. This project ranked #3 in practicality, and is expected to start upon completion of 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves
- 2008-12 Coordinate Interchange Standards. This project is expected to start upon completion of 2010-07 Generator Requirements at the Transmission Interface.
- 2009-07 Reliability of Protection Systems. This project ranked #1 in Reliability Priority, and is expected to start upon completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is expected to start upon completion of 2009-02 Real-time Monitoring and Analysis Capabilities.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project is expected to start upon completion of 2007-02 Operating Personnel Communication Protocols.
- 2012-06 Generator Capabilities. This project ranked #6 in Reliability Priority, and is expected to start upon completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project is expected to start upon completion of 2009-03 Emergency Operations.
- 2009-05 Resource Adequacy Assessments. This project is expected to start upon completion of 2012-04 Protection System Commissioning Testing.
- 2010-03 Modeling Data. This project is expected to start upon completion of 2008-01 Voltage and Reactive Panning and Control.
- 2010-04 Demand Data. This project is expected to start upon completion of 2010-05.2 Phase 2 of Protection Systems: SPS and RAS.
- 2010-08 Functional Glossary Model Revisions. This project is expected to start upon completion of 2010-01 Support Personnel Training.
- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. This project is expected to start upon completion of the second phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator. This project is expected to start upon completion of 2012-04 Protection System Commissioning Testing.
- 2012-05 ATC Revisions - Order 729. This project is expected to start upon completion of 2008-12 Coordinate Interchange Standards.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. There is also some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review

- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity, and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan which follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	7	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	6	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	2	29
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	3	7
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	14	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	11	16
Project 2010-07 Transmission Requirements at the Generator Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	12	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	9	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	19	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	37	41
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	4	3
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	16	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	15	25
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	8	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	20	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	22	20
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	41	43
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	10	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	17	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	18	19
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	36	40

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	40	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	42	44
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	13	31
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	38	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	39	24
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	21	33
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2010-07 Transmission Requirements at the Generator Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	32
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12

STANDARDS COMMITTEE Reliability Standard Project Prioritization

TIME SENSITIVITY SORT

Project Number and Name	Short Description	(E) Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	(F) Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	(K) Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	14	25
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	16	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	17	20
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	18	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	19
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	31
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	41
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	43
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	40
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative, BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12
Project 2010-07 Transmission Requirements at the Generator Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	16	15
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	17	19
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	20
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	14	25
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	30
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	18	31
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	32
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	40
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	41
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	42
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	43
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

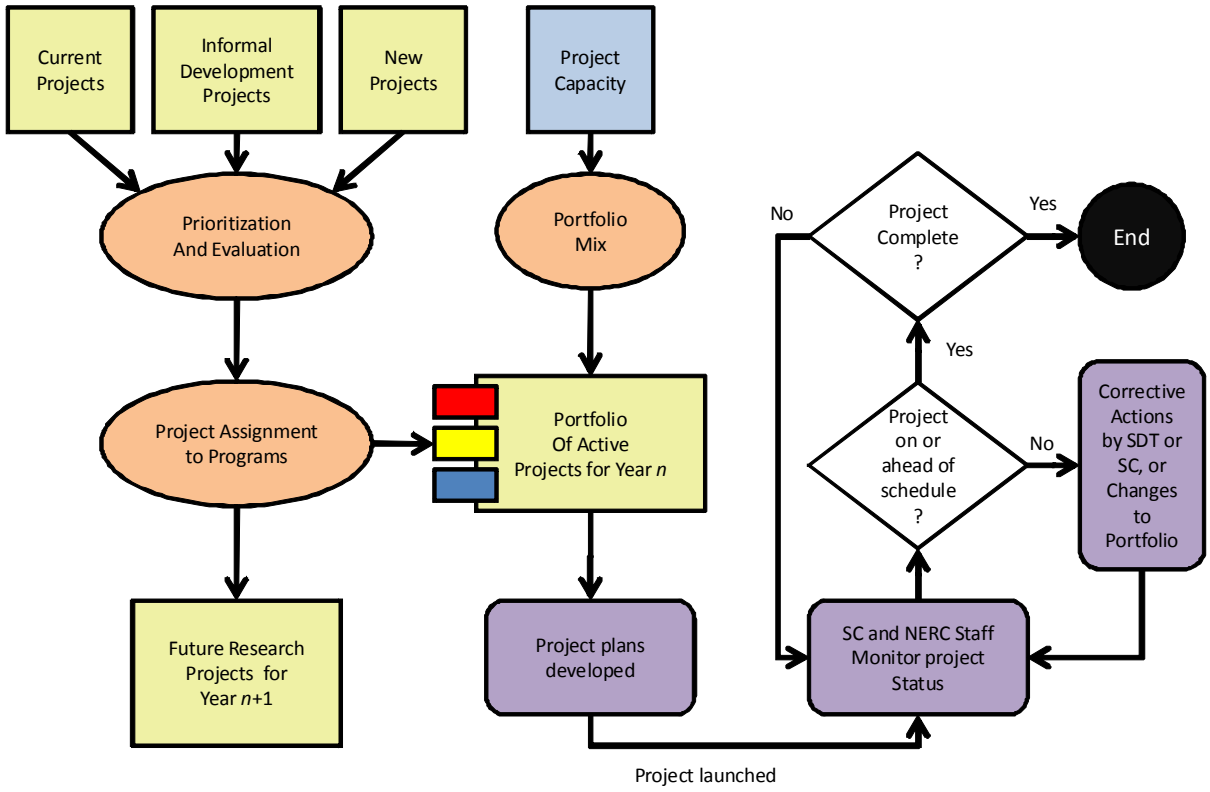
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

Attachment B: Prioritization Tool

STANDARDS COMMITTEE Reliability Standard Project Prioritization			(E) Click Here to Insert a Row	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	SUMMARY						7	25	3	3

TOTAL RANKING	Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Total Score (0-600)	TOTAL RANKING	Relaibity Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Rnaking
1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

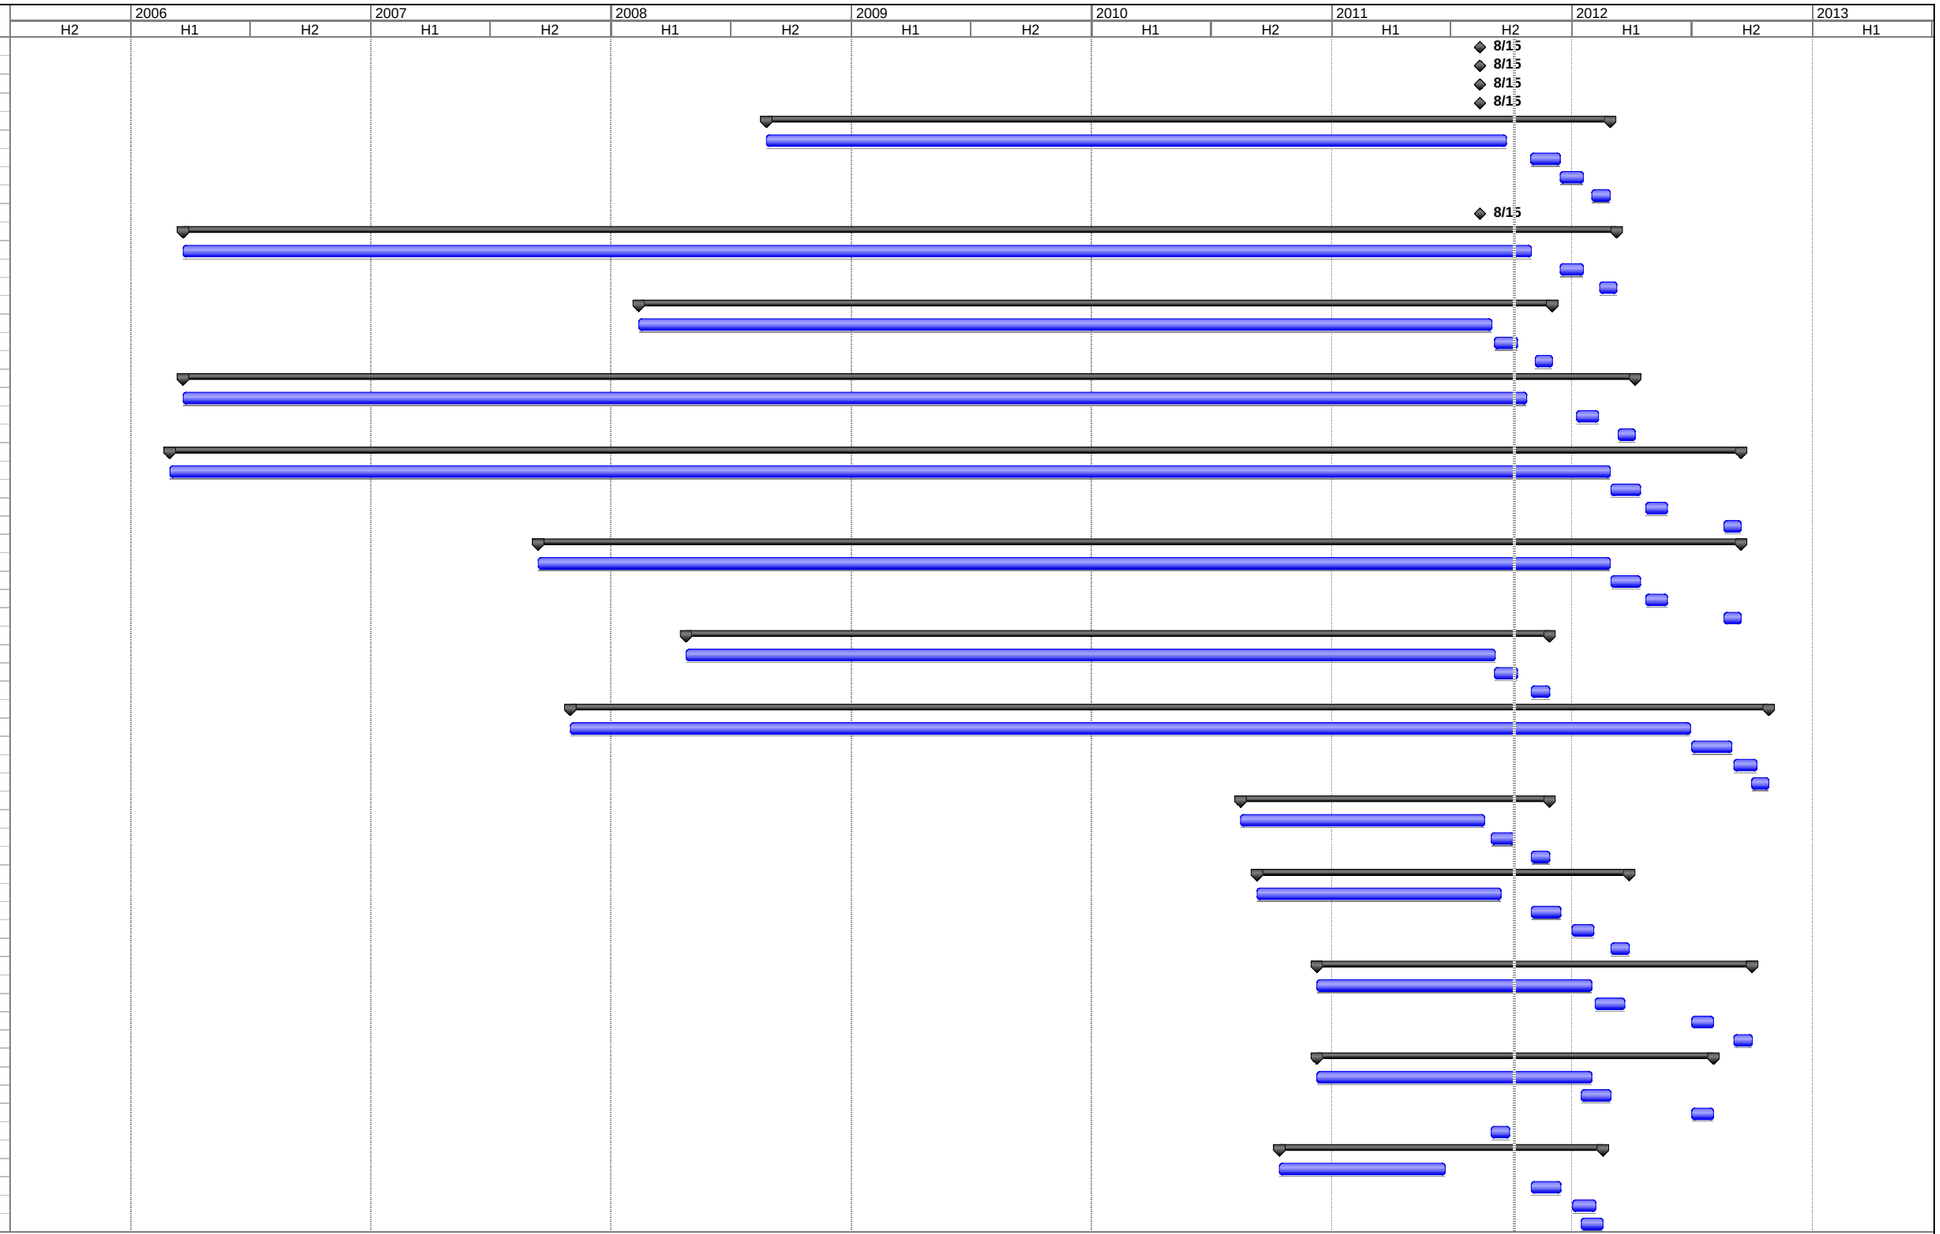
Appendix 3 – Regional Work Plan

The following page shows the schedule of regional work in Gantt chart format. Projects that are actively being pursued are identified with black Gantt chart bars, with blue bars representing various stages of development. Projects that are "on hold" are represented by a black diamond.

ID	Task Name
1	**PRC-002-FRCC-1 (on hold)**
2	**PRC-003-FRCC-1 (on hold)**
3	**PRC-006-FRCC-1 (on hold)**
4	**PRC-024-FRCC-1 (on hold)**
5	**PRC-006-NPCC-1**
6	Regional standard development
7	Posting of Documents for process evaluation at NERC
8	Prepare BOT Material
9	Develop Initial Draft of Regulatory Filings
10	**PRC-012-NPCC-1 (on hold)**
11	**MOD-024-RFC-01**
12	Regional standard development
13	Prepare BOT Material
14	Develop Initial Draft of Regulatory Filings
15	**MOD-025-RFC-01**
16	Regional standard development
17	Prepare BOT Material
18	Develop Initial Draft of Regulatory Filings
19	**PRC-002-RFC-01**
20	Regional standard development
21	Prepare BOT Material
22	Develop Initial Draft of Regulatory Filings
23	**PRC-006-RFC-1**
24	Regional standard development
25	Posting of Documents for process evaluation at NERC
26	Prepare BOT Material
27	Develop Initial Draft of Regulatory Filings
28	**PRC-012-RFC-1**
29	Regional standard development
30	Posting of Documents for process evaluation at NERC
31	Prepare BOT Material
32	Develop Initial Draft of Regulatory Filings
33	**PRC-006-SERC-01**
34	Regional standard development
35	Prepare BOT Material
36	Develop Initial Draft of Regulatory Filings
37	**PRC-006-SPP-01**
38	Regional standard development
39	Posting of Documents for process evaluation at NERC
40	Prepare BOT Material
41	Develop Initial Draft of Regulatory Filings
42	**IRO-006-TRE-1**
43	Regional standard development
44	Prepare BOT Material
45	Develop Initial Draft of Regulatory Filings
46	**BAL-001-TRE-1**
47	Regional standard development
48	Posting of Documents for process evaluation at NERC
49	Prepare BOT Material
50	Develop Initial Draft of Regulatory Filings
51	**BAL-002-WECC-1**
52	Regional standard development
53	Posting of Documents for process evaluation at NERC
54	Prepare BOT Material
55	Develop Initial Draft of Regulatory Filings
56	**BAL-004-WECC-1**
57	Regional standard development
58	Posting of Documents for process evaluation at NERC
59	Prepare BOT Material
60	Develop Initial Draft of Regulatory Filings
61	**VAR-001-WECC-1**
62	Regional standard development
63	Posting of Documents for process evaluation at NERC
64	Prepare BOT Material
65	Develop Initial Draft of Regulatory Filings



Project: Unified Regional Project Sche
Date: Wed 10/5/11

Appendix 4 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity
- Move the requirement (into another project or Standard, or to the certification process)
- Eliminate the requirement (because it is redundant or doesn't support BPS reliability).

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. At this time, no estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to realtime operating states and protocols for issuing and responding to operating directives.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Subsequently, this team was put on hold for an extended period of time. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in the several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as and other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to appropriate other standards through coordination with project 2006-06 Reliability Coordination.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, wchih were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltae transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It will also ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were most recently posted for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained with the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It will also ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also will address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery' will be reviewed and addressed.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project will also consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

Standards affected:

New

Status:

This project has an initial draft of a SAR which was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARS associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision which, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE DEVELOPMENT

PRC-002-FRCC-1 — FRCC Regional Disturbance Monitoring and Reporting Requirements

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Disturbance Monitoring Equipment", revision dated June, 2006 into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements.

Standards affected:

PRC-002-1

Status:

This Regional project is currently on 'hold'. Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-11 Disturbance Monitoring being classified as a 'Project in Informal Development', FRCC staff will be re-evaluating the current status of the regional project to determine whether to proceed with the Regional Reliability Standard development or to revise the current FRCC Regional Criteria document "FRCC Requirements for Disturbance Monitoring Equipment".

FUTURE DEVELOPMENT

PRC-003-FRCC-1 — FRCC Regional Procedure for Analysis of Mis-operations of Transmission and Generation Protection Systems

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Analysis of Protection Mis-operations & Corrective Actions Reporting", revision dated October 2003 into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Mis-operations of Transmission and Generation Protection Systems.

Standards affected:

PRC-003-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) being classified as a 'high priority' project in active development, the Regional project is currently on 'hold'. The FRCC has revised Regional Criteria documents (FRCC Requirements for Analysis of Protection Misoperations and Corrective Actions Reporting, revision date: December 2, 2010) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Mis-operations of Transmission and Generation Protection Systems.

FUTURE DEVELOPMENT

PRC-006-FRCC-1 — FRCC Automatic Underfrequency Load Shedding Program

Summary:

FRCC is developing a Regional Reliability Standard to provide last resort system preservation measures by implementing an Underfrequency Load Shedding (UFLS) program. Additional requirements may be needed due to FRCC peninsular geography and limited ties to the north. Operating experience and decades of studies by the FRCC and its predecessor reliability organizations have resulted in a well developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. The standard development project will effectively use the proven high performance characteristics of the existing FRCC UFLS program and refine its requirements and coordination procedures to comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

Standards affected:

PRC-006-1

Status:

PRC-006-FRCC-1 FRCC Automatic Underfrequency Load Shedding Program has been approved by the FRCC Registered Ballot Body and the FRCC Board of Directors. Based on concerns identified by NERC standards staff and the pending Commission (FERC) approval of the NERC Continent-Wide Reliability Standard PRC-006-1 Automatic Underfrequency Load Shedding and associated Regional variances, the Regional project has been placed on 'hold'. The FRCC has since revised Regional Criteria documents (FRCC Automatic Underfrequency Load Shedding Program, revision date: April 7, 2011) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

FUTURE DEVELOPMENT

PRC-024-FRCC-1 — FRCC Regional Generator Performance During Frequency and Voltage Excursions

Summary:

FRCC is developing a standard to establish “ride through” requirements for generators in the FRCC Region with respect to temporary grid voltage or frequency deviations from their normal range. The Standard should address time duration limits for operation of generator protection for 1) frequencies outside of the 59.5 - 60.5 hertz range, 2) voltages outside of the 95% - 105% range and 3) generator stator current overloads. The Standard should address exemption criteria and mitigation measures available for resolving apparent conflicts between generator capabilities and the coordination requirements. Considerable knowledge of grid frequency and voltage excursions and the time limited capabilities of generators to sustain these conditions have been gained through operating experience and previous reliability studies. This standards development project should effectively use this knowledge to define coordination requirements and procedures that comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Standards affected:

PRC-024-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-09 Generator Verification being classified as a ‘high priority’ project in active development, the Regional project is currently on ‘hold’. The FRCC is actively revising Regional Criteria documents (FRCC Generator Coordination Requirements) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

2012 DEVELOPMENT

PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Program

Summary:

The purpose of this Standard is to establish the requirements for NPCC and its members to operate and maintain coordinated a Regional Underfrequency load shedding (UFLS) program. The NPCC's UFLS program will meet the minimum requirements contained in NERC standards and provide those entities to which it is applicable, the guidance necessary to implement it. This standard will also mandate that, when necessary, coordination with neighboring Regional Underfrequency load shedding programs be developed. The unique character, dispersion, sensitivity and density of the NPCC regional loads emphasize the need for this Standard.

The NPCC regional UFLS standard shall apply to all applicable entities within the Region and sub-regional areas that are both synchronous and asynchronous to the eastern interconnection. Quebec has UFLS has different parameters and these are included in the standard and fully coordinated within the Region.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. NPCC expects to complete the drafting of this standard in 2011, conduct a ballot of stakeholders in the first quarter of 2012 and a submission to the NERC Board of Trustees and subsequent filing with FERC to occur in 2012.

FUTURE DEVELOPMENT

PRC-012-NPCC-1 — Special Protection Systems

Summary:

To support and enhance bulk power system reliability, this Standard will establish the criteria for the minimum design objectives and practices for special protection systems, the purpose of which are to detect abnormal system conditions, and take corrective actions other than the isolation of faulted elements to maintain the stability and security of the bulk power system. This Standard will also establish the requirements for close coordination between system planning, design, operating, maintenance and protection functions of areas to ensure that the impacts of special protection system operations do not result in a significant adverse impact.

The proposed Standard will describe the requirements for the design and approval of Special Protection Systems, and the technical criteria required to support its implementation. The Standard will also identify the need for close coordination among various parties to ensure that the Special Protection Systems are implemented correctly, and triggers and resulting actions are made known and communicated in an on-line database.

Standards affected:

PRC-012-0

Status:

This Regional project is currently on 'hold' pending the completion of the NERC Reliability Standard Development Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS and the outcome of the work by the NERC SPCS on the definition of SPS.

2011 DEVELOPMENT

MOD-024-RFC-1 — Verification and Data Reporting of Generator Gross and Net Real Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Real Power capability to support NERC Reliability Standard MOD-024. The objective of the regional standard is to ensure accurate information on generator gross and net Real (MWs) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-024-1

Status:

This Regional standard has been approved by the Reliability*First* Board. Currently, VRFs and VSLs are in development. Reliability*First* expects to complete the drafting of the VRFs and VSLs in 2011, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2011 DEVELOPMENT

MOD-025-RFC-1 — Verification and Data Reporting of Gen Gross and Net Reactive Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Reactive Power capability to support NERC Reliability Standard MOD-025. The objective of this standard is to ensure that accurate information on generator gross and net Reactive (MVAR) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-025-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with the FERC is expected to occur in 2012.

2011 DEVELOPMENT

PRC-002-RFC-1 — Disturbance Monitoring and Reporting Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for Disturbance monitoring and reporting to support NERC Reliability Standard PRC-002.

Standards affected:

PRC-002-1

Status:

Reliability*First* is currently working on the technical justification for the locational requirements for DME equipment. This Regional standard has been approved by the Reliability*First* Board. Reliability*First* expects submission of this standard to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2012 DEVELOPMENT

PRC-006-RFC-1 — Automatic Under Frequency Load Shedding Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency assist recovery of frequency following underfrequency events and provide last resort system preservation measures. The standard goes beyond the NERC PRC-006-1 standard and prescribes; with more certainty, aspects that the Planning Coordinator's UFLS program must contain, further details on certain procedural matters with respect to how islands are addressed, and assessment of UFLS program implementation as well as program design. This standard also attempts further consolidating requirements of the Reliability*First* legacy underfrequency load shedding programs, permitting retirement of legacy documents, to ensure appropriate coordination among the Reliability*First* legacy regional UFLS programs.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur later in 2012.

2012 DEVELOPMENT

PRC-012-RFC-1 — Special Protection System Requirements

Summary:

To purpose of the standard is to establish Reliability*First* requirements for the review, development and application of Special Protection Systems (SPS).

Standards affected:

PRC-012-0

Status:

This Regional project is currently in the initial drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur early in 2013.

2011 DEVELOPMENT

PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

Summary:

The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

In 2008, SERC commenced work on PRC-006-SERC-1. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the continent-wide UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. This regional standard PRC-006-SERC-1 adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Standards affected:

PRC-006-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with FERC is expected to occur in 2012.

2012 DEVELOPMENT

PRC-006-SPP-1 — Under Frequency Load Shedding

Summary:

PRC-006 (Development and Documentation of Regional UFLS programs) has been identified by NERC as one of the Regional (Fill-in-the Blank) Standards. The requirements developed in this standard at a minimum, need to meet the requirements for the Regional Program as identified in NERC's PRC-006-0. Operating experience and regional studies have resulted in a well developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. This standards development intends to effectively use the proven high performance characteristics of the existing SPP UFLS program and refine its requirements and coordination procedures through an open process as described in the SPP Standard Development Process Manual.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. SPP expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

Summary:

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with certain existing non-routine ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Standards affected:

IRO-006-5 (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of IRO-006-5.)

Status:

This Regional Standard was approved by the Texas RE Board of Directors on June 28, 2011, and it will be submitted to the NERC Board of Trustees in November 2011. Subsequent filing with FERC is expected to occur in 2012.

2011 DEVELOPMENT

BAL-001-TRE-1 — Primary Frequency Response in the ERCOT Region

Summary:

This Regional Standard is intended to support reliability by ensuring adequate primary frequency response performance in the ERCOT Interconnection. The standard addresses frequency response at the Interconnection level, as well as by individual generating units and facilities. Specific maximum governor droop and deadband settings are provided, along with primary frequency response performance standards (initial and sustained) that allow actual unit-specific performance to be measured.

In 2002, NERC approved a regional difference for ERCOT that made it exempt from Requirement R2 in BAL-001-0 (CPS2), because of ERCOT's lack of synchronous connection to other control areas and the nature of the ERCOT energy market. FERC approved the ERCOT regional difference, finding that ERCOT's practice of (a) determining the minimum frequency response needed for reliability, and (b) requiring generators to have specific governor droop, to be a more stringent practice than Requirement R2 in BAL-001-0. FERC directed NERC to file a modification of the ERCOT regional difference to include the requirements concerning frequency response contained in section 5 of the ERCOT protocols. This Regional Standard is responsive to that directive.

Standards affected:

BAL-001-0.1a (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of the continent-wide standard.)

Status:

This project is currently in the Regional Standard development stage, with a stakeholder ballot closing on September 23, 2011. Texas RE expects to submit this standard to its Board of Directors for approval in October, 2011, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur in 2012.

2012 DEVELOPMENT

BAL-002-WECC-1 — Contingency Reserves

Summary:

On Oct. 21, 2010, FERC found that BAL-002-WECC-1 did not meet the statutory criteria for approval and remanded the regional standard to NERC/WECC for further modification. (RM09-15-000; Order 740). FERC held that BAL-002-WECC-1's less stringent requirements had not been supported by the technical data provided.

On remand, the Commission instructed WECC to modify the regional reliability standard to include a number of specific items contained in Order 740. This Request is submitted with the specific and narrow purpose of addressing only those issues mandated for modification in the October 2010 Oder 740.

Standards affected:

BAL-002-WECC-1

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2012 DEVELOPMENT

BAL-004-WECC-1 — Automatic Time Error Correction

Summary:

In the order approving BAL-004-WECC-1 the FERC directed WECC to make several clarifying modifications to the standard. FERC directed WECC to use the FERC-approved Process for Developing and Approving WECC standards to make these clarifying modifications

In addition, the WECC staff has identified the opportunity to make additional modifications to the existing standard to clarify the intent without changing the requirements.

There is also confusion regarding the R3 requirement that the ACE used for NERC reports shall be the same ACE as the AGC operating mode in use. This seems to conflict with the NERC response to NOPR comments that entities may use ATEC ACE for control but should use Raw ACE for reporting. WECC is developing a proposed regional variance to BAL-001-0.1a to address this apparent conflict.

Standards affected:

BAL-004-WECC-1
BAL-001-0.1a

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

VAR-001-WECC-1 — Voltage and Reactive Control

Summary:

The current draft has been converted from a Standard into a Regional Variance to the NERC VAR-001-2 Standard. The format incorporates the NERC Standard into the document with minor additions to address the scope of the variance. The regional variance specifics are included as Section E of the proposed document (see hyperlink above), and in this case, are intended to replace NERC VAR-001-2 requirements R3 and R4 as noted at the beginning of Section E.

Variance

The purpose of this regional variance to a NERC Reliability Standard is to ensure that voltage levels are within limits in real time to protect equipment and the reliable operation of the Western Interconnection. The "Rules of Procedure of the North American Electric Reliability Corporation" (Appendix 3A, page 31) permits the development of a regional variance to a NERC reliability standard on an Interconnection-wide basis when the Regional Reliability Organization has valid justification and when the variance is not inconsistent with or less stringent than the NERC Reliability Standard. The variance is an alternative method for obtaining the same reliability objective as the continent standard and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the electric reliability organization governmental authority, shall be enforced within the applicable Regional Entity(ies) pursuant to delegated authority.

Standards affected:

VAR-001-2

Status:

This Regional project has been approved by the WECC Board of Directors. WECC expects to submit the draft for the mandatory NERC 45-day comment period in the near future, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and the implementation of projects in general
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 shows the Regional Work Plan in Gantt chart form
- Appendix 4 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President of Standards and Training

To: NERC's Board of Trustees, Stakeholders, Regulatory Authorities, and other interested parties

NERC is committed to the development of clear, technically excellent standards for the reliable planning and operation of the North American bulk power system. NERC's industry-based standard development process strives to leverage the knowledge and experience of subject-matter experts to develop stakeholder consensus in support of standards that achieve reliability objectives and are responsive to regulatory directives, balanced against the burdens and costs of compliance imposed upon the more than 1,900 entities that are now subject to these standards. No single standard can ensure this outcome. Rather, NERC strives to develop and enhance a portfolio of performance, risk-mitigation, and competency-based reliability standards that achieve a consistent defense in depth against credible events that may lead to cascading, uncontrolled separation, or instability and ensure prompt system restoration when extreme events occur.

Achieving this balance is intrinsically difficult. Just as the management of the reliability "bar" through enforceable standards is an ongoing and evolving process, the process for developing standards needs to evolve as well, in response to the learning that has occurred in the period since passage of the Energy Policy Act of 2005 and the initial enforcement of NERC standards in June 2007. We would like to use this message to highlight current achievements in the standards arena and our plans for 2012-2014, as well as certain emerging factors and concerns.

NERC's Reliability Standards Development Plan delivered the following results in 2011:

- As of November 1, 2011, 20 new or revised standards have been approved by the Board of Trustees, and are either filed or in the process of being filed with the FERC.
- Results Based Standard development principles were used for all new standards projects.
- The Standards Committee worked with NERC staff to prioritize standards development resources on twelve high priority projects. There has been no specific redirection of this effort relative to the selected priorities by regulatory authorities.
- Stakeholder-driven Quality Review has been integrated into the standards development process to assure the best quality standards from a compliance and implementation perspective.
- NERC undertook a first effort to develop a standard on a Rapid Development basis utilizing the new Standard Processes Manual.

- To balance the resources committed to the development of new standards versus the interpretation of existing standards, the Standards Committee has limited the number of interpretations under active development to three projects at any one time, while pursuing new procedural options such as "rapid revision" to correct deficiencies in the underlying standard.

The 2012-14 Reliability Standards Development Plan described in this report builds on recent experience by proposing an achievable yet ambitious plan of standards development. The 2012-14 Plan provides for:

- Continuation of ongoing standards projects with sufficient resources to ensure timely completion.
- Project priorities were established using a more comprehensive model with scores and explanatory inputs from the Standards Committee, NERC staff and industry stakeholders.
- Projects have been ranked for development priority along three tracks, based on consideration of Reliability Benefits, Time Sensitivity, and Practicality.
- As ongoing projects are completed, we are scheduling follow-on projects based on the availability of subject-matter experts and the completion of technical input, research, and industry outreach conducted by NERC's standing committees and subcommittees.
- Finally, the 2012-14 Plan incorporates a more comprehensive integration of the regional standards effort into this process. For the first time a complete project management process is being applied to regional standards development.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, a wide variety of electric system events and emerging risks to bulk power system reliability may necessitate deviations from this plan. In order to respond to such threats and initiate development of new or revised standards, the actual deployment of resources to staff this plan may shift. Additionally, the estimated times listed for project completion may change as more is learned about a given project.

NERC currently is investigating the following "emerging issues," each of which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Not every issue is addressable or best addressed through development of a new industry standard; the issues outlined above illustrate that truism. But where a standards related response is indicated, we will be ready to reprioritize and adjust.

The Standards Committee and NERC staff also recognize that major standards process efficiencies are still necessary if we are to make efficient use of NERC and industry resources, while meeting external expectations for the timely development and approval of technically excellent reliability standards. In 2012, we need to ask ourselves once again, "is there a better way to develop reliability standards?"

We achieve the past results and plan for the future results only with your support, and greatly appreciate that the industry has accepted the evolving prioritization process. Our efforts to effectively manage and balance the many conflicting demands placed upon both the industry and NERC staff resources has provided this next plan, which we hope you will endorse.

Each of us, day in and day out, is driven to do the "right" thing, and your ERO's reputation will be enhanced through your active support for completion of NERC's 2012-14 Reliability Standards Development Plan.

Sincerely,

Allen Mosher
Senior Director of Policy Analysis and Reliability, American Public Power Association
Chair, NERC Standards Committee

Herb Schrayshuen
Vice President of Standards and Training, NERC

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of interest to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come;
- Status updates regarding standards and related projects currently in development;
- A forecast of Standards Development work scheduled for the next three years; and
- An overview of the process used to prioritize work and assign resources to Standards development projects.

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels initially identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, other priorities may necessitate deviations from this plan. As new technologies are discovered or new threats to reliability identified, the actual deployment of resources to staff this plan may shift. Similarly, the estimated times listed for project completion may change as more is learned about a given project.

NERC is currently investigating the following "emerging issues," which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process, Standards Development, and Regional Standards teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development

- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 continent-wide Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

[1] The data included in this paragraph does not include Regional Reliability Standards.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year in accordance with Section 321.6 of the NERC Rules of Procedure ("Rule 321") that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Regional Standards Development

Regional standards work within NERC and the Regions has seen a great deal of development and implementation of new initiatives since the beginning of 2011. First, the Regional Reliability Standards Working Group (RRSWG) transitioned into the Regional Standards Group (RSG). Comprised of the NERC Vice President of Standards and Training and the Standards Managers from each of the eight Regional Entities, the RSG reports to the ERO Executive Management Group (EMG). Its purpose is to provide process and policy recommendations in the execution of the Regional Entity delegation agreements and the NERC Rules of Procedure. An overarching objective is to coordinate the development of Regional and continent-wide standards to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners and operators.

In support of this purpose and this objective, a primary initiative of the RSG is to create and sustain viable standards development coordination processes to obtain consistency and uniformity, where appropriate, across the ERO enterprise – NERC and the Regional Entities – while ensuring efficient and effective use of resources in executing the statutory responsibilities of the ERO as the reliability standards development authority. To that end, the RSG developed a combined list of all regional standards and variances in the development process in order to prioritize these projects continent-wide. This will allow NERC to coordinate the necessary resources through the development and ultimate filing of these standards and variances with applicable regulatory authorities. Project information for each of those regional standards and variances in the development process is provided in this Plan, along with a high-level overview of the project timeline.

Rapid Development and Rapid Revision Projects

NERC's Standards Committee (SC) tentatively has identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010-05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can address an interpretation request more effectively than an interpretation can alone, the team may propose to the requester that the team instead make such changes and submit them with an associated SAR. If agreed to by the requester, and following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its Rules of Procedure, NERC has committed to review each of its standards for modification once every five years. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. While not giving the appearance of being onerous, this obligation has proved challenging to meet. The work load of the ERO remains high, and maintaining focus on those projects that are most beneficial to reliability has resulted in a delay of the work required for these five-year reviews (except when already associated with a project of significant reliability value). Using current assumptions, the five-year review obligation will not be met for a number of standards. NERC and the SC are working together with the NERC Board of Trustees to evaluate options for addressing this issue.

Product Quality

As NERC's and the industry's experience with standards has evolved, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and efficiently. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress

in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global "portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity. Additionally, the plan was developed with the use of a subjective review of the implications of cost. NERC believes this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the Tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standards based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capacity of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems generally were not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Regulatory Submission - Following adoption by NERC's Board of Trustees, the standards are submitted to regulatory authorities.

- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any necessary supplemental regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). The Regional Work Plan is included as Appendix 3. A detailed summary of projects, including regional projects, is included as Appendix 4.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active Projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact all three of these areas in some way, this is intended to illustrate the primary consideration driving each project's development priority.

Existing Active Projects:

- 2006-06 Reliability Coordination.
- 2007-02 Operating Personnel Communication Protocols.
- 2007-03 Real-time Transmission Operations.
- 2007-06 Protection System Coordination.
- 2007-07 Vegetation Management. This project is expected to be completed in early 2012, but at the time of this document's finalization, it has not yet been formally completed.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response.
- 2007-17 Protection System Maintenance and Testing.
- 2008-06 Cyber Security – Order 706.
- 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-07 Generator Requirements at the Transmission Interface.
- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves.
- 2010-17 Definition of Bulk Electric System.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited

number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such as new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project is currently in informal development.
- 2009-03 Emergency Operations. This project is currently in informal development.
- 2010-01 Support Personnel Training. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project is currently in informal development. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization.
- 2012-04 Protection System Commissioning Testing. This project is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.

NERC intends to initiate development of the following projects in 2013. As noted above, these projects generally have been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is currently in informal development.
- 2008-01 Voltage and Reactive Planning and Control. This project is currently in informal development.
- 2008-12 Coordinate Interchange Standards. This project is currently in informal development.
- 2009-07 Reliability of Protection Systems. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until after the completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is currently in informal development.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project requires research prior to initiation, which is expected to be completed in the latter part of 2012.
- 2012-06 Generator Capabilities. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project requires research prior to initiation, which is expected to be completed in 2013.
- 2009-05 Resource Adequacy Assessments.
- 2010-03 Modeling Data. This project requires research prior to initiation, which is expected to be completed in the latter part of 2013.
- 2010-04 Demand Data. This project requires research prior to initiation, which is expected to be completed in 2014.
- 2010-08 Functional Glossary Model Revisions.

- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is expected to not start until completion of the previous phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator.
- 2012-05 ATC Revisions - Order 729.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority. There also is some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan that follows as Appendix 2.

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization

RELIABILITY SORT

Project Number and Name	Short Description	(E) **Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	(F) **Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) **Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) **Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) **Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) **Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	(K) **Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) **Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) **Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) **Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	7	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	6	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	2	29
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	3	7
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	14	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	11	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	12	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	9	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	19	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	37	41
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	4	3
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	16	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	15	25
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	8	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	20	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	22	20
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	41	43
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	10	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	17	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	18	19
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	36	40

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	40	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	42	44
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	13	31
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	38	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	39	24
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	21	33
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	32
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization

TIME SENSITIVITY SORT

Project Number and Name	Short Description	(E) Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	(F) Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	(K) Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	14	25
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	16	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	17	20
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	18	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	19
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	31
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	41
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	43
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	40
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative, BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13

6. Determining Projects for Each Program 6
7. Adding New Projects Intra-year and Adjusting Project Priority 6

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

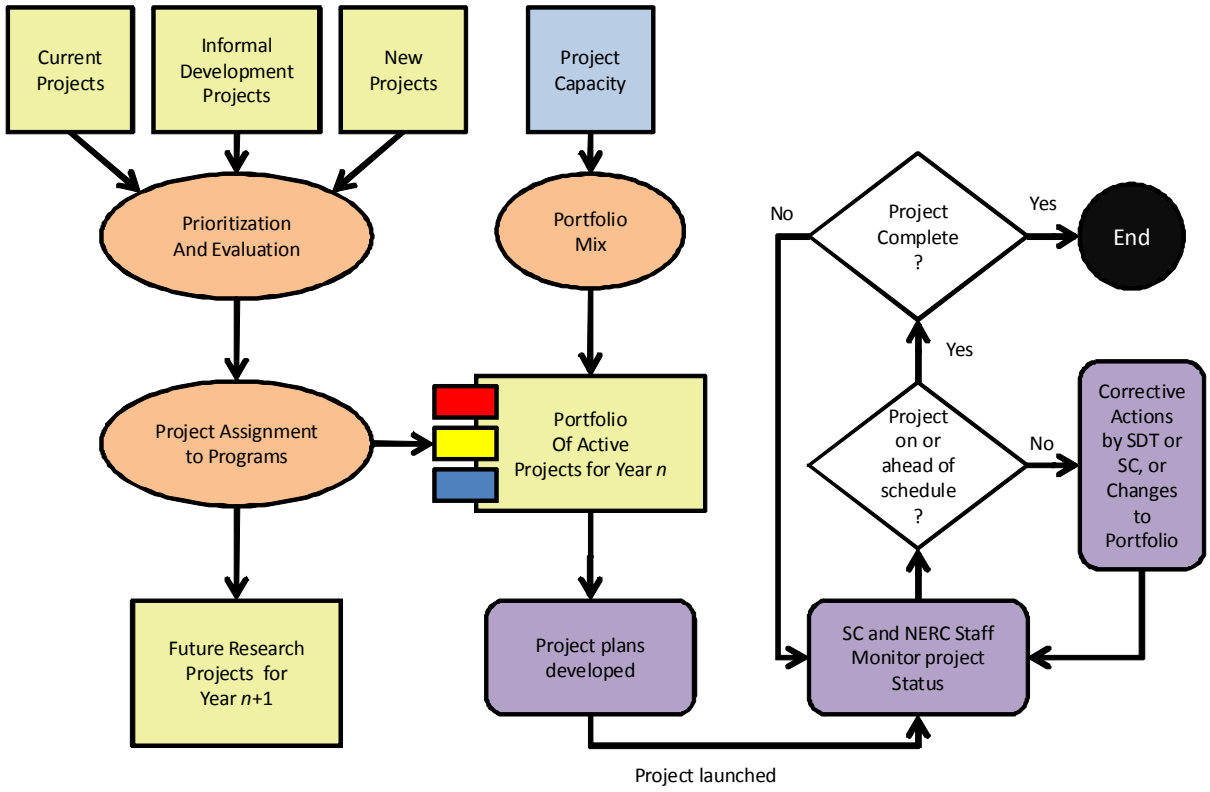
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

Attachment B: Prioritization Tool

STANDARDS COMMITTEE Reliability Standard Project Prioritization			(E) Click Here to Insert a Row	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	SUMMARY						7	25	3	3

1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

Appendix 4 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity;
- Move the requirement (into another project or Standard, or to the certification process); or
- Eliminate the requirement (because it is redundant or does not support BPS reliability).

This project ranked #13 in Reliability Priority.

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. No estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to real-time operating states and protocols for issuing and responding to operating directives.

This project ranked #5 in Reliability Priority.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Due to focusing on other priorities, this team was temporarily put on hold. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

This project ranked #5 in Practicality Priority.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to other standards as appropriate through coordination with project 2006-06 Reliability Coordination.

This project ranked #4 in Reliability Priority.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, which were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltage transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It also will ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were posted most recently for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained within the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It also will ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

This project is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

This project ranked #3 in Reliability Priority.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

This project ranked #3 in practicality.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery will be reviewed and addressed.

This project ranked #14 in Reliability Priority.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

This project ranked #2 in Reliability Priority.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator, or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project also will consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

This project ranked #8 in Reliability Priority.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

This project ranked #1 in Practicality Priority.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

This project ranked #4 in Practicality Priority.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

This project ranked #1 in Reliability Priority.

Standards affected:

New

Status:

This project has an initial draft of a SAR that was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

This project ranked #15 in Reliability Priority.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

This project ranked #7 in Reliability Priority.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

This project ranked #11 in Reliability Priority.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

This project ranked #12 in Reliability Priority, #13 in Practicality Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARs associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

This project ranked #10 in Reliability Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings, and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

This project ranked #9 in Reliability Priority,

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

This project ranked #6 in Reliability Priority

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision that, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE DEVELOPMENT

PRC-002-FRCC-1 — FRCC Regional Disturbance Monitoring and Reporting Requirements

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Disturbance Monitoring Equipment" (revision dated June, 2006) into a new Regional Reliability Standard that complies with the requirements of NERC Reliability Standard, PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements.

Standards affected:

PRC-002-1

Status:

This Regional project is currently on "hold." Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-11 Disturbance Monitoring being classified as a "Project in Informal Development," FRCC staff will be re-evaluating the current status of the regional project to determine whether to proceed with the Regional Reliability Standard development or to revise the current FRCC Regional Criteria document "FRCC Requirements for Disturbance Monitoring Equipment."

FUTURE DEVELOPMENT

PRC-003-FRCC-1 — FRCC Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems

Summary:

FRCC plans to convert the existing handbook document "FRCC Requirements for Analysis of Protection Misoperations & Corrective Actions Reporting" (revision dated October, 2003) into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

Standards affected:

PRC-003-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC has revised Regional Criteria documents ("FRCC Requirements for Analysis of Protection Misoperations and Corrective Actions Reporting," revision dateed December 2, 2010) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

FUTURE DEVELOPMENT

PRC-006-FRCC-1 — FRCC Automatic Underfrequency Load Shedding Program

Summary:

FRCC is developing a Regional Reliability Standard to provide last resort system preservation measures by implementing an Underfrequency Load Shedding (UFLS) program. Additional requirements may be needed due to FRCC peninsular geography and limited ties to the north. Operating experience and decades of studies by the FRCC and its predecessor reliability organizations have resulted in a well-developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. The standard development project will effectively use the proven high performance characteristics of the existing FRCC UFLS program and refine its requirements and coordination procedures to comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

Standards affected:

PRC-006-1

Status:

PRC-006-FRCC-1 FRCC Automatic Underfrequency Load Shedding Program has been approved by the FRCC Registered Ballot Body and the FRCC Board of Directors. Based on concerns identified by NERC standards staff and the pending Commission (FERC) approval of the NERC Continent-Wide Reliability Standard PRC-006-1 Automatic Underfrequency Load Shedding and associated Regional variances, the Regional project has been placed on “hold.” The FRCC has since revised Regional Criteria documents (FRCC Automatic Underfrequency Load Shedding Program, revision date: April 7, 2011) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

FUTURE DEVELOPMENT

PRC-024-FRCC-1 — FRCC Regional Generator Performance During Frequency and Voltage Excursions

Summary:

FRCC is developing a standard to establish "ride through" requirements for generators in the FRCC Region with respect to temporary grid voltage or frequency deviations from their normal range. The Standard should address time duration limits for operation of generator protection for

1) frequencies outside of the 59.5 - 60.5 hertz range,
2) voltages outside of the 95% - 105% range, and
3) generator stator current overloads.

The Standard should address exemption criteria and mitigation measures available for resolving apparent conflicts between generator capabilities and the coordination requirements. Considerable knowledge of grid frequency and voltage excursions and the time limited capabilities of generators to sustain these conditions has been gained through operating experience and previous reliability studies. This standards development project should effectively use this knowledge to define coordination requirements and procedures that comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Standards affected:

PRC-024-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-09 Generator Verification being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC is actively revising Regional Criteria documents (FRCC Generator Coordination Requirements) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

2012 DEVELOPMENT

PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Program

Summary:

The purpose of this Standard is to establish the requirements for NPCC and its members to operate and maintain a coordinated Regional Underfrequency load shedding (UFLS) program. The NPCC's UFLS program will meet the requirements contained in NERC standards, and provide those entities to which it is applicable the guidance necessary to implement it. This standard will also mandate that coordination with neighboring Regional Underfrequency load shedding programs be developed when necessary. The unique character, dispersion, sensitivity and density of the NPCC regional loads emphasize the need for this Standard.

The NPCC regional UFLS standard shall apply to all applicable entities within the Region and sub-regional areas that are both synchronous and asynchronous to the Eastern Interconnection. Quebec UFLS has different parameters, and these are included in the standard and fully coordinated within the Region.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. NPCC expects to complete the drafting of this standard in 2011 and conduct a ballot of stakeholders in the first quarter of 2012. Submission to the NERC Board of Trustees and subsequent filing with FERC is expected to occur in 2012.

FUTURE DEVELOPMENT

PRC-012-NPCC-1 — Special Protection Systems

Summary:

To support and enhance bulk power system reliability, this Standard will establish the criteria for the minimum design objectives and practices for special protection systems (the purpose of which are to detect abnormal system conditions, and take corrective actions other than the isolation of faulted elements to maintain the stability and security of the bulk power system). This Standard will also establish the requirements for close coordination between system planning, design, operating, maintenance and protection functions to ensure that the impacts of special protection system operations do not result in a significant adverse impact.

The proposed Standard will describe the requirements for the design and approval of Special Protection Systems and the technical criteria required to support its implementation. The Standard will also identify the need for close coordination among various parties to ensure that the Special Protection Systems are implemented correctly, and triggers and resulting actions are made known and communicated in an on-line database.

Standards affected:

PRC-012-0

Status:

This Regional project is currently on “hold” pending the completion of the NERC Reliability Standard Development Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS, and the outcome of the work by the NERC SPCS on the definition of SPS.

2011 DEVELOPMENT

MOD-024-RFC-1 — Verification and Data Reporting of Generator Gross and Net Real Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Real Power capability to support NERC Reliability Standard MOD-024. The objective of the regional standard is to ensure accurate information on generator gross and net Real (MWs) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-024-1

Status:

This Regional standard has been approved by the Reliability*First* Board. Currently, VRFs and VSLs are in development. Reliability*First* expects to complete the drafting of the VRFs and VSLs in 2011, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2011 DEVELOPMENT

MOD-025-RFC-1 — Verification and Data Reporting of Gen Gross and Net Reactive Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Reactive Power capability to support NERC Reliability Standard MOD-025. The objective of this standard is to ensure that accurate information on generator gross and net Reactive (MVAR) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-025-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with the FERC is expected to occur in 2012.

2011 DEVELOPMENT

PRC-002-RFC-1 — Disturbance Monitoring and Reporting Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for Disturbance monitoring and reporting to support NERC Reliability Standard PRC-002.

Standards affected:

PRC-002-1

Status:

Reliability*First* is currently working on the technical justification for the locational requirements for DME equipment. This Regional standard has been approved by the Reliability*First* Board. Reliability*First* expects submission of this standard to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2012 DEVELOPMENT

PRC-006-RFC-1 — Automatic Under Frequency Load Shedding Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency and assist in the recovery of frequency following underfrequency events, providing last resort system preservation measures. The standard goes beyond the NERC PRC-006-1 standard and prescribes with more certainty aspects that the Planning Coordinator's UFLS program must contain, further details on certain procedural matters with respect to how islands are addressed, and assessment of UFLS program implementation as well as program design. This standard also attempts further consolidating requirements of the Reliability*First* legacy underfrequency load shedding programs, permitting retirement of legacy documents to ensure appropriate coordination among the Reliability*First* legacy regional UFLS programs.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur later in 2012.

2012 DEVELOPMENT

PRC-012-RFC-1 — Special Protection System Requirements

Summary:

To purpose of the standard is to establish Reliability*First* requirements for the review, development and application of Special Protection Systems (SPS).

Standards affected:

PRC-012-0

Status:

This Regional project is currently in the initial drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur early in 2013.

2011 DEVELOPMENT

PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

Summary:

The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

In 2008, SERC commenced work on PRC-006-SERC-1. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the continent-wide UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. This regional standard PRC-006-SERC-1 adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Standards affected:

PRC-006-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011, and subsequent filing with FERC is expected to occur in 2012.

2012 DEVELOPMENT

PRC-006-SPP-1 — Under Frequency Load Shedding

Summary:

PRC-006 (Development and Documentation of Regional UFLS programs) has been identified by NERC as one of the Regional "Fill-in-the Blank" Standards. At a minimum, the requirements developed in this standard need to meet the requirements for the Regional Program as identified in NERC's PRC-006-0. Operating experience and regional studies have resulted in a well developed UFLS program that is very resilient to frequency excursions resulting from severe and extreme contingencies. This standards development effort intends to effectively use the proven high performance characteristics of the existing SPP UFLS program and refine its requirements and coordination procedures through an open process as described in the SPP Standard Development Process Manual.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. SPP expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

Summary:

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with certain existing non-routine ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Standards affected:

IRO-006-5 (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of IRO-006-5.)

Status:

This Regional Standard was approved by the Texas RE Board of Directors on June 28, 2011, and it will be submitted to the NERC Board of Trustees in November 2011. Subsequent filing with FERC is expected to occur in 2012.

2011 DEVELOPMENT

BAL-001-TRE-1 — Primary Frequency Response in the ERCOT Region

Summary:

This Regional Standard is intended to support reliability by ensuring adequate primary frequency response performance in the ERCOT Interconnection. The standard addresses frequency response at the Interconnection level, as well as by individual generating units and facilities. Specific maximum governor droop and deadband settings are provided, along with primary frequency response performance standards (initial and sustained) that allow actual unit-specific performance to be measured.

In 2002, NERC approved a regional difference for ERCOT that made it exempt from Requirement R2 in BAL-001-0 (CPS2), because of ERCOT's lack of synchronous connection to other control areas and the nature of the ERCOT energy market. FERC approved the ERCOT regional difference, finding that ERCOT's practice of (a) determining the minimum frequency response needed for reliability, and (b) requiring generators to have specific governor droop, to be a more stringent practice than Requirement R2 in BAL-001-0. FERC directed NERC to file a modification of the ERCOT regional difference to include the requirements concerning frequency response contained in section 5 of the ERCOT protocols. This Regional Standard is responsive to that directive.

Standards affected:

BAL-001-0.1a (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of the continent-wide standard.)

Status:

This project has been approved by the Texas RE Board of Directors, with expected submission to the NERC Board of Trustees in 2011 and subsequent filing with FERC to occur in 2012.

2012 DEVELOPMENT

BAL-002-WECC-1 — Contingency Reserves

Summary:

On Oct. 21, 2010, FERC found that BAL-002-WECC-1 did not meet the statutory criteria for approval and remanded the regional standard to NERC/WECC for further modification (RM09-15-000; Order 740). FERC held that BAL-002-WECC-1's less stringent requirements had not been supported by the technical data provided.

On remand, the Commission instructed WECC to modify the regional reliability standard to include a number of specific items contained in Order 740. This Request is submitted with the specific and narrow purpose of addressing only those issues mandated for modification in the October 2010 Oder 740.

Standards affected:

BAL-002-WECC-1

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2012 DEVELOPMENT

BAL-004-WECC-1 — Automatic Time Error Correction

Summary:

In the order approving BAL-004-WECC-1 the FERC directed WECC to make several clarifying modifications to the standard. FERC directed WECC to use the FERC-approved Process for Developing and Approving WECC standards to make these clarifying modifications

In addition, the WECC staff has identified the opportunity to make additional modifications to the existing standard to clarify the intent without changing the requirements.

There is also confusion regarding the R3 requirement that the ACE used for NERC reports shall be the same ACE as the AGC operating mode in use. This seems to conflict with the NERC response to NOPR comments that entities may use ATEC ACE for control but should use Raw ACE for reporting. WECC is developing a proposed regional variance to BAL-001-0.1a to address this apparent conflict.

Standards affected:

BAL-004-WECC-1
BAL-001-0.1a

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

VAR-001-WECC-1 — Voltage and Reactive Control

Summary:

The current draft has been converted from a Standard into a Regional Variance to the NERC VAR-001-2 Standard. The format incorporates the NERC Standard into the document with minor additions to address the scope of the variance. The regional variance specifics are included as Section E of the proposed document (see hyperlink above), and in this case, are intended to replace NERC VAR-001-2 requirements R3 and R4 as noted at the beginning of Section E.

The purpose of this regional variance to a NERC Reliability Standard is to ensure that voltage levels are within limits in real time to protect equipment and the reliable operation of the Western Interconnection. The "Rules of Procedure of the North American Electric Reliability Corporation" (Appendix 3A, page 31) permits the development of a regional variance to a NERC reliability standard on an Interconnection-wide basis when the Regional Reliability Organization has valid justification and when the variance is not inconsistent with or less stringent than the NERC Reliability Standard. The variance is an alternative method for obtaining the same reliability objective as the continent standard and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the electric reliability organization governmental authority, shall be enforced within the applicable Regional Entity(ies) pursuant to delegated authority.

Standards affected:

VAR-001-2

Status:

This Regional project has been approved by the WECC Board of Directors. WECC expects to submit the draft for the mandatory NERC 45-day comment period in the near future, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and the implementation of projects in general
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 shows the Regional Work Plan in Gantt chart form
- Appendix 4 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President of Standards and Training

To: NERC's Board of Trustees, Stakeholders, Regulatory Authorities, and other interested parties

NERC is committed to the development of clear, technically excellent standards for the reliable planning and operation of the North American bulk power system. NERC's industry-based standard development process strives to leverage the knowledge and experience of subject-matter experts to develop stakeholder consensus in support of standards that achieve reliability objectives and are responsive to regulatory directives, balanced against the burdens and costs of compliance imposed upon the more than 1,900 entities that are now subject to these standards. No single standard can ensure this outcome. Rather, NERC strives to develop and enhance a portfolio of performance, risk-mitigation, and competency-based reliability standards that achieve a consistent defense in depth against credible events that may lead to cascading, uncontrolled separation, or instability and ensure prompt system restoration when extreme events occur.

Achieving this balance is intrinsically difficult. Just as the management of the reliability "bar" through enforceable standards is an ongoing and evolving process, the process for developing standards needs to evolve as well, in response to the learning that has occurred in the period since passage of the Energy Policy Act of 2005 and the initial enforcement of NERC standards in June 2007. We would like to use this message to highlight current achievements in the standards arena and our plans for 2012-2014, as well as certain emerging factors and concerns.

NERC's Reliability Standards Development Plan delivered the following results in 2011:

- As of November 1, 2011, 20 new or revised standards have been approved by the Board of Trustees, and are either filed or in the process of being filed with the FERC.
- Results Based Standard development principles were used for all new standards projects.
- The Standards Committee worked with NERC staff to prioritize standards development resources on twelve high priority projects. There has been no specific redirection of this effort relative to the selected priorities by regulatory authorities.
- Stakeholder-driven Quality Review has been integrated into the standards development process to assure the best quality standards from a compliance and implementation perspective.
- NERC undertook a first effort to develop a standard on a Rapid Development basis utilizing the new Standard Processes Manual.

- To balance the resources committed to the development of new standards versus the interpretation of existing standards, the Standards Committee has limited the number of interpretations under active development to three projects at any one time, while pursuing new procedural options such as "rapid revision" to correct deficiencies in the underlying standard.

The 2012-14 Reliability Standards Development Plan described in this report builds on recent experience by proposing an achievable yet ambitious plan of standards development. The 2012-14 Plan provides for:

- Continuation of ongoing standards projects with sufficient resources to ensure timely completion.
- Project priorities were established using a more comprehensive model with scores and explanatory inputs from the Standards Committee, NERC staff and industry stakeholders.
- Projects have been ranked for development priority along three tracks, based on consideration of Reliability Benefits, Time Sensitivity, and Practicality.
- As ongoing projects are completed, we are scheduling follow-on projects based on the availability of subject-matter experts and the completion of technical input, research, and industry outreach conducted by NERC's standing committees and subcommittees.
- Finally, the 2012-14 Plan incorporates a more comprehensive integration of the regional standards effort into this process. For the first time a complete project management process is being applied to regional standards development.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, a wide variety of electric system events and emerging risks to bulk power system reliability may necessitate deviations from this plan. In order to respond to such threats and initiate development of new or revised standards, the actual deployment of resources to staff this plan may shift. Additionally, the estimated times listed for project completion may change as more is learned about a given project.

NERC currently is investigating the following "emerging issues," each of which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Not every issue is addressable or best addressed through development of a new industry standard; the issues outlined above illustrate that truism. But where a standards related response is indicated, we will be ready to reprioritize and adjust.

The Standards Committee and NERC staff also recognize that major standards process efficiencies are still necessary if we are to make efficient use of NERC and industry resources, while meeting external expectations for the timely development and approval of technically excellent reliability standards. In 2012, we need to ask ourselves once again, "is there a better way to develop reliability standards?"

We achieve the past results and plan for the future results only with your support, and greatly appreciate that the industry has accepted the evolving prioritization process. Our efforts to effectively manage and balance the many conflicting demands placed upon both the industry and NERC staff resources has provided this next plan, which we hope you will endorse.

Each of us, day in and day out, is driven to do the "right" thing, and your ERO's reputation will be enhanced through your active support for completion of NERC's 2012-14 Reliability Standards Development Plan.

Sincerely,

Allen Mosher
Senior Director of Policy Analysis and Reliability, American Public Power Association
Chair, NERC Standards Committee

Herb Schrayshuen
Vice President of Standards and Training, NERC

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of interest to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come;
- Status updates regarding standards and related projects currently in development;
- A forecast of Standards Development work scheduled for the next three years; and
- An overview of the process used to prioritize work and assign resources to Standards development projects.

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels initially identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, other priorities may necessitate deviations from this plan. As new technologies are discovered or new threats to reliability identified, the actual deployment of resources to staff this plan may shift. Similarly, the estimated times listed for project completion may change as more is learned about a given project.

NERC is currently investigating the following "emerging issues," which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process, Standards Development, and Regional Standards teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development

- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 continent-wide Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

[1] The data included in this paragraph does not include Regional Reliability Standards.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year in accordance with Section 321.6 of the NERC Rules of Procedure ("Rule 321") that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Regional Standards Development

Regional standards work within NERC and the Regions has seen a great deal of development and implementation of new initiatives since the beginning of 2011. First, the Regional Reliability Standards Working Group (RRSWG) transitioned into the Regional Standards Group (RSG). Comprised of the NERC Vice President of Standards and Training and the Standards Managers from each of the eight Regional Entities, the RSG reports to the ERO Executive Management Group (EMG). Its purpose is to provide process and policy recommendations in the execution of the Regional Entity delegation agreements and the NERC Rules of Procedure. An overarching objective is to coordinate the development of Regional and continent-wide standards to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners and operators.

In support of this purpose and this objective, a primary initiative of the RSG is to create and sustain viable standards development coordination processes to obtain consistency and uniformity, where appropriate, across the ERO enterprise – NERC and the Regional Entities – while ensuring efficient and effective use of resources in executing the statutory responsibilities of the ERO as the reliability standards development authority. To that end, the RSG developed a combined list of all regional standards and variances in the development process in order to prioritize these projects continent-wide. This will allow NERC to coordinate the necessary resources through the development and ultimate filing of these standards and variances with applicable regulatory authorities. Project information for each of those regional standards and variances in the development process is provided in this Plan, along with a high-level overview of the project timeline.

Rapid Development and Rapid Revision Projects

NERC's Standards Committee (SC) tentatively has identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010-05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can address an interpretation request more effectively than an interpretation can alone, the team may propose to the requester that the team instead make such changes and submit them with an associated SAR. If agreed to by the requester, and following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its Rules of Procedure, NERC has committed to review each of its standards for modification once every five years. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. While not giving the appearance of being onerous, this obligation has proved challenging to meet. The work load of the ERO remains high, and maintaining focus on those projects that are most beneficial to reliability has resulted in a delay of the work required for these five-year reviews (except when already associated with a project of significant reliability value). Using current assumptions, the five-year review obligation will not be met for a number of standards. NERC and the SC are working together with the NERC Board of Trustees to evaluate options for addressing this issue.

Product Quality

As NERC's and the industry's experience with standards has evolved, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and efficiently. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress

in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global "portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity. Additionally, the plan was developed with the use of a subjective review of the implications of cost. NERC believes this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the Tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standards based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capacity of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems generally were not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Regulatory Submission - Following adoption by NERC's Board of Trustees, the standards are submitted to regulatory authorities.

- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any necessary supplemental regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). The Regional Work Plan is included as Appendix 3. A detailed summary of projects, including regional projects, is included as Appendix 4.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active Projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact all three of these areas in some way, this is intended to illustrate the primary consideration driving each project's development priority.

Existing Active Projects:

- 2006-06 Reliability Coordination.
- 2007-02 Operating Personnel Communication Protocols.
- 2007-03 Real-time Transmission Operations.
- 2007-06 Protection System Coordination.
- 2007-07 Vegetation Management. This project is expected to be completed in early 2012, but at the time of this document's finalization, it has not yet been formally completed.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response.
- 2007-17 Protection System Maintenance and Testing.
- 2008-06 Cyber Security – Order 706.
- 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-07 Generator Requirements at the Transmission Interface.
- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves.
- 2010-17 Definition of Bulk Electric System.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited

number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such as new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project is currently in informal development.
- 2009-03 Emergency Operations. This project is currently in informal development.
- 2010-01 Support Personnel Training. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project is currently in informal development. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization.
- 2012-04 Protection System Commissioning Testing. This project is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.

NERC intends to initiate development of the following projects in 2013. As noted above, these projects generally have been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is currently in informal development.
- 2008-01 Voltage and Reactive Planning and Control. This project is currently in informal development.
- 2008-12 Coordinate Interchange Standards. This project is currently in informal development.
- 2009-07 Reliability of Protection Systems. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until after the completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is currently in informal development.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project requires research prior to initiation, which is expected to be completed in the latter part of 2012.
- 2012-06 Generator Capabilities. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project requires research prior to initiation, which is expected to be completed in 2013.
- 2009-05 Resource Adequacy Assessments.
- 2010-03 Modeling Data. This project requires research prior to initiation, which is expected to be completed in the latter part of 2013.
- 2010-04 Demand Data. This project requires research prior to initiation, which is expected to be completed in 2014.
- 2010-08 Functional Glossary Model Revisions.

- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is expected to not start until completion of the previous phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator.
- 2012-05 ATC Revisions - Order 729.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority. There also is some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan that follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization

RELIABILITY SORT

Project Number and Name	Short Description	(E) **Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	(F) **Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) **Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) **Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) **Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) **Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	(K) **Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) **Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) **Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) **Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	7	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	6	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	2	29
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	3	7
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	14	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	11	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	12	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	9	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	19	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	37	41
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	4	3
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	16	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	15	25
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	8	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	20	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	22	20
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	41	43
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	10	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	17	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	18	19
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	36	40

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	40	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	42	44
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	13	31
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	38	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	39	24
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	21	33
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	32
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12

STANDARDS COMMITTEE Reliability Standard Project Prioritization

TIME SENSITIVITY SORT

Project Number and Name	Short Description	(E) Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	(F) Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	(K) Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	14	25
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	16	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	17	20
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	18	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	19
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	31
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	41
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	43
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	40
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative, BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13

Attachment A – Project Prioritization Tool Details 9

Attachment B: Prioritization Tool 13

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

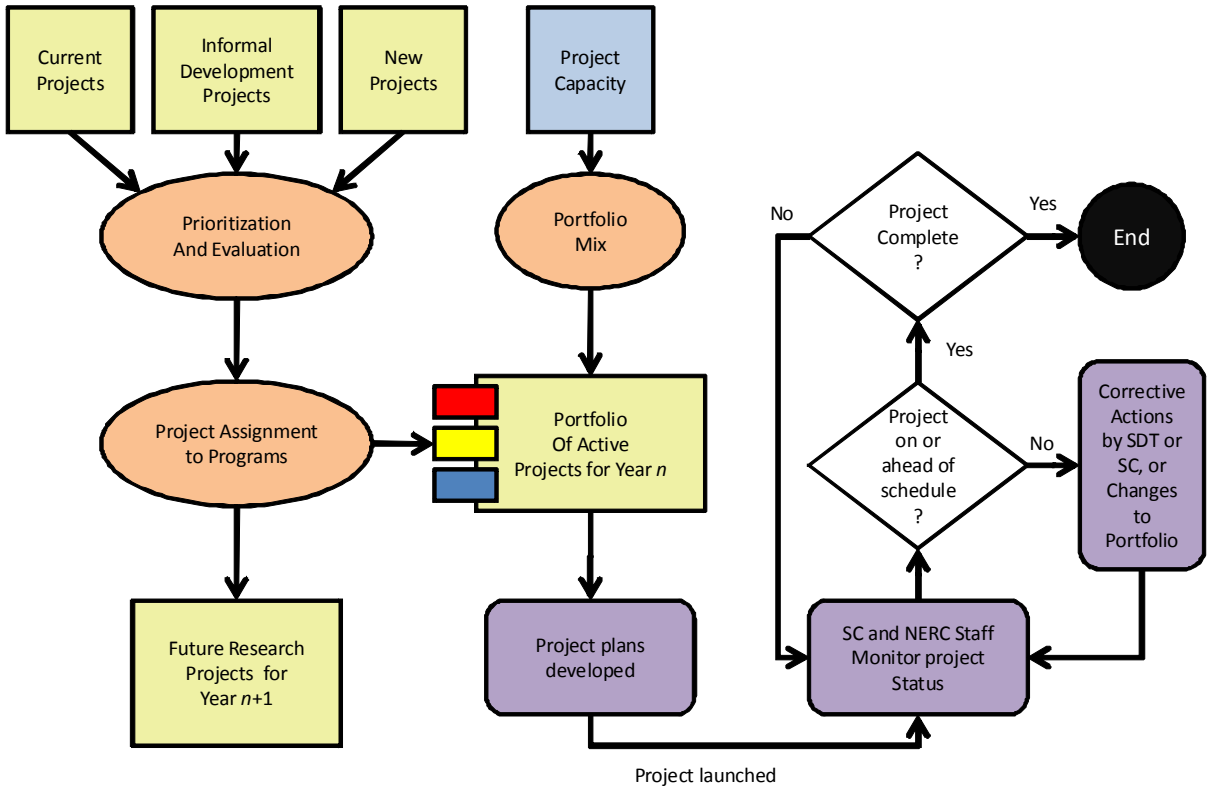
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

TOTAL RANKING	Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Total Score (0-600)	TOTAL RANKING	Relaibity Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Rnaking
1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

ID	Task Name

Appendix 4 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity;
- Move the requirement (into another project or Standard, or to the certification process); or
- Eliminate the requirement (because it is redundant or does not support BPS reliability).

This project ranked #13 in Reliability Priority.

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. No estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to real-time operating states and protocols for issuing and responding to operating directives.

This project ranked #5 in Reliability Priority.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Due to focusing on other priorities, this team was temporarily put on hold. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

This project ranked #5 in Practicality Priority.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to other standards as appropriate through coordination with project 2006-06 Reliability Coordination.

This project ranked #4 in Reliability Priority.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, which were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltage transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It also will ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were posted most recently for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained within the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It also will ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

This project is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

This project ranked #3 in Reliability Priority.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

This project ranked #3 in practicality.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery will be reviewed and addressed.

This project ranked #14 in Reliability Priority.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

This project ranked #2 in Reliability Priority.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator, or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project also will consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

This project ranked #8 in Reliability Priority.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

This project ranked #1 in Practicality Priority.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

This project ranked #4 in Practicality Priority.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

This project ranked #1 in Reliability Priority.

Standards affected:

New

Status:

This project has an initial draft of a SAR that was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

This project ranked #15 in Reliability Priority.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

This project ranked #7 in Reliability Priority.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

This project ranked #11 in Reliability Priority.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

This project ranked #12 in Reliability Priority, #13 in Practicality Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARs associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

This project ranked #10 in Reliability Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings, and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

This project ranked #9 in Reliability Priority,

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

This project ranked #6 in Reliability Priority

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision that, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE DEVELOPMENT

PRC-002-FRCC-1 — FRCC Regional Disturbance Monitoring and Reporting Requirements

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Disturbance Monitoring Equipment" (revision dated June, 2006) into a new Regional Reliability Standard that complies with the requirements of NERC Reliability Standard, PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements.

Standards affected:

PRC-002-1

Status:

This Regional project is currently on "hold." Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-11 Disturbance Monitoring being classified as a "Project in Informal Development," FRCC staff will be re-evaluating the current status of the regional project to determine whether to proceed with the Regional Reliability Standard development or to revise the current FRCC Regional Criteria document "FRCC Requirements for Disturbance Monitoring Equipment."

FUTURE DEVELOPMENT

PRC-003-FRCC-1 — FRCC Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems

Summary:

FRCC plans to convert the existing handbook document "FRCC Requirements for Analysis of Protection Misoperations & Corrective Actions Reporting" (revision dated October, 2003) into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

Standards affected:

PRC-003-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC has revised Regional Criteria documents ("FRCC Requirements for Analysis of Protection Misoperations and Corrective Actions Reporting," revision dateed December 2, 2010) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

FUTURE DEVELOPMENT

PRC-006-FRCC-1 — FRCC Automatic Underfrequency Load Shedding Program

Summary:

FRCC is developing a Regional Reliability Standard to provide last resort system preservation measures by implementing an Underfrequency Load Shedding (UFLS) program. Additional requirements may be needed due to FRCC peninsular geography and limited ties to the north. Operating experience and decades of studies by the FRCC and its predecessor reliability organizations have resulted in a well-developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. The standard development project will effectively use the proven high performance characteristics of the existing FRCC UFLS program and refine its requirements and coordination procedures to comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

Standards affected:

PRC-006-1

Status:

PRC-006-FRCC-1 FRCC Automatic Underfrequency Load Shedding Program has been approved by the FRCC Registered Ballot Body and the FRCC Board of Directors. Based on concerns identified by NERC standards staff and the pending Commission (FERC) approval of the NERC Continent-Wide Reliability Standard PRC-006-1 Automatic Underfrequency Load Shedding and associated Regional variances, the Regional project has been placed on “hold.” The FRCC has since revised Regional Criteria documents (FRCC Automatic Underfrequency Load Shedding Program, revision date: April 7, 2011) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

FUTURE DEVELOPMENT

PRC-024-FRCC-1 — FRCC Regional Generator Performance During Frequency and Voltage Excursions

Summary:

FRCC is developing a standard to establish "ride through" requirements for generators in the FRCC Region with respect to temporary grid voltage or frequency deviations from their normal range. The Standard should address time duration limits for operation of generator protection for

1) frequencies outside of the 59.5 - 60.5 hertz range,
2) voltages outside of the 95% - 105% range, and
3) generator stator current overloads.

The Standard should address exemption criteria and mitigation measures available for resolving apparent conflicts between generator capabilities and the coordination requirements. Considerable knowledge of grid frequency and voltage excursions and the time limited capabilities of generators to sustain these conditions has been gained through operating experience and previous reliability studies. This standards development project should effectively use this knowledge to define coordination requirements and procedures that comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Standards affected:

PRC-024-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-09 Generator Verification being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC is actively revising Regional Criteria documents (FRCC Generator Coordination Requirements) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

2012 DEVELOPMENT

PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Program

Summary:

The purpose of this Standard is to establish the requirements for NPCC and its members to operate and maintain a coordinated Regional Underfrequency load shedding (UFLS) program. The NPCC's UFLS program will meet the requirements contained in NERC standards, and provide those entities to which it is applicable the guidance necessary to implement it. This standard will also mandate that coordination with neighboring Regional Underfrequency load shedding programs be developed when necessary. The unique character, dispersion, sensitivity and density of the NPCC regional loads emphasize the need for this Standard.

The NPCC regional UFLS standard shall apply to all applicable entities within the Region and sub-regional areas that are both synchronous and asynchronous to the Eastern Interconnection. Quebec UFLS has different parameters, and these are included in the standard and fully coordinated within the Region.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. NPCC expects to complete the drafting of this standard in 2011 and conduct a ballot of stakeholders in the first quarter of 2012. Submission to the NERC Board of Trustees and subsequent filing with FERC is expected to occur in 2012.

FUTURE DEVELOPMENT

PRC-012-NPCC-1 — Special Protection Systems

Summary:

To support and enhance bulk power system reliability, this Standard will establish the criteria for the minimum design objectives and practices for special protection systems (the purpose of which are to detect abnormal system conditions, and take corrective actions other than the isolation of faulted elements to maintain the stability and security of the bulk power system). This Standard will also establish the requirements for close coordination between system planning, design, operating, maintenance and protection functions to ensure that the impacts of special protection system operations do not result in a significant adverse impact.

The proposed Standard will describe the requirements for the design and approval of Special Protection Systems and the technical criteria required to support its implementation. The Standard will also identify the need for close coordination among various parties to ensure that the Special Protection Systems are implemented correctly, and triggers and resulting actions are made known and communicated in an on-line database.

Standards affected:

PRC-012-0

Status:

This Regional project is currently on “hold” pending the completion of the NERC Reliability Standard Development Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS, and the outcome of the work by the NERC SPCS on the definition of SPS.

2011 DEVELOPMENT

MOD-024-RFC-1 — Verification and Data Reporting of Generator Gross and Net Real Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Real Power capability to support NERC Reliability Standard MOD-024. The objective of the regional standard is to ensure accurate information on generator gross and net Real (MWs) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-024-1

Status:

This Regional standard has been approved by the Reliability*First* Board. Currently, VRFs and VSLs are in development. Reliability*First* expects to complete the drafting of the VRFs and VSLs in 2011, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2011 DEVELOPMENT

MOD-025-RFC-1 — Verification and Data Reporting of Gen Gross and Net Reactive Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Reactive Power capability to support NERC Reliability Standard MOD-025. The objective of this standard is to ensure that accurate information on generator gross and net Reactive (MVAR) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-025-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with the FERC is expected to occur in 2012.

2011 DEVELOPMENT

PRC-002-RFC-1 — Disturbance Monitoring and Reporting Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for Disturbance monitoring and reporting to support NERC Reliability Standard PRC-002.

Standards affected:

PRC-002-1

Status:

Reliability*First* is currently working on the technical justification for the locational requirements for DME equipment. This Regional standard has been approved by the Reliability*First* Board. Reliability*First* expects submission of this standard to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2012 DEVELOPMENT

PRC-006-RFC-1 — Automatic Under Frequency Load Shedding Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency and assist in the recovery of frequency following underfrequency events, providing last resort system preservation measures. The standard goes beyond the NERC PRC-006-1 standard and prescribes with more certainty aspects that the Planning Coordinator's UFLS program must contain, further details on certain procedural matters with respect to how islands are addressed, and assessment of UFLS program implementation as well as program design. This standard also attempts further consolidating requirements of the Reliability*First* legacy underfrequency load shedding programs, permitting retirement of legacy documents to ensure appropriate coordination among the Reliability*First* legacy regional UFLS programs.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur later in 2012.

2012 DEVELOPMENT

PRC-012-RFC-1 — Special Protection System Requirements

Summary:

To purpose of the standard is to establish Reliability*First* requirements for the review, development and application of Special Protection Systems (SPS).

Standards affected:

PRC-012-0

Status:

This Regional project is currently in the initial drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur early in 2013.

2011 DEVELOPMENT

PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

Summary:

The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

In 2008, SERC commenced work on PRC-006-SERC-1. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the continent-wide UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. This regional standard PRC-006-SERC-1 adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Standards affected:

PRC-006-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011, and subsequent filing with FERC is expected to occur in 2012.

2012 DEVELOPMENT

PRC-006-SPP-1 — Under Frequency Load Shedding

Summary:

PRC-006 (Development and Documentation of Regional UFLS programs) has been identified by NERC as one of the Regional "Fill-in-the Blank" Standards. At a minimum, the requirements developed in this standard need to meet the requirements for the Regional Program as identified in NERC's PRC-006-0. Operating experience and regional studies have resulted in a well developed UFLS program that is very resilient to frequency excursions resulting from severe and extreme contingencies. This standards development effort intends to effectively use the proven high performance characteristics of the existing SPP UFLS program and refine its requirements and coordination procedures through an open process as described in the SPP Standard Development Process Manual.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. SPP expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

Summary:

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with certain existing non-routine ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Standards affected:

IRO-006-5 (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of IRO-006-5.)

Status:

This Regional Standard was approved by the Texas RE Board of Directors on June 28, 2011, and it will be submitted to the NERC Board of Trustees in November 2011. Subsequent filing with FERC is expected to occur in 2012.

2011 DEVELOPMENT

BAL-001-TRE-1 — Primary Frequency Response in the ERCOT Region

Summary:

This Regional Standard is intended to support reliability by ensuring adequate primary frequency response performance in the ERCOT Interconnection. The standard addresses frequency response at the Interconnection level, as well as by individual generating units and facilities. Specific maximum governor droop and deadband settings are provided, along with primary frequency response performance standards (initial and sustained) that allow actual unit-specific performance to be measured.

In 2002, NERC approved a regional difference for ERCOT that made it exempt from Requirement R2 in BAL-001-0 (CPS2), because of ERCOT's lack of synchronous connection to other control areas and the nature of the ERCOT energy market. FERC approved the ERCOT regional difference, finding that ERCOT's practice of (a) determining the minimum frequency response needed for reliability, and (b) requiring generators to have specific governor droop, to be a more stringent practice than Requirement R2 in BAL-001-0. FERC directed NERC to file a modification of the ERCOT regional difference to include the requirements concerning frequency response contained in section 5 of the ERCOT protocols. This Regional Standard is responsive to that directive.

Standards affected:

BAL-001-0.1a (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of the continent-wide standard.)

Status:

This project has been approved by the Texas RE Board of Directors, with expected submission to the NERC Board of Trustees in 2011 and subsequent filing with FERC to occur in 2012.

2012 DEVELOPMENT

BAL-002-WECC-1 — Contingency Reserves

Summary:

On Oct. 21, 2010, FERC found that BAL-002-WECC-1 did not meet the statutory criteria for approval and remanded the regional standard to NERC/WECC for further modification (RM09-15-000; Order 740). FERC held that BAL-002-WECC-1's less stringent requirements had not been supported by the technical data provided.

On remand, the Commission instructed WECC to modify the regional reliability standard to include a number of specific items contained in Order 740. This Request is submitted with the specific and narrow purpose of addressing only those issues mandated for modification in the October 2010 Oder 740.

Standards affected:

BAL-002-WECC-1

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2012 DEVELOPMENT

BAL-004-WECC-1 — Automatic Time Error Correction

Summary:

In the order approving BAL-004-WECC-1 the FERC directed WECC to make several clarifying modifications to the standard. FERC directed WECC to use the FERC-approved Process for Developing and Approving WECC standards to make these clarifying modifications

In addition, the WECC staff has identified the opportunity to make additional modifications to the existing standard to clarify the intent without changing the requirements.

There is also confusion regarding the R3 requirement that the ACE used for NERC reports shall be the same ACE as the AGC operating mode in use. This seems to conflict with the NERC response to NOPR comments that entities may use ATEC ACE for control but should use Raw ACE for reporting. WECC is developing a proposed regional variance to BAL-001-0.1a to address this apparent conflict.

Standards affected:

BAL-004-WECC-1
BAL-001-0.1a

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

VAR-001-WECC-1 — Voltage and Reactive Control

Summary:

The current draft has been converted from a Standard into a Regional Variance to the NERC VAR-001-2 Standard. The format incorporates the NERC Standard into the document with minor additions to address the scope of the variance. The regional variance specifics are included as Section E of the proposed document (see hyperlink above), and in this case, are intended to replace NERC VAR-001-2 requirements R3 and R4 as noted at the beginning of Section E.

The purpose of this regional variance to a NERC Reliability Standard is to ensure that voltage levels are within limits in real time to protect equipment and the reliable operation of the Western Interconnection. The "Rules of Procedure of the North American Electric Reliability Corporation" (Appendix 3A, page 31) permits the development of a regional variance to a NERC reliability standard on an Interconnection-wide basis when the Regional Reliability Organization has valid justification and when the variance is not inconsistent with or less stringent than the NERC Reliability Standard. The variance is an alternative method for obtaining the same reliability objective as the continent standard and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the electric reliability organization governmental authority, shall be enforced within the applicable Regional Entity(ies) pursuant to delegated authority.

Standards affected:

VAR-001-2

Status:

This Regional project has been approved by the WECC Board of Directors. WECC expects to submit the draft for the mandatory NERC 45-day comment period in the near future, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

December 21, 2011

VIA ELECTRONIC FILING

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

Re: *North American Electric Reliability Corporation*
Docket No. RM11-18-000

Dear Ms. Bose:

The North American Electric Reliability Corporation ("NERC") hereby submits these comments in response to the Federal Energy Regulatory Commission's ("FERC" or "Commission") October 20, 2011, NOPR, seeking comments regarding a proposed revision to footnote 'b' of Table 1 in four proposed Transmission Planning Reliability Standards TPL-001-1– System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-1b – System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-1a – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-1– System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D). Footnote 'b' appears in all four of the aforementioned TPL standards, however, its relevance and practical applicability is limited to TPL-002-1b — System Performance Following Loss of a Single Bulk Electric System Element (Category B).

Proposed footnote 'b' was developed to address the directives from Order No. 693,[1] as clarified in the Commission's June 11, 2010 order denying rehearing and granting partial clarification.[2] Proposed footnote 'b' enhances the clarity of the proposed Reliability Standards TPL-001-1– System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-1b – System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-1a – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-1– System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D) while better protecting the reliability of the BES. As previously stated, proposed footnote 'b' "represent[s] a significant revision and improvement relative to the current

[1] *Mandatory Reliability Standards for the Bulk-Power System*, 118 FERC ¶ 61,218, FERC Stats. & Regs. ¶31,242 (2007) ("Order No. 693") at P 1773, 1794, 1797. *Order on Reh'g, Mandatory Reliability Standards for the Bulk-Power System*, 120 FERC ¶ 61,053 ("Order No. 693-A") (2007).
[2] *Order Denying Rehearing and Granting Partial Clarification, Denying Request for Stay, and Granting Extension of Time*, 131 FERC ¶ 61,231 (2010). ("June 2010 Order").

set of enforceable standards."[3] NERC further believes that the directive to clarify footnote 'b' issued in Order No. 693 and re-iterated in the June 2010 Order has been addressed by the proposed footnote 'b'. Accordingly, NERC respectfully disagrees with the Commission's proposal to remand footnote 'b'. The Commission should approve footnote 'b' as proposed by NERC in its petition submitted to the Commission on March 18, 2011.

In the NOPR, the Commission expressed three main concerns:

1. *The Commission believes that NERC's proposal does not meet the directives in Order No. 693 and the June 2010 Order and does not clarify or define the circumstances in which an entity can plan to interrupt Firm Demand for a single contingency. Specifically, the Commission is concerned that the procedural and substantive parameters … are too undefined to provide assurances that the process will be effective in determining when it is appropriate to plan for interrupting Firm Demand … and could result in inconsistent results in implementation.*[4]

2. *In proposing a stakeholder process without specification of any technical means by which exceptions are to be evaluated, the proposed footnote effectively turns the processes into a reliability standards development outside of NERC's existing procedures.*[5]

3. *Regardless of the process used, the result could lead to inconsistent reliability requirements within and across reliability regions … [and that] there are no technical or other criteria to determine whether varied results among regions or entities are arbitrary or based on meaningful distinctions.*[6]

NERC Responds:

1. Footnote 'b' meets FERC's Order No. 693 directive to clarify the circumstances in which an entity can plan to interrupt Firm Demand for a single contingency. The proposed standard is clear, enforceable, and technically justified even if procedural and substantive parameters for different planning entities do not impose precisely consistent processes.

2. NERC did not propose a specific stakeholder process.

3. The performance requirements imposed on all entities are the same. Established open and transparent stakeholder processes that allow for stakeholder input will provide an opportunity to

[5] *Id.*
[6] *Id.*

review planned interruptions of firm demand, but will not be able to approve or disapprove such interruptions.

The proposed footnote 'b' represents an improvement over the prior Commission-approved version. A quorum of the registered ballot body (93.61%) affirmed the footnote 'b' revision with a substantial majority (86.54%) of the balloters approving the revision in a recirculation ballot. The NERC Board of Trustees agreed and approved the standard on February 17, 2011. NERC filed its petition for approval of the revised footnote 'b' with the Commission on March 18, 2011. Additionally, NERC has petitioned the Commission to approve Reliability Standard TPL-001-2 — Transmission System Planning Performance Requirements. The footnote 'b' revision was very important to many of the balloters that approved NERC's proposed TPL-001-2 — Transmission System Planning Performance Requirements with 75.37% of balloters voting in favor of the new TPL-001-2 Reliability Standard with 20 of the affirmative votes for the standard conditioned on the approval of footnote 'b' by the Commission which was retained in TPL-001-2 as footnotes 9 and 12.

Thus, NERC respectfully disagrees with the Commission's proposal to remand the proposed footnote 'b'

Please contact the undersigned if you have any questions.

Respectfully submitted,

VI.	CONCLUSION	16

Exhibit A - Current Transmission Planning Regions

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC")[1] hereby provides these comments in response to the Federal Energy Regulatory Commission's ("FERC" or "Commission") Notice of Proposed Rulemaking ("NOPR")[2] regarding a proposed revision to footnote 'b' of Table 1 in four proposed Transmission Planning Reliability Standards. In the NOPR, the Commission proposed to remand the proposed revision to footnote 'b' to Table 1 of the four currently-effective Reliability Standards TPL-001-0.1– System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-0b – System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-0a – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-0– System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D). The Commission sought comments from interested parties on the proposed remand of NERC's revisions.

Table 1, footnote 'b' to the four proposed Reliability Standards concerns planned or controlled interruption of electric supply where a single contingency occurs on a transmission system. Proposed footnote 'b' reads as follows:

> An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side

[1] The Federal Energy Regulatory Commission certified NERC as the electric reliability organization ("ERO") in its order issued on July 20, 2006 in Docket No. RR06-1-000. *North American Electric Reliability Corporation*, "Order Certifying North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing," 116 FERC ¶ 61,062 (July 20, 2006).

[2] *Transmission Planning Reliability Standards*, 137 FERC ¶ 61,077 (October 20, 2011) ("NOPR").

> Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.

Proposed footnote 'b' was developed to address the directives from Order No. 693,[3] as clarified in the Commission's June 11, 2010 order denying rehearing and granting partial clarification.[4] Proposed footnote 'b' enhances the clarity of the proposed Reliability Standards TPL-001-1– System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-1b – System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-1a – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-1– System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D) while better protecting the reliability of the BES. As previously stated, proposed footnote 'b' "represent[s] a significant revision and improvement relative to the current set of enforceable standards."[5] NERC further believes that the directive to clarify footnote 'b' issued in Order No. 693 and re-iterated in the June 2010 Order has been addressed by the proposed footnote 'b'. Accordingly, NERC respectfully disagrees with the Commission's proposal to remand footnote 'b'. The Commission should approve footnote 'b' as proposed by NERC in its petition submitted to the Commission on March 18, 2011.

By this filing, NERC submits its response to the NOPR.

III. SUMMARY

In the NOPR, the Commission expressed three main concerns:

1. *The Commission believes that NERC's proposal does not meet the directives in Order No. 693 and the June 2010 Order and does not clarify or define the circumstances in which an entity can plan to interrupt Firm Demand for a single contingency. Specifically, the Commission is concerned that the procedural and substantive parameters … are too undefined to provide assurances that the process will be effective in determining when it is appropriate to plan for interrupting Firm Demand … and could result in inconsistent results in implementation.*[6]

2. *In proposing a stakeholder process without specification of any technical means by which exceptions are to be evaluated, the proposed footnote effectively turns the processes into a reliability standards development outside of NERC's existing procedures.*[7]

3. *… [R]egardless of the process used, the result could lead to inconsistent reliability requirements within and across reliability regions … [and that] there are no technical or*

[6] NOPR at P 11.
[7] *Id.*

other criteria to determine whether varied results among regions or entities are arbitrary or based on meaningful distinctions.[8]

NERC responds:

1. Footnote 'b' meets FERC's Order No. 693 directive to clarify the circumstances in which an entity can plan to interrupt Firm Demand for a single contingency. The proposed standard is clear, enforceable, and technically justified even if procedural and substantive parameters for different planning entities do not impose precisely consistent processes.

2. NERC did not propose a specific stakeholder process.

3. The performance requirements imposed on all entities are the same. Established open and transparent stakeholder processes that allow for stakeholder input will provide an opportunity to review planned interruptions of firm demand, but will not be able to approve or disapprove such interruptions.

NERC respectfully disagrees with the Commission's proposal to remand the proposed Reliability Standards TPL-001-1– System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-1b – System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-1a – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-1– System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D). Footnote 'b' appears in all four of the aforementioned TPL standards, however, its relevance and practical applicability is limited to TPL-002-1b — System Performance Following Loss of a Single Bulk Electric System Element (Category B).

These standards represent an improvement over the prior versions of the standards. A quorum of the registered ballot body (93.61%) affirmed the footnote 'b' revision with a substantial majority (86.54%) of the balloters approving the revision in a recirculation ballot. The NERC Board of Trustees agreed and approved the standard on February 17, 2011. NERC filed its petition for approval of the revised footnote 'b' with the Commission on March 18,

[8] *Id.*

2011. Additionally, NERC has petitioned the Commission to approve Reliability Standard TPL-001-2 — Transmission System Planning Performance Requirements.[9] The footnote 'b' revision was very important to many of the balloters that approved NERC's proposed TPL-001-2 — Transmission System Planning Performance Requirements with 75.37% of balloters voting in favor of the new TPL-001-2 Reliability Standard with 20 of the affirmative votes for the standard conditioned on the approval of footnote 'b' by the Commission which was retained in TPL-001-2 as footnotes 9 and 12.[10]

The Commission asserts in the NOPR that NERC is proposing a stakeholder process for transmission planning that would exist outside the standards development process but that is not correct. NERC clarifies that its petition did not propose a new stakeholder process, but builds upon existing transmission planning processes at the regional and state levels. FERC Order Nos.

[9] The four Reliability Standards TPL-001-0.1– System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-0b – System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-0a – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-0– System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D) will be replaced by TPL-001-2 which was filed with the Commission on October 19, 2011. TPL-001-2 includes significant improvements over the currently-effective standards and addresses numerous Commission directives. *See Petition of the North American Electric Reliability Corporation for Approval of a Revised Transmission Planning System Performance Requirements Reliability Standard and Five New Glossary Terms and for Retirement of Four Existing Reliability Standards*, Docket No. RM12-1-000 (October 19, 2011).

[10] TPL-001-2 — Transmission System Planning Performance Requirements Table 1 footnote 9 states:

> An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.

TPL-001-2 — Transmission System Planning Performance Requirements Table 1 footnote 12 states:

> An objective of the planning process should be to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. However, in limited circumstances Non-Consequential Load Loss may be needed to address BES performance requirements. When Non-Consequential Load Loss is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss is documented, including alternatives evaluated; and where the utilization of Non-Consequential Load Loss is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.

890[11] and 1000[12] actually mandate many of the regional and interregional planning processes to which NERC is referring. Other well-established stakeholder processes involve the intersection of transmission planning and distribution network planning and are carried out by state public utility commissions, agencies, and other authorized state actors.

This is an area that is beyond the jurisdictional reach of the Federal Power Act section 215. Furthermore, questions of reliability of local systems that do not affect the BES should be left to those who bear the costs of improving reliability or will suffer the consequences from an unreliable design.

IV. DISCUSSION

A. The Proposed Reliability Standards

In a March 31, 2011 filing,[13] NERC requested Commission approval of four proposed Reliability Standards TPL-001-1— System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-1b — System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-1a — System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-1— System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D). The purpose of the revisions to these standards was to clarify footnote 'b' to Table 1 included in each of the four standards in fulfillment of a directive from

[11] *Preventing Undue Discrimination and Preference in Transmission Service*, Order No. 890, FERC Stats. & Regs. ¶ 31,241, *order on reh'g*, Order No. 890-A, FERC Stats. & Regs. ¶ 31,261 (2007), *order on reh'g*, Order No. 890-B, 123 FERC ¶ 61,299 (2008), *order on reh'g*, Order No. 890-C, 126 FERC ¶ 61,228 (2009), *order on clarification*, Order No. 890-D, 129 FERC ¶ 61,126 (2009). ("Order No. 890")

[12] *Transmission Planning and Cost Allocation by Transmission Owning and Operating Public Utilities*, 136 FERC ¶ 61,051 (2011) ("Order No. 1000").

[13] *See* NERC**,** *Petition of the North American Electric Reliability Corporation for Approval of Four Transmission Planning System Performance Reliability Standards and Retirement of Four Existing Reliability Standards*, Docket No. RM11-18-000 (March 31, 2011).

Order No. 693[14] and a subsequent order issued on March 18, 2010 setting a deadline for compliance with the original directive.[15] On October 20, 2011, FERC issued a NOPR in which it proposed to remand NERC's proposed revisions to footnote 'b' of Table 1 included in revised Reliability Standards TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1.

B. Responses to Specific Matters Identified by the Commission

Issue 1 - Stakeholder Process and Enforceability

> *The Commission seeks comment on whether a stakeholder process is the appropriate vehicle to approve or deny exceptions to allow entities to plan to interrupt Firm Demand for a single contingency and if so, whether the proposed footnote 'b' would require any stakeholder due process.*[16]
>
> *The Commission seeks comment on its concerns regarding enforceability, vetting of Firm Demand interruption decisions, and openness and transparency of the proposed stakeholder process set forth in NERC's proposal.*[17]

NERC's proposed footnote 'b' states that "an objective of the planning process is to limit the likelihood and magnitude of interruption of … Firm Demand following Contingency events."[18] The proposed footnote allows for interruptions of Firm Demand under limited circumstances. Specifically, footnote 'b' allows for an interruption of load that is "(1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load."[19] Further, the proposed footnote allows for planned interruptions of Firm Demand to meet Bulk Electric System ("BES") performance requirements under a narrow set of circumstances. Footnote 'b' limits these instances by requiring that when interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where

[14] Order No. 693 at P 1773, 1794, 1797.
[15] *Order Setting Deadline for Compliance*, 130 FERC ¶ 61,200 (March 18, 2010).
[16] NOPR at P 20,
[17] *Id.* at P 23.
[18] Footnote 'b'.
[19] *Id.*

(1) the use of Demand interruption is documented;

(2) alternatives are evaluated;

(3) the Demand interruption is subject to review in an open and transparent stakeholder process;

(4) that process must include addressing stakeholder comments.

Publishing the interruption and the alternatives evaluated to such an interruption significantly raises the bar compared to the existing standards. If the planned interruption of Firm Demand is required to meet performance requirements, and that planned interruption and the alternatives evaluated are documented, then the final piece of the footnote adds an additional requirement that "where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments."[20] The requirement to address stakeholder comments in such a process is not presently an obligation and the addition of this concept greatly raises the bar by requiring planners to share not only their plans to interrupt Firm Demand but also their rationale for the decisions being made. Tracking this information over time, and reporting on it to the Commission will reveal to NERC and the Commission whether there is a continued reliability concern here.[21] At present, it is unknown how many instances exist where such planning occurs, or how frequently service is planned on an N-1 basis is interrupted.[22]

[20] *Id.*

[21] In the comments submitted by the National Association of Regulatory Utility Commissioners ("NARUC") on December 20, 2011, NARUC suggested that "FERC could play a valuable role by requiring transmission plans drafted under the provisions of Orders 890 and 1000 to disclose what system conditions will lead to retail load shedding. This information would aid States in ensuring that appropriate planning takes place for the local distribution system." NERC agrees with this suggested approach. *Comments of the National Association Of Regulatory Utility Commissioners*, Docket No. RM11-18-000 (December 20, 2011) at footnote 4.

[22] As proposed in Section V of this document, NERC is prepared to monitor the implementation and use of footnote 'b' in transmission planning processes and submit an annual report to FERC.

NERC's proposal to allow entities to plan for interruptions of Firm Demand in limited circumstances following a single contingency is based upon the idea that limited interruptions are acceptable only "where Demand interruptions are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process."[23] Accordingly, the proposed footnote 'b' can only be employed by Transmission Planners and Planning Authorities if the interruption does not affect the reliability of the BES. This means that no planning entity can plan to interrupt load if it will cause instability, cascading, or uncontrolled separation. Planned, controlled loss of a small amount of load is not an indication of an unreliable system; unplanned or uncontrolled load loss is. Tripping load is in some instances the lesser of two evils. Planned, controlled loss of local load is a service issue, not a reliability issue.

NERC's proposal also recognizes that the decision to interrupt local Firm Demand is essentially an economic decision – trading the possibility of the potential interruptions with the increased costs of requiring all load to be served at N-1. The impact on customers of any potential power interruption will need to be addressed and evaluated in a process that can address local service quality needs and economics, so that those familiar with local conditions can determine the appropriate balance between reliability and costs.

In the limited instances that applicable entities may plan to interrupt Firm Demand following a Contingency, it is beneficial to review those interruptions with affected parties in an open and transparent stakeholder process. This ensures that any planned interruptions of Firm Demand will be visible to affected and neighboring entities allowing others to either prepare for that loss or challenge the planning entity on their decision to interrupt Firm Demand. NERC does not propose to rely on a new stakeholder process to approve or deny such a plan to interrupt

[23] TPL-002-1b Table 1 footnote 'b' ("footnote 'b'").

Firm Demand. Instead, NERC builds upon established stakeholder processes, such as those that take place under Order Nos. 890 and 1000 and those before state public utility commissions which are required to be open and transparent, only for review. NERC believes the introduction of an additional planning process may contribute to further delays and regulatory confusion. Further, NERC will not challenge FERC's or the state commissions' due process provisions in their already-existing stakeholder processes as insufficient or arbitrary.

In the compliance guidance NERC will establish for the use of the proposed footnote 'b', NERC compliance auditors will be directed to request information about the stakeholder process utilized to ensure all the requirements within footnote 'b' have been met by planning entities that plan to interrupt Firm Demand following Contingencies and that planning entities meet the performance requirements. Failure to do so will be a violation of the requirements referencing footnote b.[24]

States have long been the arbiter for rate cases and siting of facilities covering all generation, transmission, and distribution facilities. FERC has recognized this on several occasions as well as the limited jurisdictional authority of Section 215 to the Federal Power Act.[25] Order No. 672 acknowledges:

> Section 215(i) (Savings Provisions) states that the ERO shall have authority to develop and enforce compliance with Reliability Standards for only the Bulk-Power System and provides that section 215 of the FPA shall not be construed to preempt any authority of any state to take action to ensure the safety, adequacy, and reliability of electric service

[24] If the stakeholder process referenced by the utility under audit, is an actual process managed by the utility is the authority having jurisdiction (as is done in some utilities which are agencies of the state for instance), then NERC compliance auditors will be looking closely for any self-dealing which may occur in the review process. These situations will receive closer scrutiny for adherence to the tenets of footnote 'b' to ensure that the process is well-documented, open to all relevant stakeholders, and makes available the necessary information for stakeholders to participate in the process.

[25] 16 U.S.C § 824o(b) as limited by 16 U.S.C § 824o(i).

> within that state, as long as such action is not inconsistent with any Reliability Standard.[26]

Additionally FERC has:

> Emphasize[d] that [the Commission] intend[s] to continue to respect states' roles in these areas. Indeed, the Commission has devoted considerable time and attention in recent years, through its orders and its many regional infrastructure conferences, to encouraging states and others to develop plans for ensuring adequate electric generation, transmission, and demand response infrastructure for both reliability and market adequacy.[27]

State-level stakeholder processes, typically overseen by the state public utility commission, have been created by the states to include rules that require all stakeholder concerns be addressed including those of the utilities, the ratepayers, consumer advocates, and environmental advocates.[28] Following the passage of the Energy Policy Act of 2005,[29] state regulators no longer could exercise plenary authority as reliability regulator on their state's piece of the Bulk Power System, but they did not lose their role over the reliability of local transmission systems and distribution networks. Congress realized that the balance of interests in any local area should be evaluated locally by those who foot the bill. NERC agrees.

Transmission planning processes also exist at the regional and Interconnection-wide level. Regional and interregional planning was mandated by the Commission in Order No. 890[30] and furthered in Order No. 1000.[31] The processes instilled by these orders are open and

[27] Order No. 672 at P 814.

[28] Twenty-seven of the states subject to the authority of 16 U.S.C. § 824o require participation in Integrated Resource Planning. Another eleven of these states have mandated some type of long-term procurement planning. Many of the remaining states are in ISO/RTO markets which have instituted their own open and transparent regional planning processes as discussed below. For a good summary of Integrated Resource Planning requirements, *see A Brief Survey of State Integrated Resource Planning Rules and Requirements*, Prepared for the American Clean Skies Foundation by Rachel Wilson, Paul Peterson (April, 2011) at fig. 3 and Appendix 1. Available at: http://www.cleanskies.org/wp-content/uploads/2011/05/ACSF_IRP-Survey_Final_2011-04-28.pdf.

[29] Codified at 16 U.S.C. § 824o.

[30] Order No. 890 at P 435 – 443.

[31] Order No. 1000 P 77 -83. **Exhibit A** contains a map of the current transmission planning regions.

transparent and include methods for addressing stakeholder comments. Each of the seven U.S.-based Independent System Operators conduct regional transmission planning in accordance with Order No. 890 and will be required to do so under Order No. 1000. These processes are well-established and allow for considerable due process considerations for affected entities and persons. Interconnection-wide planning now occurs at some level in each of the three interconnections with the assistance from the Department of Energy through the American Recovery and Reinvestment Act.[32] Those grants sought to facilitate or strengthen the capabilities "to prepare analyses of transmission requirements under a broad range of alternative futures and develop long-term interconnection-wide transmission expansion plans."[33] Additionally, those grants required broad inclusion of diverse stakeholders including industry representatives, state officials and agencies, and non-governmental organizations. There is therefore no reason to introduce an additional stakeholder process.

The foregoing reasons – keeping decision-making with those most impacted by decisions regarding reliability and costs, lack of jurisdictional authority, and the existence of established open and transparent stakeholder processes – are the reasons NERC did not create a new stakeholder process to vet decisions to plan to interrupt Firm Demand. No new stakeholder process will be empowered by the proposed footnote to approve or deny any planned interruption of Firm Demand. These decisions will not impact the enforceability of the TPL-001-1– System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-1b – System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-1a – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-1– System Performance Following Extreme Events Resulting in the

[32] American Recovery and Reinvestment Act of 2009, Pub. L. 111-5 (2009)
[33] Recovery Act – Resource Assessment and Interconnection-Level Transmission Analysis and Planning, Funding Announcement Opportunity DE-FOA-0000068 (2009).

Loss of Two or More Bulk Electric System Elements (Category D) Reliability Standards because Compliance Enforcement Authority auditors will look to ensure that the BES planning performance requirements have been met and that no decision to interrupt service will cause instability, cascading, or uncontrolled separation on the BES.

Issue 2 – Defined Criteria for an Exceptions Process

> *The Commission seeks comment on whether an exceptions process that provides defined criteria, with some allowance or consideration for unique circumstances, could be crafted that would resolve NERC's concerns of 'undesirable delays' and 'uncertainty.'*[34]

NERC does not believe that an exceptions process that provides defined criteria, with some allowances for unique circumstances, could be crafted that would respect pre-existing decision making processes that occur at state and local jurisdictions and recognizes that the option to serve load at less than N-1 level of service should be a local decision. As stated above in Issue 1, the decision to interrupt local load is essentially an economic decision – a quality of service issue, not a reliability issue. Those affected by any potential power interruption should have their concerns evaluated in a process that can address local needs. This will allow those that are familiar with local conditions to determine the appropriate balance between reliability and costs. NERC is not the appropriate forum for these types of decisions.

Addition of a new process, as described in the NOPR, would necessarily bring another level of discussion into the overall process with no discernible benefits. The existing processes that NERC's proposals rely on will not be eliminated simply because a new stakeholder process is added. Those having jurisdictional authority on existing processes are not going to cede their authority or eliminate those processes. Therefore, any new process will just add to the

[34] NOPR at P 22.

evaluation burden and require a longer period of time for the overall process to complete. This will lead to undesirable delays in the planning process.

Issue 3 – Threshold for limits on Firm Demand Interruption

> *The Commission seeks comment on whether existing protocols could provide guidance to NERC in devising criteria. Specifically, FERC requests comments on whether DOE's Form OE-417 criteria or NERC's Statement of Compliance Registry Criteria could serve as a basis for setting limits on when an entity can plan to interrupt Firm Demand on the BPS.*[35]
>
> *The Commission seeks comments on whether NERC considered a blend of quantitative and qualitative thresholds as "an option for providing criteria that would be generally applicable, but also for certain cases that may exceed the criteria." The Commission also seeks comment on whether a standard "could require a process with a quantitative limitation on how much Firm Demand could be planned for interruption and that standard could provide an exception process where a registered entity would submit documents and an explanation to the ERO or Regional Entity for approval based upon certain considerations. Further, if this can be carried out, which entities should be involved in the review and subsequent determinations on allowable exceptions?*[36]

The standards drafting team ("SDT") that developed this standard considered and discussed this issue extensively. The SDT determined that utilizing the DOE form OE 417 in this manner would be arbitrary. Moreover, the SDT determined that any bright-line MW limit would be inappropriate because the bright-line would be arbitrary. The societal impacts of lost load will be substantially different around the country due to network topology, local resources, and population density. Additionally, the jurisdictional limitations imposed on FERC and NERC through Section 215 of the Federal Power Act as described above in Issue 1 will also limit NERC's ability to set a threshold value for load interruption. As the SDT considered the issue as directed in Order No. 693, [37] NERC believes that it has fulfilled this directive.

[35] *Id.* at P 26.
[36] *Id.* at P 27.
[37] Order No. 693 at P 1795.

Issue 4- Feasibility of Footnote 'b' Revisions

> *The Commission seeks comment on whether a feasible option would be to revise footnote 'b' to allow for the planned interruption of Firm Demand in circumstances where the planner can show that it has customer or community consent and there is no adverse impact to the BPS. … [Further,] the Commission seeks comments on who might be able to represent the customer or community in this option and how customer or community consent might be demonstrated. … Additionally, [FERC] seeks comment on how it would be determined that Firm Demand shedding with customer consent would not adversely impact the BPS. … [FERC also seeks comment] on whether a customer who would have otherwise consent to having its Planning Authority or Transmission Planner plan to interrupt Firm Demand pursuant to this option could instead select interruptible or conditional firm service under the tariff to address cost concerns.*[38]

Proposed footnote 'b' is a part of a transmission planning performance standard. It will act to protect the BES even if load is not served. This comports with the fact that NERC only has the authority to act in instances where BES reliability is affected. NERC has no authority over pre-existing stakeholder processes, including those established to comply with Commission Order Nos. 888, 890, and 1000; state, regional, and interconnection-wide planning processes have been established with the consent of the authorities that brought about or have endorsed their existence.

Regarding customers, NERC does not believe it would be feasible to seek customer consent regarding the planned interruption of Firm Demand. NERC has no relationship with retail customers. Therefore, NERC has no mechanism to bring retail customers into the conversation. Customers, both wholesale and retail, are already deeply involved in state processes which provide a forum for them to be heard. Customer participation, both retail and wholesale, is already robust in local planning processes such as rate cases. Additionally, customers are represented in numerous regional planning processes as well as the interconnection-wide planning processes funded by the Department of Energy.

[38] *Id.* at P 28

V. ALTERNATIVE SOLUTION

If the Commission finds the arguments herein do not satisfy their concerns, NERC is prepared to monitor the implementation and use of footnote 'b' in transmission planning processes and submit an annual report to FERC.[39] Through this monitoring, NERC could also investigate the extent of planned interruptions of Firm Demand used in transmission planning and whether pre-existing jurisdictional processes currently address the related quality of service issues inherent in these interruptions. NERC would submit the first of these reports twelve months from the effective date of the proposed Reliability Standards. This will allow the Commission and NERC to have the information necessary to propose an appropriate policy solution for Firm Demand interruption, if necessary. If further action is deemed to be required after review of these findings, NERC will utilize the standards development process to make appropriate changes to the applicable standards.

VII. CONCLUSION

For the reasons stated above, NERC respectfully requests that the Commission take action consistent with these comments when it issues its Final Rule and approve the proposed revision to footnote 'b' to Table 1 of TPL-001-1– System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-1b – System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-1a – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-1– System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D) Reliability Standards.

[39] In addition to data acquired from spot-checks and audits, NERC will likely need to initiate a mandatory data request under Section 1600 of the NERC Rules of Procedure to supply this data.

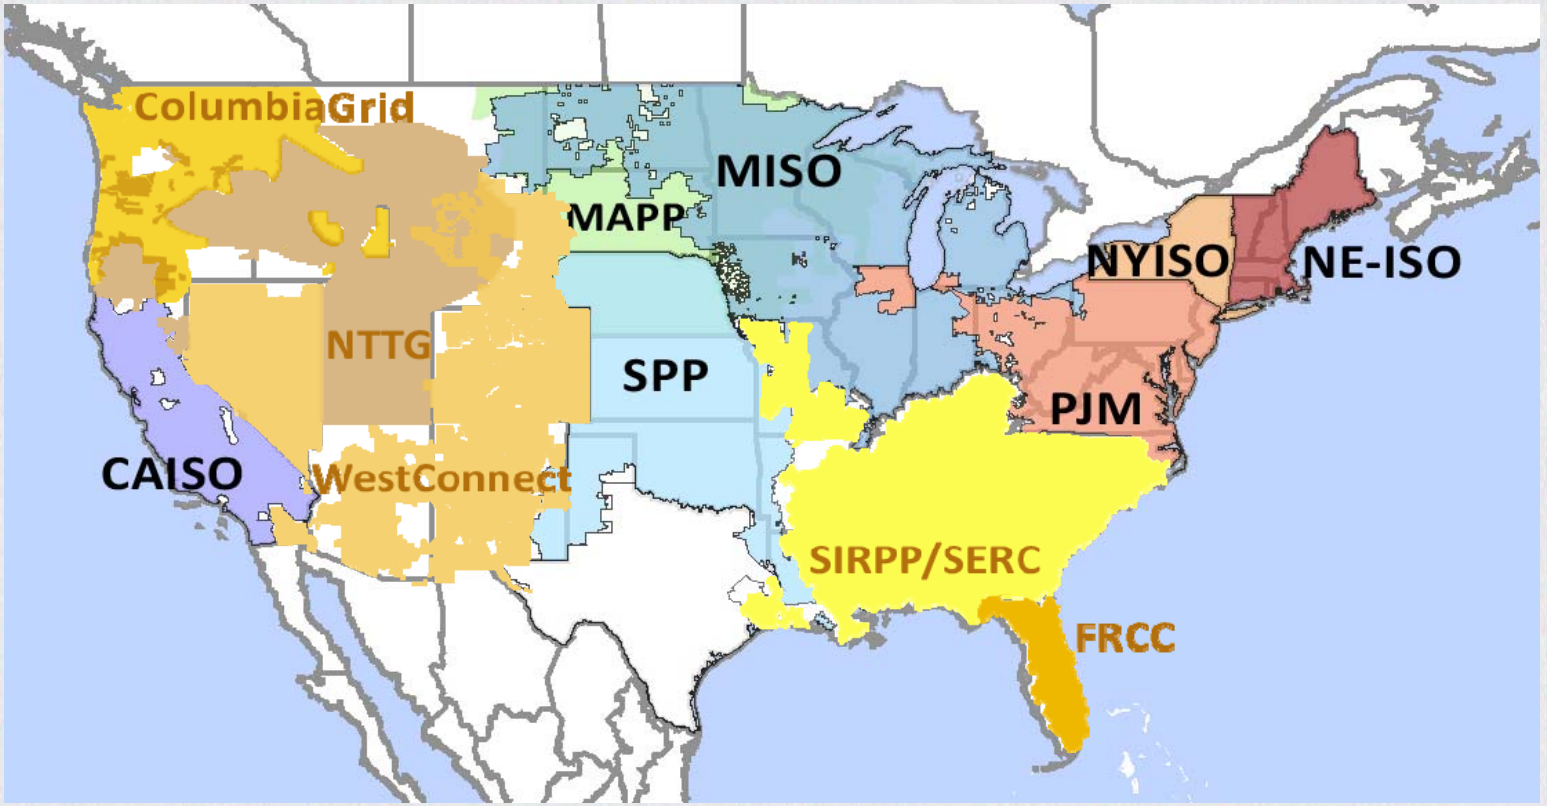
Current Transmission Planning Regions

Current Transmission Planning Regions *

Federal Energy Regulatory Commission



- This map is for illustration purposes only. This map generally depicts the borders of regional transmission planning processes through which transmission providers have complied with Order No. 890. Those borders may not be depicted precisely for several reasons (e.g., not all transmission providers complying with Order No. 890 have a defined service territory). Additionally, transmission planning regions could alter because transmission providers may choose to change regions.

I.	INTRODUCTION	1
II.	NOTICES AND COMMUNICATIONS	2
III.	DISCUSSION	2
IV.	CONCLUSION	16

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC")[1] hereby provides these comments in response to the Federal Energy Regulatory Commission's ("FERC" or "Commission") Notice of Proposed Rulemaking ("NOPR")[2] regarding proposed Reliability Standards PRC-006-1 (Automatic Underfrequency Load Shedding) and EOP-003-2 (Load Shedding Plans).

In the NOPR, the Commission proposed to approve the two revised Reliability Standards. The Commission also proposed to approve the retirement of three currently effective, FERC-approved Reliability Standards PRC-007-0, PRC-009-0, and EOP-003-1, as well as the NERC-approved Reliability Standard PRC-006-0.

The proposed Reliability Standards establish system modeling, analysis, design, and documentation requirements for automatic underfrequency load shedding ("UFLS") programs for use in extreme conditions to stabilize the balance between generation and load after an electrical island has formed, dropping enough load to allow frequency to stabilize within the island.[3] The Commission sought comment from NERC and other interested parties on several issues concerning the proposed standards.

By this filing, NERC submits its response to the NOPR.

---

[1] The Federal Energy Regulatory Commission ("FERC" or "Commission") certified NERC as the electric reliability organization ("ERO") in its order issued on July 20, 2006 in Docket No. RR06-1-000. *North American Electric Reliability Corporation*, "Order Certifying North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing," 116 FERC ¶ 61,062 (July 20, 2006).

*Persons to be included on FERC's service list are indicated with an asterisk. NERC requests waiver of FERC's rules and regulations to permit the inclusion of more than two people on the service list.

III. DISCUSSION

A. Background

In a March 31, 2011 petition,[4] NERC requested Commission approval of two proposed Reliability Standards:

- PRC-006-1 — Automatic Underfrequency Load Shedding; and
- EOP-003-2 — Load Shedding Plans.

[4] *See* NERC**,** *Petition of the North American Electric Reliability Corporation for Approval of Proposed New Reliability Standards and Implementation Plans Related to Underfrequency Load-Shedding*. Docket No. RM11-20-000 (March 31, 2011).

In addition, NERC requested the Commission approve the concurrent retirement of three currently effective, FERC-approved Reliability Standards, as well as one NERC-approved Reliability Standard:

- PRC-006-0 – Development and Documentation of Regional UFLS Programs;
- PRC-007-0 — Assuring Consistency of Entity Underfrequency Load Shedding Programs;
- PRC-009-0 — Analysis and Documentation of Underfrequency Load Shedding Performance Following an Underfrequency Event; and
- EOP-003-1 — Load Shedding Plans.

All of the standards proposed for retirement are superseded by proposed Reliability Standards PRC-006-1 and EOP-003-2. NERC also requested approval of associated Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSL"), an implementation plan, and effective dates for the two proposed standards.

The Commission seeks comment from NERC and other interested parties on several aspects of the proposed standards. NERC provides responses to the specific issues identified in the NOPR, including: (A) impact of resources not connected to the Bulk Electric System; (B) UFLS events assessments; (C) Generator Owner trip settings outside of the UFLS program; (D) UFLS program coordination with other Protection Systems; (E) identification of island boundaries in UFLS programs; (F) automatic Load shedding and manual Load shedding; (G) elimination of Balancing Authority responsibilities in EOP-003-2; (H) associated VRF and VSLs; and (I) the proposed implementation plan and effective date.

B. Specific Responses to Matters Identified by the Commission.

(A) Impact of Resources Not Connected to the Bulk Electric System

> NOPR at P. 31. *"The Commission seeks comments from the ERO and other interested persons as to whether and how all resources required for the reliable operation of the bulk electric system, including resources not connected to bulk electric system facilities, are considered in the development of UFLS programs under Requirements R3 and R4."*

The modeling of generation may impact assessments of UFLS programs in two ways. The first relates to modeling the Frequency Response of the generating units and the second relates to modeling generating unit Protection Systems that respond to off-nominal frequency.

As stated in the NOPR, failing to model generation units and plants that meet the threshold size requirements (20 MVA unit size or 75 MVA plant size) but are not directly connected to the Bulk Electric System could affect the simulated Frequency Response. NERC clarifies, however, that proposed Reliability Standard PRC-006-1 does not establish parameters for what resources are modeled in such simulations. The power system models used in UFLS assessments are generally the same models used in transmission planning assessments, which include models of all generation units and plants that meet the threshold size requirements even those not connected directly to the Bulk Electric System.

Requirement R4 of PRC-006-1 defines the generators for which underfrequency and overfrequency protection settings are modeled when these protection settings do not coordinate with the Generator Underfrequency Trip Modeling curve and Generator Overfrequency Trip Modeling curves in Attachment 1 to PRC-006-1. The effect on frequency of tripping a generator is virtually the same regardless of whether the generator is connected directly to the Bulk Electric System or at a lower voltage level. Thus, failing to model protection settings on units that meet the threshold size requirements, but that are not connected directly to the Bulk Electric

System, could have an effect on simulation results depending on the capacity of the units, the load and generation characteristics of the units assumed to be in the island and running, and whether the unit protection settings coordinate with the curves in Attachment 1.

A standard authorization request ("SAR") is currently under development for a second phase of the standard development project to revise the definition of Bulk Electric System. One of the tasks in this project will be to determine the appropriate size thresholds and other criteria for real and reactive resources that are necessary to support reliable operation of the Bulk Electric System based on a sound technical assessment. Information developed as part of that project could be used to assess whether any changes are needed to the requirements for including Protection System settings for generation units and plants not directly connected to the Bulk Electric System.

Until the second phase of the Bulk Electric System definition is completed, the proposed standard provides a significant step forward in assessment of UFLS programs, and NERC urges the Commission to approve the proposed standard with the generator size thresholds defined therein.

(B) UFLS Events Assessments

1. Assessments in the Absence of Island Formation

> NOPR at P. 36. *"The Commission seeks clarification from the ERO regarding what actions must planning coordinators take under Requirement R11 if an event results in system frequency excursions falling below this initializing set point for UFLS but without the formation of a bulk electric system island."*

NERC agrees that an assessment of the performance of the UFLS program is useful for an Interconnection-wide event that results in system frequency excursions falling below the initializing set point for UFLS. An Interconnection-wide event that results in activation of UFLS, while highly unlikely, would be a significant event requiring assessment of several

aspects of system frequency, including system Frequency Response, equipment performance, and coordination of protection and control systems, in addition to the assessment of UFLS program operation. Although PRC-006-1does not prescribe an analysis for this specific scenario, activating UFLS during an Interconnection-wide event would involve a significant loss of generation and analysis would be performed under the NERC Event Analysis program or the NERC Rules of Procedure, depending on the severity of the event.[5]

2. Coordination of Assessments and Results

> NOPR at P. 38. *"The options for coordinating event assessments in Requirement R13 include: (1) conducting a joint event assessment per Requirement R11 among planning coordinators whose areas were affected; (2) conducting an independent event assessment per Requirement R11 that reaches conclusions and recommendations consistent with other planning coordinators whose areas were affected; or (3) conducting an independent event assessment per Requirement R11 and where the assessment fails to reach conclusions and recommendations consistent with those of the other planning coordinators whose areas were affected by the same islanding event, identify differences in the assessments and report these differences to the other affected planning coordinators. The Commission seeks comments from the ERO and other interested persons as to whether the differences should be subsequently reported to the reliability coordinator for resolution in the event that the process does not resolve differences in the assessments."*

The Commission seeks comment on Requirements R5 and R13 of PRC-006-1, which require Planning Coordinators that share identified islands to coordinate UFLS program design and event assessment, and to identify differences in the assessments and reporting these differences to the other affected Planning Coordinators. NERC believes that differences identified in Planning Coordinator assessments under Requirements R5 or R13 should not be reported to the Reliability Coordinator for resolution. Such a requirement would raise a number of concerns, including:

---

5 http://www.nerc.com/page.php?cid=1|8|169.

- While the Reliability Coordinator has a wide-area view of the Bulk Electric System, it will not necessarily coincide with the island boundary.
- An entity that is registered as one of the Planning Coordinators involved may also be registered as the Reliability Coordinator, creating a potential conflict of interest in resolving the differences.
- Reliability Coordinators do not necessarily possess the tools required to resolve such planning time-frame or event analysis issues.
- The Reliability Coordinator's responsibilities lie largely in the real-time operating horizon whereas the Planning Coordinator responsibilities lie largely in the planning horizon; hence it is inconsistent and inappropriate to create a hierarchy where a Reliability Coordinator presides over a Planning Coordinator.

Therefore, NERC does not support reporting differences identified in Planning Coordinator assessments to the Reliability Coordinator for resolution.

3. Assessment Timeline for Completion

> NOPR at P. 41. *"The Commission asks the ERO and other interested persons what the basis is for proposing a two-year time frame. In addition, the Commission seeks clarification from the ERO as to how soon after event actuation would an entity need to implement corrections in response to any deficiencies identified in the event assessment under Requirements R11."*

PRC-006-1 R11and R12 require a Planning Coordinator to perform an island event assessment within one year of an event and, if the Planning Coordinator identifies program deficiencies, conduct and document UFLS design assessments within two years of an event. The one-year time frame to perform an island assessment and the two-year timeframe to conduct and document UFLS design assessments were selected to provide the Planning Coordinator sufficient time to assess UFLS performance and address any identified UFLS program deficiencies. While

some events may be analyzed in less time, one year is realistic to assess performance for complicated events and two years is realistic to address any identified deficiencies, especially in consideration of developing alternative plans, performing adequate technical and cost/benefit analyses, and considering stakeholder input when significant changes to the program are necessary.

The amount of time that a UFLS entity has to implement corrections will be established by the Planning Coordinator, as specified in Requirement R9 of PRC-006-1. The time allotted for corrections will depend on the extent of the deficiencies identified. The schedule specified by the Planning Coordinator will consider the time necessary for budget planning and implementation, recognizing that operating and maintenance budgets normally will not be sufficient to address major revisions and allowances will be necessary for inclusion of approved changes in budgeting cycles.

(C) Generator Owner Trip Settings Outside of the UFLS Program

> NOPR at P. 43. *"We agree that planning coordinators should consider generators that trip prior to underfrequency set points when developing their UFLS programs. The Commission seeks comments from the ERO and other interested persons on how generation losses outside of the UFLS set points (i.e., generators having trip settings prior to the UFLS underfrequency set points) should be accounted for in UFLS programs (e.g., generator owners who trip outside of the UFLS set points could procure load to shed to account for the loss in generation)."*

While requiring the Planning Coordinator to account for generators that trip prior to underfrequency set points when developing their UFLS programs is appropriate, it is not appropriate for a Reliability Standard to prescribe how the Planning Coordinator will determine whether mitigation is necessary or who would be responsible for providing the mitigation. The reliability of the Bulk Electric System is maintained by requiring the Planning Coordinator to

ensure that the UFLS program meets the performance characteristics defined in the standard. This approach provides Planning Coordinators with flexibility in developing UFLS programs based on the conditions and circumstances within their Planning Coordinator area and the various islands that are studied.

(D) UFLS Program Coordination with Other Protection Systems

> NOPR at P. 45. *"While PRC-006-1 requires coordination of UFLS programs among planning coordinators in Requirements R5, R7, and R13, it does not appear to capture the same level of coordination with other protection systems as in Requirement R1.2.8 of PRC-006-0. The Commission seeks comments on whether and how coordination with other protection systems is or is not achieved under the new requirements." (Footnote omitted).*

PRC-006-0, Requirement R1.2.8, provides a broad mandate that UFLS program design include "[a]ny other schemes that are part of or impact the UFLS programs." One of the objectives of PRC-006-1 is to replace the broad requirements in PRC-006-0 with more specific requirements that are clear and measurable. The proposed standard therefore includes requirements for coordination of the UFLS program with specific protection and controls that are part of or could impact the UFLS program. Requirements R3, R4, and R10 of PRC-006-1 address coordination of the UFLS program with other protection and control systems. The protection and control systems identified in the standard include generator protections that could respond to frequency and voltage excursions,[6] automatic Load restoration, and equipment switching that may be included in the UFLS program to control voltage.

Requirement R3 of PRC-006-1 identifies the specific generator protections as underfrequency, overfrequency, and overexcitation (V/Hz). Coordination of the UFLS program with generator underfrequency protection (including generation protection that is "sensitive to"

[6] Certain protection and control systems may not directly monitor frequency or voltage, but are "sensitive to" frequency or voltage (*e.g.*, reactor coolant pumps in nuclear plants).

underfrequency) is necessary to ensure that UFLS is permitted to operate to arrest declining frequency before generator tripping to prevent generator tripping from exacerbating the imbalance between load and generation. Coordination with generator overfrequency protection is necessary to avoid tripping generation during frequency "overshoot" that may occur following UFLS activation. As frequency recovers from UFLS activation, the system frequency may overshoot above 60 Hz before settling to a stable and sustainable level. It is important that generation does not trip during the frequency overshoot as this could create another imbalance between load and generation. Coordination is necessary with generator and generator step-up transformer overexcitation protection that may operate during underfrequency conditions, especially if the transmission system voltage increases following Load shedding and if power transfers are interrupted by island formation, leaving excess shunt reactive support connected to the system that is no longer necessary to support power transfer. The combined effect of increased voltage and reduced frequency may lead to tripping of generation by generator or generator step-up transformer overexcitation protection which could exacerbate the imbalance between load and generation.

Requirement R4 of PRC-006-1 provides that in cases where it is impractical to coordinate the UFLS program and generator underfrequency or overfrequency protection, because of the need to prevent generator damage, the UFLS program must be designed to account for this situation. Requirement R4 further requires coordination with automatic Load restoration. This coordination is necessary to ensure that frequency has stabilized following UFLS activation and that the system has reached a stable and sustainable operating state prior to reconnecting Load. Uncoordinated restoration of Load could reestablish an imbalance between Load and generation leading to another underfrequency event.

Requirement R10 of PRC-006-1 recognizes that after island formation and UFLS operation it may be necessary to control voltage for the reasons stated above in the discussion of overexcitation protection. While Requirement R10 does not explicitly require coordination, it does ensure that, when a Planning Coordinator identifies that automatic equipment switching is necessary to control voltage following UFLS activation, the Transmission Owner will provide this capability to restore the system to a sustainable operating state.

(E) Identification of Island Boundaries in UFLS Programs

> NOPR at P. 47. *"…The Commission seeks clarification from the ERO concerning the required degree of cooperation and/or 'mutual consent' between planning coordinators under the proposed Reliability Standard in order for island boundaries to be set so that, while deviating from Regional Entity boundaries, they better approximate actual island separation boundaries.*

NERC clarifies that the "mutual consent" statement in NERC's petition is in reference to Requirement R1 of PRC-006-1, which does not require coordination among Planning Coordinators in developing criteria for selecting portions of the Bulk Electric System in which islands may form.

As stated in the NOPR, "mutual consent" among Planning Coordinators is required by part 2.3 of Requirement R2, which ensures that Planning Coordinators assess all portions of the Bulk Electric System in their collective UFLS assessments and that regional or Interconnection-wide islands are assessed to ensure coordination of UFLS programs. To achieve this objective, each Planning Coordinator is required to assess a single island that includes all portions of the Bulk Electric System in either the Regional Entity areas or the Interconnections in which its Planning Coordinator area resides. Part 2.3 of Requirement R2 recognizes that assessing a Regional Entity area as one contiguous island may in some cases not be practical and so the proposed standard provides that the island boundary selected may deviate from the Regional

Entity boundary for the sole purpose of producing contiguous regional islands more suitable for simulation. Under part 2.3 of Requirement R2, when a Planning Coordinator selects an island boundary that does not coincide with the Regional Entity area or Interconnection boundary, mutual consent must be obtained from neighboring Planning Coordinators to ensure the deviation does not result in a portion of the Bulk Electric System that is not included in UFLS assessments.

(F) Automatic Load Shedding and Manual Load Shedding

> NOPR at P. 49. "*There are no requirements in PRC-006-1 to coordinate automatic load shedding by UFLS and manual load shedding under EOP-003-2. The Commission seeks comments from the ERO and other interested persons on how the coordination of automatic and manual load shedding is considered in light of the fact that the proposed Reliability Standards do not explicitly require coordination.*"

While neither PRC-006-1 nor EOP-003-2 explicitly require coordination of automatic and manual load shedding, EOP-003-2 Requirement R6 addresses the concern that a load resource could be unintentionally double-counted in both an automatic and manual load shedding program. Specifically, Requirement R6 of EOP-003-2 provides that "if there is insufficient generating capacity to restore system frequency following automatic underfrequency load shedding [actuation], the Transmission Operator or Balancing Authority shall [then] shed additional load." For the Transmission Operator or Balancing Authority to shed *additional* load there must be load identified in the manual load shedding program that is not included in the automatic UFLS program. This does not preclude the manual Load shedding program overlapping the underfrequency load shedding program, but it does require that the Transmission Operator and Balancing Authority include load in the manual load shedding program that is not included in the UFLS program to achieve the reliability objective of EOP-003-2.

(G) Elimination of Balancing Authority Responsibilities in EOP-003-2

> NOPR at P. 52. *"The Commission seeks clarification from the ERO as to why these existing balancing authority responsibilities were not incorporated into Reliability Standards PRC-006-1 or EOP-003-2. The Commission also seeks comments from the ERO and other interested persons as to why balancing authorities should not be informed of UFLS program plans that directly impact balancing authority functions."*

Requirements R2, R4, and R7 of EOP-003-1 contain requirements for Transmission Operators regarding automatic undervoltage load shedding, and for Balancing Authorities regarding automatic underfrequency load shedding. EOP-003-1 does not include requirements for Balancing Authorities related to undervoltage load shedding. This is consistent with other relevant standards related to undervoltage load shedding. For example, PRC-010-0 (Technical Assessment of the Design and Effectiveness of Undervoltage Load Shedding Program) and PRC-022-1 (Under-Voltage Load Shedding Program Performance) assign responsibilities to Transmission Operators, but not to Balancing Authorities.

The modifications proposed in EOP-003-2 remove requirements addressing UFLS design in EOP-003-1, but do not remove any requirements for undervoltage load shedding. All activities required for UFLS programs in the existing standards are incorporated into PRC-006-1, and are assigned to the Planning Coordinator. All activities required for undervoltage load shedding programs are retained in EOP-003-2 and are assigned to the Transmission Operator. These modifications ensure that all requirements necessary for reliability of the Bulk Electric System are retained and assigned to the appropriate Functional Model entity. While the Balancing Authority contributes to managing Interconnection frequency by balancing Load and generation resources in real-time, UFLS and undervoltage load shedding programs are automatic and must be planned and set in advance.

The Balancing Authority should be informed of UFLS program plans that directly impact the Balancing Authority function. The proposed changes in EOP-003-2 will not impact the ability of the Balancing Authority to fulfill its obligations. While the proposed standards no longer require the Balancing Authority to establish plans for UFLS, they do not preclude the Balancing Authority from obtaining information on UFLS programs that may be useful in fulfilling the Balancing Authority function. Indeed, PRC-001-1, R1 requires that each Balancing Authority: "… be familiar with the purpose and limitations of protection system schemes applied in its area."

(H) Associated VRFs and VSLs

> NOPR at P. 54-55. *"The Commission proposes to approve the VRFs and VSLs in PRC-006-1 and EOP-003-2. However, the Commission seeks comments from the ERO and other interested persons regarding one proposed VSL and one proposed VRF for PRC-006-1.*
>
> *The "Lower VSL" assignment for Requirement R8 in PRC-006-1 applies when a UFLS entity fails to provide data to its planning coordinator for 5 to 10 calendar days following the schedule specified by the planning coordinator. Requirement R8 of PRC-006-1 does not include a 5-day grace period for providing data to planning coordinators. Accordingly, the subject VSL assignment may be inconsistent with the Commission's VSL Guideline 3. The guideline states that a VSL "should not appear to redefine or undermine the requirement." The five-day grace period implicit in the proposed VSL appears to be inconsistent with this guideline. In addition, the proposed VSL creates a compliance issue. Specifically, it is unclear where a UFLS entity falls in the VRF and VSL matrices if it fails to provide data to its planning coordinator within 1 to 5 days of its scheduled date." (Footnote omitted).*
>
> NOPR at P. 57. "…*The Commission seeks clarification from the ERO why coordination of load shedding plans is a 'High' VRF for transmission operators and balancing authorities in EOP-003-2 but NERC proposes a 'Medium' VRF for planning coordinators in PRC-006-1."*

NERC clarifies that the lower VSL assignment for Requirement R8 of PRC-006-1 should be revised as follows: "The UFLS entity provided data to its Planning Coordinator(s) ~~more than 5 calendar days but~~ less than or equal to 10 calendar days following the schedule specified by the

Planning Coordinator(s) to support maintenance of each Planning Coordinator's UFLS database."

In addition, the VRF for Requirement R5 of PRC-006-1 should be revised from "Medium" to "High."

(I) The Proposed Implementation Plan and Effective Date

> NOPR at P. 60. *"The Commission proposes to accept the implementation plan and effective date proposed by the ERO for PRC-006-1 and EOP-003-2. However, the Commission seeks comments from the ERO and other interested persons about any potential reliability gaps that may occur during the development and implementation of PRC-024-1, such as how the planning coordinators will adequately determine and apply UFLS simulations and plans in the absence of generator trip settings."*

Requirement R4, parts 4.1 through 4.6, requires Planning Coordinators to model underfrequency and overfrequency trip settings of generators. Planning Coordinators presently have access to and utilize these trip settings in underfrequency load shedding assessments and NERC anticipates this practice will continue. Accordingly, the proposed implementation schedule does not create a reliability gap. However, a compliance mechanism to compel the Generator Owners to provide trip settings to the Planning Coordinators does not currently exist. Thus, the implementation schedule for Requirement R4, parts 4.1 through 4.6 defers a compliance obligation for Planning Coordinators to model the trip settings until a compliance obligation exists for Generator Owners to provide the trip settings.

IV. CONCLUSION

NERC respectfully requests that the Commission take action consistent with these comments when it issues its Final Rule regarding Reliability Standards PRC-006-1 and EOP-003-1.

Respectfully submitted,

CERTIFICATE OF SERVICE

I hereby certify that I have served a copy of the foregoing document upon all parties listed on the official service list compiled by the Secretary in this proceeding.

Dated at Washington, D.C. this 23rd day of December, 2011.

/s/ Willie L. Phillips
Willie L. Phillips
Attorney for North American Electric Reliability Corporation

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

[Docket No. RD11-8-000]

COMMISSION INFORMATION COLLECTION ACTIVITIES (FERC-725I); COMMENT REQUEST

(January 18, 2012)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Comment request.

SUMMARY: In compliance with the requirements of the Paperwork Reduction Act of 1995, 44 U.S.C. 3507(a)(1)(D), the Federal Energy Regulatory Commission (Commission or FERC) is submitting the information collection FERC-725I, Mandatory Reliability Standards for the Northeast Power Coordinating Council, to the Office of Management and Budget (OMB) for review of the information collection requirements. Any interested person may file comments directly with OMB and should address a copy of those comments to the Commission as explained below. The Commission solicited comments in an order published in the Federal Register (76 FR 66057, 10/25/2011) requesting public comments. FERC received no comments on the FERC-725I and is making this notation in its submission to OMB.

DATES: Comments on the collection of information are due by [INSERT 30 days after publication of this Notice in the Federal Register].

ADDRESSES: Comments filed with OMB, identified by collection FERC-725I, should be sent via email to the Office of Information and Regulatory Affairs:

oira_submission@omb.gov. Attention: Federal Energy Regulatory Commission Desk Officer. The Desk Officer may also be reached via telephone at 202-395-4718.

A copy of the comments should also be sent to the Federal Energy Regulatory Commission, identified by the Docket No. RD11-8-000, by either of the following methods:

- eFiling at Commission's Web Site: http://www.ferc.gov/docs-filing/efiling.asp.
- Mail/Hand Delivery/Courier: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Instructions: All submissions must be formatted and filed in accordance with submission guidelines at: http://www.ferc.gov/help/submission-guide.asp. For user assistance contact FERC Online Support by e-mail at ferconlinesupport@ferc.gov, or by phone at: (866) 208-3676 (toll-free), or (202) 502-8659 for TTY.

Docket: Users interested in receiving automatic notification of activity in this docket or in viewing/downloading comments and issuances in this docket may do so at http://www.ferc.gov/docs-filing/docs-filing.asp.

FOR FURTHER INFORMATION: Ellen Brown may be reached by e-mail at DataClearance@FERC.gov, by telephone at (202) 502-8663, and by fax at (202) 273-0873.

SUPPLEMENTARY INFORMATION:

Title: FERC-725I, Mandatory Reliability Standards for the Northeast Power Coordinating Council.

OMB Control No.: To be determined.

Type of Request: Three-year approval of the FERC-725I information collection requirements.

Abstract: This information collection relates to FERC-approved Reliability Standard, PRC-002-NPCC-01 – Disturbance Monitoring. This Northeast Power Coordinating Council (NPCC) regional Reliability Standard requires respondents to provide recording capability necessary to monitor the response of the Bulk-Power System to system disturbances, including scheduled and unscheduled outages; requires each reliability coordinator to establish requirements for its area's dynamic disturbance recording needs; and establishes disturbance data reporting requirements.

Reliability Standard PRC-002-NPCC-01 introduces several new mandatory and enforceable requirements for the applicable entities. However, NPCC presently has criteria[1] and published guidance[2] addressing similar requirements that the new Reliability Standard make mandatory. Thus, it is currently usual and customary for affected entities within NPCC to create, maintain and store some of the same or equivalent information identified in Reliability Standard PRC-002-NPCC-01. Therefore, many of the requirements contained in PRC-002-NPCC-01 do not impose new burdens on the affected entities.[3]

---

1 Disturbance Monitoring Equipment Criteria (Aug. 2007), *available at* https://www.npcc.org/Standards/Criteria/A-15.pdf (Disturbance Monitoring Criteria).

2 Guide for Application of Disturbance Recording Equipment (Sept. 2006), *available at* https:/www.npcc.org/Standards/Guides/B-26.pdf (Application Guide).

3 5 C.F.R. § 1320.3(b)(2) (2011).

Several requirements contained in regional Reliability Standard PRC-002-NPCC-01 do introduce entirely new responsibilities for the applicable entities and each of these is listed in the estimated annual burden section below.

Type of Respondents: Transmission owners, generator owners and reliability coordinators within the NPCC region.[4]

Estimate of Annual Burden[5]*:*

PRC-002-NPCC-01	Number of Respondents Annually[6] (1)	Number of Responses Per Respondent (2)	Average Burden Hours Per Response (3)		Total Annual Hours (1x2x3)
R13: GO[7] and TO to document acquisition and installation of dynamic disturbance recorders. GO, TO, and RC to develop and employ implementation schedule	1	1	*Record Retention*	10	10

[4] These entity types are contained in the North American Electric Reliability Corporation's compliance registry. See http://www.nerc.com/page.php?cid=3|25 for more information.

[5] Burden is defined as the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. For further explanation of what is included in the information collection burden, reference 5 Code of Federal Regulations 1320.3.

[6] The estimate below regarding the number of respondents is based on the NERC compliance registry as of August 29, 2011. After accounting for double counting, the net number of entities responding will be approximately 167 entities registered as a transmission owner, generation owner, or reliability coordinator.

[7] For purposes of this chart, generation owner is abbreviated to GO, transmission owner is abbreviated to TO, and reliability coordinator is abbreviated to RC.

R14.5: GO and TO maintenance and testing program for stand-alone disturbance monitoring equipment includes monthly verification of active analog quantities	163	12	*Record Retention*	5	9,780
R14.7: GO and TO requirement to return failed units to service in 90 days. Record kept of efforts if greater than 90 days[8]	33	1	*Reporting (assessment and dist. of records)*	10	330
			Record Retention	10	330
R17: RC maintains data on equipment, and provide to RE upon request	5	1	*Reporting (assessment and dist. of data)*	5	25
			Record Retention	10	50
Sub-total			***Reporting (assessment and dist)***		**355**
			Record Retention		**10,170**
Total					**10,525**

The total estimated annual cost resulting from this Reliability Standard is made up the hourly wage cost for record retention and reporting, and the compliance cost for new

[8] We estimate that an entity will experience a unit failure greater than 90 days once every five years. Therefore, 20 percent of NPCC's 163 generator owners and transmission owners will experience a unit failure of this duration each year.

equipment. The total cost[9] is **$1,077,360** ($284,760 + $42,600 + $750,000). The individual components of this cost are:

- Estimated annual record retention cost[10] = 10,170 hours @ $28/hour = $284,360
- Estimated annual reporting cost = 355 hours @ $120/hour = $ 42,600

Total estimated non-hourly annual compliance cost[11] (acquisition and installation of dynamic disturbance recorders) = $750,000

Comments: Comments are invited on: (1) whether the collection of information is necessary for the proper performance of the functions of the Commission, including whether the information will have practical utility; (2) the accuracy of the agency's estimate of the burden and cost of the collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility and clarity of the information collection; and (4) ways to minimize the burden of the collection of information on those who are to respond, including the use of automated collection techniques or other forms of information technology.

Kimberly D. Bose,
Secretary.

---

[9] In the initial order there was a calculation error in the total cost and in the record retention cost. The difference is minor and has been corrected here.

[10] The hourly reporting cost is based on the estimated cost of an engineer to implement the requirements of the rule. The record retention cost comes from Commission staff research on record retention requirements.

[11] We estimate that annually, approximately one entity within NPCC will have to procure dynamic disturbance recording capability and the total acquisition and installation cost will range between $150,000 and $750,000. We use the higher estimate here.

Re: NERC Analysis of NERC Standard Process Results Fourth Quarter 2011 in Docket Nos. RR06-1-000, RR09-7-000

Dear Ms. Bose:

The North American Electric Reliability Corporation ("NERC") submits its Analysis of NERC Standards Process Results for the Fourth Quarter 2011 ("Ballot Results Filing"). This filing is submitted in response to the Federal Energy Regulatory Commission's ("FERC") January 18, 2007 Order[1] requiring NERC to closely monitor and report to FERC the voting results for NERC Reliability Standards each quarter for three years. In a subsequent order issued on September 16, 2010, the Commission renewed and expanded on its directive for an additional three years.[2]

The Ballot Results Filing is included as **Attachment A** to this filing. The Ballot Results Filing addresses ballot results during the October 1, 2011 to December 31, 2011 time frame and includes NERC's analysis of the voting results, including trends and patterns of stakeholder approval of NERC Reliability Standards. NERC requests that FERC accept this filing as compliant with the renewed directive in the September 16, 2010 Order to submit quarterly reports for an additional three years from the date of the order.

Respectfully submitted,

/s/ Willie L. Phillips
Willie L. Phillips
Attorney for North American Electric Reliability Corporation

Introduction

Background: NERC's Revised Processes for Developing Standards

NERC develops Reliability Standards in accordance with Section 300 of its Rules of Procedure and the NERC *Standard Processes Manual*, which is included as Appendix 3A to the NERC Rules of Procedure.[1] The current *Standard Processes Manual* was approved by FERC in September 2010[2] and amended August 2011[3] and incorporates a number of process revisions intended to maintain the openness and inclusiveness of the standards development process, while improving efficiency and the quality of standards and interpretations. A summary of these revisions is included for convenience as Appendix A to this report.

The fourth quarter 2011 marks the first quarter in which projects initiated under the revised processes completed balloting. Two projects balloted during the fourth quarter, Project 2010-07 Definition of Bulk Electric System and Project 2011-INT-01 Revisions to MOD-028 in Response to Florida Power & Light's ("FPL") Request for Interpretation, were initiated under the new processes. All other projects for which ballots were completed in the fourth quarter 2011 were initiated under earlier versions of NERC's standard development processes, but will be completed under the new processes.

This Report

There are two purposes for producing this report. First, this report and future versions will provide NERC, its Board of Trustees, committees, and industry stakeholders information to support future decisions concerning improvements to the standards development process. In addition, this report is responsive to directives from the Federal Energy Regulatory Commission ("FERC" or the "Commission") directing NERC to monitor, analyze and report on the results of its standards development processes.[4]

---

[1] NERC's Rules of Procedure are available at: http://www.nerc.com/page.php?cid=1|8|169.

[2] *Order Approving Petition and Directing Compliance Filing*, 132 FERC ¶FERC 61,200 (September 3, 2010).

[3] *Letter Order Approving Standard Processes Compliance Filing* (August 25, 2011)

[4] *See Order on Compliance Filing,* 118 FERC ¶61,030 (January 18, 2007). *See also, Order on the Electric Reliability Organization's Three-Year Performance Assessment,* 132 FERC ¶61,217 at P 85 (September 16, 2010) ("Three-Year Assessment Order"). Specifically, the Three-Year Assessment Order directed NERC to analyze:

(i) the time required to complete projects (excluding urgent action projects);
(ii) the time required to complete projects initiated in response to NERC's urgent action progress (including whether or not a permanent fix was implemented within the sunset period); and

At the end of each calendar quarter, NERC will update this report by incorporating results from the most recent calendar quarter, to monitor and report progress on improvements to various aspects of the standards development process. The first section of this report provides an overview and analysis of ballots conducted during the fourth quarter of 2011. The second section compares timelines for the projects balloted in the fourth quarter 2011 against baselines provided in the report filed on January 31, 2011, on the time to complete each phase of standards development. The comparison to the historical baselines is responsive to the Commission's directive to analyze the time required to complete each phase of the standards development process. NERC staff and the Standards Committee will use this analysis to monitor successes and to identify opportunities for improvements.

(iii) the time required to complete projects in response to Commission directives. The analysis should include data on the time required for each stage of the process. For example, the analysis should document the time required to move a proposed Reliability Standard from a Standards Authorization Request to the NERC Board, and then to the Commission.

Analysis of Q4 2011 Standards Ballot Results

From October 1, 2011, through December 31, 2011, NERC conducted 21 ballots for eight separate standards projects. Table 1 summarizes these ballot events. A complete record for each project is available on NERC's website on the Ballot Results webpage.[5]

Table 1

Project Type[6]	Project Number & Name	Q4 Ballot Events	Status
Revision	2007-07 – Transmission Vegetation Management	Recirculation ballot of one standard	Adopted by NERC BOT 11/2011; filed with FERC 12/2011
Revision	2007-12 Frequency Response	Initial ballot of one standard	Ongoing
Interpretation	2008-10 Interpretation of CIP-006-x	Initial and recirculation ballots of one interpretation	Pending NERC BOT action
Revision	2009-01 Disturbance and Sabotage Reporting	Initial ballot of one standard	Ongoing
Interpretation	2009-22 Interpretation of COM-002-2	Initial and recirculation ballots of one interpretation	Pending NERC BOT action
Revision	2010-07 Definition of Bulk Electric System	Initial and recirculation ballots of definition and application form to support exception process	Adopted by NERC BOT and filed with FERC 1/2012
Revision	2010-17 Generator Requirements at the	Initial and recirculation	Pending NERC BOT action

[5] The Ballot Results webpage is available at: https://standards.nerc.net/Ballots.aspx.

[6] Appendix A to this report provides a brief description of each type of standards project.

Project Type[6]	Project Number & Name	Q4 Ballot Events	Status
	Transmission Interface	ballots of four standards	
Revision	2011-INT-01 Revision of MOD-028 to Address FPL Request for Interpretation	Initial and recirculation ballots of one standard	Pending NERC BOT action

Of the eight projects balloted during the fourth quarter 2011, six projects were balloted that resulted in standards, interpretations, or definitions being approved by the ballot pool associated with the project. Initial ballots of two other projects were conducted, but stakeholder comments and ballot results indicated that further development is needed so work is ongoing. The eight projects are summarized above in Table 1 and additional details are provided below.

- Project 2007-07 Transmission Vegetation Management: A recirculation ballot was conducted for one standard. The recirculation ballot achieved a high quorum and weighted ballot pool approval of more than 86 percent. The standard was adopted by the NERC Board of Trustees in November 2011 and filed for regulatory approval on December 21, 2011.
- Project 2010-17 Definition of Bulk Electric System: Two initial ballots (one each for the definition and one for the application form to support processing of requests for exceptions) and two recirculation ballots were conducted. This project formed a large ballot pool of just under 500 individuals, and all of the ballots achieved high quorums of approximately 90 percent. Between the initial ballot and the recirculation ballot, the drafting team made only clarifying changes and, in response to the clarifications, weighted ballot pool approval for the definition rose ten percentage points, from approximately 71 percent to just over 81 percent. FERC Order Nos. 743 and 743-A required NERC to file a revised definition of Bulk Electric System and a process for determining exceptions, by January 25, 2012[7]. The definition and amendments to NERC's Rules of Procedure to support processing of Bulk Electric System exception requests were adopted during a special meeting of the NERC Board of Trustees in January 18, 2012 and filed with FERC on January 25, 2012.

[7] *Revision to Electric Reliability Organization Definition of Bulk Electric System*, Order No. 743, 133 FERC ¶ 61,150 (2010); *order on reh'g,* Order No. 743-A, 134 FERC ¶ 61,210 (2011).

- Two projects involved initial and recirculation ballots of interpretations: Project 2008-10 Interpretation of CIP-006-x; and Project 2009-22 Interpretation of COM-002-2. The initial ballots of both interpretations received a high weighted segment approval. Recirculation ballots were conducted to provide ballot pool members an opportunity to reconsider their ballots after reviewing the drafting team's responses to stakeholder comments submitted during the parallel formal comment period and initial ballot. Each of the recirculation ballots of these interpretations achieved a high quorum and high weighted segment approval (96 and 95 percent, respectively). The two interpretations will be presented to the NERC Board of Trustees for action in February 2012.
- Project 2011-INT-01 Revision to MOD-028 to Address FPL Request for Interpretation: At its July 2011 meeting, the Standards Committee identified the option of addressing a request for interpretation through a "rapid revision" of a standard following the normal standard development process. This approach involves making narrowly tailored revisions to an approved standard to address only the requested clarification. As envisioned, this approach reduces the resources involved in processing an interpretation by making the clarification once, directly in the standard, rather than twice – once in an interpretation, and again later when the standard is eventually revised. A request for interpretation of MOD-028 was chosen as a pilot for this approach, and the initial results are promising. The revision of the standard was drafted and completed balloting in approximately four months. Stakeholders were asked to comment on whether they support the use of the "rapid revision" approach to address an interpretation, and the comments received were overwhelmingly supportive. Both ballots for the revised standard achieved high quorums and high weighted segment approval. Specifically, the recirculation ballot for both the quorum and approval were above 90 percent. The revised standard will be presented to the NERC Board of Trustees for action in February 2012.
- Project 2010-07 Generator Requirements at the Transmission Interface: This project involves revisions to several standards to clarify the performance required by Generator Owners and Generator Operators to support bulk power system reliability. Initial and recirculation ballots were conducted for four standards (including two versions of one standard, FAC-003, due to uncertainty of the timing of regulatory approval of revisions under Project 2007-07). Each of the standards was balloted separately in order to provide the best feedback to the drafting team about where additional work was needed to achieve consensus. All of the ballots achieved high quorums and high weighted segment approvals of between 85 and 90 percent, and in one case 96 percent approval. While three standards are completed, the drafting team is continuing to evaluate revisions to other standards.
- Project 2009-01 Disturbance and Sabotage Reporting: This project involves the consolidation of two standards into a single standard. An initial ballot of the standard achieved a low weighted segment approval of approximately 36 percent. Work to

revise the standard in response to stakeholder feedback provided during the formal comment period and initial ballot is ongoing.

- Project 2007-12 Frequency Response: An initial ballot of one standard achieved a low weighted segment approval rating of approximately 31 percent. Work to revise the standard in response to stakeholder feedback provided during the formal comment period and initial ballot is ongoing.

Q4 2011 Ballots and Comparison to Baseline Data

In the version of this report filed on January 31, 2011, NERC provided baselines for each phase of development for standards projects. These baselines were established by grouping all NERC standards projects from 2006 through 2010 into four categories (new standards, revisions to existing standards, expedited projects, and interpretations) and then averaging the times for each phase of development within each group.

In this section of this and future reports, NERC will compare the projects balloted each quarter against these baselines. These comparisons may highlight anomalies initially, but over time the comparison will help to identify trends in the time required for various phases of standards development.

As noted above, during the fourth quarter of 2011, ballots were conducted for eight standards projects. Six of the standards projects balloted this quarter are categorized as "revisions to existing standards" for the purposes of comparing to baselines. Two projects are categorized as interpretations, although one of the "revision" projects was a revision of a standard to provide clarification of a requirement, as an alternative to developing an interpretation.

Chart 1 compares the development phases for each of the six revision projects in this quarter to the baseline.

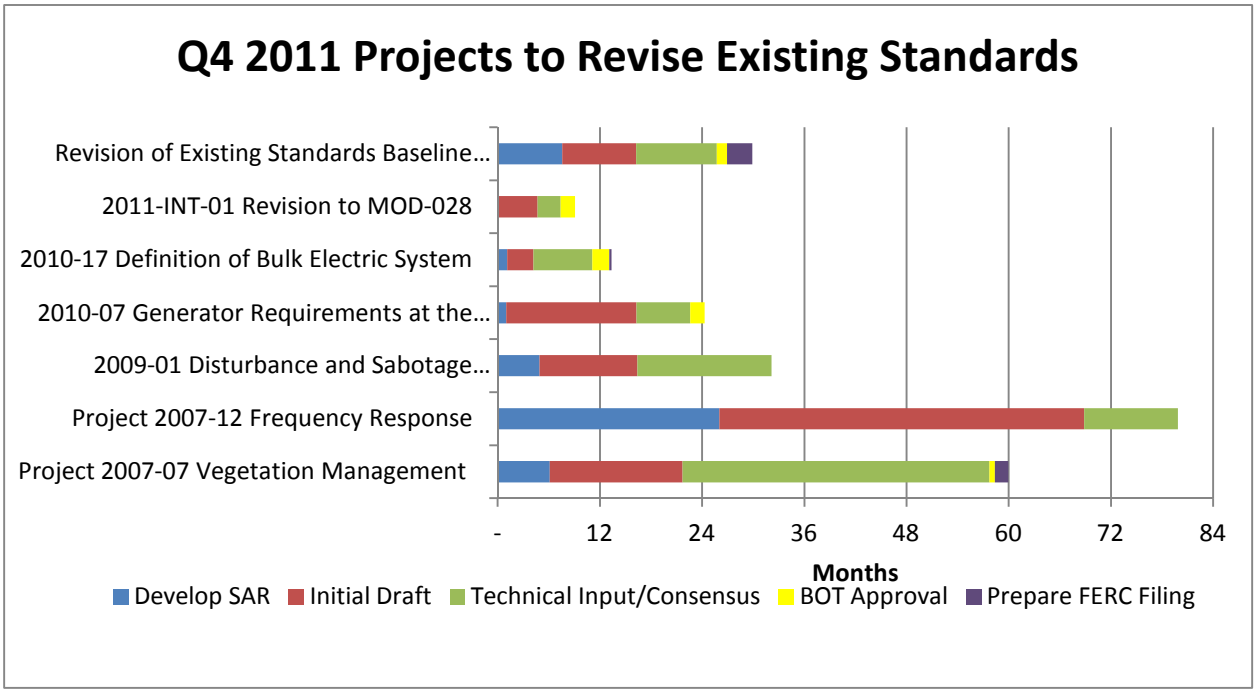

Chart 1

Chart 2 compares the development phases of the two interpretation projects to the baseline.

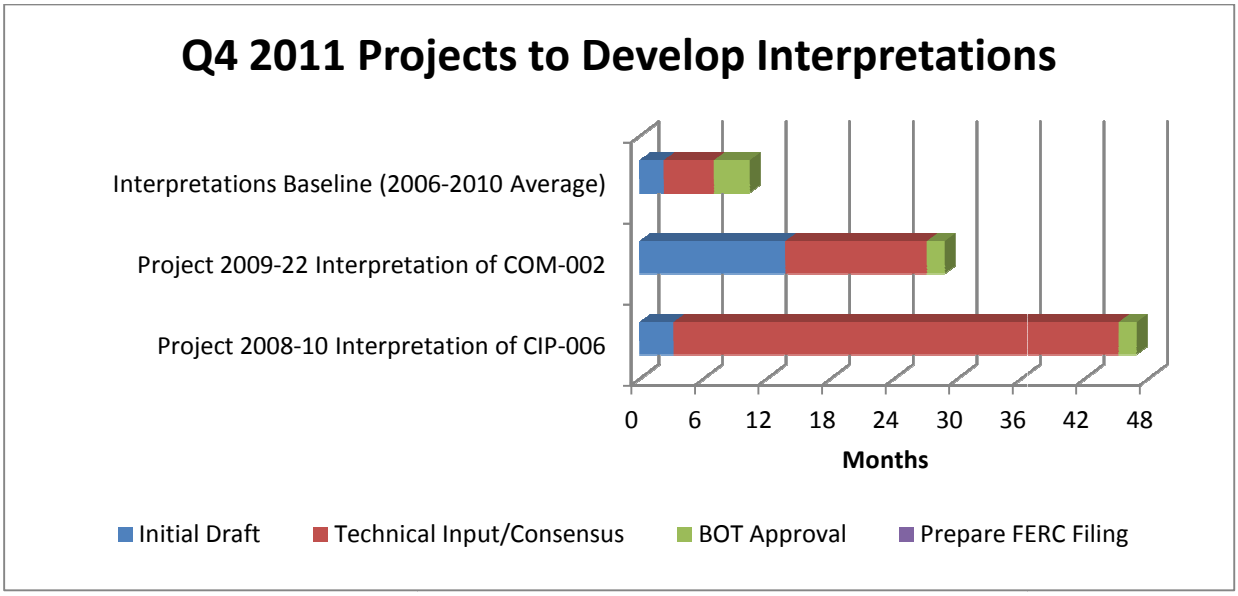

Chart 2

No ballots of projects to develop "new standards" or "expedited projects" were conducted during the fourth quarter 2011. A discussion of the development phases for the projects balloted during the fourth quarter 2011 is included below.

SAR Development Phase. For all standards projects balloted in the fourth quarter of 2011, with the exception of Project 2007-12 Frequency Response,[8] the Standard Authorization Request (SAR) was finalized quickly after being posted for industry review. From 2006 to 2010, SAR development times averaged eight months for a project to revise one or more existing standards. The SAR development period for five of the six projects balloted during the fourth quarter of 2011 was six months or less. As more projects are initiated using the revised processes in the *Standard Processes Manual*, this phase is expected to be shorter, since consensus on the scope of a project is expected to be reached prior to the initiation of work on the project in many cases.

Initial Draft Phase. All but two of the projects balloted in the fourth quarter 2011 required a longer period of time to develop an initial draft than the baseline for the comparable type of project. The duration for the initial draft phase for projects balloted in the fourth quarter 2011

[8] As discussed in the *Analysis of NERC Standard Process Results Second Quarter 2011,* filed July 29, 2011, the SAR development period for Project 2006-02 was more than 49 months, in part because SAR development for Project 2006-02 was placed on 'hold' for almost two years before the SAR was finalized while waiting for completion of Version 0 standards.

ranged from three months (for Project 2010-17 Definition of Bulk Electric System) to 42 months (for Project 2007-12 Frequency Response). For comparison, the 2006-2010 average duration of this phase of standard development was between eight and nine months for projects to revise standards, and almost 14 months for projects to develop new standards.

In some cases, the longer period to develop an initial draft encompasses work by the drafting team to develop the necessary technical basis for the standard or standards. For example, the Project 2007-12 Frequency Response project required almost 43 months to develop an initial draft. Project 2010-07 Generator Requirements at the Transmission Interface required 15.3 months to develop initial drafts of revisions to three standards; much of that time was devoted to analyzing various standards to determine which standards required revisions to support bulk power system reliability under the scope of the project. The team then developed a white paper to convey the results of this analysis to stakeholders, and posted the white paper for comment.

In other cases, the initial draft phase appears longer because of work that was initiated and then put on hold. For example, Project 2009-22, an interpretation of COM-002, was put on hold because the standard and issues related to the requested clarification were being addressed by other projects that were in progress at the time, and a decision was made, in consultation with the requester, to evaluate the progress being made in the related projects before devoting industry resources to process the interpretation.

Two factors should contribute to a reduction in the length of time required to develop an initial draft in the future. First, as more projects are initiated under the revised processes of the *Standard Processes Manual*, the technical justification or basis for the standard will have been developed prior to project initiation, which is likely to reduce delays caused by the development and analysis of a technical basis for requirements. Second, under the project prioritization initiative developed by the Standards Committee, projects are being prioritized to manage the number of standards and standards projects being worked in parallel. This management initiative is expected to produce efficiency gains as fewer projects are delayed because of throughput and capacity issues, both at NERC and within the industry.

Technical Input Phase. Technical input from the industry is received through the formal and informal posting periods. Between each posting, the drafting team reviews the feedback received from stakeholders and makes revisions to the standard or standards. For a formal posting, drafting teams are also required to respond to each stakeholder comment. Thus, the technical input phase includes periods of time when standards and associated documents are posted for industry review – typically either for 30 or 45 days – alternating with periods of time during which the drafting team is reviewing the input provided, revising the standards and associated documents, and preparing responses to the comments received. The technical input phase is essentially a highly-organized dialogue between the drafting team and other industry stakeholders.

For three of the six revision projects balloted during the fourth quarter of 2011, this phase was completed in seven months or less, which is shorter than the average 2006-2010 baseline of nine and a half months for such projects. One of the three projects, Project 2010-17 Definition of Bulk Electric System, had a regulatory deadline and although the drafting team received a substantial volume of technical input each time documents were posted for stakeholder comment, the project was carefully managed to meet the regulatory deadline. Technical input that was outside the immediate scope of the project was included in developing the scope for a second phase of the project.

A second, Project 2010-07 Generator Requirements at the Transmission Interface, included only narrow revisions to three standards to clarify the performance required of Generator Owners and Generator Operators, and completed the technical input phase for three standards in 6.3 months. The third, Project 2011-INT-01, was again a narrowly focused "rapid revision" of one standard to clarify the timing and frequency of Total Transfer Capability calculations needed for Available Transfer Capability calculations. The narrow focus allowed for the technical input and consensus phase, which under the most ideal of circumstances requires a minimum of two and a half months, to be completed in 2.67 months. All three of these projects will be presented to the NERC Board of Trustees in the first quarter 2012, although additional work is ongoing for Projects 2010-07 Generator Requirements at the Transmission Interface as well as for Project 2010-17 Definition of Bulk Electric System.

The three additional projects to revise existing standards each exceeded the baseline duration for the technical input phase, and for two of these projects, Project 2009-01 Disturbance and Sabotage Reporting and Project 2007-12 Frequency Response, work is ongoing. For Project 2007-07 Vegetation Management, the completion of the technical input phase was delayed twice. The first delay occurred while the drafting team was asked to revise its work to follow the results-based approach, and the second delay of approximately seven months occurred when the drafting team was asked by the Standards Committee leadership to explain the technical basis for its work. Including these delays, the technical input phase for this project required just over 36 months.

The technical input phase for both of the interpretations balloted in the fourth quarter 2011 was substantially longer than the 2006-2010 baseline of five months for interpretation projects. In both cases, the interpretation was initiated and then work was delayed for a period of time, contributing to the length of the technical input phase. For Project 2008-10 Interpretation of CIP-006-x, several factors contributed to the delay. First, the ongoing work on revisions to the CIP standards to respond to FERC Order No. 706 was given a higher priority and those revisions drew on the same technical experts required for drafting CIP interpretations. Second, following the November 2009 NERC Board of Trustees meeting, when the Board issued guidance on further processing of interpretations, there was a delay in processing all interpretations as the Standards Committee developed procedures to implement the Board guidance. In May of 2011, the Standards Committee appointed a standing CIP interpretation drafting team, separate from the drafting team that is assigned to revise the CIP standards, and there was a brief delay as the newly appointed drafting team reviewed the interpretation previously

drafted and the substantial record of FERC Orders on CIP standards since the original interpretation was drafted. These delays resulted in the technical input phase taking more than 41 months to complete, although active work was less than six of those months.

The second interpretation, Project 2009-22 Interpretation of COM-002, was also delayed as the Standards Committee developed procedures to implement the Board guidance and formalize and improve the transparency of interpretation drafting. The technical input phase for this interpretation was completed in slightly more than 13 months.

For all projects revising existing standards from 2006 to 2010, the average duration of the technical input phase was nine and a half months, and for interpretations, the average duration was almost five months.

Board of Trustee Adoption. The period of time between ballot pool approval of a standard and NERC Board of Trustees adoption of the standard varies depending on the number of other items that require action by the board. (The board has a fixed schedule of face-to-face meetings, and supplements its face-to-face meetings, as needed, to ensure prompt action when necessary to meet ERO obligations.) In the fourth quarter of 2011, one continent-wide standard, FAC-003-2 – Transmission Vegetation Management, was presented to the Board of Trustees for adoption. The Board adopted the standard within three weeks of ballot pool approval.

Filing with Regulatory Authorities. During the fourth quarter of 2011, NERC submitted two filings to FERC for Standards projects that required NERC Board of Trustees approval. Both of these filings were petitions for approval of standards, and the average time between action by the NERC Board of Trustees and filing with FERC was 62 days. Once the Board of Trustees approves a standards project, NERC staff routinely prepares a draft filing, which is then circulated internally for comment. If substantive edits are required in response to comments received, then additional drafts may be circulated. After a consensus is reached on the draft, NERC finalizes the filing and compiles supporting exhibits for submittal to FERC.[9]

[9] NERC also files each new or revised standard with each applicable Canadian governmental authority.

Conclusion

Several promising developments in the NERC standards development processes began to bear fruit during the fourth quarter 2011, with multiple "firsts." The first projects initiated under the revised processes of the *Standard Processes Manual* were completed this quarter. The first project using the "Rapid Revision" approach to address a request for standard clarification(s) was completed this quarter, with positive results – the process was very efficient, taking about the minimum amount of time a standard revision can take under the processes in the *Standard Processes Manual*.

Another Standards Committee initiative began to pay off in the fourth quarter as the first CIP interpretation completed by the standing CIP Interpretation Drafting Team was approved by its ballot pool. The efficiency of having a standing pool of subject matter experts to address interpretation requests in this important area will be most fully demonstrated in the future as new requests are received and processed by the team.

Along with these "firsts," a number of initiatives implemented earlier in the year are ongoing. For example, stakeholders have requested that, for projects addressing multiple standards, the standards be balloted individually. This approach provides stakeholders an opportunity to provide drafting teams with better feedback about which standards have sufficient consensus and which need further development. NERC has also implemented several administrative changes to consolidate comment and ballot reports to make more efficient use of drafting teams' time in reviewing comments submitted by stakeholders during parallel formal comment periods and ballots.

NERC and the Standards Committee are committed to continuing to explore opportunities for improving the efficiency and effectiveness of NERC's standards development processes.

Appendix A

Summary of Process Revisions in NERC Standard Processes Manual

NERC's *Standard Processes Manual* was developed to replace *Reliability Standards Development Procedure Version 7 (RSDP7)* as Appendix 3A of the NERC Rules of Procedure. The *Standard Processes Manual* was approved by FERC in September 2010. The order also directed certain modifications to clarify which sections of a standard are enforceable, and those modifications were approved by FERC in December 2010.[10]

One of the significant modifications in the new *Standard Processes Manual* is the method used to achieve consensus – through parallel comment and ballot periods, which are conducted early in the process and continue until consensus is achieved. This change appears to be increasing the quality and quantity of feedback that the standards drafting teams are receiving on proposed standards. Because drafting teams are encouraged to make significant changes to the standards between successive ballots without a pre-ballot review period, this modification gives drafting teams the flexibility to revise the standards to take account of the comments received and immediately re-ballot without the separate, successive formal comment and pre-ballot review periods that were required in the *RSDP7*.

This added efficiency means drafting teams begin ballot periods earlier in the development process. While initial ballot results may receive lower approval ratings in the initial stages, as approval increases, the successive ballot process provides a clear indication of the move toward industry consensus.

Just as in the *RSDP7*, an entity or individual that desires to vote on proposed reliability standards must be a member of the registered ballot body. The registered ballot body includes all entities or individuals that qualify for one of ten stakeholder segments and have registered with NERC as potential voting participants. Each member of the registered ballot body is eligible to participate in the voting process and ballot pool for each standard action. The ten stakeholder segments are:

- Transmission Owners
- Regional Transmission Organizations and Independent System Operators
- Load-Serving Entities
- Transmission Dependent Utilities
- Electric Generators

[10] *Order Approving Petition and Directing Compliance Filing*, 132 FERC ¶ FERC 61,200 (September 3, 2010).

- Electricity Brokers, Aggregators, and Marketers
- Large Electricity End Users
- Small Electricity Users
- Federal, State, and Provincial Regulatory or other Government Entities
- Regional Reliability Organizations and Regional Entities

Each standard ballot action has its own ballot pool, populated by interested members of the registered ballot body, including those with specific technical expertise of the subject matter. The individuals that join a ballot pool respond to a pre-ballot e-mail announcement associated with each reliability standard ballot action. The ballot pool size varies, and is based on the standard and the topic. The ballot pool votes to approve or reject each standard action. Specifically, the ballot pool votes determine: (1) the need for and technical merits of a proposed standard action; and (2) that appropriate consideration was given to views and objections received during the development process.

The reliability standards development process may include three types of ballots: an initial ballot, a successive ballot, and a recirculation ballot. An initial ballot is conducted during the last 10 days of a 45-day comment period; successive ballots are conducted during the last 10 days of a 30-day comment period. Following an initial or successive ballot, the drafting team is obligated to respond to each stakeholder comment. The drafting team must consider the issues raised in stakeholder comments to determine whether revisions to the standard and its associated implementation plan should be made.

If the comments submitted during the initial comment period and ballot indicate a need for significant changes, then the drafting team will produce a new draft standard, even if the weighted segment approval is 66.66% or greater. When a drafting team makes significant revisions to the standard, the next ballot held is a successive ballot conducted during the last 10 days of a parallel 30-day comment period. Votes cast by the ballot pool in the initial ballot are not counted in a successive ballot. Each ballot pool member must cast a new vote.

If needed, the *Standard Processes Manual* allows for multiple, successive ballots to obtain the two-thirds majority on a proposed standard. Once the comments from a successive ballot are addressed by the drafting team without significant changes to the standard, the standard proceeds to a recirculation ballot.

A recirculation ballot does not have a comment period, and votes cast in the most recent successive ballot are carried forward. If a member of the ballot pool chooses to vote in the recirculation ballot, the vote cast by that member in the successive ballot is updated.

Approval of a standard action requires that both:

- A quorum is established. This requirement is met when at least 75% of the members of the ballot pool for the standard action submit a response with an affirmative vote, a negative vote, or an abstention; and

- A two-thirds majority of the weighted segment votes cast are affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and non-responses.

The following process is used to determine whether there are sufficient affirmative votes.

- The number of affirmative votes cast in each segment is divided by the sum of affirmative and negative votes cast to determine the fractional affirmative vote for each segment. Abstentions and non-responses are not counted for the purposes of determining the fractional affirmative vote for a segment.
- If there are less than ten entities that vote in a segment, the vote weight of that segment is proportionally reduced. Each voter within that segment voting affirmative or negative receives a weight of 10% of the segment vote. For segments with ten or more voters, the regular voting procedures are followed.
- The sum of the fractional affirmative votes from all segments divided by the number of segments voting is used to determine if a two-thirds majority affirmative vote has been achieved. (A segment is considered as "voting" if any member of the segment in the ballot pool casts either an affirmative or a negative vote.) [11]
- A standard is approved if the sum of fractional affirmative votes from all segments divided by the number of voting segments is equal to or greater than two thirds.

On March 17, 2011[12] the Commission approved a modification to NERC's Rules of Procedure, Rule 321, that was developed to respond to FERC's March 18, 2010 Order directing NERC to propose modifications to NERC's Rules of Procedure was approved by the Commission.[13] Rule 321 lays out specific processes to be used if stakeholders are unable to achieve consensus through the processes in the *Standard Processes Manual* to present the NERC Board of Trustees with a standard that is responsive to a specific Commission directive.

[11] When less than ten entities vote in a segment, the total weight for that segment is determined as one tenth per entity voting.

Appendix B

Types of Standards Projects

For the purpose of analyzing results of its standards processes, NERC has identified four broad categories of standards projects.

The first category of projects is **Revisions to Existing Standards**. Revisions to existing standards are a significant and an ongoing part of NERC's standards development work, as NERC and industry work to address regulatory directives from FERC, modify standards to address changing technologies and operating conditions, and review standards in compliance with the five-year interval required to maintain ANSI accreditation. Between 2006 and 2010, the average time to complete revisions to existing standards was 30 months.

The second category is **New Standards**. There have been, and will continue to be, occasions where an entirely new standard or group of standards may be needed to address bulk power system reliability. The data collected from 2006 through 2010 show that these projects take longer, on average, than projects to revise existing standards. Between 2006 and 2010, the average time to complete projects to draft new standards was 42 months.

The third category is **Urgent Action/Expedited Projects**.[14] Urgent Action or Expedited Projects are shortened by reducing the time for certain process steps, or by allowing steps that would normally proceed serially to be conducted in parallel. By definition, these projects are expected to have a shorter development time, on average, than most standards projects. On average, the development time for Urgent Action and Expedited Projects from 2006 through 2010 was a little more than 7 months.

The final category is **Interpretations**. Entities that must comply with a reliability standard have the right to request a formal interpretation of a requirement included in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2010, NERC received a number of requests for interpretation that were absorbed into other projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard. For those interpretation requests that were processed, the average time to complete interpretations and file them with regulatory authorities was about 10 months.

[14] Prior to September 2010, the NERC *Reliability Standards Development Procedure* incorporated a process used for developing a standard more quickly than the normal standard development process, which was referred to as the Urgent Action Process. FERC's approval of the *Standard Processes Manual* in September 2010 replaced the Urgent Action process with the Expedited Standards Development Process.

Appendix C

Phases in Standard Projects

NERC has identified five phases in the development of a Reliability Standard. Table 2 identifies those phases.

Table 2

Phases in NERC Reliability Standards Development Projects	
Phase	**Description**
1. SAR Development	from initial draft SAR to SC acceptance of a SAR for posting, including industry ballot of SAR if required
2. Initial Draft Development	from acceptance of SAR to posting of initial draft
3. Industry Technical Input/Consensus Building	from posting of initial draft(s) through ballot pool approval of a recirculation ballot
4. Board of Trustee (BOT) Approval	from ballot pool approval to BOT approval
5. Filing with Regulatory Authorities	from BOT approval to filing

and Cheryl A. LaFleur.

North American Electric Reliability Corporation — Docket No. RD11-13-000

ORDER APPROVING MODIFICATION OF DEFINITION

(Issued February 3, 2012)

1. On March 30, 2011, the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO), submitted a petition for Commission approval of a proposed modification to the Glossary of Terms Used in NERC Reliability Standards (Glossary).[1] Specifically, NERC seeks Commission approval of a proposed modification to the definition of Protection System. In this order, the Commission approves NERC's modification to the Glossary, finding that the modification to the definition of Protection System is just, reasonable, not unduly discriminatory or preferential, and in the public interest.

I. Background

2. Section 215 of the Federal Power Act (FPA) requires a Commission-certified ERO to develop mandatory and enforceable Reliability Standards, which are subject to Commission review and approval. Once approved, the Reliability Standards may be enforced by the ERO, subject to Commission oversight, or by the Commission independently.[2]

[1] *North American Electric Reliability Corp.*, March 30, 2011 Petition for Approval of Modification to the Definition of Protection System (Petition).

[2] *See* 16 U.S.C. 824o(e) (2006).

3. Pursuant to section 215 of the FPA, the Commission established a process to select and certify an ERO[3] and, subsequently, certified NERC as the ERO.[4] On March 16, 2007, the Commission issued Order No. 693, approving 83 of the 107 Reliability Standards and associated definitions filed by NERC, including the definition of Protection System.[5]

II. NERC Petition

4. In its March 30, 2011 Petition, NERC requests Commission approval of a proposed modification to the definition of Protection System. NERC states that it proposed the modification "to close a reliability gap created by an omission in the current Commission-approved definition of 'Protection System.'"[6] Specifically, NERC proposes to add battery chargers to the definition.

5. The current definition of Protection System includes protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry.[7] The revised definition with the proposed modification states:[8]

[3] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[4] *North American Electric Reliability Corp.*, 116 FERC ¶ 61,062, *order on reh'g & compliance*, 117 FERC ¶ 61,126 (2006), *aff'd sub nom., Alcoa, Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009).

[5] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

[6] Petition at 5.

[7] NERC Glossary of Terms Used in Reliability Standards (2011). Available at: http://www.nerc.com/files/Glossary_of_Terms_2011October26.pdf.

[8] The modified definition approved herein shall supersede the interpretation of Requirement R1 of Reliability Standard PRC-005-1 approved concurrently with this order in Docket No. RM10-5-000 on the effective date of the modified definition (the first day of the first calendar quarter twelve months from approval, i.e., April 1, 2013).

"Protection System –

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breaker or other interrupting devices."[9]

6. In the Petition, NERC explains that the modification will improve the definition by clearly identifying the essential elements that constitute a Protection System.[10] NERC states that battery chargers are an essential piece of the bulk power system that should be included in the definition since battery chargers function to assure that batteries associated with protection systems are in a continuous state of readiness.[11]

Effective Date

7. NERC requests that the modification be made effective according to the implementation plan accompanying the filing.[12] Specifically, NERC proposes that each responsible entity subject to PRC-005-1 shall be required to modify its protection system maintenance and testing program description and basis documents, as required by Requirement R1, to reflect the revised definition of Protection System by the first day of the first calendar quarter twelve months following the appropriate regulatory approvals. NERC further proposes that each responsible entity shall be required to implement any new or additional maintenance and testing, as required by Requirement R2, by the end of the first complete maintenance and testing cycle described in the entity's program description and basis documents.

[9] Petition at 5.

[10] *Id.*

[11] *Id.*

[12] *Id*. at 2.

III. Notice of Filing, Interventions and Comments

8. On November 22, 2011, notice of NERC's filing was published in the *Federal Register* with interventions and protests due on or before December 15, 2011.[13] A motion to intervene was timely filed by American Municipal Power, Inc. (AMP). Pursuant to Rule 214 of the Commission's Rules of Practice and Procedure,[14] the timely, unopposed motion to intervene serves to make AMP a party to this proceeding.

IV. Commission Determination

9. The Commission finds that the ERO's modification to the definition of Protection System is just, reasonable, not unduly discriminatory or preferential, and in the public interest.[15] As explained by NERC, battery chargers are essential to assure that batteries used to operate protection systems are in a continuous state of readiness. Therefore, it is appropriate that battery chargers be included in the definition of Protection System. The modified definition removes any uncertainty as to whether battery chargers should be included in a responsible entity's maintenance and testing program and, therefore, closes a reliability gap identified by NERC.

10. Accordingly, the Commission approves the modification to the definition of Protection System, effective pursuant to the implementation plan described above.

V. Information Collection Statement

11. The Office of Management and Budget (OMB) regulations require that OMB approve certain reporting and recordkeeping requirements (collections of information) imposed by an agency.[16] The Commission submits reporting and recordkeeping requirements to OMB under section 3507 of the Paperwork Reduction Act of 1995.[17]

---

[13] 76 Fed. Reg. 72,195 (2011).

[14] 18 C.F.R. § 385.214 (2011).

[15] 16 U.S.C. § 824(d)(2).

[16] 5 C.F.R § 1320 (2011).

[17] 44 U.S.C. § 3507.

12. The Commission approved the definition of Protection System, the subject of this order, in Order No. 693.[18] This order proposes to approve a modification to the previously approved definition, which was developed by NERC as the ERO. The definition relates to an existing Reliability Standard, and the Commission does not expect it to affect entities' current reporting burden.[19] Accordingly, we will submit this order to OMB for informational purposes only.

The Commission Orders:

NERC's modified definition is hereby approved, as discussed in the body of this order.

By the Commission.

December 2011
Meeting Summaries

These are summaries of orders voted by the Federal Energy Regulatory Commission at its December 15, 2011 public meeting. The summaries are produced by FERC's Office of External Affairs and are intended to provide only a general synopsis of the orders. These are not intended as a substitute for the Commission's official orders. To determine the specific actions and the Commission's reasoning, please consult the individual orders when they are posted to FERC's eLibrary found at www.ferc.gov.

E-1, struck
E-2, struck

FERC conditionally accepts proposal

E-3, *Louisville Gas and Electric Co., et al.* Docket Nos. ER11-4396-000 and EC98-2-000. The order conditionally accepts a proposal by Louisville Gas & Electric Company and Kentucky Utilities Company to replace Southwest Power Pool, Inc. as Independent Transmission Organization with TranServ International, Inc. and its subcontractor, MAPPCOR. The order finds that subject to conditions the proposal is just and reasonable and not unduly discriminatory, and is consistent with the requirements placed on the applicants in the order authorizing their 1998 merger, and in the order conditionally approving the applicants' withdrawal from the Midwest Independent Transmission System Operator, Inc..

FERC denies rehearing, grants in part and denies in part clarification

E-4, *Demand Response Compensation in Organized Wholesale Energy Markets*, Docket No. RM10-17-001. This order denies rehearing of the final rule, Order No. 745, and grants in part and denies in part clarification regarding certain provisions of the final rule. The order grants clarification to the limited extent of addressing the applicability of Order No. 745 to circumstances when it is not cost-effective to dispatch demand response resources. Order No. 745 standardized the compensation amount paid to demand response resources that participate in the organized wholesale energy markets by requiring Independent System Operators (ISO) and Regional Transmission Organizations (RTO) to pay demand response resources the market price for energy. Demand response compensation payments,

however, are required only when it is cost-effective for an ISO or RTO to make such payments.

FERC accepts in part and rejects in part a compliance filing; will require further compliance filing

E-5, *California Independent System Operator Corp.,* Docket No. ER11-4100-000. This order accepts in part, subject to further compliance, and rejects in part, the California Independent System Operator Corp.'s (CAISO) Order No. 745 compliance filing. The final rule required each RTO and ISO to make a compliance filing by July 22, 2011, proposing tariff revisions necessary to implement the compensation approach adopted in Order No. 745, including a net benefits test, a cost allocation mechanism, and an assessment of their demand response measurement and verification protocols. Among other things, the order finds CAISO's proposed net benefits test is compliant with the direction provided in Order No. 745. However, because CAISO has not complied with other, related requirements of Order No. 745, the order directs CAISO to submit a further compliance filing. The order finds inconsistent with the requirements of Order No. 745 CAISO's proposal to reject bids by Proxy Demand and Reliability Demand Response Resources that are below the threshold price when the net benefits test is satisfied (that is, the Locational Marginal Pricing is equal to or greater than the applicable threshold price). The order also rejects CAISO's proposed cost allocation methodology because it has not demonstrated that its current cost allocation methodology, including the default load adjustment, appropriately allocates costs to those that benefit from the demand reduction.

E-6, struck

FERC accepts in part and rejects in part a compliance filing

E-7, *PJM Interconnection, L.L.C.*, Docket No. ER11-4106-000. The order accepts in part, and rejects in part, a compliance filing made by PJM in response to Order No. 745. The order accepts PJM's compliance revisions with respect to the circumstances under which PJM will pay locational marginal price (LMP), as required by Order No. 745, to Economic Load Response participants (i.e., at those times when these offers are equal to, or greater than, the threshold price, as indicated by PJM's application of the Order No. 745-prescribed net benefits test). The order also rejects PJM's proposal to eliminate PJM's existing LMP-(G+T) (locational marginal price less certain generation and transmission) pricing rules at all other hours, finding that such a proposal is beyond the scope of Order No. 745. The order requires PJM to make an additional compliance filing to reinstate its existing tariff provisions for payment of LMP-G+T in circumstances not addressed by Order No. 745. The order notes that, if PJM wishes to propose changes to

these pricing provisions, the appropriate forum will be a separate section 205 filing.

FERC conditionally accepts in part and rejects in part a compliance filing

E-9, *Midwest Independent Transmission System Operator, Inc.*, Docket No. ER11-4337-000. This order conditionally accepts in part and rejects in part MISO's filing in compliance with Order No. 745, and requires MISO to submit a further compliance filing. Specifically, the order accepts MISO's proposal to pay the applicable hourly LMP to cost-effective demand response resources that clear the day-ahead and/or real-time energy market, subject to further clarification and compliance. The order rejects MISO's proposals to deny LMP compensation to demand response facilitated by behind-the-meter generation and to demand response resources that are not cost effective per the net benefits test, and requires MISO to submit tariff revisions implementing these determinations in its compliance filing. The order also rejects MISO's proposed bifurcated cost allocation methodology and requires MISO to submit a just and reasonable cost allocation methodology in its compliance filing. With respect to measurement and verification, as a general matter, the order defers deciding whether MISO has complied with the measurement and verification protocol requirements of Order No. 745, subject to the outcome of the proceeding regarding MISO's compliance with the measurement and verification protocol requirements of Order No. 719 and also subject to further compliance in this proceeding. Finally, the order conditionally accepts in part and rejects in part the proposed tariff revisions regarding MISO's demand response measurement and verification protocols and requires MISO to modify these proposed tariff revisions in its compliance filing.

FERC denies rehearing; conditionally accepts a compliance filing

E-11, *Midwest Independent Transmission System Operator, Inc.*, Docket No. ER08-394-021, -022. This order denies requests for rehearing of the Commission's April 16, 2009 order, and conditionally accepts MISO's June 17, 2009 compliance filing. In particular, the order addresses various issues related to the Commission's decision to require MISO to file tariff revisions related to its market monitoring plan for its voluntary capacity auction. It also addresses issues related to the Commission's decision to accept MISO's annualized $80,000/MW initial cost of new entry (CONE) value for any deficiencies in capacity.

FERC accepts compliance filing

E-12, *Midwest Indep. Transmission Sys. Operator, Inc.*, Docket No. ER09-1049-000, *et al.* The order accepts MISO's April 28, 2009 and October 2, 2009 compliance filings to Order Nos. 719 and 719-A, subject to a further compliance filing. This order finds that MISO's April 28, 2009 filing and certain proposals in the October 2, 2009 filing, with certain modifications, comply with Order No. 719 in the areas of (1) demand response and pricing during periods of operating reserve shortage, including aggregation of retail customers; (2) long-term power contracting; and (3) market-monitoring policies. The order further finds that relevant proposals in the October 2, 2009 filing, with certain modifications, comply with Order No. 719-A. This order makes no findings as to MISO's compliance with the fourth area of reforms identified in Order No. 719: the responsiveness of RTOs and ISOs to their customers and other stakeholders. The Commission issued a separate order addressing MISO's compliance with this aspect of Order No. 719 on October 21, 2010.

FERC authorizes negotiated rates for transmission rights

E-13, *Southern Cross Transmission LLC*, Docket No. EL11-61-000. The order authorizes Southern Cross to charge negotiated rates for transmission rights on its proposed 3,000 MW high-voltage direct current transmission line that will run from a point near the Texas/Louisiana border to Mississippi. The order also accepts Southern Cross's proposal to allocate up to 75 percent of initial capacity on the proposed project for presubscription by anchor tenants, and to subscribe the remainder of the capacity in an open season auction.

FERC grants request seeking interconnection with a high-voltage direct current transmission line

E-14, *Southern Cross Transmission LLC and Pattern Power Marketing LLC*, Docket No. TX11-1-000. This order grants a request filed by Southern Cross and Pattern Power for a Commission order directing the City of Garland, Texas to interconnect with Southern Cross's proposed 3,000 MW high-voltage direct current transmission line. The order also grants the applicants' request for a Commission order directing Oncor Electric Delivery Company LLC and CenterPoint Energy Houston Electric, LLC to provide transmission services for power flows into and out of ERCOT. In addition, the order directs further proceedings to finalize the terms and conditions of the proposed interconnections, and conditionally approves a settlement among the parties related to the rates, terms, and conditions of the requested interconnection and transmission services. Finally, the order provides the requested disclaimer of jurisdiction, confirming that provision of the specified interconnection and transmission services will not cause ERCOT or any ERCOT entity that is not already a public utility to become a

public utility under Part II of the Federal Power Act and therefore, subject to FERC jurisdiction.

FERC approves an interpretation of a reliability requirement

E-16, *North American Electric Reliability Corporation*, Docket No. RD11-12-000. This order approves NERC's interpretation of Requirements R1 and R3.2 of Reliability Standard EOP-001-0 - Emergency Operations Planning. The Reliability Standard requires that each transmission operator and balancing authority develop, maintain, and implement a set of plans to mitigate operating emergencies, as well as coordinate such plans with other transmission operators and balancing authorities. The interpretation of Requirement R1 clarifies the meaning of the terms "adjacent" and "remote" with regard to neighboring balancing authorities, and clarifies the relationship between Reserve Sharing Groups and Reliability Standard EOP-001-0. The interpretation of Requirement R3.2 reinforces the need for communication and coordination between the transmission operator and balancing authority.

FERC accepts revised tariff sheets

E-17, *Southwest Power Pool, Inc.*, Docket No. ER12-140-000. The order accepts for filing SPP's revised tariff sheets to its open access transmission tariff. The revised sheets were submitted at the request of the Kansas Power Pool (KPP) to establish a formula rate for determining KPP's annual transmission revenue requirement. The order also suspends the revised tariff sheets for a nominal period, and permits them to become effective December 20, 2011, subject to refund and hearing and settlement judge procedures.

FERC accepts filing

E-18, *Midwest Independent Transmission System Operator, Inc., et al.*, Docket No. ER12-33-000. This order conditionally accepts the Exit Fee Agreement among (Midwest Independent Transmission System Operator, Inc. MISO), Duke Ohio, and Duke Kentucky covering exit fees under MISO Schedules 10, 16, and 17.

FERC accepts, with modifications, proposed tariff revisions

E-20, *Entergy Services, Inc.*, Docket Nos. ER05-1065-011 and OA07-32-008. The order accepts, with modifications, proposed revisions to Attachment C (Methodology To Assess Available Transfer Capability), Attachment D

(Methodology For Completing A System Impact Study), and Attachment E (Transmission Service Request Criteria) of Entergy's Open Access Transmission Tariff. The order also accepts, with modifications, certain revisions to Attachment T (Recovery of New Facilities Costs and Planning Redispatch Costs for Long-Term Services), previously submitted by Entergy in compliance with Order No. 890, on which the Commission has not yet made a determination. The order also addresses unresolved issues regarding (1) Entergy's modeling and curtailing practices relating to unscheduled Qualifying Facility energy, and (2) which of two options Entergy's Available Flowgate Capacity process's Study Horizon should use to resolve shortfalls in a load-serving entity's resource designations.

FERC denies rehearing

E-21, *New York Independent System Operator, Inc.*, Docket Nos. ER11-2224-007, ER11-2224-008. The order denies rehearing of two prior Commission orders concerning NYISO's update of its Installed Capacity (ICAP) demand curves. It denies rehearing of the ruling in the Commission's May 19, 2011 order that NYISO account for New York City property tax abatement in the calculation of the cost of new entry for the proxy peaking unit used to set the demand curve rates for the New York City capacity zone. The order also denies rehearing of the Commission's April 4, 2011 order which accepted a filing made by NYISO to establish that, in light of the Commission's conditional acceptance and suspension of NYISO's proposed updated demand curve rates, the then-effective ICAP demand curves would remain in effect on and after May 1, 2011, until a date set by Commission order.

FERC addresses requests for expedited reconnection of a qualifying facility to an electric power cooperative

E-24, *Gregory R. Swecker and Beverly F. Swecker v. Midland Power Cooperative and State of Iowa,* Docket No. EL11-39-001. The order addresses issues raised in a May 6, 2011 filing made by Gregory R. Swecker and Beverly F. Swecker. They filed a petition to enforce the Public Utility Regulatory Policies Act of 1978 (PURPA) against Midland Power Cooperative (Midland) and the State of Iowa. The Sweckers claimed that Midland has refused to purchase the excess electric energy produced by the Sweckers' qualifying facility (QF) at Midland's full avoided cost. The Sweckers asked the Commission to declare that the full avoided cost rate is the rate that Midland pays its full-requirements supplier for energy and power. The Sweckers also asked the Commission for payment of energy and capacity that has been delivered to Midland from 2004 to April 1, 2011, at the rate the Sweckers claim is the proper avoided cost rate. Finally, the Sweckers asked that Midland be prohibited from disconnecting its QF until all violations and complaints have been resolved. The Sweckers' May 6, 2011 filing was the latest

of many petitions to enforce PURPA filed by the Sweckers. In response to the May 6, 2011 filing of the Sweckers' petition to enforce PURPA, the Commission issued a notice of intent not to act. Shortly following issuance of the notice of intent not to act, Midland disconnected the Swecker QF. On October 27, 2011, the Sweckers filed a notice of that disconnection and a request for an expedited order for reconnection. On October 31, 2011, the Sweckers filed a second request for expedited order for reconnection.

The order finds that the actions of Midland, in disconnecting service to the QF owned by the Sweckers, are inconsistent with its obligations under PURPA. The order states that the underlying dispute concerning Midland's determination of its avoided costs for purchasing the output of the QF owned by the Sweckers is appropriate for resolution through a negotiation process with the Commission's Dispute Resolution Service. The order further states that if the parties are unable to report an agreement of the underlying dispute or progress toward an agreement within thirty days of the date of the order, the Commission will consider what steps to take next in the proceeding.

FERC proposes rule that would govern the filing of privileged documents

M-1, *Filing of Privileged Materials and Answers to Motions,* Docket No. RM12-2-000. This Notice of Proposed Rulemaking (NOPR) proposes revisions to 18 CFR 388.112 (superseding procedures throughout the Commission's rules and regulations) for filing privileged documents, modeled after the complaint procedures. The proposal permits electronic filing of privileged material and Critical Energy Infrastructure Information and, in proceedings subject to a right to intervene, access to such information via a protective agreement. The proposal will ensure that the same rules for filing privileged materials in complaint proceedings are extended to other proceedings, such as filings submitted under section 4 of the Natural Gas Act and section 205 of the Federal Power Act. In addition, the NOPR proposes to revise Rule 213(d) to provide that answers to motions requesting an extension of time or a shortened time for action be filed in 2 business days (instead of 15 days), unless otherwise ordered.

FERC rules on a proposal to recover hurricane-related expenses

G-1, *Sea Robin Pipeline Company, LLC,* Docket Nos. RP09-995-000 and RP10-422-000. The order addresses briefs on and opposing exceptions to an Initial Decision that set forth the ALJ's findings concerning a mechanism, the Hurricane Surcharge, to recover hurricane-related expenses proposed by Sea Robin in an NGA limited section 4 filing. This order reverses the ALJ's finding that a 21.4-year recovery period is just and reasonable and finds instead that Sea Robin's

proposed 4-year recovery period is just and reasonable. This order also reverses the ALJ's holding that carrying charges at the Commission-published interest rate should begin to accrue March 1, 2010, the date that the Commission authorized the Hurricane Surcharge to take effect, subject to refund, and finds instead that carrying charges should begin to accrue the later of August 1, 2009, the date Sea Robin filed to establish the Hurricane Surcharge, or the date the associated cost is incurred. Finally, this order finds that Sea Robin's discount agreements with certain shippers permit it to recover the Hurricane Surcharge from those shippers. Therefore, there is no need to modify those agreements, as the ALJ sought to do, pursuant to an analysis under the *Mobile-Sierra* public interest standard. The remainder of the Initial Decision is affirmed by this order.

FERC reaffirms rulings on oil pipeline rate issues, accepts compliance filing

G-3, *SFPP, L.P.*, Docket Nos. IS08-390-004 and IS08-390-006. This order addresses requests for rehearing of Opinion No. 511, the order on Initial Decision regarding SFPP's West Line rates, issued February 17, 2011, in Docket No. IS08-390-002. The order also addresses a related compliance filing by SFPP submitted in Docket No. IS08-390-006 containing the cost of service information SFPP filed to support the revised West Line rates as required by Opinion No. 511. On rehearing, the order affirms the Commission's prior findings in Opinion No. 511 regarding throughput, litigation costs, capital structure and the cost of capital (both debt and equity), and all income tax allowance issues except those related to the calculation of allowance for deferred income taxes. The order grants rehearing regarding the application of SFPP's cost allocation methodology to certain elements of that methodology involving the assignment of certain costs to SFPP and the exclusion of the KM Canada Entities. The order also grants rehearing (i) requiring SFPP to recalculate its starting rate base and (ii) on the issue of substantial divergence, requiring SFPP to modify its indexing calculations. In the indexing compliance filing, the Commission will permit SFPP to apply one-quarter of the July 1, 2009 oil pipeline index increase for changing costs during 2008. This one-quarter increase corresponds to the last three months of 2008 which were outside the base and adjustment periods in this proceeding. SFPP is directed to make a revised compliance filing consistent with the order.

FERC rejects revised tariff filing, grants rehearing

G-4, *Northern Natural Gas Company,* Docket Nos. RP11-2061-001 and RP11-2061-000. The order addresses Northern's response, and Indicated Shippers' request for rehearing on the *force-majeure* ruling in the Commission's June 16, 2011 order.

In that order, the Commission directed Northern to revise its tariff provisions governing reservation charge credits to conform with Commission policy with respect to non-*force majeure* situations, unless Northern could show why it should not be required to do so. However, the June 16 Order did not require Northern to revise its tariff to provide reservation charge credits during *force-majeure* events, as Indicated Shippers had requested, based upon Northern's representation that it allocated some of its fixed costs to its usage charge.
The December 2011 order finds that Northern has not shown why it should not be required to revise its tariff to implement reservation charge crediting provisions consistent with Commission policy as to non-*force majeure* events. The order also concludes that the amount of fixed costs that Northern allocated to the usage charge, three percent of its cost of service, is not an equitable sharing of the risk with its shippers. Accordingly, the order grants Indicated Shippers' request for rehearing, and requires Northern to grant reservation credits for *force-majeure* outages, but Northern may modify the approved methods for crediting for *force-majeure* outages, the Safe Harbor and No-Profit methods, to reflect that Northern allocates some of the fixed costs to the usage charge.

FERC denies rehearing; grants request for clarification

H-1, *Public Utility District No. 1 of Snohomish County, Washington,* Project No. 2157-195. This order denies the City of Everett, Washington's request for rehearing of Commission staff's September 2, 2011 order issuing a new license to Public Utility District No. 1 of Snohomish County for the continued operation and maintenance of the Henry M. Jackson Hydroelectric Project No. 2157. This order grants the City's request for clarification of one of the license articles.

FERC denies rehearing

H-2, *Appalachian Power Company,* Project No. 2210-214. The order denies a rehearing request filed by Tri-County AEP Relicensing Committee of the Commission's Oct. 20, 2011 order. Today's order addresses Tri-County's intervention request. The order emphasizes that interventions are only allowed where a post-license matter entails a material change in project development or terms and conditions of the license, or could adversely affect rights of property owners in a manner not contemplated by the license. Neither of these things occur here. Tri-County will continue to have the opportunity to be heard on global issues regarding the plan.

FERC denies rehearing

C-1, *Transcontinental Gas Pipe Line Company, LLC,* Docket No. CP11-4-001. The order denies Atlanta Gas Light Company's request for rehearing of the

Commission's March 28, 2011 order authorizing Transcontinental Gas Pipe Line Company's abandonment of storage and transportation services being provided to Atlanta Gas in accordance with the case-specific Part 157 certificate authority. The order affirms the March 28 order's finding that abandonment/conversion of case-specific services to open-access services will be authorized "unless it is otherwise demonstrated that in a given case that such conversion would be unreasonable."

The order also points out that, under the terms of the Part 157 Rate Schedule at issue, transportation service is only available to shippers also taking Transco's related storage service. That service is no longer available because CPG (the entity that provided the storage service to Transco that Transco, in turn, provided to its SS-1 shippers) has now abandoned its storage capacity by transfer to a new company. Atlanta Gas did not seek judicial review of the Commission's authorization of that abandonment.

January 2012 Meeting Summaries

These are summaries of orders voted by the Federal Energy Regulatory Commission at its January 19, 2012 public meeting. The summaries are produced by FERC's Office of External Affairs and are intended to provide only a general synopsis of the orders. These are not intended as a substitute for the Commission's official orders. To determine the specific actions and the Commission's reasoning, please consult the individual orders when they are posted to FERC's eLibrary found at www.ferc.gov.

G-1, **Press Release**

FERC denies rehearing

E-1, *ISO New England Inc.*, Docket No. ER10-787-005, *et al*. The order largely denies rehearing, and also grants clarifications and accepts compliance filings submitted in response to the April 13, 2011 order, with respect to changes in ISO-NE's Forward Capacity Market (FCM). The order explains that an offer floor mitigation regime using asset-class-specific benchmarks appropriately mitigates buyer-side market power, and that more comprehensive zonal modeling, in conjunction with mitigation rules that address seller-side market power, is appropriate.

FERC rules on a compliance filing

E-2, *Southwestern Power Pool, Inc.* Docket No. ER11-4105-000, *et al*. This order discusses whether SPP's compliance filing satisfies the requirements of Order No. 745 and rejects two aspects of SPP's compliance filing. The order directs SPP to (1) perform a net benefits test or, alternatively, demonstrate that the net benefits test requirements are satisfied by showing that, given the characteristics of its system and market, its existing practice of compensating demand response resources at the locational imbalance price is cost-effective in all hours and supports cost allocation pursuant to Order No. 745 in all hours and (2) articulate a cost allocation proposal that is consistent with Order No. 745. The order also requires SPP to explain how the measurement and verification proposal in its ongoing Order No. 719 compliance proceeding, as amended and discussed in its December 5, 2011 compliance filing, will continue to ensure that appropriate baselines are set and that demand response will continue to be adequately measured and verified as necessary to ensure demand response resource performance consistent with Order No. 745.

FERC accepts Order No. 745 compliance filing, subject to conditions

E-3, *ISO New England, Inc.*, Docket No. ER11-4336-000, *et al.* The order largely accepts ISO-NE's two-stage Order No. 745 compliance filing proposal, subject to conditions. ISO-NE's proposal includes a transition period in which it would implement many of the changes necessary to comply with Order No. 745, effective June 1, 2012, and a later fully-integrated solution in which it would be in full compliance with Order No. 745, effective June 1, 2016. The order also directs ISO-NE to either provide further justification for, or make a compliance filing to eliminate, a demand response bid floor.

E-4, **Struck.**
E-5, **Struck.**
E-7, **Struck.**
E-8, **Struck.**

FERC denies South Carolina Commission request for establishment of joint board

E-9, *Public Service Commission of South Carolina and the South Carolina Office of Regulatory Staff*, Docket No. EL11-62-000. This order denies, as beyond the reach of Federal Power Act section 209, the request by the Public Service Commission of South Carolina and the South Carolina Office of Regulatory Staff for the creation of a "joint board" under that section to address the possible impact of new or proposed regulations promulgated by the Environmental Protection Agency on the electric power sector. The order explains that such boards are to address matters arising under Part II of the Federal Power Act, and the matters raised are not cognizable under Part II. The order also denies as moot the petition's request for the production of related information by the Commission because this information is already publicly available.

FERC accepts settlement, subject to modification

E-12, *MidAmerican Energy Company*, Docket No. ER09-823-000. The order accepts a settlement agreement between MidAmerican and Clipper Windpower Development Company, LLC (Clipper) filed August 22, 2011, subject to modification regarding the standard of review. The settlement resolves all issues that had been set for hearing concerning the rates, terms, and conditions of a proposed Large Generator Interconnection Agreement between MidAmerican and Clipper for a proposed 50-megawatt wind farm.+

FERC dismisses, in part, and denies, in part, a complaint

E-13, *Louisiana Public Service Commission v. Entergy Corporation; Entergy Services, Inc.; Entergy Louisiana, LLC; Entergy Arkansas, Inc.; Entergy New Orleans, Inc.; Entergy Mississippi, Inc.; Entergy Gulf States Louisiana, L.L.C.; Entergy Texas, Inc.*, Docket No. EL11-63-000. The order dismisses as premature, in part, and denies, in part, a complaint filed by the Louisiana Public Service Commission (Louisiana Commission) against Entergy Corporation and seven affiliates. The Commission dismisses as premature the issues related to Entergy Corporation's allocation of the cost of transmission upgrades at the Ouachita Generating Station in Louisiana following Entergy Arkansas's withdrawal from the System Agreement and the allocation of the benefits from the settlement of a contractual dispute between Entergy Arkansas and Union Pacific Corporation over the delivery of coal supplies to two generation units in Arkansas. The order notes that the Commission previously instructed the Louisiana Commission that it could raise its concerns about the post-withdrawal allocation of the Ouachita Plant transmission upgrade costs and the coal supplies settlement benefits in a future proceeding regarding the structure of the post-withdrawal Entergy system. The order notes that the Commission has required Entergy to make a Federal Power Act section 205 filing on post-withdrawal arrangements, and that Entergy has committed to submit that filing on or about June 1, 2012. The order denies the complaint as to the remaining issues.

FERC establishes hearing and settlement judge procedures

E-14, *Mississippi Delta Energy Agency, Clarksdale Public Utilities Commission, Public Service Commission of Yazoo City, Arkansas Electric Cooperative Corporation, and South Mississippi Electric Power Association v. Entergy Services, Inc.* Docket Nos. ER11-3657-000, EL11-64-000. The order establishes hearing and settlement judge procedures to consider a complaint filed September 26, 2011 by Mississippi Delta Energy Agency, *et al*. The complaint alleges that the 2011 Rate Determination filing submitted in Docket No. ER11-3657-000 by Entergy on behalf of the Entergy Operating Companies departs from the proper application of Entergy's formula rate.

FERC grants rehearing, rejects compliance filing

E-15, *PJM Interconnection, L.L.C.*, Docket No. ER11-12-001, ER11-3445-000. The order grants a request for rehearing of, and rejects PJM's compliance filing on, proposed revisions to PJM's Operating Agreement and the parallel provision of the Attachment K – Appendix of the PJM Open Access Transmission Tariff (OATT). On March 30, 2011, the Commission conditionally accepted provisions to limit the calculation of, and the charge for, line losses only to those losses incurred on a set of newly defined facilities, Reliability Monitored Facilities. The

Commission conditioned acceptance on PJM's confirmation that it would calculate and charge for line losses that occur on all transmission facilities that it controls. The order finds PJM has failed to satisfy the condition of the March 30 order because it will not be calculating marginal line losses on all transmission facilities that it controls. The Commission requires PJM to make a compliance filing within 30 days of the date of this order to revise its tariff and operating agreement.

FERC denies request for rehearing, dismisses a notice of non-compliance

E-16, *Ameren Services Company and Northern Indiana Public Service Company v. Midwest Independent Transmission System Operator, Inc.*, Docket No. EL07-86-018. The order denies a request for rehearing filed by SESCO Enterprises LLC, Energy Endeavors LP, and JPTC, LLC (collectively, the Financial Marketers) and dismisses their Notice of Non-Compliance and Request for Immediate Commission Action. The Financial Marketers alleged that Midwest ISO has been improperly imposing real-time Revenue Sufficiency Guarantee charges on virtual demand bids in its markets since April 1, 2011 and asked the Commission to direct Midwest ISO to stop imposing such charges and to pay refunds. In the alternative, they sought rehearing of an April 7, 2011 order issued in this proceeding. The Commission denies rehearing of the April 7, 2011 order because the Commission denied rehearing in that order and the Commission does not allow rehearing of an order in these circumstances. The order also dismisses the Financial Marketers' Notice of Non-Compliance because it raises a fresh claim against Midwest ISO after the Commission has issued a final order addressing the issues raised and after the opportunity for rehearing has passed.

FERC holds in abeyance a decision on a complaint

E-17, *Louisiana Public Service Commission v. Entergy Corporations, Entergy Services, Inc, Entergy Louisiana, LLC, Entergy Arkansas, Inc., Entergy Mississippi, Inc., Entergy New Orleans, Inc.*, Docket No. EL11-57-000. The order holds in abeyance a decision on a complaint filed August 4, 2011 by the Louisiana Commission against Entergy Corporation, Entergy Services, Inc. (Entergy), and the Entergy Operating Companies. The Louisiana Commission seeks to modify the Entergy rough production cost equalization bandwidth formula set forth in Service Schedule MSS-3 to the Entergy System Agreement to include costs associated with the Little Gypsy Repowering Project that was cancelled in 2009 due to changed economic conditions. In a September 16, 2011 amended complaint, the Louisiana Commission seeks either to classify Little Gypsy costs as fixed and permanently assign them to all Entergy Operating Companies, or to amend Service Schedule MSS-3 to allow the inclusion of the Little Gypsy costs. Noting that Entergy plans to make a Federal Power Act section 205 filing by

March 31, 2012 to include Little Gypsy cancellation costs in the 2012 bandwidth formula calculation, the order holds the complaint in abeyance pending further Commission action.

FERC approves final rule that makes technical corrections to FERC regulations

M-1, *Technical Corrections to Commission Regulations*, Docket No. RM11-30-000. The final rule makes minor changes to the Commission's regulations by revising references that have become outdated for various reasons or contain typographical errors. Generally, these changes add or delete language in the current regulations by eliminating obsolete information, incorporating reference to updated electronic filing options, modernizing language, and correcting incorrect citations and clerical mistakes. The revisions are intended to be ministerial and/or informational in nature.

FERC grants request for a determination

G-2, *Kenai Pipe Line Company, Tesoro Alaska Company, Tesoro Logistics Operations, LLC,* Docket No. OR11-21-000. The order grants the applicants' request for a determination that certain oil pipeline routes and other facilities in Alaska are not subject to the Commission's jurisdiction under the Interstate Commerce Act because they are not used by other shippers and will only be used by Tesoro to support its refinery operations at the Nikiski Facilities near the Cook Inlet in Kenai.

FERC rules on contract dispute, orders filing of revised tariff records

G-3, *ETC Tiger Pipeline, LLC*, Docket No. RP11-1432-000, RP11-1432-001. The order finds in favor of ETC Tiger in a contract dispute with two of its shippers involving the commencement date of certain service agreements for firm service on ETC Tiger's pipeline system, The order determines the appropriate effective date for the service agreements is December 1, 2010. In addition, the order accepts, effective December 1, 2010, certain non-conforming agreements and related tariff records.

H-1, **Struck.**

FERC authorizes certificate for a new salt dome storage facility in Texas

C-1, *Golden Triangle Storage, Inc.*, Docket No. CP11-531-000. The order grants Golden Triangle Storage, Inc.'s request for a certificate of public convenience and necessity to construct and operate two new salt dome storage caverns (Caverns 3

and 4) at its existing storage facility in Jefferson County, Texas. The order also grants Golden Triangle's request to charge market-based rates for its new expansion storage capacity.

FERC authorizes pipeline and related facilities in California

C-2, *Kern River Gas Transmission Company*, Docket No. CP11-46-000. The order grants Kern River's application for a certificate to construct 8.6 miles of pipeline lateral and a meter station to provide natural gas service to Molycorp Minerals, LLC, in San Bernardino County, California. The pipeline will deliver to Molycorp the natural gas necessary for it to generate electricity for its own use in its mining and processing operations. Kern River will charge a negotiated rate for service in accordance with a firm transportation service agreement.

Subject: SPP and WECC Responses in FERC Docket No. AD11-9

Today, some information was filed in the FERC proceeding regarding FERC's inquiry into the February 2011 Southwest Cold Weather Event (FERC Docket No. AD11-9). On November 9, 2011, FERC's Office of Electric Reliability requested that TRE, SPP and WECC (the three Regional Entities affected by the February 2011 event) provide information on efforts they have taken to assess preparedness within their respective regions for winter 2011-12. The Regional Entities submitted their respective responses to this request today. Below is a summary of the responses submitted by SPP and WECC (copies of which are attached to this email). Please note that the entire TRE response and portions of the SPP response regarding registered entities involved in the February 2011 event are not public at this time and have been filed confidentially.

In its response, SPP summarized the results of a survey conducted in November 2011 on winter preparedness of registered entities and used the survey responses to indicate how the Joint Report Recommendations are being implemented. With respect to its role as Reliability Coordinator, SPP stated that it intends to implement the following recommendations of the August 16, 2011 Joint Report of FERC and NERC:

* Develop procedures for generator owners/operators to verify and provide accurate ambient temperature design specifications and limits;

* Expand outage criteria and reconsideration of outage approval and cancellation protocols to increase generator availability;

* Revise procedures and/or responsive reserve requirements to increase generator availability in the operational time frame;

* Training for operations personnel on the winter preparations/winter emergency plans; and

* Review of communication protocols and notification during cold weather events.

WECC also conducted a winter preparedness survey and reviewed a seasonal assessment of expected capacity reserve margins to determine what measures were being undertaken for potential winter weather conditions, the results of which are summarized in the WECC response. WECC also provided a list of key recommendations developed by auditors who reviewed the winterization programs of entities within WECC that were affected by the February 2011 event, which includes the following:

* Develop training and table top exercises addressing communication protocols between reliability operators and merchant groups; and communications on generator capacity changes and resource availability that may impact the bulk electric system;

* Develop operator training on station and unit-specific characteristics and requirements of gas fueled combined cycle generators;

* Develop operator training on appropriate steps in entity's emergency plan for similar events (i.e., timely initiation of load shedding);

* Evaluate and consider recommended actions from root cause analysis performed by third party audits;

* Southwestern utilities that historically have been challenged by operating conditions of extreme high temperatures should develop plans for addressing extreme cold weather conditions;

* Evaluate and consider process for prioritizing load shed blocks;

* Evaluate and consider automating the manual load block restoration process;

* Increased operator training on load shed/restoration applications; and

* Implement a process to analyze and recommend cost effective measures that allow continued operation of local generation in extreme winter weather conditions.

December 9, 2011

Federal Energy Regulatory Commission (FERC)
Attention: Mr. Loye Hull
Office of Electric Reliability
1800 Dual Highway, Suite 201
Hagerstown, MD 21740

Reference: Follow-up on Actions in Response to August 16, 2011 Joint Report

Dear Mr. Hull:

This letter represents the SPP Regional Entity's (SPP RE) response to FERC Office of Electric Reliability's letter dated November 9, 2011, requesting follow up information regarding the August 16, 2011 Joint Report of FERC and the North American Reliability Corporation (NERC) on the February 2011 Southwest Cold Weather Event (Joint Report).[1]

The SPP RE believes that sufficient winter weather preparation is very important to reliability of the bulk electric system and is supportive of the recommendations made in Joint Report. SPP RE, along with NERC, has made information on the event, the Joint Report, and lessons learned from this event available to the SPP RE Registered Entities (see Attachment).[2] Furthermore, SPP RE conducted a survey on winter preparedness on November 15, 2011 of the Registered Entities with the following NERC functions: Generator Owner, Generator Operator, Transmission Owner, Transmission Operator, Balancing Authority, Reliability Coordinator, Planning Authority, Transmission Service Provider, and Distribution Provider (see Attachment).[3] Surveys were sent to almost a hundred Registered Entities and approximately 80% of the responses were received by the due date of December 2, 2011.

The responses show that many of the recommendations in the joint report are already incorporated into the SPP RE Registered Entity winter preparations. As an example, 90% of Registered Entities with the Generator Owner or Generator Operator functions report that their winter weather preparations include a review of previous winter weather issues; approximately 70% include a review of generator facility and plant equipment temperature design limitations; over 90% include verification of heat trace functionality and visual inspection of piping and water lines.[4] Transmission Owners and Operators also include a large portion of the Joint Report's recommendations in their winter weather preparations. 97% indicated that they verified that equipment containing SF_6 gas is at the correct pressure and temperature to operate

[1] FERC NERC Report on 2011 Southwest Cold Weather Event
[2] See Attachment "SPP Registered Entity Awareness of the 2011 Southwest Cold Weather Event "
[3] See Attachment "SPP RE Winter Weather Survey"
[4] The SPP RE survey included a "N/A or not applicable" option. These responses were excluded from the survey results given in this letter.

during extreme cold weather and 77% indicated that they reviewed their communication protocols and notifications during cold weather events and over 70% indicated that they reviewed their transmission capabilities during cold weather events. Even though the majority of recommendations are already in place, many entities did indicate that elements of the Joint Report recommendations would be added to their winter preparations. Most notably, a number of responders across all of the NERC registered functions indicated that additional training for operating personnel would be added for emergency situations caused by extreme cold weather, including load shedding. Furthermore, a number of Distribution Providers indicated that they planned to identify the natural gas gathering facilities, processing facilities or compressor stations as critical and essential loads. Aggregate survey response information will be provided below in the section titled "Joint Report Recommendation Implementation."

The next section will discuss the steps taken by the SPP RE Registered Entities that were involved in the 2011 Southwest Cold Weather Event to implement the Joint Report's recommendations and/or lessons learned from the event.

SPP RE Affected Entities Adoption of Joint Report Recommendations

The SPP RE region had only three Registered Entities involved in the event, which is a testament to the winter weather preparedness of the region as a whole. The Joint Report found that no load shedding occurred during the event and concluded that the SPP region had sufficient reserves; "even if SPP had been separated from its neighbors by asynchronous ties, as is ERCOT, it probably would not have had to shed load during the February event."[5]

******This section contains confidential, non-public information and has been redacted and provided under separate letter******

Joint Report Recommendation Implementation

The following section provides information on the inclusion and/or adoption of the Joint Report Recommendations into the SPP RE Registered Entities winter preparations.

Recommendation 1: Planning authority/balancing authority modifications to the 2011-12 winter season planning and preparation process to anticipate extreme cold weather, including (a) adding sensitivity studies incorporating the February 2011 event into winter assessments, (b) expanding outage evaluation criteria and reconsidering outage approval and cancelation protocols to increase generator availability, and (c) revising procedures and/or responsive reserve requirements to increase generator availability in the operational time frame.

Response: SPP, as the Reliability Coordinator for the footprint, intends to implement the following recommendations from the Joint Report:

- Develop procedures for GOs/GOPs to verify and provide accurate ambient temperature design specifications and limits
- Expand outage criteria and reconsideration of outage approval and cancellation protocols to increase generator availability

[5] Joint Report, Pages 111-112.

- Revise procedures and/or responsive reserve requirements to increase generator availability in the operational time frame
- Training for operations personnel on the winter preparations/winter emergency plans
- Review of communication protocols and notification during cold weather events

Furthermore, 16 Balancing Authorities out of the 17 registered in the SPP RE footprint responded to the winter weather preparedness survey. These responses indicate the following:

- 70% have procedures for GOs/GOPs to provide real power output capability to determine individual unit availability in advance of anticipated severe weather
- 83% review the distribution of reserves to ensure that they are usable and deliverable
- 82% have procedures regarding emission limitations in advance of cold weather and one (1) BA indicates that it plans to implement this recommendation
- 79% have outage evaluation criteria and reconsideration of outage approval and cancellation protocols to increase generator availability and one (1) BA indicates that it plans to implement this recommendation
- 46% review procedures and/or responsive reserve requirements to increase generator availability in the operational time frame and one (1) BA indicates that it plans to implement this recommendation

Recommendation 2: Generator owner/operator winterization inspections, assessments, and maintenance of freeze protection elements, including reviewing procedures and performing associated training and timely maintenance, installation, and repair of heat tracing equipment, thermal insulation, temporary wind breaks and enclosures.

Response: See response to Recommendation 3. Several generator owners/operators indicated that they plan to take the following actions to improve their winter weather preparedness:

- Review of previous winter event issues
- Review of generator facility temperature design limitations
- Review of generator unit and plant equipment temperature design limitations
- Testing or running units with fuel switching capability on the alternate fuel source
- Addition of extra insulation to exposed components
- Stock of food and emergency supplies
- Acquisition and installation of tarps, temporary shelters, wind breaks around sensitive equipment areas
- Draining water from non-essential systems
- Conducting winter drills
- Training operations personnel on the winter preparation/winter emergency plans

Recommendation 3: Generator owner/operator verification of generating unit preparedness for severe cold weather, including operating limits; potential fuel needs and fuel switching capabilities; fuel storage capabilities, preparations, and status; and black start unit availability during extreme cold weather.

Response: 41 GOs and 42 GOPs out of 54 GOs and 55 GOPs registered in the SPP RE footprint responded to the winter weather survey. These responses indicate the following:

- 69% include a review of the generator facility temperature design limits and two (2) GOs/GOPs intend to add this recommendation to their winter preparations
- 71% review generator unit and plant equipment generator temperature design limits for their generation facilities in their winter preparations and two (2) plan to implement this recommendation
- 94% verify heat trace functionality
- 94% verify and visually inspect insulation quality for piping and water lines
- 94% verify and visually inspect insulation quality for instrumentation systems, instrument sensing lines and control valves
- 81% review generator fuel supply and delivery contracts
- 83% verify alternate fuel storage capacity for units with fuel switching capability
- 75% test or run units with fuel switching capability on the alternate fuel and one (1) GO/GOP intends to implement this recommendation
- 64% verify black start capability during extreme cold weather
- 73% add extra insulation to exposed elements and one (1) GO/GOP intends to implement this recommendation
- 47% stock food and emergency supplies and one (1) GO/GOP intends to implement this recommendation
- 86% acquire, install and test portable heaters
- 74% acquire and install tarps, temporary shelters, or wind breaks around sensitive areas and one (1) GO/GOP intends to implement this recommendation
- 89% test emergency generators
- 41% set up temporary shelters for personnel
- 94% drain water from nonessential systems and one (1) GO/GOP intends to implement this recommendation
- 25% conduct winter drills and two (2) GOs/GOPs intend to implement this recommendation
- 74% train operations personnel on winter preparations and emergency plans and three (3) GOs/GOPs intend to implement this recommendation
- 79% review communication protocols

Recommendation 4: Balancing authority/transmission operator development of procedures for generator owners/operators to verify and provide accurate ambient temperature design specifications and current forecasts of real power output capability to determine individual generator unit availability in advance of anticipated severe weather.

Response: Please see response to Recommendation 1.

Recommendation 5: Balancing authority/transmission operator development of procedures regarding emission limitation accommodations or waivers in advance of extreme weather.

Response: Please see response to Recommendation 1.

Recommendation 6: Transmission operator review of transmission facility capabilities during cold weather conditions.

Response: 35 Transmission Owners and 17 Transmission Operators out of 40 TOs and 18 TOPs registered in the SPP RE footprint completed the SPP RE winter weather survey. These responses indicate the following:

- 97% of TOs/TOPs verify that SF_6 gas breakers, metering and other electrical equipment is at the correct pressure and temperature to operate safely during extreme cold
- 81% perform annual maintenance tests on SF_6 breakers, heaters and supporting circuitry to ensure that they are functional; three (3) TOs/TOPs intend to implement this recommendation
- 52% determine the ambient temperature to which equipment, including fire protection systems, is protected and two (2) TOs/TOPs intend to implement this recommendation
- 85% ensure that equipment temperature requirements are met during operations and one (1) TO/TOP intends to implement this recommendation

Recommendation 7: Review of communications protocols and notification systems during cold weather events (RC, BA, TO, TOP, TSP, DSP).

Response: The majority of the Registered Entities with these NERC functions (64% of BAs, 77% TOs/TOPs and 71% TSPs/DSPs) indicated that they conducted a review of their communication protocols and notification systems are reviewed as part of their winter preparations. Additionally, several Registered Entities in each of these NERC registered functions, including SPP RC, indicated that they planned to add this review to their winter preparations.

Recommendation 8: Review of and training on load shedding procedures, including performing a critical load review for gas production and transmission facilities.

Response: 74% of the GOs/GOPs, 63% of TOs/TOPs, 43% of BAs, and 48% of TSPs/DSPs train operating personnel on winter preparations and winter emergency plans. A number of respondents to the winter weather survey, across all of the NERC registered functions, indicated that additional operator training on winter weather emergencies and load shedding procedures would be implemented.

Summary

SPP RE's review of the aggregate survey responses indicates that the Registered Entities, across all NERC registered functions, undertake many preventative measures for winter weather conditions. Furthermore, SPP RE is encouraged that the Registered Entities are incorporating additional steps into their winter weather preparedness plans and believes that as a result, the Registered Entities in the SPP RE footprint will be even better prepared the next time severe winter weather conditions occur. The SPP RTO Region's reserve margin for the 2011-2012 winter assessment period is 62.6%, which is well above SPP RTO's minimum required capacity margin.[6] As a follow-up to the winter weather survey, SPP RE plans to share the aggregate results of the survey with the Registered Entities and will follow-up with

[6] NERC 2011-2012 Winter Reliability Assessment, Page 160. NERC 2011-2012 Winter Assessment The Reserve Margin is based on the Existing-Certain and Net Firm Transactions.

individual entities that requested additional information about lessons learned from the event or the sharing of best practices across the footprint.

If you have any other follow questions, feel free to contact me at the address or phone number listed below. Thank you.

Sincerely,

Stacy Dochoda

December 9, 2011

Federal Energy Regulatory Commission
Attention: Mr. Loye Hull
Office of Electric Reliability
1800 Dual Highway Suite 201
Hagerstown, MD 21740

Reference: Follow-up on Actions in Response to August 16, 2011 Joint Report

Mr. Joseph McClelland's letter of November 9, 2011 requests that the three Regional Entities affected by the February 2011 event in the Southwest "provide information on efforts they have taken to assess preparedness within their respective regions for winter 2011-12." In addition, the Regions were requested to "report on measures taken by the affected registered entities to implement the … recommendations" contained in the Federal Energy Regulatory Commission's (FERC) and North American Electric Reliability Corporation (NERC) August 16, 2011 report and "prevent a recurrence of the February 2011 event." The Western Electricity Coordinating Council (WECC) herein provides the following response to these requests

Summary

WECC's review of information provided in its Seasonal Assessment, and the initial feedback from its Winterization Survey received from Generator Owners (GO), Generator Operators (GOP), Transmission Owners (TO), Transmission Operators (TOP), Balancing Authorities (BA), Reliability Coordinator (RC), Planning Authorities (PA), Transmission Service Providers (TSP), and Distribution Providers (DP) indicates that those registered entities within the Western Interconnection have undertaken numerous measures in preparation for potential winter weather conditions. WECC will make the aggregated survey results available to registered entities.

Action taken by WECC

WECC has made available to all registered entities within the Western Interconnection the Joint Report and lessons learned from this event. In response to FERC's letter dated November 9, 2011, WECC also performed a survey of NERC-registered GO, GOP, TO, TOP, BA, RC, PA, TSP, and DP in the Western Interconnection to determine whether recommendations from the Joint Report were incorporated into their winter preparedness plans. In addition to these efforts and as a result of this event, the entities within the

Western Interconnection directly affected by the event conducted outside audits with third party engineering consultants of their winterization programs and provided WECC with the results.

Seasonal Assessment

Annually, NERC performs seasonal assessments of expected capacity reserve margins. As part of the Winter Seasonal Assessment process WECC forwards to all BAs in the region a list of reliability-based questions asked by NERC. Although these questions do not focus on specific prior events, several BAs provided examples of corrective actions taken as a result of the February 2011 cold weather event. These actions include replacing degraded heat trace and insulation on vital instrumentation and sensing lines to protect these elements to minus 10 degrees Fahrenheit.

Winterization Survey

In addition to the Seasonal Assessment information, WECC developed a survey, pertaining to winter preparedness, based on the recommendations from the Joint Report. On November 17, 2011, WECC sent the survey to 392 registered entities representing the following NERC functions: GO, GOP, TO, TOP, BA, RC, PA, TSP, and DP. Approximately 52 percent of the survey recipients responded by the December 2, 2011due date. WECC continues to work with registered entities to collect the remaining responses.

The responses from the survey show that many of the recommendations in the Joint Report are already incorporated into the registered entity's winter preparations, as described below.

- Of the registered entities with GO and GOP functions,
  - 60 percent reported that their winter weather preparations include a review of previous winter weather issues
  - 43 percent reported a review of generator facility and plant equipment temperature design limitations
  - 51 percent include verification of heat trace functionality
  - 69 percent perform a verification and visual inspection of insulation quality for piping and water lines
- Of the registered entities with TO and TOP functions:
  - 72 percent reported that their winter weather preparations include a review of previous winter weather issues
  - 83 percent reported that they verified that equipment containing SF6 gas is at the correct pressure and temperature to operate during extreme cold weather
  - 60 percent reported that they reviewed their communication protocols and notifications during cold weather events

  - 57 percent reported that they reviewed their transmission capabilities during cold weather events.
  - 53 percent reported review of communication protocols and notification during cold weather events
- Of the registered entities with BA and PA functions:
  - 83 percent reported that their winter weather preparations include a review of previous winter weather issues
  - 48 percent reported they have developed procedures for GO/GOP to provide accurate ambient temperature design specifications and current forecasts of real power output capability to determine individual unit availability in advance of anticipated severe weather
  - 61 percent reported review of communication protocol and notification during cold weather events

Even though numerous actions based on the recommendations are already in place, many entities indicated that additional elements of the Joint Report recommendations will be added to their winter preparations. Several of the responses from registered entities indicated that additional training for operating personnel would be added for emergency situations caused by extreme cold weather, including load shedding procedures, communication protocols, and training on station and unit-specific characteristics of combined cycle generation fleets. Furthermore, a number of DPs indicated that they planned to identify the natural gas gathering facilities, processing facilities or compressor stations as critical and essential loads.

Affected Entity Actions

The entities within Western Interconnection that were directly affected during the February 2011Winter event voluntarily conducted outside audits by third party engineering consultants of their winterization programs and provided WECC with reports from those audits. The reports identified several actions for the entities to consider and implement in order to enhance their winterization programs and to protect against severe weather impacts on their generating and transmission facilities. Additionally, Event Analysis Reports were developed by the entities that contained specific findings and recommendations that must be implemented. Some of the key recommendations from those reports include the following:

- Develop training and table top exercises addressing communication protocols between reliability operators and merchant groups; and communications on generator capacity changes and resource availability that may impact the bulk electric system.
- Develop operator training on station and unit-specific characteristics and requirements of gas fueled combined cycle generators

20120209-4007 FERC PDF (Unofficial) 02/09/2012

- Develop operator training on appropriate steps in entity's emergency plan for similar events (i.e. timely initiation of load shedding)
- Evaluate and consider recommended actions from root cause analysis performed by third party audits
- Southwestern utilities that historically have been challenged by operating conditions of extreme high temperatures should develop plans for addressing extreme cold weather conditions
- Evaluate and consider process for prioritizing load shed blocks
- Evaluate and consider automating the manual load block restoration process
- Increased operator training on load shed/restoration applications
- Implement a process to analyze and recommend cost effective measures that allow continued operation of local generation in extreme winter weather conditions

The WECC Operating Practices Subcommittee is responsible for tracking the status and ensuring resolution of all recommendations contained in the Event Analysis Reports.

EPE reported that they performed assessments of on-site emergency fuel oil reserves to ensure fuel supply disruption would not adversely impact their infrastructure during extreme weather conditions during the winter operating season. As a result, on-site fuel reserves for fossil-fired generation remains available and resource adequacy assessments indicate that the EPE's adequacy criteria is expected to be met this winter.

Conclusion

WECC believes winterization is critical to system reliability and performs a Seasonal Assessment as part of its normal annual process. In addition, WECC supports the recommendations of FERC and NERC in their joint report titled "Outages and Curtailments During the Southwest Cold Weather Event of February 1-5, 2011" (Joint Report).

Sincerely,

Mark W. Maher

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION	**)** **)**	**Docket No. RD11-3-___**

COMPLIANCE FILING OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION IN RESPONSE TO NOVEMBER 17, 2011 ORDER APPROVING RELIABILITY STANDARD FAC-013-2 – ASSESSMENT OF TRANSFER CAPABILITY FOR THE NEAR-TERM TRANSMISSION PLANNING HORIZON

On January 28, 2011, the North American Electric Reliability Corporation ("NERC") filed a petition pursuant to section 215(d)(1) of the Federal Power Act and section 39.5 of the Federal Energy Regulatory Commission's ("FERC" or the "Commission") regulations[1] requesting approval of Reliability Standard FAC-013-2 — Assessment of Transfer Capability for the Near-Term Transmission Planning Horizon and accompanying Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs").[2] As NERC explained in its January 28 Petition, Reliability Standard FAC-013-2 presents clear, measureable, and enforceable requirements that obligate planning coordinators to have a transparent methodology for, and to annually perform, an assessment of transmission transfer capability for the Near-Term Transmission Planning Horizon, as a basis for identifying system weaknesses or limiting facilities that could limit energy transfers in the future.[3]

[1] 16 U.S.C. § 824o(2)(2006) and 18 C.F.R. § 39.5 (2011).
[2] *Petition of the North American Electric Reliability Corporation for Approval of a Facilities Design, Connections, and Maintenance Reliability* Standard, Docket No. RD11-3-000 (January 28, 2011)("January 28 Petition").
[3] *See* January 28 Petition at 3-5.

On November 17, 2011, FERC issued an order approving Reliability Standard FAC-013-2 and directing NERC to file a revision to two VRFs and one VSL for Reliability Standard FAC-013-2 ("November 17 Order").[4] The instant compliance filing reflects this directive.

II. REVISIONS TO VIOLATION SEVERITY LEVEL FOR REQUIREMENT R1 AND VIOLATION RISK FACTORS REQUIREMENTS FOR R1 AND R4

In the November 17 Order, FERC directed NERC to (1) modify the VSL language for R1; (2) either (a) revise the VRFs for FAC-013-2 Requirement R1 from a "Lower" designation to a "Medium" designation, or (b) provide additional justification for a "Lower" VRF designation; and (3) submit a compliance filing within 60 days reflecting such revision.[6]

[4] *Order Approving Reliability Standard*, 137 FERC ¶ 61,123 (2011)("November 17 Order").
[5] Persons to be included on FERC's service list are indicated with an asterisk. NERC requests waiver of 18 C.F.R. § 385.203(b) to permit the inclusion of more than two people on the service list.
[6] November 17 Order at P 27-28.

1. Violation Severity Level for FAC-013-2 Requirement R1

FAC-013-2 Requirement R1 mandates that each Planning Coordinator shall have a documented methodology it uses to perform an annual assessment of Transfer Capability in the Near-Term Transmission Planning Horizon ("Transfer Capability methodology"). The requirement also requires the Transfer Capability methodology include at least a minimum set of information.

In the November 17 Order the Commission stated (at P 27):

> 27. Finally, we approve the violation severity levels (VSLs) for FAC-013-2 as proposed, with the exception of the VSL triggers for R1, which appear to contain a typographical error. The VSL language for R1, as filed by NERC, uses the same description for "medium," "high," and "severe" violations, as follows:
>
> > The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate one of [sub-requirements 1.1 through 1.5] of Requirement R1 into that methodology.
>
> It appears that these triggers were intended to be progressive, i.e., the failure to incorporate one component was intended to be a medium level violation, as is currently stated in NERC's filed version of FAC-013-2, but a high level violation should require a failure to incorporate *two* components, and so on. Accordingly, we will direct NERC to modify the VSL language for Requirement R1 to correct this apparent error.

In compliance with paragraph 27 of the November 17 Order, NERC has modified the VSL language for R1 to clarify that these triggers are progressive, *i.e.*, the failure to incorporate one component of sub-requirements 1.1 through 1.5 is a "Medium" violation, the failure to incorporate two components is a "High" violation and the failure to incorporate three or more components is a "Severe" violation.[7]

2. Violation Risk Factor Requirements for FAC-013-2 Requirements R1 and R4

FAC-013-2, Requirements R4 through R6 ensure an annual assessment of Transfer Capability is performed and that the data and results are communicated to those same entities

[7] *See* Attachment B.

that have a reliability related need for those results. Communication and response to comments on the methodology and comments on the annual assessment provide for coordination of planning between the affected entities.[8] Requirement R4 provides: that "[d]uring each calendar year, each Planning Coordinator shall conduct simulations and document an assessment based on those simulations in accordance with its Transfer Capability methodology for at least one year in the Near-Term Transmission Planning Horizon.

FAC-013-2 Requirement R1 is described above. In the November 17 Order the Commission stated (at P 25-26):

> 25. Requirement R4 does not appear to be "administrative in nature," in that it requires the planning coordinator to annually conduct a simulation assessing transfer capability on its system during at least one year in the near-term planning time frame. Requirement R4 requires an affirmative action by the applicable entity, and not merely documentation of the results of the study.
>
> 26. We have similar concerns with respect to R1, as it is a substantive requirement to adopt and document a methodology for assessing transfer capability that is consistent with the specific criteria set out in sub-requirements R1.1.2 – 1.5. This requirement goes further than mere documentation, and instead establishes the criteria that must be incorporated into a compliant methodology.

NERC proposes to change the VRF for FAC-013-2 Requirements R1 and R4 from a "Lower" designation to a "Medium" designation in compliance with the November 17 Order.

The revisions included herein for Commission approval were approved by NERC's Board of Trustees on January 16, 2012.

[8] *See* January 28 Petition at p. 14.

III. ATTACHMENTS

ATTACHMENT A Clean Version of FAC-013-2

ATTACHMENT B Redlined Version of FAC-013-2

IV. CONCLUSION

The North American Electric Reliability Corporation respectfully requests that the Commission accept this Compliance Filing in accordance with the Commission's directives in the November 17, 2011 Order.

Respectfully submitted,

/s/ Stacey Tyrewala

ATTACHMENT A

Clean Version of FAC-013-2

A. Introduction

1. Title: Assessment of Transfer Capability for the Near-Term Transmission Planning Horizon

2. Number: FAC-013-2

3. Purpose: To ensure that Planning Coordinators have a methodology for, and perform an annual assessment to identify potential future Transmission System weaknesses and limiting Facilities that could impact the Bulk Electric System's (BES) ability to reliably transfer energy in the Near-Term Transmission Planning Horizon.

4. Applicability:

4.1. Planning Coordinators

5. Effective Date:

In those jurisdictions where regulatory approval is required, the latter of either the first day of the first calendar quarter twelve months after applicable regulatory approval or the first day of the first calendar quarter six months after MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-2 are effective.

In those jurisdictions where no regulatory approval is required, the latter of either the first day of the first calendar quarter twelve months after Board of Trustees adoption or the first day of the first calendar quarter six months after MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-2 are effective.

B. Requirements

R1. Each Planning Coordinator shall have a documented methodology it uses to perform an annual assessment of Transfer Capability in the Near-Term Transmission Planning Horizon (Transfer Capability methodology). The Transfer Capability methodology shall include, at a minimum, the following information: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. Criteria for the selection of the transfers to be assessed.

1.2. A statement that the assessment shall respect known System Operating Limits (SOLs).

1.3. A statement that the assumptions and criteria used to perform the assessment are consistent with the Planning Coordinator's planning practices.

1.4. A description of how each of the following assumptions and criteria used in performing the assessment are addressed:

1.4.1. Generation dispatch, including but not limited to long term planned outages, additions and retirements.

1.4.2. Transmission system topology, including but not limited to long term planned Transmission outages, additions, and retirements.

1.4.3. System demand.

1.4.4. Current approved and projected Transmission uses.

1.4.5. Parallel path (loop flow) adjustments.

1.4.6. Contingencies

1.4.7. Monitored Facilities.

1.5. A description of how simulations of transfers are performed through the adjustment of generation, Load or both.

R2. Each Planning Coordinator shall issue its Transfer Capability methodology, and any revisions to the Transfer Capability methodology, to the following entities subject to the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

2.1. Distribute to the following prior to the effectiveness of such revisions:

2.1.1. Each Planning Coordinator adjacent to the Planning Coordinator's Planning Coordinator area or overlapping the Planning Coordinator's area.

2.1.2. Each Transmission Planner within the Planning Coordinator's Planning Coordinator area.

2.2. Distribute to each functional entity that has a reliability-related need for the Transfer Capability methodology and submits a request for that methodology within 30 calendar days of receiving that written request.

R3. If a recipient of the Transfer Capability methodology provides documented concerns with the methodology, the Planning Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Transfer Capability methodology and, if no change will be made to that Transfer Capability methodology, the reason why. [Violation Risk Factor: Lower][Time Horizon: Long-term Planning]

R4. During each calendar year, each Planning Coordinator shall conduct simulations and document an assessment based on those simulations in accordance with its Transfer Capability methodology for at least one year in the Near-Term Transmission Planning Horizon. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

R5. Each Planning Coordinator shall make the documented Transfer Capability assessment results available within 45 calendar days of the completion of the assessment to the recipients of its Transfer Capability methodology pursuant to Requirement R2, Parts 2.1 and Part 2.2. However, if a functional entity that has a reliability related need for the results of the annual assessment of the Transfer Capabilities makes a written request for such an assessment after the completion of the assessment, the Planning Coordinator shall make the documented Transfer Capability assessment results available to that entity within 45 calendar days of receipt of the request [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

R6. If a recipient of a documented Transfer Capability assessment requests data to support the assessment results, the Planning Coordinator shall provide such data to that entity within 45 calendar days of receipt of the request. The provision of such data shall be subject to the legal and regulatory obligations of the Planning Coordinator's area regarding the disclosure of confidential and/or sensitive information. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

C. Measures

M1. Each Planning Coordinator shall have a Transfer Capability methodology that includes the information specified in Requirement R1.

M2. Each Planning Coordinator shall have evidence such as dated e-mail or dated transmittal letters that it provided the new or revised Transfer Capability methodology in accordance with Requirement R2

M3. Each Planning Coordinator shall have evidence, such as dated e-mail or dated transmittal letters, that the Planning Coordinator provided a written response to that commenter in accordance with Requirement R3.

M4. Each Planning Coordinator shall have evidence such as dated assessment results, that it conducted and documented a Transfer Capability assessment in accordance with Requirement R4.

M5. Each Planning Coordinator shall have evidence, such as dated copies of e-mails or transmittal letters, that it made its documented Transfer Capability assessment available to the entities in accordance with Requirement R5.

M6. Each Planning Coordinator shall have evidence, such as dated copies of e-mails or transmittal letters, that it made its documented Transfer Capability assessment data available in accordance with Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Data Retention

The Planning Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Planning Coordinator shall have its current Transfer Capability methodology and any prior versions of the Transfer Capability methodology that were in force since the last compliance audit to show compliance with Requirement R1.
- The Planning Coordinator shall retain evidence since its last compliance audit to show compliance with Requirement R2.
- The Planning Coordinator shall retain evidence to show compliance with Requirements R3, R4, R5 and R6 for the most recent assessment.
- If a Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time periods specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Planning Coordinator has a Transfer Capability methodology but failed to address one or two of the items listed in Requirement R1, Part 1.4.	The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate one of the following Parts of Requirement R1 into that methodology: • Part 1.1 • Part 1.2 • Part 1.3 • Part 1.5 OR The Planning Coordinator has a Transfer Capability methodology but failed to address three of the items listed in Requirement R1, Part 1.4.	The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate two of the following Parts of Requirement R1 into that methodology: • Part 1.1 • Part 1.2 • Part 1.3 • Part 1.5 OR The Planning Coordinator has a Transfer Capability methodology but failed to address four of the items listed in Requirement R1, Part 1.4.	The Planning Coordinator did not have a Transfer Capability methodology. OR The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate three or more of the following Parts of Requirement R1 into that methodology: • Part 1.1 • Part 1.2 • Part 1.3 • Part 1.5 OR The Planning Coordinator has a Transfer Capability methodology but failed to address more than four of the items listed in Requirement R1, Part 1.4.

R2	The Planning Coordinator notified one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology after its implementation, but not more than 30 calendar days after its implementation. OR The Planning Coordinator provided the transfer Capability methodology more than 30 calendar days but not more than 60 calendar days after the receipt of a request.	The Planning Coordinator notified one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology more than 30 calendar days after its implementation, but not more than 60 calendar days after its implementation. OR The Planning Coordinator provided the Transfer Capability methodology more than 60 calendar days but not more than 90 calendar days after receipt of a request	The Planning Coordinator notified one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology more than 60 calendar days, but not more than 90 calendar days after its implementation. OR The Planning Coordinator provided the Transfer Capability methodology more than 90 calendar days but not more than 120 calendar days after receipt of a request.	The Planning Coordinator failed to notify one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology more than 90 calendar days after its implementation. OR The Planning Coordinator provided the Transfer Capability methodology more than 120 calendar days after receipt of a request.
R3	The Planning Coordinator provided a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 more than 45 calendar days, but not more than 60 calendar days after receipt of the concern.	The Planning Coordinator provided a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 more than 60 calendar days, but not more than 75 calendar days after receipt of the concern.	The Planning Coordinator provided a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 more than 75 calendar days, but not more than 90 calendar days after receipt of the concern.	The Planning Coordinator failed to provide a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 by more than 90 calendar days after receipt of the concern. OR The Planning Coordinator failed to respond to a documented concern with its Transfer Capability methodology.

R4.	The Planning Coordinator conducted a Transfer Capability assessment outside the calendar year, but not by more than 30 calendar days.	The Planning Coordinator conducted a Transfer Capability assessment outside the calendar year, by more than 30 calendar days, but not by more than 60 calendar days.	The Planning Coordinator conducted a Transfer Capability assessment outside the calendar year, by more than 60 calendar days, but not by more than 90 calendar days.	The Planning Coordinator failed to conduct a Transfer Capability assessment outside the calendar year by more than 90 calendar days. OR The Planning Coordinator failed to conduct a Transfer Capability assessment.

R5	The Planning Coordinator made its documented Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 45 calendar days after the requirements of R5,, but not more than 60 calendar days after completion of the assessment.	The Planning Coordinator made its Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 60 calendar days after the requirements of R5, but not more than 75 calendar days after completion of the assessment.	The Planning Coordinator made its Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 75 calendar days after the requirements of R5, but not more than 90 days after completion of the assessment.	The Planning Coordinator failed to make its documented Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 90 days after the requirements of R5. OR The Planning Coordinator failed to make its documented Transfer Capability assessment available to any of the recipients of its Transfer Capability methodology under the requirements of R5.
R6	The Planning Coordinator provided the requested data as required in Requirement R6 more than 45 calendar days after receipt of the request for data, but not more than 60 calendar days after the receipt of the request for data.	The Planning Coordinator provided the requested data as required in Requirement R6 more than 60 calendar days after receipt of the request for data, but not more than 75 calendar days after the receipt of the request for data.	The Planning Coordinator provided the requested data as required in Requirement R6 more than 75 calendar days after receipt of the request for data, but not more than 90 calendar days after the receipt of the request for data.	The Planning Coordinator provided the requested data as required in Requirement R6 more than 90 after the receipt of the request for data. OR The Planning Coordinator failed to provide the requested data as required in Requirement R6.

ATTACHMENT B

Redlined Version of FAC-013-2

A. Introduction

1. Title: **Assessment of Transfer Capability for the Near-Term Transmission Planning Horizon**

2. Number: FAC-013-2

3. Purpose: To ensure that Planning Coordinators have a methodology for, and perform an annual assessment to identify potential future Transmission System weaknesses and limiting Facilities that could impact the Bulk Electric System's (BES) ability to reliably transfer energy in the Near-Term Transmission Planning Horizon.

4. Applicability:

4.1. Planning Coordinators

5. Effective Date:

In those jurisdictions where regulatory approval is required, the latter of either the first day of the first calendar quarter twelve months after applicable regulatory approval or the first day of the first calendar quarter six months after MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-2 are effective.

In those jurisdictions where no regulatory approval is required, the latter of either the first day of the first calendar quarter twelve months after Board of Trustees adoption or the first day of the first calendar quarter six months after MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-2 are effective.

B. Requirements

R1. Each Planning Coordinator shall have a documented methodology it uses to perform an annual assessment of Transfer Capability in the Near-Term Transmission Planning Horizon (Transfer Capability methodology). The Transfer Capability methodology shall include, at a minimum, the following information: *[Violation Risk Factor: ~~Lower~~Medium] [Time Horizon: Long-term Planning]*

1.1. Criteria for the selection of the transfers to be assessed.

1.2. A statement that the assessment shall respect known System Operating Limits (SOLs).

1.3. A statement that the assumptions and criteria used to perform the assessment are consistent with the Planning Coordinator's planning practices.

1.4. A description of how each of the following assumptions and criteria used in performing the assessment are addressed:

1.4.1. Generation dispatch, including but not limited to long term planned outages, additions and retirements.

1.4.2. Transmission system topology, including but not limited to long term planned Transmission outages, additions, and retirements.

1.4.3. System demand.

1.4.4. Current approved and projected Transmission uses.

1.4.5. Parallel path (loop flow) adjustments.

1.4.6. Contingencies

1.4.7. Monitored Facilities.

1.5. A description of how simulations of transfers are performed through the adjustment of generation, Load or both.

R2. Each Planning Coordinator shall issue its Transfer Capability methodology, and any revisions to the Transfer Capability methodology, to the following entities subject to the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

2.1. Distribute to the following prior to the effectiveness of such revisions:

2.1.1. Each Planning Coordinator adjacent to the Planning Coordinator's Planning Coordinator area or overlapping the Planning Coordinator's area.

2.1.2. Each Transmission Planner within the Planning Coordinator's Planning Coordinator area.

2.2. Distribute to each functional entity that has a reliability-related need for the Transfer Capability methodology and submits a request for that methodology within 30 calendar days of receiving that written request.

R3. If a recipient of the Transfer Capability methodology provides documented concerns with the methodology, the Planning Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Transfer Capability methodology and, if no change will be made to that Transfer Capability methodology, the reason why. [Violation Risk Factor: Lower][Time Horizon: Long-term Planning]

R4. During each calendar year, each Planning Coordinator shall conduct simulations and document an assessment based on those simulations in accordance with its Transfer Capability methodology for at least one year in the Near-Term Transmission Planning Horizon. [Violation Risk Factor: ~~Lower~~Medium] [Time Horizon: Long-term Planning]

R5. Each Planning Coordinator shall make the documented Transfer Capability assessment results available within 45 calendar days of the completion of the assessment to the recipients of its Transfer Capability methodology pursuant to Requirement R2, Parts 2.1 and Part 2.2. However, if a functional entity that has a reliability related need for the results of the annual assessment of the Transfer Capabilities makes a written request for such an assessment after the completion of the assessment, the Planning Coordinator shall make the documented Transfer Capability assessment results available to that entity within 45 calendar days of receipt of the request [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

R6. If a recipient of a documented Transfer Capability assessment requests data to support the assessment results, the Planning Coordinator shall provide such data to that entity within 45 calendar days of receipt of the request. The provision of such data shall be subject to the legal and regulatory obligations of the Planning Coordinator's area regarding the disclosure of confidential and/or sensitive information. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

C. Measures

M1. Each Planning Coordinator shall have a Transfer Capability methodology that includes the information specified in Requirement R1.

M2. Each Planning Coordinator shall have evidence such as dated e-mail or dated transmittal letters that it provided the new or revised Transfer Capability methodology in accordance with Requirement R2

M3. Each Planning Coordinator shall have evidence, such as dated e-mail or dated transmittal letters, that the Planning Coordinator provided a written response to that commenter in accordance with Requirement R3.

M4. Each Planning Coordinator shall have evidence such as dated assessment results, that it conducted and documented a Transfer Capability assessment in accordance with Requirement R4.

M5. Each Planning Coordinator shall have evidence, such as dated copies of e-mails or transmittal letters, that it made its documented Transfer Capability assessment available to the entities in accordance with Requirement R5.

M6. Each Planning Coordinator shall have evidence, such as dated copies of e-mails or transmittal letters, that it made its documented Transfer Capability assessment data available in accordance with Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Data Retention

The Planning Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Planning Coordinator shall have its current Transfer Capability methodology and any prior versions of the Transfer Capability methodology that were in force since the last compliance audit to show compliance with Requirement R1.
- The Planning Coordinator shall retain evidence since its last compliance audit to show compliance with Requirement R2.
- The Planning Coordinator shall retain evidence to show compliance with Requirements R3, R4, R5 and R6 for the most recent assessment.
- If a Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time periods specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Planning Coordinator has a Transfer Capability methodology but failed to address one or two of the items listed in Requirement R1, Part 1.4.	The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate one of the following Parts of Requirement R1 into that methodology: • Part 1.1 • Part 1.2 • Part 1.3 • Part 1.5 OR The Planning Coordinator has a Transfer Capability methodology but failed to address three of the items listed in Requirement R1, Part 1.4.	The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate ~~one~~ two of the following Parts of Requirement R1 into that methodology: • Part 1.1 • Part 1.2 • Part 1.3 • Part 1.5 OR The Planning Coordinator has a Transfer Capability methodology but failed to address four of the items listed in Requirement R1, Part 1.4.	The Planning Coordinator did not have a Transfer Capability methodology. OR The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate ~~one~~ three or more of the following Parts of Requirement R1 into that methodology: • Part 1.1 • Part 1.2 • Part 1.3 • Part 1.5 OR The Planning Coordinator has a Transfer Capability methodology but failed to address more than four of the items listed in Requirement R1, Part 1.4.

R2	The Planning Coordinator notified one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology after its implementation, but not more than 30 calendar days after its implementation. OR The Planning Coordinator provided the transfer Capability methodology more than 30 calendar days but not more than 60 calendar days after the receipt of a request.	The Planning Coordinator notified one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology more than 30 calendar days after its implementation, but not more than 60 calendar days after its implementation. OR The Planning Coordinator provided the Transfer Capability methodology more than 60 calendar days but not more than 90 calendar days after receipt of a request	The Planning Coordinator notified one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology more than 60 calendar days, but not more than 90 calendar days after its implementation. OR The Planning Coordinator provided the Transfer Capability methodology more than 90 calendar days but not more than 120 calendar days after receipt of a request.	The Planning Coordinator failed to notify one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology more than 90 calendar days after its implementation. OR The Planning Coordinator provided the Transfer Capability methodology more than 120 calendar days after receipt of a request.
R3	The Planning Coordinator provided a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 more than 45 calendar days, but not more than 60 calendar days after receipt of the concern.	The Planning Coordinator provided a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 more than 60 calendar days, but not more than 75 calendar days after receipt of the concern.	The Planning Coordinator provided a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 more than 75 calendar days, but not more than 90 calendar days after receipt of the concern.	The Planning Coordinator failed to provide a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 by more than 90 calendar days after receipt of the concern. OR The Planning Coordinator failed to respond to a documented concern with its Transfer Capability methodology.

R4.	The Planning Coordinator conducted a Transfer Capability assessment outside the calendar year, but not by more than 30 calendar days.	The Planning Coordinator conducted a Transfer Capability assessment outside the calendar year, by more than 30 calendar days, but not by more than 60 calendar days.	The Planning Coordinator conducted a Transfer Capability assessment outside the calendar year, by more than 60 calendar days, but not by more than 90 calendar days.	The Planning Coordinator failed to conduct a Transfer Capability assessment outside the calendar year by more than 90 calendar days. OR The Planning Coordinator failed to conduct a Transfer Capability assessment.

R5	The Planning Coordinator made its documented Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 45 calendar days after the requirements of R5,, but not more than 60 calendar days after completion of the assessment.	The Planning Coordinator made its Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 60 calendar days after the requirements of R5, but not more than 75 calendar days after completion of the assessment.	The Planning Coordinator made its Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 75 calendar days after the requirements of R5, but not more than 90 days after completion of the assessment.	The Planning Coordinator failed to make its documented Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 90 days after the requirements of R5. OR The Planning Coordinator failed to make its documented Transfer Capability assessment available to any of the recipients of its Transfer Capability methodology under the requirements of R5.
R6	The Planning Coordinator provided the requested data as required in Requirement R6 more than 45 calendar days after receipt of the request for data, but not more than 60 calendar days after the receipt of the request for data.	The Planning Coordinator provided the requested data as required in Requirement R6 more than 60 calendar days after receipt of the request for data, but not more than 75 calendar days after the receipt of the request for data.	The Planning Coordinator provided the requested data as required in Requirement R6 more than 75 calendar days after receipt of the request for data, but not more than 90 calendar days after the receipt of the request for data.	The Planning Coordinator provided the requested data as required in Requirement R6 more than 90 after the receipt of the request for data. OR The Planning Coordinator failed to provide the requested data as required in Requirement R6.

Subject: New NERC Related Matters (2.1.2012 and 2.3.2012)

February 1, 2012

1. NERC Full Notice of Penalty Regarding Unidentified Registered Entity (NP12-11)

On February 1, 2012, NERC filed a Notice of Penalty with FERC because WECC and a URE have entered into a Settlement Agreement to resolve all outstanding issues arising from WECC's determination and findings of the violations of certain reliability standards. According to the Settlement Agreement, URE agrees and stipulates to the facts of the violations and has agreed to the assessed penalty of $135,000.

http://elibrary.ferc.gov/idmws/File_list.asp?document_id=13992925

2. NERC Find, Fix, and Tract Informational Filing (RC12-7)

On February 1, 2012, NERC provided FERC with the Find, Fix, and Track Report ("FFT") regarding 30 registered entities. The FFT resolves 57 possible violations of 22 Reliability Standards that posed a lesser risk to the reliability of the bulk power system. In all cases, the possible violations contained in the FFT have been found and fixed so they are described as remediated issues in the Report.

http://elibrary.ferc.gov/idmws/File_list.asp?document_id=13993154

3. Petition of NERC for Approval of Proposed SERC Regional Reliability Standard Automatic Underfrequency Load Shedding Requirements (RM12-9)

On February 1, 2012, NERC submitted a petition in accordance with Section 215(d) of the FPA and Part 39.5 of the FERC regulations seeking approval of proposed Regional Reliability Standard PRC-006-SERC-01- Automatic Underfrequency Load Shedding ("UFLS") Requirements in the Southeastern Electric Reliability Council Region, associated Violation Severity Levels and Violation Risk Factors, and the implementation plan for PRC-006-SERC-01. NERC stated that the purpose of the standard is to establish consistent and coordinated requirements for the design, implementation, and analysis of automatic UFLS schemes among all applicable entities within the SERC Region. The proposed rule applies to all entities that are responsible for the ownership, operation, or control of automatic UFLS equipment as required by the UFLS program established by the Planning Coordinators. The Proposed Regional Reliability Standard was approved by the NERC Board of Trustees during its November 3, 2011, meeting.

http://elibrary.ferc.gov/idmws/File_list.asp?document_id=13993268

February 3, 2012

1. Order Approving Modification of Definition (RD11-13)

On February 3, 2012, FERC submitted an Order Approving modification of a definition to the NERC Glossary of Terms. NERC

seeks Commission approval of a proposed modification to the definition of “Protection System.” NERC stated in its petition that it proposed the modification "to close a reliability gap created by an omission in the current Commission-approved definition of Protection System.” Specifically, NERC proposes to add battery chargers to the definition.

http://elibrary.ferc.gov/idmws/File_list.asp?document_id=13993771

2. Final Rule re Interpretation of Protection System Reliability Standard (RM10-5)

On February 3, 2012, FERC issued an Order approving a NERC Petition requesting approval of NERC's interpretation of Requirement R1 of Commission-approved Reliability Standard PRC-005-1 (Transmission and Generation Protection System Maintenance and Testing). On December 16, 2010, the Commission issued a Notice of Proposed Rulemaking ("NOPR"). In the NOPR, the Commission indicates that it plans to accept NERC’s proposed interpretation of Requirement R1 of Reliability Standard PRC-005-1. FERC proposed to direct NERC to develop modifications to the PRC-005-1 Reliability Standard through its Reliability Standards development process to address gaps in the Protection System maintenance and testing standard that were highlighted by the proposed interpretation.
