The Reliability Coordinating Committee (RCC) supports the standards development process through the assignment of NPCC Task Forces to serve as technical resources for: (1) staffing Drafting Teams, and (2) performing a technical advisory role in the regional standards process through comments, recommendations and technical justifications.

REQUESTER

~~**4. PROCEDURE DESCRIPTION**~~

~~***STEPS 1 AND 2: REQUEST TO DEVELOP A NEW REGIONAL STANDARD***~~

~~Requests to develop a new Regional Reliability Standard shall be submitted to the RSPM by completing a **Regional Standard Authorization Request** (RSAR) ***(see Appendix A)***. The RSAR is a description of the new or revised standard in sufficient detail to clearly define the scope, purpose, and importance of the Regional Standard, impacted parties or other relevant information. A "needs" statement will provide the justification for the development of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard. The RSPM shall maintain the RSAR form and make it available electronically on the NPCC website.~~

~~Any person or entity ("Requester") directly or materially affected by an existing standard or the need for a new or revised standard may initiate a RSAR.~~

~~The Requester will submit the RSAR to the RSPM electronically and the RSPM will acknowledge receipt of the RSAR immediately, through electronic receipt. The RSAR, as a minimum, needs to contain the following information in order to be qualified for consideration. The NPCC RSPM will assist the Requester to ensure all the following information is submitted (on the RSAR) in a form appearing in Appendix A:~~

~~1. Proposed Title and Date of New RSAR~~
~~2. Requester's Name and Contact Information~~

Any individual representing an organization (entity, company, government agency, etc.) that is directly and materially affected by the reliability of the Bulk Electric System within the NPCC geographical area may request a regional standard be developed or an existing regional standard be modified, interpreted, or deleted.

QUALITY REVIEW TEAM

The NPCC Standards Staff shall coordinate a quality review of the "final draft" of the regional standard, implementation plan, VRFs and VSLs to assess whether the documents are within the scope of the associated RSAR, and whether the regional standard is clear and enforceable as written. The Quality Review Team may be comprised of legal and compliance representatives, a technical writer, and NPCC Standards Staff. It will not involve individuals who participated on the Drafting Team of the standard undergoing the Quality Review.

DRAFT

2. Standard Development Process Steps

Step 2.1: Regional Standards Authorization Request to Develop, Modify or Retire

A Regional Standard Authorization Request[11] (RSAR) is the form used to document the scope and reliability benefit of a proposed project for one or more new or modified regional standards or the benefit of retiring one or more approved regional standards.

A RSAR shall be used to seek approval and initiate the development, modification or retirement of a NPCC regional standard. A RSAR is not used to seek a formal Request for Interpretation (RFI) of a NPCC regional standard. The initiation and handling of a RFI is covered in Step 3 Standard Interpretation Process Steps, of this manual.

Any individual representing an organization which is directly or materially impacted by the operation of the Bulk Electric System within the geographical footprint of NPCC may request, via a submittal of a RSAR to the NPCC Manager of Reliability Standards, the development, modification, or deletion of a NPCC regional standard. The individual completing the form is referred to herein as the Requester.

Step 2.1.a. Requester Actions

> *Note: The NPCC Manager of Reliability Standards will assist the Requester, as necessary, to ensure all required information is submitted on the RSAR.*

The Requester shall complete a RSAR form in accordance with the guidance provided in Appendix A: RSAR Completion Guidelines.

The Requester shall submit the completed RSAR to the NPCC Manager of Reliability Standards, via npccstandard@npcc.org, for processing.

Step 2.1.b. NPCC Manager of Reliability Standards Actions

The NPCC Manager of Reliability Standards shall review the submitted RSAR and verify that the submitted form has been adequately completed. Within fifteen (15) calendar days[12] of receipt of the submitted RSAR, the NPCC Manager of Reliability Standards will electronically acknowledge receipt of the RSAR. If, at that time, the NPCC Manager of Reliability Standards finds the RSAR to be deficient, the Requester will be contacted to decide on how to proceed.

~~3.~~ Within ten (10) calendar days of the receipt of an adequately completed RSAR, the NPCC Manager of Reliability Standards **~~Purpose~~** ~~of the Regional Standard~~

~~4. Description of Industry Need~~

~~5. Provide a Brief Description of the Standard~~

~~6. Identification of the Entities in the Functional Model as being responsible to adhere to the standard.~~

~~7. Necessary information to assist the drafting the team, to the extent feasible, to allow them to draft the standard.~~

~~8. A cross references to existing NPCC or NERC documents~~

[11] The RSAR is located on the NPCC website under Standards – Regional Standards General

[12] Time periods specified in this manual may be extended as deemed appropriate by NPCC Staff. When business days are specified, this provision could be used to take into account differing Canadian and US holiday schedules. When calendar days are specified, this provision could be used to take into account due dates that fall on a weekend.

~~The RSPM~~ shall forward ~~all~~the properly completed ~~RSARs to the RSC. The RSC shall meet at established intervals to review all pending RSARs. The frequency of this review process will depend on workload, but in no case shall a properly completed RSAR wait for~~ RSAR to the NPCC Regional Standards Committee (RSC) for its review and processing. Included in the transmittal of the RSAR to the RSC, the NPCC Manager of Reliability Standards shall include a statement indicating the applicability of the NPCC Cost Effectiveness Analysis Procedure (CEAP) for the proposed change.

STEP 2.1.C. NPCC REGIONAL STANDARDS COMMITTEE (RSC~~ action more than 60 calendar days from the date of receipt. The RSC may~~) ACTIONS

Note: The RSC shall meet to review all pending RSARs. The frequency of this review process will depend on workload, but in no case shall a properly completed RSAR wait for RSC action more than 60 calendar days from the date of receipt by the RSC.

The RSC shall review the RSAR and take one of the following actions:

- ~~•~~ Remand the RSAR back to the ~~RSPM~~NPCC Manager of Reliability Standards for additional work. In this case, the ~~RSPM~~NPCC Manager of Reliability Standards may request additional information or clarification for the RSAR from the Requester.

  ~~•~~ ~~Accept~~Reject the RSAR ~~as a candidate for a new or revised standard~~. In this case, the RSC will ~~forward the RSAR to the RCC to assign a NPCC Task Force to provide technical support and analysis of comments for that RSAR, and assist the Requester and the RSPM in the remaining steps of the process. The RSPM shall post notification of intent to develop a standard on both NPCC and ERO websites within 30 calendar days of acceptance.~~
- ~~• Reject the RSAR. In this case, the RSC will~~provide its determination to the NPCC Manager of Reliability Standards, who will then provide a written explanation for rejection to the Requester within ~~30~~ten (10) calendar days of the rejection decision.

~~STEPS 3, 4, AND 5: RSC ACCEPTS RSAR AND RCC ASSIGNS TF TO DRAFT NEW OR REVISED STANDARD~~

Note: Before the RSC can accept a RSAR for a new or modified standard the applicable CEAP process steps shall be completed.

- Accept the RSAR.
  - If a new or modified standard has been authorized, within ten (10) calendar days of the authorization the NPCC Manager of Reliability Standards shall: 1) post notification on the NPCC website of the intent to develop or modify a regional standard; 2) notify the ERO for processing in accordance with its process, as applicable; and 3) notify the Requester of the acceptance of the RSAR.
    - If the retirement of an existing regional standard has been authorized, within ten (10) calendar days of the authorization the NPCC Manager of Reliability Standards shall: 1) post notification on the NPCC website of the intent to retire an existing regional standard; 2) notify the ERO for processing in accordance with its process, as applicable; and 3) notify the Requester of the acceptance of the RSAR.

DRAFT

The process to retire an existing regional standard is included in Step 5 RETIREMENT OF AN APPROVED NPCC REGIONAL STANDARD.

STEP 2.2: FORMATION OF DRAFTING TEAM FOR NEW OR MODIFIED STANDARD

A RSAR that ~~is~~has been accepted by the RSC ~~will~~shall, within ten (10) calendar days of the acceptance of the RSAR, be submitted by the NPCC Manager of Reliability Standards to the NPCC Reliability Coordinating Committee (RCC~~. Within 60 calendar days the~~). The RCC shall, within sixty (60) calendar days, assign the development of the regional standard to a NPCC Task Force, and notify the NPCC Manager of Reliability Standards of its decision within ten (10) calendar days.

After receipt of the notification of Drafting Team~~. The RSPM shall solicit and recommend~~ assignment, the NPCC Manager of Reliability Standards shall oversee solicitation and recommendation of a list of additional qualified[13] candidates over and above the appropriate NPCC Task Force members, for appointment to the ~~team and~~Drafting Team. The Requester and a NPCC Compliance Staff person will be included on the Drafting Team. Within sixty (60) calendar days of the Drafting Team assignment notification from the RCC, the NPCC Manager of Reliability Standards shall submit the list ~~to the RSC.~~of the entire Drafting Team membership to the RSC for acceptance. The RSC may accept the recommendations of the NPCC Manager of Reliability Standards as presented or revise the recommendations as necessary.

Upon acceptance of the Drafting Team slate, the RSC shall provide a target date on which the Drafting Team is expected to have ready a completed draft regional standard and associated supporting documentation available for consideration by the NPCC membership. Additionally, the RSC shall provide the Drafting Team with any preliminary development products including, but not limited to, a draft standard, comments, and related white papers.

STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS

Prior to beginning work on the development of a new or revised regional standard and the associated supporting documentation, the Drafting Team should develop a work plan for completing the regional standard development work, including the establishment of milestones for completing critical elements of the work in sufficient detail to ensure that the Drafting Team will meet the target date established by the RSC, or the Drafting Team shall propose an alternative date. This ~~list shall include the Requester. The RSC may select other individuals to serve, with the Task Force to draft the Standard. This team shall~~work plan must be submitted to the RSC for its concurrence. When a Drafting Team begins its work, it shall regularly (at least quarterly) report progress against that aforementioned work plan to the NPCC Manager of Reliability Standards for presentation to the RSC.

[13] Refer to Appendix B: Selection of Drafting Team Members

DRAFT

Note: During the regional standards development, the Drafting Team will deliberate on whether the requirements in the regional standard are developed enough to begin the Cost Effectiveness Analysis (CEA) of the NPCC Cost Effectiveness Analysis Procedure (CEAP). When appropriate, the Drafting Team shall request that the RSC initiate the second phase (CEA) of the CEAP process.

The Drafting Team shall create and manage its work structure (e.g., sub-teams) and meeting schedule (face-to face as well as electronic meetings), as necessary, to meet the milestone dates and project deliverables outlined in the work plan.

The work products of the Drafting Team should consist of ~~a small group of people who collectively have the necessary technical expertise and work process skills.~~ the following

- ~~The RSPM shall assign~~A draft regional standard consistent with the RSAR on which it was based
- An implementation plan, including the nature, extent and duration of field-testing, if any
- Identification of any existing regional standard and NPCC ~~staff personnel to~~criteria that will be deleted, in part or whole, or otherwise impacted by the implementation of the draft regional standard
- Technical reports, white papers and/or work papers that provide technical justification for the draft regional standard under consideration
- Reliability Standard Audit Worksheet (RSAW) collaboratively developed by the Drafting Team and NPCC Compliance Staff

NPCC Standards Staff can assist in the drafting of the regional standard including compliance ~~measure~~measures, process and elements. The drafting of measures and compliance administration aspects of the standard will be coordinated with the NPCC Compliance ~~Program.~~Staff.

The Drafting Team shall submit the initial and subsequent interim drafts of the regional standard and associated documents to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post documents for comment.

STEP ~~*6: SOLICIT PUBLIC*~~ 2.4: POSTING FOR COMMENT PERIOD AND RESOLUTION OF COMMENTS ~~*ON DRAFT STANDARD*~~

~~Once a draft standard has been verified by the RSC to be within the scope and purpose of the RSAR, the RSPM will post the draft standard for the purpose of soliciting public comments. The posting of the draft standard will be linked to the RSAR for reference. In addition to the standard, an implementation plan shall be posted to provide additional details to the public and aid in their commenting and decision process. Comments on the draft standard will be accepted for a 45 calendar day period from the public notice of posting. Comments will be accepted on-line using the NPCC Open Process web-based application.~~

~~Final draft standards will be concurrently posted on the ERO website for comments.~~

~~*STEPS 7, 8, AND 9: OPEN PROCESS POSTING AND ANALYSIS OF THE COMMENTS*~~

~~The RSPM~~

Note: There are no limits to the number of public comment periods and ballots that can be conducted to result in a regional standard that is clear and enforceable, and achieves a quorum and sufficient affirmative votes for approval.

STEP 2.4.A. COMMENT PERIOD

Note: For Final Comment Period skip this step and proceed to STEP 2.4.B. FINAL COMMENT PERIOD.

As authorized by the RSC, the NPCC Manager of Reliability Standards shall post the draft of the regional standard on the NPCC website, along with a draft implementation plan and available supporting documents, for a forty-five (45) calendar day comment period. The NPCC Manager of Reliability Standards shall also notify NERC to process the draft document in accordance with NERC's regional standards review procedure, as applicable.

Following the conclusion of the NPCC comment period, the NPCC Manager of Reliability Standards will assemble the comments on the ~~new~~ draft regional standard and ~~distribute those~~associated documents and provide all comments to the Drafting Team for consideration.

Within thirty (30) calendar days of the conclusion of the comment period the Drafting Team shall convene and consider changes to the draft Standard, the implementation plan and/or supporting technical documents based upon comments received. All submitted comments ~~to the Task Force acting as the standard drafting team. The Task Force shall give prompt consideration to the written views and comments of all participants. An effort to address all expressed comments shall be made~~shall be addressed, and each commenter shall be advised of the disposition ~~of the comment and the reasons therefore, in addition to public posting of the responses.~~, with reasons, of their comments. The NPCC Manager of Reliability Standards shall publicly post all of the Drafting Team's responses to stakeholder comments on the NPCC website.

~~The Task Force acting as the Standard Drafting Team shall take one of the following actions:~~

- ~~Submit the draft standard for RCC endorsement as it stands, along with the comments received and responses to the comments. Based on the comments received, the Task Force acting as the standard drafting team may include revisions that are not substantive. A substantive change is one that directly and materially affects the application of the standard, including, for example: changing "shall" to "should," changing "should" to "shall"; adding, deleting, or revising requirements; or adding, deleting, or revising measures for which compliance is mandatory.~~

- ~~Make substantive revisions to the draft standard and reposts it for further open review and comment.~~

- ~~Task Force recommends Field Test if necessary to RSC.~~

~~Requester also may withdraw the request for a standard.~~

~~RCC submits proposed RRS to the RSC along with its recommendation based on comments, Task Force statements and any field test results.~~

~~STEPS 10 AND 11: RSC APPROVES OF THE NEW OR REVISED STANDARD FOR POSTING~~

If the RSC, acting with consideration of any recommendations by the RCC and utilizing the composite sector voting structure, as outlined in the NPCC, votes to post the draft standard for approval, the draft standard, all comments received, and the responses to those comments shall be posted electronically for the NPCC Members, by the RSPM and made public through the NPCC Website (www.npcc.org) for a 30 calendar day "pre-ballot review" and request for balloting. If the RSC decides more work is needed, the draft standard will be remanded back to the drafting Task Force. All actions of the RCC, Task Forces acting as drafting teams and the Regional Standards Committee will be recorded in regular minutes of the group(s) and posted on the NPCC website. Once the notice for a ballot has been issued, no substantive modifications may be made to the proposed standard unless the revisions are posted and a new notice of the vote is issued

STEPS 12, 13 AND 14: BALLOT OF STANDARD

Upon notification of a ballot, the Members of NPCC's registered ballot body will cast their vote consistent with the NPCC Bylaws. This ballot shall commence no sooner than 15 calendar days and no later than 30 calendar days following the notification of ballot. All members of the NPCC are eligible to participate in the voting on proposed, standard revisions or deletions of regional standards. The ballot period will typically begin immediately following the 30 calendar day pre-ballot posting and will last at least 10 business days.

The NPCC registered ballot body comprises all entities or individuals that qualify for one of the eight NPCC stakeholder sectors and are registered with NPCC as potential ballot participants in the voting on standards. Each member of the NPCC registered ballot body is eligible to vote on standards.

In order for a NPCC Regional Standard to be approved;

- A quorum must be established by at least 50% of the NPCC Members of at least 60% of the Voting Sectors on the roster of Members maintained by NPCC.
- A two-thirds majority of the total weighted sector votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions, and non-responses. Weighted sector vote will be calculated as follows;
  - Affirmative votes cast in each sector will be divided by the sum of affirmative and negative votes cast, in that same sector, to determine the fractional affirmative vote for each sector. Abstentions and non-responses will not be counted for the purposes of determining the fractional affirmative vote for a sector.
  - The sum of the fractional affirmative votes from all sectors divided by the number of sectors voting will be used to determine if a two-thirds majority has been achieved. (A sector will be considered as "voting" if any member of the sector in the ballot pool casts either an affirmative or a negative vote.)
  - A standard will be approved if the sum of fractional affirmative votes from all sectors divided by the number of voting sectors is at least 2/3.

Ballots will be cast electronically and alternatives are as follows;

- Affirmative
- Affirmative with Comments

DRAFT

Based on the comments received, the Drafting Team may elect to:

- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the draft regional standard, the implementation plan and/or supporting technical documents.
- Recommend that the RSC authorize Field Testing of the draft regional standard. Upon completion of the Field Test, return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the draft regional standard based on insights learned during the Field Test.
- Obtain RSC concurrence to post documents for Final Comment Period and request that the RSC initiate the second phase (CEA) of the CEAP process

STEP 2.4.B. FINAL COMMENT PERIOD

The NPCC Standards Staff shall coordinate a Quality Review of "final draft" of the regional standard, implementation plan, VRFs and VSLs to assess whether the documents are within the scope of the associated RSAR, and whether the regional standard is clear and enforceable as written. Upon Completion of the Quality Review, including resolution of comments, the Drafting Team shall submit the regional standard to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post these documents for comment.

As authorized by the RSC, the NPCC Standards Staff shall post the "final draft" of the regional standard on the NPCC website, along with the implementation plan, supporting documents and the Cost Effectiveness Analysis (CEA) survey[14] for a forty-five (45) calendar day comment period. NPCC Standards Staff shall also notify NERC to process the proposed final document in accordance with NERC's regional standards review procedure, as applicable.

Following the conclusion of the NPCC comment period, the NPCC Manager of Reliability Standards will assemble the comments on the posted regional standard and associated documents and provide all comments to the Drafting Team for consideration.

In addition, the RSC, pursuant with the requirements of the Cost Effectiveness Analysis Procedure (CEAP), will use the responses to the posted CEA survey to develop a recommendation based on the cost effectiveness of the proposed regional standard.

The NPCC Task Forces (TFs) or Working Groups (WGs) may develop recommendations for submittal to the RSC. Following the RSC deliberations to determine a course of action, the RSC will communicate to the Drafting Team to:

- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the Standard to address the results of the CEAP
- Accept the Standard "as is" to move forward through the remainder of the process
- Hold the Standard in abeyance until such time as additional guidance can be provided regarding whether or how to continue

[14] In accordance to the Cost Effectiveness Analysis Procedure (CEAP) the Cost Effectiveness Analysis (CEA) survey may be assigned directly to NPCC Task Forces (TFs) or Working Groups (WGs) in addition to the posting process.

- Decide not to pursue the development of certain requirements or the entire Standard due to cost effectiveness considerations

Upon Completion of the final comment period the Drafting Team shall submit the proposed regional standard, along with any supporting materials, consideration of comments and field test results, to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post the regional standard and implementation plan for ballot and concurrently provide an information copy to the RCC.

The NPCC Manager of Reliability Standards shall also publicly post all of the Drafting Team's responses to stakeholder comments on the NPCC website.

STEP 2.5: POSTING FOR BALLOT PERIOD IN THE OPEN PROCESS

Note: There are no limits to the number of public comment periods and ballots that can be conducted to result in a regional standard that is clear and enforceable, and achieves a quorum and sufficient affirmative votes for approval.

As authorized by the RSC, the NPCC Manager of Reliability Standards shall post the proposed regional standard on the NPCC website, along with supporting documentation [15] (e.g., implementation plan, consideration of comments, technical reports, white papers and any field test results), for a thirty (30) day pre-ballot review period and a subsequent ten (10) day ballot period. The ten (10) day ballot period will commence immediately following the pre-ballot review period. In the event that a quorum exists for purposes of an electronic vote but the ballot purpose has not been resolved, NPCC may continue to solicit additional responses in order to resolve the matter by electronic voting. In the event that quorum has not been achieved for purposes of an electronic vote, NPCC may continue to solicit electronic ballots, including abstentions, to obtain quorum and resolve the matter.

At the time the regional standard is posted for ballot, the NPCC Manager of Reliability Standards shall also notify NERC to process the proposed regional standard in accordance with NERC's regional standards review procedure, as applicable.

During the ballot period, the NPCC Members of the ballot body can cast their vote as follows:

- Affirmative, with or without comments
- Negative with comments
  - ~~Negative with Comments~~
- Abstain

In accordance with the NPCC Bylaws, a quorum and receipt of a two-thirds (2/3) affirmative majority of the weighted sector votes is required for a ballot to pass.

The ~~RSPM~~ NPCC Manager of Reliability Standards shall post the final outcome of the ballot process~~.~~ on the NPCC website.

[15] The ballot posting is for the regional standard, definition, variance or interpretation. Supporting documentation is included for information only and is not balloted.

STEP 2.5.A. BALLOT DOES NOT RECEIVE 2/3 AFFIRMATIVE VOTE

If ~~the~~ a ballot fails to achieve the 2/3 majority vote the NPCC Manager of Reliability Standards may:

- Direct the Drafting Team to respond to ballot comments and return to STEP 2.5: POSTING FOR BALLOT PERIOD IN THE OPEN PROCESS to re-ballot the regional standard ~~is rejected, it may be withdrawn~~. The consideration of comments from prior ballot will be included with the re-posting.
- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the regional standard to address the comments received.
- Pursue the curtailment of the regional standard development by ~~either~~soliciting the ~~RCC or the original~~ Requester~~, or the standard may be remanded~~ to withdraw the RSAR or by soliciting the RSC ~~back to the Task Force acting as the drafting team to address the issues. All~~ to reject the RSAR pursuant with STEP 2.1.C. NPCC REGIONAL STANDARDS COMMITTEE (RSC) ACTIONS. The NPCC Manager of Reliability Standards, in the event of a curtailment of the development of a regional standard, shall post a notice of the curtailment and will post and archive all comments submitted during the process ~~will be posted and archived~~ for future consideration ~~when redrafting~~, if required. The NPCC Manager of Reliability Standards will also notify NERC to process the proposed regional standard ~~upon~~in accordance with NERC's regional standards review~~.~~ procedure, as applicable.

~~The~~ STEP 2.5.B. BALLOT RECEIVES ≥ TWO-THIRDS (2/3) AFFIRMATIVE VOTE

A ballot that achieved two-thirds or greater affirmative vote has successfully passed. However, negative votes with comments should still be reconciled. If there is at least one negative vote with comments proceed to STEP 2.5.B.1 APPROVED BALLOT WITH "NEGATIVE VOTE WITH COMMENT". If there was not any negative vote with comments proceed to STEP 2.5.B.2 APPROVED BALLOT WITHOUT "NEGATIVE VOTE WITH COMMENT".

STEP 2.5.B.1 APPROVED BALLOT WITH "NEGATIVE VOTE WITH COMMENT"

Following the conclusion of the NPCC ballot period, the NPCC Manager of Reliability Standards will assemble the comments on the posted regional standard~~, once~~ and provide all comments to the Drafting Team for consideration. The Drafting Team shall review all negative votes with comments and elect to:

- Recommend to the RSC to accept the regional standard "as is" and seek RSC endorsement to move forward through the remainder of the process. Upon receiving RSC endorsement to proceed, the regional standard and associated documents, approved by the NPCC ballot~~, and a recommendation will~~ body, shall be forwarded by the Assistant Vice President Standards to the NPCC Board of Directors for final Regional approval. If comments that were received during balloting should be considered in future revisions to the regional standard then the NPCC Manager of Reliability Standards should log comments in an issues database.
- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the regional standard to address the comments received.

DRAFT

- Respond to ballot comments and recommend to the RSC endorse the return to STEP 2.5: POSTING FOR BALLOT PERIOD IN THE OPEN PROCESS to re-ballot the regional standard. The NPCC Manager of Reliability Standards should include the consideration of comments from the prior ballot with the re-posting.

STEP 2.5.B.2 APPROVED BALLOT WITHOUT "NEGATIVE VOTE WITH COMMENT"

Regional standard and associated documents, approved by the NPCC ballot body, shall be forwarded by the Assistant Vice President Standards to the NPCC Board of Directors for final Regional approval.

STEP 2.6: NPCC BOARD OF DIRECTORS APPROVAL

Following approval by the NPCC Members, regional standards require review and approval by the NPCC Board of Directors. The NPCC Board of Directors may take the following actions:

- Approve the regional standard as presented.
- Approve the regional standard with comments to incorporate non-substantive revisions. [The NPCC Board of Directors may not make substantive ~~modifications~~revisions to the standard~~. If~~.]
- Remand the ~~Board does not approve the~~ regional standard ~~for transmittal~~back to the RSC and the Drafting Team to address their concerns.

STEP 2.7: NERC BOARD OF TRUSTEES SUBMITTAL

Upon approval by the NPCC Board of Directors, the NPCC Manager of Reliability Standards shall submit the regional standard to NERC, as the Electric Reliability Organization, for approval and subsequent filing with FERC and the applicable Canadian Provincial regulatory and/or governmental authorities for adoption.

STEP 2.8: IMPLEMENTATION OF A NPCC REGIONAL STANDARD

Following the approval of a NPCC regional standard by FERC and the applicable Canadian Provincial regulatory and/or governmental authorities, all users, owners, planners, and operators of the Bulk Electric System in the NPCC geographic area are required to comply with the standard as of its enforcement date.

ERO approved Reliability Standards (both continent-wide and regional) are included in both the NERC and NPCC Compliance Monitoring and Enforcement Programs (CMEPs).

FIGURE 1: FLOWCHART OF REGIONAL STANDARDS DEVELOPMENT PROCESS

Placeholder for flowchart

3. STANDARD INTERPRETATION PROCESS STEPS

This section applies to NPCC regional standards that have been approved[16] and are currently enforceable or have a future enforcement date. A request for interpretation is not permitted for regional standards under development. For regional standards under development, clarification

[16] Approval is granted by FERC and the Canadian Provincial regulatory and/or governmental authorities, as applicable.

can be sought during a comment period. Refer to Step 2, STANDARD DEVELOPMENT PROCESS STEPS of this manual for details on the comment process for a standard under development.

STEP 3.1: REGIONAL STANDARDS REQUEST FOR INTERPRETATION (RFI)

Any member of NPCC or group within the NPCC region shall be allowed to submit a formal Request for Interpretation (RFI) of a NPCC regional standard.

Additionally, any person (organization, company, government agency, individual, etc.) who is directly and materially affected by the reliability of the NPCC Bulk Electric System shall be allowed to submit a formal Request for Interpretation (RFI) of a NPCC regional standard.

> *Note: A valid interpretation request is one that seeks additional clarity about one or more requirements in an approved regional standard, but does not request approval as to how to comply with any requirements of the standard.*

Request for Interpretation of a NPCC regional standard shall be initiated under the NERC process for developing an interpretation. The entity requesting the interpretation shall submit a Request for Interpretation form[17] to the NERC Reliability Standards Staff explaining the clarification required, the specific circumstances surrounding the request, and the impact of not having the interpretation provided. A copy of the completed RFI form should also be sent to the NPCC Manager of Reliability Standards.

Upon receipt of a RFI for a requirement of a NPCC regional standard, NERC Reliability Standards Staff shall forward the RFI to the NPCC Manager of Reliability Standards and in doing so shall delegate the validation of and response to the RFI to NPCC.

STEP 3.2: REVIEW AND VALIDATION OF REQUEST FOR INTERPRETATION (RFI)

Upon receipt of the NERC delegation to NPCC to validate and respond to a RFI for a requirement of a NPCC regional standard, the NPCC Manager of Reliability Standards shall review the RFI to determine whether:

- It meets the requirements for a valid interpretation
- A compliance process or approach could be used in lieu of an interpretation

The NPCC Manager of Reliability Standards will utilize, as necessary, the NPCC Standards Staff, NPCC Compliance and Legal Staffs when determining the validity of the RFI. Based on this review, the NPCC Manager of Reliability Standards will recommend to the RSC whether to accept or reject the RFI. The recommendation to the RSC should be made within thirty (30) calendar days of the receipt of the RFI from NERC.

The following examples identify situations that may warrant a recommendation from the NPCC Manager of Reliability Standards to reject the RFI:

- Requests approval of a particular compliance approach
- Identifies a gap or perceived weakness in the approved regional standard (Requester should be redirected to initiate an RSAR rather than a RFI)

[17] The *Request for Interpretation* form is posted under Resource Documents on the NERC Standards webpage.

- Where an issue can be addressed by an active (regional or continent-wide) standard Drafting Team
- Where an issue can be better addressed by a compliance process or approach
- Where it ~~will be remanded back to the RSC.~~requests clarification of any element of a regional standard other than a requirement

- ~~If~~Where a question has already been addressed in the record
- Where the interpretation identifies an issue and proposes the development of a new or modified regional or continent-wide standard ~~is approved, the standard will~~(such issues should be ~~submitted to the NERC/ERO Board of Trustees for approval.~~addressed via submission of a RSAR or SAR)

- ~~**STEPS 15, 16 AND 17: IMPLEMENTATION OF**~~ Where an interpretation seeks to expand the scope of a regional standard
- Where the requirement of the regional standard is clear

STEP 3.3: NPCC REGIONAL ~~STANDARD~~STANDARDS COMMITTEE (RSC) ACTIONS

~~Upon approval within the NPCC , the standard will be~~The RSC shall review the RFI along with the recommendation from the NPCC Manager of Reliability Standards and take one of the following actions:

- Reject the RFI. In this case, the RSC will provide its determination to the NPCC Manager of Reliability Standards, who will then provide a written explanation for rejection to the RFI to the entity requesting the interpretation within ten (10) calendar days of the decision to reject.
- Accept the RFI. In this case, the RSC will provide its determination to the NPCC Manager of Reliability Standards, who will then: 1) post notification on the NPCC website of the intent to develop an interpretation; 2) notify the ERO for processing in accordance with its process, as applicable; and 3) notify the Requester of the acceptance of the RFI.

STEP 3.4: FORMATION OF DRAFTING TEAM FOR RESPONSE TO RFI

A RFI that has been accepted by the RSC shall, within ten (10) calendar days of the acceptance of the RFI, be assigned by the NPCC Manager of Reliability Standards to the responsible NPCC Task Force to make up the interpretation Drafting Team and develop the RFI response.

DRAFT

STEP 3.5: DEVELOPMENT OF RESPONSE TO RFI

Note: A valid interpretation response provides additional clarity about one or more requirements, but does not expand on any requirement and does not explain how to comply with any requirement.

The Drafting Team shall submit a proposed interpretation response within forty-five (45) calendar days, from the receipt of the RFI, to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post the proposed response for comment.

If the RSC concurrence is not received, the Drafting Team will continue to refine the interpretation response.

Note: There are no limits to the number of public comment periods that can be conducted to result in a clear and concise interpretation of a regional standard requirement.

STEP 3.6: POSTING RFI FOR COMMENT PERIOD AND RESOLUTION OF COMMENTS

As authorized by the RSC, the NPCC Manager of Reliability Standards shall post the proposed interpretation response on the NPCC website for a forty-five (45) calendar day comment period. NPCC Manager of Reliability Standards shall also notify NERC for processing in accordance with NERC's regional standards review procedure, as applicable.

Following the conclusion of the NPCC comment period, the NPCC Manager of Reliability Standards will assemble the comments on the proposed interpretation response and provide all comments to the Drafting Team for consideration.

Within thirty (30) calendar days of the conclusion of the comment period the Drafting Team shall convene and consider changes to the proposed interpretation response based upon comments received. All submitted comments shall be addressed, and each commenter shall be advised of the disposition, with reasons, of their comments. The NPCC Manager of Reliability Standards shall publicly post all of the Drafting Team's responses to stakeholder comments on the NPCC website.

Based on the comments received, the Drafting Team may elect to:

- Return to STEP 3.5: DEVELOPMENT OF RESPONSE TO RFI to revise the proposed interpretation response.
- Accept the proposed interpretation response "as is" to move forward through the remainder of the process.

Upon Completion of the final comment period the Drafting Team shall submit the proposed interpretation response to the NPCC Manager of Reliability Standards to obtain RSC concurrence to submitted ~~to~~ proposed interpretation response.

The NPCC Manager of Reliability Standards shall also publicly post all of the ~~NERC/ERO~~Drafting Team's responses to stakeholder comments on the NPCC website.

STEP 3.7: REGIONAL STANDARDS COMMITTEE APPROVAL OF RFI

Upon receipt of the RFI response from the NPCC Manager of Reliability Standards, the RSC shall elect to:

- Endorse the proposed interpretation response

- Direct the Drafting Team to return to STEP 3.5: DEVELOPMENT OF RESPONSE TO RFI to revise the proposed interpretation response
- Direct the Assistant Vice President Standards to forward the RFI to the NPCC Board of Directors for final Regional approval~~(s)~~

STEP 3.8: NPCC BOARD OF DIRECTORS APPROVAL OF RFI

Following endorsement by the RSC, interpretation responses require review and ~~filing~~approval by the NPCC Board of Directors. The NPCC Board of Directors may take the following actions:

- Approve the interpretation response as presented
- Approve the interpretation response with ~~FERC~~comments to incorporate non-substantive revisions. [The NPCC Board of Directors may not make substantive revisions to the interpretation response.]
- Remand the interpretation response back to the RSC and the Drafting Team to address their concerns

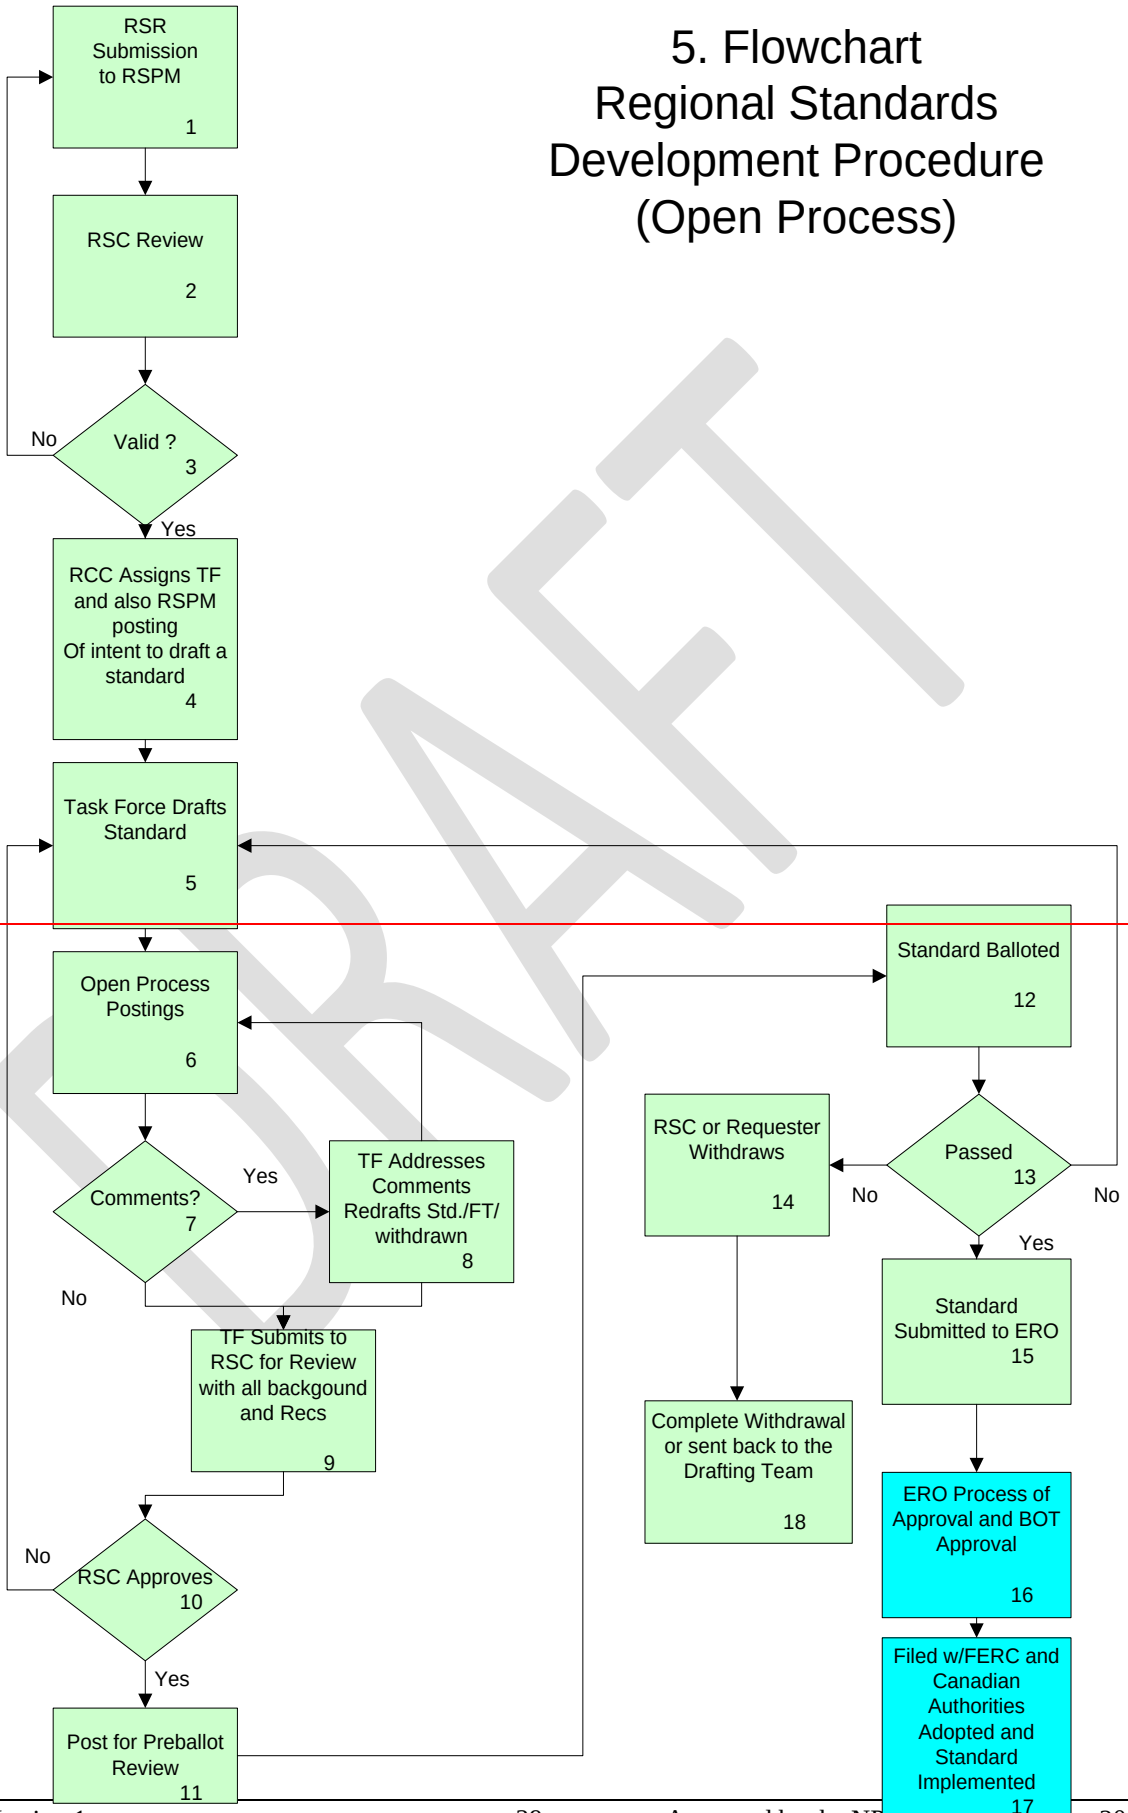
Upon receipt of Board approval, the NPCC Manager of Reliability Standards shall notify NERC of the approved interpretation for processing in accordance with NERC procedures, as applicable ~~Canadian~~.

FIGURE 2: FLOWCHART OF REGIONAL STANDARDS INTERPRETATION PROCESS

Placeholder for flowchart

4. WITHDRAWAL OF A REGIONAL STANDARD PENDING APPROVAL

The term "withdrawal" as used herein, refers to the revocation of a request for approval of a regional standard, variance, interpretation or definition that has been approved by the NPCC Board of Directors and has not been filed with Applicable Governmental ~~and/or Regulatory~~ Authorities ~~for adoption.~~or has been filed but not yet approved by Applicable Governmental Authorities. The RSC may withdraw a regional standard, variance, interpretation or definition for good cause upon approval by the NPCC Board of Directors. Upon approval by the NPCC Board of Directors, the NPCC Manager of Reliability Standards will notify NERC Staff to petition the Applicable Governmental Authorities, as necessary, to allow for withdrawal.



~~Once a reliability standard is adopted and made effective, all users, owners, planners, and operators of the Bulk Power System in the NPCC geographic area of the Northeast are required to comply with the standard. The NERC/ERO Board of Trustees has established a separate compliance program, also administered in the Northeast by NPCC , to measure compliance with the standards and administer sanctions as appropriate. After adoption of a NPCC Regional Standard, the standard will be forwarded to the compliance program for compliance monitoring and enforcement.~~

~~**STEP 18: WITHDRAWAL OF STANDARD**~~

~~Upon rejection of a proposed standard, the RCC or the requester may withdraw the standard completely or remand it back to the Task Force acting as the standard drafting team for further work.~~

DRAFT

5. Flowchart Regional Standards Development Procedure (Open Process)

DRAFT

~~**6. ERO and Regulatory Process and Approvals**~~

- ~~**NERC/ERO Comment Period** – NERC/ERO shall publicly notice and request comment on the NPCC Regional Reliability Standard, allowing a minimum of 45 calendar days for comment on NERC's website and actively notify all adjoining Regions. Concurrent with this regional posting, final drafts will be forwarded to NERC for posting on the NERC website to ensure full industry awareness of the standard and expedite and coordinate all commenting. All comments will be responded to electronically through a posted response on the NPCC website or a link on the NERC website. NPCC shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the NPCC Regional Reliability Standard and request another posting for comment, or submit the NPCC Regional Reliability Standard along with a response to any objections received, for approval by NERC.~~

- ~~**NERC/ERO Approval of NPCC Regional Reliability Standards** – Proposed regional reliability standards shall be subject to approval by the NERC/ERO who shall have a process to evaluate and recommend whether a proposed non-Interconnection-wide NPCC Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether NPCC has considered and addressed stakeholder objections. NPCC Board, having been notified of the results of the regional ballot concerning a NPCC Regional Reliability Standard, shall vote to submit the Standard to the NERC/ERO Board for approval as a NERC Reliability Standard. The NERC/ERO Board shall consider NPCC's request, the scope and implications of the Standard, the recommendation for action on the Standard, any unresolved stakeholder comments, and NPCC's consideration of comments and unresolved issues if any, in determining whether to approve the NPCC Regional Reliability Standard as a NERC Reliability Standard.~~

- ~~**Regulatory Authority Approval** – An NPCC Regional Reliability Standard that has been approved by the NERC/ERO board shall be filed with FERC and applicable Canadian Governmental and/or Regulatory Authorities for approval and shall become effective and enforceable within the U.S., per Section 215 of the Federal Power Act, only when adopted by FERC, and within Canada, only when adopted by applicable Canadian Governmental and/or Regulatory Authorities. The regional reliability standard, once adopted will be made part of the body of NERC reliability standards and shall be mandatory and enforceable on all applicable bulk power system owners, operators, and users within the NPCC Region, regardless of membership status.~~

5. Retirement of an Approved NPCC Regional Standard

The term "retirement" refers to the discontinuation of a regional standard, variance, interpretation or definition that: 1) has been approved by Applicable Governmental Authorities and 2) is not being superseded by or merged into a new or revised regional standard, interpretation or definition.

DRAFT

Upon identification of a need to retire a regional standard, variance, interpretation or definition, where the item will not be superseded by a new or revised version, a RSAR containing the proposal to retire a regional standard, variance, interpretation or definition will be posted for a comment period and ballot in the same manner as a Reliability Standard. The proposal shall include the rationale for the retirement and a statement regarding the impact of retirement on the reliability of the Bulk Electric System. Upon approval by the NPCC Members and the NPCC Board of Directors, the NPCC Manager of Reliability Standards shall submit the request for retirement to NERC, as the Electric Reliability Organization, for approval and to subsequently petition the Applicable Governmental Authorities to allow for retirement.

6. Approval of Process Waiver

While it is NPCC's intent to adhere to this manual under normal circumstances, NPCC may need to develop a new or modified regional standard, implementation plan, variance, interpretation or definition under extenuating circumstances. Extenuating circumstances may include, but not be limited to, specific time constraint imposed by a regulatory body and urgent reliability issue that requires expedited handling outside of the normal regional Reliability Standards process.

The RSC, by two-thirds (2/3) majority vote, may waive any of the provisions contained in this manual for good cause shown, but limited to the following circumstances:

- Where necessary to meet regulatory deadlines
- Where necessary to address an urgent reliability issue identified by regulatory and/or governmental authorities, including response to national emergency declared by the United States or Canadian government that involves the reliability of the Bulk Electric System or cyber-attack on the Bulk Electric System
- Where necessary to meet deadlines imposed by the NPCC Board of Directors
- Where the RSC determines that a revision to a proposed regional standard, implementation plan, variance, interpretation or definition has already been vetted by the industry through the standards development process or is so insubstantial that developing the revision through the processes contained in this manual will add significant time delay without any corresponding benefit.

In no circumstances shall this provision be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard.

A waiver request may be submitted to the RSC by any entity or individual, including NPCC committees or subgroups and NPCC Standards Staff. Prior to consideration of any waiver request, the NPCC Manager of Reliability Standards must provide notification to stakeholders at least five (5) business days prior to RSC consideration and action. Posting the waiver request on the NPCC website satisfies the notification provision.

Action on the waiver request will be included in the minutes of the RSC. Following the approval of the RSC to waive any provision of the regional Reliability Standards process, the Assistant Vice President Standards shall report the exercise of this waiver provision to the NPCC Board of Directors prior to adoption of the related Reliability Standard, interpretation, definition or variance. Actions taken pursuant to an approved waiver request will be posted on the NPCC Standards webpage.

DRAFT

In addition,

7. PROCESS FOR CORRECTING ERRATA

From time to time, an error may be discovered in a regional standard after it has received final ballot approval by the NPCC ballot body. Such errors may be corrected by the RSC without re-balloting if the RSC agrees that the correction of the error does not change the scope or intent of the associated regional standard, and agrees that the correction has no material impact on the end users of the regional standard.

If the regional standard containing errata is pending approval by the NPCC Board of Directors, the corrected regional standard shall be presented to the NPCC Board for approval in lieu of the regional standard approved by the NPCC ballot body.

The NPCC Board of Directors has resolved to concurrently approve any errata approved by the RSC associated with a regional standard that has received prior approval by the NPCC Board. If the regional standard containing errata is:

- Pending filing with NERC for approval, the corrected regional standard approved by the RSC shall be filed with NERC for approval in lieu of the regional standard approved by the NPCC Board of Directors
- Filed with NERC for approval, then the correction shall be filed for approval with NERC

~~7.~~8. APPEALS

- Persons who have directly and materially affected interests and who have been or will be adversely affected by any substantive or procedural action or inaction related to the ~~development,~~ approval, revision, reaffirmation, or withdrawal of a regional ~~reliability~~ standard (appellant) shall have the right to appeal. This appeals process applies only to the regional standards process as defined in this ~~procedure~~manual.

The burden of proof to show adverse effect shall be on the appellant. Appeals shall be made within thirty (30) calendar days of the date of the action purported to cause the adverse effect, except appeals for inaction, which may be made at any time. In all cases, the request for appeal must be made prior to the next step in the process.

The final decisions of any appeal shall be documented in writing and made public.

The appeals process provides two levels, with the goal of expeditiously resolving the issue to the satisfaction of the participants:

- LEVEL 1 APPEAL

Level 1 is the required first step in the appeals process. The appellant submits a complaint in writing to the ~~RSPM~~NPCC Manager of Reliability Standards that describes the substantive or procedural action or inaction associated with a ~~reliability standard~~Reliability Standard or the standards process. The appellant describes in the complaint the actual or potential adverse

impact to the appellant. Assisted by any necessary ~~staff~~NPCC Standards Staff and ~~committee~~Committee resources, the ~~RSPM~~NPCC Manager of Reliability Standards shall prepare a written response addressed to the appellant as soon as practical, but not more than forty-five (45) calendar days after receipt of the complaint. If the appellant accepts the response as a satisfactory resolution of the issue, both the complaint and response will be made a part of the public record associated with the standard and posted with the standard.

- LEVEL 2 APPEAL

If after the Level 1 Appeal the appellant remains unsatisfied with the resolution, as indicated by the appellant in writing to the ~~regional standards process manager~~NPCC Manager of Reliability Standards, the ~~RSPM~~NPCC Board of Directors shall ~~convene~~appoint a five member panel to serve as a Level 2 Appeals Panel. ~~This panel shall consist of five members total appointed by the NPCC's board.~~

In all cases, Level 2 Appeals Panel members shall have no direct affiliation with the participants in the appeal.

The ~~RSPM~~NPCC Manager of Reliability Standards shall post the complaint and other relevant materials and provide at least a thirty (30) calendar ~~days~~day notice of the meeting of the Level 2 Appeals Panel.

In addition to the appellant, any person that is directly and materially affected by the substantive or procedural action or inaction referenced in the complaint shall be heard by the panel. The panel shall not consider any expansion of the scope of the appeal that was not presented in the Level 1 Appeal. The panel may in its decision find for the appellant and remand the issue to the RSC with a statement of the issues and facts in regard to which unfair and/or inequitable action was taken, or which fair and/or equitable action was not taken. The panel may find for or against the appellant with a specific statement of the facts that demonstrate fair and equitable treatment of the appellant and the appellant's objections. The panel may not, however, revise, approve, disapprove, or adopt a ~~reliability standard.~~Reliability Standard. The actions of the Level 2 Appeals Panel shall be publicly posted.

In addition to the foregoing, a procedural objection that has not been resolved may be submitted to the NPCC Board of Directors for consideration at the time the ~~board~~Board decides whether to adopt a particular ~~reliability standard~~Reliability Standard. The objection must be in writing, signed by an officer of the objecting entity, and contain a concise statement of the relief requested and a clear demonstration of the facts that justify that relief. The objection must be filed no later than thirty (30) calendar days after the announcement of the vote on the standard in question.

DRAFT

DRAFT

APPENDIX A-: RSAR COMPLETION GUIDELINES

The Requester shall complete a RSAR form in accordance with the guidance provided below.

The RSAR, at a minimum, shall contain information in the required fields in order to be qualified for consideration. The NPCC Manager of Reliability Standards will assist the Requester to ensure all required information is submitted on the RSAR.

Information in a Regional Standard Authorization Request (RSAR)

The tables below identify information to be submitted in a Regional Standard Authorization Request to the NPCC ~~Regional~~Manager of Reliability Standards ~~Process Manager,~~, at ~~NPCCstandard@npcc.org~~ .npccstandard@npcc.org. The NPCC ~~Regional~~Manager of Reliability Standards ~~Process Manager~~ shall be responsible for implementing and maintaining this form as needed to support the information requirements of the standards process.

Regional Standard Authorization Request Form

Title of Proposed Standard:	***[Required Field]***
Request Date:	***[Required Field]***

RSAR Requester Information

Name:	***[Required Field]***	**RSAR Type -(Check box for one of these selections.)**
Company:	***[Required Field]***	☐ New Standard
Telephone:	***[Required Field]***	☐ Revision to Existing Standard
Fax:		☐ Withdrawal of Existing Standard
Email:	***[Required Field]***	☐ Urgent Action

~~Purpose (**Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.**)~~

~~Industry Need (Provide **a detailed statement justifying the need for the proposed standard, along with any supporting documentation.**)~~

~~Brief Description (**Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.**)~~

Purpose: (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.)

[Required Field]

Industry Need: (Provide a detailed statement justifying the need for the proposed standard, along with a technical justification and any supporting documentation.)

[Required Field -- must include technical justification (relevant studies, documentation, etc.) for a new standard or revision to an existing standard.]

Brief Description: (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

[Required Field]

Reliability Functions *[Required Field]*

The Standard will Apply to the Following Functions (Check all applicable boxes.)		
☐	Reliability Coordinator	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.

☐	Balancing Authority	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☐	Planning Authority	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.
☐	Transmission Service Provider	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.
☐	Transmission Owner	The entity that owns and maintains transmission facilities.
☐	Transmission Operator	The entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission facilities.
☐	Transmission Planner	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.
☐	Resource Planner	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
☐	Generator Operator	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
☐	Generator Owner	Entity that owns and maintains generating units.
☐	Purchasing-Selling Entity	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
☐	Distribution Provider	Provides and operates the "wires" between the transmission system and the customer.
☐	Load-Serving Entity	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check all boxes that apply.)*	
☐	1. Interconnected ~~bulk power systems~~Bulk Electric System shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

☐	2. The frequency and voltage of interconnected ~~bulk power systems~~Bulk Electric System shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected ~~bulk power systems~~Bulk Electric System shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected ~~bulk power systems~~Bulk Electric System shall be developed, coordinated, maintained, and implemented.
☐	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected ~~bulk power systems.~~Bulk Electric System.
☐	6. Personnel responsible for planning and operating interconnected ~~bulk power systems~~Bulk Electric System shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected ~~bulk power systems~~Bulk Electric System shall be assessed, monitored, and maintained on a wide-area basis.
Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*	
Recognizing that reliability is an Common Attribute of a robust North American economy:	
1. A reliability standard shall not give any market participant an unfair competitive advantage~~. Yes~~. Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. ~~Yes~~ Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. ~~Yes~~ Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. ~~Yes~~ Yes	

Detailed Description: (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

[Required Field – Provide: 1) Necessary information to assist the Drafting Team (which is to include relevant study results and documentation), to the extent feasible,

to allow them to draft the standard, 2) Any existing known cross references to NPCC or NERC documents and 3) Technical background for the RSAR to properly address the need for the standard.]

Standard No.	Explanation

Related SARs or RSARs *[Required Field, to extent known]*

SAR ID	Explanation

APPENDIX B: SELECTION OF DRAFTING TEAM MEMBERS

A regional standard Drafting Team shall be comprised of Subject Matter Experts (SMEs) from NPCC Task Forces and Working Groups as determined by the RCC, and from industry. The guidelines provided herein primarily address overall team requirements and more specifically those of a SME.

Formal membership on a Drafting Team should be reserved only for those individuals who intend to work consistently, diligently, and professionally on what is required to be done for a regional standard. Drafting Team members are expected to contribute meaningfully to the ongoing development of the standard.

Drafting team members must be:

- Committed to participating in scheduled Drafting Team meetings, teleconferences, as well as industry outreach (e.g., workshops and webinars)
- Willing to lead teams / sub-teams, as necessary
- Champions for standard development and promoters of the approval of the standard
- Open to consider the comments of others and provide constructive feedback

Subject Matter Experts should possess the necessary expertise and knowledge regarding the topic of the standard. The SMEs should represent a cross section of the registered entities applicable to the standard under development as well as geographical areas within the NPCC footprint.

Industry stakeholders may nominate themselves for consideration by the NPCC Regional Standards Committee (RSC) for the specific Drafting Team vacancies by completing the following Drafting Team Self Nomination form and submitting it to NPCC Manager of Reliability Standards, at npccstandard@npcc.org.

Nomination Form for NPCC [Name of Drafting Team] Drafting Team

Please return this form as soon as possible. If you have any questions, please contact the NPCC Standards Staff at npccstandard@npcc.org.

By submitting the following information you are indicating your willingness and agreement to actively participate in the Drafting Team meetings if appointed to the Drafting Team by the NPCC Regional Standards Committee (RSC). This means that if you are appointed to the DT you are expected to attend all (or at least the vast majority) of the face-to-face DT meetings as well as participate in all the DT meetings held via conference calls. Failure to do so shall result in your removal from the DT.

Name:	
Organization:	
Address:	
Telephone:	

E-mail:	

Please briefly describe your experience and qualifications to serve on the requested Drafting Team.

If you are currently a member of any NERC or Regional drafting teams, please list each team here.

☐ Not currently on any active SAR or standard drafting team.

☐ Currently a member of the following SAR or standard drafting team(s):

_____

_____

_____

_____

If you previously worked on any drafting team please identify the team(s).

☐ No prior NERC or Regional SAR or standard drafting team experience.

☐ Prior experience on the following team(s):

Select each NERC Region that you represent:	**Select each Industry Segment that you represent:**	
☐ ERCOT	☐	1 — Transmission Owners
☐ FRCC	☐	2 — RTOs, ISOs
☐ MRO	☐	3 — Load-serving Entities
☐ NPCC	☐	4 — Transmission-dependent Utilities
☐ RFC	☐	5 — Electric Generators
☐ SERC	☐	6 — Electricity Brokers, Aggregators, and Marketers
☐ SPP	☐	7 — Large Electricity End Users
☐ WECC	☐	8 — Small Electricity End Users
☐ NA – Not Applicable	☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
	☐	10 — Regional Reliability Organizations and Regional Entities
	☐	NA – Not Applicable

Select each Function[18] in which you have current or prior expertise:

☐ Balancing Authority	☐ Transmission Operator
☐ Compliance Enforcement Authority	☐ Transmission Owner
☐ Distribution Provider	☐ Transmission Planner
☐ Generator Operator	☐ Transmission Service Provider
☐ Generator Owner	☐ Purchasing-selling Entity
☐ Interchange Authority	☐ Reliability Coordinator
☐ Load-serving Entity	☐ Reliability Assurer
☐ Market Operator	☐ Resource Planner

[18] These functions are defined in the NERC Functional Model, which is downloadable from the NERC website.

☐ Planning Coordinator	

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group.

APPENDIX C: MAINTENANCE OF REGIONAL STANDARDS AND PROCESS

NPCC regional standards and the Regional Standards Process Manual are living documents that will be updated periodically to remain current and viable (e.g., respond to changing conditions, as well as to incorporate lessons learned and process improvements).

MAINTENANCE OF REGIONAL STANDARDS

NPCC regional standards will be posted for open process review by the RSC for possible revision at least once every five (5) years after the first regulatory approval and follow the same process as in the case of a new standard. If no changes are warranted, the Regional Standards Committee (RSC) shall recommend to the NPCC Board that the standard be reaffirmed. If the review indicates a need to revise or retire a regional standard, a Regional Standard Authorization Request shall be prepared by the RSC and submitted in accordance with the NPCC regional standards process. The existing, approved standard subject to revision will remain in effect until such time as the revised version has received FERC or applicable Provincial Governmental Authorities approvals, as appropriate, at which time it will be retired in accordance with any applicable implementation plan associated with the newly approved regional standard.

MAINTENANCE OF THE REGIONAL STANDARDS PROCESS

This NPCC Regional Standards Process will be reviewed for possible revision at least once every five (5) years, or more frequently if needed, and subject to the same procedure as applies to the development of a Regional Standard. All such revisions shall be subject to approval by the NPCC Board of Directors, NERC Board of Trustees, FERC, and may be subject to approval, if required, by Applicable Governmental Authorities in Canada.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

October 28, 2014

VIA ELECTRONIC FILING

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, D.C. 20426

RE: Errata to Petition of the North American Electric Reliability Corporation for Approval of Amendments to Regional Reliability Standards Development Procedure of the Northeast Power Coordinating Council, Inc.
Docket No. RR14-7-000

Dear Ms. Bose:

On September 15, 2014, the North American Electric Reliability Corporation ("NERC") filed a Petition for Approval ("Petition") of Proposed Amendments to Regional Reliability Standards Development Procedure of the Northeast Power Coordinating Council, Inc. ("NPCC") with the Federal Energy Regulatory Commission. It has come to NERC's attention that the Petition included an incorrect "Redline" version of the newly renamed NPCC Regional Standards Process Manual (RSPM) in Attachment 2 of the Petition, thus causing an inconsistency between the "Clean" and "Redline" versions therein. The "Clean" version of the RSPM submitted as Attachment 1 of this Petition is correct.

Accordingly, NERC requests approval of the "Clean" version in the Petition. The attached corrected "Redline" in Attachment 1 of this Petition will assist the Commission and others in evaluating the proposed changes.

Respectfully submitted,

/s/ William H. Edwards

William H. Edwards
Counsel for North American Electric Reliability Corporation

3353 Peachtree Road NE

MAINTENANCE OF THE REGIONAL STANDARDS PROCESS C1
APPENDIX D: NPCC CLARIFICATION REQUEST D1

I. EXECUTIVE SUMMARY

~~The purpose of the Northeast Power Coordinating Council, Inc. ("NPCC"), is to enhance the reliability of the international, interconnected bulk power system in Northeastern North America through the development of more stringent and specific regional reliability standards and compliance assessment and enforcement of continent-wide and regional reliability standards pursuant to the execution and implementation of a Regional Delegation Agreement with the Electric Reliability Organization ("ERO") and applicable Canadian Memoranda of Understanding that are backstopped by the Federal Energy Regulatory Commission ("FERC") and Canadian Provincial authorities. In the development and enforcement of Regional Reliability Standards, NPCC, to the extent possible, facilitates attainment of fair, effective, efficient, and competitive electric markets.~~

~~General Membership in NPCC is voluntary and is open to any person or entity, including any entity participating in the Registered Ballot Body of the ERO that has an interest in the reliable operation of the Northeastern North American bulk power system.~~

The NPCC Bylaws state "NPCC shall develop a Regional Reliability Standards Development Procedure that provides the design-basis approach to a consensus building process by which NPCC may develop Regional Reliability Standards and Regional Variances to be proposed to the ERO for adoption, under delegated authority by the FERC and the Canadian Provincial regulatory and/or governmental authorities."

The NPCC Regional Reliability Standards Development Procedure was originally adopted by the NPCC Board of Directors on September 19, 2007. The NPCC Reliability Standards Staff in concert with the NPCC Regional Standards Committee (RSC) has completed a revision to the NPCC Regional Reliability Standards Process Manual to incorporate process improvements, provide greater clarity and reflect the new NPCC Cost Effectiveness Analysis Procedure (CEAP).

Key changes addressed in this revision include:

- Replacing interpretation with clarification and expanding the Clarification Section narrative into process steps and including an associated flowchart
- Creating separate sections for: 1) Withdrawal of a Regional Standard Pending Approval; 2) Retirement of an Approved NPCC Regional Standard; and 3) Approval of Process Waiver; 4) Process for Correcting Errata
- Recognizing the new NPCC Cost Effectiveness Analysis Procedure (CEAP)
- Identifying the Reliability Standard Audit Worksheet (RSAW) as a companion document to a regional standard that needs to be collaboratively developed by the drafting team and NPCC Compliance Staff
- Creating three new appendices: 1) Appendix A: Regional Standard Authorization Request (RSAR) Completion Guidelines and Form; 2) Appendix B: Selection of drafting team Members and Nomination Form; and 3) Appendix C: Maintenance of Regional Standards and Process

In addressing areas for improvement in the NPCC Regional Reliability Standards Development Procedure, recent improvements made to the NERC Standards Process Manual (e.g., Standards Process Input Group (SPIG) recommendations) as well as the manuals of other Regional Entities were benchmarked to identify best practices for inclusion in this manual.

The process improvements and clarity captured in this revision to NPCC Regional Reliability Standards Development Procedure, will result in a more timely and efficient manner to address the development of regional standards to ensure the reliability of the Bulk Electric System within the NPCC geographical area.

II. INTRODUCTION

PURPOSE

This manual defines the characteristics of a Northeast Power Coordinating Council, Inc. (NPCC) regional Reliability Standard (hereinafter referred to as "regional standard") and establishes the process by which NPCC regional standards are developed, approved, revised, clarified and retired. The NPCC regional standards process is a stakeholder process that is approved by the NPCC members to ensure a transparent standard development process that is "open, fair, and inclusive."

~~The NPCC Regional Reliability Standards Development Procedure describes the procedures, policies and practices implemented to ensure an "open, fair, and inclusive" process for the transparent initiation, development, implementation and revision of NPCC Regional Reliability Standards necessary for the reliable operation~~NPCC regional standards address the reliability of the international and interconnected ~~bulk power system~~ Bulk Electric System in~~-~~ Northeast ~~-~~North America. ~~These Standards~~NPCC regional standards shall enable or support one or more NERC/ERO reliability principles[1] and will, in all cases, not be inconsistent with or less stringent than any requirements of the North American Electric Reliability Council/Electric Reliability Organization (NERC/ERO) ~~Reliability Standards. The procedure will not unnecessarily delay the development of the proposed reliability standards. Each regional reliability standard shall enable or support one or more of the reliability principles, thereby ensuring that each standard serves a purpose in support of the reliability of the regional bulk power system. Each standard shall also be consistent with all of pertinent reliability principles and criteria, thereby ensuring that no standard undermines reliability through an unintended consequence~~continent-wide Reliability Standards.

The development of NPCC regional standards is performed according to the following principles using the process contained in this manual:

- Developed in a fair and open process that provides an opportunity for all interested parties to participate;
- Does not have an adverse impact on commerce that is not necessary for reliability;
- Provides a level of Bulk Electric System reliability that is adequate to protect public health, safety, welfare, and national security and would not have a significant adverse impact on reliability; and
- Based on a justifiable difference between Regions or between sub-Regions within the Regional geographic area.

Following industry approval, NPCC regional standards process and NPCC regional standards require approval by the NPCC Board of Directors, NERC as the Electric Reliability Organization (ERO) and the applicable regulatory authorities in the United States (FERC) and Canada.

BACKGROUND

Northeast Power Coordinating Council, Inc. (NPCC) is responsible for promoting and improving the reliability of the international, interconnected Bulk Electric System in Northeastern North America. NPCC carries out its mission through (i) the development of regional standards and compliance assessment and enforcement of continent-wide and regional standards, coordination of system planning, design and operations, and assessment of reliability, (collectively, "Regional Entity activities"), and (ii) the establishment of regionally-specific criteria, and monitoring and enforcement of compliance with such criteria (collectively, "criteria services activities").

The Energy Policy Act (EPA) of 2005 (Section 1211) amended the Federal Power Act (FPA) by

adding Section 215, Electric Reliability. Specifically regarding standards development and pursuant with Section 215(e)(4) of the FPA, NPCC as a Regional Entity with delegated authority from NERC may propose regional standards to NERC for eventual enforcement within the NPCC region.

[1] Reliability Principles are available on the NERC website as amended from time to time

As a condition of NPCC membership, NPCC General and Full Members[2] agree to adhere to NERC Reliability Standards. NERC Reliability Standards are comprised of both continent-wide and regional standards. The NPCC regional standards apply only to that part of the Eastern Interconnection within the NPCC geographical area.

III. ~~II.~~ REGIONAL ~~RELIABILITY~~ STANDARD ~~DEVELOPMENT PROCEDURE~~CHARACTERISTICS AND ELEMENTS

1. CHARACTERISTIC ATTRIBUTES

~~The NPCC Regional Reliability Standards Development Procedure is:~~

~~• **Open** The NPCC Regional Reliability Standards Development Procedure provides any person the ability to participate in the development of~~ The NPCC regional standards development process has the following key characteristics:

- **Fair due process** — The NPCC regional standards development process provides for reasonable notice and opportunity for public comment. At a minimum, the procedure shall include public notice of the intent to develop a standard~~. Any entity that is~~, a public comment period on the proposed standard, due consideration of those public comments, and a ballot of interested stakeholders. Upon approval by the NPCC Members, the NPCC Board of Directors then votes to approve submittal of the regional standard to NERC for ERO approval, followed by submission to FERC and Canadian Authorities for their approvals.
- **Openness** — Participation in the NPCC regional standards development process is open to all persons and organizations that are directly and materially affected by the reliability of the NPCC's ~~bulk power system has the ability to participate in the development and approval of reliability standards.~~Bulk Electric System. There ~~are~~is no undue financial ~~barriers~~burden to participation. ~~—~~Participation ~~in the open comment process is~~shall not ~~conditional~~be conditioned upon membership in the ERO, NPCC or any organization, and ~~participation is~~shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.~~ NPCC utilizes a website to accomplish this. Online posting and review of standards and the real time sharing of comments uploaded to the website allow complete transparency.~~

- **Inclusive** ~~— The NPCC Regional Reliability Standards Development Procedure provides any~~ — Any entity (person, organization, company, government agency, individual, etc.) with a direct and material interest in the reliability of NPCC's Bulk Electric System has the right to participate by: (a) expressing an opinion and its basis~~, have that~~; (b) having their position considered, and ~~appealed~~(c) having the right to appeal a response through an established ~~appeals~~appeal process ~~if adversely affected~~.

- ~~**Balanced** — The NPCC Regional Reliability Standards Development Procedure has a balance of interests and all those entities that are directly and materially affected by the reliability of the NPCC's bulk power system are welcome to participate~~• **Balanced** — The NPCC regional standards development process strives to have an appropriate balance of interest and shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter. ~~This will be accomplished through~~ Pursuant with the NPCC ~~Bylaws defining eight~~By- Laws[3] there are seven (7) stakeholder voting sectors ~~(categories)~~and the votes for ~~voting~~each sector are weighted to achieve an appropriate balance.

  - ~~**Fair Due Process** — The NPCC Regional Reliability Standards Development Procedure provides for reasonable notice and opportunity for public comment. The procedure includes public notice of the intent to develop a standard, a 45 calendar day public comment period on the proposed standard request, or standard with due consideration of those public comments, and responses to those comments will be posted on the NPCC website. A final draft will be posted for a 30 calendar day pre-balloting period, and then a ballot of NPCC Members will be conducted. Upon approval by the NPCC Members, the NPCC Board then votes to approve submittal of the Regional Standard to NERC.~~

- **Transparent** ~~——~~ All ~~–~~actions ~~–~~material ~~–~~to ~~–~~the ~~–~~development ~~of Regional Reliability Standards~~ of NPCC regional standards are transparent and information regarding the progress ~~is posted~~of a standard's development action is made available to the public through postings on the NPCC website as well as through ~~extensive email~~E- mail lists.

- **Without undue delay** — The NPCC regional standards development process shall be performed within a reasonable time.

In as much as NPCC is one of ~~several regional entities~~six Regional Entities within the Eastern Interconnection of North~~-~~
America, there will be no presumption of validity by the ERO ~~–~~for~~–~~ any ~~–~~NPCC ~~Regional Reliability Standard.~~ regional standard.

[2] As defined in the NPCC By-Laws – available on the NPCC website
[3] NPCC By-Laws are available on the NPCC website

In order to receive the approval of the ERO, the NPCC ~~Reliability Standards Development Process~~regional standards development process must also achieve the following objectives:

- **No Adverse Impact on Reliability of the Interconnection** — ~~An NPCC Regional Reliability Standard provides a level of bulk power system reliability that is necessary and adequate to protect public health, safety, welfare, and North American security and will not have an adverse impact on the reliability of the Interconnection or other Regions within the Interconnection~~ A NPCC regional standard provides an Adequate Level of Reliability[4] as defined by NERC.

- **Justifiable Difference** — ~~An NPCC Regional Reliability Standard is based on justifiable differences between Regions, such as different electrical systems or facilities, sensitivity of load to disruptions, sensitivity of generation to disruptions, frequency and voltage sensitivity, system operating limit development and facilities ratings process, electrical system interactions, etc.~~

- ~~**Uniformity** NPCC Regional Reliability Standards shall provide for as much uniformity as possible with reliability standards across the interconnected bulk~~

power system of the North American continent. A NPCC Reliability Standard shall be more stringent than a continent-wide reliability standard, may include a regional variation that regional standard addresses matters that the continent-wide reliability standard does not, or shall be a regional a justifiable difference necessitated bywithin the NPCC geographical area that results from a physical difference[5] or operating difference in the northeast's bulk power system, where the interpretation of the phrase "physicalNortheast's Bulk Electric System. Although a justifiable difference" will be consistent with FERC's Order, issued September 22, 2004, Granting Request For Clarification regarding Docket No. PL04-5-000, Policy Statement on Matters Related to Bulk Power System Reliability.

- allows for a unique regional standard, a NPCC regional standard shall be no less stringent than a continent-wide standard.

- **Uniformity** — To the extent possible, the NPCC regional standards provides uniformity with Reliability Standards across the interconnected Bulk Electric System of North America.

- **No Undue Adverse Impact on Commerce** — AnA NPCC Regional Reliability Standardregional standard will not cause any undue adverse impact on business activities that are not necessary for reliability of the Region and its interconnected Regions. All regional reliability standards shall be consistent with NERC's market principlesprinciples[6].

Other Attributes of the NPCC Regional Reliability Standards Development Procedure include;

- **Maintenance of Regional Reliability Standards** NPCC Regional Standards will be reviewed for possible revision at least every three years and follow the same process as a new standard. The old standard will remain in place until such time as the revised version has passed through the entire process, at which point the old standard will be retired in accordance with any applicable new implementation plan associated with the approved revised standard. The review process shall be conducted by soliciting comments from the stakeholders and through open posting on the NPCC website. If no changes are warranted, Regional Standards Committee (RSC) shall recommend to the NPCC Board that the standard be reaffirmed. If the review indicates a need to revise or withdraw a standard, a regional standard authorization request shall be prepared by the RSC and submitted in accordance with the standards development process contained in this procedure.

- **Maintenance of Regional Reliability Standards Development Procedure** This NPCC Regional Reliability Standards Development Procedure will be reviewed for possible revision at least once every five years or more frequently if needed and subject to the same procedure as that of the development of a standard. All such revisions shall be subject to approval by the NPCC Board, NERC, FERC, and could be subject to approval, if required, by applicable authorities in Canada. The NPCC RSC has the authority to make non-substantive changes to this procedure and subsequently notify the NPCC Board for their concurrence at their next scheduled meeting.

- **Interpretation of Standards** All persons who are directly and materially

~~affected by the NPCC's bulk power system reliability shall be permitted to request an interpretation of a standard. The person requesting an interpretation will send an email request to the Regional Standards Process Manager (RSPM), as noted on the NPCC website, explaining the specific circumstances surrounding the request and what clarifications are required as applied to those circumstances. The request should indicate the material~~

impact to the requesting party or others caused by the lack of clarity or a possibly incorrect interpretation of the standard. The RSPM along with guidance from the RSC will forward the request to the originating Task Force which acted as the drafting team for that regional reliability standard. The Task Force will address, through a written response, the request for clarification as soon as practical, but not more than 45 business days from its receipt by the Task Force. This written interpretation will be posted along with the final approved and adopted standard and will stand until such time as the standard is revised through the normal RSAR process, at which time the standard will be modified to incorporate the clarifications provided by the interpretation.

2. ELEMENTS OF A RELIABILITY REGIONAL STANDARD

- **Elements of a Regional Reliability Standard**

  To ensure uniformity of regional reliability standards and avoid inconsistency with NERC continent-wide standards, a NPCC regional reliability standard shall consist ofbe consistent with the elements identified in this section of the procedure. These elements are intended to apply a systematic discipline in the development and revision of regional standards. This The application of a systematic discipline is necessary tofor achieving regional standards that are measurable, enforceable, and consistent.

All mandatory requirements of a regional reliability standard shall be within the standard document. Supporting documents to aid in the implementation of a standard may be referenced by the standard but are not part of the standard itself .

The most current version of the approved NERC Reliability Standard template and its associated elements as or if applicable, will be used at the time of the development of the NPCC Regional Reliability Standard to ensure all essential elements are contained therein to achieve consistency and uniformity and meet all statutory requirements. A sample of the elements contained in the standard appears in Table 1 below, however the latest ERO Board approved Standard template, that may be found on the NERC website, will supersede the list below at the time the regional standard is developed.

Table 1- Elements of a Regional Reliability Standard

Identification Number	A unique identification number assigned in accordance with an administrative classification system to facilitate tracking and reference. (i.e. "NPCC- BAL-002-0-Date" which refers to NPCC Regional Standard, referencing NERC BAL-002 Version 0, with NPCC Effective Date final adoption by all Regional Authorities)
Title	A brief, descriptive phrase identifying the topic of the standard.
Applicability	Clear identification of the functional classes of entities responsible for complying with the standard, noting any specific additions or exceptions. The standard will be applicable to the Bulk Power System unless otherwise noted.
Effective Date	The effective date of the standard or, prior to approval of the

and Status	standard, the proposed effective date.
Purpose	The purpose of the standard. The purpose shall explicitly state what outcome will be achieved or is expected by this standard.
Requirement(s)	Explicitly stated technical, performance, and preparedness requirements. Each requirement identifies what entity is responsible and what action is to be performed or what outcome is to be achieved. Each statement in the requirements section shall be a statement for which compliance is mandatory.
Risk Factor(s)	The potential reliability significance of each requirement, designated as a High, Medium, or Lower Risk Factor in accordance with the criteria listed below: A High Risk Factor requirement (a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or (b) is a requirement in a planning timeframe that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. A Medium Risk Factor requirement (a) is a requirement that, if violated, could directly affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or (b) is a requirement in a planning timeframe that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

Measure(s)	Each requirement shall be addressed by one or more measures. Measures are used to assess performance and outcomes for the purpose of determining compliance with the requirements stated above. Each measure will identify to whom the measure applies and the expected level of performance or outcomes required demonstrating compliance. Each measure shall be tangible, practical, and as objective as is practical. It is important to realize that measures are proxies to assess required performance or outcomes. Achieving the measure should be a necessary and sufficient indicator that the requirement was met. Each measure shall clearly refer to the requirement(s) to which it applies.

Table 2 — Compliance Elements of a Regional Reliability Standard

Compliance Monitoring Process	Defines for each measure: • The specific data or information that is required to measure performance or outcomes. • The entity that is responsible for providing the data or information for measuring performance or outcomes. • The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes. • The entity that is responsible for evaluating data or information to assess performance or outcomes. • The time period in which performance or outcomes is measured, evaluated, and then reset. • Measurement data retention requirements and assignment of responsibility for data archiving. • Violation severity levels.

Supporting Information Elements

Interpretation	Any interpretation of regional reliability standard that is developed and approved in accordance with the "Interpretation of Standards" section of Appendix A of this procedure, to expound on the application of the standard for unusual or unique situations or to provide clarifications.
Implementation Plan	Each regional reliability standard shall have an associated implementation plan describing the effective date of the standard or effective dates if there is a phased implementation. The implementation plan may also describe the implementation of the standard in the compliance program and other considerations in the initial use of the standard, such as necessary tools, training, etc. The implementation plan must be posted for at least one public comment period and is approved as part of the ballot of the standard.

Supporting References	This section references related documents that support reasons for, or otherwise provide additional information related to the regional reliability standard. Examples include, but are not limited to: • Glossary of terms • Developmental history of the standard and prior versions • Notes pertaining to implementation or compliance • Standard references • Standard supplements • Procedures • Practices • Training references • Technical references • White papers • Internet links to related information

3. TERMS AND FUNCTIONS

• **Regional Standards Committee (RSC)** – An NPCC committee charged with management of the NPCC Standards Procedure under a sector based voting structure as described in the NPCC Bylaws. The NPCC RSC will consider requests for new or revised standards and be available for advisement to the NPCC Board on the standards.

The RSC may not itself modify the standard without issuing a new notice to stakeholders regarding a vote of the modified standard. Any RSC action will only be activated in the event of a minor correction of a standard such as errata.

The RSC is an open and balanced stakeholder committee inclusive of all stakeholder interests that provide for or are materially impacted by the reliability of the bulk power system.

The RSC disposition regarding the regional standard authorization request, which will in all cases be within 60 calendar days of receipt of a completed standard request, shall include:

- Accept the standard request as a candidate for development of a new standard, revision of an existing standard, or deletion of an existing standard. The RSC may, at its discretion, expand or narrow the scope of the standard request under consideration. The RSC shall prioritize the development of standards in relation to other proposed standards, as may be required based on the volume of requests and resources.

- ~~Reject the standard request. If the RSC rejects a standard request, a written explanation for rejection will be delivered to the requester within 30 calendar days of the decision.~~

- ~~Remand the standard request back to the requester for additional work. The standards process manager will make reasonable efforts to assist the requester in addressing the deficiencies identified by the RSC. The requester may then resubmit the modified standard request using the process above. The requester may choose to withdraw the standard request from further consideration prior to acceptance by the RSC.~~

~~The NPCC Standard Process responsibilities of the RSC will include:~~

- ~~Review of NPCC Draft Standards for such factors as completeness, sufficient detail, rational result, and compatibility with existing standards; clarifying standard development issues not specified in this procedure. Under no circumstance will the RSC change the substance of a draft standard.~~

~~• Due consideration to the work of the drafting team~~ as well as ~~the comments of stakeholders and minority objections, in approving a~~results oriented[7], i.e.:

- Performance-based,
- Risk-based, and
- Capability-based.

TYPES OF RELIABILITY REQUIREMENTS

Regional reliability standards should be viewed as a portfolio of requirements designed to achieve an effective defense-in-depth strategy. Each requirement should identify a clear and measurable expected outcome, such as: a) a stated level of reliability performance, b) a reduction in a specified reliability risk, or c) a necessary competency.

a) **Performance-based** - defines a specific reliability objective or outcome that has a direct, observable effect on the reliability of the Bulk Electric System, i.e. an effect that can be measured using power system data or trends.

[4] Adequate Level of Reliability is available on the NERC website as amended from time to time

[5] The meaning of the phrase "physical difference" will be consistent with FERC's Order, issued September 22, 2004, Granting Request For Clarification regarding Docket No. PL04-5-000, Policy Statement on Matters Related to Bulk Power System Reliability.

~~proposed regional reliability standard to go to ballot.~~

- ~~Approve standards for pre-ballot posting under a sector based voting structure as described later in the NPCC Inc. Bylaws or~~
- ~~Remand the standard back to the Task Force acting as the drafting team for further work or recommend a change in those participating in the drafting team (i.e. a new drafting team).~~

- ~~**Regional Standards Process Manager (RSPM)** - The Regional Reliability Standards Procedure shall be administered by a NPCC staff Regional Standards Process Manager. The RSPM is responsible for ensuring that the development and revision of standards is in accordance with this manual. The RSPM works to ensure the integrity of the process, format, consistency of~~

quality, and completeness of the reliability standards. The RSPM facilitates all steps in the process.

- **Reliability Coordinating Committee (RCC)** – The RCC, will support the standards development process through the assignment of NPCC Task Forces. They will also provide a technical advisory role in the Regional Reliability Standards development procedure through recommendations.

- **Requester** – A Requester is any individual or an entity (organization, company, government authority, etc.) that submits a complete request for development, revision, or withdrawal of a standard. Any person or an entity that is directly and materially affected by an existing standard or the need for a new standard may submit a request for a new standard or revision to a standard. The Requester is assisted by the RSAR drafting team (if one is appointed by the RSC) to respond to comments and to decide if and when the RSAR is forwarded to the RSC with a request to draft a standard. The Requester is responsible for the RSAR, assisted by the RSAR drafting team and Regional Standards Process Manager, until such time the RSC authorizes

development of the standard. The Requester has the option at any time to allow the RSAR drafting team to assume full responsibility for the RSAR. The Requester may chose to participate in subsequent standard drafting efforts related to the RSAR.

- **Task Forces and Working Groups,** The committees, task forces and working groups within NPCC , serve an active role in the standards process:
  - Identify the need for new or modified regional standards.
  - Initiate NPCC Standards actions by developing Regional Standard Authorization Requests (RSARs).
  - Develop comments (views and objections) to standards actions.
  - Participate in NPCC Standard drafting.
  - Provide technical oversight in response to changing industry conditions and ERO Requirements.
  - Conduct Field Tests as required

4. PROCEDURE DESCRIPTION

STEPS 1 AND 2: REQUEST TO DEVELOP A NEW [6] Market Principles are available on the NERC website as amended from time to time

[7] Results-based Standards see http://www.nerc.com/pa/Stand/Resources/Documents/ResultsBasedStandardGuidance.pdf

b) **Risk-based** - defines actions of entities that reduce a stated risk to the reliability of the Bulk Electric System and can be measured by evaluating a particular product or outcome resulting from the required actions.

c) **Capability-based** - defines capabilities needed to perform reliability functions and can be measured by demonstrating that the capability exists as required.

Each regional standard shall enable or support one or more of the reliability principles[8] as identified in the most recent set posted on the NERC website. Each regional standard shall also be consistent with all of the reliability principles. The intent of the set of NPCC regional standards is to deliver an Adequate Level of Reliability[9] as defined by NERC.

Recognizing that Bulk Electric System reliability and electricity markets are inseparable and mutually interdependent, all regional standards shall be consistent with the most recent set of Market Principles[10] as posted on the NERC website. Consideration of the Market Principles is intended to ensure that regional standards are written such that they achieve their reliability objective without placing undue restrictions or causing adverse impacts on competitive electricity markets.

ELEMENTS OF A REGIONAL STANDARD

A regional standard includes several components designed to work collectively to identify what entities must do to meet their reliability-related obligations as an owner, operator or user of the Bulk Electric System. The components of a NPCC regional standard identified below are based on the NERC Standard Processes Manual (SPM) that was approved by the NERC Board of Trustees at its February 2013 meeting. Future revisions of the NERC SPM will be used at the time of development of a NPCC regional standard if different from the elements listed below~~Requests to develop a new Regional Reliability Standard shall be submitted to the RSPM by completing a **Regional Standard Authorization Request** (RSAR) ***(see Appendix A)***. The RSAR is a description of the new or revised standard in sufficient detail to clearly define the scope, purpose, and importance of the Regional Standard, impacted parties or other relevant information. A "needs" statement will provide the justification for the development of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard. The RSPM shall maintain the RSAR form and make it available electronically on the NPCC website.~~

~~Any person or entity ("Requester") directly or materially affected by an existing standard or the need for a new or revised standard may initiate a RSAR.~~

~~The Requester will submit the RSAR to the RSPM electronically and the RSPM will acknowledge receipt of the RSAR immediately, through electronic receipt. The RSAR, as a minimum, needs to contain the following information in order to be qualified for consideration. The NPCC RSPM will assist the Requester to ensure all the following information is submitted (on the RSAR) in a form appearing in Appendix A:~~

~~1. Proposed Title and Date of New RSAR~~
~~2. Requester's Name and Contact Information~~
~~3. Purpose of the Regional Standard~~
~~4. Description of Industry Need~~
~~5. Provide a Brief Description of the Standard~~

~~6.~~The only mandatory and enforceable components of a regional standard are the: (1) Applicability,

(2) Requirements, and (3) the Effective Dates. The additional components are included in the regional standard for informational purposes, to establish the relevant scope and technical paradigm, and to provide guidance to functional entities concerning how compliance will be assessed by the Compliance Enforcement Authority.

The components of a regional standard may include the following:

Title:	A brief, descriptive phrase identifying the topic of the regional standard.
Number:	A unique identification number assigned in accordance with a published classification system to facilitate tracking and reference to the regional standards.
Purpose:	The reliability outcome achieved through compliance with the requirements of the regional standard.
Applicability:	Identifies which entities are assigned reliability requirements; i.e., the specific functional entities and facilities to which the regional standard applies.
Effective Dates:	Identification of the ~~Entities in the Functional Model as being~~date or pre-conditions determining when each Requirement becomes effective in each jurisdiction.

[8] Reliability Principles are available on the NERC website as amended from time to time
[9] Adequate Level of Reliability is available on the NERC website as amended from time to time
[10] Market Principles are available on the NERC website as amended from time to time

Requirement: An explicit statement that identifies the functional entity responsible ~~to adhere to the standard~~, the action or outcome that must be achieved, any conditions achieving the action or outcome, and the reliability-related benefit of the action or outcome. Each requirement shall be a statement for which compliance is mandatory.

~~7. Necessary information to assist the drafting~~

Compliance Elements: Elements to aid in the administration of compliance monitoring and enforcement responsibilities.

Measure: Provides identification of the ~~team, to~~ evidence or types of evidence that may demonstrate compliance with the ~~extent feasible, to allow them to draft the standard~~associated requirement.

Violation Risk Factors and Violation Severity Levels: Violation risk factors (VRFs) and violation severity levels (VSLs) are used as factors when determining the size of a penalty or sanction associated with the violation of a requirement in an approved Reliability Standard. Each requirement in each Reliability Standard has an associated VRF and a set of VSLs. VRFs and VSLs are developed by the drafting team, working with NPCC Standards Staff and Compliance Staff, at the same time as the associated Reliability Standard, but are not part of the Reliability Standard. The Board of Directors is responsible for approving VRFs and VSLs.

- Violation Risk Factors
  VRFs identify the potential reliability significance of noncompliance with each requirement. Each requirement is assigned a VRF in accordance with the latest approved set of VRF criteria.
- Violation Severity Levels
  VSLs define the degree to which compliance with a requirement was not achieved. Each requirement shall have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs. Each requirement is assigned one or more VSLs in accordance with the latest approved set of VSL criteria.

Version History: The version history is provided for informational purposes and lists information regarding prior versions of the regional standard.

Variance: As applied to a NPCC regional standard is a Requirement (to be applied in the place of the NPCC region-wide Requirement) that is applicable to a specific geographic area or to a specific set of Registered Entities.

Compliance Enforcement Authority (CEA): The entity that is responsible for assessing performance or outcomes to determine if an entity is compliant with the associated regional standard. The Compliance Enforcement Authority will be NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the ERO regional standards.

Reliability Standard Audit Worksheets (RSAWs)[11] Reliability Standard Audit Worksheets (RSAWs) are developed as companion documents to regional and continent-wide Reliability Standards to facilitate the CEA assessment of a registered entity's compliance with a standard.

[11] While RSAWs are not part of the regional standard, they are developed through collaboration of the drafting team and NPCC Compliance Staff.

Informational Elements: Elements to aid in the implementation of the regional standard.

Application Guidelines: Guidelines or reference documents to support the implementation of the associated regional standard.

Procedures: Procedures to support implementation of the associated regional standard.

IV. REGIONAL STANDARDS DEVELOPMENT PROCESS

1. ROLES IN THE NPCC REGIONAL STANDARD PROCESS

NOMINATION, REVISION, CLARIFICATION, OR RETIREMENT OF A STANDARD:

Any member of NPCC or group within the NPCC region shall be allowed to request that a NPCC regional standard be developed, modified, clarified, or retired. Additionally, any person (organization, company, government agency, individual, etc.) who is directly and materially affected by the reliability of the NPCC Bulk Electric System shall be allowed to request that a NPCC regional standard be developed, modified, clarified, or retired. The following section identifies the process roles in the NPCC regional standards process. Refer to Step 2 STANDARD DEVELOPMENT PROCESS STEPS and FIGURE 1: FLOWCHART OF REGIONAL STANDARDS DEVELOPMENT PROCESS OVERVIEW for the regional standards development process steps and associated flowchart. Refer to Step 3 STANDARD CLARIFICATION PROCESS STEPS and FIGURE 2: FLOWCHART OF REGIONAL STANDARDS CLARIFICATION PROCESS OVERVIEW for the regional standards clarification process steps and associated flowchart.

PROCESS ROLES AND RESPONSIBILITIES

BOARD OF DIRECTORS

The NPCC Board of Directors (Board) shall consider for adoption regional standards, definitions, variances and clarifications and associated implementation plans that have been processed according to the processes identified in this manual.

DRAFTING TEAM

The drafting team (DT) should strive to achieve a portfolio of performance, risk, and capability-based mandatory reliability requirements that support an effective defense-in-depth strategy. The drafting team develops standards-related regional products as directed by the NPCC RSC and within the scope of an approved Regional Standard Authorization Request (RSAR) or a Clarification Request (CR). The product that is developed is typically a new or revised regional standard, but could also be a definition, a reference document, a set of Violation Risk Factors, a set of Violation Severity levels, or the team could be appointed to assist an author in refining a Regional Standard Authorization Request (RSAR). The drafting team also works collaboratively with NPCC Compliance Staff to develop Reliability Standard Audit Worksheets (RSAWs) at the same time regional standards are developed. The drafting team shall remain in place until such time as the NERC Board of Trustees adopts the regional standard.

MANAGER OF RELIABILITY STANDARDS

The NPCC Manager of Reliability Standards has the overall responsibility for managing the NPCC regional standards processes in accordance with this manual. As used herein, the NPCC Manager of Reliability Standards will be the NPCC Manager of Reliability Standards or his/her designee.

NPCC MEMBERS

NPCC members may participate in the comment and ballot periods associated with the development and industry approval of regional standards. The ballot body is comprised of all

entities or individuals that qualify for one of the stakeholder sectors within NPCC as stated in the most recently approved NPCC Bylaws. All General and Full Members of NPCC can participate in the balloting of regional standards. Any entity or person, including non-NPCC members, may submit comments during the open process comment periods for standards.

NON-NPCC MEMBERS

Any entity or person that is neither a General nor Full Member of NPCC is not eligible to participate in the ballot body voting on a regional standard. However, any entity or person, including non-NPCC members, may submit comments during the open process comment periods for standards. Subject Matter Experts (SMEs), regardless of NPCC membership status, are encouraged to participate in comment periods for regional standards.

NPCC STANDARDS STAFF

The Standards Staff is responsible for assisting the NPCC Manager of Reliability Standards and the RSC in administering the NPCC regional standards processes in accordance with this manual.

NPCC COMMITTEES, TASK FORCES AND WORKING GROUPS

The Committees, Task Forces and Working Groups within NPCC serve an active role in the standards process. Activities performed by these groups include, but are not limited to, the following:

- Identify the need for new or modified regional standards
- Initiate NPCC Standards actions by developing Regional Standard Authorization Requests (RSARs)
- Develop comments (views and objections) to standards actions
- Participate in NPCC Standard drafting
- Dispensation of Clarification Requests (CRs)
- Provide technical oversight in response to changing industry conditions and ERO Requirements
- Conduct Field Tests, as required

REGIONAL STANDARDS COMMITTEE (RSC)

The NPCC Regional Standards Committee (RSC), a committee of the NPCC Board of Directors, is charged with oversight of all drafting team activities and managing the NPCC regional standards development process in accordance with this manual.

~~8. A cross references to existing NPCC or NERC documents~~

~~The RSPM shall forward all properly completed RSARs to the RSC.~~The RSC is responsible for maintenance of the Regional Standard Processes Manual (RSPM), including the endorsement of RSPM revisions for NPCC Board review and approval.

RELIABILITY COORDINATING COMMITTEE (RCC)

The Reliability Coordinating Committee (RCC) supports the standards development process through the assignment of NPCC Task Forces to serve as technical resources for: (1) staffing drafting teams, and (2) performing a technical advisory role in the regional standards process through comments, recommendations and technical justifications.

REQUESTER

Any individual representing an organization (entity, company, government agency, etc.) that is directly and materially affected by the reliability of the Bulk Electric System within the NPCC

geographical area may request a regional standard be developed or an existing regional standard be modified, clarified, or deleted.

QUALITY REVIEW TEAM

The NPCC Standards Staff shall coordinate a quality review of the "final draft" of the regional standard, implementation plan, VRFs and VSLs to assess whether the documents are within the scope of the associated RSAR, whether the regional standard is clear and enforceable as written and the VRFs and VSLs are developed according to NERC and FERC guidelines. The Quality Review Team may be comprised of legal and compliance representatives, a technical writer, and NPCC Standards Staff. It will not involve individuals who participated on the drafting team of the standard undergoing the Quality Review.

2. STANDARD DEVELOPMENT PROCESS STEPS

STEP 2.1: REGIONAL STANDARDS AUTHORIZATION REQUEST TO DEVELOP, MODIFY OR RETIRE

A Regional Standard Authorization Request[12] (RSAR) is the form used to document the scope and reliability benefit of a proposed project for one or more new or modified regional standards or the benefit of retiring one or more approved regional standards.

A RSAR shall be used to seek approval and initiate the development, modification or retirement of a NPCC regional standard. A RSAR is not used to seek a Clarification Request (CR) of a NPCC regional standard. The initiation and handling of a CR is covered in Step 3 STANDARD CLARIFICATION PROCESS STEPS, of this manual.

Any individual representing an organization which is directly or materially impacted by the operation of the Bulk Electric System within the geographical footprint of NPCC may request, via a submittal of a RSAR to the NPCC Manager of Reliability Standards, the development, modification, or deletion of a NPCC regional standard. The individual completing the form is referred to herein as the Requester.

STEP 2.1.A. REQUESTER ACTIONS

> *Note: The NPCC Manager of Reliability Standards will assist the Requester, as necessary, to ensure all required information is submitted on the RSAR.*

The Requester shall complete a RSAR form in accordance with the guidance provided in APPENDIX A: RSAR COMPLETION GUIDELINES.

The Requester shall submit the completed RSAR to the NPCC Manager of Reliability Standards, via npccstandard@npcc.org, for processing.

STEP 2.1.B. NPCC MANAGER OF RELIABILITY STANDARDS ACTIONS

The NPCC Manager of Reliability Standards shall review the submitted RSAR and verify that the submitted form has been adequately completed. Within fifteen (15) calendar days[13] of receipt of the submitted RSAR, the NPCC Manager of Reliability Standards will electronically acknowledge

[12] The RSAR is located on the NPCC website under Standards – Regional Standards General

[13] Time periods specified in this manual may be extended as deemed appropriate by NPCC Staff. When business days are specified, this provision could be used to take into account differing Canadian and US holiday schedules. When calendar days are specified, this provision could be used to take into account due dates that fall on a weekend.

receipt of the RSAR. If, at that time, the NPCC Manager of Reliability Standards finds the RSAR to be deficient, the Requester will be contacted to determine how to proceed.

Within ten (10) calendar days of the receipt of an adequately completed RSAR, the NPCC Manager of Reliability Standards shall forward the properly completed RSAR to the NPCC Regional Standards Committee (RSC) for its review and processing. Included in the transmittal of the RSAR to the RSC, the NPCC Manager of Reliability Standards shall include a statement indicating the applicability of the NPCC Cost Effectiveness Analysis Procedure (CEAP) for the proposed change.

STEP 2.1.C. NPCC REGIONAL STANDARDS COMMITTEE (RSC) ACTIONS

Note: The RSC shall meet ~~at established intervals~~ to review all pending RSARs. ~~-~~ The frequency of this review process will depend on workload, but in no case shall a properly completed RSAR wait for RSC action more than 60 calendar days from the date of receipt by the RSC.

~~for RSC action more than 60 calendar days from the date of receipt. The RSC may~~

The RSC shall review the RSAR and take one of the following actions:

- ~~•~~ Remand the RSAR back to the ~~RSPM~~NPCC Manager of Reliability Standards for additional work.~~–~~

  In this case, the ~~RSPM may request~~ NPCC Manager of Reliability Standards shall work with the Requester to provide additional information or clarification for the RSAR ~~from~~as specified by the ~~Requester~~RSC.

  ~~• Accept the RSAR as a candidate for a new or revised standard. In this case, the RSC will forward the RSAR to the RCC to assign a NPCC Task Force to provide technical support and analysis of comments for that RSAR, and assist the Requester and the RSPM in the remaining steps of the process. The RSPM shall post notification of intent to develop a standard on both NPCC and ERO websites within 30 calendar days of acceptance.~~

- ~~•~~ Reject the RSAR. In this case, the RSC will provide its determination to the NPCC Manager of Reliability Standards, who will then provide a written explanation for rejection to the Requester within ~~30~~ten (10) calendar days of the rejection decision.

~~STEPS 3, 4, AND 5: RSC ACCEPTS RSAR AND RCC ASSIGNS TF TO DRAFT NEW OR REVISED STANDARD~~

Note: Before the RSC can accept a RSAR for a new or modified standard the applicable CEAP process steps shall be completed.

- Accept the RSAR.
  - If a new or modified standard has been authorized, within ten (10) calendar days of the authorization the NPCC Manager of Reliability Standards shall: 1) post notification on the NPCC website of the intent to develop or modify a regional standard; 2) notify the ERO for processing in accordance with its process, as applicable; and 3) notify the Requester of the acceptance of the RSAR.
  - If the retirement of an existing regional standard has been authorized, within ten (10) calendar days of the authorization the NPCC Manager of Reliability Standards shall: 1) post notification on the NPCC website of the intent to retire an existing regional standard; 2) notify the ERO for processing in accordance with its process, as applicable; and 3) notify the Requester of the acceptance of the RSAR. The process to retire an existing regional standard is included in Step 6 RETIREMENT OF AN APPROVED NPCC REGIONAL STANDARD.

STEP 2.2: FORMATION OF DRAFTING TEAM FOR NEW OR MODIFIED STANDARD

A RSAR that ~~is~~has been accepted by the RSC ~~will~~shall, within ten (10) calendar days of the acceptance of the RSAR, be submitted ~~to the~~ by the NPCC Manager of Reliability Standards to the NPCC Reliability Coordinating Committee (RCC). The RCC~~. Within~~ shall, within sixty (60) calendar days ~~the RCC shall~~, assign the development of the regional standard to a NPCC Task Force ~~Drafting Team. The RSPM~~, and notify the NPCC Manager of Reliability Standards of its decision within ten (10) calendar days.

After receipt of the notification of drafting team assignment, the NPCC Manager of Reliability Standards shall ~~solicit~~ oversee solicitation and ~~recommend~~ recommendation of a list of additional qualified [14] candidates over and above the appropriate NPCC Task Force members, for appointment to the ~~team and~~ drafting team. The Requester and a NPCC Compliance Staff person will be included on the drafting team. Within sixty (60) calendar days of the drafting team assignment notification from the RCC, the NPCC Manager of Reliability Standards shall submit the list ~~to the RSC. This list shall include the Requester. The RSC may select other individuals~~of the entire drafting team membership to ~~serve, with the Task Force to draft the Standard. This team shall consist of a small group of people who collectively have the~~the RSC for acceptance. The RSC may accept the recommendations of the NPCC Manager of Reliability Standards as presented or revise the recommendations as necessary ~~technical expertise and work process skills~~.

Upon acceptance of the drafting team slate, the RSC shall provide a target date on which the drafting team is expected to have ready a completed draft regional standard and associated supporting documentation available for consideration by the NPCC membership. Additionally, the RSC shall provide the drafting team with any preliminary development products including, but not limited to, a draft standard, comments, and related white papers.

The RSC shall designate one of its members to actively monitor and assist NPCC staff in the oversight of drafting team milestones and deadlines, and extend or expedite milestones and deadlines, as appropriate, acting as a liaison between the drafting team and the RSC to help resolving any issues.

STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS

Prior to beginning work on the development of a new or revised regional standard and the associated supporting documentation, the drafting team should develop a work plan for completing the regional standard development work, including the establishment of milestones for completing critical elements of the work in sufficient detail to ensure that the drafting team will meet the target date established by the RSC, or the drafting team shall propose an alternative date. This work plan must be submitted to the RSC for its concurrence. When a drafting team begins its work, it shall regularly (at least quarterly) report progress against that aforementioned work plan to the NPCC Manager of Reliability Standards for presentation to the RSC.

> *Note: During the regional standards development, the drafting team will deliberate on whether the requirements in the regional standard are developed enough to begin the Cost Effectiveness Analysis (CEA) of the NPCC Cost Effectiveness Analysis Procedure (CEAP). When appropriate, the drafting team shall request that the RSC initiate the second phase (CEA) of the CEAP process.*

The drafting team shall create and manage its work structure (e.g., sub-teams) and meeting schedule (face-to-face as well as electronic meetings), as necessary, to meet the milestone dates and project deliverables outlined in the work plan.

The work products of the drafting team should consist of the following

- A draft regional standard consistent with the RSAR on which it was based
- An implementation plan, including the nature, extent and duration of field-testing, if any
- Identification of any existing regional standard and NPCC criteria that will be deleted, in part or whole, or otherwise impacted by the implementation of the draft regional standard

[14] Refer to Appendix B: Selection of Drafting Team Members

- Technical reports, white papers and/or work papers that provide technical justification for the draft regional standard under consideration
- Reliability Standard Audit Worksheet (RSAW) collaboratively developed by the drafting team and NPCC Compliance Staff

Any proposed changes to definitions in existing regional standards should be sent to the appropriate Task Force (TF) for consideration of the impact to the standard. If necessary, the TF can produce a RSAR.

~~The RSPM shall assign NPCC staff personnel to~~NPCC Standards Staff can assist in the drafting of the regional standard including compliance ~~measure~~measures, process and elements. ~~-~~ The drafting of measures and compliance administration aspects of the standard will be coordinated with the NPCC Compliance ~~Program~~Staff.

The drafting team shall submit the initial and subsequent interim drafts of the regional standard and associated documents to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post documents for comment.

STEP ~~6: SOLICIT PUBLIC~~ 2.4: POSTING FOR COMMENT PERIOD AND RESOLUTION OF COMMENTS ~~ON DRAFT STANDARD~~

~~Once a draft standard has been verified by the RSC to be within the scope and purpose of the RSAR, the RSPM will post the draft standard for the purpose of soliciting public comments. The posting of the draft standard will be linked to the RSAR for reference. In addition to the standard, an implementation plan shall be posted to provide additional details to the public and aid in their commenting and decision process. Comments on the draft standard will be accepted for a 45 calendar day period from the public notice of posting. Comments will be accepted on-line using the NPCC Open Process web-based application.~~

~~Final draft standards will be concurrently posted on the ERO website for comments.~~

STEPS 7, 8, AND 9: OPEN PROCESS POSTING AND ANALYSIS OF THE COMMENTS

The RSPM will assemble the comments on the new draft standard and distribute those comments to the Task Force acting as the standard drafting team. The Task Force shall give prompt consideration to the written views and comments of all participants. An effort to address all expressed comments shall be made, and each commenter shall be advised of the disposition of the comment and the reasons therefore, in addition to public posting of the responses.

The Task Force acting as the Standard Drafting Team shall take one of the following actions:

- Submit the draft standard for RCC endorsement as it stands, along with the comments received and responses to the comments. Based on the comments received, the Task Force acting as the standard drafting team may include revisions that are not substantive. A substantive change is one that directly and materially affects the application of the standard, including, for example: changing "shall" to "should," changing "should" to "shall"; adding, deleting, or revising requirements; or adding, deleting, or revising measures for which compliance is mandatory.
- Make substantive revisions to the draft standard and reposts it for further open review and comment.
- Task Force recommends Field Test if necessary to RSC.

Requester also may withdraw the request for a standard.

RCC submits proposed RRS to the RSC along with its recommendation based on comments, Task Force statements and any field test results.

STEPS 10 AND 11: RSC APPROVES OF THE NEW OR REVISED STANDARD FOR POSTING

If the RSC, acting with consideration of any recommendations by the RCC and utilizing the composite sector voting structure, as outlined in the NPCC, votes to post the draft standard for approval, the draft standard, all comments received, and the responses to those comments shall be posted electronically for the NPCC Members, by the RSPM and made public through the NPCC Website (www.npcc.org) for a 30 calendar day "pre-ballot review" and request for balloting. If the RSC decides more work is needed, the draft standard will be remanded back to the drafting Task Force. All actions of the RCC, Task Forces acting as drafting teams and the Regional Standards Committee will be recorded in regular minutes of the group(s) and posted on the NPCC website. Once the notice for a ballot has been issued, no substantive modifications may be made to the proposed standard unless the revisions are posted and a new notice of the vote is issued

STEPS 12, 13 AND 14: BALLOT OF STANDARD

Upon notification of a ballot, the Members of NPCC's registered ballot body will cast their vote consistent with the NPCC Bylaws. This ballot shall commence no sooner than 15 calendar days and no later than 30 calendar days following the notification of ballot. All members of the NPCC are eligible to participate in the voting on proposed, standard revisions or deletions of regional standards. The ballot period will typically begin immediately following the 30 calendar day pre-ballot posting and will last at least 10 business days.

The NPCC registered ballot body comprises all entities or individuals that qualify for one of the eight NPCC stakeholder sectors and are registered with NPCC as potential

~~ballot participants in the voting on standards. Each member of the NPCC registered ballot body is eligible to vote on standards.~~

~~In order for a NPCC Regional Standard to be approved;~~

- ~~A quorum must be established by at least 50% of the NPCC Members of at least 60% of the Voting Sectors on the roster of Members maintained by NPCC.~~
- ~~A two-thirds majority of the total weighted sector votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions, and non-responses. Weighted sector vote will be calculated as follows;~~
  - ~~Affirmative votes cast in each sector will be divided by the sum of affirmative and negative votes cast, in that same sector, to determine the fractional affirmative vote for each sector. Abstentions and non-responses will not be counted for the purposes of determining the fractional affirmative vote for a sector.~~
  - ~~The sum of the fractional affirmative votes from all sectors divided by the number of sectors voting will be used to determine if a two-thirds majority has been achieved. (A sector will be considered as "voting" if any member of the sector in the ballot pool casts either an affirmative or a negative vote.)~~
  - ~~A standard will be approved if the sum of fractional affirmative votes from all sectors divided by the number of voting sectors is at least 2/3.~~

~~Ballots will be cast electronically and alternatives are as follows;~~

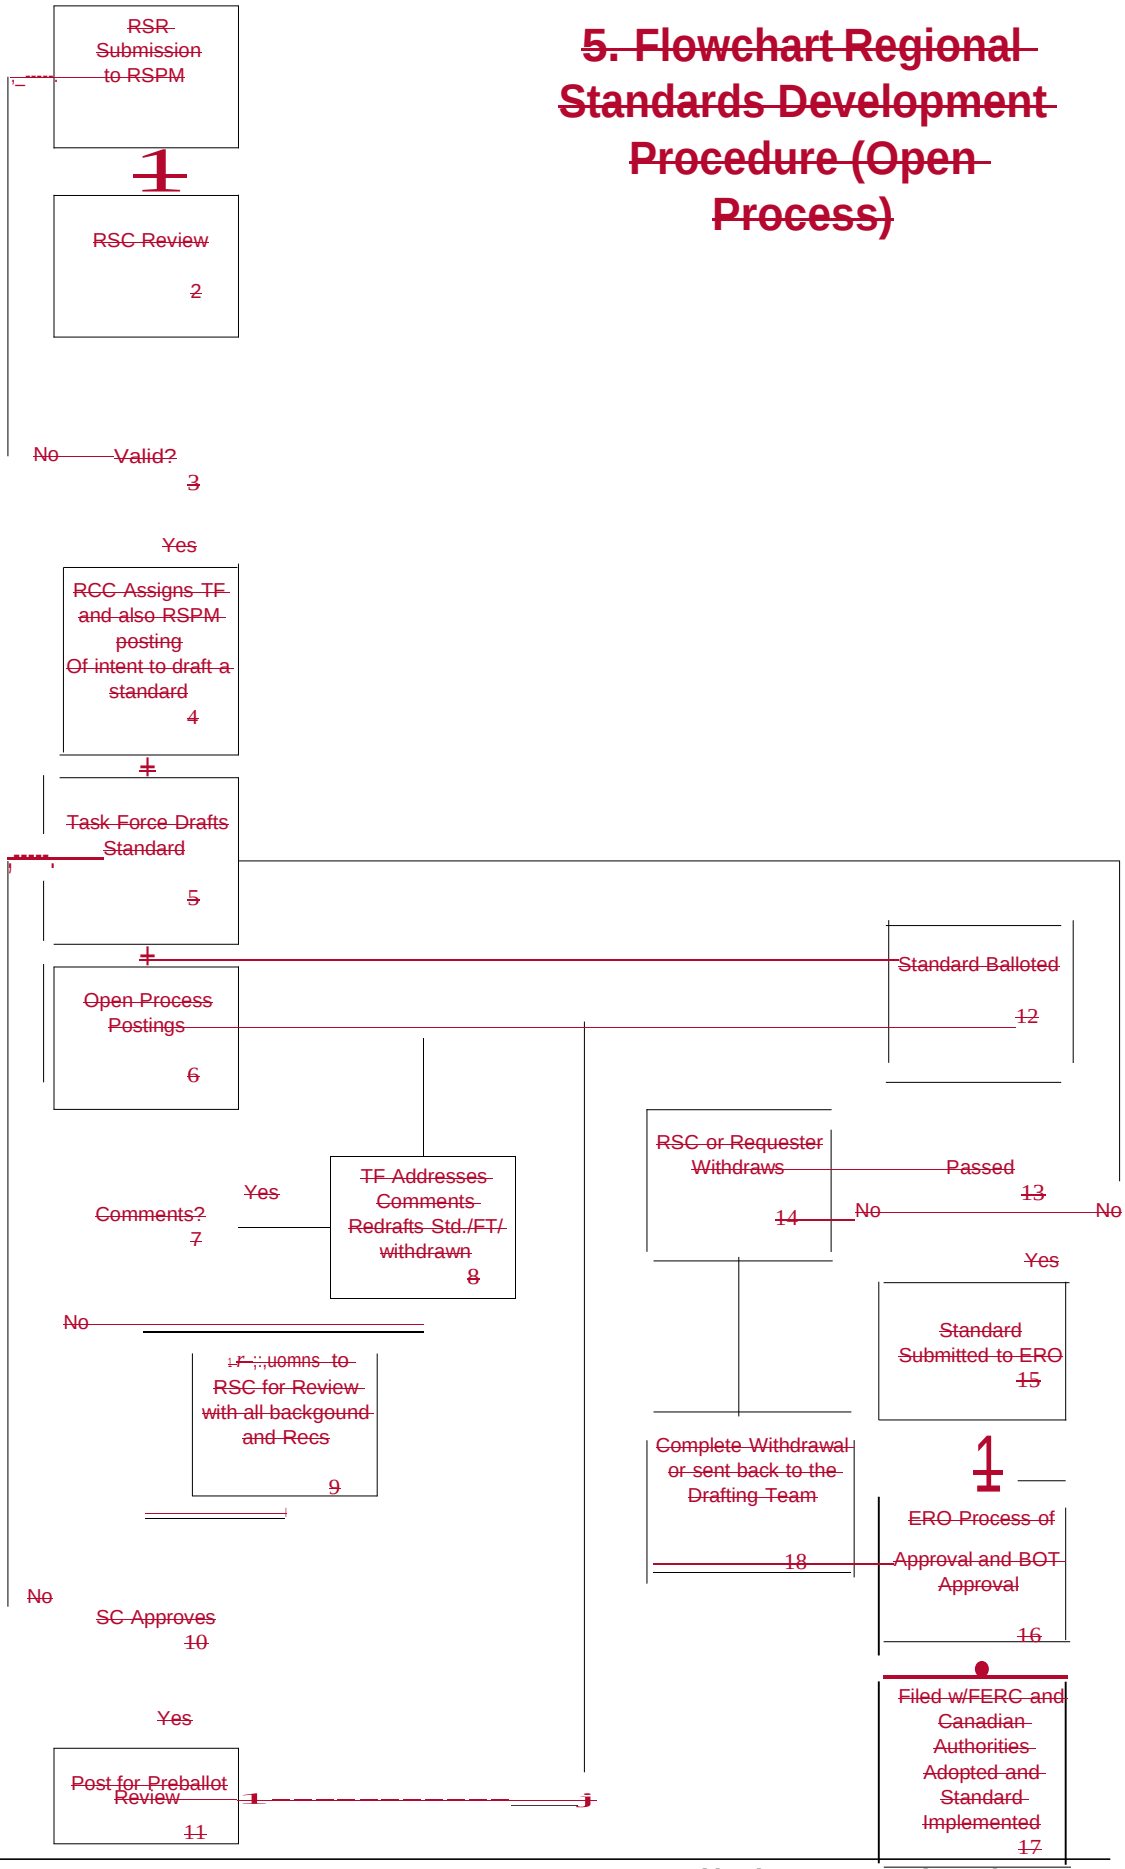
- ~~Affirmative~~
- ~~Affirmative with Comments~~
- ~~Negative~~
- ~~Negative with Comments~~
- ~~Abstain~~

~~The RSPM shall post the final outcome of the ballot process. If the standard is rejected, it may be withdrawn by either the RCC or the original Requester, or the standard may be remanded by the RSC back to the Task Force acting as the drafting team to address the issues. All comments submitted during the process will be posted and archived for consideration when redrafting the standard upon review.~~

~~The standard, once approved by ballot, and a recommendation will be forwarded to the NPCC Board for final Regional approval. The Board may not make substantive modifications to the standard. If the Board does not approve the standard for transmittal to NERC it will be remanded back to the RSC.~~

~~If the standard is approved, the standard will be submitted to the NERC/ERO Board of Trustees for approval.~~

STEPS 15, 16 AND 17: IMPLEMENTATION OF THE NPCC REGIONAL STANDARD



Upon approval within the NPCC , the standard will be submitted to the NERC/ERO for approval(s) and filing with FERC and applicable Canadian Governmental and/or Regulatory Authorities for adoption.

Once a reliability standard is adopted and made effective, all users, owners, planners, and operators of the Bulk Power System in the NPCC geographic area of the Northeast are required to comply with the standard. The NERC/ERO Board of Trustees has established a separate compliance program, also administered in the Northeast by NPCC , to measure compliance with the standards and administer sanctions as appropriate. After adoption of a NPCC Regional Standard, the standard will be forwarded to the compliance program for compliance monitoring and enforcement.

STEP 18: WITHDRAWAL OF STANDARD

Upon rejection of a proposed standard, the RCC or the requester may withdraw the standard completely or remand it back to the Task Force acting as the standard drafting team for further work.

5. Flowchart Regional Standards Development Procedure (Open Process)

6. ERO and Regulatory Process and Approvals

- **NERC/ERO Comment Period** – NERC/ERO shall publicly notice and request comment on the NPCC Regional Reliability Standard, allowing a minimum of 45 calendar days for comment on NERC's website and actively notify all adjoining Regions. Concurrent with this regional posting, final drafts will be forwarded to NERC for posting on the NERC website to ensure full industry awareness of the standard and expedite and coordinate all commenting. All comments will be responded to electronically through a posted response on the NPCC website or a link on the NERC website. NPCC shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the NPCC Regional Reliability Standard and request another posting for comment, or submit the NPCC Regional Reliability Standard along with a response to any objections received, for approval by NERC.

- **NERC/ERO Approval of NPCC Regional Reliability Standards** – Proposed regional reliability standards shall be subject to approval by the NERC/ERO who shall have a process to evaluate and recommend whether a proposed non-Interconnection-wide NPCC Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether NPCC has considered and addressed stakeholder objections. NPCC Board, having been notified of the results of the regional ballot concerning a NPCC Regional Reliability Standard, shall vote to submit the Standard to the NERC/ERO Board for approval as a NERC Reliability Standard. The NERC/ERO Board shall consider NPCC's request, the scope and implications of the Standard, the recommendation for action on the Standard, any unresolved stakeholder comments, and NPCC's consideration of comments and unresolved issues if any, in determining whether to approve the NPCC Regional Reliability Standard as a NERC Reliability Standard.

- **Regulatory Authority Approval** – An NPCC Regional Reliability Standard that has been approved by the NERC/ERO board shall be filed with FERC and applicable Canadian Governmental and/or Regulatory Authorities for approval and shall become effective and enforceable within the U.S., per Section 215 of the Federal Power Act, only when adopted by FERC, and within Canada, only when adopted by applicable Canadian Governmental and/or Regulatory Authorities. The regional reliability standard, once adopted will be made part of the body of NERC reliability standards and shall be mandatory and enforceable on all applicable bulk power system owners, operators, and users within the NPCC Region, regardless of membership status.

7. Appeals

-

Note: There are no limits to the number of public comment periods and ballots that can be conducted to result in a regional standard that is clear and enforceable, and achieves a quorum and sufficient affirmative votes for approval.

STEP 2.4.A. COMMENT PERIOD

Note: For Final Comment Period skip this step and proceed to STEP 2.4.B. FINAL COMMENT PERIOD.

As authorized by the RSC, the NPCC Manager of Reliability Standards shall post the draft of the regional standard on the NPCC website, along with a draft implementation plan and available supporting documents, for a forty-five (45) calendar day comment period. The NPCC Manager of Reliability Standards shall also notify NERC to process the draft document in accordance with NERC's regional standards review procedure, as applicable.

Following the conclusion of the NPCC comment period, the NPCC Manager of Reliability Standards will assemble the comments on the draft regional standard and associated documents and provide all comments to the drafting team for consideration.

Within thirty (30) calendar days of the conclusion of the comment period the drafting team shall convene and consider changes to the draft Standard, the implementation plan and/or supporting technical documents based upon comments received. All submitted comments shall be addressed, and each commenter shall be advised of the disposition, with reasons, of their comments. The NPCC Manager of Reliability Standards shall publicly post all of the drafting team's responses to stakeholder comments on the NPCC website.

Based on the comments received, the drafting team may elect to:

- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the draft regional standard, the implementation plan and/or supporting technical documents.
- Recommend that the RSC authorize Field Testing of the draft regional standard. Upon completion of the Field Test, return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD

AND ASSOCIATED DOCUMENTS to revise the draft regional standard based on insights learned during the Field Test.

- Obtain RSC concurrence to post documents for Final Comment Period and request that the RSC initiate the second phase (CEA) of the CEAP process

STEP 2.4.B. FINAL COMMENT PERIOD

The NPCC Standards Staff shall coordinate a Quality Review of "final draft" of the regional standard, implementation plan, VRFs and VSLs to assess whether the documents are within the scope of the associated RSAR, whether the regional standard is clear and enforceable as written and the VRFs and VSLs are developed according to NERC and FERC guidelines. Upon Completion of the Quality Review, including resolution of comments, the drafting team shall submit the regional standard to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post these documents for comment.

As authorized by the RSC, the NPCC Standards Staff shall post the "final draft" of the regional standard on the NPCC website, along with the implementation plan, supporting documents and the Cost Effectiveness Analysis (CEA) survey[15] for a forty-five (45) calendar day comment period. NPCC Standards Staff shall also notify NERC to process the proposed final document in accordance with NERC's regional standards review procedure, as applicable.

Following the conclusion of the NPCC comment period, the NPCC Manager of Reliability Standards will assemble the comments on the posted regional standard and associated documents and provide all comments to the drafting team for consideration.

In addition, the RSC, pursuant with the requirements of the Cost Effectiveness Analysis Procedure (CEAP), will use the responses to the posted CEA survey to develop a recommendation based on the cost effectiveness of the proposed regional standard.

The NPCC Task Forces (TFs) or Working Groups (WGs) may develop recommendations for submittal to the RSC. Following the RSC deliberations to determine a course of action, the RSC will communicate to the drafting team to:

- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the Standard to address the results of the CEAP
- Accept the Standard "as is" to move forward through the remainder of the process
- Hold the Standard in abeyance until such time as additional guidance can be provided regarding whether or how to continue
- Decide not to pursue the development of certain requirements or the entire Standard due to cost effectiveness considerations

Upon Completion of the final comment period the drafting team shall submit the proposed regional standard, along with any supporting materials, consideration of comments and field test results, to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post the regional standard for ballot and concurrently provide an information copy to the RCC.

[15] In accordance to the Cost Effectiveness Analysis Procedure (CEAP) the Cost Effectiveness Analysis (CEA) survey may be assigned directly to NPCC Task Forces (TFs) or Working Groups (WGs) in addition to the posting process.

The NPCC Manager of Reliability Standards shall also publicly post all of the drafting team's responses to stakeholder comments on the NPCC website.

STEP 2.5: POSTING FOR BALLOT PERIOD IN THE OPEN PROCESS

> *Note: There are no limits to the number of public comment periods and ballots that can be conducted to result in a regional standard that is clear and enforceable, and achieves a quorum and sufficient affirmative votes for approval.*

As authorized by the RSC, the NPCC Manager of Reliability Standards shall post the proposed regional standard on the NPCC website, along with supporting documentation [16] (e.g., implementation plan, consideration of comments, technical reports, white papers and any field test results), for a thirty (30) day pre-ballot review period and a subsequent ten (10) day ballot period. The ten (10) day ballot period will commence immediately following the pre-ballot review period. In the event that a quorum exists for purposes of an electronic vote but the ballot purpose has not been resolved, NPCC may continue to solicit additional responses in order to resolve the matter by electronic voting. In the event that quorum has not been achieved for purposes of an electronic vote, NPCC may continue to solicit electronic ballots, including abstentions, to obtain quorum and resolve the matter.

At the time the regional standard is posted for ballot, the NPCC Manager of Reliability Standards shall also notify NERC to process the proposed regional standard in accordance with NERC's regional standards review procedure, as applicable.

During the ballot period, the NPCC Members of the ballot body can cast their vote as follows:

- Affirmative, with or without comments
- Negative with comments
- Abstain

In accordance with the NPCC Bylaws, a quorum and receipt of a two-thirds (2/3) affirmative majority of the weighted sector votes is required for a ballot to pass.

The NPCC Manager of Reliability Standards shall post the final outcome of the ballot process on the NPCC website.

STEP 2.5.A. BALLOT DOES NOT RECEIVE 2/3 AFFIRMATIVE VOTE

If a ballot fails to achieve the 2/3 majority vote the NPCC Manager of Reliability Standards may:

- Direct the drafting team to respond to ballot comments and return to STEP 2.5: POSTING FOR BALLOT PERIOD IN THE OPEN PROCESS to re-ballot the regional standard. The consideration of comments from prior ballot will be included with the re-posting.
- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the regional standard to address the comments received.
- Pursue the discontinuance of the regional standard development by soliciting the Requester to withdraw the RSAR or by soliciting the RSC to reject the RSAR pursuant with STEP 2.1.C. NPCC REGIONAL STANDARDS COMMITTEE (RSC) ACTIONS. The NPCC Manager of

[16] The ballot posting is for the regional standard, definition, variance or clarification. Supporting documentation is included for information only and is not balloted.

Reliability Standards, in the event of a discontinuance of the development of a regional standard, shall post a notice of the discontinuance and will post and archive all comments submitted during the process for future consideration, if required. The NPCC Manager of Reliability Standards will also notify NERC to process the proposed regional standard in accordance with NERC's regional standards review procedure, as applicable.

STEP 2.5.B. BALLOT RECEIVES ≥ TWO-THIRDS (2/3) AFFIRMATIVE VOTE

A ballot that achieved two-thirds or greater affirmative vote has successfully passed. However, negative votes with comments should still be reconciled. If there is at least one negative vote with comments proceed to STEP 2.5.B.1 APPROVED BALLOT WITH "NEGATIVE VOTE WITH COMMENT". If there was not any negative vote with comments proceed to STEP 2.5.B.2 APPROVED BALLOT WITHOUT "NEGATIVE VOTE WITH COMMENT".

STEP 2.5.B.1 APPROVED BALLOT WITH "NEGATIVE VOTE WITH COMMENT"

Following the conclusion of the NPCC ballot period, the NPCC Manager of Reliability Standards will assemble the comments on the posted regional standard and provide all comments to the drafting team for consideration. The drafting team shall review all negative votes with comments and elect to:

- Recommend to the RSC to accept the regional standard "as is" and seek RSC endorsement to move forward through the remainder of the process. Upon receiving RSC endorsement to proceed, the regional standard and associated documents, approved by the NPCC ballot body, shall be forwarded by the Assistant Vice President Standards to the NPCC Board of Directors for final Regional approval. If comments that were received during balloting should be considered in future revisions to the regional standard then the NPCC Manager of Reliability Standards should log comments in an issues database.
- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the regional standard to address the comments received.
- Respond to ballot comments and recommend to the RSC endorse the return to STEP 2.5: POSTING FOR BALLOT PERIOD IN THE OPEN PROCESS to re-ballot the regional standard. The NPCC Manager of Reliability Standards should include the consideration of comments from the prior ballot with the re-posting.

STEP 2.5.B.2 APPROVED BALLOT WITHOUT "NEGATIVE VOTE WITH COMMENT"

Regional standard and associated documents, approved by the NPCC ballot body, shall be forwarded by the Assistant Vice President Standards to the NPCC Board of Directors for final Regional approval.

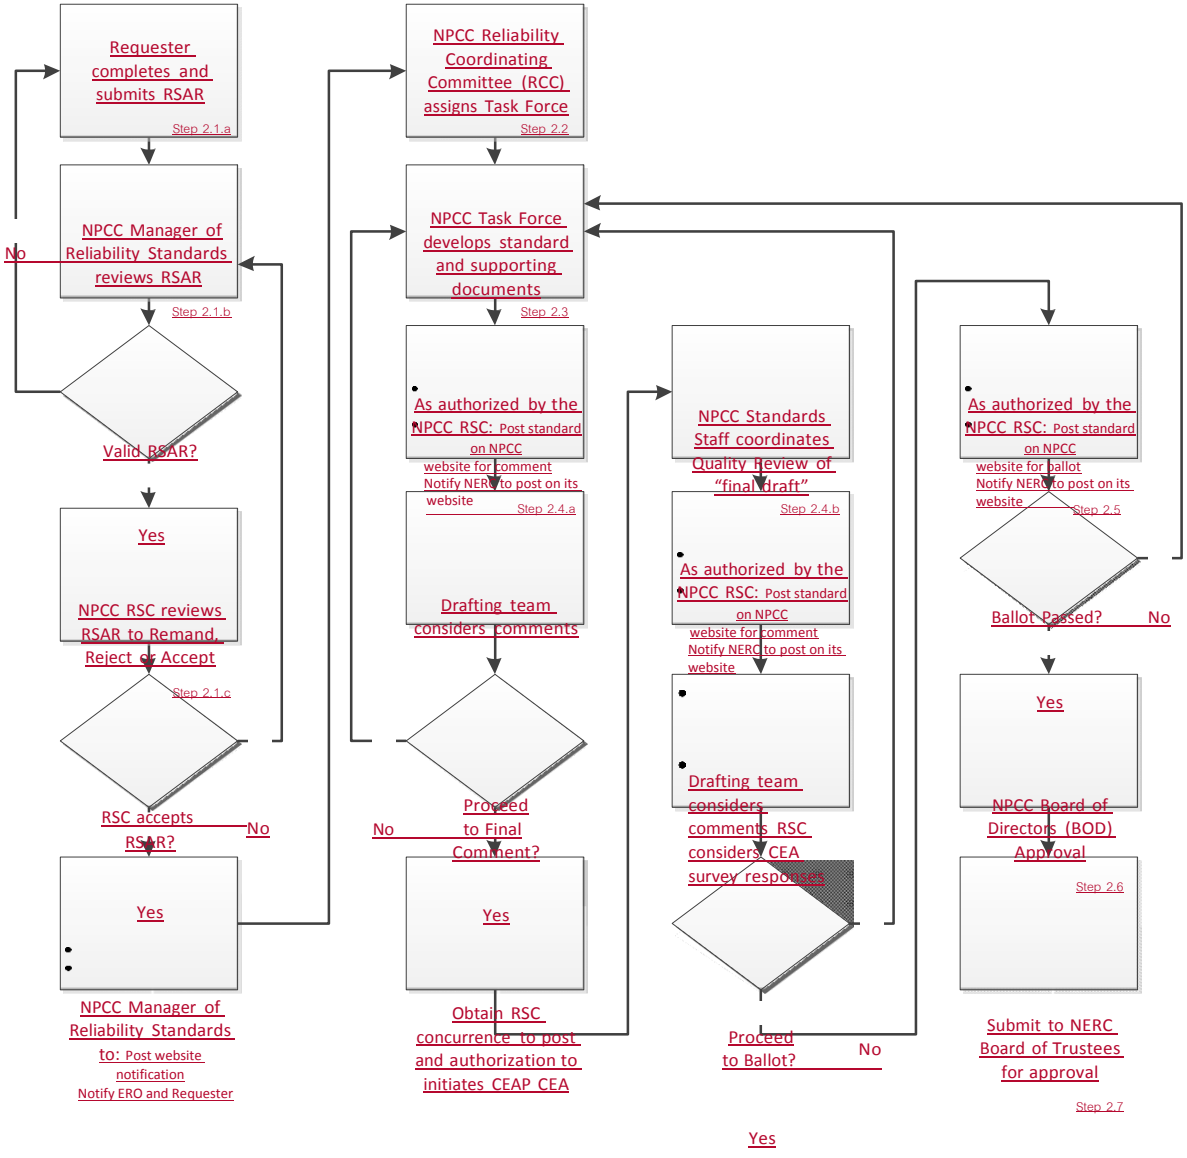
STEP 2.6: NPCC BOARD OF DIRECTORS APPROVAL

Following approval by the NPCC Members, regional standards require review and approval by the NPCC Board of Directors. The NPCC Board of Directors may take the following actions:

- Approve the regional standard as presented.
- Approve the regional standard with comments to incorporate non-substantive revisions. [The NPCC Board of Directors may not make substantive revisions to the standard.]
- Remand the regional standard back to the RSC and the drafting team to address their concerns. The RSC / drafting team can address the BOD comments and re-submit for BOD

approval or return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the regional standard to address the comments received.

STEP 2.7: NERC BOARD OF TRUSTEES SUBMITTAL



Upon approval by the NPCC Board of Directors, the NPCC Manager of Reliability Standards shall submit the regional standard to NERC, as the Electric Reliability Organization, for approval and subsequent filing with FERC and the applicable Canadian Provincial regulatory and/or governmental authorities for adoption.

STEP 2.8: IMPLEMENTATION OF A NPCC REGIONAL STANDARD

Following the approval of a NPCC regional standard by FERC and the applicable Canadian Provincial regulatory and/or governmental authorities, all users, owners, and operators of the Bulk Electric System in the NPCC geographic area are required to comply with the standard as of its enforcement date.

ERO approved Reliability Standards (both continent-wide and regional) are included in both the NERC and NPCC Compliance Monitoring and Enforcement Programs (CMEPs).

FIGURE 1: FLOWCHART OF REGIONAL STANDARDS DEVELOPMENT PROCESS OVERVIEW

3. STANDARD CLARIFICATION PROCESS STEPS

This section applies to NPCC regional standards that have been approved[17] and are currently enforceable or have a future enforcement date. A clarification request is not permitted for regional standards under development. For regional standards under development, an explanation of a requirement or its meaning can be sought during a comment period. Refer to Step 2, STANDARD DEVELOPMENT PROCESS STEPS of this manual for details on the comment process for a standard under development.

STEP 3.1: REGIONAL STANDARDS CLARIFICATION REQUEST (CR)

Any member of NPCC or group within the NPCC region shall be allowed to submit a Clarification Request (CR) for a NPCC regional standard.

Additionally, any person (organization, company, government agency, individual, etc.) who is directly and materially affected by the reliability of the NPCC Bulk Electric System shall be allowed to submit a Clarification Request (CR) for a NPCC regional standard.

> *Note: A valid Clarification Request is one that seeks additional clarity about one or more requirements in an approved regional standard, but does not request approval as to how to comply with any requirements of the standard.*

The Requester should submit a Clarification Request[18] (CR) for a NPCC regional standard directly to the NPCC Manager of Reliability Standards, via npccstandard@npcc.org, for processing. Alternatively, the Requester can submit a Request for Interpretation (RFI) of a NPCC regional standard under the NERC process for developing an interpretation[19] to the NERC Reliability Standards Staff explaining the clarification required, the specific circumstances surrounding the request, and the impact of not having the clarification provided. A copy of the completed RFI form should also be sent to the NPCC Manager of Reliability Standards.

NERC Reliability Standards Staff will refer the RFI to NPCC and delegate its resolution to NPCC. NPCC will process the NERC delegation pursuant with the NPCC Clarification Request (CR) process described herein.

STEP 3.2: REVIEW AND VALIDATION OF CLARIFICATION REQUEST (CR)

Upon receipt of a Clarification Request (CR) for a NPCC regional standard, the NPCC Manager of Reliability Standards shall review the CR to determine whether:

- It meets the requirements for a valid Clarification Request
- A compliance process or approach could be used in lieu of a clarification

The NPCC Manager of Reliability Standards will utilize, as necessary, the NPCC Standards Staff, NPCC Compliance and Legal Staffs when determining the validity of the CR. Based on this review, the NPCC Manager of Reliability Standards will recommend to the RSC whether to accept or reject the CR. The recommendation to the RSC should be made within thirty (30) calendar days of the receipt of the CR.

[17] Approval is granted by FERC and the Canadian Provincial regulatory and/or governmental authorities, as applicable.
[18] The NPCC Clarification Request form is included as Appendix D
[19] The *Request for Interpretation* form is posted under Resource Documents on the NERC Standards webpage.

The following examples identify situations that may warrant a recommendation from the NPCC Manager of Reliability Standards to reject the CR:

- Requests approval of a particular compliance approach
- Identifies a gap or perceived weakness in the approved regional standard (Requester should be redirected to initiate a RSAR rather than a CR)
- Where an issue can be addressed by an active (regional or continent-wide) standard drafting team
- Where an issue can be better addressed by a compliance process or approach
- Where it requests clarification of any element of a regional standard other than a requirement
- Where a question has already been addressed in the record
- Where the clarification identifies an issue and proposes the development of a new or modified regional or continent-wide standard (such issues should be addressed via submission of a RSAR or SAR)
- Where a clarification seeks to expand the scope of a regional standard
- Where the requirement of the regional standard is clear

STEP 3.3: NPCC REGIONAL STANDARDS COMMITTEE (RSC) ACTIONS

The RSC shall review the CR along with the recommendation from the NPCC Manager of Reliability Standards and take one of the following actions:

- Reject the CR. In this case, the RSC will provide its determination to the NPCC Manager of Reliability Standards, who will then provide a written explanation for rejection to the CR to the entity requesting the clarification within ten (10) calendar days of the decision to reject.
- Accept the CR. In this case, the RSC will provide its determination to the NPCC Manager of Reliability Standards, who will then: 1) post notification on the NPCC website of the intent to develop a clarification; 2) notify the NPCC Reliability Coordinating Committee (RCC) of the need to assign the resolution of the CR to one or more Task Forces (if more than one Task Force is assigned, one of them shall be assigned the lead role); and 3) notify the Requester of the acceptance of the CR. The notifications shall be made within ten (10) calendar days of the acceptance of the CR.

STEP 3.4: FORMATION OF DRAFTING TEAM FOR RESPONSE TO CR

A CR that has been accepted by the RSC shall be assigned by the RCC to the responsible NPCC Task Force to make up the clarification drafting team (CDT) and develop the CR response.

STEP 3.5: DEVELOPMENT OF RESPONSE TO CR

> *Note: A valid clarification response provides additional clarity about one or more requirements, but does not expand on any requirement and does not explain how to comply with any requirement.*

Within sixty (60) calendar days from the receipt of being assigned to respond to a CR, the CDT shall submit a proposed clarification response to the NPCC Manager of Reliability Standards. Upon receipt of the proposed clarification response from the CDT, the NPCC Manager of

Reliability Standards shall present the response to the RSC to obtain concurrence to post the proposed response for comment.

Along with the proposed clarification response, the drafting team shall also develop and submit a set of questions to be included in the comment form, for approval by the RSC.

If the RSC concurrence is not received, the drafting team will continue to refine the clarification response.

> *Note: There are no limits to the number of public comment periods that can be conducted to result in a clear and concise clarification of a regional standard requirement.*

STEP 3.6: POSTING CR FOR COMMENT PERIOD AND RESOLUTION OF COMMENTS

As authorized by the RSC, the NPCC Manager of Reliability Standards shall post the proposed clarification response on the NPCC website for a forty-five (45) calendar day comment period.

Following the conclusion of the NPCC comment period, the NPCC Manager of Reliability Standards will assemble the comments on the proposed clarification response and provide all comments to the drafting team for consideration.

Within thirty (30) calendar days of the conclusion of the comment period the drafting team shall convene and consider changes to the proposed clarification response based upon comments received. All submitted comments shall be addressed, which may be in the form of a summary response addressing each of the issues raised in comments received. The NPCC Manager of Reliability Standards shall publicly post all of the drafting team's responses to stakeholder comments on the NPCC website.

Based on the comments received, the drafting team may elect to:

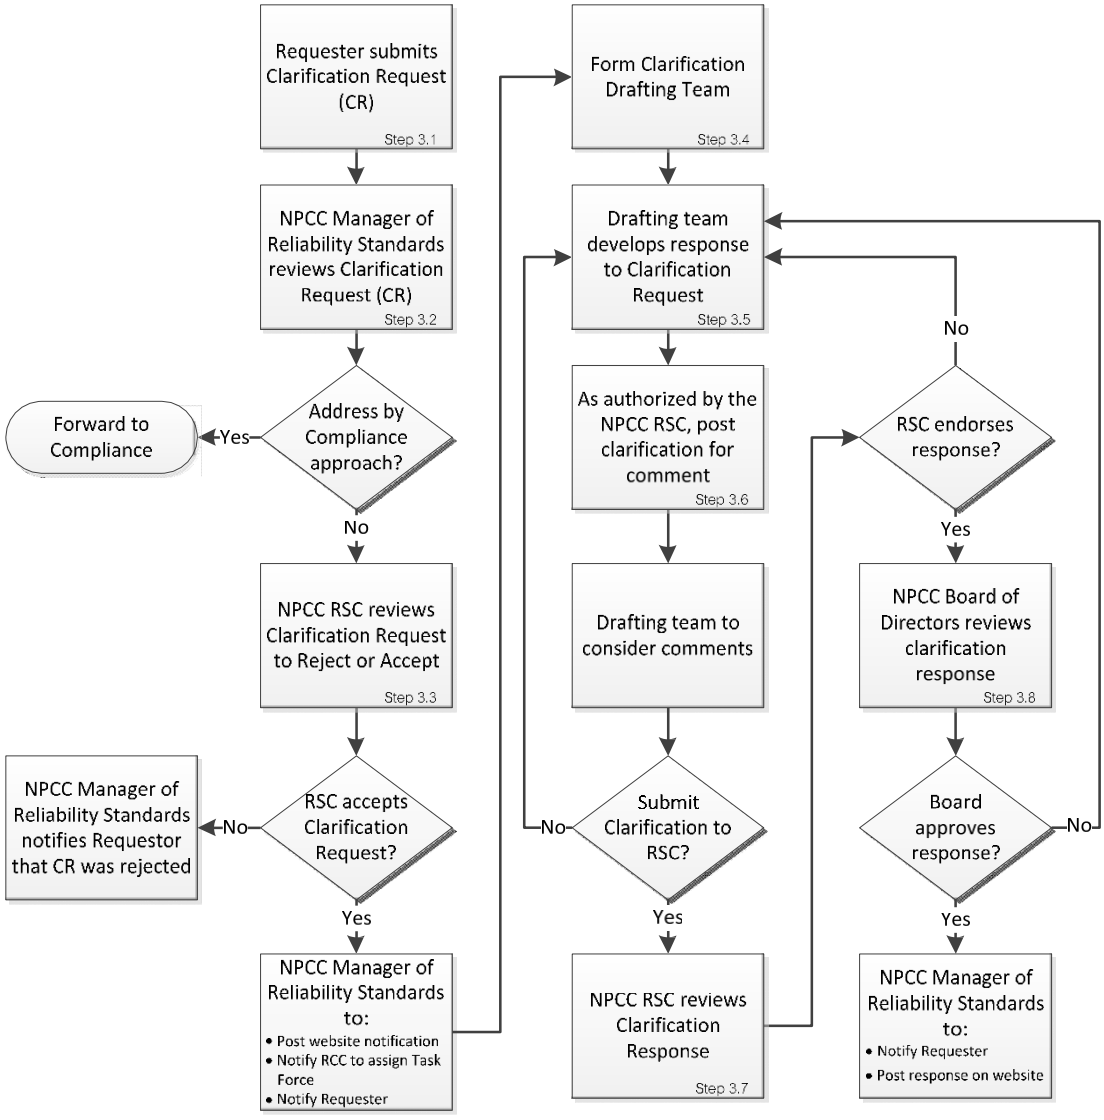
- Return to STEP 3.5: DEVELOPMENT OF RESPONSE TO CR to revise the proposed clarification response.
- Accept the proposed clarification response "as is" to move forward through the remainder of the process.

Upon acceptance of the proposed clarification response "as is," the drafting team shall submit the proposed clarification response to the NPCC Manager of Reliability Standards to obtain RSC endorsement to the submitted CR response.

STEP 3.7: REGIONAL STANDARDS COMMITTEE APPROVAL OF CR

Upon receipt of the CR response from the NPCC Manager of Reliability Standards, the RSC shall elect to:

- Endorse the proposed clarification response and direct the NPCC Assistant Vice President Standards to forward the CR to the NPCC Board of Directors for final Regional approval; or
- Direct the drafting team to return to STEP 3.5: DEVELOPMENT OF RESPONSE TO CR to revise the proposed clarification response



STEP 3.8: NPCC BOARD OF DIRECTORS APPROVAL OF CR

Following endorsement by the RSC, clarification responses require review and approval by the NPCC Board of Directors. The NPCC Board of Directors may take the following actions:

- Approve the clarification response as presented
- Approve the clarification response with comments to incorporate non-substantive revisions. [The NPCC Board of Directors may not make substantive revisions to the clarification response.]
- Remand the clarification response back to the RSC and the drafting team to address their concerns

Upon receipt of Board approval, the NPCC Manager of Reliability Standards shall notify the Requestor and post the approved clarification on the NPCC website.

FIGURE 2: FLOWCHART OF REGIONAL STANDARDS CLARIFICATION PROCESS OVERVIEW

4. DISCONTINUANCE OF REGIONAL STANDARD DEVELOPMENT

The term "discontinuance" as used herein refers to terminating the standard development process after RSAR approval but prior to posting a regional standard for industry ballot. From time to time the need or rationale for a regional standard may change thereby necessitating the curtailment

of the regional standard development. Upon notification or determination that a regional standard under development should be considered for discontinuance due to a perceived change in the need for the standard, the NPCC Manager of Reliability Standards will submit the recommendation for discontinuance to the RSC for approval.

5. Withdrawal of a Regional Standard Pending Approval

The term "withdrawal" as used herein, refers to the revocation of a request for approval of a regional standard, variance, clarification or definition that has been approved by the NPCC Board of Directors and has not been filed with Applicable Governmental Authorities or has been filed but not yet approved by Applicable Governmental Authorities. The RSC may withdraw a regional standard, variance, clarification or definition for good cause subject to approval by the NPCC Board of Directors. Upon approval by the NPCC Board of Directors, the NPCC Manager of Reliability Standards will notify NERC Staff to petition the Applicable Governmental Authorities, as necessary, to allow for withdrawal in the case that the regional standard has been filed.

6. Retirement of an Approved NPCC Regional Standard

The term "retirement" refers to the discontinuation of a regional standard in whole, certain requirements within a regional standard, a variance, clarification or definition that: 1) has been approved by Applicable Governmental Authorities and 2) is not being superseded by or merged into a new or revised regional standard, clarification or definition.

Upon identification of a need for retirement, a RSAR containing the proposal of the retirement will be handled in accordance with the Step 2.1: Regional Standards Authorization Request to Develop, Modify or Retire. The proposal shall include the rationale for the retirement and a statement regarding the impact of retirement on the reliability of the Bulk Electric System. Upon approval by the NPCC Members and the NPCC Board of Directors, the NPCC Manager of Reliability Standards shall submit the request for retirement to NERC, as the Electric Reliability Organization, for approval and to subsequently petition the Applicable Governmental Authorities to allow for retirement.

7. Approval of Process Waiver

While it is NPCC's intent to adhere to this manual under normal circumstances, NPCC may need to develop a new or modified regional standard, implementation plan, variance, clarification or definition under extenuating circumstances. Extenuating circumstances may include, but not be limited to, specific time constraint imposed by a regulatory body and urgent reliability issue that requires expedited handling outside of the normal regional Reliability Standards process.

The RSC, by two-thirds (2/3) majority vote, may waive any of the provisions contained in this manual for good cause shown, but limited to the following circumstances:

- Where necessary to meet regulatory deadlines
- Where necessary to address an urgent reliability issue identified by regulatory and/or governmental authorities, including response to national emergency declared by the United States or Canadian government that involves the reliability of the Bulk Electric System or cyber-attack on the Bulk Electric System
- Where necessary to meet deadlines imposed by the NPCC Board of Directors

- Where the RSC determines that a revision to a proposed regional standard, implementation plan, variance, clarification or definition has already been vetted by the industry through the standards development process or is so insubstantial that developing the revision through the processes contained in this manual will add significant time delay without any corresponding benefit.

In no circumstances shall this provision be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard.

A waiver request may be submitted to the RSC by any entity or individual, including NPCC committees or subgroups and NPCC Standards Staff. Prior to consideration of any waiver request, the NPCC Manager of Reliability Standards must provide notification to stakeholders at least five (5) business days prior to RSC consideration and action. Posting the waiver request on the NPCC website satisfies the notification provision.

Action on the waiver request will be included in the minutes of the RSC. Following the approval of the RSC to waive any provision of the regional Reliability Standards process, the Assistant Vice President Standards shall report the exercise of this waiver provision to the NPCC Board of Directors prior to adoption of the related Reliability Standard, clarification, definition or variance. Actions taken pursuant to an approved waiver request will be posted on the NPCC Standards webpage.

8. PROCESS FOR CORRECTING ERRATA

From time to time, an error may be discovered in a regional standard after it has received final ballot approval by the NPCC ballot body. Such errors may be corrected by the RSC without re-balloting if the RSC agrees that the correction of the error does not change the scope or intent of the associated regional standard, and agrees that the correction has no material impact on the end users of the regional standard.

If the regional standard containing errata is pending approval by the NPCC Board of Directors, the corrected regional standard shall be presented to the NPCC Board for approval in lieu of the regional standard approved by the NPCC ballot body.

If a regional standard containing errata had received prior approval by the NPCC Board of Directors, the corrected regional standard shall be presented to the NPCC Board for approval. Upon approval by the Board, the corrected regional standard will be filed for approval by NERC.

The NPCC Board of Directors has resolved to concurrently approve any errata approved by the RSC associated with a regional standard that has received prior approval by the NPCC Board.

9. APPEALS

Persons who have directly and materially affected interests and who have been or will be adversely affected by any substantive or procedural action or inaction related to the approval, revision, reaffirmation, or withdrawal of a regional standard (appellant) shall have the right to appeal. This appeals process applies only to the regional standards process as defined in this manual.

~~inaction related to the development, approval, revision, reaffirmation, or withdrawal of a regional reliability standard shall have the right to appeal.~~

~~This appeals process applies only to the standards process as defined in this procedure.~~

The burden of proof to show adverse effect shall be on the appellant. Appeals shall be made within thirty (30) calendar days of the date of the action purported to cause the adverse effect, except appeals for inaction, which may be made at any time. ~~-~~In all cases, the request for appeal must be made prior to the next step in the process.

The final decisions of any appeal shall be documented in writing and made public.

The appeals process provides two levels, with the goal of expeditiously resolving the issue to the satisfaction of the participants:

- ~~Level~~ LEVEL 1 ~~Appeal~~ APPEAL

Level 1 is the required first step in the appeals process. The appellant submits a complaint in writing to the ~~RSPM~~NPCC Manager of Reliability Standards that describes the substantive or procedural action or inaction associated with a ~~reliability standard~~Reliability Standard or the standards process. The appellant describes in the complaint the actual or potential adverse impact to the appellant. Assisted by any necessary ~~staff~~NPCC Standards Staff and ~~committee~~Committee resources, the ~~RSPM~~NPCC Manager of Reliability Standards shall prepare a written response addressed to the appellant as soon as practical, but not more than forty-five (45) calendar days after receipt of the complaint. ~~-~~ If the appellant accepts the response as a satisfactory resolution of the issue, both the complaint and response will be made a part of the public record associated with the standard and posted with the standard.

- ~~Level~~ LEVEL 2 ~~Appeal~~ APPEAL

If after the Level 1 Appeal the appellant remains unsatisfied with the resolution, as indicated by the appellant in writing to the ~~regional standards process manager~~NPCC Manager of Reliability Standards, the ~~RSPM~~NPCC Board of Directors shall ~~convene~~appoint a five member panel to serve as a Level 2 Appeals Panel~~. This panel shall consist of five members total appointed by the NPCC's board~~.

In all cases, Level 2 Appeals Panel members shall have no direct affiliation with the participants in the appeal.

The ~~RSPM~~NPCC Manager of Reliability Standards shall post the complaint and other relevant materials and provide at least a thirty (30) calendar ~~days~~day notice of the meeting of the Level 2 Appeals Panel. ~~-~~

In addition to the appellant, any person that is directly and materially affected by the substantive or procedural action or inaction referenced in the complaint shall be heard by the panel. The panel shall not consider any expansion of the scope of the appeal that was not presented in the Level 1 ~~Appeal. The panel may in its decision find for the appellant and remand the issue to the RSC~~

Appeal. The panel may in its decision find for the appellant and remand the issue to the RSC with a statement of the issues and facts in regard to which unfair and/or inequitable action was taken, or which fair and/or equitable action was not taken. ~~-~~The panel may find for or against the appellant with a specific

statement of the facts that demonstrate fair and equitable treatment of the appellant and the appellant's objections. The panel may not, however, revise,

approve, disapprove, or adopt a ~~reliability standard.~~ Reliability Standard. The actions of the Level 2 Appeals Panel shall be publicly posted.

In addition to the foregoing, a procedural objection that has not been resolved may be submitted to the NPCC Board of Directors for consideration at the time the ~~board~~Board decides whether to adopt a particular ~~reliability standard~~Reliability Standard. The objection must be in writing, signed by an officer of the objecting entity, and contain a concise statement of the relief requested and a clear demonstration of the facts that justify that relief. The objection must be filed no later than thirty (30) calendar days after the announcement of the vote on the standard in question.

APPENDIX A: RSAR COMPLETION GUIDELINES

The Requester shall complete a RSAR form in accordance with the guidance provided below.

The RSAR, at a minimum, shall contain information in the required fields in order to be qualified for consideration. The NPCC Manager of Reliability Standards will assist the Requester to ensure all required information is submitted on the RSAR.

Information in a Regional Standard Authorization Request ~~(RSAR)~~ (RSAR)

The tables below identify information to be submitted in a Regional Standard Authorization Request to the NPCC ~~Regional Standards Process Manager, NPCCstandard@npcc.org . The NPCC Regional Standards Process Manager shall be responsible for implementing and maintaining this form as needed to support the information requirements of the standards process.~~Manager of Reliability Standards, at npccstandard@npcc.org. The NPCC Manager of Reliability Standards shall be responsible for implementing and maintaining this form as needed to support the information requirements of the standards process.

Regional Standard Authorization Request Form

Title of Proposed Standard~~:~~: ***[Required Field]***
Request Date: ***[Required Field]***

RSAR Requester Information

Name: ***[Required Field]***	**RSAR Type ~~(~~(Check box for one of these selections.)**
Company: ***[Required Field]***	☐ New Standard
~~Telephone:~~ ***[Required Field]***	☐ Revision to Existing Standard
Fax:	☐ Withdrawal of Existing Standard
~~Email:~~ ***[Required Field]***	☐ Urgent Action
~~**Purpose (**Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.**)**~~	
~~**Industry Need (Provide** a detailed statement justifying the need for the proposed standard, along with any supporting documentation.**)**~~	

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.**)**

Purpose: (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.)

[Required Field]

Industry Need: (Provide a detailed statement justifying the need for the proposed standard, along with a technical justification and any supporting documentation.)

[Required Field -- must include technical justification (relevant studies, documentation, etc.) for a new standard or revision to an existing standard.]

Brief Description: (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

[Required Field]

Reliability Functions *[Required Field]*

~~**The Standard will Apply to the Following Functions** (Check all applicable boxes.)~~

☐

☐

☐

☐

☐

☐

☐

☐

☐

☐

☐

The Standard will Apply to the Following Functions (Check all applicable boxes.)	
☐ Reliability Coordinator	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
☐ Balancing Authority	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
☐ Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☐ Planning Authority	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.
☐ Transmission Service Provider	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.
☐ Transmission Owner	The entity that owns and maintains transmission facilities.
☐ Transmission Operator	The entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission facilities.
☐ Transmission Planner	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.
☐ Resource Planner	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
☐ Generator Operator	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
☐ Generator Owner	Entity that owns and maintains generating units.

☐

☐

Purchasing-Selling Entity	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
Distribution Provider	Provides and operates the "wires" between the transmission system and the customer.
Load-Serving Entity	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check all boxes that apply.)*
☐ 1. Interconnected ~~bulk power systems~~Bulk Electric System shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in
☐ 2. The frequency and voltage of interconnected ~~bulk power systems~~Bulk Electric System shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐ 3. Information necessary for the planning and operation of interconnected ~~bulk power systems~~Bulk Electric System shall be made available to those entities responsible for planning and operating the systems reliably.
☐ 4. Plans for emergency operation and system restoration of interconnected ~~bulk power systems~~Bulk
☐ 5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected ~~bulk power systems.~~Bulk Electric
☐ 6. Personnel responsible for planning and operating interconnected ~~bulk power systems~~Bulk Electric System shall be trained, qualified, and have the responsibility and authority to implement actions.
☐ 7. The security of the interconnected ~~bulk power systems~~Bulk Electric System shall be assessed, monitored, and maintained on a wide-area basis.
Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
Recognizing that reliability is an Common Attribute of a robust North American economy:
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes

4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description: (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

[Required Field – Provide: 1) Necessary information to assist the drafting team (which is to include relevant study results and documentation), to the extent feasible, to allow them to draft the standard, 2) Any existing known cross references to NPCC or NERC documents and 3) Technical background for the RSAR to properly address the need for the standard.]

APPENDIX B: SELECTION OF DRAFTING TEAM MEMBERS

A regional standard drafting team shall be comprised of Subject Matter Experts (SMEs) from NPCC Task Forces and Working Groups as determined by the RCC, and from industry. The guidelines provided herein primarily address overall team requirements and more specifically those of a SME.

Formal membership on a drafting team should be reserved only for those individuals who intend to work consistently, diligently, and professionally on what is required to be done for a regional standard. Drafting team members are expected to contribute meaningfully to the ongoing development of the standard.

Drafting Team members must be:

- Committed to participating in scheduled drafting team meetings, teleconferences, as well as industry outreach (e.g., workshops and webinars)
- Willing to lead teams / sub-teams, as necessary
- Champions for standard development and promoters of the approval of the standard
- Open to consider the comments of others and provide constructive feedback

Subject Matter Experts should possess the necessary expertise and knowledge regarding the topic of the standard. The SMEs should represent a cross section of the registered entities applicable to the standard under development as well as geographical areas within the NPCC footprint.

Industry stakeholders may nominate themselves for consideration by the NPCC Regional Standards Committee (RSC) for the specific drafting team vacancies by completing the following drafting team Self Nomination form and submitting it to NPCC Manager of Reliability Standards, at npccstandard@npcc.org.

Nomination Form for NPCC [Name of drafting team] Drafting Team

Please return this form as soon as possible. If you have any questions, please contact the NPCC Standards Staff at npccstandard@npcc.org.

By submitting the following information you are indicating your willingness and agreement to actively participate in the drafting team meetings if appointed to the drafting team by the NPCC Regional Standards Committee (RSC). This means that if you are appointed to the DT you are expected to attend all (or at least the vast majority) of the face-to-face DT meetings as well as participate in all the DT meetings held via conference calls. Failure to do so shall result in your removal from the DT.

Name:	
Organization:	
Address:	
Telephone:	

E-mail:	

Please briefly describe your experience and qualifications to serve on the requested drafting team.

If you are currently a member of any NERC or Regional drafting teams, please list each team here.

- ☐ Not currently on any active SAR or standard drafting team.
- ☐ Currently a member of the following SAR or standard drafting team(s):

If you previously worked on any drafting team please identify the team(s).

- ☐ No prior NERC or Regional SAR or standard drafting team experience.
- ☐ Prior experience on the following team(s):

Select each NERC Region that you represent:	Select each Industry Segment that you represent:	
☐ ERCOT	☐	1 — Transmission Owners
☐ FRCC	☐	2 — RTOs, ISOs
☐ MRO	☐	3 — Load-serving Entities
☐ NPCC	☐	4 — Transmission-dependent Utilities
☐ RFC	☐	5 — Electric Generators
☐ SERC	☐	6 — Electricity Brokers, Aggregators, and Marketers
☐ SPP	☐	7 — Large Electricity End Users
☐ WECC	☐	8 — Small Electricity End Users
☐ NA – Not Applicable	☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
	☐	10 — Regional Reliability Organizations and Regional Entities
	☐	NA – Not Applicable

Select each Function[20] in which you have current or prior expertise:

☐ Balancing Authority	☐ Transmission Operator
☐ Compliance Enforcement Authority	☐ Transmission Owner
☐ Distribution Provider	☐ Transmission Planner
☐ Generator Operator	☐ Transmission Service Provider
☐ Generator Owner	☐ Purchasing-selling Entity
☐ Interchange Authority	☐ Reliability Coordinator
☐ Load-serving Entity	☐ Reliability Assurer
☐ Market Operator	☐ Resource Planner
☐ Planning Coordinator	

[20] These functions are defined in the NERC Functional Model, which is downloadable from the NERC website.

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group.

APPENDIX C: MAINTENANCE OF REGIONAL STANDARDS AND PROCESS

NPCC regional standards and the Regional Standard Processes Manual are living documents that will be updated periodically to remain current and viable (e.g., respond to changing conditions, as well as to incorporate lessons learned and process improvements).

MAINTENANCE OF REGIONAL STANDARDS

NPCC regional standards will be posted for open process review by the RSC for possible revision at least once every five (5) years[21] after the first regulatory approval and follow the same process as in the case of a new standard. If no changes are warranted, the Regional Standards Committee (RSC) shall recommend to the NPCC Board that the standard be reaffirmed. If the review indicates a need to revise or retire a regional standard, a Regional Standard Authorization Request shall be prepared by the RSC and submitted in accordance with the NPCC regional standards process. The existing, approved standard subject to revision will remain in effect until such time as the revised version has received FERC or applicable Provincial Governmental Authorities approvals, as appropriate, at which time it will be retired in accordance with any applicable implementation plan associated with the newly approved regional standard.

MAINTENANCE OF THE REGIONAL STANDARDS PROCESS

This NPCC Regional Standards Process will be reviewed for possible revision at least once every five (5) years, or more frequently if needed, and subject to the same procedure as applies to the development of a Regional Standard. All such revisions shall be subject to approval by the NPCC Board of Directors, NERC Board of Trustees, FERC, and may be subject to approval, if required, by Applicable Governmental Authorities in Canada.

[21] More frequent reviews of NPCC regional standards may be required to promptly evaluate new or revised NERC reliability standards to ensure NPCC regional standards remain consistent and more stringent than continent-wide reliability standards.

APPENDIX D: NPCC CLARIFICATION REQUEST

NORTHEAST POWER COORDINATING COUNCIL, INC.
1040 AVE. OF THE AMERICAS, NEW YORK, NY 10018 (212) 840-1070 FAX (212) 302-2782

Note: A valid clarification request is one that requests additional clarity about one or more requirements in approved NPCC regional standards, but does not request approval as to how to comply with one or more requirements.

When completed, email this form to: npccstandard@npcc.org
For questions about this form or for assistance in completing the form, call Lee Pedowicz at 212-840-1070.

Request for an Clarification of a Regional Standard	
Date submitted:	
Contact information for person requesting the clarification:

Standard Title:	
Identify specifically what requirement needs clarification:	
Requirement Number and Text of Requirement:	
Identify the nature of clarification that is requested: (Check as many as applicable)	
☐ Clarify the required performance ☐ Clarify the conditions under which the performance is required ☐ Clarify which functional entity is responsible for performing an action in a requirement ☐ Clarify the reliability outcome the requirement is intended to produce Please explain the clarification needed:	
Identify the material impact associated with this clarification:	

Identify the material impact to your organization or others, if known, caused by the lack of clarity or an incorrect clarification of this standard.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Protection System Maintenance Reliability Standard	**)** **)**	**Docket No. RM14-8-000**

COMMENTS OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION IN RESPONSE TO NOTICE OF PROPOSED RULEMAKING

The North American Electric Reliability Corporation ("NERC")[1] hereby provides comments in response to the Notice of Proposed Rulemaking ("NOPR")[2] regarding proposed Reliability Standard PRC-005-3 (Protection System and Automatic Reclosing Maintenance), issued by the Federal Energy Regulatory Commission ("FERC" or "Commission") in this proceeding on July 17, 2014. In the NOPR, the Commission proposes to approve proposed Reliability Standard PRC-005-3 to supersede Reliability Standard PRC-005-2 (Protection System Maintenance). The Commission also proposes to direct NERC to modify the proposed Reliability Standard to add the maintenance and testing of supervisory relays for Automatic Reclosing such as synchronism check and voltage relays. In addition, the Commission proposes to direct NERC to: (1) submit a report that addresses whether the proposed Reliability Standard applies to an appropriate set of autoreclosing relays that can affect Bulk-Power System reliability; and (2) add tracking of automatic reclosing misoperations to NERC's data collection efforts going forward. As discussed more fully below, the Commission seeks comment on

[1] The Federal Energy Regulatory Commission certified NERC as the electric reliability organization in its order issued on July 20, 2006, in Docket No. RR06-1-000. *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062 (2006).

[2] *Protection System Maintenance Reliability Standard*, Notice of Proposed Rulemaking, 148 FERC ¶ 61,041 (2014). NERC notes that the title of the modified PRC-005 standard is now "Protection System and Automatic Reclosing Maintenance" and suggests that the Commission modify the title of the proceeding in its final rule to "Protection System and Automatic Reclosing Maintenance Reliability Standard" in order to avoid confusion with its final rule approving PRC-005-2. NERC inadvertently captioned the title of the proposed standard in its petition as "PRC-005-3 (Protection System Maintenance)" instead of "PRC-005-3 (Protection System and Automatic Reclosing Maintenance)."

certain aspects of the proposed Reliability Standard and the proposed actions by the Commission.

As discussed more fully below, NERC supports the Commission's proposal to approve the proposed Reliability Standard. NERC also acknowledges the issues the Commission raises in the NOPR regarding the inclusion of maintenance and testing of certain supervisory devices for autoreclosing. In light of the Commission's concerns and in the interest of improving reliability, NERC would support the addition of voltage supervision and, where used, supervisory inputs associated with selective autoreclosing in the coverage of PRC-005. NERC would also support the addition of synchronism check supervision as it provides a reliability benefit without a significant increase in maintenance burden on industry.

However, NERC does not support the Commission's proposed directives related to further data collection and verification of the applicability thresholds as currently drafted in the NOPR. NERC is generally not opposed to measuring the effectiveness of a proposed Reliability Standard through analysis of data. In this instance, the Commission has not yet justified why further evaluation of the effectiveness of the proposed applicability thresholds is necessary in the short term or why NERC should continue data collection of misoperations information for automatic reclosing on a going forward basis.

Finally, NERC explains how its current project to modify the PRC-005 Reliability Standard addresses the Commission's inquiry on the reasonableness of proposed record retention obligations through a reduction in the required period for document retention.

II. Coverage of Supervisory Devices

A. Supervisory Devices

In the NOPR, the Commission states that the proposed PRC-005-3 Reliability Standard does not include supervisory devices such as synchronism check or voltage relays that may be critical to the operation of an autoreclosing scheme. The Commission continues that the supervisory devices, like synchronism check relays, are "applied to monitor voltages on both sides of a circuit breaker to allow autoreclosing for desirable conditions (e.g., proper phase angle and voltage) or block autoreclosing for undesirable conditions.[4] The Commission explains that "these supervisory devices essentially 'supervise' the actions of an autoreclosing scheme; i.e.,

[3] Persons to be included on the Commission's service list are identified by an asterisk. NERC respectfully requests a waiver of Rule 203 of the Commission's regulations, 18 C.F.R. § 385.203 (2014), to allow the inclusion of more than two persons on the service list in this proceeding.

[4] NOPR at P 28.

allow autoreclosing for desirable conditions or block autoreclosing for undesirable conditions."[5] The Commission asserts that NERC has not explained in its petition how a failure of a synchronism check relay for undesirable conditions would not allow autoreclosing.[6] The Commission proposes to direct that NERC develop modifications to PRC-005-3 that address the appropriateness of including supervisory relays under the mandatory maintenance and testing provisions of the PRC-005 Reliability Standard.

While NERC supports the standard as proposed, NERC acknowledges the issues the Commission raises in the NOPR regarding the inclusion of maintenance and testing of certain supervisory devices for autoreclosing. In light of the Commission's concerns, NERC suggests modifying the proposed Reliability Standard to include maintenance of supervision functions for which a failure can result in autoreclosing into a fault and potentially cause generating unit or plant instability. NERC would support the addition of voltage supervision and, where used, supervisory inputs associated with selective autoreclosing in the coverage of PRC-005.[7] The analysis in the report by the System Analysis and Modeling Subcommittee ("SAMS") and System Protection and Control Subcommittee ("SPCS") ("SAMS/SPCS Report")[8] identified that

---

5 NOPR at P 30.

6 *Id.* (citing *Interpretation of Protection System Reliability Standard*, Order No. 758, 138 FERC ¶ 61,094 at P 24) (2012)). In Order No. 758, the Commission explains that that "a misoperating or miscoordinated reclosing relay may result in the reclosure of a Bulk-Power System element back onto a fault or that a misoperating or miscoordinated reclosing relay may fail to operate after a fault has been cleared, thus failing to restore the element to service." The Commission goes on to explain that misoperated or miscoordinated relays may result in damage to the Bulk-Power System such as excessive shaft torques and winding stresses and exposure of circuit breakers to systems conditions less than optimal for correct operation. Order No. 758 at P 24.

7 In preparing these comments, NERC has reviewed the SAMS/SPCS Report, which provides a thorough analysis of the Commission's concern that autoreclosing failures may impact reliable operation of the Bulk-Power System following reclosure of a Bulk-Power System element back onto a fault, or failure of a reclosing relay to operate after a fault has been cleared, thus failing to restore the element to service. NERC has also consulted with its internal subject matter experts on which supervisory devices should be included within NERC's PRC-005 standard to meet the Commission's concerns raised in the NOPR and ensure entities properly maintain the devices in order to minimize the risk of failure.

8 As noted in the Petition, the SAMS and SPCS jointly performed a technical study to determine which reclosing relays should be addressed within PRC-005 and provide advice to the Standard Drafting Team regarding appropriate maintenance intervals and activities for those relays. *See* NERC Petition at Ex. D.

the failure mode of concern is associated with premature autoreclosing into a fault, which creates the potential for generating unit or plant instability. As noted in the SAMS/SPCS Report, this may occur due to a timing failure in the autoreclosing relay or when a supervision failure results in autoreclosing into a dead-line with a fault when this closing is not intended. Autoreclosing into a fault when dead-line closing is not intended could result from failure of voltage supervision or, when used, failure of a selective autoreclosing input, such as a protective relay output that blocks autoreclosing following a three-phase fault.

NERC would also support the addition of synchronism check supervision. Undesired autoreclosing due to a supervision failure is an infrequent, unplanned disturbance, which falls into the category of unplanned and unavoidable disturbances contemplated in the accepted industry practice for switching near generating stations. For these reasons, NERC asserts that synchronism check failures do not have the potential to affect reliable operation of the Bulk-Power System. However, NERC acknowledges that including synchronism check supervision, as suggested by the Commission, would provide a reliability benefit. Therefore, NERC supports the addition of this device to meet the Commission's concerns. NERC also notes that if the Commission decides to direct inclusion of synchronism check relays in PRC-005-3, the incremental burden on entities to include these within the maintenance and testing program would not be significant.

Inclusion of the maintenance and testing of the above identified devices would: (1) address the Commission's concerns set forth in the NOPR; (2) meet a reliability concern related to "Supervision Function Failures" as identified in the SAMS/SPCS Report[9]; and (3) not be

[9] SAMS/SPCS Report, Ex. D of NERC's Petition at 6.

unduly burdensome to industry to include verification of these permissive inputs in all cases where an autoreclosing relay is subject to PRC-005-3.

If the Commission issues its proposed directive, NERC requests that the Commission direct NERC to develop modifications to PRC-005-3 to include only those supervisory devices related to autoreclosing that are needed to directly address the Commission's concerns raised in the NOPR.[10] A clear and limited directive would provide industry with certainty as to which supervisory devices need to be included in PRC-005-3 in order to address the issues identified by the Commission. In addition, NERC asks the Commission to provide its position on whether the devices identified in NERC's comments would address the Commission's concerns. The Commission's opinion on NERC's suggested additions to the PRC-005 standard would assist NERC during the standard development process to design modifications that would ultimately meet the Commission's concerns related to supervisory devices.

B. Clarification of SAMS/SPCS Report Findings on Synchronism Check Relays

In the NOPR, the Commission states "NERC has not explained in its petition how failure of a synchronism check relay for *undesirable conditions*, such as when static angles are greater than designed, would not allow autoreclosing and, consequently the concern discussed in Order No. 758."[11] The Commission further states that SAMS and SPCS dismissed the need to consider supervision failures because the subcommittees believe supervisory device failures to be a small subset of autoreclosing failures.[12]

---

[10] Some industry participants questioned NERC as to whether the Commission's directive was to include all supervisory devices used in conjunction with an applicable autoreclosing relay.

[11] NOPR at P 30.

[12] The NOPR also states that the Commission rejected almost identical arguments in Order No. 733 regarding inclusion of supervisory relays. NERC asserts that the circumstances related to autoreclosing supervision is substantially different as explained in these comments, because the SAMS/SPCS Report does not use this as a sole basis for excluding supervisory devices; rather, the report only cites the infrequent nature of certain failures in relation to accepted industry practice to conduct planned switching operations, such as simple line restoration, in a

NERC asserts that the Commission has read the SAMS/SPCS Report discussion out of context. The SAMS/SPCS Report does state that premature autoreclosing due to a supervision failure is a small subset of autoreclosing failures (the overwhelming majority of autoreclosing failures are failure to close) and is an infrequent, unplanned disturbance. However, the SAMS/SPCS Report does not use this statement to dismiss concern with all supervisory device failures. Rather, this statement is one part of the rationale regarding why it is not necessary to consider the incremental shaft fatigue that may occur for infrequent events as the basis for whether to include maintenance and testing of autoreclosing relays in PRC-005. The SAMS/SPCS Report explains that autoreclosing when static angles are greater than designed contributes to cumulative shaft fatigue, rather than impacting reliable operation of the Bulk-Power System. The SAMS/SPCS analysis concludes that the incremental shaft fatigue is acceptable because, consistent with accepted industry guidance, planned switching operations (e.g., simple line restoration) are conducted in a way that avoids significant contribution to cumulative shaft fatigue. Entities typically implement this guidance at generating stations by using time-delayed autoreclosing to allow shaft oscillations to dampen, and/or live-line autoreclosing or autoreclosing with synchronism check supervision to minimize shaft torque. By conducting planned switching in this manner, nearly all of the fatigue capability of the shaft is preserved to withstand the impact of unplanned and unavoidable disturbances such as faults, fault clearing, reclosing into system faults, and emergency line switching.

III. Proposed Directives Regarding Applicability Thresholds and Data Collection

In the NOPR, the Commission summarizes that NERC's proposed Reliability Standard would, consistent with Order No. 758, expand the scope of the Protection System maintenance

way that preserves fatigue capability of generating unit shafts to withstand the impact of unplanned and unavoidable disturbances.

Reliability Standard requirements to apply to a limited subset of autoreclosing relays.[13] The Commission states that NERC provided technical support for the applicability thresholds in the proposed Reliability Standard through both the SAMS/SPCS Report and the NERC study of the ten-mile threshold.[14] Despite the support NERC provides for the thresholds, the Commission, without elaboration, finds that it "nonetheless ha[s] concerns whether the thresholds are too narrow and that the standard therefore does not encompass a comprehensive set of autoreclosing relays that could affect the reliable operation of the Bulk-Power System."[15]

The Commission proposes that NERC submit a report, two years after the effective date of the standard, addressing the effectiveness of the autoreclosing provisions based on (1) actual operations data, and (2) simulated system conditions from planning assessments. For actual operations data, the Commission proposes that NERC enhance the granularity of its misoperations database to gather relevant information regarding events that involve autoreclosing relays, such as distance from the fault, whether the relay reclosed into the fault, and whether that reclosure caused or exacerbated an event. The Commission further proposes that NERC continue this enhancement of its data collection on a going forward basis. The Commission also suggests that simulated contingency analyses, generated as part of planning assessments, could serve as an appropriate benchmark or metric to assess whether the right set of autoreclosing relays is included in the proposed Reliability Standard, or whether further enhancements or modifications are appropriate to include those autoreclosing relays that affect reliable operation of the Bulk-Power System. The Commission proposes to require NERC to submit a report two years after the effective date of Reliability Standard PRC-005-3, comparing

---

13 NOPR at P 21.

14 *Id.* (citing NERC Petition at 15-21 and Ex. D at 2-7).

15 *Id.* at P 22.

the set of reclosing relays identified as having an impact on reliability using the contingency analyses generated under TPL-001-4, versus the set of relays covered by PRC-005-3.[16]

While NERC supports the Commission's proposal to approve the proposed Reliability Standard, NERC does not support the Commission's proposed directives related to further data collection and verification of the applicability thresholds as currently drafted in the NOPR. NERC is generally not opposed to measuring the effectiveness of a proposed Reliability Standard through analysis of data. However, in this case, the Commission has not justified why further evaluation of the effectiveness of the proposed applicability thresholds is necessary in the short term or why NERC should continue data collection of misoperations information for automatic reclosing on a going forward basis.[17] Further, NERC contends it has supported its proposed approach in the Reliability Standard and requests that the Commission limit its action regarding the applicability thresholds to approval and allow NERC and industry to focus their time and attention on implementing the proposed Reliability Standard.

A. NERC Support of the Applicability Thresholds

As explained in NERC's petition, the applicability thresholds meet the recommendations of the SAMS and SPCS, which conducted a lengthy review of the use of reclosing within the Bulk-Power System. The applicability section also reflects the agreement, input, and support of NERC's standard drafting team and the industry ballot body that approved the standard. In addition, prior to submitting these comments, NERC reviewed current event analysis data with respect to automatic reclosing failures to determine whether the standard drafting team failed to include applications of automatic reclosing that caused or contributed to an event. NERC

[16] *Id*. at P 26.

[17] NERC also notes that the Commission has not estimated the burden of these collections in the NOPR in its "Information Collection" analysis.

reviewed all 507 qualified events reported since the inception of the NERC Event Analysis Process in October 2010. Of the 507 events, 34 events have relay failures as a part of the event. None of these relay failures included applications of automatic reclosing failures that impact Bulk-Power System reliability.

The Commission also acknowledges in the NOPR that NERC has supported the applicability thresholds in the proposed Reliability Standard through the SAMS/SPCS Report and NERC's petition[18] and that the proposed standard adds automatic reclosing in a manner that is "consistent with the Commission's directive in Order No. 758."[19] In Order No. 758, the Commission agreed with NERC that it is reasonable to require maintenance and testing where reclosing relays are applied to meet performance requirements in approved NERC Reliability Standards, or where automatic restoration of service is fundamental to derivation of an Interconnection Reliability Operating Limit ("IROL").[20] The Commission also noted that a misoperating or miscoordinated reclosing relay may result in the reclosure of a Bulk-Power System Element back onto a fault or that a misoperating or miscoordinated reclosing relay may fail to operate after a fault has been cleared, thus failing to restore the Element to service. As explained in the SAMS/SPCS Report, failure to restore an element to service cannot impact reliable operation of the Bulk-Power System or be fundamental to establishing the transfer limit associated with an IROL because the system must be planned and operated to address the potential that a permanent fault prevents successful autoreclosing. Autoreclosing into a permanent fault results in a more severe system response than a failure to reclose, with the same result that the faulted element is not restored to service. The SAMS/SPCS Report identified that

---

18 NOPR at P 21.

19 *Id*. at P 26.

20 Order No. 758 at P 23.

the only exception is when autoreclosing is an integral part of a Special Protection System, and the proposed Reliability Standard addresses this exception by including autoreclosing applied as an integral part of a Special Protection System.[21]

The Commission further agreed in Order No. 758 with a commenter that states "specific requirements or selection criteria should be used to identify reclosing relays that affect the reliability of the Bulk-Power System."[22] NERC has created, proposed, and supported such criteria in the applicability section. The Commission continues in Order No. 758 by stating that the Reliability Standard should "provide the Transmission Owner, Generator Owner, and Distribution Provider with the discretion to include in a Protection System maintenance and testing program only those reclosing relays that the entity identifies as having an effect on the reliability of the Bulk-Power System."[23] The proposed standard establishes continent-wide criteria for inclusion of autoreclosing relays. The proposed standard also provides entities the ability to exclude autoreclosing relays, based on application of a defined test, in cases where the entity can demonstrate an autoreclosing failure will not impact reliable operation of the Bulk-Power System. This approach results in a robust solution to address the concern by ensuring consistent application on a continent-wide basis.

In addition, NERC staff and standard drafting team members engaged Commission staff throughout the standard development process to ensure that the standard was adequately covering Automatic Reclosing that may have an effect on the reliability of the Bulk-Power System. As a result of that input from Commission staff, NERC developed and provided the

---

[21] NERC notes that inclusion of autoreclosing applied as an integral part of a Special Protection System addresses the Commission concern with an event that ultimately resulted in the loss of over 4,000 MW of generation and multiple 765 kV lines.

[22] Order No. 758 at P 26.

[23] *Id*.

Commission with specific technical analysis of the 10-mile threshold used in the applicability section 4.2.6.2.[24]

Therefore, as discussed above, NERC believes that the coverage of Automatic Reclosing in the applicability section of the Reliability Standard has met all of the Commission's stated concerns in Order No. 758 with respect to setting the applicability of the proposed Reliability Standard and should be approved without additional compliance work necessary. As discussed above and in the SAMS/SPCS Report, the addition of specific supervisory functions to the proposed standard, fully addresses the Commission's concern in Order No. 758 with reclosure of a Bulk-Power System element back onto a fault.

B. Commission Concerns Regarding Applicability Thresholds

As previously noted, the Commission concludes in the NOPR that it "nonetheless ha[s] concerns whether the thresholds are too narrow and that the standard therefore does not encompass a comprehensive set of autoreclosing relays that could affect the reliable operation of the Bulk-Power System."[25] Without a more detailed description of the Commission's concerns regarding the applicability thresholds, NERC and the industry are unable to meaningfully comment on the Commission's proposal. The Commission has not adequately explained the need for further support of the proposed applicability thresholds to justify the additional burden on NERC and industry to collect, analyze, and report back to the Commission on the results, let alone permanently expand data collection indefinitely related to automatic reclosing. NERC asks that the Commission refrain from issuing any directive regarding measuring the effectiveness of the applicability thresholds through data collection and reporting and engage

[24] Section 4.2.6.2 includes Automatic Reclosing applied on the terminals of all Bulk Electric System Elements at substations one bus away from generating plants specified in applicability section 4.2.6.1 when the substation is less than 10 circuit-miles from the generating plant substation.

[25] NOPR at 22.

NERC staff informally to address any concerns that the Commission may have. In the event that the Commission chooses to issue its directive, NERC requests that the Commission identify its specific concerns regarding the applicability thresholds in its final rule so that NERC is able to measure the effectiveness of the standard in a way that will address remaining concerns the Commission may have in the subsequent report. This detail will also allow NERC to limit the data collection scope to just the information necessary to meet the Commission's concerns.

The Commission has not identified a specific reliability concern for NERC to monitor or address through the additional data collection and report other than to verify the effectiveness of the standard. NERC asserts that a follow-up report is not justified since NERC adequately supports the applicability thresholds and the Commission signaled in Order No. 758 that only a subset of autoreclosing relays need to be covered in the PRC-005 standard. NERC does not see a compelling need to expand data collection at this time prior to the proposed standard's implementation. NERC and the Commission staff can revisit this issue at any time on an informal basis. NERC also uses a number of methods to measure the effectiveness of standards, not just data collection, including review by technical committees or subcommittees, periodic reviews through the standard development process, and other technical reviews as deemed necessary. NERC also continuously monitors effective Reliability Standards for issues through its compliance and enforcement program and in response to events analysis findings. NERC would have the option to pursue an expansion of its data collection efforts through Section 1600 of the NERC Rules of Procedure if at any time it determines that the reliability reason for a collection justifies the burden imposed on industry due to reporting.

C. Use of Contingency Analyses in TPL-001-4

As a separate matter, the NOPR asks NERC to address whether the information generated pursuant to the contingency analyses required by Requirement R4 of TPL-001-4 would provide a meaningful metric or benchmark in analyzing the scope of PRC-005-3. Based on NERC's understanding of the NOPR proposal regarding using TPL-001-4 as a source of information, NERC notes that simulations of autoreclosing in planning assessments pursuant to TPL-001-4 only assess the impact of successful autoreclosing (no fault present and the element is restored to service) and unsuccessful autoreclosing into a fault. The former case is the desired outcome and provides no information relative to the Commission's concern. The latter case will assess correct operation of an autoreclosing relay when a fault is still present, but will not provide information regarding the potential impact of an autoreclosing failure that may result in premature reclosing into a fault. Therefore, use of the contingency analyses in the context of measuring the effectiveness of the applicability thresholds in the proposed standard may not return meaningful information.

IV. Record Retention

As noted by the Commission, the proposed standard retains the same evidence retention requirements approved in PRC-005-2, which require entities to maintain documentation of maintenance activities for the longer of: (1) the two most recent performances of each distinct maintenance activity for the component; or (2) all performances of each distinct maintenance activity for the component since the previous scheduled audit date.[26] This could result in entities retaining evidence for up to twenty-four years (two maintenance cycles). The Commission seeks comment regarding the reasonableness of the proposed data retention obligations.

[26] NOPR at 33.

NERC has consulted with its compliance staff and determined that there is not a substantial need to maintain the records for two full cycles. NERC is currently balloting changes to the PRC-005 Reliability Standard in Project 2007-17.3 (PRC-005-X) Protection System Maintenance and Testing - Phase 3 (Sudden Pressure Relays)[27] and has revised the compliance section. The last ballot of the draft standard in Project 2007-17.3 achieved industry approval and will now transition to a final ballot in preparation for NERC Board of Trustees adoption and submission to the Commission. The compliance section now requires Transmission Owners, Generator Owners, and Distribution Providers to keep documentation of the most recent performance of that maintenance activity for the relevant Component in cases where the interval of the maintenance activity is longer than the audit cycle. In cases where the interval of the maintenance activity is shorter than the audit cycle, documentation of all performances of that maintenance activity for the Component since the previous scheduled audit date must be retained.

V. Conclusion

For the reasons set forth above, NERC respectfully requests that the Commission accept these comments for consideration.

Respectfully submitted,

/s/ William H. Edwards

UNITED STATES OF AMERICA
Before the
FEDERAL ENERGY REGULATORY COMMISSION

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION	**)** **)** **)**	**Docket No. RR14-6-000**

REQUEST OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION TO SUBMIT REVISIONS TO THE 2015 BUDGET AND ASSESSMENTS OF PEAK RELIABILITY, INC. TO REFLECT ADDITIONAL REVENUES FROM BRITISH COLUMBIA HYDRO AND POWER AUTHORITY

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC") hereby requests to submit certain revisions to the 2015 Business Plan and Budget of Peak Reliability, Inc. ("Peak"), including a revised schedule of assessments which reduces Peak's 2015 assessments to all load serving entities and designees ("LSEs") in the U.S. and Mexico portions of the Western Electricity Coordinating Council ("WECC") region from the assessment amounts submitted in NERC's original August 22, 2014 filing in this docket. The revised budget and assessment schedules reflect that on October 8, 2014, Peak entered into an agreement with the British Columbia Hydro and Power Authority ("BC Hydro"), pursuant to which BC Hydro's Balancing Authority Area will remain part of the Peak Reliability Coordination Area in the Western Interconnection ("Agreement"). Under the Agreement, BC Hydro will pay its full assessment (determined using the Net Energy for Load ("NEL") method) to Peak for 2015 (and subsequent years during the term of the Agreement) and 50 percent of its assessment for 2014.

On September 30, 2014, in Docket No. RR13-9-003, the Commission approved NERC's petition for a special assessment for Peak. The need for the special assessment was based on the fact that BC Hydro and the Alberta Electricity System Operator ("AESO") had not paid their

2014 assessments to Peak.[1] The original Peak assessment to BC Hydro for 2014 was $2,073,380 (which represents 7.012% of total 2012 NEL in WECC). Pursuant to the Agreement, BC Hydro has now agreed to make a payment to Peak of $1,036,690 (50 percent of the original assessment) for 2014. Invoices have already been issued to the U.S. and Mexico LSEs in the WECC region for the 2014 special assessment approved by the Commission, and it would be confusing and administratively cumbersome to now attempt to issue revised invoices for the special assessment reflecting the payment that Peak will receive from BC Hydro for 2014. Therefore, Peak is proposing to treat the $1,036,690 payment from BC Hydro as other funding (a "Contracted Assessment") for 2014, which will increase Working Capital Reserve at December 31, 2014. The $1,036.690 increase in Working Capital Reserve in turn is being used (as described below) to reduce the 2015 Peak assessments to all U.S. and Mexico LSEs in the WECC region.

Similarly, NERC's original August 22, 2014 filing in this docket included a proposed schedule of 2015 assessments for Peak which did not allocate any portion of Peak's 2015 funding requirement to BC Hydro or the AESO. No assessments were allocated to BC Hydro or AESO because, at that time, these entities had not paid their 2014 assessments to Peak nor entered into any agreements to provide compensation or revenue to Peak for 2015.[2] Based on the Agreement, BC Hydro will now pay an assessment to Peak of $3,063,771 for 2015.[3] The amount of this BC Hydro assessment for 2015 reduces the originally-proposed 2015 Peak assessments to all U.S. and Mexico LSEs in the WECC region on a pro rata basis based on NEL.

The overall impact is that for 2015, the payments from BC Hydro of $1,036,690 for 2014 and the assessment to BC Hydro of $3,063,771 for 2015 is being used by Peak to reduce the

[3] As shown on **Attachment 3**, BC Hydro's NEL for 2013 (the NEL data used to determine 2015 assessments) is 7.303% of the total NEL in the WECC region excluding the NEL of the AESO.

originally-proposed 2015 assessments to all U.S. and Mexico LSEs in the WECC region by $4,100,461, with the reduction allocated among those LSEs on the basis of NEL.

This filing includes the following three attachments:

Attachment 1 to this filing is a revised Total Statutory Statement of Activities, Fixed Assets Expenditures and Changes in Working Capital for Peak for 2015, reflecting the Agreement and in particular the receipt of the 2014 Contracted Assessment from BC Hydro.

Attachment 2 is a revised Table B-1, Working Capital Reserve Analysis for Peak for 2014-2015, reflecting the Agreement and in particular the impact of the Contracted Assessment payment from BC Hydro in reducing Peak's 2015 assessment requirement.

Attachment 3 is a revised 2015 assessment schedule for Peak, showing the calculation of the revised 2015 Peak assessments for all U.S. and Mexico LSEs in the WECC region.

Peak is proposing to replace the assessment schedule submitted in its 2015 Business Plan and Budget included in NERC's original August 22, 2014 filing in this docket with the revised assessment schedule in **Attachment 3**. NERC therefore requests that the Commission issue an order approving the revised 2015 assessment schedule as expeditiously as possible, so that invoices can be issued for Peak's 2015 assessments based on the revised assessment schedule.

III. DISCUSSION

On July 23, 2014, NERC filed a petition in Docket No. RR13-9-003 requesting authority for a supplemental assessment for Peak for 2014, in the total amount of $4,030,696 to U.S. LSEs in the WECC region. The basis for the request was that BC Hydro and AESO had not paid their 2014 assessments to Peak, totaling $ 4,094,340.[4] As stated in that petition, BC Hydro's unpaid assessment for 2014 was $2,073,380. On September 30, 2014, the Commission issued the Peak Special Assessment Order approving the requested special assessment. WECC, as billing agent for Peak, promptly issued invoices to LSEs for the special assessment amounts authorized by the Commission. In the Peak Special Assessment Order, the Commission also directed, as proposed by NERC, that "if Peak Reliability receives any compensation from AESO or BC Hydro for 2014, Peak Reliability use the amount received as a funding source to reduce its requested assessment in the next year for which it submits a budget."[5]

On August 22, 2014, NERC submitted its 2015 Business Plan and Budget filing in this docket, which included Peak's proposed 2015 Business Plan and Budget and proposed assessments.[6] Peak's proposed 2015 assessments as submitted in that filing did not include any assessments to BC Hydro (or the AESO), because at that time, neither entity had paid its 2014 assessment to Peak nor agreed to pay assessments or other compensation to Peak for 2015.

On October 8, 2014, Peak entered into the Agreement with BC Hydro, pursuant to which BC Hydro's Balancing Authority Area will remain part of the Peak Reliability Coordination Area in the Western Interconnection. Under the Agreement, BC Hydro will pay its full assessment to Peak for 2015 (and subsequent years during the term of the Agreement) and 50

[4] The difference between the total unpaid BC Hydro and AESO assessments ($4,094,340) and the requested special assessment amount to U.S. LSEs ($4,030,696), equal to $63,644, was allocated to the LSE in the Mexico portion of the WECC region.

[5] Peak Special Assessment Order at ¶10 and 13.

[6] Peak's schedule of proposed 2015 assessments to LSEs was included with its proposed 2015 Business Plan and Budget, which is Attachment 11 to the August 22, 2014 filing.

percent of its original assessment for 2014. The payment of 50 percent of Peak's original assessment for 2014 is equal to $1,036,690 (*i.e.*, $2,073,380 times 0.50 = $1,036,690).

In accordance with the directive in the Peak Special Assessment Order, Peak is proposing to use the payment of $1,036,690 that BC Hydro will make for 2014 to reduce Peak's requested assessments for 2015, in the manner described below. Similarly, by this filing, Peak is seeking to incorporate BC Hydro's agreement to pay a NEL-based assessment for 2015 into Peak's overall calculation of its 2015 assessments, thereby reducing Peak's 2015 assessments to all U.S. and Mexico LSEs in the WECC region from the amounts requested in the original August 22, 2014 filing in this docket.

Attachment 1 is a revised Total Statutory Statement of Activities, Fixed Assets Expenditures and Changes in Working Capital for Peak for 2015, reflecting the Agreement and in particular the receipt of the Contracted Assessment for BC Hydro.[7] Specifically, BC Hydro's payment of $1,036,690 for 2014 pursuant to the Agreement is now shown in Peak's 2014 Projection as Funding that was not included in Peak's 2014 Budget. As shown on **Attachment 2** (described in the next paragraph below), the $1,036,690 of additional funding for 2014 increases Peak's projected Working Capital Reserve at December 31, 2014, and is therefore used to reduce Peak's required 2015 assessment by that same amount of $1,036,690. In the "2015 Budget" column of **Attachment 1**, the Assessments amount of $40,916,546 is lower by $1,036,690 than the 2015 Assessments amount shown in Peak's original Total Statutory Statement of Activities in Attachment 11 to the August 22, 2014 filing in this docket (which was $41,953,236; *i.e.*, $41,953,236 minus $1,036,690 = $40,916,546).

Attachment 2 is a revised Table B-1, Working Capital Reserve Analysis for Peak for 2014-2015, reflecting the Agreement and in particular the impact of the Contracted Assessment

[7] Peak's original Total Statutory Statement of Activities, Fixed Assets Expenditures and Changes in Working Capital for 2015 appears on page 8 of Attachment 11 to NERC's August 22, 2014 filing in this docket.

payment from BC Hydro for 2014 in reducing the 2015 assessment requirement.[8] BC Hydro's Contracted Assessment payment of $1,036,690 for 2014 is now shown as funding received in 2014, which increases Peak's projected Working Capital Reserve at December 31, 2014 to $1,162,175 from the amount of $125,485 shown on original Table B-1. With the higher Working Capital Reserve at December 31, 2014, the adjustment to Peak's 2015 assessments to achieve its target Working Capital Reserve at December 31, 2015 of $3,230,000 (which is not changed from original Table B-1) is $2,067,825; this number is $1,036,690 lower than the adjustment amount of $3,104,515 shown on original Table B-1. As a result, Peak's required 2015 assessment shown on the revised Table B-1 is $40,916,546, which is $1,036,690 lower than the 2015 assessment amount of $41,953,236 shown on original Table B-1.

Attachment 3 shows the calculation of the revised 2015 assessments to all LSE's (excluding AESO) in the WECC Region. Each LSE's percentage of total NEL is now calculated based on a total 2013 regional NEL amount that includes BC Hydro's NEL of 59,004,439 Mwh (*see* Column 5). BC Hydro's percentage of the total NEL is 7.303% (*see* Column 7); the NEL percentages of all U.S. and Mexico LSEs in the WECC region are corresponding reduced from the percentages shown in Peak's original 2015 assessment schedule. The revised NEL percentages are used to reallocate the original 2015 assessment amount of $41,953,236 among the LSEs, as shown in Column 11. Then, the assessment amount for each LSE except BC Hydro is further reduced by its allocated (based on its NEL percentage) share of BC Hydro's Contracted Assessment payment for 2014 of $1,036,690 (*see* Column 12). BC Hydro is excluded in this step so that its own 2015 assessment amount is not reduced as a result of its 2014 Contracted Assessment payment. Column 13 of **Attachment 3** shows the final, revised 2015 assessment amounts for BC Hydro and for each LSE in the U.S. and Mexico portions of the WECC region, based on the revised total 2015 Peak assessment amount of $40,916,546.

[8] Peak's original Table B-1 for 2015 appears at page 35 of its 2015 Business Plan and Budget, Attachment 11 to the August 22, 2014 filing in this docket.

The end result of the assessment calculation procedure shown on **Attachment 3** and described in the immediately preceding paragraph is that BC Hydro's 2014 Contracted Assessment payment of $1,036,690 and its 2015 assessment of $3,063,771 serve to reduce the 2015 assessments to all LSEs in the U.S. and Mexico portions of the WECC region from the amounts shown in Peak's original 2015 assessment schedule provided in Attachment 11 to NERC's August 22, 2014 filing in this docket.

As noted earlier, promptly after the Commission issued the Peak Special Assessment Order on September 30, 2014, WECC, as billing agent for Peak, issued invoices to LSEs in the U.S. and Mexico portions of the WECC region for the special assessment amounts. For this reason, it would be confusing and administratively cumbersome to now attempt to issue revised invoices for the special assessment reflecting the payment that Peak will receive from BC Hydro for 2014 pursuant to the Agreement. Therefore, Peak is proposing to use the $1,036,690 payment from BC Hydro for 2014 in the manner described above to reduce 2015 assessments to LSEs in the U.S. and Mexico portions of the WECC region. Further, this approach complies with the directive in the Peak Special Assessment Order that "if Peak Reliability receives any compensation from AESO or BC Hydro for 2014, Peak Reliability use the amount received as a funding source to reduce its requested assessment in the next year for which it submits a budget."

As the Commission is aware, pursuant to its regulations at 18 C.F.R. §39.4(c), it issues its order on NERC's annual business plan and budget filings by November 2 of the year preceding the budget year. Invoices are then promptly issued to LSEs by NERC and, for LSE's in the WECC region, by WECC, for the assessment amounts for NERC, the Regional Entities and Peak, in order that revenues for the budget year can begin to be received in December of the preceding year and January of the budget year. Peak is proposing to replace its 2015 assessment schedule submitted in the original August 22, 2014 filing in this docket with the 2015 assessment schedule provided in **Attachment 3** to this filing. Therefore, Peak is requesting that the

Commission issue an order as expeditiously as possible approving the revised 2015 assessments in **Attachment 3**, so that WECC (as billing agent for Peak) can issue invoices for Peak's 2015 assessments during November 2015.

IV. CONCLUSION

For the reasons set forth herein, the Commission is respectfully requested to issue an order, as expeditiously as possible, approving the revisions to Peak's 2015 Business Plan and Budget provided in **Attachments 1** and **2** to this filing and authorizing Peak's revised 2015 assessments to U.S. LSEs in the WECC region shown in **Attachment 3** to this filing.

September 30, 2014

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC") hereby provides the 2014 Annual Report on Wide-Area Analysis of Technical Feasibility Exceptions (the "2014 Annual Report") in compliance with Paragraphs 220 and 221 of the Federal Energy Regulatory Commission's ("FERC" or "Commission") Order No. 706[1] and Appendix 4D of the NERC Rules of Procedure ("ROP").

In Order No. 706, FERC approved eight Critical Infrastructure Protection ("CIP") Reliability Standards and, among other things, directed NERC to develop a set of conditions or criteria that a Responsible Entity must follow to obtain a Technical Feasibility Exception ("TFE") from specific requirements in the CIP Reliability Standards.[2] The Commission stated that the TFE process must include: mitigation steps, a remediation plan, a timeline for eliminating the use of the TFE unless appropriate justification otherwise is provided, regular review of the continued need for the TFE, internal approval by senior managers, and regional approval through the Electric Reliability Organization ("ERO").[3]

Order No. 706 also required that NERC submit an annual report to the Commission that provides a wide-area analysis of the use of TFEs and their effect on Bulk-Power System reliability. The Commission stated:

> The annual report must address, at a minimum, the frequency of the use of such provisions, the circumstances or justifications that prompt their use, the interim mitigation measures used to address vulnerabilities, and efforts to eliminate future reliance on the exception. . . [T]he report should contain aggregated data with sufficient detail for the Commission to understand the frequency with which

[2] *Id.* at P 178.

[3] *Id.* at P 222.

> specific provisions are being invoked as well as high level data regarding mitigation and remediation plans over time and by region . . . .[4]

In October 2009, NERC filed amendments to its ROP to implement the Commission's directive in Order No. 706, proposing Section 412 (Requests for Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Reliability Standards) and Appendix 4D (Procedure for Requesting and Receiving Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Reliability Standards). In a January 21, 2010 order, the Commission approved NERC's amended ROP.[5]

On April 8, 2013, NERC filed revisions to Appendix 4D of the ROP to streamline the TFE approval process reflecting NERC, Regional Entity and industry experience processing TFE requests since the inception of the program. On September 3, 2013, FERC approved the proposed revisions and directed limited revisions to Appendix 4D, including modifications to: (1) specify a time frame for reporting Material Changes to TFEs upon identification and discovery; and (2) require the annual TFE report to include information on Material Change Reports and TFE expiration dates.[6] NERC submitted a compliance filing consistent with the directives from the September 2013 Order, which the Commission approved on January 30, 2014.[7] Sections 11.2.4 and 13 of Appendix 4D set forth the requirements for the annual TFE report, as modified in

5 *North American Electric Reliability Corp.*, 130 FERC ¶ 61,050 (2010), *order on compliance*, 133 FERC ¶ 61,008 (2010) (October 1 Order), *order on reh'g*, 133 FERC ¶ 61,209 (2010), *order on compliance*, 135 FERC ¶ 61,026 (2011) (April 12 Order). The Commission requested further information and clarification regarding certain aspects of the TFE process. On April 21, 2010, NERC submitted its compliance filing in response to the January 21 Order. On October 1, 2010, the Commission issued an order accepting NERC's April 2010 filing as partially compliant and directing further changes to the TFE Procedure. October 1 Order, 133 FERC ¶ 61,008. On December 23, 2010, NERC submitted a compliance filing in response to the Commission's October 1 Order, which the Commission subsequently accepted. April 12 Order, 135 FERC ¶ 61,026.

III. 2014 ANNUAL REPORT

In accordance with Appendix 4D of the ROP, NERC prepared the 2014 Annual Report in consultation with the Regional Entities. The Regional Entities provided regular reports to NERC regarding the types of Covered Assets for which the Regional Entities have approved TFEs.[8] In addition, each Regional Entity provided information on the 10 elements identified in Section 13 of Appendix 4D to be included in the 2014 Annual Report. NERC compiled and analyzed the TFE data provided by the Regional Entities in preparation for the 2014 Annual Report.

In addition to the new information required by the September 2013 Order regarding Material Change Reports and TFE expiration dates, there are two other differences between the 2014 Annual Report and prior annual reports. First, as a result of the new streamlined TFE process approved in the September 2013 Order, there is no longer a two-step process for evaluating TFE requests. Prior to the revisions, the Regional Entities would conduct an initial review to determine

[8] As defined in Appendix 4D, a Covered Asset is a Cyber Asset or Critical Cyber Asset that is subject to a TFE.

whether the request was complete and could move to a formal ERO review (i.e., initial acceptance or rejection). Data regarding this initial step was included in prior annual reports.[9] As that initial step is no longer part of the TFE approval process and a request for a TFE proceeds directly to formal review, the 2014 Annual Report does not include any data on initial acceptances or rejections, only the number of TFE requests that were submitted and approved/disapproved.

Second, during the course of the reporting period for the 2014 Annual Report, Requirement R2.6 of Reliability Standard CIP-005-3a was retired.[10] Because TFEs for CIP-005-3a, Requirement R2.6 were only applicable for a portion of the reporting period and are not relevant going forward, the 2014 Annual Report does not include data on TFEs for CIP-005-3a, Requirement R2.6.

a. Elements Required by Appendix 4D, Section 13.1

The following is a summary of the TFE data reported by each Regional Entity for the 10 elements identified in Section 13.1 of Appendix 4D:[11]

1. *The frequency of use of the TFE Request process, disaggregated by Regional Entity and in the aggregate for the United States and for the jurisdictions of other Applicable Governmental Authorities, including (A) the numbers of TFE Requests that have been submitted, accepted/rejected, and approved/disapproved during the preceding year and cumulatively since the effective date of this Appendix, (B) the numbers of unique Covered Assets for which TFEs have been approved, (C) the numbers of approved TFEs that are still in effect as of on or about the date of the Annual Report; (D) the numbers of approved TFEs that reached their Expiration Dates or were terminated during the preceding year;*

[9] Tables 2 and 3 of the 2013 Annual Report included information on the initial acceptances and rejections, respectively.

[10] *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, 145 FERC ¶ 61,147 (2013).

[11] Unless stated otherwise, a table or reference to "2014" refers to the reporting period for this report: July 1, 2013 – June 30, 2014.

and (E) the numbers of approved TFEs that are scheduled to reach their Expiration Dates during the ensuing year.

a. TFE Requests that have been Submitted and Approved/Disapproved

During the 2014 reporting period (July 1, 2013 through June 30, 2014) there were 692 new TFE requests submitted, of which 611 were approved. For purposes of this report, "submitted" indicates a new request (as opposed to an amendment or change to a previously received request).[12] Table 1, below, provides the number of new TFE requests submitted to the ERO during the 2014 reporting period per CIP requirement and Region.

Totals	559	494	212	2559	1442	407	1306	2936	9915

Tables 5 and 6 show the cumulative number of TFEs that the ERO has approved and disapproved, respectively, since the inception of the program. As noted above, because the TFE program prior to the revisions to Appendix 4D approved in the September 2013 Order included an initial "Accepted/Rejected" phase, the totals in Tables 5 and 6 do not match the totals from Table 4. Numerous submissions included in Table 4 were initially rejected and sometimes more than once. Tables 5 and 6 only reflect those TFE requests that were accepted in the initial stage and ultimately approved or disapproved. Additionally, the automated tracking of amendments early in the TFE program resulted in amendments to existing requests or active TFE to be counted in the same way as the submission of an a new TFE request. As such, the aggregated "submissions" total in Table 4 is significantly includes both new requests and amendments and is different from the "Approved" and "Disapproved" total of new TFE requests.

b. Number of Unique Covered Assets for which TFEs have been Approved

Tables 7a and 7b provide the number of unique Covered Assets for which the ERO has approved TFEs. Specifically, Table 7a details the numbers of assets, by Regional Entity, covered by TFEs for the respective requirements. Table 7b takes the total number of assets and groups them by category. Table 8 provides several examples of devices that are not clearly assigned to the more common categories and listed as "Other" in Table 7b.

2. *Categorization of the submitted and approved TFE Requests to date by broad categories such as the general nature of the TFE Request, the Applicable Requirements covered by submitted and approved TFE Requests, and the types of Covered Assets that are the subject of submitted and approved TFE Requests.*

NERC and the Regional Entities categorize submitted and approved TFEs by Applicable Requirement and type of Covered Asset. The types of Covered Assets for which the ERO has approved TFEs has remained generally consistent since the program's inception. Tables 7a, 7b, and 8, above, provide details about the types of Covered Assets that are the subject of submitted and approved TFE requests. Further, Tables 1-4 identify the Applicable Requirements for which the ERO has approved or disapproved TFEs.

3. *Categorization of the circumstances or justifications on which the approved TFEs to date were submitted and approved, by broad categories such as the need to avoid replacing existing equipment with significant remaining useful lives, unavailability of suitable equipment to achieve Strict Compliance in a timely manner, or conflicts with other statutes and regulations applicable to the Responsible Entity.*

The categories of circumstances or justifications on which TFEs to date were submitted and approved have not changed since the inception of the TFE program. They include:

- Not technically possible
- Operationally infeasible

- Precluded by technical limitations
- Adverse effect on bulk electric system reliability
- Cannot achieve by compliance date
- Excessive cost that exceeds reliability benefit
- Conflicts with other statutory or regulatory requirement
- Unacceptable safety risks

4. *Categorization of the compensating measures and mitigating measures implemented and maintained by Responsible Entities pursuant to approved TFEs, by broad categories of compensating measures and mitigating measures and by types of Covered Assets.*

As described in previous annual reports, Regional Entities find that Responsible Entities are employing multiple strategies to protect Covered Assets that are unable to meet applicable Reliability Standards. Typically, Responsible Entities apply more than one strategy to mitigate the risk posed by a TFE. The principal strategies employed include protecting devices with physical and logical security controls. A significant portion of compensating and mitigating measures involve firewalls, the use of Intrusion Detection and Intrusion Prevention systems, and strong access policies.

The compensating and mitigating measures used most often is an Electronic Security Perimeter ("ESP"). Other significant compensating and mitigating measures deployed include Physical Security Perimeter ("PSP"), Authentication, Intrusion Detection and Prevention ("IDS/IPS"), and System Status Monitoring. Table 13 provides information on the common compensating and mitigating measures reported by the Regional Entities. As described below, the use of these compensating and mitigating measures has resulted in adequate protection for the bulk electric system.

Table 12: Compensating & Mitigating Measures	
Electronic Security Perimeter (ESP)	Covered Assets asserted in the TFE are protected as they reside within a defined ESP and access to/from these assets is controlled via defined access points.
Physical Security Perimeter (PSP)	Covered Assets asserted in the TFE are protected as they reside within a defined PSP and access to these assets is controlled via defined access points.
Status Monitoring	Covered Assets are protected by implementation of System Status Monitoring of all cyber assets residing within a defined ESP. Detection and alerting of system state and condition provides early warning and proactive troubleshooting and corrective action.
Enhanced Authentication	Access to Covered Assets asserted in the TFE and all cyber assets that reside within a defined ESP are protected by multi-factor authentication services (*e.g.* , SecurID, Biometrics).
Intrusion Detection and/Prevention Systems	Covered Assets asserted in the TFE are protected by network or host based IDS/IPS services. Anomalous data traffic is detected and alerted on and/or prevented from affected Covered Assets.
Training	Covered Assets are protected by general cyber security training and awareness related to CIP-004 or augmented training is provided due to the lack of strict compliance.
Host-Based Malware Prevention	When Covered Assets asserted in a TFE cannot implement anti-virus or anti-malware tools, they are protected by all other cyber assets within a defined ESP having these security controls installed and managed. Propagation of viruses (*e.g.* , Trojans) to Critical Cyber Assets (CCAs) is a low risk.
Physical Monitoring	When other mandatory controls cannot be implemented, Covered Assets and/or access to them are physically monitored by Responsible Entity staff.
Data Encryption	When other mandatory controls cannot be implemented, data is encrypted between cyber assets to protect data confidentiality.

5. *For each TFE Request that was rejected or disapproved, and for each TFE that was terminated, but for which, due to exceptional circumstances as determined by the Regional Entity, the Effective Date was later than the latest date specified in Section 5.1.5, 5.2.6, or 9.3, as applicable, a statement of the number of days the Responsible Entity was not subject to imposition of findings of violations of the Applicable Requirement or imposition of penalties or sanctions pursuant to Section 5.3.*

All eight Regional Entities reported that during the 2014 reporting period there were no instances of rejection, disapproval, or termination of TFE requests where the effective date was extended past the latest date specified in Section 5.1.5, 5.2.6, or 9.3, as applicable.

6. *A discussion, on an aggregated basis, of Compliance Audit results and findings concerning the implementation and maintenance of compensating measures and mitigating measures, and the implementation of steps and the conduct of research and analyses to achieve Strict*

Compliance with the Applicable Requirements, by Responsible Entities in accordance with approved TFEs.

The TFE Procedure, in conjunction with the Compliance Monitoring and Enforcement Program ("CMEP"), is the framework that Regional Entities use to review and audit TFE requests. During a compliance audit, a Responsible Entity that has a TFE for a particular requirement is *not* evaluated against the applicable Reliability Standard for which a TFE was accepted and approved. Instead, the Responsible Entity is evaluated against the alternative compliance obligations assumed by the Responsible Entity (*i.e.*, compensating and mitigating measures).

All eight Regional Entities have conducted Compliance Audits where approved or terminated TFEs were in scope. Typically, an audit of a Registered Entity with TFEs will be managed according to the TFEs that need to be reviewed; i.e., based on factors such as quantity, locations, etc. Reviews include interviewing subject matter experts specifically about TFEs, sampling evidence pertaining to a TFE's mitigating and compensating measures, etc. As was indicated in previous annual reports, Regional Entities continue to report that Responsible Entities are managing and maintaining their TFEs within the procedural requirements of Appendix 4D. Regional Entities have also issued audit findings that identify TFEs to be processed consistent with the CMEP.

7. *Assessments, by Regional Entity (and for more discrete areas within a Regional Entity, if appropriate) and in the aggregate for the United States and for the jurisdictions of other Applicable Governmental Authorities, of the wide-area impacts on the reliability of the Bulk Electric System of approved TFEs in the aggregate, including the compensating measures and mitigating measures that have been implemented.*

The Regional Entity representatives who are designated "TFE Managers" continue to hold regular meetings to discuss various topics, including those pertaining to issues related to the impact of TFEs. The consensus from those discussions is that there have been no negative wide-area

impacts on the reliability of the bulk electric system as a result of any TFEs. Any wide-area impact of approved TFEs on the reliability of the bulk electric system, in the aggregate, remains negligible.

The Regional Entities have reported similar experiences with the execution and management of the TFE process and the manner in which it impacted the reliability of the bulk electric system. Regional Entities reported that a large majority of Responsible Entities have implemented multiple compensating and mitigating measures for Covered Assets, and, in general, the mitigating and compensating measures of approved TFEs that were implemented in lieu of strict compliance with applicable CIP Reliability Standards accomplished the stated alternate compliance objective. As a result, the level of security for the bulk electric system achieved through the TFE process is comparable to strict compliance with the applicable Reliability Standards.

8. *Discussion of efforts to eliminate future reliance on TFEs.*

Regional Entities reported that they are undertaking a number of efforts to eliminate future reliance on TFEs, including:

- Upgrading or replacing Covered Assets that will enable implementation of security controls defined in CIP Standards and Requirements.
- Removing Critical Cyber Assets that are covered by approved TFEs that reside within defined ESPs.
- Retiring legacy systems that are now subject to coverage by an approved TFE.
- Implementing previously unused or unidentified functionality on Covered Assets that will achieve Strict Compliance with the Applicable Requirement

Where applicable, upgrades of Covered Assets will result in strict compliance without having to rely on TFEs.

In addition, efforts to better train personnel on the requirements of applicable Reliability Standards and coordination with Regional Entity compliance monitoring and enforcement staff

regarding the need for TFEs have led to the continuing decline of devices that rely on a TFE for compliance. Moreover, non-essential devices are also being evaluated for continued inclusion within a defined ESP. Where a device does not need to reside within the ESP for operational necessity, Covered Assets have been relocated outside of the ESP, eliminating the need for a TFE and reducing residual risk to devices remaining within the ESP.

The Regional Entities have observed that the primary barrier to the elimination of TFEs continues to be the inherent design of much BES equipment, particularly legacy equipment that is unable to satisfy various requirements of the CIP Standards. The anticipated implementation of the Version 5 CIP Reliability Standards will provide additional compliance options, but the need for TFEs will remain. Regional Entities have noted the difficulty in providing flexibility for future technology and security changes when developing a standard, thereby making it difficult to eliminate the TFE.

Additionally, the Regional Entities support requirements in the standards to use products that have been independently certified as offering adequate and appropriate security measures. Applying enhanced security features often requires that properly operating equipment be replaced with a more modern, secure models. Therefore, in order to eliminate the need for a TFE, replacement costs may become a barrier to implementing enhanced security features. Without a concerted and coordinated effort from industry, manufacturers will continue with the status quo.

9. *Data and information regarding Material Change Reports, including the number of Material Change Reports filed annually and information regarding the types of circumstances or events that led to Material Changes, as well as any additional information NERC believes would be useful.*

As Responsible Entities update their systems, replace equipment, and add assets to inventory, requests to modify existing TFEs have become more common. The update to the TFE procedure in Appendix 4D streamlined that process, moving from a formal approval process to the

submission of a "Material Change Report" ("MCR"). An MCR does not require approval by the respective Regional Entity, but information from an MCR is available to the Regional Entity and is helpful for subsequent compliance activities (e.g., audits, spot checks, self-certifications, etc.).

The revision to Appendix 4D was approved during the period covered by this report and Regional Entities are in the process of implementing the MCR process, which requires updating the compliance portals. Regional Entities and Responsible Entities use the portals to submit TFE data, and are being modified to support the submission of MCRs. From a reporting perspective, the ERO views TFEs that have were amended prior to the Appendix 4D revisions or changed via an MCR as the same, and for the purposes of the data in the 2014 Annual Report, the terms are synonymous. Table 13 provides the number of active TFE that were amended/changed during the 2014 reporting period.[13]

U.S. Entities only	Table 13: TFE Amendments & Changes during the Report Period

Table 14 provides additional data about active TFEs that were amended or changed during the reporting period. As indicated by that data, over two-thirds of the changes and amendments pertain to asset count changes and administrative updates.

[13] Approximately 1/3 of amendments/changes reported during the 2014 reporting period were submitted via MCRs.

Table 14: Request Categories – Amendments & Changes	
Category of Request	**Percentage**
Updates to asset data (added quantities, modify types, manufacturer, etc.)	**59%**
Updated security measures (procedural changes, implement new equipment, response to audit findings, etc.)	**22%**
Administrative (update point of contact information, correct typographical errors, termination date change, etc.)	**12%**
Other	**6%**

10. *Additional information about TFEs and their expiration dates, including the number of TFEs by expiration year and CIP Standard requirement, the percentage of currently approved TFEs without expiration dates, and the number of new TFEs approved without expiration dates annually.*

In the September 2013 Order, the Commission directed NERC to provide additional information in the annual reports related to TFEs with and without expiration dates. As has been the case in previous annual reports, the majority of TFEs (approximately 82%) do not have expiration dates. As shown in Table 15, below, of the 959 active TFEs, 787 TFEs do not have an expiration dates. TFEs are approved without expiration dates where the system, device, or technology in question is fundamentally unable to satisfy the corresponding CIP requirement, and there is no indication that such a capability is likely in the foreseeable future. In most cases, these open ended TFEs are considered to be the best approach for managing the applicable devices because of uncertainty about if or when compliant equipment will become available. Of the 172 TFEs with expiration dates, 116 are scheduled to expire in the ensuing year (see Table 11).

U.S. Entities only	Table 15: Active TFEs, Amended & Approved, with no Expiration Date (2014)

b. Consistency in Review, Approval and Disapproval of TFE Requests

Appendix 4D requires that NERC and the Regional Entities collaborate to assure "consistency in the review, approval and disapproval of TFE Requests…."[14] Also, as noted above, Section 11.2.4 of the NERC Rules of Procedure requires that NERC submit with each Annual Report certain information concerning the manner in which Regional Entities have made determinations to approve or disapprove TFE requests.

NERC has received no reports of inconsistency either in assessing the accuracy or validity of TFEs submitted by Responsible Entities, or in the decisions approving or rejecting TFEs. NERC and the Regional Entities review TFE requests for consistency. Primary and alternate representatives from each Regional Entity, facilitated by NERC staff, meet regularly to discuss common issues. Those representatives also led the efforts at their respective Regional Entities for receiving, reviewing, and reporting TFE-related data.

[14] Section 11 of Appendix 4D of the NERC Rules of Procedure.

In addition to regularly scheduled conference calls and face-to-face meetings, the TFE Managers communicate regularly by email and in person at workshops and regular meetings with the goal of reaching consistency among the Regional Entities on the pertinent issues.

IV. CONCLUSION

For the foregoing reasons, NERC respectfully requests that the Commission accept the 2014 Annual Report as compliant with the directives contained in Order No. 706, the September 2013 Order, and Appendix 4D of NERC's Rules of Procedure.

Respectfully submitted,

/s/ Shamai Elstein

Monitoring System Conditions - Transmission Operations Reliability Standard	**Docket No. RM13-12-000**
Transmission Operations Reliability Standards	**Docket No. RM13-14-000**
Interconnection Reliability Operations and Coordination Reliability Standards	**Docket No. RM13-15-000**

QUARTERLY STATUS REPORT OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION, THIRD QUARTER 2014

On December 20, 2013, the North American Electric Reliability Corporation ("NERC") filed a motion requesting that the Commission defer action, until January 31, 2015, to allow NERC time to consider the reliability concerns raised by the Commission in the November 21, 2013, Notice of Proposed Rulemaking ("NOPR") in connection with the revisions to the Transmission Operations ("TOP") and Interconnection Reliability Operations and Coordination ("IRO") Reliability Standards in the above-referenced dockets.[1] NERC committed to providing the Commission with quarterly reports regarding the status of revisions, and the instant filing is submitted consistent with that commitment. On January 14, 2014, the Commission granted NERC's motion to defer action until January 31, 2015.[2] On April 1, 2014, NERC filed a quarterly status report regarding standard development activities in the first quarter of 2014 and on July 1, 2014 NERC filed a quarterly status report for the second quarter of 2014. The following quarterly report addresses standard development activities in the third quarter of 2014, (*i.e.*, July 1, 2014 – September 30, 2014).

II. Status of Revisions – Project 2014-03

A. First Quarter 2014, January 1 – March 31, 2014

A Standards Authorization Request ("SAR") was submitted on February 12, 2014 to address the concerns identified by the Commission in the NOPR. A standard drafting team was appointed by the NERC Standards Committee on February 12, 2014. This project has been designated as 2014-03.[4]

Two technical conferences were held by NERC in March to facilitate discussion of the issues identified by the Commission in the NOPR.[5] An informal comment period was held from March 11, 2014 through March 24, 2014 to allow for industry comments on the topics discussed during the conferences, or suggestions for further consideration of issues identified in the NOPR.

---

[3] Persons to be included on FERC's service list are indicated with an asterisk. NERC requests waiver of 18 C.F.R. § 385.203(b) to permit the inclusion of more than two people on the service list.

[4] The project page is *available here*: http://www.nerc.com/pa/Stand/Pages/Project-2014-03-Revisions-to-TOP-and-IRO-Standards.aspx.

[5] The slides from the conferences are *available here*: http://www.nerc.com/pa/Stand/Prjct201403RvsnstoTOPandIROStndrds/top_iro_technical_conference_presentation_20140306.pdf.

These comments are posted on the project webpage as part of the development record and have been considered by the standard drafting team for Project 2014-03.[6]

B. Second Quarter 2014, April 1, 2014 – June 30, 2014

A standard drafting team meeting was held from April 8-10, 2014,[7] followed by a meeting from April 22-24, 2014.[8] Revisions to the IRO and TOP Reliability Standards were posted for a 45-day formal comment period from June 23, 2014 through July 2, 2014. Revisions to the defined terms "Operational Planning Analysis" and "Real-time Assessment" were also proposed and posted for comment. Initial ballots of the standards, definitions, and proposed implementation plan were conducted during the last ten days of the comment period, with the following results:

Reliability Standard	Approval
TOP-001-3 – Transmission Operations	30.99%
TOP-002-4 - Operations Planning	62.18%
TOP-003-3 – Operational Reliability Data	63.07%
IRO-001-4 – Reliability Coordination – Responsibilities	68.57%
IRO-002-4 – Reliability Coordination	36.94%
IRO-008-2—Reliability Coordinator Operational Analyses and Real-time Assessments	47.87%
IRO-010-2—Reliability Coordinator Data Specification and Collection	60.26%
IRO-014-3—Coordination Among Reliability Coordinators	61.67%
IRO-017-1 – Outage Coordination	57.94%

The definitions received an approval of 62.64% and the implementation plan received an approval of 64.70%.

[8] This information is publicly posted on the NERC calendar, *available here*: http://www.nerc.net/meetings/details.asp?id=3992.

The Project 2014-03 standard drafting team has written a whitepaper on System Operating Limits ("SOLs") in order to clarify how to establish SOLs and mitigate an exceedance of an SOL.[9] In addition, consistent with the NOPR, the team has reviewed the recommendations of the 2011 Southwest Outage Blackout Report[10] and has addressed how the proposed Reliability Standards fulfill many of these recommendations.[11]

C. Third Quarter 2014, July 1, 2014 – September 30, 2014

A drafting team meeting was held on July 22, 2014 – July 24, 2014. A technical conference was held on August 12, 2014 in order to discuss proposed revisions to the standards. Revisions to the TOP and IRO Reliability Standards were posted for a 45-day formal comment period from August 6, 2014 – September 19, 2014. Revisions to the defined terms "Operational Planning Analysis" and "Real-time Assessment," as well as the implementation plan for these new and revised standards and definitions, were also proposed and posted for comment. Additional ballots of the standards, definitions, and proposed implementation plan were conducted during the last ten days of the comment period, with the following results:

In addition, the standard drafting team has also considered issues raised in the NOPR, in the following document, *available here*: http://www.nerc.com/pa/Stand/Prjct201403RvsnstoTOPandIROStndrds/2014_03_first_posting_nopr_issues_20140509.pdf.

Reliability Standard	Approval
TOP-001-3 – Transmission Operations	48.73%
TOP-002-4 - Operations Planning	78.87%
TOP-003-3 – Operational Reliability Data	87.03%
IRO-001-4 – Reliability Coordination – Responsibilities	76.12%
IRO-002-4 – Reliability Coordination	74.23%
IRO-008-2—Reliability Coordinator Operational Analyses and Real-time Assessments	75.67%
IRO-010-2—Reliability Coordinator Data Specification and Collection	85.49%
IRO-014-3—Coordination Among Reliability Coordinators	75.96%
IRO-017-1 – Outage Coordination	78.67%

The definitions received an approval of 93.34% and the implementation plan received an approval of 90.13%. A drafting team meeting is scheduled for September 30 – October 2, 2014. The Project 2014-03 standard drafting team and NERC Staff are diligently working to revise the IRO and TOP Reliability Standards.

III. Conclusion

The North American Electric Reliability Corporation respectfully requests that the Commission accept this quarterly report for informational purposes.

Respectfully submitted,

/s/ Stacey Tyrewala

Counsel for the North American Electric Reliability Corporation

Dated: October 1, 2014

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation	**)** **)**	**Docket No. _____**

PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF THE BYLAWS AND RELIABILITY STANDARDS DEVELOPMENT PROCEDURES OF THE WESTERN ELECTRICITY COORDINATING COUNCIL

Pursuant to §215(e)(4) of the Federal Power Act[1] ("FPA") and 18 C.F.R. §§39.8, 39.10, the North American Electric Reliability Corporation ("NERC") requests the Commission's approval of amendments to the Delegation Agreement of the Western Electricity Coordinating Council ("WECC Delegation Agreement") consisting of amendments to the WECC Bylaws in Exhibit B and the WECC Reliability Standards Development Procedures ("WECC RSDP") in Exhibit C.[2] By approving the proposed amendments to the WECC RSDP included in this filing, the Commission will also be approving the amendments for purposes of the WECC Delegation Agreement. The Bylaws and RSDP are "Regional Entity Rules" as defined in 18 C.F.R. §39.1; thus, in accordance with 18 C.F.R. §39.10, amendments to the Bylaws and the WECC RSDP require Commission approval.

As described in greater detail in Section II of this Petition, the principal purpose of the amendments to the WECC RSDP is to revise the process to gain efficiencies based on WECC's

---

1 16 U.S.C. §824o (2012).

2 The complete currently effective WECC Delegation Agreement is available at: http://www.nerc.com/FilingsOrders/us/Regional%20Delegation%20Agreements%20DL/WECC_RDA_Effective_20140212_executed.pdf.

experience to date. The changes include: (1) revising and expand existing definitions; (2) separating the RSDP into separate sections for the "Normal Process" for development and an "Expedited Action"; (3) updating the timeline in Exhibit C: Common Attributes; and (4) adjusting the table of contents to correlate with the other changes. The proposed revisions also implement various updates, corrections, and typographical and format changes. The revisions to the WECC Bylaws, found in Section III, were made in order to align the WECC Bylaws with the NERC Rules of Procedure ("NERC ROP") with respect to the definition of the term "Regional Criteria," and to set forth a process for the WECC Board of Directors to schedule and conduct reviews of the structure and governance of WECC after the first full year of operation following internal bifurcation. The changes to the Bylaws also remove from the Bylaws provisions related to standard development that are contained in the WECC RSDP and consolidate the remaining provisions related to standard development into one Section 8.7 in the Bylaws.

NERC has included a clean and redline version of the WECC RSDP as Attachments 1 and 2, respectively. A clean and redline version of the WECC Bylaws are found in Attachments 3 and 4, respectively. Finally, a clean and redline version of the WECC Common Attributes in Exhibit C of the WECC Delegation Agreement are found in Attachments 5 and 6, respectively. There are no proposed changes to the WECC Delegation Agreement other than the proposed changes to the WECC Bylaws, Exhibit C, and the WECC RSDP.

[3] Persons to be included on the Commission's service list are identified by an asterisk. NERC respectfully requests a waiver of Rule 203 of the Commission's regulations, 18 C.F.R. § 385.203 (2014), to allow the inclusion of more than two persons on the service list in this proceeding.

II. PROPOSED WECC RSDP

The currently effective version of the WECC Delegation Agreement was approved by FERC and became effective on December 6, 2013. The proposed amendments revise the WECC RSDP and Exhibit C of the WECC Delegation Agreement to revise the process to gain efficiencies based on WECC's experience to date, including: (1) to revise and expand existing definitions; (2) to separate the WECC RSDP into separate sections for the "Normal Process" for development and an "Expedited Action"; (3) to update the timeline in Exhibit C: Common Attributes; and, (4) to adjust the table of contents to correlate with the other changes. The proposed revisions also implement various updates, corrections, and typographical and format changes. The discussion in the following subsections describes the proposed amendments to the WECC RSDP.

A. Introduction

The introductory paragraph with itemized steps for the process of introducing and solemnizing new Reliability Standards is removed and replaced with a description of WECC and an explanation of the RSDP. The definition of "WECC Standards Committee" is removed and relocated in the "Definitions" section. Other changes are made to improve the text or correct grammatical inconsistencies.

B. Definitions

A new term, "Ballot Pool," is added and defined as "[t]hat pool of Ballot Body entities that have registered to vote on a specific document."

A new term, "Day," is added and defined as:

> All references to days are calendar days. When counting the number

> of days, the count shall exclude the first day of the time window to be measured. If a terminus date falls on a weekend or a day that WECC is scheduled to be closed, the new terminus date shall be the day following the weekend or WECC closure day. For example, if a 15-day period ends on a holiday the terminus date is on the following WECC business day.

A new term, "Drafting Team (DT)," is added and defined as:

> A team of pertinent subject matter experts (SME) that was appointed by the WECC Standards Committee (WSC) to develop the document(s) that were called for in a Standard Authorization Request (SAR) consider and respond to industry comments, participate in forums to help build consensus on draft documents, and perform other tasks as assigned by the WSC.

A new term, "Electric Line of Business," is added and defined as "[t]he generation, transmission, distribution, or trading of electricity or the provision of related energy services in the Western Interconnection."

A new term, "NERC Compliance Registry," is added and defined as "[r]egistry of the Bulk Electric System owners, operators, and users that are subject to approved reliability standards."

A new term, "Non-Substantive Changes," is added and defined as:

> A Non-Substantive Change is one that does not change the scope, applicability, intent of the document, or the actions required by affected entities. For example, Non-Substantive Changes include, but are not limited to: correcting grammar or sentence structure, typographical or spelling errors, font and formatting, numbering, references, adding an obviously missing word, or rephrasing a statement to improve its clarity. Non-Substantive Changes do not require, but may receive posting for comments and/or revision of the document under these Procedures.

A new term, "Other Projects (OP)," is added and defined as "[a]ny document type other than an RRS developed under these Procedures. These include, but are not limited to, WECC Criteria."

A new term, "Participating Stakeholder," is added and defined as "[a]ny person or entity that is not a WECC Member, but who has applied for and been granted participating stakeholder rights as defined and currently set forth in the WECC Bylaws."

A new term, "Regional Reliability Standard (RRS)," is added and defined as:

> A requirement approved by FERC under Section 215 of the Federal Power Act, to provide for reliable operation of the Bulk Electric System in the United States. Regional Reliability Standards are specific to the Western Interconnection and shall be established using these Procedures. When approved by FERC and applicable authorities in Canada and Mexico, Regional Reliability Standards shall be made part of the body of NERC Reliability Standards and shall be enforced upon all applicable Bulk-Electric System owners, operators, and users within the WECC area, regardless of membership in the region.

A new term, "Standard Authorization Request (SAR)," is added and defined as "[t]he WECC Standard Authorization Request ("SAR") administered by the WECC Standards Department for the purpose of requesting development, revision, retirement, or interpretation of an RRS or OP."

A new term, "Standards Briefing," is added and defined as "[a]ny meeting initiated by WECC for the purpose of creating an open forum for discussion and explanation of an RRS or OP, generally but not exclusively held during the development process of those documents in advance of a ballot window."

A new term, "Standards Email List (SEL)," is added and defined as "[e]mail list(s) established and maintained by WECC for the purpose of communicating due process activity; generally, but not exclusively, for standards-related activities."

A new term, "Substantive Changes," is added and defined as "[a] Substantive Change is one that changes the scope, applicability, intent of the document, or the actions required by

affected entities. For example, Substantive Changes include but are not limited to: changes to the functional entities listed in the applicability section of the RRS or OP, changes to the effective date, adding, deleting or revising requirements, measures or explanatory narrative. Substantive Changes to an RRS or an OP require at least one posting/comment/response cycle."

A new term, "WECC Member," is added and defined as "[a]ny entity that has applied and been accepted for membership in WECC and is current in the payment of dues."

A new term, "WECC Standards Committee (WSC)," is added and defined as "Committee established by the WECC Board of Directors (Board) for the purpose of overseeing the implementation of these Procedures pursuant to its Board-approved charter."

C. Overview

The "Overview" divides the document into two sections for the development steps: one section details the "Normal Process" for Regional Reliability Standards, and the other, titled "Supporting Processes," addresses exceptions to the normal process such as an "Expedited Process for Urgent Action" and "Regulatory Directives" as well as "Maintenance of the Procedures" and "Maintenance of RRS and OPs Documents." A table of contents for Steps 1 through 14 is added to provide reference to each development step of the normal Reliability Standards development process.

A new subsection, "Notices," is added to describe the type of notice required to be provided by WECC to both the public and to NERC related to Reliability Standards activities. A subsection titled "WECC Standards Committee (WSC)" is added to define the WSC role in the management of development procedures, and another subsection titled "WECC Standards Voting Sectors" is created to revise definitions for the eight Standards Voting Sectors (SVS) in which an entity may vote and to describe the process for registration and voting on Regional Reliability

Standards.

D. Normal Process for Regional Reliability Standards and Other Projects

Step 1 is renamed from "Request to Revise or Develop a Standard" to "Submit and Validate a Standard Authorization Request," and the substance of the step is revised to reflect the new process.

Step 2 is renamed from "Standard Authorization Request Validation and Submission to the WSC" to "Step 2—Complete SAR and Present to the WSC," and the substance of the step is revised with procedures for receipt of the SAR by WECC, for the WSC to accept or remand the SAR, and for the SAR author to remedy deficiencies found by the WSC.

Step 3 is renamed from "Drafting Team Begins" to "Step 3—Convene the Drafting Team," and the substance of the step is revised to explain the prioritization of the development of the SAR and the procedure for convening a drafting team to develop the RRS or OP required by the SAR.

"Step 4—Begin Drafting Phase and Submit Draft to WSC" is added to provide the process for beginning drafts of the new standard proposed in the SAR and what should be required in the RRS. The existing requirements for the Drafting Team are removed and replaced with a more robust description of the Drafting Team, its roles, its involvement with the new or revised standard, and requirements for the final submission of the RRS.

"Step 5—Post for Comment," is added to explain the procedure for posting the draft of the RRS or OP for comment for a period of no less than 45 days for the first iteration and no less than 30 days for each subsequent iteration. A requirement to create an implementation plan and to provide notice that the comment period has been opened is added to this section, and directions for opening a web portal to serve as the means of receiving comments included. The WSC is directed to monitor the posting and review the posted documents to ensure the development process

remains within the scope of the SAR.

"Step 6—Respond to Comments" is added to explain the process for the DT to consider and organize comments related to the proposed RRS or OP and the resulting changes to them. A requirement is added to ensure the comment posting is done within 30 days after the comment window has closed. Separate requirements are articulated for changes in the RRS or OP that are substantive and for changes that are non-substantive.

"Step 7—Submit Proposed Draft to the WSC with a Request for Ballot" is added to require the DT to present the proposed RRS or OP to the WSC with a request for ballot and to require the WSC to respond no later than its next regularly scheduled meeting. Language is also added to require the WSC to ensure the RRS or OP complies with the SAR and with FERC orders, board directives, or other regulatory directives. Several lines are added to describe the required actions of the WSC if the RRS or OP is ready for ballot or is not ready for ballot, as well as the process for a remanded RRS or OP.

"Step 8—Convene a Standards Briefing" is added to require WECC to conduct a briefing after the RRS or OP is approved by the WSC and to provide notice of that briefing 15 days or more before it occurs.

"Step 9—Form the Ballot Pool and Ballot the Standard," is added to require an individual or entity desiring to participate in the ballot of an RRS or OP to apply to WECC for Ballot Body membership if eligible. Further guidance is added to instruct the formation of the ballot pool from the ballot body and the required notices upon the forming of the pool. A limitation on subsequent additions or withdrawals from the Ballot Pool is added, as well as the ability of the WECC Director of Standards to authorize deviations for the rule under extraordinary circumstances. The specific procedures for voting on an RRS or OP is outlined, including the following: (i) the ability

of Participating Stakeholders to vote on an RRS or OP, (ii) the requirements for casting a "Negative Vote" on an RRS or OP, (iii) the necessary quorum of two-thirds of the Ballot Pool for each vote, (iv) the requirement of a weighted majority of the Ballot Pool to approve the RRS or OP based on a clearly articulated weighting schedule, and (v) the actions available to the WSC after a vote by the Ballot Pool.

"Step 10—Initiate the Appeals Process-If Needed" is added to inform the required processes of bringing an appeal related to either a technical reliability concern or a due process concern. A line is added to ensure that the appeal does not halt development of the standard but that the appeal is settled by the Board before the Board votes for final approval of the RRS or OP.

"Step 11—Obtain Board Approval" is added to require the Board to consider the RRS or OP for approval, taking into account enumerated considerations, no later than the next regularly scheduled meeting after the close of the Ballot Pool window and recommendation for approval by the WSC. Further, lines are added describing actions of the WECC upon approval or rejection and subsequent remediation of the RRS or OP.

"Step 12—Submit RRSs for ERO Review, FERC Approval & Implementation of WECC Regional Reliability Standards" is added to describe the process for submitting a new, revised, or retired RRS to NERC for NERC and FERC approval. A line is added to clarify that the step only applies to RRSs.

"Step 13—Retire an OP" is added to provide the WSC with authority to retire a WECC OP on its own initiative if the subject matter of a NERC Reliability Standard is duplicated and retirement will not cause a reliability gap.

"Step 14—Submit a Request for Interpretation" is added to describe a "Request for Interpretation (RI)" and the process for submitting the RI on the WECC online SAR form. Certain

exceptions to the Procedures are made for processing of the RIs, including the creation of an Interpretation Drafting Team (IDT) to respond to RIs.[4]

E. Supporting Processes

Supporting Processes is added with four subsections as described below.

The first subsection, "Expedited Process for Urgent Action," allows any person or entity to propose an interim RRS or OP for approval in cases requiring urgent action and allows the Board to approve the interim document with an initial effective date. A line is added that requires that the Board take action within 90 days after the initial effective date of the document.

The second subsection, "Regulatory Directives," replaces the existing "Special Procedures for Addressing Regulatory Directives" section. In this subsection, a process is articulated for the Board to determine whether a Directive Regional Reliability Standard (DRRS) meets a federal regulatory directive, and if not, to take action to ensure that the DRRS is responsive to the regulatory directive. Requirements are added to "Regulatory Directives" requiring the Board to take certain steps to meet the regulatory obligations.

The third subsection, "Maintenance of the Procedures," is added to describe the responsibilities of the WSC with regard to maintenance of the procedures in the RSDP, including changes to the procedures and response to comments on any redraft.

The fourth subsection, "Maintenance of RRS and OPs Documents," is added to ensure that each RRS is reviewed periodically for the identification of needed changes if necessary and subsequent communication of the decision regarding changes.

---

[4] In addition to the revisions that are mentioned in this section, Step 14 of the Normal Process for Regional Reliability Standards also includes instruction for the Drafting Team to make a recommendation to the Standing Committee for retirement of certain documents if that document is to be subsumed into the new PSS RRS. WECC has recognized and notified NERC that inclusion of this line is a clerical error. NERC requests that FERC act on the WECC RSDP as filed. NERC will submit WECC's at a later date if the errata is adopted.

The Standards Drafting Procedures Flowchart at the end of the WECC RSDP was removed, as it is inapplicable to the revised Bylaws due to the changes in procedure.

F. Exhibit C—Regional Standard Development Procedure

In Common Attribute 5 of Exhibit C, the WECC Standing Committees are removed from involvement in the Reliability Standards development process. The WECC Standards Committee (WSC) will no longer be assisted by the standing committees regarding the requests for new or revised Reliability Standards.

In Common Attribute 6 of Exhibit C, an exception for Participating Stakeholders who vote for Regional Reliability Standards and Regional Criteria is added by noting that these entities may only vote on Regional Criteria that would result in a sanction to a non-WECC member. Other non-substantive revisions are made to improve the text.

In Common Attribute 7 of Exhibit C, outdated references to standard development steps in the WECC RSDP are updated to reflect changes made to that document.

In Common Attribute 9 of Exhibit C, the amount of time given to the WSC to determine the disposition of a standard request is increased from fourteen days to sixty days.

In Common Attribute 10 of Exhibit C, the amount of time given to the WSC to deliver an explanation for rejection to a requester of a standard is increased from fourteen days to thirty days.

In Common Attribute 14 of Exhibit C, the WSC is removed from the process of preparing a summary of comments received and changes made so that the drafting team has sole responsibility for this job. With regard to the time of posting of the summary, the attribute is edited to require the summary to be posed no later than the next posting of the proposed standard.

In Common Attribute 16, the process for voting on a standard is revised to allow for

voting by the Ballot Pool instead of the WECC lead standing committee and to change the time period for dating from thirty days to fifteen days after the issuance of the notice for vote. The last sentence is removed, thereby deleting the requirement that voting not begin sooner than seven days after the Joint Session of the Standing Committee where the draft was considered.

In Common Attribute 17, the word "business" is deleted so that only 15 days total are required for a vote of the Ballot Pool on a proposed standard.

In Common Attribute 18, the first sentence allowing all Ballot Body members to vote on proposed new Reliability Standards is deleted and a sentence requiring that each standard be considered by a newly formed Ballot Pool of interested members of the registered Ballot Body is added.

In Common Attribute 19, the word "non responses" is deleted and changed to "negative votes cast without explanation" to include votes that are made but that do not offer an explanation for purposes of determining whether a quorum of the Ballot Pool is achieved.

In Common Attribute 34, a bullet point is added for "Violation Severity Levels," to require that this term be defined in the Compliance Monitoring Process.

III. PROPOSED WECC BYLAWS

The proposed WECC Bylaws include a variety of amendments to the currently effective WECC Bylaws, a document found in Exhibit B of the WECC Delegation Agreement. Substantive changes to the Bylaws along with an explanation of the change are enumerated below, according to its section therein. The proposed Bylaws also implement various non-substantive, inconsequential updates, corrections, and typographical and format changes.

A. Definitions

The definition for the term "Ballot Body" is edited to remove reference to the "voting

sectors" described in section 8.6.5.2 and replaced with a reference to the "voting sectors" found in the RSDP. The definition for the term "Ballot Pool" is deleted from the definition section entirely, and the definition for "Regional Criteria" is removed and replaced with a reference to the definition of "Regional Criteria" as set forth in the NERC Rules of Procedure.

B. Members and Membership

Section 4.5 (Affiliates and Distinct Business Entities) provides an alternative route to membership for Affiliates of a Member, given compliance with four subsections. Section 4.5.2, one of those subsections which evinces the requirement for affiliates who are members of the same class, is edited to add a limitation on the ability of a group of affiliates to split their single vote amongst all affiliates or designate a single Affiliate as the group's voting Member. This limitation excludes situations as set forth in Section 8.7.6 of the Bylaws (Procedures for Developing and Voting on Reliability Standards)(described below), including when Affiliates are within a single Standards Voting Sector that may only have one vote and must designate a single Affiliate as the group's Ballot Pool member to vote in that Standards Voting Sector. Because WECC added this explicit exception in section 4.5.2, the requirement that non-WECC members identify their affiliations with other Ballot Body members and that WECC staff limit the voting of these members is removed and placed in Section 8.7.6. .. These changes allow WECC to consolidate the provisions related to Standards development in Section 8.7, including affiliate voting on Reliability Standards.

Under Section 4.9 (WECC Structure and Governance Review), a line is added to provide guidance on the commencement of the initial review of WECC performance required by Section 4.9. Under the new provision, the review will occur after the first year of operation under the July 2013 Bylaws and will be done collaboratively with the Member Advisory Committee (MAC).

C. Member Committees

In the description of the WECC Standards Committee, a reference to "WECC Standards Voting Sectors" as it was described Section 8.6.5.2 is replaced with a reference to the term "WECC Standards Voting Sectors" found in the RSDP.

The subsection titled "Assessment of Standing Committee Activities" is wholly repealed. The assessment envisioned by this section has been replaced by the review of WECC's structure and governance set forth in section 4.9, as mentioned above.

Section 8.5 (formerly titled "Procedures for Committee Decision-Making") is revised and renamed "Procedures for Member Advisory Committee Decision-Making" to avoid confusion and to provide clarity on the type of committee for which the subsection is providing guidance.

Under Section 8.6 (Procedures for Committees other than the Member Advisory Committee), the description of "Committee Membership" in Section 8.6.4 is revised to remove the exception for interested stakeholders to vote on proposed Reliability Standards or revisions to Reliability Standards due to the fact that voting by participating stakeholders is addressed in the WECC RSDP and Section 8.7 of the Bylaws. The description of "WECC Standards Voting Sectors" in Section 8.6.5.2, including all subsections therein, is wholly removed from the WECC Bylaws. WECC also removes a lengthy, unnumbered provision in Section 8.6 called "Voting on Regional Reliability Standards and Regional Criteria." This provision used to provide the procedure for a Ballot Body to cast a vote on a WECC Standards Committee-approved draft of a Regional Reliability Standard or Regional Criteria is removed in its entirety. These provisions were removed from Section 8.6 of the Bylaws because they are addressed in the WECC RSDP.

Under Section 8.7 (Procedures for Developing and Voting on Reliability Standards), the reference to Sections 8.6.5.2 and 8.6.5.4 for procedures and conditions of voting in Section 8.7.2 is deleted because the language in these sections was deleted as explained above. Further, the

explanation of the ability of Participating Stakeholders to vote on a proposed Reliability Standard or revision is deleted because this explanation is contained in the WECC RSDP. The complete process associated with the Board Authority to Address Regulatory Directives is deleted because this process is contained in the WECC RSDP and only a reference to the Board's authority in this regard is retained. Finally, two new sections, 8.7.5 and 8.7.6 are added to define entry into the WECC Standards Voting Sectors and to require WECC Ballot Body members to identify affiliations with other Ballot Body members, respectively. These sections were added to Section 8.7 because they were removed from Sections 8.6.5.2 and 4.5.5, respectively, as part of WECC's effort to consolidate all Reliability Standards related provisions into Section 8.7.

IV. CONCLUSION

The North American Electric Reliability Corporation respectfully requests that the Commission approve the proposed amendments to its Delegation Agreement with Western Electricity Coordinating Council, Inc., shown in Attachment 1, Attachment 3, and Attachment 5 to this Petition, including approving the amendments to the WECC RSDP and Exhibit C as amendments to Regional Entity Rules.

Respectfully submitted,

/s/ William H. Edwards

Counsel for the North American Electric Reliability Corporation

September 15, 2014

Attachment 1

Reliability Standards Development Procedures

Amended Exhibit of the Delegation Agreement Between

North American Electric Reliability Corporation and

Western Electricity Coordinating Council

Clean Version

RELIABILITY STANDARDS DEVELOPMENT PROCEDURES

Introduction

The Western Electricity Coordinating Council (WECC) is a Regional Entity[1] authorized through a delegation agreement between the North American Electricity Reliability Corporation (NERC) and WECC pursuant to Section 215 of the Federal Power Act. NERC delegates designated powers, rights, and responsibilities to WECC regarding the administration within the Western Interconnection of electric Reliability Standards adopted or approved by NERC and the Federal Energy Regulatory Commission (FERC).

These Reliability Standards Development Procedures (Procedures) define the process to be used by WECC for the development, revision, and retirement of Regional Reliability Standards (RRS) and various Other Projects (OP) created under these Procedures.

These Procedures were established to create the structure for open and transparent due process in the development of WECC RRSs and OPs. These Procedures include, but are not limited to, public notice of intent to develop RRSs and OPs, a public comment period on the proposed documents, due consideration of comments provided, and a balanced ballot of interested stakeholders.

The Procedures shall be interpreted and applied in a manner that is consistent with the WECC Bylaws. Should any conflict arise between the Procedures and the WECC Bylaws, the WECC Bylaws will prevail.

Definitions

Ballot Body

That body of qualified WECC Members and non-members that register with WECC for participation in Ballot Pools.

Ballot Pool

That pool of Ballot Body entities that have registered to vote on a specific document.

Day

All references to days are calendar days. When counting the number of days, the count shall exclude the first day of the time window to be measured. If a terminus date falls on a weekend or a day that WECC is scheduled to be closed, the new terminus date shall be the day following the weekend or WECC closure day.

[1] Unless otherwise specified, capitalized terms are defined in the NERC Glossary of Terms Used in Reliability Standards.

For example, if a 15-day period ends on a holiday the terminus date is on the following WECC business day.

Drafting Team (DT)

A team of pertinent subject matter experts (SME) that was appointed by the WECC Standards Committee (WSC) to develop the document(s) that were called for in a Standard Authorization Request (SAR) consider and respond to industry comments, participate in forums to help build consensus on draft documents, and perform other tasks as assigned by the WSC.

Electric Line of Business

The generation, transmission, distribution, or trading of electricity or the provision of related energy services in the Western Interconnection.

NERC Compliance Registry

Registry of the Bulk Electric System owners, operators, and users that are subject to approved reliability standards.

Non-Substantive Changes

A Non-Substantive Change is one that does not change the scope, applicability, intent of the document, or the actions required by affected entities.

For example, Non-Substantive Changes include, but are not limited to; correcting grammar or sentence structure, typographical or spelling errors, font and formatting, numbering, references, adding an obviously missing word, or rephrasing a statement to improve its clarity. Non-Substantive Changes do not require, but may receive posting for comments and/or revision of the document under these Procedures.

Other Projects (OP)

Any document type other than an RRS developed under these Procedures. These include, but are not limited to, WECC Criteria.

Participating Stakeholder

Any person or entity that is not a WECC Member, but who has applied for and been granted participating stakeholder rights as defined and currently set forth in the WECC Bylaws.

Regional Reliability Standard (RRS)

A requirement approved by FERC under Section 215 of the Federal Power Act, to provide for reliable operation of the Bulk Electric System in the United States. Regional Reliability Standards are specific to the Western Interconnection and shall be established using these

Procedures. When approved by FERC and applicable authorities in Canada and Mexico, Regional Reliability Standards shall be made part of the body of NERC Reliability Standards and shall be enforced upon all applicable Bulk-Electric System owners, operators, and users within the WECC area, regardless of membership in the region.

Standard Authorization Request (SAR)

The WECC form titled *Standard Authorization Request (SAR)* administrated by the WECC Standards Department for the purpose of requesting development, revision, retirement, or interpretation of an RRS or OP.

Standards Briefing

Any meeting initiated by WECC for the purpose of creating an open forum for discussion and explanation of an RRS or OP, generally but not exclusively held during the development process of those documents in advance of a ballot window.

Standards Email List (SEL)

Email list(s) established and maintained by WECC for the purpose of communicating due process activity; generally, but not exclusively, for standards-related activities.

Substantive Changes

A Substantive Change is one that changes the scope, applicability, intent of the document, or the actions required by affected entities.

For example, Substantive Changes include but are not limited to:

- changes to the functional entities listed in the applicability section of the RRS or OP;
- changes to the effective date;
- adding, deleting or revising requirements, measures or explanatory narrative.

Substantive Changes to an RRS or an OP require at least one posting / comment / response cycle.

WECC Member

Any entity that has applied and been accepted for membership in WECC and is current in the payment of dues.

WECC Standards Committee (WSC)

Committee established by the WECC Board of Directors (Board) for the purpose of overseeing the implementation of these Procedures pursuant to its Board-approved charter.

Overview

This document has two dominate sections. The first section describes the development steps for the Normal Process for Regional Reliability Standards and Other Projects. The second section augments the first with Supporting Processes to address exceptions such as an expedited process for urgent actions, addressing regulatory directives, and maintenance of certain documents.

Development Steps/Table of Contents

The following development steps are included in the normal process for Regional Reliability Standards and Other Projects section:[2]

Step 1 – Submit and Validate a Standard Authorization Request 7

Step 2 – Complete SAR and Present to the WSC 7

Step 3 – Convene the Drafting Team 8

Step 4 –Begin Drafting Phase and Submit Draft to WSC 9

Step 5 – Post for Comment 10

Step 6 – Respond to Comments 11

Step 7 – Submit Proposed Draft to the WSC with a Request for Ballot 12

Step 8 – Convene a Standards Briefing 12

Step 9 – Form the Ballot Pool and Ballot the Standard 13

Step 10 – Initiate the Appeals process – If Needed 15

Step 11 – Obtain Board Approval 15

Step 12 – Submit RRSs for ERO Review, FERC Approval & Implementation of WECC Regional Reliability Standards

Step 13 – Retire an OP 16

Step 14 – Submit a Request for Interpretation 16

The following related processes are included in the Supporting Processes section:

- Expedited Process for Urgent Action
- Regulatory Directives

[2] This Table of Contents will reflect the final actual pagination after final formatting. This footnote will be deleted from the final document.

- Maintenance of Procedures
- Maintenance of RRSs and OPs Documents

Notices

Notices required under these Procedures shall be distributed electronically via WECC's SEL(s) and deemed delivered when posted on the WECC website, except as noted in the following paragraph. Concurrent running of notice and posting periods is explicitly allowed.

WECC shall provide notice to NERC of all standards-related activities by including NERC on WECC's SEL. Inclusion of a NERC-provided email address on the related SEL shall constitute coordination of notice to NERC of standards-related activities and shall be deemed delivered upon dispatch via the SEL(s).

All WECC Members and Participating Stakeholders will be given an opportunity to receive notices provided via the SEL.

WECC Standards Committee (WSC)

The WSC manages these Procedures. The WSC protects the integrity, credibility and implementation of the Procedures while acting in accordance with the WSC Charter. Delineation of specific WSC duties, WSC composition and governance, WSC voting privileges, and other related practices, shall be in accordance with the WSC charter as approved by the Board.

WECC Standards Voting Sectors

There are eight (8) Standards Voting Sectors (SVS) in which an entity may register to vote. The SVSs are divided into two separate categories: Registered and Non-Registered.

The Registered category is for those entities *registered* on the NERC Compliance Registry and to those Canadian and Mexican entities that perform functions that, if performed in the United States, would allow those entities to be registered for compliance in the NERC Compliance Registry. The Non-Registered category is for all others meeting the qualifications of those defined SVSs. A single entity cannot be in the Registered category and the Non-Registered category at the same time.

SVSs 1 through 5 are "Registered" SVSs.

1) Transmission Sector. This sector consists of Western Interconnection entities registered in the NERC Compliance Registry as Transmission Owners, Transmission Operators, Transmission Service Providers, or Transmission Planners;

2) Generation Sector. This sector consists of Western Interconnection entities registered in the NERC Compliance Registry as Generation Owners or Generation Operators;

3) Marketers and Brokers Sector. This sector consists of Western Interconnection entities registered in the NERC Compliance Registry as Purchasing-Selling Entities.

4) Distribution Sector. This sector consists of Western Interconnection entities registered in the NERC Compliance Registry as Distribution Providers or Load-Serving Entities;

5) System Coordination Sector. This sector consists of Western Interconnection entities registered in the NERC Compliance Registry as Balancing Authorities, Reserve Sharing Groups, Planning Authorities/Coordinators, Resource Planners, Interchange Authorities/Coordinators, or Reliability Coordinators.

SVS 6 through 8 are “Non-Registered” SVSs.

6) End-Use Representative Sector. This sector consists of entities not on the NERC Compliance Registry, but that are WECC Members and are end users of significant amounts of electricity in the Western Interconnection, including; industrial, agricultural, commercial and retail entities as well as organizations in the Western Interconnection that represent the interests of a substantial number of end users or a substantial number of persons interested in the impacts of electric systems on the public or the environment.

7) State and Provincial Representatives Sector. This sector consists of entities not on the NERC Compliance Registry, but that are WECC Members that are representatives of states and provinces in the Western Interconnection provided that such representatives will have policy or regulatory roles and do not represent state or provincial agencies and departments whose function involves significant direct participation in the market as end users or in Electric Line of Business activities.

8) Other Non-Registered WECC Members and Participating Stakeholders Sector. This sector consists of (1) Participating Stakeholders as defined in the WECC Bylaws, (2) WECC Members not on the NERC Compliance Registry that are Electric Line of Business entities doing business in the Western Interconnection that do not own, control or operate transmission or distribution lines in the Western Interconnection, including power markets, independent power producers, any other entities whose primary business is the provision of energy services, and (3) those entities that are not eligible for membership in any other Standards Voting Sector and who have a substantial interest in the purposes of WECC.

If a single entity qualifies for more than one Registered SVS, that entity may register and vote in each Registered SVS for which it qualifies. For example, if a single entity was registered in the NERC Compliance Registry as a transmission owner and also a generator owner; that single entity could register and vote once in SVS 1 and once in SVS 2.

Non-Registered SVSs 6 through 8 represent those entities that are *not registered* in the NERC Compliance Registry. Unlike Registered SVSs 1 through 5, entities in Non-Registered SVSs 6 through 8 are only eligible to register and vote in a single SVS.

Normal Process for Regional Reliability Standards and Other Projects

Step 1 – Submit and Validate a Standard Authorization Request

Development, revision or retirement of a Regional Reliability Standard (RRS) or Other Project (OP) shall be initiated by the filing of a Standard Authorization Request (SAR) by any person or entity. A SAR is filed by completing the electronic fields of the online WECC SAR form. WECC staff shall review the incoming SAR to ensure it is valid. Once deemed valid, the SAR shall be immediately posted on the WECC website and notification shall be sent to the SEL.[3]

Step 2 – Complete SAR and Present to the WSC

WECC staff shall assign a unique tracking number to each SAR. The unique tracking number shall be used to identify the SAR throughout the development and archival processes. The SAR and those documents developed in response to the SAR shall be publicly accessible on the WECC website.

WECC staff shall determine within 30 days of receipt whether a SAR is complete. WECC staff may assist with completing the SAR, or report to the WSC that the SAR is incomplete and request guidance.

To be deemed complete, each SAR shall contain a description of the proposed RRS or OP subject matter sufficiently detailed to clearly define the purpose, scope, impacted parties, requirements and any other information relevant to the proposed RRS or OP.

Once deemed complete by WECC staff, WECC staff shall notify the WSC that the SAR has been received and is complete, and shall place the SAR on the agenda for the next scheduled WSC meeting for disposition, subject to required notice. Notice of WSC meetings and posting of WSC agendas will be provided in accordance with the WSC Charter.

The WSC shall determine whether the SAR is within the scope of WECC's authority and activities, and is appropriate for development. The WSC shall make that determination within 60 days of the date that the SAR is received by WECC, except where the SAR has been remanded, in which case the WSC shall make that determination within 30 days of receiving the curative SAR. Public comment on the SAR will be reviewed and considered by the WSC during a duly noticed WSC meeting prior to the WSC approving the SAR.

[3] A "valid" SAR is different than a "complete" SAR. A SAR is deemed valid by staff as a threshold review that filters out spam and unwanted nuisance documents that may be received via an open website portal. Whether a SAR is "complete" is addressed in Step 2.

The WSC shall ensure that the SAR provides enough information that a Drafting Team (DT) will have a clear understanding of the reasons for, and nature of, the RRS or OP to be developed. The SAR author may be asked to further assist in the development or clarification of the SAR.

The WSC may accept the SAR, in which case development proceeds to Step 3.

The WSC may remand a SAR if it determines the content of the SAR is deficient. If the SAR is deemed deficient, the WSC shall specify the deficiency identified in the SAR and suggest potential remedies as part of its remand. WECC staff will make reasonable efforts to assist the SAR author in addressing the deficiencies identified by the WSC.

The SAR author shall have 30 days from the date of remand or until the 60th day following submittal of the SAR, whichever is longer, to remedy each deficiency identified in the remand, or withdraw the SAR.

If the deficiencies are remedied, WECC staff will resubmit the SAR to the WSC for disposition. If the deficiencies are not remedied within the allotted period: 1) the SAR will be deemed incomplete, 2) no further developmental action will be taken on the SAR, and 3) the SAR will be archived. The SAR author may submit a new SAR without prejudice based on the same or similar fact pattern.

The WSC may reject a SAR if it determines the SAR is outside the scope of WECC's authority or is not appropriate to be undertaken by WECC. If a SAR is rejected, the WSC shall post its explanation for rejection on the WECC website. Notification of the WSC's decision shall: 1) be communicated to the SAR author, the Board, and the Standards Email List (SEL), 2) reference the unique SAR tracking number and direct the recipient to supporting information as appropriate, and 3) be made no more than 30 days from the date of the WSC's determination. The WSC's decision to reject a SAR may be appealed to the Board.

Step 3 – Convene the Drafting Team

If it accepts a SAR, the WSC may, at its discretion, expand or narrow the scope of the SAR. The WSC shall prioritize the development of the SAR in relation to other RRSs or OPs proposed for development under the Procedures, as may be required based on the volume of requests and resources. If prioritization dictates a postponed starting date, the WSC shall either set a postponed starting date or set a review date upon which the WSC shall re-evaluate the SAR for purposes of its progress through these Procedures. In no case shall the review date be more than 180 days after the date the SAR was received.

Upon establishing a start date for the development of an RRS or OP, the WSC shall convene a DT to develop the RRS or OP required by the SAR. The WSC may either directly assign a DT or solicit team member nominations from the industry. The WSC shall approve the DT membership within 60 days of establishing a start date. The WSC may augment or modify DT membership at any time as needed.

Because the DT chair's primary responsibility is leadership and coordination, the DT chair need not be a SME in the field associated with the SAR.

Names of DT members will be posted on the associated project development website.

The WSC should provide to the DT a proposed starting date and an expected completion date.

Step 4 –Begin Drafting Phase and Submit Draft to WSC

All DT meetings shall be open and publicly noticed on the WECC website.

The DT will begin working on the documents required by the SAR following assignment by the WSC. Notice of each DT meeting shall be posted on the WECC website for a minimum of 15 days prior to the meeting.

The author of the SAR may participate in the drafting process. The author of the SAR may be asked to provide additional information, supporting studies, and other information to support the requirements of the proposed RRS or OP.

An RRS shall include those sections mandated by NERC, such as an applicability section, effective date, mandatory requirements, affected time horizons, measures, compliance, violation risk factors (VRF), and violation severity levels (VSL).

Each RRS shall promote at least one reliability principle and be consistent with all reliability principles and NERC market interface principles. Each RRS shall provide for as much uniformity as possible with reliability standards across the interconnected Bulk-Power System of the North American continent. An RRS shall be more stringent than a continent-wide reliability standard, include a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the Bulk-Power System.

An RRS or OP may include a guidance section, background section or other narrative sections; however, these sections are not required. Incorporation of extrinsic documents into an RRS or OP should be avoided.

An RRS or OP may include new definitions of terms that need to be added to the WECC or NERC glossaries. Wherever possible, DTs are encouraged to use existing defined terms rather than create new defined terms.

In drafting the applicability section of an RRS, only those functional entities listed in the currently approved NERC Functional Model shall be used. When drafting the applicability section of an OP, use of the NERC Functional Model is not required. Development of an OP should conform to WECC internal policies and practices, unless otherwise specified herein.

In the course of its assignment, the DT shall, at a minimum:

- Review any preliminary technical assessment provided with the SAR;
- Perform or request additional technical studies as needed;
- Prepare supporting documents to support the RRS or OP as needed; and
- Request from the WSC additional time to develop the RRS or OP, if necessary.

Step 5 – Post for Comment

Upon completion of each iterative draft of the RRS or OP, WECC staff shall facilitate the posting of the draft RRS or OP on the WECC website, along with supporting documents, if any, for a comment period of no less than 45 days for the first iteration and no less than 30 days for each iteration thereafter, except as allowed in the Expedited Process for Urgent Action section of these Procedures.

An implementation plan shall be included in at least one iterative posting during the development of the RRS or OP and shall be a part of the final record for consideration prior to ballot.

A notice that the comment period has been opened shall be distributed via the SEL. The notice shall include, at a minimum, the following information:

- Identification of the RRS or OP;
- What action is being taken (e.g., request for 30- or 45-day comment);
- The location of the document for review;
- How to submit comments or perform the requested action; and
- The opening and closing dates during which the solicited action shall take place. Unless otherwise posted, all posting periods close at 5:00 p.m. (Mountain).

WECC shall open a Web portal to serve as the sole means of receiving comments on the RRS or OP. Comments received via other media or received outside of the posted comment period will be accepted at the discretion of the DT. Comments may be submitted by any individual or entity, or a group of parties with a common comment. To streamline the process, if a group of parties elects to submit a common comment, those parties are encouraged to submit that common comment only once and append to the comment the names of all those individuals, entities or groups that are in support of the common position. DTs are charged to give due weight to such a joint comment and not to view the comment as having been received by a single individual or entity.

The WSC shall monitor each posting and review the posted documents to determine whether the DT remains within the scope of the SAR. At any time prior to opening a Ballot Pool, if the WSC concludes that the proposed RRS or OP is not within the scope of the SAR or does not meet other regulatory requirements or directives, the WSC shall either remand the RRS or OP to the DT with a specific explanation identifying the deficiencies that must be remedied, adjust the scope of the SAR, or retain the SAR as drafted and replace the DT.

Upon receiving the remanded RRS or OP and explanation of deficiencies, the DT shall

initiate a redraft following the steps contained in these Procedures. If a new DT is assigned, the new DT shall start the development efforts at Step 4 of these Procedures.

Step 6 – Respond to Comments

The DT shall consider all comments submitted in accordance with these Procedures. If the same comment is provided more than once, the DT may provide a single response to all comments that raise the same or a similar concern.

The DT shall prepare a summary of the comments received and the changes made to the proposed RRS or OP as a result of comments received. The DT shall summarize comments that were rejected by the DT, in whole or in part, and the reason(s) that these comments were rejected. The summary, along with a response to each comment received, will be posted on the WECC website no later than the next posting of the proposed RRS or OP.

All parties submitting comments are encouraged to participate in the DT meetings during which responses to their comments are considered and drafted.

The DT should target posting its responses to the WECC website no later than 30 days after the comment window has closed. If more than 30 days are required, the DT chair shall advise the WSC chair of the DT's progress and request additional assistance as needed.

Substantive Changes

If the DT determines that comments received during any posting warrant a Substantive Change to the language of an RRS or OP, the DT shall consider each comment and redraft the RRS or OP accordingly, repeating the posting / comment / response cycle as many times as needed to address the Substantive Changes while staying within the scope of the SAR.

If at any time during the development process the DT determines that the scope of the SAR should be adjusted, the DT shall present that request to the WSC for disposition.

If at any time during the development process the DT determines that it has reached a developmental impasse, the DT shall present the issue to the WSC for disposition.

If comments received during any posting do not warrant a Substantive Change to the language of an RRS or OP, the DT shall be polled at a regularly scheduled and announced DT meeting and asked whether the RRS or OP should be forwarded to the WSC with a recommendation to ballot the document. If the DT concludes by an affirmative majority vote that the RRS or OP should be forwarded to the WSC with a recommendation for ballot, the document will be forwarded accordingly.

Non-Substantive Changes

These Procedures acknowledge that a Non-Substantive change may be discovered at any point during or after the final development of the RRS or OP.

Non-Substantive Changes to an RRS shall be handled in accordance with the NERC Standards Development Manual or its successor.

Non-Substantive Changes to an OP shall be addressed using WECC's internal policies and practices. Non-Substantive changes for OPs do not require a comment / response cycle.

Step 7 – Submit Proposed Draft to the WSC with a Request for Ballot

Upon completion of the proposed RRS or OPs, the DT shall present the proposed RRS or OPs to the WSC with a request for ballot. The WSC shall address that request no later than its next regularly scheduled meeting.

After receiving a request for ballot, the WSC shall review the RRS or OP as presented and determine whether it fulfills the requirements stated in the SAR. The WSC shall also consider whether extrinsic requirements, such as FERC orders, Board directives, or other regulatory directives are met by the content of the document.

If the WSC concludes that the proposed RRS or OP is ready for ballot, the WSC shall forward the RRS or OP to WECC staff with a request that a Ballot Pool be formed from the Ballot Body, for the specific intent of seeking approval of the proposed RRS or OP. The results of the WSC's vote to forward the RRS or OP to the Ballot Pool shall be documented. Any WSC member that opposes submittal of the RRS or OP will be encouraged to provide dissenting comments, and if possible, specific language that would make the draft document acceptable to the dissenting member. If the WSC cannot reach agreement to submit the RRS or OP to the Ballot Pool, the WSC will report to and seek guidance from the Board.

If the WSC concludes that the proposed RRS or OP is not ready for ballot because it does not fulfill the requirements of the SAR or because it fails to meet other regulatory requirements or directives, the WSC shall remand the RRS or OP to the DT with a specific explanation identifying the deficiencies that must be remedied.

Upon receiving the remanded RRS or OP and explanation of deficiencies, the DT shall:

1) Redraft the RRS or OP accordingly;
2) Initiate iterative comment / response cycles as needed until it again concludes that no further Substantive Changes are needed; and
3) Return the proposed RRS or OP to the WSC for disposition.

Step 8 – Convene a Standards Briefing

Once the WSC approves submitting the RRS or OP to the Ballot Pool for ballot, WECC shall dispatch notice to the SEL that a Standards Briefing will be held to discuss the content of the proposed RRS or OP prior to balloting. Notice shall be provided 15 days or more before

the Standards Briefing is to be held and shall provide, at a minimum, the following:

- Identification of the RRS or OP;
- The time and place of the Standards Briefing; and
- The location of the proposed RRS or OP and related documentation for review.

Step 9 – Form the Ballot Pool and Ballot the Standard

Any individual or entity seeking participation in the ballot of an RRS or OP shall apply to WECC for Ballot Body membership in any SVS in which it is eligible. WECC staff shall review the request and confirm eligibility to join the Ballot Body.

Decisions of the staff to approve, deny, or restrict the admission of an individual or entity to a voting sector may be appealed in accordance with the WECC Bylaws.

From the Ballot Body, a discrete Ballot Pool will be formed for each RRS or OP to be balloted under these Procedures. All members of the Ballot Body shall be provided an opportunity to opt into a Ballot Pool formed for purposes of voting on each RRS or OP. It is the Ballot Pool that votes on RRSs and OPs developed under these Procedures.

Notice that a Ballot Pool is forming will be dispatched via the SEL. That notice shall contain, at a minimum, the following information:

1) Identification of the RRS or OP;
2) The proposed action to be taken (e.g., Notice of Ballot Pool Formation / Notice of Ballot);
3) When the Ballot Pool will open;
4) When the ballot will take place;
5) How to cast a vote; and
6) The location of the proposed RRS or OP and related documentation for review.

The Ballot Pool registration window shall remain open for a period determined by WECC staff, but in no case shall the Ballot Pool registration window be open less than 15 days or more than 30 days.

Once notice of a Ballot Pool forming has been dispatched: 1) the ballot window shall commence no sooner than 15 days and no later than 45 days after that dispatch; and 2) no Substantive Changes may be made to the proposed document unless the revisions are posted for an iterative comment / response cycle and a new date is set for ballot.

Once the ballot window opens, no Ballot Body member may join or withdraw from the Ballot Pool. The WECC Director of Standards (DOS) may authorize deviations from this rule for extraordinary circumstances such as the death, retirement, or disability of a Ballot Pool member that would prevent an otherwise eligible entity from casting a vote during a given ballot window.

Voting on an RRS or OP shall be via electronic voting administered on the WECC website.

The default voting window shall be a period of 15 days; however, the window may be held open up to a maximum of 60 days to reach a quorum. During a ballot window, WECC shall not sponsor or facilitate public discussion of the standard to be balloted.

Eligible members of the Ballot Pool may cast one vote in each SVS for which they are eligible.

Participating Stakeholders may only vote on an RRS if they have applied for and been granted Participating Stakeholder status. A Participating Stakeholder is only entitled to vote on an RRS and may only vote on a WECC Criterion if the proposed WECC Criterion could result in sanction to a non-WECC Member. A Participating Stakeholder is not entitled to vote on any other OP.

Each member of the Ballot Pool casting a negative vote on an RRS or OP will be required to provide a statement explaining the reason for the negative vote. The statement should include language that would make the RRS or OP acceptable. The statement will be included in the voting record for consideration by the WSC and the Board.

A two-thirds (2/3) quorum of the Ballot Pool is required for each vote. Quorum shall be based on the total number of Ballot Pool members and shall not be based on the total number of votes cast. Abstentions and negative votes cast without an explanation shall not be counted for the purpose of determining consensus, but will be counted for purposes of obtaining a quorum.

A weighted majority vote of the Ballot Pool is required for an RRS or OP to be approved. Voting among the SVSs shall be weighted as follows:

- For each SVS with 10 or more voters, the number of affirmative votes cast shall be divided by the sum of the affirmative and negative votes cast to determine the fractional affirmative vote for that SVS.

- For each SVS with less than 10 voters, the same process shall be used to determine the fractional affirmative vote, but the fractional affirmative vote of that SVS shall be multiplied by 10 percent times the number of voters.

    - For example, for SVSs with nine voters, the fractional affirmative vote will be multiplied by 90 percent.

- The sum of the fractional affirmative votes from all SVSs divided by the weighted number of SVSs voting shall be used to determine if a weighed majority has been achieved and whether the RRS or OP has been approved. An SVS shall be considered as voting if any member of the SVS in the Ballot Pool casts either an affirmative or a negative vote. If there are more than ten voters in the SVS, the weighting used for the calculation of “weighted sectors voting” shall be 100 percent. For SVSs with less than ten voters, the weighting used for the calculation of the “weighted sectors voting” shall be 10 percent per voter.

- An RRS or OP shall be deemed approved by the Ballot Pool if the sum of fractional affirmative votes from all SVSs divided by the weighted number of voting SVSs is a majority (i.e., greater than 50 percent).

After a vote by the Ballot Pool, the WSC shall take one of the following actions.

If the Ballot Pool approves an RRS or OP, the WSC shall submit the RRS or OP to the Board for approval. The WSC shall provide voting results to the Board, including the final ballot results and any rationale supporting any negative votes cast.

Any RRS or OP that was provided to the Board for approval will be posted for Board review for at least the period mandated by the WECC Bylaws.

If the Ballot Pool rejects the RRS or OP, the SAR shall be deemed complete and all associated documents shall be archived, except as allowed in the Regulatory Directive section of these Procedures.

Step 10 – Initiate the Appeals Process – If Needed

An appeal may be brought on the basis of either a technical (reliability) concern or a due process (procedural) concern.

If the appeal is based on technical grounds, that appeal may be brought at any stage of the development process prior to the opening of a ballot window. The appeal shall be submitted to the DOS who shall place the appeal on the agenda of the next regularly scheduled WSC meeting. If the appellant does not concur with the WSC's findings, the appellant may request that the DOS forward the matter to the Board for disposition.

If the appeal is based on due process concerns, the appellant shall submit the matter to the DOS no later than 30 days after the alleged occurrence of the due process violation, but in no case shall an appeal on due process grounds be accepted more than 30 days after the RRS or OP has been approved by the Ballot Pool. The appeal shall be submitted to the DOS who shall place the appeal on the agenda of the next regularly scheduled WSC meeting. If the appellant does not concur with the WSC's findings, the appellant may request that the DOS forward the matter to the Board for disposition.

The filing of an appeal shall not halt the development process; however, the appeal shall be settled by the Board before the Board votes to approve the RRS or OP.

Step 11 – Obtain Board Approval

The Board shall consider the RRS or OP for approval no later than at its next regularly scheduled meeting after the close of the Ballot Pool window and recommendation for approval by the WSC, subject to the notice requirements in the WECC Bylaws.

Any person or entity may submit comments to the Board for the Board's consideration. The

Board shall consider:

1) All comments submitted for its consideration;
2) The WSC's recommendations and minority opinions, if any;
3) All comments that were not incorporated into the RRS or OP;
4) Voting results including, at a minimum, the final ballot results and any rationale supporting negative votes; and
5) Any other supporting documentation.

If an OP is approved by the Board, WECC shall post the final OP on its website and the SAR will be deemed complete. The effective date will be that approved by the Board.

If an RRS is approved by the Board, WECC shall forward the RRS to NERC for NERC and FERC disposition.

If the RRS or OP is not approved by the Board, the Board may either deem the SAR complete or remand the RRS or OP to the DT with specific guidance as to proposed changes.

If the RRS or OP is remanded, any Substantive Changes must be vetted in accordance with these Procedures. Under no circumstances shall the Board make Substantive Changes to the RRS or OP, except in accordance with its backstop authority as authorized by the WECC Bylaws.

Step 12 – Submit RRSs for ERO Review, FERC Approval & Implementation of WECC Regional Reliability Standards

Note: Step 12 only applies to RRSs.

All new, revised, or retired RRSs shall be submitted to NERC for NERC and FERC approval. The approval, revision or retirement of an RRS shall not be effective in the United States until approved by FERC and shall not be effective in another jurisdiction until approved by the applicable governmental authority.

Step 13 – Retire an OP

Upon determining that the subject matter of an OP is duplicated in a NERC Reliability Standard, and that retirement of the OP will not cause a reliability gap after the effective date of the associated NERC Reliability Standard, the WSC may retire a WECC OP on its own initiative without further due process.

Step 14 – Submit a Request for Interpretation

A Request for Interpretation (RI) of a document developed under these Procedures is limited to clarifying existing requirements in the approved document and may not expand

upon a requirement or provide guidance on how to implement a requirement.

The RI is initiated by submitting WECC's online SAR form. The SAR shall: 1) identify the specific document; 2) identify the requirement within that document for which an interpretation is being requested, and 3) specify the perceived lack of clarity. The SAR shall indicate the material impact to the requesting entity or others caused by the perceived lack of clarity.

The RI is processed using the same process set forth in these Procedures with the following exceptions:

- The chair of the WSC shall assemble an Interpretation Drafting Team (IDT). The IDT shall be composed of SMEs with relevant expertise to address the clarification and, to the extent possible, should include members of the original DT. The IDT shall not include any team member representing the entity that filed the RI; however, this prohibition does not preclude representatives of the filing entity from participating in the development process.

- If all of the document is to be subsumed into the new PSS RRS the PSS DT should recommend to the Standing Committee that the document be retired as of the effective date of the replacement document.

- Once an interpretation of an RRS has been approved by the Board, the interpretation shall be appended to the RRS and submitted to NERC for NERC and FERC approval. The interpretation will remain appended to the RRS until such time as the RRS is revised and the interpretation's content is addressed during the revision process. RRS interpretations shall not be effective in the United States until approved by FERC and shall not be effective in other jurisdictions until approval by the applicable governmental authority.

Supporting Processes

Expedited Process for Urgent Action

In cases requiring urgent action, such as in the development of emergency procedures, any person or entity may propose an interim RRS or OP for approval by the WECC Board. The RRS or OP must go through a process that eliminates any or all of the steps outlined previously, but only to the extent deemed necessary by the Board and only in a manner that is consistent with the WECC Bylaws.

If the Board approves the interim document, it shall establish an initial effective date for the interim document.

Within 90 days after the initial effective date of the document, the Board shall either:

1) Cause a SAR to be submitted requesting the development under these Procedures of a permanent replacement to the interim document; or

2) Shall extend the applicability of the interim document for an additional 90 days.

Renewal may occur more than once, but a good faith effort must be made to develop a permanent replacement under these Procedures.

If a SAR is submitted, the interim RRS or OP shall remain in effect until the permanent replacement RRS or OP becomes effective.

If a SAR is not submitted and the interim RRS or OP has not been extended, the interim RRS or OP shall be deemed retired.

Regulatory Directives

These Procedures acknowledge that FERC may order WECC to make specified regulatory changes to documents created under these Procedures. For the purpose of this section only, those documents are referred to as Directive Regional Reliability Standards (DRRS).

If the Board determines that these Procedures failed to result in a DRRS meeting the mandated regulatory changes, the Board shall have authority to take the following actions to ensure that the DRRS is responsive to the regulatory directive.

If the Ballot Pool approves a DRRS that does not address a regulatory directive required to be included in that document, the Board may remand the DRRS to the original DT or instruct the WSC to convene a new DT to redraft the document. The Board shall instruct the DT on the specific regulatory directive that must be contained in the redraft. Once the DRRS is redrafted it shall be reprocessed under these Procedures.

If the Ballot Pool rejects a DRRS or fails to ballot the DRRS due to failure to reach a quorum, either when first presented for ballot or during an iterative redraft as instructed by the Board, the Board shall review the DRRS, including all comments provided and all rationale accompanying any negative vote.

Upon a finding that the DRRS was rejected for reasons not related to the regulatory directive, the Board may direct WECC staff to file a new SAR with the specific narrow scope of addressing only the regulatory directive. The Board may suggest specific language for inclusion in the proposed DRRS.

Upon a finding that the DRRS was rejected based on language addressing the regulatory directive, the Board shall take the following steps to meet its regulatory obligation:

1) Review the entire record of development.
2) Require a public technical conference to be noticed and convened to determine whether the rejected DRRS is:
    - just and reasonable;
    - not unduly discriminatory or preferential;
    - in the public interest;

- helpful to reliability;
- practical;
- technically sound;
- technically feasible;
- cost-justified; and
- meets the regulatory directive (hereafter “Just and Reasonable”).

3) Determine whether the DRRS should be implemented as drafted, notwithstanding rejection by the Ballot Pool.

Upon a finding that the rejected DRRS should be implemented, the Board shall approve the DRRS and direct that it be submitted to NERC for NERC and FERC approval, as required.

Upon a finding that the rejected DRRS should not be implemented, the Board may submit the DRRS and its record of development as a regulatory compliance filing in response to the regulatory directive. The filing shall include a recommendation that the DRRS not be made effective and an explanation of the basis for that recommendation.

Maintenance of the Procedures

The WSC is charged with maintenance of these Procedures. Proposed changes to these Procedures shall first be brought to the WSC for consideration. The WSC may initiate proposed changes on its own initiative.

If it determines that a change to these Procedures should be pursued, the WSC shall draft the proposed changes and post the proposed changes to the WECC website for comment, accompanied by a notice to the SEL soliciting comments on the proposed changes.

The WSC shall consider all comments received and shall redraft the proposed changes as it deems necessary. Once the WSC approves the proposed changes, those changes shall be submitted to the Board for approval. Changes to these Procedures approved by the Board shall be submitted to NERC for NERC and FERC approval.

Maintenance of RRS and OPs Documents

The WSC shall ensure that each RRS is reviewed at least once every five years from the effective date of the most recent version of the RRS. If the review identifies needed changes, the WSC shall cause a remedial SAR to be filed. If the review does not identify needed changes, the WSC shall communicate its decision via the SEL and no further action will be required.

Review of OPs shall be conducted in accordance with internal WECC policies and procedures.

Attachment 2

Reliability Standards Development Procedures

Amended Exhibit of the Delegation Agreement Between

North American Electric Reliability Corporation and

Western Electricity Coordinating Council

Redline Version

RELIABILITY STANDARDS
DEVELOPMENT PROCEDURES

Introduction

This document explains the WECC process for requesting, announcing, developing, revising, withdrawing and approving WECC Standards as defined below ("WECC Standards Process"). The process involves several steps:

- A request to develop a new Standard or revise an existing Standard
- Decision to proceed with development or revision of a Standard and assignment to a Drafting Team

Public (including members) notification

The Western Electricity Coordinating Council (WECC) is a Regional Entity[1] authorized through a delegation agreement between the North American Electricity Reliability Corporation (NERC) and WECC pursuant to Section 215 of the Federal Power Act. NERC delegates designated powers, rights, and responsibilities to WECC regarding the administration within the Western Interconnection of electric Reliability Standards adopted or approved by NERC and the Federal Energy Regulatory Commission (FERC).

These Reliability Standards Development Procedures (Procedures) define the process to be used by WECC for the development, revision, and retirement of Regional Reliability Standards (RRS) and various Other Projects (OP) created under these Procedures.

- These Procedures were established to create the structure for open and transparent due process in the development of WECC RRSs and OPs. These Procedures include, but are not limited to, public notice of intent to develop ~~or revise~~RRSs and OPs, a ~~Standard~~
- ~~Drafting stage~~
- ~~Posting of draft for~~ public comment
- ~~Review of all comments and public posting of decisions reached on each comment~~
- ~~Ballot Body balloting of the~~ period on the proposed ~~Standard~~
- ~~Consideration~~documents, due consideration of comments provided, and a balanced ballot of ~~any appeals~~
- ~~WECC Board of Directors (Board) decision regarding approval, disapproval or remand of proposed Standard~~
- ~~Forwarding proposed WECC Reliability Standards to the ERO~~

~~The~~ process for developing and approving WECC Standards includes:

~~1. Notification of pending Standard change before a wide audience of all "~~interested ~~and affected parties"~~stakeholders.

The ~~2. Posting Standard change drafts for all parties to review~~

[1] Unless otherwise specified, capitalized terms are defined in the NERC Glossary of Terms Used in Reliability Standards.

3. Provision for gathering and posting comments from all parties

4. Provision for an appeals process – both "due process" and "technical" appeals

The WECC Standards Committee (WSC) has the responsibility for developing and balloting WECC Standards. The WSC Chair is responsible for ensuring administration of the process and completion of all WSC responsibilities. The WSC is supported by the Standing Committees as well as Drafting Teams that draft the Standards. The WSC, with the support of a Drafting Team and Standing Committees, ensures the Draft Standard is properly reviewed consistent with WECC due process requirements, responses have been provided to comments on the Draft Standard, or the Draft Standard is revised in response to the comments. Board approval signifies that WECC has adopted the Standard. WECC staff has the role of tracking the Standard as it moves through the process and facilitating resolution of issues. In accordance with Section 8.6 of the WECC Bylaws, Participating Stakeholders may participate in Reliability Standard development by joining the Ballot Body and may vote electronically on a Draft Standard.

WECC Bylaws Controlling

It is the intention of the drafters of the WECC Standards Process that the procedures described herein Procedures shall be interpreted and applied in a manner that is consistent with the WECC Bylaws. Should any conflict arise between this WECC Standards Process the Procedures and the WECC Bylaws arise, the WECC Bylaws will control prevail.

Terms

Definitions

Ballot Body. The Ballot Body consists

That body of qualified WECC members Members and non-members that register with WECC for participation in Ballot Pools.

Ballot Pool

That pool of Ballot Body entities that have been determined eligible for registered to vote on a specific document.

Day

All references to days are calendar days. When counting the WECC Standard Voting Sectors described in this Reliability number of days, the count shall exclude the first day of the time window to be measured. If a terminus date falls on a weekend or a day that WECC is scheduled to be closed, the new terminus date shall be the day following the weekend or WECC closure day.

For example, if a 15-day period ends on a holiday the terminus date is on the following WECC business day.

Drafting Team (DT)

A team of pertinent subject matter experts (SME) that was appointed by the WECC Standards Committee (WSC) to develop the document(s) that were called for in a Standard Authorization Request (SAR) consider and respond to industry comments, participate in forums to help build consensus on draft documents, and perform other tasks as assigned by the WSC.

Electric Line of Business

The generation, transmission, distribution, or trading of electricity or the provision of related energy services in the Western Interconnection.

NERC Compliance Registry

Registry of the Bulk Electric System owners, operators, and users that are subject to approved reliability standards.

Non-Substantive Changes

A Non-Substantive Change is one that does not change the scope, applicability, intent of the document, or the actions required by affected entities.

For example, Non-Substantive Changes include, but are not limited to; correcting grammar or sentence structure, typographical or spelling errors, font and formatting, numbering, references, adding an obviously missing word, or rephrasing a statement to improve its clarity. Non-Substantive Changes do not require, but may receive posting for comments and/or revision of the document under these Procedures.

Other Projects (OP)

Any document type other than an RRS developed under these Procedures. These include, but are not limited to, WECC Criteria.

Participating Stakeholder~~Development Process and in section 8.5.5.2 of~~

Any person or entity that is not a WECC Member, but who has applied for and been granted participating stakeholder rights as defined and currently set forth in the WECC Bylaws. ~~The Ballot Body consists of the entities that may vote on Regional Criteria and~~

Regional Reliability Standard (RRS)

A requirement approved by FERC under Section 215 of the Federal Power Act, to provide for reliable operation of the Bulk Electric System in the United States. Regional Reliability

Standards, except as otherwise limited by these procedures. are specific to the Western Interconnection and shall be established using these Procedures. When approved by FERC and applicable authorities in Canada and Mexico, Regional Reliability Standards shall be made part of the body of NERC Reliability Standards and shall be enforced upon all applicable Bulk-Electric System owners, operators, and users within the WECC area, regardless of membership in the region.

Standard Authorization Request (SAR)

Ballot Pool. The Ballot Pool consists of Ballot Body entities that have opted to vote on a specific Standard. Quorum for voting on a Standard is based on the Ballot Pool.

Days. All references to days in this document refer to calendar days, except as otherwise noted in these procedures.

Draft Standard. A Draft Standard includes any proposed new Standards, revisions to existing Standards, or termination of existing Standards. Draft Standards are introduced by use of Standard Authorization Requests or the Special Procedures for Addressing Regulatory Directives, as described in these procedures.

Joint Session. The Joint Session is any collective meeting of the Standing Committees. Such meetings are generally held in conjunction with the regular meetings of the individual Standing Committees.

Participating Stakeholder. A Participating Stakeholder as defined in Section 3.33 of the WECC Bylaws.

Standard. In the context of this document, the term Standard refers to a Regional Reliability Standard or a Regional Criterion.

form titled *Standard Authorization Request (*~~**or "***~~*SAR*~~**").** The form titled~~*)* administrated by the WECC Standards~~/Regional Criteria Request Form approved~~ Department for the purpose of requesting development, revision, retirement, or interpretation of an RRS or OP.

Standards Briefing

Any meeting initiated by WECC for the purpose of ~~requesting a new Standard, a revision to an existing Standard, or termination of~~creating an ~~existing Standard.~~

Standing Committee. The Market Interface Committee (MIC), Operating Committee (OC) or Planning Coordination Committee (PCC).[2]

[2] In accordance with WECC Bylaws Section 8.5.4, Membership in WECC's Standing Committees is open to all WECC members.

~~**WECC Standards Committee.** This committee consists of one representative from each of the eight Voting Sectors described in Section 8.5.5.2 of the Bylaws~~open forum for discussion and ~~a ninth member who shall be a member of the WECC Board of Directors. The members of the WSC shall be appointed by, and serve at the pleasure of, the Board, in accordance with a charter of the WSC approved by the Board. The chair of the Board shall designate a member of the Board of Directors to serve as the chair of the WSC. The WSC is responsible for determining if a Standard Authorization Request is within the scope of WECC's activities, and overseeing the drafting, comment and voting~~explanation of an RRS or OP, generally but not exclusively held during the development process ~~for a Standard. The WSC is responsible for taking actions described in the Special Procedures for Addressing Regulatory Directives to ensure compliance with directives issued by the Federal Energy Regulatory Commission (FERC) or Mexican or Canadian regulatory authorities. The WSC shall also oversee the process for responding to requests for interpretations of Standards.~~of those documents in advance of a ballot window.

Standards Email List (SEL)

Email list(s) established and maintained by WECC for the purpose of communicating due process activity; generally, but not exclusively, for standards-related activities.

Substantive Changes

A Substantive Change is one that changes the scope, applicability, intent of the document, or the actions required by affected entities.

For example, Substantive Changes include but are not limited to:

- changes to the functional entities listed in the applicability section of the RRS or OP;
- changes to the effective date;
- adding, deleting or revising requirements, measures or explanatory narrative.

Substantive Changes to an RRS or an OP require at least one posting / comment / response cycle.

WECC Member

Any entity that has applied and been accepted for membership in WECC ~~**Standards Voting Sectors**. For purposes of voting on Standards,~~ and is current in the payment of dues.

WECC Standards Committee (WSC)

Committee established by the WECC Board of Directors (Board) for the purpose of overseeing the implementation of these Procedures pursuant to its Board-approved charter.

Overview

This document has two dominate sections. The first section describes the development steps for the Normal Process for Regional Reliability Standards and Other Projects. The second section augments the first with Supporting Processes to address exceptions such as an expedited process for urgent actions, addressing regulatory directives, and maintenance

of certain documents.

Development Steps/Table of Contents

The following development steps are included in the normal process for Regional Reliability Standards and Other Projects section:[3]

Step 1 – Submit and Validate a Standard Authorization Request 9

Step 2 – Complete SAR and Present to the WSC 10

Step 3 – Convene the Drafting Team 11

Step 4 –Begin Drafting Phase and Submit Draft to WSC 12

Step 5 – Post for Comment 13

Step 6 – Respond to Comments 15

Step 7 – Submit Proposed Draft to the WSC with a Request for Ballot 16

Step 8 – Convene a Standards Briefing 16

Step 9 – Form the Ballot Pool and Ballot the Standard 17

Step 10 – Initiate the Appeals process – If Needed 22

Step 11 – Obtain Board Approval 23

Step 12 – Submit RRSs for ERO Review, FERC Approval & Implementation of WECC Regional Reliability Standards

Step 13 – Retire an OP 24

Step 14 – Submit a Request for Interpretation 24

The following related processes are included in the Supporting Processes section:

- Expedited Process for Urgent Action
- Regulatory Directives~~members~~
- Maintenance of Procedures
- Maintenance of RRSs and OPs Documents

[3] This Table of Contents will reflect the final actual pagination after final formatting. This footnote will be deleted from the final document.

Notices

Notices required under these Procedures shall be distributed electronically via WECC's SEL(s) and deemed delivered when posted on the WECC website, except as noted in the following paragraph. Concurrent running of notice and posting periods is explicitly allowed.

WECC shall provide notice to NERC of all standards-related activities by including NERC on WECC's SEL. Inclusion of a NERC-provided email address on the related SEL shall constitute coordination of notice to NERC of standards-related activities and shall be deemed delivered upon dispatch via the SEL(s).

All WECC Members and Participating Stakeholders will be given an opportunity to receive notices provided via the SEL.

WECC Standards Committee (WSC)

The WSC manages these Procedures. The WSC protects the integrity, credibility and implementation of the Procedures while acting in accordance with the WSC Charter. Delineation of specific WSC duties, WSC composition and governance, WSC voting privileges, and other related practices, shall ~~vote~~be in ~~the following eight sectors.~~ accordance with the WSC charter as approved by the Board.

WECC Standards Voting Sectors

There are eight (8) Standards Voting Sectors (SVS) in which an entity may register to vote. The SVSs are divided into two separate categories: Registered and Non-Registered.

The Registered category is for those entities *registered* on the NERC Compliance Registry and to those Canadian and Mexican entities that perform functions that, if performed in the United States, would allow those entities to be registered for compliance in the NERC Compliance Registry. The Non-Registered category is for all others meeting the qualifications of those defined SVSs. A single entity cannot be in the Registered category and the Non-Registered category at the same time.

SVSs 1 through 5 are "Registered" SVSs.

~~1)~~ 1) Transmission Sector. ~~-~~This sector consists of Western Interconnection entities registered in the NERC ~~compliance registry~~Compliance Registry as ~~transmission owners, transmission operators, transmission service providers, or transmission planners~~Transmission Owners, Transmission Operators, Transmission Service Providers, or Transmission Planners;

~~2)~~ 2) Generation Sector. ~~-~~This sector consists of Western Interconnection entities registered in the NERC ~~compliance registry~~Compliance Registry as ~~generation owners or generation operators~~Generation Owners or Generation Operators;

~~3)~~ 3) Marketers and Brokers Sector. ~~-~~This sector consists of Western

Interconnection entities registered in the NERC ~~compliance registry~~Compliance Registry as ~~purchasing-selling entities~~Purchasing-Selling Entities.

~~4)~~ 4) Distribution Sector. ~~-~~This sector consists of Western Interconnection entities registered in the NERC ~~compliance registry~~Compliance Registry as ~~distribution providers or load-serving entities~~Distribution Providers or Load-Serving Entities;

~~5)~~ 5) System Coordination Sector. ~~-~~This sector consists of Western Interconnection entities registered in the NERC ~~compliance registry as balancing authorities, reserve sharing groups, planning authorities, resource planners, interchange authorities, and reliability coordinators. WECC may cast a vote in this sector;~~Compliance Registry as Balancing Authorities, Reserve Sharing Groups, Planning Authorities/Coordinators, Resource Planners, Interchange Authorities/Coordinators, or Reliability Coordinators.

~~6) End Use Representative Sector. This sector consists of non-registered members of WECC Member Class Four;~~

SVS 6 through 8 are "Non-Registered" SVSs.

6) End-Use Representative Sector. This sector consists of entities not on the NERC Compliance Registry, but that are WECC Members and are end users of significant amounts of electricity in the Western Interconnection, including; industrial, agricultural, commercial and retail entities as well as organizations in the Western Interconnection that represent the interests of a substantial number of end users or a substantial number of persons interested in the impacts of electric systems on the public or the environment.

~~7)~~ 7) State and Provincial Representatives Sector. ~~-~~This sector consists of ~~non-registered~~ entities not on the NERC Compliance Registry, but that are WECC ~~members of~~ Members that are representatives of states and provinces in the Western Interconnection provided that such representatives will have policy or regulatory roles and do not represent state or provincial agencies and departments whose function involves significant direct participation in the market as end users or in Electric Line of Business activities.~~**WECC Member** Class Five;~~

8) Other Non-Registered WECC Members and Participating Stakeholders Sector. ~~-~~This sector consists of ~~consultants or other members of WECC Member Class Seven, or interested stakeholders who qualify for~~ (1) Participating ~~Stakeholder status but are not~~ Stakeholders as defined in the WECC Bylaws, (2) WECC Members not on the NERC Compliance Registry that are Electric Line of Business entities doing business in the Western Interconnection that do not own, control or operate transmission or distribution lines in the Western Interconnection, including power markets, independent power producers, any other entities whose primary business is the provision of energy services, and (3) those entities that are not eligible for membership in any other Standards Voting Sector and who have a substantial interest in the purposes of WECC.

8) If a single entity qualifies for more than one Registered SVS, that entity may register and vote in each Registered SVS for which it qualifies. For example, if a single entity was registered in the NERC compliance registry.Compliance Registry as a transmission owner and also a generator owner; that single entity could register and vote once in SVS 1 and once in SVS 2.

For sectors oneNon-Registered SVSs 6 through five, Western Interconnection8 represent those entities that perform functions outside the United States, that if conducted in the United States would qualify them for the NERC compliance registries included in these sectors, shall be eligible to vote in the appropriate sector(s), as may be determined by WECC staff.

Each WECC member or Participating Stakeholder shall have a vote that may be cast in each sector for which the member or stakeholder is eligible as described in Section 8.5.5.4 of the Bylaws.

Sectors one through five are the*not registered* sectors, and the three non-registered sectors are sectors six through eight. If an entity is eligible for a registered sector, then that entity may be eligible for more than one registered sector. An entity can only be in one non-registered sector. An entity cannot be in both a registered and a non-registered sector. The first five sectors (in the NERC Compliance Registry. Unlike Registered SVSs 1 through 5) shall be in the North American Electric Reliability Corporation ("NERC") compliance registry, with the exception for, entities that perform functions outside the United States that are determined eligible for these voting sectors by WECC Staffin Non-Registered SVSs 6 through 8 are only eligible to register and vote in a single SVS.

Participating Stakeholders may not vote on Regional Criteria unless the proposed Regional Criteria could result in sanctions to a non-WECC member.

Normal Process for Regional Reliability Standards and Other Projects

Step 1 – Request To Revise or DevelopSubmit and Validate a Standard Authorization Request

Requests to develop, terminate,
Development, revision or revise retirement of a Regional Reliability Standard will(RRS) or Other Project (OP) shall be submitted toinitiated by the WECC staff through the usefiling of the WECCa Standard Authorization Request ("(SAR"). Requesters may be) by any individual or organization. WECC membershipperson or entity. A SAR is not a requirement as long asfiled by completing the electronic fields of the online WECC SAR form. WECC staff shall review the requester has an interest in electric system reliability or commercial business practices inincoming SAR to ensure it is valid. Once deemed valid, the Western Interconnection.SAR shall be

immediately posted on the WECC website and notification shall be sent to the SEL.[4]

Step 2 – ~~Standard Authorization Request Validation and Submission~~**Complete SAR and Present** to the WSC

~~The SAR will be reviewed for completeness and assigned a tracking number by the~~ WECC staff shall assign a unique tracking number to each SAR. The unique tracking number shall be used to identify the SAR throughout the development and archival processes. The SAR and those documents developed in response to the SAR shall be publicly accessible on the WECC website.

WECC staff~~. Staff may~~ shall determine within 30 days of receipt whether a SAR is complete. WECC staff may assist with completing the ~~request~~SAR, or report to the WSC that the SAR is incomplete and request guidance. ~~When complete, the WECC staff will forward the SAR to the WSC. WECC staff will maintain a web-based form that tracks all SARs through the Standard development process, as well as a Standards development tracking log that is posted on the WECC website.~~

~~The WSC will confer either in person or via conference call within two weeks of receipt of a completed request to determine whether the request is within WECC's scope.~~

~~If the WSC~~

To be deemed complete, each SAR shall contain a description of the proposed RRS or OP subject matter sufficiently detailed to clearly define the purpose, scope, impacted parties, requirements and any other information relevant to the proposed RRS or OP.

Once deemed complete by WECC staff, WECC staff shall notify the WSC that the SAR has been received and is complete, and shall place the SAR on the agenda for the next scheduled WSC meeting for disposition, subject to required notice. Notice of WSC meetings and posting of WSC agendas will be provided in accordance with the WSC Charter.

The WSC shall determine whether the SAR is within the scope of WECC's authority and activities, and is appropriate for development. The WSC shall make that determination within 60 days of the date that the SAR is received by WECC, except where the SAR has been remanded, in which case the WSC shall make that determination within 30 days of receiving the curative SAR. Public comment on the SAR will be reviewed and considered by the WSC during a duly noticed WSC meeting prior to the WSC approving the SAR.

The WSC shall ensure that the SAR provides enough information that a Drafting Team (DT) will have a clear understanding of the reasons for, and nature of, the RRS or OP to be developed. The SAR author may be asked to further assist in the development or clarification of the SAR.

[4] A "valid" SAR is different than a "complete" SAR. A SAR is deemed valid by staff as a threshold review that filters out spam and unwanted nuisance documents that may be received via an open website portal. Whether a SAR is "complete" is addressed in Step 2.

The WSC may accept the SAR, in which case development proceeds to Step 3.

The WSC may remand a SAR if it determines the content of the SAR is deficient. If the SAR is deemed deficient, the WSC shall specify the deficiency identified in the SAR and suggest potential remedies as part of its remand. WECC staff will make reasonable efforts to assist the SAR author in addressing the deficiencies identified by the WSC.

The SAR author shall have 30 days from the date of remand or until the 60th day following submittal of the SAR, whichever is longer, to remedy each deficiency identified in the remand, or withdraw the SAR.

If the ~~, by majority vote, that a~~ deficiencies are remedied, WECC staff will resubmit the SAR to the WSC for disposition. If the deficiencies are not remedied within the allotted period: 1) the SAR will be deemed incomplete, 2) no further developmental action will be taken on the SAR, and 3) the SAR will be archived. The SAR author may submit a new SAR without prejudice based on the same or similar fact pattern.

The WSC may reject a SAR if it determines the SAR is outside the scope of WECC's authority or ~~inappropriate, it will prepare an~~is not appropriate to be undertaken by WECC. If a SAR is rejected, the WSC shall post its explanation ~~and post it~~ for rejection on the WECC website. ~~The party that submitted the SAR, parties subscribing to the WECC standards email list, the Standing Committees, and Board will all be notified of the posting and its location on the WECC website. If the WSC decides to reject a SAR at this stage, such~~Notification of the WSC's decision shall: 1) be communicated to the SAR author, the Board, and the Standards Email List (SEL), 2) reference the unique SAR tracking number and direct the recipient to supporting information as appropriate, and 3) be made no more than 30 days from the date of the WSC's determination. The WSC's decision to reject a SAR may be appealed to the Board ~~in accordance with Step 8.~~.

~~Upon ascertaining that a SAR is within the scope of WECC's authority and appropriate, the WSC will select and oversee a Drafting Team formed for the purpose of drafting a Draft Standard. The WSC shall ensure that the Drafting Team includes a composite of individuals having the appropriate planning, operations, and market expertise. Notification of such assignments will be posted on the WECC website and sent to all parties that subscribe to the WECC standards email list. In addition, such assignments will be simultaneously noticed to NERC. The WSC shall ensure that the SAR provides the Drafting Team and WECC a description of the Draft Standard it expects the Drafting Team to draft, and an explanation as to why the Draft Standard is needed.~~

~~Step 3 – Drafting Team Begins~~Step 3 – Convene the Drafting Team

If it accepts a SAR, the WSC may, at its discretion, expand or narrow the scope of the SAR. The WSC shall prioritize the development of the SAR in relation to other RRSs or OPs proposed for development under the Procedures, as may be required based on the volume

of requests and resources. If prioritization dictates a postponed starting date, the WSC shall either set a postponed starting date or set a review date upon which the WSC shall re-evaluate the SAR for purposes of its progress through these Procedures. In no case shall the review date be more than 180 days after the date the SAR was received.

Upon establishing a start date for the development of an RRS or OP, the WSC shall convene a DT to develop the RRS or OP required by the SAR. The WSC may either directly assign a DT or solicit team member nominations from the industry. The WSC shall approve the DT membership within 60 days of establishing a start date. The WSC may augment or modify DT membership at any time as needed.

Because the DT chair's primary responsibility is leadership and coordination, the DT chair need not be a SME in the field associated with the SAR.

Names of DT members will be posted on the associated project development website.

The WSC should provide to the DT a proposed starting date and an expected completion date.

Step 4 –Begin Drafting Phase and ~~Submits~~Submit Draft ~~Standard~~ to WSC

~~The Drafting Team will begin working on the Draft Standard following assignment by the WSC, as directed by the WSC chair. The WSC shall provide a time period for which the Drafting Team should complete the Draft Standard. The WSC chair shall designate a Drafting Team leader who shall be responsible for coordinating the Drafting Team's efforts. Notification of Drafting Team meetings will be posted on the WECC website and sent to all parties that subscribe to the WECC standards email list at least 15 calendar days prior to the meeting. In addition, notification of all Drafting Team meetings will be simultaneously noticed to NERC. These meetings will be open to interested stakeholders. The Drafting Team will facilitate interested stakeholder participation in the discussion in order to encourage understanding of the issues and consensus among the meeting participants. The Drafting Team will work to achieve a consensus recommendation. A consensus recommendation is one that strives to eliminate all well-reasoned objections, but if the Drafting Team determines that it is not possible to accommodate all such points of view, it may proceed to provide a recommendation that is supported by a majority of the Drafting Team members.~~

~~Standard requesters have the right, and are encouraged to~~
All DT meetings shall be open and publicly noticed on the WECC website.

The DT will begin working on the documents required by the SAR following assignment by the WSC. Notice of each DT meeting shall be posted on the WECC website for a minimum of 15 days prior to the meeting.

The author of the SAR may participate in the drafting process. ~~Requesters~~The author of the SAR may be ~~called on~~asked to provide additional information, supporting studies, and other information to support the requirements of the ~~Draft Standard~~proposed RRS or OP.

An RRS shall include those sections mandated by NERC, such as an applicability section, effective date, mandatory requirements, affected time horizons, measures, compliance, violation risk factors (VRF), and violation severity levels (VSL).

Each ~~All WECC Standards will follow a standard format that refers to the "Responsible Entities" included in the NERC Functional Model and includes compliance measures according to the WECC standard template. The Drafting Team will include definitions for any terms included in the Draft Standard that need to be added to the WECC glossary.~~

RRS shall promote at least one reliability principle and be consistent with all reliability principles and NERC market interface principles. Each RRS shall provide for as much uniformity as possible with reliability standards across the interconnected Bulk-Power System of the North American continent. An RRS shall be more stringent than a continent-wide reliability standard, include a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the Bulk-Power System.

An RRS or OP may include a guidance section, background section or other narrative sections; however, these sections are not required. Incorporation of extrinsic documents into an RRS or OP should be avoided.

An RRS or OP may include new definitions of terms that need to be added to the WECC or NERC glossaries. Wherever possible, DTs are encouraged to use existing defined terms rather than create new defined terms.

In drafting the applicability section of an RRS, only those functional entities listed in the currently approved NERC Functional Model shall be used. When drafting the applicability section of an OP, use of the NERC Functional Model is not required. Development of an OP should conform to WECC internal policies and practices, unless otherwise specified herein.

In the course of its ~~review~~assignment, the ~~Drafting Team:~~ DT shall, at a minimum: ~~will review the~~

- Review any preliminary technical assessment provided ~~by~~with the ~~requester;~~ SAR;
- ~~may perform~~Perform or request additional technical studies~~, if necessary;~~ as needed;

- ~~will complete an impact assessment report as part of its evaluation to assess the potential effects of the request;~~

- ~~may prepare additional~~Prepare supporting documents to support the ~~Draft Standard~~RRS or OP as needed; and
- ~~may request~~Request from the WSC additional time to develop the ~~Draft Standard~~RRS or OP, if ~~the Drafting Team believes it is~~ necessary.~~-~~

~~The Drafting Team, upon reaching a determination, by majority vote, on the language for a Draft Standard, shall submit the Draft Standard to the WSC. The Drafting Team shall also~~

~~supply the WSC with the impact assessment report, any additional technical studies performed, and any other materials that significantly contributed to the Drafting Team's evaluation and drafting of the Draft Standard.~~

Step ~~4 – Draft Standard Posted~~5 – Post for Comment

Upon completion of each iterative draft of the RRS or OP, WECC staff shall facilitate the posting of the draft RRS or OP on the WECC website, along with supporting documents, if any, for a comment period of no less than 45 days for the first iteration and no less than 30 days for each iteration thereafter, except as allowed in the Expedited Process for Urgent Action section of these Procedures.

An implementation plan shall be included in at least one iterative posting during the development of the RRS or OP and shall be a part of the final record for consideration prior to ballot.

A notice that the comment period has been opened shall be distributed via the SEL. The notice shall include, at a minimum, the following information:

- Identification of the RRS or OP;
- What action is being taken (e.g., request for 30- or 45-day comment);
- The location of the document for review;
- How to submit comments or perform the requested action; and
- The opening and closing dates during which the solicited action shall take place. Unless otherwise posted, all posting periods close at 5:00 p.m. (Mountain).

WECC shall open a Web portal to serve as the sole means of receiving comments on the RRS or OP. Comments received via other media or received outside of the posted comment period will be accepted at the discretion of the DT. Comments may be submitted by any individual or entity, or a group of parties with a common comment. To streamline the process, if a group of parties elects to submit a common comment, those parties are encouraged to submit that common comment only once and append to the comment the names of all those individuals, entities or groups that are in support of the common position. DTs are charged to give due weight to such a joint comment and not to view the comment as having been received by a single individual or entity.

The WSC shall monitor each posting and review the posted documents to determine whether the DT remains within the scope of the SAR. At any time prior to opening a Ballot Pool, if the WSC concludes that the proposed RRS or OP is not within the scope of the SAR or does not meet other regulatory requirements or directives, the WSC shall either remand the RRS or OP to the DT with a specific explanation identifying the deficiencies that must be remedied, adjust the scope of the SAR, or retain the SAR as drafted and replace the DT.

Upon receiving the remanded RRS or OP and explanation of deficiencies, the DT shall initiate a redraft following the steps contained in these Procedures. If a new DT is assigned, the new DT shall start the development efforts at Step 4 of these Procedures.

Step 6 – Respond to Comments

The DT shall consider all comments submitted in accordance with these Procedures. If the same comment is provided more than once, the DT may provide a single response to all comments that raise the same or a similar concern.

The DT shall prepare a summary of the comments received and the changes made to the proposed RRS or OP as a result of comments received. The DT shall summarize comments that were rejected by the DT, in whole or in part, and the reason(s) that these comments were rejected. The summary, along with a response to each comment received, will be posted on the WECC website no later than the next posting of the proposed RRS or OP.

All parties submitting comments are encouraged to participate in the DT meetings during which responses to their comments are considered and drafted.

The DT should target posting its responses to the WECC website no later than 30 days after the comment window has closed. If more than 30 days are required, the DT chair shall advise the WSC chair of the DT's progress and request additional assistance as needed.

Substantive Changes

If the DT determines that comments received during any posting warrant a Substantive Change to the language of an RRS or OP, the DT shall consider each comment and redraft the RRS or OP accordingly, repeating the posting / comment / response cycle as many times as needed to address the Substantive Changes while staying within the scope of the SAR.

If at any time during the development process the DT determines that the scope of the SAR should be adjusted, the DT shall present that request to the WSC for disposition.

If at any time during the development process the DT determines that it has reached a developmental impasse, the DT shall present the issue to the WSC for disposition.

If comments received during any posting do not warrant a Substantive Change to the language of an RRS or OP, the DT shall be polled at a regularly scheduled and announced DT meeting and asked whether the RRS or OP should be forwarded to the WSC with a recommendation to ballot the document. If the DT concludes by an affirmative majority vote that the RRS or OP should be forwarded to the WSC with a recommendation for ballot, the document will be forwarded accordingly.

Non-Substantive Changes

These Procedures acknowledge that a Non-Substantive change may be discovered at any point during or after the final development of the RRS or OP.

Non-Substantive Changes to an RRS shall be handled in accordance with the NERC Standards Development Manual or its successor.

Non-Substantive Changes to an OP shall be addressed using WECC's internal policies and practices. Non-Substantive changes for OPs do not require a comment / response cycle.

Step 7 – Submit Proposed Draft to the WSC with a Request for Ballot

Upon completion of the proposed RRS or OPs, the DT shall present the proposed RRS or OPs to the WSC with a request for ballot. The WSC shall address that request no later than its next regularly scheduled meeting.

After receiving a request for ballot, the WSC shall review the RRS or OP as presented and determine whether it fulfills the requirements stated in the SAR. The WSC shall also consider whether extrinsic requirements, such as FERC orders, Board directives, or other regulatory directives are met by the content of the document.

If the WSC concludes that the proposed RRS or OP is ready for ballot, the WSC shall forward the RRS or OP to WECC staff with a request that a Ballot Pool be formed from the Ballot Body, for the specific intent of seeking approval of the proposed RRS or OP. The results of the WSC's vote to forward the RRS or OP to the Ballot Pool shall be documented. Any WSC member that opposes submittal of the RRS or OP will be encouraged to provide dissenting comments, and if possible, specific language that would make the draft document acceptable to the dissenting member. If the WSC cannot reach agreement to submit the RRS or OP to the Ballot Pool, the WSC will report to and seek guidance from the Board.

If the WSC concludes that the proposed RRS or OP is not ready for ballot because it does not fulfill the requirements of the SAR or because it fails to meet other regulatory requirements or directives, the WSC shall remand the RRS or OP to the DT with a specific explanation identifying the deficiencies that must be remedied.

Upon receiving the remanded RRS or OP and explanation of deficiencies, the DT shall:

1) Redraft the RRS or OP accordingly;
2) Initiate iterative comment / response cycles as needed until it again concludes that no further Substantive Changes are needed; and
3) Return the proposed RRS or OP to the WSC for disposition.

Step 8 – Convene a Standards Briefing

Once the WSC approves submitting the RRS or OP to the Ballot Pool for ballot, WECC shall dispatch notice to the SEL that a Standards Briefing will be held to discuss the content of the proposed RRS or OP prior to balloting. Notice shall be provided 15 days or more before the Standards Briefing is to be held and shall provide, at a minimum, the following:

- Identification of the RRS or OP;
- The time and place of the Standards Briefing; and

- The location of the proposed RRS or OP and related documentation for review.

Step 9 – Form the Ballot Pool and Ballot the Standard

Any individual or entity seeking participation in the ballot of an RRS or OP shall apply to WECC for Ballot Body membership in any SVS in which it is eligible. WECC staff shall review the request and confirm eligibility to join the Ballot Body.

Decisions of the staff to approve, deny, or restrict the admission of an individual or entity to a voting sector may be appealed in accordance with the WECC Bylaws.

From the Ballot Body, a discrete Ballot Pool will be formed for each RRS or OP to be balloted under these Procedures. All members of the Ballot Body shall be provided an opportunity to opt into a Ballot Pool formed for purposes of voting on each RRS or OP. It is the Ballot Pool that votes on RRSs and OPs developed under these Procedures.

Notice that a Ballot Pool is forming will be dispatched via the SEL. That notice shall contain, at a minimum, the following information:

1) Identification of the RRS or OP;
2) The proposed action to be taken (e.g., Notice of Ballot Pool Formation / Notice of Ballot);
3) When the Ballot Pool will open;
4) When the ballot will take place;
5) How to cast a vote; and
6) The location of the proposed RRS or OP and related documentation for review.

The Ballot Pool registration window shall remain open for a period determined by WECC staff, but in no case shall the Ballot Pool registration window be open less than 15 days or more than 30 days.

Once notice of a Ballot Pool forming has been dispatched: 1) the ballot window shall commence no sooner than 15 days and no later than 45 days after that dispatch; and 2) no Substantive Changes may be made to the proposed document unless the revisions are posted for an iterative comment / response cycle and a new date is set for ballot.

Once the ballot window opens, no Ballot Body member may join or withdraw from the Ballot Pool. The WECC Director of Standards (DOS) may authorize deviations from this rule for extraordinary circumstances such as the death, retirement, or disability of a Ballot Pool member that would prevent an otherwise eligible entity from casting a vote during a given ballot window.

Voting on an RRS or OP shall be via electronic voting administered on the WECC website. The default voting window shall be a period of 15 days; however, the window may be held open up to a maximum of 60 days to reach a quorum. During a ballot window, WECC shall not sponsor or facilitate public discussion of the standard to be balloted.

Eligible members of the Ballot Pool may cast one vote in each SVS for which they are eligible.

Participating Stakeholders may only vote on an RRS if they have applied for and been granted Participating Stakeholder status. A Participating Stakeholder is only entitled to vote on an RRS and may only vote on a WECC Criterion if the proposed WECC Criterion could result in sanction to a non-WECC Member. A Participating Stakeholder is not entitled to vote on any other OP.

Each member of the Ballot Pool casting a negative vote on an RRS or OP will be required to provide a statement explaining the reason for the negative vote. The statement should include language that would make the RRS or OP acceptable. The statement will be included in the voting record for consideration by the WSC and the Board.

A two-thirds (2/3) quorum of the Ballot Pool is required for each vote. ~~Upon receiving the Draft Standard from the Drafting Team, the WSC shall decide whether to: (i) post the Draft Standard provided by the Drafting Team for comment; (ii) further revise or modify the Draft Standard provided by the Drafting Team, then post the WSC's revision for comment; (iii) return the Draft Standard to the Drafting Team for further work, as directed; or (iv) terminate the Standard development activity in accordance with the procedures for rejecting a SAR in Step 2. A majority (greater than 50 percent) vote of the authorized membership of the WSC is required to terminate a Draft Standard at this stage. If the WSC chooses to remand the draft back to the Drafting Team, the WSC chair shall provide the Drafting Team with the committee's reason for the remand and provide further guidance, as necessary.~~ Quorum shall be based on the total number of Ballot Pool members and shall not be based on the total number of votes cast. Abstentions and negative votes cast without an explanation shall not be counted for the purpose of determining consensus, but will be counted for purposes of obtaining a quorum.

~~If the WSC chooses to present the Draft Standard for comment, the WSC shall post the initial Draft Standard on the WECC website and provide 45 days for comments. Along with the draft, the WSC will post the impact assessment report and other supporting materials. The Draft Standard will include all mandatory requirements. In addition, the Draft Standard will include measurements, Violation Risk Factors (VRFs), and Violation Severity Levels (VSLs).[5] Notice of this posting and a solicitation for comments on the draft will be sent to all WECC members and all individuals who subscribe to the WECC standards e-mail list. In addition the notification of posting and solicitation for comments will be simultaneously noticed to NERC. The WSC may request input from affected parties regarding their estimated cost to implement the Draft Standard and may use that data to amend an impact assessment report, which will be posted for comment when it becomes available.~~

~~[5] Regional Criteria, which are also to be developed under this Procedure, will not contain VRFs of VSLs which are only necessary for Standards that will be enforceable and for which violations may result in penalties.~~

Members of electric industry organizations may respond through their organizations, or directly, or both. All comments will be supplied electronically and will be posted on the WECC website.

Step 5 – WSC Deliberates on Comments

The WSC chair is responsible for ensuring that comments are addressed in a timely manner. The WSC may further employ and oversee the Drafting Team for purposes of analyzing and responding to comments. The WSC will post its response to comments on the WECC website within 30 days of the close of the comment period. All parties that submit comments are strongly encouraged to participate in WSC deliberations.

If the WSC determines, by majority vote, any technical comments including those on the draft or the impact assessment report are significant, it will repeat Steps 3 and 4 as many times as considered necessary to ensure adequate opportunity for interested stakeholder input. All interested stakeholders are strongly encouraged to submit their comments as early in the process as possible. The number of days for comment on each subsequent revision to the Draft Standard will be 30 days.

A majority vote of the WSC is required to approve submitting the recommended Draft Standard to the Ballot Body for a vote. Balloting results will be documented. All WSC member dissenting voters, as well as others participating in the WSC deliberations, will be encouraged to provide dissenting comments and, if possible, specific language that a party believes would make the Draft Standard acceptable. If the WSC vote fails to capture a simple majority to approve submittal to the Ballot Body for a vote, and there is no apparent way to reach a majority agreement, the WSC will report to and seek guidance from the WECC Board.

Step 6 – WSC Submits Draft Standard for Ballot Body Vote and Ballot Pools Are Established

The WSC's final Draft Standard will be posted on the WECC website at least 30 days prior to the commencement of the voting window and WECC members and Participating Stakeholders who have joined the Ballot Body[6] will be notified of the WSC's recommendation. The posting will include the final WSC member vote, any dissenting WSC member comments, a summary addressing comments that were not incorporated into the Draft Standard, the impact assessment report and the period of time during which the Ballot Body is scheduled to vote on the WSC's recommendation.[7]

[6] Each WECC Member and Participating Stakeholder shall be permitted to designate a person who is authorized to join Ballot Pools for Standards and to either cast a vote within those Ballot Pools or designate a proxy to cast the vote of the WECC Member or Participating Stakeholder. Each such designated person shall be provided a user name and password for use in electronically identifying that entity's authorization to act within the Ballot Body. The Ballot Body will be renewed every five years as part of WECC's section 4.9 review.

[7] The period of time the vote is scheduled shall take into account the next scheduled Joint Session of the Standing Committees.

Notice of the posting also will be sent to the Standing Committees, all Participating Stakeholders, and the standards email list. In addition, the notification of the posting for ballot will be simultaneously noticed to NERC.

After posting of the Draft Standard, the Standing Committees shall participate in at least one Joint Session addressing the Draft Standard. In addition to the Joint Session, individual Standing Committees may undertake additional discussions or webinars.

The notice shall solicit participants for the Ballot Pool for the final Draft Standard scheduled for a vote. Members of the Ballot Body choosing to vote on the Draft Standard shall respond to the WSC's solicitation for Ballot Pools within a period designated by WECC Staff. Responses from Ballot Body members shall indicate within which WECC Standards Voting Sector(s) the party chooses to vote. Where a WECC member or Participating Stakeholder is eligible for multiple WECC Standards Voting Sectors, it may vote in any or all of its eligible sectors as allowed pursuant to the Bylaws (section 8.5.5.2) and this Reliability Standards Development Process. Based on responses to the Ballot Pool solicitation, WECC staff shall form the Ballot Pool for a particular Draft Standard.

Step 7 – Ballot Pool Vote on Recommendation to Board

In accordance with Sections 8.5 and 8.6 of the WECC Bylaws, the Ballot Pool will vote on the Draft Standard. Voting shall begin at least seven (7) calendar days following the Joint Session of the Standing Committees at which the Draft Standard was considered. Voting on Draft Standards shall be via electronic voting administered by the WECC website, and shall take place over a fifteen (15) business day voting window. Each WECC member or Participating Stakeholder may cast one vote in each eligible voting sector. Voters rejecting the Draft Standard will be required to provide an explanation of their vote. Explanations will be added to the record in order to assist the WSC's and/or the Board's subsequent consideration of the Draft Standard.[4]

A weighted majority vote of the Ballot Pool is required for a Draft Standardan RRS or OP to be approved by the WECC membership and Participating Stakeholders.. Voting among the WECC Standards Voting Sectors will be SVSs shall be weighted as follows:

- For each SectorSVS with ten10 or more voters, the number of affirmative votes cast shall be divided by the sum of the affirmative and negative votes cast to determine the fractional affirmative vote for that Sector. Abstentions, incomplete votes, and non-responses shall not be counted for the purposes of determining the number of voters in the SectorSVS.

- For each SectorSVS with less than ten10 voters, the same process shall be used to determine the fractional affirmative vote, but the fractional affirmative vote of that SectorSVS shall be multiplied by ten10 percent (10%) times the number of voters. E.g.,

  - For example, for a SectorSVSs with nine voters, the fractional affirmative vote will be multiplied by ninety90 percent (90%). Abstentions, incomplete votes, and non-responses shall not be counted for the purposes of determining the number of voters in the Sector..

- The sum of the fractional affirmative votes from all ~~Sectors~~SVSs divided by the weighted number of ~~Sectors~~SVSs voting shall be used to determine if a weighed majority has been achieved~~. A Sector~~ and whether the RRS or OP has been approved. An SVS shall be considered as voting if any member of the ~~Sector~~SVS in the Ballot Pool casts either an affirmative or a negative vote. ~~-~~If there are more than ten voters in the ~~Sector~~SVS, the weighting used for the calculation of "weighted sectors voting" shall be ~~one hundred~~100 percent ~~(100%).~~. For ~~Sectors~~SVSs with less than ten voters, the weighting used for the calculation of the "weighted sectors voting" shall be ~~ten~~10 percent ~~(10%)~~ per voter. ~~Abstentions, incomplete votes, and non-responses~~

- ~~An RRS or OP~~ shall ~~not~~ be ~~counted for the purposes of determining the number of voters per Sector.~~

- ~~A Standard shall be~~deemed approved by the Ballot Pool if the sum of fractional affirmative votes from all ~~Sectors~~SVSs divided by the weighted number of voting ~~Sectors~~SVSs is a majority (i.e~~.~~., greater than ~~fifty~~50 percent ~~(50%)).~~).

~~A two-thirds (2/3) quorum of the Ballot Pool is required for each vote. Abstentions and incomplete responses will be counted in determining whether a quorum of the Ballot Pool is achieved. Quorum shall be based on total number of Ballot Pool members, and shall not be based on total number of votes cast. If necessary, the voting window may be extended by the WSC until a quorum is achieved.~~

After a vote by the Ballot Pool, the WSC ~~will~~shall take one of the following actions~~:~~.

~~(1)~~ If the Ballot Pool approves ~~a Draft Standard~~an RRS or OP, the WSC shall submit the ~~recommended Draft Standard~~RRS or OP to the ~~WECC~~ Board~~.~~ for approval. The WSC shall provide ~~the Draft Standard, any comments on which the WSC members did not agree, minority opinions of WSC members, explanations supporting votes in opposition to the Draft Standard, and the impact assessment for the Draft Standard~~voting results to the Board ~~for~~, including the final ~~approval. To be considered by the Board,~~ ballot results and any rationale supporting any ~~"no" votes by a WSC member on a Draft Standard shall be accompanied by a text explaining the "no" vote and, if possible, should provide specific language~~negative votes cast.

Any RRS or OP that ~~would make the Draft Standard acceptable. Relevant voting information from the Ballot Pool shall be submitted to the Board for its consideration in determining whether or not to approve the Draft Standard. Final Draft Standards and all materials~~was provided to the Board for approval will be posted ~~no less than 30 days prior to the Board vote.[8] The date of the expected Board vote will also be posted.~~for Board review for at least the period mandated by the WECC Bylaws.

~~[8] WECC Bylaws, Section 7.5.1 – "Except as set forth in Section 7.5.2 regarding urgent business, all regular business of the Board will occur at the Board meetings, at least twenty-one (21) days' advance notice of which has been provided…"~~

~~(2) If the Ballot Pool rejects a Draft Standard, the WSC may, by a majority vote (greater than 50 percent of the WSC membership), decide to amend or modify the initial Draft Standard or remand it back to the Drafting Team to amend or modify it. Any amended or modified Draft Standard must be resubmitted to the Ballot Pool for a vote before the WSC submits the subsequent Draft Standard to the WECC Board. If the WSC determines by majority vote (greater than 50% of the WSC members) that the modifications to the Draft Standard could be unanticipated by the Ballot Pool or may be controversial, the amended or modified Draft Standard shall be subjected to an additional Joint Session discussion prior to voting. The reasons for the modification(s) will be documented, posted, and provided to the Board. If any changes are made at the WSC meeting, the roll call of votes for and against the subsequent Draft Standard and abstentions will be recorded at the meeting, and the subsequent Draft Standard will be posted for 10 days for comments. The comments will be posted and distributed to the Ballot Pool and will be made available prior to any subsequent rounds of voting. Unless otherwise directed by the WSC, the Ballot Pool for subsequent votes on a Draft Standard shall consist of the same parties.~~

~~(3) If the Ballot Pool rejects a Draft Standard, the WSC may allow the Draft Standard to terminate.~~

If the Ballot Pool rejects the RRS or OP, the SAR shall be deemed complete and all associated documents shall be archived, except as allowed in the Regulatory Directive section of these Procedures.

Step ~~8~~ 10 – Initiate the Appeals Process – If Needed

~~Requests for reconsideration of WSC decisions may be made to the WSC. The WSC will post its findings. The subsequent rejection of such a request by the WSC may be appealed to the Board.~~

~~A Draft Standard recommended by the WSC may be appealed on either technical or due process grounds. Any due process or technical appeals must be submitted, in writing, to the WECC staff within 15 days of the date the WSC posts a recommendation.~~

~~An appeal to the Board shall be posted on the WECC website and shall be heard at the Board's next regularly scheduled meeting occurring at least 21 days after the appeal is filed.~~

~~Step 9 – Board Approval~~

~~The WECC Board of Directors will consider the proposed Draft Standard no later than at its next~~

~~meeting occurring at least 30 days after the Ballot Pool vote. The Board will consider the WSC's~~ An appeal may be brought on the basis of either a technical (reliability) concern or a due process (procedural) concern.

If the appeal is based on technical grounds, that appeal may be brought at any stage of the development process prior to the opening of a ballot window. The appeal shall be submitted to the DOS who shall place the appeal on the agenda of the next regularly scheduled WSC meeting. If the appellant does not concur with the WSC's findings, the appellant may request that the DOS forward the matter to the Board for disposition.

If the appeal is based on due process concerns, the appellant shall submit the matter to the DOS no later than 30 days after the alleged occurrence of the due process violation, but in no case shall an appeal on due process grounds be accepted more than 30 days after the RRS or OP has been approved by the Ballot Pool. The appeal shall be submitted to the DOS who shall place the appeal on the agenda of the next regularly scheduled WSC meeting. If the appellant does not concur with the WSC's findings, the appellant may request that the DOS forward the matter to the Board for disposition.

The filing of an appeal shall not halt the development process; however, the appeal shall be settled by the Board before the Board votes to approve the RRS or OP.

Step 11 – Obtain Board Approval

The Board shall consider the RRS or OP for approval no later than at its next regularly scheduled meeting after the close of the Ballot Pool window and recommendation for approval by the WSC, subject to the notice requirements in the WECC Bylaws.

Any person or entity may submit comments to the Board for the Board's consideration. The Board shall consider:

1) All comments submitted for its consideration;
2) The WSC's recommendations and minority opinions, ~~all~~if any;
3) All comments that were not incorporated into the ~~draft Standard~~RRS or ~~revision(s),~~OP;
4) Voting results including, at a minimum, the final ballot results and ~~the impact assessment report. The~~ any rationale supporting negative votes; and
5) Any other supporting documentation.

If an OP is approved by the Board, WECC shall post the final OP on its website and the SAR will be deemed complete. The effective date will be that approved by the Board.

If an RRS is approved by the Board, WECC shall forward the RRS to NERC for NERC and FERC disposition.

If the RRS or OP is not ~~amend or modify~~approved by the Board, the Board may either deem the SAR complete or remand the RRS or OP to the DT with specific guidance as to proposed changes.

If the RRS or OP is remanded, any Substantive Changes must be vetted in accordance with these Procedures. Under no circumstances shall the Board make Substantive Changes to the RRS or OP, except in accordance with its backstop authority as authorized by the WECC Bylaws.

Step 12 – Submit RRSs for ERO Review, FERC Approval & Implementation of WECC Regional Reliability Standards

Note: Step 12 only applies to RRSs.

All new, revised, or retired RRSs shall be submitted to NERC for NERC and FERC approval. The approval, revision or retirement of an RRS shall not be effective in the United States until approved by FERC and shall not be effective in another jurisdiction until approved by the applicable governmental authority.

Step 13 – Retire an OP

Upon determining that the subject matter of an OP is duplicated in a NERC Reliability Standard, and that retirement of the OP will not cause a reliability gap after the effective date of the associated NERC Reliability Standard, the WSC may retire a WECC OP on its own initiative without further due process.

Step 14 – Submit a ~~Draft Standard, except to make nonmaterial changes to the language~~Request for Interpretation

A Request for Interpretation (RI) of a ~~Standard or revision thereto. If approved, the Standard will be posted on the WECC website and all parties notified.~~
~~If~~ the Draft Standard is not approved, the Board may return the Draft Standard to the WSC for further work, or the Board may terminate the Standard activity with an appropriate notice and explanation to the SAR requester, WSC, and participants in the Ballot Pool. These Board actions will also be posted.

~~A majority vote of the Directors present at a Board meeting, as specified in Sections 7.2 and 7.4.1 of the WECC Bylaws, is required to approve the recommended Standard.~~

~~**Step 10 – ERO Review, FERC Approval and Implementation of Reliability Standards**~~

~~To the extent required under Section 215 of the Federal Power Act, 18 C.F.R. Part 39, and according to procedures established in the delegation agreement between WECC and the Electric Reliability Organization ("ERO"), the Board shall submit new Reliability Standards, revisions to existing Reliability Standards, and terminations of existing Reliability Standards for review by the ERO and approval by FERC. Upon approval by FERC, the Reliability Standards will be made part of the body of NERC reliability standards and enforced upon all applicable bulk power system owners, operators, and users within the WECC region. Parties' right to participate in the ERO and FERC review processes shall be as established in the applicable regulations and the ERO/WECC delegation agreement. Reliability~~

Standards subject to ERO review shall become effective as approved by FERC or, for entities outside of the U.S. portion of the Western Interconnection, upon approval by the applicable Canadian or Mexican authorities.

Step 11 – Implementation of Standards Not Subject to ERO/FERC/Other Approval

All new and modified Standards not subject to ERO review and FERC, Canadian or Mexican approval as provided in Step 10 shall become effective as ordered by the WECC Board. As of the effective date of such new or modified Standard, all industry participants in the Western Interconnection that such Standard is applicable to are expected to implement and abide by the Standard. Any and all parties to this Process retain the right of appeal to other authorities as the law allows.

Expedited Process for Urgent Action **Interim Standards** document developed under these Procedures

In cases requiring urgent action, such as in the development of emergency operating procedures, any Standing Committees or Participating Stakeholders may propose a new or modified interim Standard for approval by the WECC Board through a process that eliminates any or all of the steps outlined above, but only to the extent necessary, and only in a manner that is consistent with the WECC Bylaws. Such interim Standard shall be replaced by a Board-approved permanent Standard, developed using all the steps identified in this document within one year (or such additional time as may reasonably be required to complete all steps) from the date on which the WECC Board approved the interim standard. An interim Standard may be converted to a successor permanent Standard as long as any procedural steps bypassed in developing the interim Standard are completed with respect to the permanent Standard. If necessary, the Board may renew an interim Standard to allow additional time for the development of a successor permanent Standard. Renewal may occur more than once, but a good faith effort must be made to develop a successor permanent Standard.

Interpretation of Regional Standards and Regional Criteria

Any entity may request an interpretation of a Standard by sending a request through the WECC web portal identifying the Standard and requirement or requirements for which additional clarity is sought. The request shall indicate the material impact to the requesting entity or others caused by the actual or potential lack of clarity. An interpretation is limited to clarifying existing requirements in the approved Standards. Interpretationsdocument and may not be developed that expand upon a requirement or that provide guidance on how to applyimplement a requirement.

The WECC Staff shall review the request for clarity and completeness and shall work with the requestor to clarify the request or complete any missing elements of the request if needed. The WECC Staff shall forward the request to the WSC. If the WSC believes that the request is intended to change a requirement or is seeking feedback on how to apply a requirement, rather than interpret the requirement, the request shall be denied and returned to the requestor with an explanation. If denied, the requestor shall be advised of the appeals process.

The RI is initiated by submitting WECC's online SAR form. The SAR shall: 1) identify the specific document; 2) identify the requirement within that document for which an interpretation is being requested, and 3) specify the perceived lack of clarity. The SAR shall indicate the material impact to the requesting entity or others caused by the perceived lack

of clarity.

The RI is processed using the same process set forth in these Procedures with the following exceptions:

The chair of the WSC

- ~~Within 21 days of receiving the request, the WSC Chair~~ shall assemble an Interpretation Drafting Team (IDT~~)~~). The IDT shall be composed of SMEs with ~~the~~ relevant expertise to address the clarification~~. The IDT~~ and, to the extent possible, should include members ~~from~~of the original ~~Standard Drafting Team to the extent possible, and may be supplemented as deemed appropriate by the WSC Chair, but shall not contain any members~~ DT. The IDT shall not include any team member representing the entity that ~~submitted the request.~~filed the RI; however, this prohibition does not preclude representatives of the filing entity from participating in the development process.

~~As soon as practicable, but not more than 45 calendar days after the WSC assembles the IDT, the IDT shall draft a written interpretation to the Standard providing the requested clarity. The interpretation shall be posted for a 30-day formal comment period. The IDT shall then have 15 days to respond to the comments and to make any changes to the interpretation. The IDT shall reach a determination on the language for an interpretation by majority vote of the IDT. The IDT shall then return the interpretation to the WSC which shall then post the interpretation for another 30 days to give entities time to review the interpretation prior to a Ballot Pool vote. Notice of this posting will be sent to the Ballot Body, and the notice shall solicit participants for the Ballot Pool for voting on the interpretation. After posting of the interpretation, the Standing Committees shall participate in at least one Joint Session addressing the interpretation. Voting on the interpretation shall be consistent with the quorum and weighted voting procedures explained in Step 7 of these Reliability Standards Development Procedures. Use of a conference call or web meeting and electronic or email balloting is encouraged to shorten the interpretation process. If the interpretation is approved by a weighted majority of the Ballot Pool, the WSC shall forward the interpretation to the WECC Board of Directors for approval. If the Ballot Pool rejects the interpretation, the WSC shall notify the requestor. The WSC shall also ask the IDT to provide a revised interpretation.~~

- ~~Interpretations of Regional Standards shall be~~ If all of the document is to be subsumed into the new PSS RRS the PSS DT should recommend to the Standing Committee that the document be retired as of the effective date of the replacement document.

Once an interpretation of an RRS has been approved by the Board, the interpretation shall be appended to the RRS and submitted to NERC for ~~processing with a request that the interpretation be adopted by the~~ NERC ~~Board of Trustees and then filed for approval with~~ and FERC ~~and applicable Governmental Authorities in British Columbia, Alberta and Mexico.~~approval.

- ~~For~~ ~~entities operating in the United States, once the interpretation of a Regional Standard is approved by FERC, the interpretation shall become effective and shall be appended to the Standard. For entities outside of the U.S. portion of the Western Interconnection, interpretations shall become effective for these entities only upon approval by the appropriate Canadian or Mexican regulatory authority.~~ The interpretation will remain appended to the ~~Standard~~RRS until such time as the ~~Standard is revised through the normal process incorporating the clarifications provided by the interpretation~~RRS is revised and the

interpretation's content is addressed during the revision process. RRS interpretations shall not be effective in the United States until approved by FERC and shall not be effective in other jurisdictions until approval by the applicable governmental authority.

Supporting Processes

Expedited Process for Urgent Action

In cases requiring urgent action, such as in the development of emergency procedures, any person or entity may propose an interim RRS or OP for approval by the WECC Board. The RRS or OP must go through a process that eliminates any or all of the steps outlined previously, but only to the extent deemed necessary by the Board and only in a manner that is consistent with the WECC Bylaws.

If the Board approves the interim document, it shall establish an initial effective date for the interim document.

Within 90 days after the initial effective date of the document, the Board shall either:

1) Cause a SAR to be submitted requesting the development under these Procedures of a permanent replacement to the interim document; or
2) Shall extend the applicability of the interim document for an additional 90 days.

Renewal may occur more than once, but a good faith effort must be made to develop a permanent replacement under these Procedures.

If a SAR is submitted, the interim RRS or OP shall remain in effect until the permanent replacement RRS or OP becomes effective.

If a SAR is not submitted and the interim RRS or OP has not been extended, the interim RRS or OP shall be deemed retired.

Regulatory Directives
~~Special Procedures for Addressing Regulatory Directives~~

These Procedures acknowledge that FERC may order WECC to make specified regulatory changes to documents created under these Procedures. For the purpose of this section only, those documents are referred to as Directive Regional Reliability Standards (DRRS).

If the Board determines that ~~the WECC Standards Process did not~~ these Procedures failed to result in a ~~proposed Draft Standard that addresses a directive issued by the FERC or by a Mexican or Canadian~~DRRS meeting the mandated regulatory ~~authority (Applicable Regulatory Authority), hereinafter, "regulatory directive," then~~changes, the Board shall have authority to take ~~certain~~the following actions to ensure that ~~a Draft Standard~~ the DRRS is responsive to the regulatory

directive ~~is drafted, approved and/or submitted to the Applicable Regulatory Authority.[9] The Board shall have the authority to choose which one or more of the actions set out below are appropriate to the circumstances and need not take these actions in sequential steps.~~ .

~~1. Board Remand to the WSC after an Affirmative Vote of the~~ If the Ballot Pool~~. If the Board is presented with~~ approves a ~~Draft Standard~~DRRS that ~~fails to~~does not address a regulatory directive required to be included in that document, the Board may remand ~~to the WSC the proposed Draft Standard with instructions (including establishing a timetable for action).~~

~~2. Board Remand to WSC for Additional Public Consideration and Re-ballot. Upon a written finding by the Board that a Ballot Pool has failed to approve a Draft Standard that contains a provision to address a specific matter identified in a regulatory directive, the Board has the authority to remand the Draft Standard to the WSC with instruction to (i)~~ the DRRS to the original DT or instruct the WSC to convene a ~~public technical conference~~new DT to ~~discuss~~redraft the ~~issues surrounding~~document. The Board shall instruct the DT on the specific regulatory directive~~, including whether or not the Draft Standard is just, reasonable, not unduly discriminatory or preferential,~~ that must be contained in the ~~public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified; (ii) working with WECC staff, prepare a memorandum discussing the issues, an analysis of the alternatives considered and other appropriate matters; and (iii) re-ballot the Draft Standard one additional time, with such adjustments in the schedule as are necessary complete a re-ballot of the Draft Standard within forty-five (45) days of the remand. The WSC memorandum shall be made available to the Ballot Pool in connection with the re-ballot. In any re-ballot, negative votes without comment shall be counted for purposes of establishing a quorum, but only affirmative votes and negative votes with comments related to the Draft Standard shall be counted for purposes of determining the number of votes cast and whether the Draft Standard has been approved by the Ballot Pool.~~

~~3. Affirmative Vote upon Re-ballot of Draft Standard. If the re-balloted Draft Standard achieves an affirmative majority vote of the Ballot Pool, with a quorum established, then the Draft Standard shall move to the Board for approval.~~

~~4. Negative Vote upon Re-ballot of Draft Standard. If the re-balloted proposed Draft Standard fails to achieve an affirmative majority vote of the Ballot Pool, or if a quorum~~redraft. Once the DRRS is ~~not established, then the Board has the authority to consider the Draft Standard for approval pursuant to the following:~~redrafted it shall be reprocessed under these Procedures.

~~(i) The Board~~ If the Ballot Pool rejects a DRRS or fails to ballot the DRRS due to failure to reach a quorum, either when first presented for ballot or during an iterative redraft as instructed by the Board, the Board shall ~~issue notice of its intent to consider the Draft Standard~~review the DRRS, including all comments provided and ~~shall solicit written public comment particularly focused on the technical aspects of the provisions of the Draft Standard~~ all rationale accompanying any negative vote.

~~[9] The procedures in this section, "Special Procedures for Addressing Regulatory Directives," only apply to draft Regional Reliability Standards.~~

Upon a finding that address the specific matter identified inDRRS was rejected for reasons not related to the regulatory directive, including the Board may direct WECC staff to file a new SAR with the specific narrow scope of addressing only the regulatory directive. The Board may suggest specific language for inclusion in the proposed DRRS.

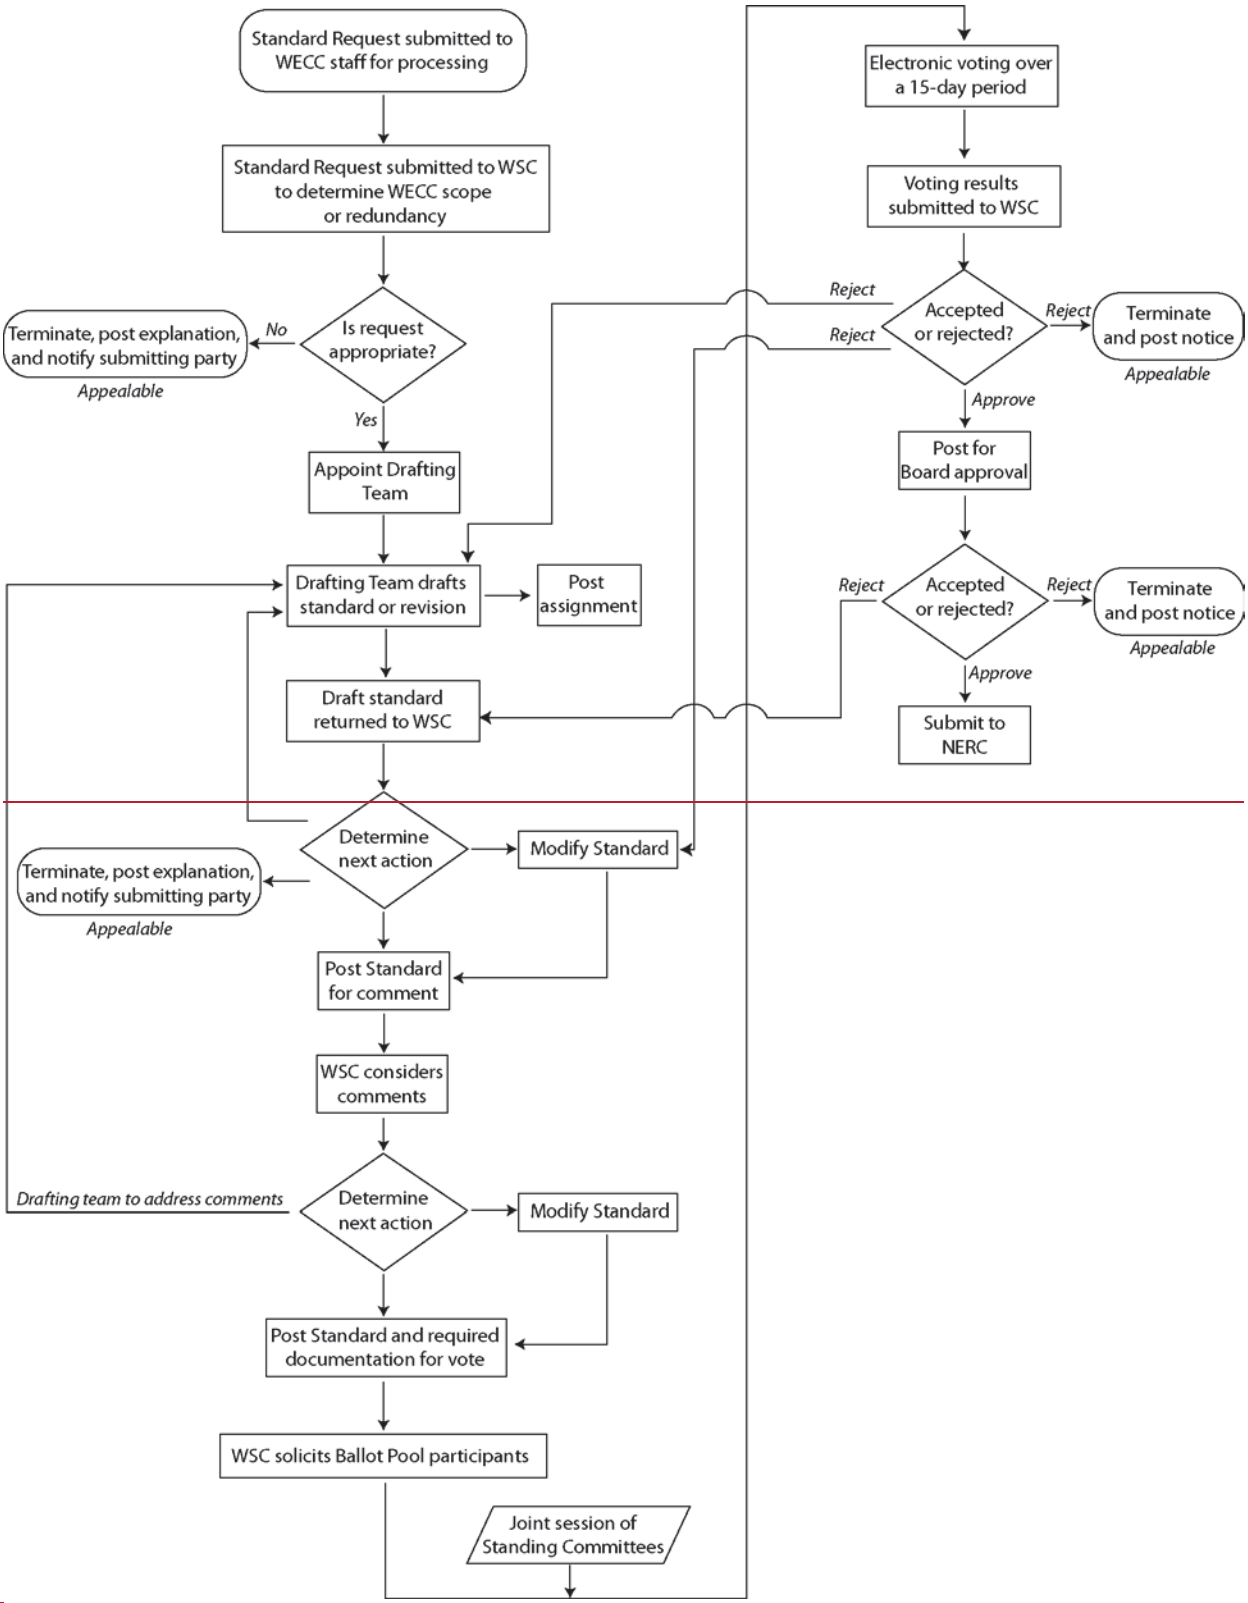
Upon a finding that the DRRS was rejected based on language addressing the regulatory directive, the Board shall take the following steps to meet its regulatory obligation:

1) Review the entire record of development.
2) Require a public technical conference to be noticed and convened to determine whether or not the Draft Standardrejected DRRS is:
   - just, and reasonable,;
   - not unduly discriminatory or preferential,;
   - in the public interest,;
   - helpful to reliability,;
   - practical,;
   - technically sound,;
   - technically feasible, and ;
   - cost-justified.; and

(ii) The Board may convene a public technical conference to receive additional input on the matter.

(iii) After considering the developmental record, the comments received during balloting and the additional input received under (i) and (ii), the Board has authority to act on the Draft Standard. If the Board finds that the Draft Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then the Board has authority to approve the Draft Standard and direct that it be filed with the Applicable Regulatory Authority with a request that it be made effective. If the Board is unable to find that the proposed Draft Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to direct that the Draft Standard and complete developmental record, including the additional input received under (i) and (ii), be submitted to the Applicable Regulatory Authority, as a compliance filing in response to the order giving rise to the regulatory directive, along with a recommendation that the Draft Standard not be made effective and an explanation of the basis for the recommendation.

5. Board Approval or Rejection of a Draft Standard Prepared by the WSC or WECC Staff and Not Balloted. Upon a written finding by the Board that the WSC has failed to develop, or a Ballot Pool has failed to approve, a Draft Standard that contains a provision to address a specific matter identified in a regulatory directive, the Board has the authority to direct the WSC (with the assistance of stakeholders and WECC staff) to prepare a Draft Standard that addresses the regulatory directive, taking account of the entire developmental record pertaining to the matter. If the WSC fails to prepare such Draft Standard, the Board may direct WECC management to prepare such Draft Standard. As part of this process, the Board may convene a public technical conference to receive input on the matter. The Draft Standard shall be posted for a forty-five (45) day public comment period. After considering the entire developmental record, including any comments received during the public comment period, the Board may do one of the following:



(i) The Board may find that the Draft Standard, with such modifications as the Board determines are appropriate in light of the comments received, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the bulk power system. In this case, the Board has the authority to approve the Draft Standard and direct that the proposed Standard be submitted to the Applicable Regulatory Authority with a request that the Draft Standard be made effective.

(ii) The Board may be unable to find that the Draft Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the bulk power system. In this case, the Board has the authority to direct that the Draft Standard and the complete developmental record be filed as a compliance filing in response to the regulatory directive with the Applicable Regulatory Authority, with a recommendation that the Draft Standard not be made effective.

WECC shall on or before January 31st of each year file a report with the FERC on the status and timetable for addressing each outstanding directive to address a specific matter received from FERC.

Approved by the WECC Board June 22, 2011.

~~***STANDARDS DRAFTING PROCEDURES FLOWCHART***~~

- meets the regulatory directive (hereafter "Just and Reasonable").

3) Determine whether the DRRS should be implemented as drafted, notwithstanding

rejection by the Ballot Pool.

Upon a finding that the rejected DRRS should be implemented, the Board shall approve the DRRS and direct that it be submitted to NERC for NERC and FERC approval, as required.

Upon a finding that the rejected DRRS should not be implemented, the Board may submit the DRRS and its record of development as a regulatory compliance filing in response to the regulatory directive. The filing shall include a recommendation that the DRRS not be made effective and an explanation of the basis for that recommendation.

Maintenance of the Procedures

The WSC is charged with maintenance of these Procedures. Proposed changes to these Procedures shall first be brought to the WSC for consideration. The WSC may initiate proposed changes on its own initiative.

If it determines that a change to these Procedures should be pursued, the WSC shall draft the proposed changes and post the proposed changes to the WECC website for comment, accompanied by a notice to the SEL soliciting comments on the proposed changes.

The WSC shall consider all comments received and shall redraft the proposed changes as it deems necessary. Once the WSC approves the proposed changes, those changes shall be submitted to the Board for approval. Changes to these Procedures approved by the Board shall be submitted to NERC for NERC and FERC approval.

Maintenance of RRS and OPs Documents

The WSC shall ensure that each RRS is reviewed at least once every five years from the effective date of the most recent version of the RRS. If the review identifies needed changes, the WSC shall cause a remedial SAR to be filed. If the review does not identify needed changes, the WSC shall communicate its decision via the SEL and no further action will be required.

Review of OPs shall be conducted in accordance with internal WECC policies and procedures.

B. Officers and Employees Standards of Conduct

C. WECC Dispute Resolution Procedures

BYLAWS

Of

The

WESTERN ELECTRICITY COORDINATING COUNCIL

1. Vision and Mission.

1.1 Vision.

The Western Electricity Coordinating Council ("WECC") shall seek to achieve the appropriate level of Bulk Electric System reliability at least cost considering all costs throughout the economy.

1.2 Mission

WECC is a Utah nonprofit corporation with the mission to foster and promote reliability and efficient coordination in the Western Interconnection. WECC will lead the stakeholders in the Western Interconnection to achieve appropriate system reliability, be the premier source of unbiased information, and serve as the trusted thought leader for the Western Interconnection by providing, consistent with these Bylaws: 1) impartial independent review and analysis of reliability issues impacting the Western Interconnection 2) development of electric reliability standards incorporating Western Interconnection experience and knowledge; 3) consistent and fair monitoring and enforcement activities for compliance with reliability standards; 4) event analysis and lessons-learned from system events; and 5) value for its membership through cost effective and efficient services and practices through: a) being a centralized repository of reliable information relating to the planning and operation of the Bulk Electric System in the Western Interconnection, b) coordinating system planning and modeling, c) sharing of, and providing comment on adherence to, recognized industry best practices, d) facilitating resolution of market seams and coordination issues, e) secure sharing of critical reliability data, and f) providing a robust stakeholder forum.

2. Furtherance of WECC's Mission

2.1 Activities to Carry Out WECC's Mission.

2.1.1 Compliance with the Federal Power Act. WECC will carry out responsibilities and exercise rights of a Regional Entity organized on an interconnection-wide basis pursuant to Section 215 of the Federal Power Act, including any responsibilities and rights delegated to it by the ERO pursuant to a Delegation Agreement.

2.1.2 Agreements with Canada and Mexico. WECC will carry out responsibilities and exercise rights pursuant to International Reliability Agreements with Canadian or Mexican authorities.

2.1.3 Regional Coordination. WECC will act as a coordinating entity for the entire Western Interconnection for activities of regional organizations with responsibilities for reliability and market functions.

2.1.4 Standard Setting. WECC will develop and adopt reliability, operating, and planning standards, criteria and guidelines necessary to maintain the reliable operation of the Western Interconnection's interconnected Bulk Electric System, including seeking, as appropriate, variances from standards of the ERO (or any successor organization which may be created by legislation or otherwise), as well as providing a process for regional variances.

2.1.5 Certification of Grid Operating Entities. WECC will assist in certifying Grid Operating Entities in the Western Interconnection.

2.1.6 Reliability Assessment. WECC will ensure that interconnected Bulk Electric System reliability assessments are conducted as needed. WECC will do this work in conjunction with the Regional Entities to the greatest extent possible. WECC will also facilitate coordinated reliability assessments among Regional Entities.

2.1.7 Compliance Activities. With respect to enforcement of reliability standards, WECC will:

2.1.7.1 implement the Reliability Management System in effect as of WECC's formation and as the Reliability Management System may be subsequently modified in accordance with its terms;

2.1.7.2 implement any monitoring and enforcement mechanisms delegated to it pursuant to Section 215 of the Federal Power Act and any Delegation Agreement with the ERO, or required by any International Reliability Agreement with a Canadian or Mexican authority; and

2.1.7.3 administer any other monitoring and enforcement mechanisms where WECC is designated to perform administration.

2.1.8 Coordinated Regional Planning. With respect to the coordination of regional planning activities, WECC:

2.1.8.1 will develop coordinated planning policies and procedures for the Western Interconnection, including facilitation of market-based solutions, consistent with WECC/ERO standards and FERC policy.

2.1.8.2 will review and assess Local Regional Entity planning processes to determine whether WECC planning procedures have been satisfied;

2.1.8.3 will refer planning matters back to the originating Local Regional Entity for revision or other corrective actions when the WECC Board determines that WECC planning procedures have not been satisfied; and

2.1.8.4 may perform other interconnection-wide studies as needed.

2.1.9 Coordinated Operations. With respect to coordinating reliable operating activities within the Western Interconnection, WECC will develop, coordinate and promote consistent interregional operating policies and procedures for the Western Interconnection, consistent with WECC/ERO standards and FERC policy.

2.1.10 Market Interface Issues. With respect to Market Interface issues WECC will:

2.1.10.1 facilitate development of compatible and efficient practices across the Western Interconnection; and

2.1.10.2 exercise Backstop Authority where an unresolved Market Interface issue will cause Material External Impacts by taking some or all of the following actions: 1) providing a forum for and coordinating voluntary solutions among Members; 2) recommending specific solutions for voluntary adoption by Members; and 3) if necessary, proposing solutions to an Applicable Regulatory Authority.

2.1.11 Dispute Resolution. WECC will provide a process for the timely resolution of disputes between WECC Members as set forth in Section 11.

2.2 Organizational Characteristics.

As WECC carries out activities to fulfill its mission, it will seek to develop and maintain the following characteristics:

2.2.1 dedication to serving the individuals, businesses, and other organizations that generate, transmit, distribute, market, and use electrical energy in the Western Interconnection;

2.2.2 efficiency in its administration, decision-making, policy and standards development, and dispute resolution processes;

2.2.3 the ability to maintain status as an Interconnection-wide regional reliability entity and be afforded deference and delegation by ERO (or successor organization); and

2.2.4 fair and open processes through which practices, policies, and standards are developed and implemented based on sound technical and policy analysis.

2.2.5 Promote an efficient western electric market by reducing or eliminating conflict, duplication and overlap among electric organizations in the Western Interconnection.

2.2.6 Allow access to WECC data by individuals who can demonstrate a legitimate business need for the data, provided such individuals agree to such protections and non-disclosure restrictions which may be necessary due to the nature of the data sought to be accessed and agree to pay the incremental costs of providing the data which may be requested.

3. Definitions.

The capitalized terms used in these Bylaws shall have the meanings set forth below, or if not set forth below, shall have the meanings given them in the NERC Glossary of Terms Used in NERC Reliability Standards.

3.1 Affiliate.

An Entity that directly or indirectly through one (1) or more intermediaries, controls, or is controlled by, or is under common control with, another Entity. An Entity "controls" any Entity in which it has the power to vote, directly or indirectly, 5% or more of the voting interests in such entity or, in the case of a partnership, if it is a general partner. Notwithstanding the foregoing definition, for purposes of these Bylaws: 1) electric distribution cooperatives that are member-owners of a generation and transmission cooperative are not Affiliates of the generation and transmission cooperative or of each other; 2) an entity controlled by or operating as a unit, agency, or subdivision of a local, state, provincial, or U.S. federal or Canadian or Mexican national government will not be considered an Affiliate of any other entity controlled by or operating as a unit, agency, or subdivision of a local, state, provincial, or federal government; 3) separate agencies of a single state or province, or of the U.S. federal or Canadian or Mexican national government will not be considered Affiliates of each other, regardless of any commonality of political control; 4) members of any joint powers authority, and such joint powers authority, will not be considered Affiliates of each other; and 5) members of an RTO will not be considered Affiliates of such RTO or of each other solely as a result of such membership.

3.2 Annual Meeting.

The annual membership meeting of WECC, as described in Section 5.3.

3.3 Applicable Regulatory Authority.

The FERC or any state or provincial government agency with jurisdiction to regulate or directly affect the transmission of electricity within the Western Interconnection.

3.4 Backstop Authority.

The ability, obligation, or responsibility of WECC to address an issue when the WECC Board determines that a Local Regional Entity(ies) holding Primary Authority has not resolved an issue, has created incompatible resolutions or has not acted. In each case where these Bylaws authorize WECC to exercise Backstop Authority, the provisions that authorize Backstop Authority will also specify the conditions necessary to trigger Backstop Authority and the actions that fall within WECC's exercise of Backstop Authority.

3.5 Balancing Authority.
The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.

3.6 Ballot Body.
The Ballot Body consists of WECC members and non-members that have been determined eligible for the voting sectors described in the Reliability Standards Development Procedures and may, therefore, vote on Regional Criteria and Regional Reliability Standards.

3.7 Board of Directors (Board).
WECC Board of Directors, collectively, as described in Section 6.

3.8 Class.
A grouping of Members described in Sections 4.2.1 through 4.2.7 and 4.3.

3.9 Commercial Practices.
The products and practices involved in trading electricity. The term "Commercial Practices" only refers to an interaction among market entities that does not affect or require assistance from Grid Operating Entities that have grid reliability responsibilities.

3.10 Compliance Hearing Body.
The hearing body used for the purpose of providing a balanced compliance panel to conduct hearings for the resolution of disputes concerning compliance with or enforcement of Reliability Standards that may arise between WECC (acting as Compliance Enforcement Authority for the Western Interconnection) and a Registered Entity.

3.11 Delegation Agreement.
An agreement between the ERO and WECC pursuant to Section 215 of the Federal Power Act by which the ERO delegates to WECC designated powers, rights and responsibilities regarding the administration within the Western Interconnection of electric Reliability Standards adopted or approved by the ERO and the FERC.

3.12 Director.
An individual member of the WECC's Board of Directors.

3.13 Electric Line of Business.
The generation, transmission, distribution, or trading of electricity or the provision of related energy services in the Western Interconnection.

3.14 Electric Reliability Organization (ERO).
The organization certified by FERC under 18 C.F.R. §39.3, the purpose of which is to establish and enforce Reliability Standards for the Bulk-Electric System in the United States, subject to FERC review.

3.15 Entity.
Any individual, person, corporation, partnership, association, governmental body or organization of any kind.

3.16 FERC.
The Federal Energy Regulatory Commission or any successor.

3.17 Grid Operating Entity.
Any operating entity, such as a Balancing Authority, that is certified pursuant to Section 2.1.5 of these Bylaws to be responsible for reliable operation of a portion of the Western Interconnection.

3.18 International Reliability Agreement.
An agreement between WECC and any appropriate Canadian or Mexican authority related to WECC's powers, rights and responsibilities regarding the administration of electric reliability standards applicable within such authority's geographic area of the Western Interconnection.

3.19 Local Regional Entity.
A regional transmission organization or some other formally or informally constituted regional organization or group within the Western Interconnection, including but not limited to a Balancing Authority, a group of Balancing Authorities acting in concert, or a group of Entities that own or operate Transmission Facilities acting in concert. These Local Regional Entity boundaries can be reevaluated or modified over time.

3.20 Market Interface.
Market Interface involves all interactions among market entities and Grid Operating Entities related to transmission service and physical delivery.

3.21 Material External Impacts (MEI).
Significant effects on another Local Regional Entity or market within the Western Interconnection but outside of the Local Regional Entity or market adopting a policy, standard, practice or procedure, or implementing an action.

3.22 Member.

Any entity that has applied and been accepted for membership in WECC and is current in the payment of dues.

3.23 Participating Stakeholder.
Any person or entity that is not a WECC Member, but is an interested stakeholder and has applied and been granted, pursuant to Section 8.7.2, the participation and voting rights set forth in Section 8.7.1.

3.24 Primary Authority.
The ability, obligation, or responsibility of an entity to address an issue in the first instance.

3.25 Regional Criteria
The term Regional Criteria shall have the definition set forth in the NERC Rules of Procedure as may be amended from time to time.

3.26 Regional Entity (RE).
An entity having enforcement authority pursuant to 18 C.F.R. §39.8.

3.27 Registered Entity.
An owner, operator, or user of the Bulk-Electric System or the entities registered as their delegates for the purpose of compliance in the North American Electric Reliability Corporation Compliance Registry or similar Entity operating in Canada or Mexico and which could be registered in the Compliance Registry if it operated in the United States.

3.28 Reliability Management System
The contracts, separate from these Bylaws, by which Members and other parties agree to certain procedures and sanctions intended to enforce specified Reliability Practices to maintain reliable electric service throughout the Western Interconnection.

3.29 Reliability Standard.
A requirement approved by FERC under section 215 of the Federal Power Act, to provide for reliable operation of the Bulk-Electric System in the United States. Regional Reliability Standards are specific to the Western Interconnection and shall be established using the WECC Standards Development Procedures.

3.30 Reliability Standards Development Procedures.
The process for developing and approving WECC Regional Reliability Standards (or its successor) attached as Exhibit C to the Delegation Agreement between WECC and North American Electric Reliability Corporation.

3.31 Transmission Facilities.
Those facilities that are defined as "transmission facilities" by FERC for purposes of the open access requirements of Section 210 and 211 of the Federal Power Act or any facilities which would be so defined if the Member were subject to FERC jurisdiction.

3.32 Western Interconnection.

The geographic area containing the synchronously operated electric transmission grid in the western part of North America, which includes in the United States Arizona, California, Idaho, Nevada, Oregon, Utah, and Washington, as well as parts of Montana, Nebraska, New Mexico, South Dakota, Texas, Wyoming, and Colorado; parts of the Canadian Provinces of British Columbia and Alberta; and Baja California Norte, Mexico.

4. Members and Membership.

4.1 Voluntary Membership.

Except as otherwise may be required by applicable authority, membership in WECC is voluntary. A Member may withdraw upon giving the Secretary thirty (30) days' advance written notice. Notwithstanding such notice of withdrawal, all contracts, FERC orders, unpaid Member costs, and decisions of arbitration in effect or pending as of the date of the written notice of withdrawal will be followed through to completion, pursuant to these Bylaws, by the withdrawing Member; however. Nothing herein will relieve any Member withdrawing from WECC from any obligation it may have under applicable law including, but not limited to, Section 215 of the Federal Power Act. A Member that withdraws is obligated to pay any unpaid dues owed through the remainder of the fiscal year in which its withdrawal becomes effective.

4.2 Eligibility for Membership.

Subject to Section 4.5, any Entity that is an interested stakeholder or that meets the criteria for membership in the membership classes described in Sections 4.2.1 through 4.2.5 may be a Member of WECC:

4.2.1 Class 1. Electric Line of Business Entities owning, controlling or operating more than 1000 circuit miles of transmission lines of 115 kV and higher voltages within the Western Interconnection.

4.2.2 Class 2. Electric Line of Business Entities owning, controlling or operating transmission or distribution lines, but not more than 1,000 circuit miles of transmission lines of 115 kV or greater, within the Western Interconnection.

4.2.3 Class 3. Electric Line of Business Entities doing business in the Western Interconnection that do not own, control or operate transmission or distribution lines in the Western Interconnection, including power marketers, independent power producers, load serving entities, any other Entities whose primary business is the provision of energy services, and those Entities that are not eligible for membership in the other Member Classes and who have a substantial interest in the purposes of WECC.

4.2.4 Class 4. End users of significant amounts of electricity in the Western Interconnection, including industrial, agricultural, commercial and retail entities as well as organizations in the Western Interconnection that represent the interests

of a substantial number of end users or a substantial number of persons interested in the impacts of electric systems on the public or the environment.

4.2.5 Class 5. Representatives of states and provinces in the Western Interconnection, provided that such representatives will have policy or regulatory roles and do not represent state or provincial agencies and departments whose function involves significant direct participation in the market as end users or in Electric Line of Business activities.

4.2.6 Sub-Class Organization. A Member Class may subdivide in up to three subclasses based on a majority desire within that class for purposes of electing Member Advisory Committee representation.

4.3 Designation of Membership Class.

A Member of WECC may not belong to more than one Class. An applicant for membership will designate the Class for which it qualifies based upon the criteria for membership set forth in Section 4.2, however any Member owning, controlling or operating Transmission Facilities or distribution facilities must belong to Class 1 or 2 unless the Board grants the Member's petition for a change in Member Class pursuant to the provisions of Section 4.4 of these Bylaws. Applications for membership will be submitted to WECC. WECC staff will review the application to verify eligibility for membership and Member Class designation. An applicant whose application has been rejected or any Member who disputes the WECC staff's determination regarding the appropriate Member Class designation may request review by the Governance Committee. If the applicant or any Member disagrees with the Governance Committee's decision, the applicant or such Member may appeal this decision to the Board.

4.4 Changes in Membership Class.

Notwithstanding any other provision of these Bylaws, upon a petition from a Member, the WECC staff (subject to review by the Governance Committee and appeal to the Board) may allow the Member to change Member Class if the interest of the Member is more closely aligned with the proposed Class than the Member's current Class.

4.5 Affiliates and Distinct Business Entities.

An Affiliate of a Member that satisfies the membership qualifications may also become a Member provided:

4.5.1 The Affiliate applying for membership and the Member disclose to the Chief Executive Officer all Affiliates that are WECC Members and the Classes to which the Affiliates belong. Every Member will promptly notify the Chief Executive Officer whenever it becomes, or ceases to be, an Affiliate of any other Member.

4.5.2 Affiliates may be members of the same Class; provided, however, a group of Affiliates within a single Class may only have one vote in any WECC forum. Except as set forth in Section 8.7.6, a group of Affiliates within a single Class may, by providing at least three (3) business days advance written notice to the

Chief Executive Officer, split their single vote equally amongst all Affiliates or designate a single Affiliate as the group's voting Member.

4.5.3 For good cause shown and with the express approval of the Board, a company or organization containing functionally distinct entities within it may obtain separate memberships for such entities; provided that such entities will be considered Affiliates.

4.5.4 The Board may adopt a policy regarding whether Members may share the benefits of membership (including the right to receive information that is only available to Members) with a non-member Affiliate.

4.6 Rights and Obligations of Membership.

Except as otherwise provided in these Bylaws or other applicable authority, Members of WECC have the following general rights and obligations:

4.6.1 The right to elect and remove Directors as described in Section 6.5;

4.6.2 The right to amend these Bylaws, and to review and rescind any Board amendment of these Bylaws, in accordance with Section 12;

4.6.3 The right to receive appropriate meeting notices, as well as reports and information produced by WECC;

4.6.4 The right to attend, participate and vote in all WECC Member meetings and the right to attend Board meetings (other than closed sessions of Board meetings) and to comment upon all matters considered in such meetings;

4.6.5 The right to be a member of, attend meetings of, and to introduce motions, debate and to vote in the deliberations of WECC committees, subject to the limitations of these Bylaws and such other reasonable limitations as the Board may adopt from time to time;

4.6.6 The right to invoke the dispute resolution provisions of these Bylaws;

4.6.7 The right to petition the Board to take any action consistent with applicable law (including Section 215 of the Federal Power Act and implementing orders and regulations), these Bylaws and the articles of incorporation and to have such petition voted upon in a reasonable and timely manner;

4.6.8 The obligation to abide by these Bylaws, decisions resulting from the dispute resolution process, and all standards or decisions of WECC, subject to the exceptions set forth in Section 4.7 and the enforcement provisions of Section 4.8.

4.6.9 The obligation to notify the Chief Executive Officer promptly of changes with respect to Affiliates as provided in Section 4.5.1 of these Bylaws; and

4.6.10 The obligation to pay in a timely manner the membership dues pursuant to Section 11.

4.6.11 The obligation to provide system data that the Board has determined is necessary for WECC functions and does not impose an undue burden on the Members; provided, however, that the Board shall adopt appropriate limitations on this obligation or procedures that protect and avoid unnecessary collection of confidential, privileged, trade secret, cybersecurity or critical energy infrastructure information or other information that the Board determines merits such protection consistent with applicable law.

4.6.12 The obligation to support surfacing minority and majority opinions or views within their Member Class, along with supporting rationale to enable the Board of Directors to make decisions based on informed judgment aligned with WECC's vision, mission and these Bylaws.

4.7 Limitations on Member Obligations.

4.7.1 The obligation of Members pursuant to Section 4.6.8 will not require any Member to take any action which the Member in good faith determines: 1) would exceed the physical capabilities of the Member's electric system (or any part of another's electric system that the Member has the legal right to cause to comply with a WECC action governed by Section 4.6.8); 2) would create serious and immediate risks to public health or safety (provided, however, that the shedding of load shall not in and of itself be deemed a serious and immediate risk to public health and safety for the purpose of this section); 3) would create an immediate risk of serious damage to facilities or equipment within its electric system or cause it to operate any of its electric facilities or equipment in an unsafe manner; 4) would cause the Member to violate or improperly implement an applicable law, regulation, rule, order, FERC license provision or other legal obligation; or 5) would conflict with any non-power requirement applicable to the Member (including without limitation any obligation under environmental laws, regulations, court and administrative decisions or biological opinions).

4.7.2 Each Member shall retain sole control of its facilities and the use thereof, and a Member shall not be required to construct or dedicate facilities for the benefit of any other Member, or be required to take action, or refrain from action, as may be deemed necessary to maintain reliable service to its own customers and/or to fulfill its obligations to third parties; provided, that a Member shall comply with duly-adopted reliability standards applicable to its system and shall comply with any directives under existing security coordination agreements. Nothing in these Bylaws is intended to preclude application of Section 210 or 211 of the Federal Power Act. The above limitations shall not be construed as altering a Member's

obligation to comply with applicable Reliability Standards or enforcement orders, or any other obligation arising under 18 C.F.R. Part 39.

4.8 Compliance and Enforcement.

The power of WECC to enforce Member obligations other than compliance with Reliability Standards and other obligations arising under 18 C.F.R. Part 39 and applicable Canadian and Mexican regulatory requirements is limited to suspension or termination of membership as set forth in this Section; provided, however, that: 1) nothing in this Section will limit the power of Members to agree to additional enforcement provisions in separate contracts (such as contracts pursuant to the Reliability Management System); 2) nothing in this Section will limit the power of WECC to propose solutions regarding Market Interface issues to any Applicable Regulatory Authority as described in Section 2.1.10; and 3) nothing in this Section will limit WECC's delegated authority under Section 215 of the Federal Power Act and 18 C.F.R. Part 39 and applicable Canadian and Mexican regulatory requirements to enforce reliability standards and perform other delegated or contractual functions within the Western Interconnection. The Board may suspend or, to the extent consistent with applicable law, terminate the membership of any Member for a material failure to meet any obligation of membership set forth in these Bylaws, including, but not limited to: 1) non-payment of dues sixty (60) days after the dues become delinquent; 2) intentionally or repeatedly violating any WECC Bylaw; 3) materially breaching or intentionally violating any FERC order or arbitration decision issued pursuant to these Bylaws; 4) willfully obstructing any lawful purpose or activity of WECC; or 5) remaining inactive as described in Section 5.9. The Board will give the affected Member not less than twenty-one (21) days prior written notice of any proposed suspension or termination, which will include the specific basis for the proposed action and, if applicable, instructions on curing the problem. Prior to terminating a membership, the Board will consider any information provided by the Member in response to the notice described herein.

4.8.1 Suspension. The suspension of a Member will not affect the Member's rights and obligations other than that the Member will not be entitled to vote at any meeting of the Members, Classes, subclasses, or any committee until the suspension is removed except that a suspended Member may participate in the WECC proposed Reliability Standards Development Procedure.

4.8.2 Termination. The termination of membership will have the same effect, and be subject to the same continuing obligations, as such Member's withdrawal pursuant to Section 4.1, except that it will be effective as of the issuance date of the notice provided pursuant to Section 4.8.

4.9 WECC Structure and Governance Review.

At least each five years, the Board of Directors will conduct a thorough assessment of whether WECC is fulfilling its purposes in a manner that is consistent with: 1) the provisions of Section 2.2 of these Bylaws; and 2) the then-current state and the expected future evolution of the electric power industry within the Western Interconnection. Unless determined otherwise by a majority vote of both the Board of Directors and the Members Advisory Committee (MAC), the initial review required under this Section 4.9 will

commence after the completion of the first full year of operation under these Bylaws as amended in June 2013 and will be done collaboratively with the MAC and to the extent practical, will be coordinated with any similar structure and governance reviews being conducted by Peak Reliability. In particular, the Board will focus on whether the standards, obligations, processes, and decisions WECC imposes on its Members are timely, fair, effective, and reasonable in view of the commercial, legal, regulatory, and economic needs and objectives of the affected Members. The Board will evaluate WECC's Board composition, Member Class structure, committee structure and activities, and staff responsibilities as they relate to the foregoing considerations. The assessment required by this Section 4.9 will be accompanied by Board recommendations for any changes the Board determines are warranted by the assessment. The assessment and recommendations prepared by the Board in accordance with this Section 4.9 will be submitted in writing to the Members at the first annual Member meeting held after they are completed.

5. Procedures for Member Decisions.

5.1 Quorum and Alternative Voting.

With the exception of voting on Regional Reliability Standards and Regional Criteria under the oversight of the WECC Standards Committee, members may conduct business and take votes only at duly noticed Member meetings. Members may not conduct any business of the membership as a whole at any meeting unless a quorum is first established.

5.1.1 Quorum. A majority of all Members, including a majority in at least three (3) Classes, will constitute a quorum for all meetings of the membership as a whole. A majority of the members of a Class or subclass will constitute a quorum for all Member Class or subclass meetings. Members participating through a designated alternative representative or through submission of an absentee ballot will be counted in determination of a quorum. Inactive Members, as defined in Section 5.9 of these Bylaws, will not be counted in determining a quorum at Member, Member Class or subclass meetings. A quorum, once established, will be deemed to continue for the balance of any Member, Member Class, or subclass meeting, except that no election of Directors may occur without a quorum being present. Members may designate an alternate representative or submit an absentee ballot in a form consistent with Section 5.1.2 for any Member, Member Class, or subclass meeting.

5.1.2 Alternate or Absentee Voting: In the event that a Member's designated voting representative cannot attend a meeting of the Membership or a Member Class meeting where Directors are being elected or amendments to these Bylaws are considered, a Member may designate an alternate voting Member representative, with two (2) days written notice to the Corporate Secretary, or a Member may cast an absentee ballot pursuant to the procedures established by the Corporate Secretary.

5.2 General Membership Meetings.

All business of the Members acting as a whole will be conducted at meetings called by advance notice to all WECC Members provided in accordance with Section 5.5. Unless stated otherwise in these Bylaws, decisions at all meetings of the Members, Member Classes, or subclasses will be by simple majority vote of the Members present or otherwise represented in accordance with these Bylaws, with each Member having one vote, unless other Bylaw provisions provide for the allocation of the Member's vote. The Chair of the Board will preside over all Members acting-as-a-whole meetings.

5.3 Annual Member Meetings.

WECC will hold an Annual Meeting of all Members at a time and place determined by the Board. At the Annual Meeting, and at other times as provided for in these Bylaws, in addition to such other actions the Members may take, Member Classes will elect Directors for vacant director positions.

5.4 Special Member Meetings.

Members may hold special meetings whenever called by the Board. The Board will call special Member meetings whenever a majority of the Members of any Class request a special meeting or at such other times as it deems appropriate. The Chair of the Board will preside over all special Member meetings.

5.5 Member Class and Subclass Meetings

An individual WECC Member Class or subclass may hold a meeting for any purpose relevant to the interests of Class or subclass Members. Such meeting will be initiated by request by one or more Class or subclass Member(s), and agreement by at least fifty percent (50%) of Class or subclass Members.

5.6 Notice of Member Meetings.

5.6.1 Annual Meeting. The Chief Executive Officer will provide at least thirty (30) days' advance notice to all Members and the Board of the date, place and time of the Annual Meeting of the Members and an agenda of the business to be conducted at such meeting.

5.6.2 Other Member Meetings. The Chief Executive Officer will provide notice of regularly scheduled and special meetings of the Members to the Members not less than fifteen (15) days before the meeting if delivered by first-class mail, or not less than ten (10) days before the meeting if the notice is delivered personally, by telephone, by facsimile, electronic mail or express mail. If mailed, such notice will be deemed given when deposited in the United States mail, with first-class postage thereon prepaid, addressed to a Member. Such notice will state the date, time and place of the meeting and the meeting agenda.

5.6.3 Public and Website Notice. Public notice of each meeting of the Members will be placed on WECC's website at least ten (10) days before such meeting. In addition, the Chief Executive Officer will provide notice in the same manner and time as set forth in Section 5.6.2 of each meeting to each member of the public

who so requests and who has provided appropriate information regarding delivery of notice.

5.7 Open Meetings.
All Membership meetings are open to observation by the public.

5.8 Policymaking Authority.
The Board of Directors may adopt policies for the interpretation and implementation of the meeting and voting procedures established in this Section 5.

5.9 Minimum Participation Requirement.
In order to be counted for quorum purposes at a meeting of the membership as a whole, Class, or subclass meeting, a WECC Member must actively participate (by attending in person, sending an alternate, or voting absentee) in at least one WECC meeting (including meetings of the Board, committees and subcommittees) each year. If the Member does not meet this minimum participation requirement, the Member will be considered an "inactive" Member until its active status is restored by participation in at least one WECC meeting (including meetings of the Board, committees and subcommittees) by attending in person, sending an alternate, or voting absentee. An inactive Member will not be counted toward establishing a quorum of the membership as a whole, of a Class, or of a subclass. An applicant for WECC membership or a WECC Member may at any time self-designate itself an inactive Member. Such designation will be effective until the Member is reinstated to "active" status. If a Member does not participate for twenty four (24) consecutive months, the Member's membership will be terminated. If a Member's membership is so terminated, reapplication for membership may be made at any subsequent time.

6. Governance.

6.1 Board of Directors.
Subject to those matters expressly requiring approval of the Membership, a Board of Directors elected by the Members will govern WECC. The Board of Directors will elect its own Chair and Vice-Chair from those individuals serving as Directors.

6.2 Composition of the Board and Board Member Qualifications.

6.2.1 The Board of Directors shall consist of nine (9) Directors. At all times, subject to temporary vacancies, the Board of Directors shall include at least three directors who have at least ten years of experience in the utility industry, preferably in the Western Interconnection, including at least one director who has transmission operations experience, at least one director who has transmission planning experience, and at least one director who has generation operations experience. At any time where the membership of the Member Advisory Committee (MAC) is modified, as may be provided in other provisions of these bylaws, to include representation for Entities of the two Canadian Provinces of British Columbia and Alberta and the Mexican State of Baja California, at least one Director, elected

subsequent to such MAC representation, shall have international experience corresponding to such geographic area(s) and/or representation in the MAC.

6.2.2 The remaining members of the Board of Directors shall be selected in an effort to ensure diversity of background and experience. Desirable categories of experience may include: regulatory or legal; accounting, finance or economics; environmental; end-user advocacy; information technology; compliance or standards; public sector; and international.

6.2.2.1 Transmission operations experience shall preferably include experience in control center operations at the senior management or officer level.

6.2.2.2 Transmission planning experience shall preferably include experience in modeling and/or planning transmission facilities, including economic and reliability modeling at the senior management or officer level.

6.2.2.3 Generation operations experience shall preferably include experience in development or operation of generation facilities, including economic and reliability modeling at the senior management or officer level.

6.2.2.4 Regulatory or legal experience shall preferably include at least one of the following types of experience: state, provincial or federal industry regulation; significant litigation experience ideally at the appellate level; evaluation of complex legal arguments; and advising clients with respect to settlements.

6.2.2.5 Accounting, finance or economic experience shall preferably include experience as a Chief Financial Officer, a Chief Account Officer, a Corporate Risk Officer, a Certified Public Accountant, or the equivalent thereof.

6.2.2.6 Environmental experience shall preferably include experience advocating environmental interests before local, state or federal agencies or boards, and/or leadership experience in representing environmental interests in relation to energy issues.

6.2.2.7 End-user advocacy experience shall preferably include experience advocating end-user economic interests before local, state or federal ratemaking agencies or boards.

6.2.2.8 Information technology experience shall preferably include experience as a senior level manager responsible for integrating information technology services with organizational needs in areas such as capacity planning, budget and finance, acquisition and deployment, operations, change management, application development, trade ally relationships, user support, data quality, security and similar areas.

6.2.2.9 Compliance or standards experience shall preferably include experience as a senior level officer or manager for corporate compliance with internally and/or externally imposed requirements, rules or standards.

6.2.2.10 Public sector experience shall preferably include experience representing the public interests with respect to energy issues.

6.2.2.11 International experience shall preferably include experience as described in the previously listed experience categories, but in the Canadian provinces of British Columbia or Alberta, or the Mexican state of Baja California.

6.2.3 Director Affiliation Restrictions. A Director may not be a full time employee of a Registered Entity. Nor may a Director be affiliated with any Member or Registered Entity operating in the Western Interconnection, nor a Director of an entity performing the function of Reliability Coordinator in the Western Interconnection.

6.2.3.1 For the purposes of this section, "affiliated" shall mean (1) an employee of, (2) a contractor for, (3) an employee of a contractor for, or (4) an equity owner of Registered Entity or Member. For purposes of determining whether a Director is "affiliated" the term "Director" shall include a spouse and/or minor child of the Director.

6.2.3.2 A Director with an equity interest in private or publicly traded companies that are end-users of electricity in the Western Interconnection but are not otherwise "affiliated" pursuant to the restrictions set forth in Section 6.2.2 shall not be considered to be "affiliated".

6.2.3.3 A Director with an equity ownership in a broadly diversified mutual fund which may from time to time include interests in one of the types of organizations described in Section 6.2.2, shall "not be considered to be "affiliated, provided that such equity interest cannot confer a controlling interest in a Member or Registered Entity within the Western Interconnection.

6.2.3.4 A Director receiving post-employment compensation, which compensation is not indexed to the success of the disbursing entity shall not be considered "affiliated".

6.2.3.5 A Director shall not be considered "affiliated" solely by having a contractual relationship with a state government that has one or more

agencies that are Members, provided that the Director cannot be affiliated with the Member agency or agencies.

6.2.3.6 A Director shall not be considered "affiliated" for being a residential or small business end-user of electricity or for being affiliated with, a member of, or a contributor to an organization that represents a substantial number of end users or a substantial number of persons interested in the impacts of electric systems on the public interests or the environment, but a Director shall be considered "affiliated" if the Director is an employee of, or serves as a director, trustee, or officer or in any other policy-setting capacity with respect to any such organization.

6.2.3.7 The affiliation restrictions set forth in this Section are not all encompassing. Candidates and Board members are expected to disclose all known potential financial or relationship conflicts, including any known relationships between companies they have affiliation with and/or entities described in Section 6.2.2. Furthermore, any Nominating Committee will be expected to investigate and evaluate all potential conflicts, whether financial or otherwise.

6.2.4 In addition, the Board may provide for the Chief Executive Officer ("CEO") of WECC to be a voting, additional tenth, member of the Board through the inclusion of such a provision in the resolution the Board adopts appointing WECC's CEO. Such provision shall not permit the CEO to be a member of a Board committee or to cast either a tie-breaking vote or a vote that creates a tie. The CEO may not serve as the Chair or Vice-Chair of the Board.

6.3 Term of Office.

Directors will hold office for staggered terms of three (3) years, three Directors' terms ending each year. Each three (3) year term shall commence upon the adjournment of the portion of the Annual Member Meeting provided for in Section 5.3, in which all Members are counted for purposes of determining a quorum. Similarly, the three year terms of outgoing Directors shall end upon the adjournment of that portion of the Annual Member Meeting in which all Members are counted for purposes of determining a quorum, whether that results in a longer or shorter term than exactly three years.

6.4 Nomination, Selection and Compensation of Directors.

6.4.1 Nominating Committee. Candidates for a Director position shall be nominated by a Nominating Committee. The Nominating Committee shall consist of seven members. Three members shall be Directors, not standing for re-election, designated by the Board Chair. The remaining four Nominating Committee members shall be designated by the Member Advisory Committee and come from individuals serving on the Member Advisory Committee, with two (2) members being from Classes 1, 2, and/or 3, and two (2) members being from Classes 4 and/or 5.

6.4.1.1 If the Member Advisory Committee does not designate MAC members to serve on the Nominating Committee within 30 days of being notified of the Board Chair's designation of the three Directors to serve on the Nominating Committee, the Board Chair may designate MAC members to serve.

6.4.1.2 A Nominating Committee shall be formed each year not less than 180 days prior to the Annual Meeting. A Nominating Committee will continue to function until a replacement Nominating Committee is formed, but may not continue for a period longer than twelve (12) months from its creation, provided however, that the Board, by resolution, may authorize a Nominating Committee to function beyond twelve (12) months as the Board may determine is necessary.

6.4.2 Director Candidate Nominations.

6.4.2.1 The Nominating Committee shall develop candidate pools and make candidate nominations to the Members. The Nominating Committee may consider any qualified applicant in developing the candidate pool, and may identify applicants through the following process: (1) selecting and utilizing an independent search firm to provide the Nominating Committee with a list of qualified applicants for each Director position subject to election; (2) consider an incumbent Director who is willing to stand for reelection, including a review of such Director's tenure on the Board of Directors; (3) consider external nominations.

6.4.2.2 External parties, including but not limited to Members and Western Interconnection stakeholders, may recommend candidates (self-recommendations and third party recommendations) to the Nominating Committee for consideration, by submitting the following: the candidate's resume, a summary of the candidate's relevant experience, a disclosure statement from the candidate, and a letter of interest from the candidate. All recommendations from external parties must be submitted to the Nominating Committee within sufficient time for the Nominating Committee to evaluate the candidate prior to the notification required in Section 6.4.2.5.

6.4.2.3 The Nominating Committee shall review the qualifications of the potential candidates and put forth one nominee for each Director position up for election.

6.4.2.4 Five (5) affirmative votes of the Nominating Committee shall be necessary to put forth a nominee to the Members.

6.4.2.5 At least sixty (60) days in advance of the Annual Meeting, the Nominating Committee shall notify the Board Chair whether or not it has finalized all Director nominations. If the Committee fails to put forth a nomination for an open position, then the Board Chair may form a new Nominating Committee with different Board and Member Advisory Committee members, who shall be tasked with developing any remaining nominations for open Director positions.

6.4.2.6 Each nominee, put forth by the Nominating Committee, shall be presented for separate election by the Members.

6.4.3 Director Elections. Members will vote for each vacant Director position separately. A candidate will be elected to the Board upon majority vote of the Members as a whole in addition to a majority of the Classes (three of the five) having a majority vote from the Members of the individual Class.

6.4.4 Should a candidate fail to receive the required vote of the Members or Member Classes, the Board may:

6.4.4.1 conduct a new election of an alternate candidate put forward by the Nominating Committee, if any, or the Board may ask the Chair to establish a new Nominating Committee to recommence the nomination and election process. Where a candidate has not received the required vote of the Members and Member Classes, the director position shall remain vacant until a candidate is elected, except as provided in Section 6.7.2.

6.4.5 Annual Compensation of Directors. Every two years, or sooner if, in the discretion of the CEO, a new survey is required, the CEO shall contract with an appropriate firm to conduct a national compensation survey, which shall provide an independent review of the compensation paid independent directors. The latest survey so procured shall be used by the Nominating Committee to make an annual recommendation for the compensation of Directors for the following year. Any such recommendation shall require five (5) affirmative votes of Nominating Committee members. This recommendation shall be presented to the MAC no later than one hundred fifty (150) days prior to the Annual Meeting. The MAC shall set the compensation for the Directors at least one hundred and twenty (120) days prior to the Annual Meeting. When making this decision, the MAC shall consider the recommendation of the Nominating Committee and any other material relevant to setting Director compensation. If the Nominating Committee is unable to reach the five (5) vote majority necessary to make a compensation recommendation, the MAC shall make no changes to the compensation paid Directors for the following year.

6.5 Removal of Directors.

The Members or the Board may remove a Director before completion of the Director's term of office pursuant to the following provisions.

6.5.1 Removal by the Members. Directors may be removed only for gross negligence, violation of local, state, provincial, or federal laws, gross misconduct, or failure to meet the fiduciary obligations of Directors.

6.5.1.1 Removal of a Director will be by a vote of a majority of all the WECC Members, not just those Members voting, in addition to a majority of the Classes (three of the five) having a majority vote from the Members of the individual Class. Removal may only take place at a meeting called for that purpose by notice provided in accordance with the notice requirements for member meetings. A vote, by all Members, to consider removal of a Director will occur based upon a petition, for such an all-Member vote, supported by twenty percent (20%), each, of the Members of three of the five Member Classes.

6.5.2 Removal by the Board. The Board may remove any Director for gross negligence, violation of local, state, provincial, or federal laws, gross misconduct, or failure to meet the fiduciary obligations of Directors. Such removal will only occur upon the affirmative vote of not less than six (6) Directors.

6.6 Resignation.

Any Director may resign from their position at any time by written notice to the Board by delivery to the Chair. The acceptance of a resignation will not be required to make it effective.

6.7 Procedures for Filling Vacant Director Positions.

6.7.1 Director Vacancies. If the position of any Director becomes vacant prior to its normal term expiration, the remaining Directors may charge the Nominating Committee with selecting a successor immediately. The Nominating Committee will follow the requirements set out in Sections 6.2.1 and 6.2.2 in its selection of any successor Director. Alternatively, if less than one (1) year remains in the term of that Director, the remaining Directors may choose to leave the position vacant for the remainder of the term.

6.7.2 Holdover to Cure Procedural Vacancies. Whenever an incumbent Director is a candidate for a Director position and a vacancy would be created due to expiration of the Director's term, the Director may continue to serve, for up to an additional 12 months, until such time as an election of the Director's position can be conducted, provided the vacancy arises from a lack of quorum or other procedural inability to elect a candidate for the Director position.

6.7.3 Should the number of serving Directors fall below seven (7), the Board may appoint one or more individuals to serve as temporary Directors until such time as replacement Directors can be elected by the Members.

6.7.3.1 In appointing temporary Directors, the Board shall select individuals who meet the requirements of Section 6.2.

6.8 Duties of Directors.

The Directors will have the following duties:

6.8.1 Fiduciary Obligation to WECC: All Directors, will have a fiduciary obligation to WECC consistent with the requirements for Directors of Utah non-profit corporations. Members of the Board will at all times act in conformance with such requirements, these Bylaws and the Standards of Conduct set forth in Appendix A.

6.8.2 Preserve Non-Affiliated Status: Throughout their terms, Directors will have a duty to avoid any affiliation that is inconsistent with the qualifications for Directors in Section 6.2.2 of these Bylaws. If a Director becomes aware of any intervening disqualification, he/she must either resign or eliminate the disqualification (e.g., dispose of securities) within sixty (60) days.

6.9 Powers of Directors.

The management of all the property and affairs of WECC will be vested in the Board of Directors. The Board will hold annual elections to select a Board Chair and to fill any other Board officer positions that may be created by the Board or required by applicable law. The Board may exercise all the powers of WECC and do all lawful acts and things (including the adoption of such rules and regulations for the conduct of its meetings, the exercise of its powers and the management of WECC) as are consistent with these Bylaws and the Articles of Incorporation. The Board will give serious consideration to the Member Advisory Committee's and the Western Interconnection Regional Advisory Board's (or any successor) recommendations. The Board will respond to Member Advisory Committee and Western Interconnection Regional Advisory Board recommendations through a means which the Board determines appropriate.

6.10 Delegation of Board Authority.

The Board may delegate to the Chief Executive Officer or to any Board Committee formed pursuant to Section 7.7.3 any or all of its powers and authority except: 1) any power which it may not delegate pursuant to applicable Utah law; 2) the power to adopt any reliability standard; 3) the power to determine when to exercise the Backstop Authority of WECC; 4) the power to approve budgets; 5) the power to form committees; 6) the power to amend the Bylaws; 7) the power to elect the Chair and other officers of the Board; and 8) the power to hire, fire or set the terms of employment of the Chief Executive Officer. The Board may also delegate to any Member committee the power to make specific decisions, subject to the right of any Member to appeal any of such decisions to the Board within 30 days of the committee vote on the decision by writing a letter to the Chief Executive Officer that describes in reasonable detail the grounds for appeal, and requests that the appeal be considered by the Board at its next regularly scheduled meeting, subject to applicable notice requirements. Delegation will be by express decision and will require the affirmative vote of not less than a majority of the

Directors. Any Director may call for a vote to rescind such delegation at any time and such delegation will be rescinded if a majority of the Directors vote to do so.

6.10.1 Notice to Members. Within seven (7) days of any decision delegated pursuant to Section 6.10, except for routine decisions of the Chief Executive Officer, Members will be notified of the decision by electronic mail, posting on the WECC website and any other means determined appropriate by the Board. Routine decisions of the Chief Executive Officer will be noticed in periodic reports to the Board and Members as determined by the Board, which will be sent to Members by electronic mail and posted on the WECC website.

6.10.2 Board Review of Delegated Decisions. Decisions delegated pursuant to Section 6.10 will be reviewed by the Board at the request of any Director, provided such request is lodged with the Secretary within thirty (30) days of the notice. Whenever it determines that a matter requires an urgent decision, the Board may shorten the deadline for requests for review, provided that: 1) the notice and opportunity for review will be reasonable under the circumstances; and 2) notices to Members will always contain clear notification of the procedures and deadlines for Board review. A request for review of a decision will stay the effect of the decision pending review unless the Board in making the delegation expressly determines otherwise.

7. Procedures for Board Decisions.

7.1 Quorum.

No business will be conducted by the Board unless at least five (5) Directors are present, or six (6) Directors if the CEO is counted to determine a Board quorum.

7.2 Majority Vote.

A decision of the Board will require an affirmative vote of a majority of Directors present and not abstaining; provided that no decision of the Board shall be made with fewer than three (3) affirmative votes, or four (4) affirmative votes if the CEO is counted to determine a Board quorum. Directors may not vote by proxy or by absentee ballot, but Directors may participate in Board meetings by telephone as provided in Section 7.3 of these Bylaws.

7.3 Attendance at Board Meetings by Teleconference.

Any or all of WECC's Directors may participate in any meeting of the Board by telephone conference or any other means of communication that enable all Directors participating in the meeting to simultaneously hear one another. Every Director participating in a meeting in the manner described in the preceding sentence will be deemed to be present in person at that meeting.

7.4 Board Action by Unanimous Consent.

7.4.1 Action Without a Meeting. Unless WECC's Articles of Incorporation or applicable law provides otherwise, action required or permitted to be taken at a

meeting of the Board may be taken without a meeting through one or more written consents describing the action taken. Any Board action taken by written consent must be signed by all Directors in office at the time the action is taken. Such actions must be noticed to Members in accordance with Section 7.5 and Members must be given an opportunity to comment prior to the Board taking such actions through electronic mail, comments on the website or other appropriate means. The required notice of such meeting may generally describe the arrangements (rather than the place) for the holding of the meeting. All other provisions herein contained or referred to will apply to such meeting as though it were physically held at a single place. All Board actions by written consent must be filed with WECC's Board meeting minutes. Action taken under this Section is effective when the last Director signs the consent, unless the consent specifies an earlier or later effective date. Any action by written consent has the same effect as a meeting vote and may be described as such in any document.

7.4.2 Waiver of Procedures. For any specific action at any noticed meeting of the Board, and under exigent or unusual circumstances, the Board by unanimous vote of those present may waive any procedural requirement applicable to Board decision-making, including any requirement for notice of a specific potential action, except for the following: 1) the requirement for notice of the time and place of the meeting pursuant to Section 7.5; 2) the quorum and voting requirements of Sections 7.1 and 7.2; and 3) any non-procedural limitation on the power of the Board to make a decision, including, but not limited to, those restrictions in Sections 6.10 (limiting the power to delegate) and 12.1 (limiting the power to amend the Bylaws). Whenever such action is taken, a statement describing the action, the exigent or unusual circumstances, the specific procedure waived, the basis for the waiver and the votes of all Directors present shall be posted on the website and communicated in writing or by e-mail to all Members within five (5) days.

7.5 Notice of Board Meetings.

7.5.1 Regular Meetings. Except as set forth in Section 7.5.2 regarding urgent business, all regular business of the Board will occur at the Board meetings, at least twenty-one (21) days' advance notice of which has been provided by the Chief Executive Officer to all Directors and all Members. Notice will include an agenda that will identify those matters on which a vote will be taken at the meeting. The foregoing requirement shall not preclude the Board from taking an action that is different from the specific proposed action identified in the agenda, as long as the relevant subject matter has been reasonably identified in the agenda. The Directors will establish a regular meeting schedule that will be made available to the Members. The schedule will include not less than two meetings of the Board annually.

7.5.2 Special Meetings. Whenever the Chair of the Board or any three (3) Directors find that there is urgent business requiring Board action before the next regular Board

meeting, a special meeting of the Board may be called. Such special meetings will be held upon as much written notice to each Board Member and all Members as is possible under the circumstances, which will not be less than three (3) days. However, this notice of special meetings may be waived if: 1) the waiver is by a writing signed by a quorum of Board members; and 2) as much notice of the meeting as practicable has been given to WECC Members via e-mail and posting on the WECC website.

7.5.3 Public and Website Notice. Public notice of each meeting of the Board will be placed on WECC's website at least ten (10) days before such meeting (or such lesser time as provided pursuant to Section 7.5.2). In addition, the Chief Executive Officer will provide notice of each meeting by first-class mail, facsimile or electronic mail to each member of the public who so requests and who has provided appropriate information regarding delivery of notice.

7.6 Open Meetings.

Except as provided in Section 7.6.1, all regular and special meetings of the Board will be open to observation by any Member and any member of the public.

7.6.1 Closed Session. Notwithstanding the provisions of Section 7.6, upon an affirmative vote of two-thirds (2/3) of the Directors present, the Board may meet in closed session: 1) to consider the employment, evaluation of performance, or dismissal of an employee of WECC and to deliberate regarding decisions the Board may be called upon to make regarding the nomination, qualification, appointment, or removal of a member of the Board of Directors; 2) to discuss pending or proposed litigation and to receive confidential attorney-client communications from legal counsel; and 3) to receive and discuss any information that is privileged, trade secret, cybersecurity, critical energy infrastructure information (as defined by the FERC), protected from public disclosure by law or that the Board determines should be confidential in order to protect a legitimate public interest.

7.6.1.1 Attendance by an Affected Director. Closed sessions of the Board may not be attended by a Director under the following circumstances: 1) where the qualifications or performance of the Director or the Director's spouse or children are being discussed; 2) where the Director is employed by an entity that is or is likely to become a party to the litigation being discussed; and 3) where the Director or the Board determines that the Director would have a serious and substantial conflict of interest by becoming privy to confidential attorney-client or trade secret information that is to be presented to the Board in closed session.

7.6.1.2 Announcement of Closed Session. Before adjourning into closed session, the Chair of the Board will announce the purpose of the closed session in a manner that provides the public an understanding of the general subject matter to be discussed but which does not reveal sensitive or personal

information. The Board will not discuss additional items outside the scope of this description.

7.6.1.3 Confidentiality of Closed Session. All Directors and others present will maintain the confidentiality of discussions and decisions made in closed session. The Board will appoint a secretary for closed session to keep a minute book for the purpose of recording the subject matter discussed in closed session and any actions taken in closed session. After a closed session has ended, the Board Chair shall provide the public a general description of the business conducted during the closed session, without breaching the confidentiality of the information used in the session.

7.7 Board Committees.

7.7.1 Governance Committee. The Chair will appoint a Governance Committee that shall: oversee implementation and amendment of these Bylaws and address such other issues pertinent to Governance as the Board may choose to delegate to it. The Chair will designate one of the appointed Directors to be the Chair of the Governance Committee.

7.7.2 Nominating Committee. Constituted as described in Section 6.4.1 of these Bylaws.

7.7.3 Other Board Committees. The Board may appoint such Board committees as it deems necessary from time to time to carry out its business affairs. In appointing such committees, the Board will specify their purpose, membership, voting, notice and meeting procedures and such other direction as the Board may deem appropriate. The Board may appoint one or more Members or other persons to participate in Board committees as full voting members or as non-voting advisory members.

7.7.4 Standards of Conduct for Board Committee Members. Members of Board committees shall comply with the Board Member Standards of Conduct set forth in Appendix A.

8. Member Committees.

8.1 Purpose.

WECC will have committees composed of its Members to advise and make recommendations to the Board. Such committees will include both standing committees required by these Bylaws and such other committees as the Board may choose to create.

8.2 Standing Committees.

WECC will have the following standing committees:

8.2.1 Member Advisory Committee. This committee is comprised of Member representatives elected by the Member Classes, or subclasses, as set forth herein.

8.2.1.1 The committee shall advise the Board on any matters the Board requests the committee to evaluate or consider; and advise the Board on matters as the committee deems appropriate.

8.2.1.2 The committee's Chair or designee will attend the Board's meetings to provide advice, clarifications or respond to Directors' questions. The Board Chair and committee Chair shall develop guiding principles and procedures as necessary, to ensure open, effective, and efficient dialog between the MAC and Board. Such guiding principles and procedures may be amended by the Board and committee's Chairs.

8.2.2 WECC Standards Committee. This committee will oversee the process for responding to requests for Regional Reliability Standards and Regional Criteria in accordance with the Reliability Standards Development Procedures. The WECC Standards Committee is responsible for determining if a request for a Regional Reliability Standard or a Regional Criteria is within the scope of WECC's activities, and for overseeing the drafting, comment and voting process for a Regional Reliability Standard or Regional Criteria. The WECC Standards Committee shall also oversee the process for responding to requests for interpretations of Regional Reliability Standards and Regional Criteria. The WECC Standards Committee shall consist of one member from each of the WECC Standards Voting Sectors set forth in the Reliability Standard Development Procedures, and a member of the WECC Board who shall act as chair of this committee. The WECC Board shall approve a Charter for the WECC Standards Committee that describes the WECC Standards Committee membership selection process.

8.2.3 Planning Coordination Committee. This committee will advise and make recommendations to the Board on all matters within the jurisdiction of WECC pertaining to maintaining reliability through evaluating generation and load balance and the adequacy of the physical infrastructure of the interconnected Bulk Electric System within the Western Interconnection.

8.2.4 Operating Committee. This committee will advise and make recommendations to the Board on all matters within the jurisdiction of WECC pertaining to maintaining reliability through the operation and security of the interconnected Bulk Electric System in the Western Interconnection.

8.2.5 Market Interface Committee. This committee will advise and make recommendations to the Board on the development of consistent Market Interface practices and compatible commercial practices within the Western Interconnection. It will consider matters pertaining to the impact of WECC's reliability standards, practices, and procedures on the commercial electricity

market in the Western Interconnection, and facilitate analysis of the impact of electricity market practices on electric system reliability.

8.3 Other Committees.

8.3.1 The Board may create such other committees as it may desire from time to time. The Board will specify the functions, duties and responsibilities of any such committee at the time of its creation. The Board will also specify the membership rules, quorum requirements, voting levels and meeting and notice requirements at the time of creation. Any changes in the membership rules, quorum requirements, or voting levels of a committee, once established by the Board, will require a seventy-five percent (75%) vote of the Board to alter. The specific function or sunset date for a committee will be designated by the Board at the time of the committee's creation. The committee will terminate its activities upon the completion of its function or the expiration of the date set by the Board.

8.4 [Repealed]

8.5 Procedures for Member Advisory Committee Decision-Making.

8.5.1 Member Advisory Committee (MAC). The committee shall be comprised of three representatives from each of the five (5) Member Classes, for a total of fifteen (15) members.

8.5.1.1 The Board, by resolution, may create up to three additional representative positions on the MAC, to include representation for Entities of the Canadian Provinces of British Columbia, and/or Alberta, and/or the Mexican State of Baja California. The Board resolution shall set forth the terms through which Canadian or Mexican representatives shall be selected and serve.

8.5.2 MAC Member Elections. At the Annual Members Meeting, each Member Class shall conduct elections to elect Class member representatives for the committee. As set forth herein, each Class may subdivide into up to three subclasses for purposes of electing a Class' MAC members.

8.5.2.1 Committee member terms. Each committee member will serve a three year term. Terms shall be staggered such that one of each Class' representative committee member's terms ends each year. Class committee members may have term limits as determined appropriate by the Class or subclass electing such committee member.

8.5.2.2 Subclasses. Each Class will determine the need for diversity within the Class (e.g., geographic, stakeholder issues, etc.) which may lead to the establishment of subclasses. A Class may subdivide into up to three

subclasses. Each Class shall determine to establish or discontinue its subclasses, if any, by majority vote of the members in the Class.

8.5.2.3 Committee member nominations and elections. Only members of each Class, or subclass, if applicable, may nominate and vote on candidates for election as a MAC member representative for their respective Class or subclass.

8.5.2.3.1 A Class or subclass candidate need not be a member of the Class or subclass, neither an employee of a Class or subclass member.

8.5.2.3.2 A quorum of a majority of the members of a Class or subclass must be present in order to elect a MAC member for the Class or subclass; election shall be by simple majority of votes cast.

8.5.2.3.3 Where there are more candidates for election than positions to fill, absentee ballots shall allow voters to order the candidates by order of preference so that their wishes may be honored in case a runoff is required. Absentee ballots shall be counted in the first ballot based on the top choice, or the top two or three choices if more than one seat is being filled. In any runoff election, absentee ballots shall be counted based on the highest preferences indicated for the candidates who remain in the runoff election.

8.5.2.3.4 Other nomination and election procedures, beyond those contained in these bylaws, may be proposed for a Class or subclass. Contingent upon their approval, by the General Counsel, for their submission to Members, they may be adopted for implementation by majority vote of the Member Class or subclass.

8.5.3 MAC Member Vacancy by Resignation or Removal

8.5.3.1 Resignation. At any time, any MAC member may resign from their position by providing written notice of resignation to the MAC Chair. Such notice shall be effective as of the date the notice is submitted to the MAC chair.

8.5.3.2 Removal. The MAC or the Member Class or subclass which elected a MAC member may remove the MAC member prior to completion of the Mac member's term of office as set forth herein:

8.5.3.2.1 Removal by the MAC. The MAC may remove any MAC member for gross negligence, gross misconduct, violation of local, state, provincial, or federal law, or gross failure to carry

out the duties of a MAC member. Such removal will only occur after the affirmative vote of at least two-thirds (2/3) of the MAC members.

8.5.3.2.2 Removal by the Electing Class or Subclass. The electing Member Class or subclass may remove any MAC member representing that respective Class or subclass. Such removal will occur after the affirmative vote of a majority of the Members of the electing Class or subclass.

8.5.3.3 Vacancy. Whenever a MAC vacancy occurs, the MAC Chair shall conduct a proper and effective election, allowing for a reasonable period to select candidates and to organize such an election.

8.5.3.3.1 Whenever a MAC vacancy occurs, the MAC Chair shall, as promptly as feasible, conduct an election consistent with these Bylaws for the Member Class or subclass from which the vacancy arose, allowing for a reasonable period to select candidates and to organize such an election.

8.5.3.3.2 Until an election can be held, the MAC Chair may appoint an interim MAC member to fill the vacancy as may be required to meet the MAC quorum requirements of 8.5.8. The appointee shall serve until an effective election can be held. Any interim appointment must come from Members of the same Class or subclass from which the vacancy arose.

8.5.4 MAC officers. At the Annual Meeting, after incoming MAC members have been duly elected by the Member Classes or subclasses, if applicable, the MAC will elect the MAC Chair and MAC Vice-Chair from the MAC members. The Chair and Vice-Chair must represent different Classes, and shall serve one year terms, measured from the Annual Meeting to the next Annual Meeting. In the event of the resignation or removal of the Chair or Vice-Chair, the MAC members shall, at their next regular or special meeting, whichever is sooner, elect a new MAC Chair or MAC Vice-Chair, respectively.

8.5.5 MAC Member Duties. All MAC members shall have a duty to represent the interests of their Member Class or subclass. All MAC members shall maintain regular contact with the members of their Member Class as issues are considered by the MAC, and shall make reasonable good faith efforts to present and discuss both majority and minority opinions from their Member Class on matters before the MAC.

8.5.6 Regular and Special Meetings.

8.5.6.1 Regular meetings. All regular business of the MAC shall occur at MAC meetings which are noticed pursuant to Section 8.5.7. The MAC shall meet in person not less than two times per year, including once in conjunction with the Annual Meeting. The MAC shall establish a regular meeting schedule, which will be made available to the Members and Directors electronically, and available to the public through posting on the WECC website.

8.5.6.2 Special Meetings. Whenever the MAC Chair finds, or upon request to the MAC Chair from any five (5) MAC Members, that there is urgent business requiring MAC consideration or action prior to the next regularly scheduled meeting, then a special meeting shall be called with notice given in accordance with Section 8.5.7.

8.5.7 Notice.

8.5.7.1 Regular Meetings. All regular meetings of the MAC shall require at least twenty-one (21) days written notice to the MAC members, the Directors, and the Members. Such notice shall specify the time and place of the meeting, and an agenda of the business to be conducted including those matters upon which a vote will be taken. Notice of regular MAC meetings shall be effective upon electronic distribution, and shall be posted to the WECC website within one (1) business day of electronic distribution.

8.5.7.2 Special Meetings. Any special meetings of the MAC shall require at least ten (10) days written notice to the MAC members, the Directors, and the Members. Such notice shall specify the time and place of the meeting, and an agenda of the business to be conducted, including those matters upon which a vote will be taken. Notice of special MAC meetings shall be effective upon electronic distribution, and shall be posted to the WECC website within one (1) business day of electronic distribution.

8.5.8 Quorum. No business shall be conducted by the MAC unless a majority of the MAC members is present, including at least one MAC member from each Member Class which elects MAC members (not including subclass designations).

8.5.9 Majority Vote. A decision of the MAC shall be upon a simple majority vote of committee members voting unless otherwise required in other bylaw provisions.

8.5.10 Remote Participation at MAC Meetings. Any or all of the MAC members may participate in any meeting of the MAC electronically or by telephone, or by any other means of communications which enables the MAC members to simultaneously hear one another. Every MAC member participating in a meeting in this manner will be deemed to be present in person at the meeting.

8.5.11 Reporting to the Board. The MAC Chair, or designee, shall provide a report to the Board at each Board meeting detailing the business carried out by the MAC, and advising the Board of MAC recommendations on matters as set forth in Section 8.2.1 herein. In the event that there are dissenting MAC member opinions regarding a matter on which the MAC is advising or providing recommendations to the Board, the MAC Chair, or designee, shall present dissenting opinions and rationales in conjunction with the respective MAC advice or recommendations.

8.5.12 Open Meetings. Except as provided in Section 8.5.13, all regular and special meetings of the MAC will be open to observation by any Member, Director, and/or any member of the public.

8.5.13 Closed Session. Notwithstanding the provisions of Section 8.5.12, after a quorum has been established at any MAC meeting and upon an affirmative vote of two-thirds (2/3) of the MAC members present, the MAC may close an open meeting and reconvene in closed session in the following instances: (1) to receive and/or discuss confidential attorney-client privileged information from WECC's counsel; or (2) to receive and discuss any other information which is privileged, confidential, proprietary, trade secret, or otherwise protected from public disclosure by law.

8.5.13.1 Attendance by an Affected MAC Member. Closed sessions of the MAC may not be attended by a MAC member under the following circumstances: (1) when the qualification or performance of the MAC member is being discussed; (2) when the MAC member is employed by an entity that is or is likely to become a party to the litigation or legal issue being discussed; or (3) when the MAC Chair determines that the MAC member would have a conflict of interest by becoming privy to the privileged or confidential information that is to be presented to or discussed by the MAC in closed session.

8.5.13.2 Attendance by Directors. Any member of the Board may attend a closed session of the MAC unless the topic considered by the MAC concerns the Director.

8.5.13.3 Announcement and Adjournment of Closed Session. Prior to adjourning to a closed session, the MAC Chair will announce the purpose of the closed session in a manner that provides the public an understanding of the general subject matter to be discussed, but which does not reveal privileged, confidential or otherwise sensitive personal information. The closed session then shall be limited in scope to the publicly stated purpose of the closed session. After the closed session has ended, the MAC Chair shall provide the public a general description of the business conducted during the closed session, without breaching the confidentiality of the information used in the session.

8.5.13.4 Confidentiality of Closed Session. All MAC members and any others present at a closed session shall maintain the confidentiality of the information, discussions, and decisions made in closed session. Unless otherwise required, all MAC members and closed session attendees shall execute an appropriate confidentiality agreement provided by WECC's General Counsel. The MAC Chair will appoint a secretary for the closed session to take minutes of the closed session, which shall be delivered to the WECC Corporate Secretary. Minutes of the closed session will be maintained confidential by the Corporate Secretary.

8.5.14 MAC Committees. The MAC may appoint such subcommittees and work groups as it deems necessary from time to time to carry out its business affairs. In appointing such subcommittees or work groups, the MAC will specify, in a charter, their purpose, membership, voting, notice and meeting procedures, and other such direction as the MAC deems appropriate. The MAC may appoint one or more MAC members or other persons to participate in MAC subcommittees or work groups as full voting members or as non-voting advisory members.

8.5.15 MAC meetings and activities will be self-funded by Members with respect to labor and travel expenses. However, WECC and WECC staff will provide facilitation and coordination support, including payment for the expenses of meeting facilities. A MAC member may seek reimbursement, from WECC, for reasonable and actual travel expenses arising from attendance at MAC meetings, consistent with WECC employee travel expense reimbursements, where such MAC member's travel expenses are not reimbursed by any Member or other source.

8.6 Procedures for Committees other than the Member Advisory Committee.

8.6.1 Reports to Board of Directors. Action by a committee will be in the form of a recommendation for Board action except in those instances in which the Board has, by resolution, specifically delegated to a committee the power to take action subject to an appeal to the Board by any Member. The recommendation of a committee must be forwarded to the Board for its action along with any minority or dissenting reports filed with the committee Chair or Vice-Chair.

8.6.2 Subcommittees, Task Forces and Ad Hoc Groups. Any Board or member committee may create such subcommittees, task forces or other ad hoc groups ("subcommittee") as it deems appropriate to carry out the committee's responsibilities consistent with these Bylaws and the direction of the Board. The composition, responsibilities and procedures of such groups shall be specified by the committee as appropriate; provided, however that: 1) the committee may only delegate to such subcommittee responsibilities that are within the scope of the committee's responsibilities pursuant to these Bylaws and direction of the Board; and 2) the subcommittee may only make recommendations to the committee. A committee may create a subcommittee without prior approval of the Board;

provided, however, that the committee shall promptly inform the Board in writing and at the next Board meeting regarding the creation of the subcommittee. The notification to the Board shall include a charter for the subcommittee that describes how members of the subcommittee will be selected, the duties of the subcommittee, and whether the committee has established a sunset date for review of (1) the need for the subcommittee and (2) the charter of the subcommittee.

8.6.3 Committee Officers. The Board will appoint the Chair and Vice-Chair of each committee. The Committee Chair or Vice-Chair will preside over all meetings of the committee and will report recommendations of the committee to the Board of Directors. The Chair and Vice-Chair will be responsible for informing the Board regarding minority opinions and other information required by the Board along with overall committee recommendations. Whenever the committee elects to form a subcommittee to represent regions or address specific tasks, the Chair (or in the absence of the Chair, the Vice-Chair) will have the power to appoint the members of such subcommittee from both members of the committees and non-members. Upon resignation of the Committee Chair, the Vice Chair shall serve as Chair until the Board appoints a replacement. Upon resignation of the Vice Chair, the Chair may appoint a temporary Vice Chair to serve until the Board appoints a replacement. Upon resignation of both the Chair and Vice Chair, the Chair of the Board may appoint one or more temporary replacements to serve until the Board appoints permanent replacements.

8.6.4 Committee Membership. Except as provided in Sections 8.2.2 and 8.6.4.1, any Member of WECC may designate one representative as its committee member to any standing committee or other committee. The WECC Member will have one vote at any committee meeting through that committee member. Any number of other persons may attend a committee meeting, but such persons will have no right to vote without a prior designation of representation by a WECC Member..

8.6.4.1 Dual Representation for Functionally-Separated Members. A Member which has distinct and functionally-separated interests as both a transmission provider and a transmission customer may designate two representatives as committee members to any standing committee, one to represent each functionally separate interest. Each such committee member will have one vote. The privilege granted by this Section is subject to revocation by the Board on a case-by-case basis or generally whenever the Board finds, upon petition from any Member or its own motion, that such dual representation creates unfairness or imbalance within a committee.

8.6.5 Committee Voting and Classes.

8.6.5.1 Classes. For purposes of voting, committees, excluding the WECC Standards Committee and the Member Advisory Committee, will have three classes of membership:

8.6.5.1.1 Transmission Provider Members;

8.6.5.1.2 Transmission Customer Members; and

8.6.5.1.3 States and Provincial Members (Member Class 5).

8.6.5.2 Voting. Except as provided in Section 4.5.2, each committee member will have one vote. In order for a recommendation to be made to the Board, such recommendation must receive a simple majority vote of both: 1) committee members present and voting from the Transmission Provider Class; and 2) committee members present and voting from Transmission Customer Class. The Board will adopt voting and record-keeping procedures to ensure that committee voting is conducted consistent with these Bylaws. This requirement will also apply where decision making power has been delegated to a committee pursuant to Section 6.9.1.

8.6.5.2.1 State and Provincial Votes. The position of the state and provincial Class committee members must be recorded, but the failure of a proposed recommendation or decision to obtain a simple majority vote of the state and provincial committee members will not prevent the recommendation or decision from being posted for due process comment or sent to the Board of Directors.

8.6.6 Notice and Review of Committee Recommendations and Decisions (Due Process). Committee recommendations or decisions delegated to a committee pursuant to Section 6.9.1 will be subject to the due process provisions of this Section. Following a committee's development of a proposed recommendation or decision, the committee will post the proposed recommendation or decision on the WECC website for review and comment by other WECC Members, and other interested parties. The committee will provide all Members e-mail notification of the posting and will allow at least thirty (30) days for comment on the proposal. The committee will consider all such additional input before reaching its final recommendation or decision. If the committee's recommendation or decision changes significantly as a result of comment received, the committee will post the revised recommendation or decision on the website, provide e-mail notification to Members and provide no less than ten (10) days for additional comment before reaching its final recommendation or decision. Upon reaching its final recommendation or decision, the committee will forward it to the Board. Whenever it determines that a matter requires an urgent decision, the Board may shorten any time period set forth in this Section, provided that: 1) notice and opportunity for comment on recommendations or decisions will be reasonable under the circumstances; and 2) notices to Members will always contain clear notification of the procedures and deadlines for comment.

8.7 Procedures for Developing and Voting on Reliability Standards.

8.7.1 Rights and Obligations of WECC Members and Participating Stakeholders. All WECC Members and Participating stakeholders are entitled to participate in the development of and to vote on Reliability Standards, Regional Criteria or revisions, subject to any applicable obligations, limitations and conditions set forth in these Bylaws, and in accordance with the WECC Reliability Standards Development Procedures.

8.7.1.1 Participation. The right to participate in Reliability Standards and Regional Criteria development and voting includes the right to request the development or revision of a Reliability Standard, the right to receive notice of, attend and participate in related WECC discussions, the right to review information relevant to a Reliability Standard or revision, the right to provide written comments on a proposed Reliability Standard, Regional Criteria, or revision, the right to participate in voting on a Reliability Standard, Regional Criteria, or revision and the right to file an appeal requesting review of any decision on a Reliability Standard, Regional Criteria, or revision.

8.7.2 Voting. The procedures and conditions for voting by WECC Members and Participating Stakeholders are set forth in the Reliability Standards Development Procedures.

8.7.3 Board Authority to Address Regulatory Directives. The Board shall have backstop authority to address regulatory directives as described in the Reliability Standards Development Procedures.

8.7.4 Participating Stakeholder Application Process. Any person or entity that is an interested stakeholder may apply to WECC for Participating Stakeholder status and, upon WECC's acceptance of such application, acquire the participation and voting rights set forth above in Section 8.7.1. WECC staff, under the direction of the CEO, will process applications and make the initial determination of eligibility for Participating Stakeholder status. Denial of Participating Stakeholder status may be appealed to the WECC Governance Committee and, if denied by the Governance Committee, to the WECC Board. A person or entity's Participating Stakeholder status will be maintained so long as the Participating Stakeholder continues to meet the requirements set forth in Section 3.24 and participates in at least one WECC meeting per year at which a Reliability Standard or revision is discussed. In the event a person or entity's Participating Stakeholder status lapses due to failure to meet the above minimum participation requirement, the person or entity may restore Participating Stakeholder status by re-applying for Participating Stakeholder status and attending a WECC meeting at which a Reliability Standard is discussed.

8.7.5 WECC Standards Voting Sectors. WECC staff shall confirm eligibility for the WECC Standards Voting Sectors set forth in the Reliability Standards Development Procedures. Decisions of the staff to approve, deny, or restrict the admission of an entity to a voting sector may be appealed to the Governance Committee. Decisions of the Governance Committee to affirm or reverse such decisions of staff may be appealed to the Board.

8.7.6 WECC staff shall require Ballot Body members to identify their affiliations with other Ballot Body members. Affiliates within a single Standards Voting Sector may only have one vote in that Standards Voting Sector. Affiliates within a single Standards Voting Sector must designate a single Affiliate as the group's Ballot Pool member to vote in that Standards Voting Sector.

8.8 Notice of Committee Meetings.

8.8.1 Standing Committees. The committee Chair, with the assistance of the Chief Executive Officer, will ensure that not less than ten (10) days' notice of all standing committee meetings is posted on the WECC website and is also provided to: 1) members of the committee; 2) Participating Stakeholders (if the meeting concerns development or approval of a Reliability Standard or revision); and 3) any WECC Member or member of the public requesting notice. A committee may take up any matter at a duly noticed meeting including matters not expressly identified in the notice; provided, however, that a final recommendation to the Board must be made in accordance with Section 8.6.1.

8.8.2 Other Committees. Notice of other committee meetings will be provided in the manner adopted for such notice by the affected Members and in accordance with the requirements of Section 8.8.1.

8.9 Open Meetings.

All committee meetings of WECC will be open to any WECC Member, Director and for observation by any member of the public, except as set forth in these bylaws or in policies on closed sessions that the Board may adopt for the purpose of preventing public disclosure of information that the Board might more appropriately discussed in closed session.

9. The Chief Executive Officer, Officers, and Employees.

9.1 Designation of Officers and Terms of Office.

WECC will have a Chief Executive Officer, a Secretary, and any other officers specified by the Board from time to time. The Chief Executive Officer will also hold the title of President of WECC if applicable law requires WECC to have a President. Each officer will be appointed by the Board and will serve for the term of office specified in the Board action appointing the officer and until his or her successor is appointed. Any two or more offices may be held by the same person except the offices of Chief Executive Officer and Secretary.

9.2 Chief Executive Officer Qualifications.

The Chief Executive Officer will be a person with senior management level experience and knowledge of bulk power electric transmission systems reliability, planning and operations.

9.3 Standards Applicable to All Employees.

A person may not be an officer or employee of WECC if: 1) the person is also the employee of or has a contractual relationship with any Entity, or any Affiliate of any Entity, that is eligible for membership in WECC; or 2) the person has a financial interest that, in the judgment of the Board or the Chief Executive Officer, creates the fact or appearance of bias, undue influence or lack of objectivity regarding any action or decision of WECC. The Board will adopt Standards of Conduct for officers and employees setting forth their duty of care, duty of loyalty, duty to avoid conflicts of interest and related matters intended to promote their neutrality, objectivity and professionalism. Upon adoption, such standards shall be attached hereto as Appendix B.

9.3.1 Exemptions from the disqualification criteria found in Section 9.3 are as follows:

9.3.1.1 Status as a residential electricity customer will not disqualify a person from employment with WECC.

9.3.1.2 A candidate for Chief Executive Officer or employee of WECC will not be disqualified for owning shares in a mutual fund because the mutual fund owns an interest in a Member or an Affiliate of a Member.

9.3.1.3 The disqualification standards described in Section 9.3 will not apply to disqualify a candidate who is receiving payments from a pension plan of a Member or an Affiliate of a Member in a form other than securities of such Member or Affiliate if the pension plan payments bear no relationship to the economic performance of the Member or Affiliate.

9.3.2 If an officer or employee receives a gift or inheritance of securities in any Member or Affiliate, he/she must resign or dispose of such securities within six (6) months of the date of receipt. Within six (6) months of the time a new Member is added in which an officer or employee owns securities, the officer or employee will resign or dispose of those securities.

9.4 Employment.

The Chief Executive Officer will be employed by the Board of Directors and will serve at the Board's pleasure. Any contract of employment with a Chief Executive Officer will permit the Board to dismiss the officer with or without cause.

9.5 Chief Executive Officer's Duties.

Subject to the Board's direction, the Chief Executive Officer or his/her designees will have the following duties, among others:

9.5.1 Execute policies at the direction of the Board and be responsible to the Board for the performance of the WECC functions described in Section 2;

9.5.2 Hire and fire staff within the constraints of the annual budget;

9.5.3 Perform administrative duties, such as preparing annual budgets for the approval of the Board, making employment decisions and ensuring conformance with regulatory requirements;

9.5.4 Develop and implement employment policies and standards of conduct; and

9.5.5 Accept or reject membership applications in accordance with the criteria of these Bylaws.

9.6 Secretary's Duties.

9.6.1 Maintain Member and Affiliates Lists. The Secretary will maintain continuously updated lists of all Members and Affiliates.

9.6.2 Maintain Official Records. The Secretary will keep minutes of all WECC Board and Member meetings and will receive and maintain minutes of committee meetings and all other official records of WECC. Within five (5) business days after any vote taken by Members, the Board, a Class or any committee, the Secretary will provide notice to all Members and Participating Stakeholders (if applicable) of the results of such a vote through postings on the website, email and/or other means of communication.

9.6.3 Maintain Website. The Secretary will oversee the creation, maintenance, and updating of the WECC's website and the information published through it.

10. Dispute Resolution.

Except as may be otherwise provided herein, and subject to the conditions set forth in Appendix C, Section A.1, disputes between Members and/or WECC will be resolved pursuant to the WECC Dispute Resolution Procedures set forth in Appendix C. Matters subject to the jurisdiction of the WECC Compliance Hearing Body are not subject to the procedures in Appendix C.

11. Costs and Finances.

11.1 Funding of Reliability Activities.

11.1.1 U.S. Statutory Funding. WECC shall fund all activities undertaken pursuant to Section 215 of the Federal Power Act in accordance with the funding provisions and procedures of that law and related FERC regulations and orders. The Board shall approve a budget for such activities in time for submission to the ERO and

to the FERC for approval of such funding in accordance with applicable requirements.

11.1.2 International Funding. WECC shall fund reliability activities undertaken in accordance with any agreements it enters into with Canadian or Mexican Entities. Specifically:

(a) Subject to (b), in the event that a Canadian or Mexican Entity seeks membership in the WECC, that Entity may elect to negotiate an agreement with WECC that provides the terms upon which that Entity will become a Member and, among other things, participate in and/or fund WECC. In such a case and unless agreed otherwise, the Canadian or Mexican Entity shall not be a Member of WECC and shall not have an obligation to fund activities undertaken by the WECC until the terms of such agreement are executed.

(b) Section 11.1.2(a) shall not apply to any Canadian or Mexican Entity that is a Member as of the date of the approval of these WECC Bylaws. Existing Canadian or Mexican Members shall continue as Members in accordance with the terms and conditions of their membership as of the date of the approval of the WECC Bylaws, including the terms and conditions of any agreements in place as of the date of the approval of these WECC Bylaws. Nothing in the Section precludes existing Canadian or Mexican Members from negotiating an agreement with WECC that modifies the terms of its participation in and funding of WECC at any time.

11.1.3 Equitable Allocation of Funding. In adopting budgets for the costs of reliability activities, the Board shall endeavor to achieve an equitable allocation as between funding through Sections 11.1.1 and 11.1.2 based upon the net energy to load and other relevant factors consistent with applicable law, the Delegation Agreement and any International Reliability Agreements.

11.2 Dues.

The Board may require Members and Participating Stakeholders to pay nominal annual dues consistent with applicable FERC requirements (or those of International Reliability Agreements as applicable) to cover reasonable costs of membership and/or participation in standards development that are not funded through Sections 11.1.1 or 11.1.2. Initial dues of a Member or Participating Stakeholder will be submitted with a completed application for membership or Participating Stakeholder status and will be for the prorated share of the full annual amount based on the Member's or Participating Stakeholder's actual months of membership or participation in the calendar year. In determining nominal dues, the Board may consider all relevant factors including, but not limited to, the ability of different classes of membership or Participating Stakeholders to pay such dues. The Board may also reduce, defer or eliminate the dues obligation of an individual Member or Participating Stakeholder for good cause shown.

11.3 Funding of Non-Statutory Activities.

To the extent that WECC elects to fund any activities not eligible for funding pursuant to Sections 11.1.1 and 11.1.2, it shall do so through the use of service fees, charges or dues applicable to the persons or entities that voluntarily participate in such activities. Participation in or funding of such activities shall not be a condition of membership in WECC.

12. Amendments to these Bylaws.

These Bylaws may be amended by either the Board or by the Members in accordance with the following procedures.

12.1 Amendment by the Board.

Except for those provisions described below, the Board may approve an amendment of the Bylaws after providing not less than thirty (30) days' notice of the proposed amendment to all Members. Approval of such an amendment requires the affirmative votes of not less than two-thirds (2/3) of the Directors in office. Such amendment will become effective sixty (60) days after its approval by the Board (1) unless the vote is appealed to the Members prior to the sixtieth day, or (2) subsequent regulatory approval is required. A Member appeal shall be sufficient to hold implementation of an amendment if a majority of any Class files a petition with the Secretary seeking appeal of such amendment. If such an appeal is received, the membership will vote on whether to rescind the Board approved amendment at the next Annual Meeting unless the Board calls a special meeting of the Members beforehand. An appeal will only be successful if a majority of all Members and a majority (three of five) of Member Classes vote to rescind the amendment. If the appeal vote is not successful, then the amendment will be deemed approved as of the day of the failed Membership vote. If subsequent regulatory approval is required for the amendment, then the amendment shall be effective upon the effective date of such approval.

12.1.1 Notwithstanding the foregoing, both Board and Member approval is required to amend provisions of these Bylaws concerning Sections 1.1 and 1.2; Section 4.2; Sections 6.2 through 6.8, inclusive; Section 7.2; Section 10; Sections 12.1 through 12.4, inclusive; Appendix C, and any other sections as may be required by Utah law. In such case, the Board shall first vote on the proposed amendment. If approved by the Board by the majority specified in Section 12.1 necessary to attain Board approval, the amendment must then be noticed to Members at least sixty (60) days prior to the Annual Meeting or a Special Member Meeting at which the Member vote will occur. The amendment will then be approved if approved by two thirds (2/3) or more of the Members who vote upon such amendment.

12.2 Amendment by the Members.

Upon petition filed with the Secretary by any Member or Director, at any Annual Meeting the Members may amend any provision of these Bylaws; provided: 1) the proposed amendment has first been presented to the Board and not adopted (this provision will not apply to amendments which the Board is prohibited from adopting); 2) Members have received not less than sixty (60) days' notice of the proposed amendment,

the reasons there for and a statement of the Board's position regarding it; and 3) the amendment receives the affirmative votes of not less than two-thirds (2/3) of all Members and a majority of Member Classes.

12.3 Amendments in Response to Mandatory Membership.
If at any time, pursuant to legislation or otherwise, membership becomes mandatory for some or all Members, upon the request of the affected Member(s) the Board will consider amendments to these Bylaws appropriate to such mandatory membership.

12.4 Amendments proposed by FERC.
FERC, upon its own motion or upon complaint, may propose an amendment to these Bylaws pursuant to 18 C.F.R. § 39.10(b).

13. Termination of Organization.

WECC may be terminated upon a vote of a majority of the Members in accordance with the provisions of Utah law, the Federal Power Act and the requirements of the Delegation Agreement and applicable International Reliability Agreements. Immediately upon such a vote, the Board will, after paying all debts of WECC, distribute any remaining assets in accordance with the requirements of Utah law, the Internal Revenue Code and these Bylaws.

14. Miscellaneous Provisions.

14.1 Limitation on Liability.
It is the express intent, understanding and agreement of the Members that the remedies for nonperformance expressly included in Section 4.8 hereof shall be the sole and exclusive remedies available hereunder for any nonperformance of obligations under these Bylaws. Subject to any applicable state or federal law which may specifically limit a Member's ability to limit its liability, no Member, its directors, members of its governing bodies, officers or employees shall be liable to any other Member or Members or to third parties for any loss or damage to property, loss of earnings or revenues, personal injury, or any other direct, indirect, or consequential damages or injury which may occur or result from the performance or nonperformance of these Bylaws, including any negligence, gross negligence, or willful misconduct arising hereunder. This Section 14.1 of these Bylaws applies to such liability as might arise between Members under these Bylaws. This Section 14.1 does not apply to parties to the Agreement Limiting Liability Among Western Interconnected Systems ("WIS Agreement") with respect to matters covered by the WIS Agreement and does not apply to any liability provision in any other agreement.

14.2 Indemnification.
WECC shall indemnify and hold harmless its Directors, officers, employees, agents and advisors against any and all damages, losses, fines, costs and expenses (including attorneys' fees and disbursements), resulting from or relating to, in any way, any claim, action, proceeding or investigation, instituted or threatened, arising out of or in any way relating to any action taken or omitted to have been taken (or alleged to have been taken or omitted to have been taken) by such person in connection with actions on behalf of WECC, and against any and all damages, losses, fines, costs and expenses (including attorneys' fees and disbursements) incurred in connection with any settlement of any

such claim, action, proceeding or investigation unless such action of such person is determined to constitute fraud, gross negligence, bad faith or willful misconduct with respect to the matter or matters as to which indemnity is sought.

14.3 No Third Party Beneficiaries.

Nothing in these Bylaws shall be construed to create any duty to, any standard of care with reference to or any liability to any third party.

14.4 Informal Inquiries for Information.

Nothing in these Bylaws shall preclude: 1) a Member from making an informal inquiry for information outside of the procedures outlined in Section 4.6.11 hereof to another Member and 2) that other Member from responding voluntarily to that informal inquiry, provided, however, that any such response to an informal inquiry for information shall not be binding upon that other Member and shall be used by the Member making the informal inquiry for informational purposes only.

15. Incorporation.

WECC shall organize itself as a non-profit corporation pursuant to the laws of the state of Utah regarding non-profit corporations under the name "Western Electricity Coordinating Council." All Members agree to take no actions that would contravene the ability of WECC to maintain its status as a non-profit corporation existing pursuant to the Utah Act. The Board shall adopt these Bylaws as the Bylaws of WECC as a non-profit corporation.

WECC is intended to qualify as an organization described in Section 501(c)(4) of the Internal Revenue Code. No part of any net earnings of WECC shall inure to the benefit of any Member or individual. Upon liquidation, to the extent consistent with the Internal Revenue Code and Utah law, any monies remaining from assessments paid by Members for the costs of WECC shall be rebated to Members in proportion to their payments. Any remaining assets of WECC shall be transferred to another organization exempt from tax under Section 501(a) of the Internal Revenue Code, or government agency, promoting the same purposes as WECC, as designated by the Board.

16. Governing Law.

Unless otherwise agreed, if any conflict of law arises under these Bylaws among the Members, the laws of the United States of America shall govern, as applicable. The venue for any legal action initiated under these Bylaws shall be the city and state (or province) in which the headquarters of WECC is located.

17. WECC Transition

The provisions of this Section shall apply to that period of time and activities associated with the transition of WECC from a hybrid Board of Directors to an independent Board of Directors with a Member Advisory Committee.

17.1 Board of Directors transition.

17.1.1 The transition of WECC governance from a hybrid Board to an independent Board of Directors will be effective upon the effective date of Federal Energy Regulatory Commission approval of Section 6.1 establishing an independent Board ("Effective Date"). The non-affiliated directors of WECC, whose terms extend past the Effective Date, so willing to continue to serve, shall form part of the initial cadre of independent Directors. These continuing Directors shall be entitled to serve the remainder of their respective three-year terms of office.

17.2 Transition Exceptions

The nomination, election and term of additional independent Directors shall be in conformance with the requirements of these bylaws, as amended, except:

17.2.1 The requirement that the Nominating Committee notify the Board Chair of the committee's nominations sixty (60) days prior to an Annual Meeting shall not apply.

17.2.2 Appointments of Member Advisory Committee members to the Nominating Committee shall be made such that no one class can occupy more than one seat at a time and cannot have a representative on the committee more than two years in a row.

17.2.3 Director positions of non-affiliated directors of WECC, whose terms extend beyond the Effective Date, but whose directors resign or indicate they will resign prior to the Effective Date, will be filled through the same nomination and election process used to select additional independent directors as provided above.

17.2.4 Those Directors first elected as a result of this transition from a hybrid to an independent Board will draw lots to determine their term length determined to achieve the staggered terms required by Section 6.3.

17.2.5 The nomination and election of a number of additional Directors needed to seat the entire Independent Board as described in section 6.4 as of the Effective Date may occur prior to the Effective Date. While the nomination and election of an individual to a director position may occur prior to the Effective Date, such nomination and election shall have the full force and effect of these bylaws after the Effective Date.

17.3 Member Advisory Committee transition

17.3.1 Initial Formation. When there is a meeting where Members vote to amend the WECC bylaws to provide for a Member Advisory Committee (MAC), the MAC will initially be constituted through elections conducted in conjunction with the same meeting.

17.3.2 Election of the initial MAC member representatives shall be as provided in these bylaws, as amended, except:

17.3.3 Where what had been the Class Seven membership category is combined with the Class Three membership category, Class Seven Members will indicate, prior to the meeting, whether they intend to continue participation in WECC as a member of the newly combined Class Three category. Entities so indicating will be considered members of Class Three for purposes of the initial formation of the MAC and shall be entitled to participate in elections for Class Three member representatives of the MAC.

17.3.4 Member Classes will not be allowed to subdivide into subclasses for purposes of electing class representative MAC members at the meeting where the MAC is initially formed and where initial MAC member elections are conducted.

17.3.5 The terms of each Class' three (3) initial Class representative members on the MAC shall be allocated, by the drawing of lots, such that the intended staggered terms for MAC members will be obtained, with one of a Class' initial MAC member representatives serving an initial term of one year, another two years, and another three years.

Appendix A
Standards of Conduct for
Members of the WECC Board of Directors

By accepting appointment to the Board of Directors (the "Board") of the Western Electricity Coordinating Council ("WECC"), a Director agrees to abide by the duties required of corporate directors and trustees. Utah law (and similar law in other states) imposes quasi-fiduciary duties of care and loyalty on all corporate directors or trustees, including directors and trustees of nonprofit corporations. For as long as he or she remains a member of the Board of Directors of WECC, a Director will abide by the following standards of conduct.

I. Duty of care. The Directors of a corporation are bound to use due care and to be diligent in respect to the management and administration of the affairs of the corporation. This duty of care is generally thought to have two components: the time and attention devoted to corporate affairs and the skill and judgment reflected in business decisions.

A. Each Director will regularly attend Board of Directors meetings, digest the materials sent to him or her, participate in Board discussions and make independent inquiries as needed.

B. In voting on any matter before the Board or otherwise acting in his or her capacity as a Director, each Director will:

1. make reasonable inquiry to inform himself or herself of the nature and consequences of the matter or action at issue;

2. exercise, at a minimum, the degree of care, skill, and diligence that an ordinarily prudent business person would exercise under similar circumstances; and

3. act in a manner the Director, in the exercise of his or her independent judgment, believes to be in the best interests of WECC and the membership of WECC, taken as a whole.

C. In exercising the duty of care described in paragraphs IA and B above, a Director has the right to rely on statements by the persons immediately in charge of business areas of WECC, to rely on professionals and experts (such as engineers, accountants and lawyers) and to rely on committees of WECC, unless facts or circumstances appear which would prompt further concerns of the ordinarily prudent person.

II. Duty of loyalty. The duty of loyalty imposes on a Director the obligation to remain loyal to WECC, acting at all times in the best interests of WECC and its Members as a whole and unhampered by any personal pecuniary gain. This duty does not preclude a Director from being employed in a competing or related business so long as the Director acts in good faith and does not interfere with the business of WECC.

A. Each Director will carry out his or her duties as a Director in good faith.

B. Each Director will refrain from using any influence, access, or information gained through his or her service as a Director to confer any improper personal benefit (financial or otherwise) upon himself or herself, any family member, or any person living in the Director's household.

C. Each Director will refrain from using any influence, access, or information gained through his or her service as a Director to confer an improper benefit (financial or otherwise) on any organization:

1. for which the Director serves as an officer, director, employee, consultant, or in any other compensated or management position; or

2. in which the Director or any family member or person living in the Director's household has a material financial interest (whether as a shareholder, partner, or otherwise).

D. To the extent permitted by law, each Director will maintain the confidentiality of:

1. any confidential or proprietary information of WECC disclosed or available to the Director;

2. any confidential or proprietary information of WECC Member(s) to which the Director has access by virtue of his or her status as Director; and

3. any confidential or proprietary information of third parties that has been provided to WECC or the Board on condition of confidentiality.

E. Conflicts of Interest. Because conflicts of interest may arise from time to time, specific guidelines are provided. In general, conflicts of interest involving a Director are not inherently illegal nor are they to be regarded as a reflection on the integrity of the Board or of the Director. It is the manner in which the Director and the Board deal with a disclosed conflict that determines the propriety of the transaction.

Directors of nonprofit corporations may have interests in conflict with those of the corporation. The duty of loyalty requires that a Director be conscious of the potential for such conflicts and act with candor and care in dealing with these situations.

The following are guidelines for Directors with actual or potential conflicts of interest:

1. Each Director has a responsibility to recognize potential conflicts of interest and to be guided when acting as a Director by his or her independent judgment of what is in the best interests of WECC and the membership of WECC, taken as a whole. If any Director has questions about whether a conflict of interest exists, he or she may make inquiry to the Chief Executive Officer of WECC for advice.

2. Potential conflicts of interest may arise because of a Director's private, individual interests (personal conflicts of interest) or because of relationships the Director may have with other organizations or interest groups (organizational conflicts of interest). Current or past employment or other compensation-based relationships with one or more WECC Members are examples of potential organizational conflicts of interest. Whether a potential conflict of interest is personal or organizational, in all cases involving WECC affairs a Director's conflicting interests are subordinate to those of WECC and the membership of WECC, taken as a whole.

3. Personal conflicts of interest.

   a. Personal conflicts of interest exist if a Director, a member of the Director's family, or a person sharing the Director's household: 1) has a material financial interest in a matter or transaction that comes before the Board for action; or 2) stands to receive a benefit (in money, property, or services) from a transaction involving WECC to which the person is not legally entitled.

   b. In cases of personal conflicts of interest, the affected Director's obligations are to:

      (1) disclose to the Board, before the Board acts with respect to that matter, the material facts concerning the Director's personal conflict of interest; and

      (2) refrain from voting, and from attempting to influence the vote of any other Director(s), in those matters in which the Director has a personal conflict of interest.

4. Organizational conflicts of interest.

   a. An organization has a "direct" conflict of interest if a decision by the Board would confer material benefits on that organization that other WECC Members would not share, or impose material detriments or costs on that organization that other WECC Members would not share. The fact that many if not all Members are affected to some extent by Board decisions on core issues such as standards, new transmission lines and their ratings, does not create or constitute a "direct" conflict of interest.

   b. It is not a "direct" conflict of interest for a Director to be associated with an organization or an interest group that may stand to benefit from decisions made or actions taken by the Board, so long as the Director does not attempt to use his or her position as a Director to confer special

benefits on associated organizations or interest groups when other WECC Members would not share in those benefits.

c. In cases of potential "direct" organizational conflicts of interest, the affected Director's obligations are to:

(1) disclose to the Board, before the Board acts with respect to the matter, the material facts concerning the organizational conflict of interest; and

(2) refrain from voting and from attempting to influence the vote of any other Director(s) with respect to the proposed action or decision.

Appendix B
Officers and Employee
Standards of Conduct

By accepting employment with the Western Electricity Coordinating Council ("WECC"), an Employee agrees to abide by these Standards of Conduct. For the purpose of these Standards, an Employee includes each and all officers, employees and substantially full-time consultants and contractors of WECC.

I. Duty of care. The Employees of WECC are bound to use due care and to be diligent in respect to the management and administration of the affairs of the corporation. This duty of care is generally thought to have two components: the time and attention devoted to corporate affairs and the skill and judgment reflected in business decisions.

Employees shall not have any outside employment that limits in any way their ability to fulfill their employment responsibilities to WECC. If an Employee has any question about whether outside employment is consistent with this standard, they should consult with their supervisor.

II. Duty of loyalty. The duty of loyalty imposes on an Employee the obligation to remain loyal to the WECC, acting at all times in the best interests of WECC and its Members as a whole and unhampered by any personal pecuniary gain. WECC expects all Employees to avoid adversely affecting the public's confidence in the integrity and reputation of WECC. Any conduct or activities of any Employee should be capable of being justified and withstanding public scrutiny.

A. Each Employee will carry out his or her duties as an Employee in good faith, with integrity and in a manner consistent with these Standards and all applicable laws governing WECC.

B. Each Employee will refrain from using, or creating the appearance of using, any influence, access, or information gained through his or her service as an Employee to confer any improper personal benefit (financial or otherwise) upon himself or herself, or Family Member.[1] Employees shall not accept gifts or entertainment that would tend to affect, or give the appearance of affecting, the performance of their duties; provided, however, that Employees may accept de minimus food or entertainment or non-cash gifts received as part of a social or special occasion in amounts not to exceed $1000 per source per year.

C. Each Employee will refrain from using, or creating the appearance of using, any influence, access, funds or information gained through his or her service as an Employee to confer an improper benefit (financial or otherwise) on any organization. The obligation to avoid the appearance of impropriety shall apply in particular to any organization:

1 For purposes of these Standards, a Family Member includes a spouse, domestic partner, child of the Employee, or a relative living in the same home as the Employee.

1. for which the Employee is serving or has in the past served as an officer, director, employee, consultant, or in any other compensated or management position; or

2. in which the Employee, or Family Member has a material financial interest known to the Employee (whether as a shareholder, partner, or otherwise).

D. Employees shall not use their WECC position, WECC funds or WECC resources to support any political party, candidate or proposition except as expressly authorized by the Board.

E. To the extent permitted by law, each Employee shall maintain the confidentiality of:

1. any confidential or proprietary information of WECC disclosed or available to the Employee;

2. any confidential or proprietary information of WECC Member(s) to which the Employee has access by virtue of his or her status as Employee; and

3. any confidential or proprietary information of third parties that has been provided to WECC or the Board on condition of confidentiality.

F. Conflicts of Interest. The following conflicts of interest policy shall apply to all WECC Employees. Conflicts of interest may arise from time to time. In general, conflicts of interest involving an Employee are not inherently illegal, nor are they to be regarded as a reflection on the integrity of WECC or of the Employee. It is the manner in which the Employee and WECC deal with a disclosed conflict that determines the propriety of the transaction. The following are guidelines for Employees with actual or potential conflicts of interest:

1. In general, personal conflicts of interest exist if an Employee, or a Family Member, has a material financial interest in a matter or transaction that comes before WECC for action, or stands to receive a benefit (in money, property, or services) from a transaction involving WECC to which the person is not legally entitled. For purposes of determining whether stock constitutes a material financial interest, see Paragraph F(6) below.

2. Organizational conflicts of interest exist if an Employee, or a Family Member, has a relationship with an organization or interest group that would cause a reasonable person to believe such Employee's judgment, loyalty, or objectivity might be influenced in a way that is adverse to the interests of WECC.

3. Where there is any question about potential conflicts of interest, the Employee shall disclose to the Chief Executive Officer as soon as possible and prior to when WECC takes action with respect to that matter, the material facts concerning the Employee's personal conflict of interest, and refrain from participating in, or from

attempting to influence the action of any Directors or Employee(s) of WECC regarding those matters in which the Employee has a conflict of interest.

4. No Employee may be an employee, director of, or consultant to or provide services to or be associated in any way with any WECC Member without full disclosure to, and written consent of, the Chief Executive Officer. To the extent that an Employee becomes aware that a Family Member is or will in the future be engaged in activity described in this Paragraph F(4), the Employee shall promptly notify the Chief Executive Officer, who shall review all the material facts and determine whether they constitute a conflict of interest pursuant to Paragraphs F(1) and F(2), above.

5. No Employee shall participate in any electric energy transaction other than for ordinary personal use except to the extent necessary to, and consistent with, the functions of WECC. Participation in an energy transaction includes, but is not limited to, purchasing, selling, marketing, or brokering of electricity, ancillary services, electricity transmission or electricity distribution. To the extent that an Employee becomes aware that a Family Member is or will in the future be engaged in activity described in this Paragraph F(5), the Employee shall promptly notify the Chief Executive Officer who shall review all the material facts and determine whether they constitute a conflict of interest pursuant to Paragraphs F(1) and F(2), above.

6. All Employees shall promptly disclose to the CEO and the Chair of the Board any direct or indirect financial interest in excess of $5,000 (including the direct or indirect ownership of securities) held by the Employee or a Family Member living with the Employee[2] in any Electric Line of Business entity as defined in Section 3.15 of the Bylaws doing business in the Western Interconnection. Upon such disclosure, the CEO and the Chair of the Board shall determine whether such financial interest constitutes a conflict of interest, or the appearance thereof, in light of the duties of the Employee, the ability to divest such financial interest without undue hardship and the totality of the circumstances. In response to such disclosure, the CEO and the Chair may impose such remedies as are reasonable under the circumstances and consistent with section 9.3 of the Bylaws. Such remedies may include, but are not limited to, restrictions on the Employee's duties or involvement in certain matters, transfer of the Employee to another position, broader disclosure of the financial interest, voluntary or mandatory divestiture of the interest (in whole or in part) or other remedies. Pursuant to section 9.3.2 of the Bylaws, if an Employee (not a Family Member) receives a gift or inheritance of securities of a Member of WECC, or if a new Member joins WECC in which the

2 Nothing in this section shall require an Employee to investigate the financial interests of Family Members not living with the Employee. However, to the extent known to the Employee, the financial interests of a Family Member not living with the Employee may create a potential conflict of interest (or appearance thereof) subject to Sections II(B) and/or II(F)(1) of these standards, in which case disclosure pursuant to Section II(F)(3) is appropriate.

Employee (not a Family Member) holds securities, the Employee must resign or divest such securities within six months thereafter. For the purposes of this section, none of the following shall constitute a direct or indirect financial interest:

a. An interest that exists through diversified mutual funds;

b. An interest that exists for six months following receipt of a gift or inheritance of securities of a Market Participant or acceptance of employment with WECC, whichever is later (provided that employees of the WSCC shall have two years from WECC organizational meeting to divest securities in their possession as of that date);

c. An interest that exists through a pre-existing participation in a qualified defined benefits pension plan or health benefits plan of a Market Participant so long as the benefits under such plan do not vary with the economic performance or value of the securities of such Market Participant.

Appendix C

WECC Dispute Resolution Procedures

C. DISPUTE RESOLUTION.

C.1 Obligation To Comply with Dispute Resolution Procedures. If any dispute concerning one or more issues identified in Section C.2 below arises between a Member and one or more other Members, or between one or more Members and WECC, all of the parties to the dispute shall, to the extent permitted by law, be obligated to comply with the dispute resolution procedures specified in these Bylaws (except to the extent all of the parties to the dispute may agree otherwise as provided in Section C.4 below). Only Members and WECC have the right to invoke the provisions of this Appendix C and, except where all affected parties have separately agreed otherwise with respect to a particular dispute, only Members and WECC are obligated to carry out the dispute resolution procedures set forth herein. Any dispute subject to the provisions of this Appendix C to which WECC is made a party shall be subject to the additional requirements specified in Section C.3 below if the dispute is initiated by a party other than WECC. To the extent permitted by law (and except as otherwise permitted by the provisions of Section C.6.3), no party to a dispute subject to the provisions of this Appendix C may pursue any other available remedy with respect to the dispute until all of the parties to the dispute have fully complied with the dispute resolution procedures specified herein, *provided, however,* that if any party to a dispute subject to the provisions of this Appendix C refuses to comply with the dispute resolution procedures specified herein, all other parties to the dispute shall subsequently be relieved of any further obligation to comply with these dispute resolution procedures before pursuing other remedies in connection with that dispute.

C.2 Issues Subject to Dispute Resolution Procedures. Any dispute between or among the parties identified in Section C.1 above (that the parties to the dispute do not resolve through negotiations between or among themselves) shall be subject to the dispute resolution procedures set forth in this Appendix C if the dispute concerns: (i) the application, implementation, interpretation, or fulfillment of any guidelines, criteria, policies, procedures, or Bylaws of WECC or the North American Electric Reliability Council (or any successor organization); or (ii) any matter specified in Section C.6.2 below; except that any matter that is subject to the jurisdiction of the WECC Compliance Hearing Body is not subject to the requirements of this Appendix C. Notwithstanding the foregoing provisions of this Section C.2, however, neither WECC nor any Member shall be obligated to comply with the dispute resolution procedures of these Bylaws if: (a) the dispute is between two or more Members (or WECC), all of which, at the time of the dispute, are parties to the WECC Reliability Management System Agreement and the matter is within the scope of the dispute resolution procedures set forth in that agreement; or (b) the dispute is between two or more Members, all of which, at the time of the dispute, are parties to a separate agreement or treaty or where an applicable tariff, rate schedule, or other legal obligation of one of the parties provides for the parties to resolve the dispute in a manner other than in accordance with the provisions of this Appendix C of the Bylaws.

C.3 Limitations on Members' Rights To Make WECC a Party to a Dispute. In addition to the other provisions of this Appendix C of the Bylaws, any dispute (other than a dispute initiated by WECC) to which WECC is made a party shall be subject to the limitations set forth in Sections C.3.1 and C.3.2 below.

C.3.1 Bases for Using Dispute Resolution Procedures To Challenge WECC Action. Subject to any limitation set forth in these Bylaws or in applicable statute, regulation or FERC order, one or more Members may use the dispute resolution procedures specified in this Appendix C to challenge any final action of WECC only on one or more of the following bases: (i) the action is contrary to applicable law or regulation; (ii) the action is contrary to WECC's Articles of Incorporation or these Bylaws (including WECC's purposes as set forth in those documents); (iii) the action was taken in violation of applicable procedures of WECC governing that action; or (iv) the action encompasses a decision in which there was plain error material to the decision. For purposes of this Appendix C, action taken by WECC shall be deemed final if: (a) the action has been taken or adopted or approved or accepted by WECC's Board of Directors (other than by a motion specifically providing that the action is conditional or will have temporary application not to exceed six months); (b) all conditions specified to make any conditional action of WECC's Board of Directors effective have been fulfilled; or (c) the action has been taken or adopted or approved or accepted by a committee, subcommittee, task force, or other group or person acting under authority of WECC without any provision making the action subject to further approval or adoption or acceptance by the Board of Directors. Nothing contained in this Appendix C shall limit any rights any Member (or any other party) may have under applicable law or regulation to initiate or participate in an administrative or legal action to which WECC is made a party in accordance with applicable provisions of law or regulation.

C.3.2 Obligation to Bear WECC's Share of Facilitator Costs. If one or more Members initiate a dispute under this Appendix C to challenge an action of WECC, the Member(s) initiating the challenge shall be obligated to bear all of the costs of facilitators' services incurred to comply with the requirement of Section C.5 below, except to the extent WECC agrees to pay a share of the costs of facilitators' services.

C.4 Ability to Modify Dispute Resolution Procedures by Agreement. Any provision of the dispute resolution procedures set forth in this Appendix C may be modified, waived, or omitted by agreement of all of the parties to the dispute. Parties to a dispute subject to these provisions are obligated to comply with its procedures unless all of the parties to the dispute agree to do otherwise. The manner in which the dispute resolution procedures set forth in this Appendix C may be varied include (by way of example and not as limitation): the manner of selecting a facilitator or arbitrator; the procedures or time lines to be followed during mediation or arbitration; the grounds or forum or right to appeal an arbitrator's decision; the manner of allocating fees and costs associated with the dispute; whether the parties are obligated to proceed to arbitration if the dispute is not resolved through mediation; and whether a decision rendered through arbitration is binding on the parties. In addition, any dispute that does not fall within the scope specified in Section C.2 above may be resolved according to the procedures set forth in Appendix C of these Bylaws if all of the parties to the dispute agree to do so.

C.5 Mediation.

C.5.1 Notice to Other Parties and WECC's Chief Executive Officer. To initiate the dispute resolution process with respect to a dispute governed by the provisions of

this Appendix C, the Member or WECC that has elected to initiate the dispute shall deliver to all other parties to the dispute and to WECC's Chief Executive Officer (whether or not WECC is a party to the dispute) written notice invoking the dispute resolution procedures set forth in this Appendix C (a "Dispute Notice").

C.5.1.1 The Dispute Notice shall: (i) include a brief, general description of the matter(s) in dispute; (ii) include a complete list of all other Members the party submitting the Dispute Notice intends to make a party to the dispute; and (iii) state whether or not WECC is to be made a party to the dispute.

C.5.1.2 Within five business days of receiving a Dispute Notice, any party to the dispute may elect to deliver a brief supplemental description of the dispute to WECC's Chief Executive Officer.

C.5.1.3 Within 10 business days of receiving an initial Dispute Notice, WECC's Chief Executive Officer shall: (a) publish (or cause to be published) in WECC's newsletter or on its electronic bulletin board a notice containing a list of the parties to the dispute and a summary of the descriptions of the matter(s) in dispute provided by the parties to the dispute; and (b) deliver to each party to the dispute a copy of WECC's then-current standing list of qualified facilitators, knowledgeable in the matters addressed by WECC (as approved by the Board of Directors).

C.5.1.4 No person may be listed on WECC's standing list of qualified facilitators unless the person has agreed to: (i) disclose, at any time the

person is selected to serve as a facilitator under this Appendix C, any personal or financial interest the facilitator may have with respect to the matter(s) in dispute (including any indirect personal or financial interest that could arise because of interests or relationships affecting any of the facilitator's immediate family members); (ii) disclose any relationship the facilitator may have with any party to the dispute that is not permitted under Section C.5.2 below; and (iii) abide by all applicable provisions of these Bylaws, including restrictions on disclosure of matters discussed and information exchanged during mediation as provided in Section C.5.3 below.

C.5.2 Selection of a Facilitator. Within 10 calendar days after the delivery of a Dispute Notice, the parties to the dispute shall select a neutral facilitator by mutual agreement. If the parties to the dispute cannot agree on a facilitator within 10 calendar days after delivery of a Dispute Notice, the facilitator shall be selected from WECC's standing list of qualified facilitators as follows: The parties to the dispute shall take turns striking names from WECC's standing list of qualified facilitators until there is only one name remaining. (The parties to the dispute shall draw lots to determine the order in which they take turns striking names.) The last person whose name remains on the list shall serve as the facilitator. No facilitator other than a facilitator chosen by agreement of all the parties to the dispute may (i) have a personal or financial interest in the matter(s) in dispute (including any indirect personal or financial interest that could arise because of interests or relationships affecting any of the facilitator's immediate family

members); or (ii) be (or have an immediate family member who is) a past or present director, commissioner, officer, employee, consultant, agent, or other representative of any of the parties to the dispute. If the facilitator selected through the process of striking names specified above is disqualified under the preceding sentence, the facilitator whose name was stricken last shall serve in his or her place. In addition, if WECC is a party to a dispute initiated by one or more Members, turns striking names from the standing list of qualified facilitators shall alternate between WECC on the one hand and all other parties to the dispute on the other.

C.5.3 Mediation Process. The facilitator and representatives of all of the parties to the dispute shall meet within 14 calendar days after the facilitator has been selected and attempt in good faith to negotiate a resolution to the dispute. Each party's representative designated to participate in the mediation process must have the authority to settle the dispute (or, at a minimum, be authorized to negotiate on behalf of the party and make recommendations with respect to settlement of the dispute if final authority to approve a settlement is reserved to a party's board, executive committee, commission, or other governing body). At the parties' initial meeting with the facilitator, the facilitator shall, after soliciting input from the parties to the dispute, set the schedule for further meetings among the parties to the dispute (subject to the 60-day maximum mediation period specified in Section C.5.6 below). The parties to the dispute shall comply with the schedule set by the facilitator and attempt in good faith at every meeting to negotiate a resolution to the dispute. To the extent permitted by law, neither the facilitator nor any party to the dispute may publicly disclose, rely on, or introduce as evidence in any subsequent arbitration, FERC proceeding, Canadian Regulatory

Authority proceeding, proceeding before a Mexican Regulatory Authority, appeal, or litigation concerning the same or any related dispute: (i) any views expressed or suggestions made by another party to the dispute with respect to a possible settlement of the dispute; (ii) admissions made by another party to the dispute in the course of the mediation proceedings; (iii) proposals made or views expressed by the facilitator; or (iv) the fact that another party to the dispute has or has not indicated willingness to accept a proposal for settlement made by the facilitator. In those cases in which a party to a dispute subject to the provisions of this Appendix C of the Bylaws is a membership organization (including WECC, if applicable), nothing in the preceding sentence shall prohibit that organization from reasonably communicating with its members and governing body to share general information about the dispute, such as the parties, status, disputed issues, and positions of each of the parties with respect to the disputed issues.

C.5.4 Referral for Resolution. With the consent of all parties to the dispute, a resolution may include referring the matter to a technical body (such as a technical advisory panel of WECC) for resolution or an advisory opinion, to arbitration, directly to FERC or, in a dispute involving a Canadian Member, directly to the appropriate Canadian Regulatory Authority, or, in a dispute involving a Mexican Member, directly to the appropriate Mexican Regulatory Authority.

C.5.5 Mediation Participation by WECC Staff When WECC Not a Party. If, during the course of mediation to which WECC is not a party, the facilitator or any party to the dispute wishes to solicit the views of WECC concerning the application, implementation, interpretation, or fulfillment of any guidelines, criteria, standards, policies, or procedures of WECC, the facilitator may request or permit the submission of WECC staff views only if: (i) any participation by WECC staff

takes place exclusively in the presence of all parties to the dispute; (ii) participating WECC staff members agree to be equally available upon request to all parties to the dispute; and (iii) participating WECC staff members agree to comply with the restrictions on disclosure contained in Section C.5.3.

C.5.6 Mediation Deemed at Impasse After 60 Days. If the parties to the dispute have met and negotiated in good faith in accordance with the schedule set by the facilitator but have not succeeded in negotiating a resolution of the dispute within 60 calendar days after the first meeting with the facilitator pursuant to Section C.5.3 above, the parties to the dispute shall be deemed to be at impasse and, except as otherwise provided in Section C.5.6.2 below, shall also be deemed to have fulfilled their obligations under Section C.1 of these Bylaws to fully comply with the dispute resolution provisions before pursuing any other available remedy. If any party participating in the mediation process is subject to a contractual or statutory limitations period with respect to the matter in dispute, and the limitations period will expire before the 60-day period for mediation under this Section C.5.6 is completed, then the parties shall be deemed at impasse on the seventh calendar day preceding the expiration of the shortest applicable limitations period.

C.5.6.1 Disputes Not Subject to Provisions of Section C.6.2. Unless the matter in dispute is subject to the provisions of Section C.6.2 below, at any time after the parties to the dispute are deemed at impasse, the dispute may be submitted to binding arbitration in accordance with the procedures set forth in Section C.7 of these Bylaws (but only by agreement of all of the parties to the dispute). If the matter in dispute is subject to the provisions of Section C.6.2 below, the parties' obligations with respect to submitting the matter to binding arbitration under Sections C.6 and C.7 of these Bylaws shall be as specified in Section C.5.6.2 below. In

all other cases, if the parties to the dispute do not agree to submit the dispute to binding arbitration in accordance with the procedures set forth in Section C.7 of these Bylaws, any party to the dispute may at any time thereafter pursue any other remedy available under regulation, law, or equity (subject to the restrictions on disclosure set forth in Section C.5.3 above).

C.5.6.2 Disputes Covered by Section C.6.2. If the parties to a dispute concerning a matter subject to the provisions of Section C.6.2 either: (i) are deemed at impasse after attempting to resolve the matter through mediation as provided in Sections C.5.1 through C.5.6 above; or (ii) have agreed to submit the matter directly to binding arbitration without attempting to resolve the matter through mediation as provided in Sections C.5.1 through C.5.6 above, the parties to the dispute shall submit the matter to binding arbitration in accordance with the procedures set forth in Sections C.6 and C.7 of these Bylaws.

C.5.7 Costs of Facilitator's Services. Except as otherwise provided under Section C.3.2, the costs of the facilitator's services shall be born equally by all parties to the dispute unless the parties to the dispute agree otherwise, but the parties also intend that the costs of mediation should be taken into account in any resolution proposed through the mediation process.

C.5.8 Notice to WECC of Completion of Mediation. Within 10 calendar days after either: (i) reaching a negotiated resolution through the mediation process set forth in Section C.5; or (ii) reaching deemed impasse in accordance with Section C.5.6 above, the parties to the dispute shall jointly deliver to WECC's Chief Executive Officer a written notice briefly describing the outcome of the mediation process. Promptly after receiving written notice describing the outcome of a mediation conducted in accordance with Section C.5, WECC's Chief Executive Officer shall

publish (or cause to be published) in WECC's newsletter or on its electronic bulletin board a brief description of the outcome of the mediation, together with a list of all of the parties to the dispute.

C.6 General Provisions Relating to Binding Arbitration.

C.6.1 Matters for Which Binding Arbitration is Elective. Except with respect to any dispute that concerns one or more matters specified in Section C.6.2 below, the binding arbitration procedures set forth in Section C.7 may be invoked only by agreement of all of the parties to the dispute to be arbitrated and are solely for the convenience of WECC and its Members. If a dispute governed by this Appendix C does not concern a matter specified in Section C.6.2 below, a party to the dispute shall be deemed to have fulfilled its obligations to comply with Appendix C of these Bylaws (irrespective of whether the parties to the dispute agree to proceed with binding arbitration) to the extent that either: (i) that party has fully performed the obligations set forth in Sections C.1 through C.5.8; or (ii) all of the parties to the dispute have agreed to a different process for resolving the dispute and the agreed-upon process has been fully carried out.

C.6.2 Matters for Which Binding Arbitration Is Obligatory. If a dispute is governed by Appendix C of these Bylaws and is not resolved through the process of mediation in accordance with Sections C.5.1 through C.5.6 above, the parties shall be obligated to submit the matter to binding arbitration in accordance with the procedures set forth in Section C.7 (subject to the limitations on the arbitrator's authority set forth in Section C.6.3 below) if the dispute concerns one or more of the following matters:

C.6.2.1 a decision of WECC's Board of Directors or a Committee of the Board acting on the recommendation of, or on a matter within the jurisdiction of, the Operating Transfer Capability Policy Group ("OTCPG") or successor;

C.6.2.2 a transmission path rating, or a modification to a transmission path rating, assigned to one or more transmission paths operated by a Member (or jointly operated by more than one Member);

C.6.2.3 transmission access, pursuant to Sections 10.1.2, 10.1.3, and 10.5; or

C.6.2.4 any matter that, by vote of both WECC's Board of Directors and WECC's Membership, is designated as a matter to be subject to the provisions of Section C.6.2 of these Bylaws, provided that any matter submitted to WECC's Membership pursuant to this provision must be approved by at least the number of votes required to amend these Bylaws under Section 13.2.

C.6.3 Limitations on Arbitrator's Authority with Respect to Matters Specified in Section C.6.2. Unless all of the parties to a dispute agree otherwise, an arbitrator rendering a decision with respect to any matter specified in Section C.6.2 above shall have no authority to consider or award remedies for past economic harm or damages of any kind, including without limitation actual or direct damages; indirect, consequential, or incidental damages; or exemplary or punitive damages. Nothing in this Section C.6.3 shall: (i) limit any rights that a party to a dispute concerning a matter specified in Section C.6.2 above may have to pursue legal claims for damages or other economic remedies after the arbitrator has rendered

his or her decision on that matter (within the scope of his or her authority under this Section C.6.3); or (ii) limit an arbitrator's authority under Section C.8 below to shift costs or impose monetary sanctions for "good cause" (as that term is defined in Section C.8).

C.6.4 Arbitration Decisions Not To Modify Underlying Rights and Obligations. Unless all of the parties to a dispute agree otherwise, the resolution through binding arbitration of any dispute governed by this Appendix C shall not have the effect of increasing, decreasing, or otherwise modifying WECC's or any Member's obligation to abide by, or ability to enforce or impose penalties or sanctions with respect to, any guidelines, criteria, standards, policies, procedures, decisions, or Bylaws of WECC or any limitation on the foregoing, whether established by law; regulation; judicial, executive, or administrative order, decree, or decision; tariff; contract; course of performance; treaty; or otherwise.

C.6.5 Laws Relating to Binding Arbitration. WECC and its Members recognize that some Members may be subject to laws (including without limitation United States federal or state laws, Canadian or provincial laws, or Mexican laws) that limit or define those Members' ability to agree in advance to be subject to binding arbitration. If a Member has the right or obligation under applicable law to refuse to submit to binding arbitration in connection with any dispute that would otherwise be subject to binding arbitration under Section C.6.2 of these Bylaws, that Member shall not be obligated to comply with the binding arbitration procedures set forth in Sections C.6 and C.7. Any Member subject to any law or other legally binding authority that may limit (or permit the Member to limit) its

obligation to comply with the provisions requiring binding arbitration under Sections C.6 and C.7 or to fully comply with a valid arbitrator's decision rendered in accordance with this Appendix C shall provide notice to this effect to all other disputing parties and WECC's Chief Executive Officer upon initiation of any dispute involving that Member if the dispute is subject to Section C.6.2. Upon receiving a notice under Section C.6.5, any other party to the dispute shall thereafter be relieved of any obligation to comply with the provisions Sections C.6 and C.7 in connection with that dispute, except to the extent that the Member giving notice agrees to be fully bound by procedures governing and results of any arbitration proceeding. If there are more than two parties to a dispute covered by the preceding sentence, however, then all parties to the dispute other than the party giving notice under Section C.6.5 shall make good faith efforts to establish a mutually acceptable approach for resolving among themselves whatever aspects of the dispute can reasonably be resolved through the procedures set forth in this Appendix C without the participation of the party giving notice under Section C.6.5. If any Member fails to submit to binding arbitration, or fails to abide by a valid arbitrator's decision rendered in accordance with this Appendix C, that Member shall thereafter have no right to enforce any of the provisions of Section C.6.2 (concerning obligations to submit specified disputes to binding arbitration) against any other Member or WECC until such time as the WECC Board of Directors, or a delegate designated by the Board, determines that it is appropriate to restore the Member's ability to enforce the provisions of Section C.6.2.

C.6.6 Consistency with Laws, Regulatory Jurisdiction and Orders, Etc. Nothing contained in this Appendix C and no arbitrator's decision rendered in accordance with Section C.7 shall be construed to require or shall otherwise operate to cause any Member or WECC to incur any obligation or take any action that is contrary to: (i) any applicable law or regulation; (ii) any applicable authority, order, decree, rule, or decision of a regulatory, judicial, administrative, executive, or other governmental body having jurisdiction over one or more of the matters or parties subject to this Appendix C or covered by an arbitrator's decision; or (iii) any applicable rate schedule, tariff, treaty, or valid, pre-existing contractual obligation with which any party subject to this Appendix C or covered by an arbitrator's decision is legally obligated to comply.

C.7 Arbitration Procedures.

C.7.1 Notice to WECC of Initiation of Binding Arbitration. Within 10 calendar days after all of the parties to a dispute have agreed (or become obligated under Section C.6.2 above) to submit the dispute to binding arbitration under Sections C.6 and C.7, the parties to the dispute shall deliver written notice to WECC's Chief Executive Officer (an "Arbitration Notice").

C.7.1.1 The Arbitration Notice shall: (i) include a brief, general description of the issues to be arbitrated; and (ii) identify all parties who have agreed (or become obligated) to submit the dispute to binding arbitration under Sections C.6 and C.7.

C.7.1.2 Within five business days of receiving an Arbitration Notice, WECC's Chief Executive Officer shall: (a) publish (or cause to be published) in

WECC's newsletter or on its electronic bulletin board a notice containing a list of the parties to the arbitration and the parties' brief, general description of the issues to be arbitrated; and (b) deliver to each party to the dispute a copy of WECC's then-current standing list of qualified arbitrators, knowledgeable in matters addressed by WECC (as approved by the Board of Directors).

C.7.1.3 No person may be listed on WECC's standing list of qualified arbitrators unless the person has agreed to: (a) disclose, at any time the person is selected to serve as a arbitrator under this Appendix C, any personal or financial interest the arbitrator may have with respect to the matter(s) in dispute (including any indirect personal or financial interest that could arise because of interests or relationships affecting any of the arbitrator's immediate family members); (b) disclose any relationship the arbitrator may have with any party to the dispute that is not permitted under Section C.7.2 below; (c) assemble a complete record of the arbitration process and the materials received as evidence by the arbitrator if any of the parties to the dispute elect to appeal or contest the arbitrator's decision; and (d) abide by all applicable provisions of and procedures specified by Sections C.6 and C.7.

C.7.2 Selection of an Arbitrator. Within 10 calendar days after all of the parties to a dispute have agreed (or become obligated) to submit the dispute to binding arbitration under Sections C.6 and C.7, the parties to the dispute shall select an arbitrator by mutual agreement. If the parties cannot agree on an arbitrator within

10 calendar days after agreeing to arbitrate their dispute, the arbitrator shall be selected from WECC's standing list of qualified arbitrators as follows: The parties to the dispute shall take turns striking names from WECC's standing list of qualified arbitrators until there is only one name remaining. (The parties to the dispute shall draw lots to determine the order in which they take turns striking names.) The last person whose name remains on the list shall serve as the arbitrator. No arbitrator other than an arbitrator chosen by agreement of all the parties to the dispute may (i) have a personal or financial interest in the matter(s) in dispute (including any indirect personal or financial interest that could arise because of interests or relationships affecting any of the arbitrator's immediate family members); or (ii) be (or have an immediate family member who is) a past or present director, commissioner, officer, employee, consultant, agent, or other representative of any of the parties to the dispute. If the arbitrator selected through the process of striking names specified above is disqualified under the preceding sentence, the arbitrator whose name was stricken last shall serve in his or her place.

C.7.3 Initial Statements and Proposed Arbitration Decisions. Within 10 calendar days after the selection of an arbitrator under Section C.7.2 above, each party to the dispute shall submit a statement in writing to all other parties to the dispute and to the arbitrator. Each disputing party's statement shall set forth in reasonable detail the nature of the dispute, the issues to be arbitrated, and the party's reasonable, good faith proposal for resolving the dispute. As provided in Section C.5.3 above, to the extent permitted by law, no party to an arbitration conducted under

Sections C.6 and C.7 shall publicly disclose, rely on, or introduce as evidence in any arbitration, FERC proceeding, Canadian Regulatory Authority proceeding, proceeding before a Mexican Regulatory Authority, appeal, or litigation concerning the same or any related dispute any information required to be kept confidential by the terms of Section C.5.3.

C.7.4 Procedural Matters. The arbitrator shall determine discovery procedures, how evidence shall be taken, what written submittals may be made, and other such procedural matters, taking into account the complexity of the issues involved, the extent to which factual matters are disputed and the extent to which the credibility of witnesses is relevant to a resolution. Each party to the dispute shall produce all evidence determined by the arbitrator to be relevant and material to the issues presented. If such evidence involves proprietary or confidential information, the party submitting the evidence shall petition the arbitrator for a protective order, and to the extent the arbitrator determines there is good cause the arbitrator shall issue an appropriate protective order and all parties to the dispute shall comply with the protective order. The arbitrator may elect to resolve the arbitration matter solely on the basis of written evidence and arguments.

C.7.5 Out-of-Court Sworn Testimony. At the request of any disputing party, the arbitrator shall have the discretion to allow that party to examine witnesses through sworn out-of-court testimony (referred to in the United States as "deposition" and in Canada as "discovery") to the extent the arbitrator deems the evidence sought to be relevant and appropriate. In general, out-of-court witness examinations shall be limited to a maximum of three per party and shall be held

within 30 calendar days after the making of a request. Each witness examination shall be limited to a maximum of three hours' duration. The arbitrator shall have the discretion to permit the number and duration of examination sessions allowed under this Section C.7.5 to be increased, and to extend the 30-day time limit, upon request for good cause shown. All objections are reserved for the arbitration hearing except for objections based on privilege and proprietary or confidential information.

C.7.6 Intervention by Other Parties. Unless all of the parties to the dispute agree otherwise, no one (whether a Member, WECC, or any other entity or person) that is not a party to a dispute at the initiation of arbitration under Sections C.6 and C.7 shall have the right to intervene in the arbitration. Any party wishing to intervene in an arbitration under Sections C.6 and C.7 may petition the arbitrator for permission to intervene, provided that the petition is submitted to the arbitrator not more than 30 calendar days after notice of the arbitration is posted by WECC's Chief Executive Officer in accordance with Section C.7.1. The arbitrator shall have the discretion to permit a party to intervene if the arbitrator determines that the party petitioning to intervene has a direct and substantial interest in the outcome of the arbitration. In exercising his or her discretion concerning a requested intervention, the arbitrator shall also consider any additional complexity or delay that may be caused by allowing the intervention and also any other remedies available to the party requesting intervention. Any party that is granted the privilege of intervening in an arbitration under Sections C.6 and C.7 shall be permitted to intervene subject to the same terms, conditions,

limitations, rights, and obligations of all other parties to the dispute, including without limitation the binding effect of arbitrator's decision, limitations on rights of appeal, the obligation to share equally in the costs of the arbitrator, and the obligation to be subject to the provisions of Section C.8.

C.7.7 Consideration of WECC Criteria, Etc. The Arbitrator shall give due consideration to the reliability criteria, standards, guidelines, policies, and procedures of WECC and the North American Electric Reliability Council (or any successor organization) to the extent they are relevant to resolution of the matter(s) in dispute. If the arbitrator's decision will include interpretation of any of WECC's reliability criteria, standards, guidelines, policies, and procedures, (and WECC is not a party to the arbitration), the arbitrator shall, before rendering his or her decision, consult with WECC (subject to the provisions of Section C.7.10 below) concerning the interpretation of WECC's applicable reliability criteria, standards, guidelines, policies, and procedures.

C.7.8 Evidence and Rebuttal. The arbitrator shall consider all issues material to the matter(s) in dispute. The arbitrator shall take evidence submitted by the parties to the dispute in accordance with procedures established by the arbitrator and may request additional information the arbitrator deems material to the resolution of the dispute. With the consent of all parties to the dispute, the arbitrator's request for additional information may include the opinion of any individual or organization with recognized expertise in the matter(s) in dispute, subject to the following conditions: (i) any verbal communication with an expert consulted by the arbitrator must take place exclusively in the presence of all parties to the

dispute and copies of any written communications must be provided to all parties to the dispute; (ii) any expert consulted by the arbitrator must agree to be equally available upon request to all of the parties to the dispute; (iii) any expert consulted by the arbitrator must agree to comply with the restrictions on disclosure contained in Section C.5.3; and (iv) all parties to the dispute shall be afforded a reasonable opportunity to question the expert and to rebut any additional information submitted by the expert at the request of the arbitrator.

C.7.9 Arbitrator's Decision. The arbitrator shall make all reasonable efforts to complete hearings (if applicable) and submissions of written evidence not more than 90 calendar days after receiving initial statements submitted under Section C.7.3 above. As soon as practicable, but in no event more than 30 calendar days after the completion of hearings and evidence submittals, the arbitrator shall render his or her final decision for resolving the dispute. By agreement of all of the parties to the dispute or at the discretion of the arbitrator for good cause, the foregoing deadline for delivery of the arbitrator's decision may be extended. The arbitrator's decision shall be based on the arbitrator's good faith determination of a resolution that will: (i) be consistent with any laws, rules, and regulations applicable to the matter(s) in dispute; (ii) be consistent with any valid pre-existing agreements among the parties to the dispute that bear on the matter(s) in dispute; (iii) not require any party to the dispute to take action that is not in compliance with any of WECC's reliability criteria, standards, guidelines, policies, and procedures; and (iv) best serve to promote or maintain reliable operation of the interconnected Bulk Electric System of the Western Interconnection, without

imposing inequitable burdens or benefits on any of the parties to the dispute or others that may be affected by implementation of the arbitrator's decision. The arbitrator shall deliver to each of the parties to the dispute, along with his or her decision, a written statement including specific findings of fact, conclusions of law (if applicable), and an explanation of the arbitrator's basis for rendering his or her decision. Subject to any protective order that may have been issued under Section C.7.4 above, WECC's Chief Executive Officer shall publish (or cause to be published) in WECC's newsletter or electronic bulletin board a brief summary of the arbitrator's decision. An arbitrator's decision that is not appealed shall not be deemed to be precedential in any other arbitration related to a different dispute.

C.7.10 WECC Staff Participation in Arbitration When WECC Not a Party. If, during the course of binding arbitration conducted under Sections C.6 and C.7 (in which WECC is not a party) the arbitrator or any party to the dispute wishes to solicit the views of WECC staff concerning the application, implementation, interpretation, or fulfillment of any guidelines, criteria, standards, policies, or procedures of WECC, the arbitrator may request or permit the submission of WECC staff views only with the consent of all of the parties to the dispute and only if: (i) any participation by WECC staff takes place exclusively in the presence of all parties to the dispute; (ii) participating WECC staff members agree to be equally available upon request to all parties to the dispute; and (iii) participating WECC staff members agree to comply with the restrictions on disclosure contained in Section C.5.3.

C.7.11 Compliance and Costs. Unless one or more of the parties to the dispute initiates and notifies all other parties to the dispute that it has initiated a process to contest or appeal the arbitrator's decision under Sections C.9 through C.13, upon the decision by the arbitrator, the parties to the dispute shall, within the time frame specified by the arbitrator, and, subject to Section C.6.6 above, take whatever action is required to comply with the arbitrator's decision to the extent the arbitrator's decision does not require regulatory action. To the extent the arbitrator's decision affects jurisdictional rates, terms and conditions of service, or facilities or otherwise requires local, state, federal, or provincial approval or regulatory action, or a FERC filing or a Canadian Regulatory Authority filing by a Canadian Member or a Mexican Regulatory Authority filing by a Mexican Member, the affected Member (or WECC, if WECC is the party with the obligation to seek regulatory action) shall, within the time frame specified by the arbitrator, submit the arbitrator's decision or an appropriate filing to implement the arbitrator's decision and support the appropriate authority's acceptance or approval of the arbitrator's decision or implementation filing, except in cases where any party to the dispute has given notice of its intent to contest or appeal the arbitrator's decision. All costs associated with the arbitration (not including costs associated with attorney and expert witness fees incurred by the parties to the dispute) shall be divided equally among the parties to the dispute unless: (i) all of the parties to the dispute agree to an alternate method of allocating costs; or (ii) in rendering his or her decision, the arbitrator exercises his or her discretion

under Section C.8 below to assess fees, costs, or other monetary sanctions against one or more of the parties to the dispute for good cause.

C.7.12 Entry of Judgment. At any time after an arbitrator has rendered his or her decision in an arbitration conducted under Sections C.6 and C.7 (provided that the time provided for initiating an appeal under Sections C.11.1 and C.12 below has expired and no appeal or other means of contesting the arbitrator's decision has been initiated), judgment on the decision rendered by the arbitrator may be entered by any court of competent jurisdiction (subject to the provisions of Sections C.6.3, C.6.4, and C.6.6 above). If the award is against the United States, a party to the arbitration may apply to the United States District Court for the district in which the principal office of the applicable United States department or agency is located for an order confirming the award pursuant to 5 U.S.C. § 580.

C.8 Arbitrator's Discretion to Shift Costs or Impose Sanctions for Cause. Each party to any dispute submitted to arbitration under Sections C.6 and C.7 shall bear its own costs and fees associated with representation and participation in the arbitration process, and shall share equally in the arbitrator's fees except that the arbitrator shall have the discretion, to the extent permitted by law, to require one or more of the parties to the dispute to pay part or all of the costs and fees (including without limitation attorneys' and arbitrator's fees) of one or more other parties to the dispute, or to impose monetary sanctions on some other basis that is reasonable under the circumstances, for good cause. As used in this Section C.8, "good cause" means conduct involving serious abuse of or failure to comply with the dispute resolution process set forth in this Appendix C, willfully undertaken to harass or delay other parties to the dispute or to substantially impede the

arbitrator's ability to render a decision consistent with the provisions set forth in Section C.7.9.

C.9 Rights to Appeal Arbitration Decisions. Except to the extent otherwise provided by applicable United States state or federal law, applicable Canadian or provincial law, or applicable Mexican law, a party to a dispute resolved by arbitration under Sections C.6 and C.7 may appeal or contest the arbitrator's decision only on one or more of the bases specified in Section C.9.1 below and only in accordance with the procedures set forth in Sections C.9.2 through C.13.

C.9.1 Grounds for Appealing Arbitration Decisions. A party to a dispute resolved by arbitration under Sections C.6 and C.7 may contest or appeal the arbitrator's decision only on the basis that: (i) the arbitrator's decision is contrary to applicable law or regulation (including without limitation the FPA or FERC's then-applicable standards or policies, or comparable types of provisions that may apply under applicable Canadian, provincial, Mexican, or other laws and regulations); (ii) the arbitrator's decision is demonstrably arbitrary and capricious and without support in the record assembled during the arbitration; (iii) the arbitrator failed to afford one or more parties to the dispute an opportunity for a fair and meaningful hearing; (iv) the arbitrator engaged in serious misconduct in connection with the arbitration; (v) the arbitrator exceeded the authority conferred upon him or her under this Appendix C or as otherwise established by agreement of all the parties to the dispute; or (vi) the arbitrator's decision is contrary to the provisions of Section C.6.6.

C.9.2 Matter and One or More Parties to Dispute Subject to FERC Jurisdiction. If (i) the subject matter of a dispute arbitrated under Sections C.6 and C.7 is within the jurisdiction of FERC, and (ii) the conditions specified in Section C.12.1 or C.12.2 are satisfied, the rights of the parties to contest or appeal the arbitrator's decision shall be as set forth in Sections C.10 and C.12 below (subject also to the provisions of Section C.9.1 above). Notwithstanding the foregoing, nothing herein shall be construed or operate to require any Canadian or Mexican party or any other party that is not a "public utility" within the meaning of the FPA to make any filing with FERC under Sections 205 or 206 of the FPA.

C.9.3 All Parties and Matters in Dispute Subject to Jurisdiction of a Canadian Regulatory Authority. If all of the parties to an arbitrated dispute are subject to the jurisdiction of a particular Canadian Regulatory Authority, and if all matters in dispute are also subject to the jurisdiction of the same Canadian Regulatory Authority, any disputing party may appeal an arbitrator's decision to that Canadian Regulatory Authority, where such Canadian Regulatory Authority has jurisdiction to hear the appeal, or to the appropriate Canadian court. Any appeal to a Canadian Regulatory Authority or Canadian court shall be subject to the provisions set forth in Sections C.10 and C.11 below.

C.9.4 All Parties and the Matter in Dispute Subject to Jurisdiction of a Mexican Regulatory Authority. If all of the parties to an arbitrated dispute are subject to the jurisdiction of a particular Mexican Regulatory Authority, and if all matters in dispute are also subject to the jurisdiction of the same Mexican Regulatory Authority, any disputing party may appeal an arbitrator's decision to the

appropriate Mexican Regulatory Authority, subject to the provisions set forth in Sections C.10 and C.11 below.

C.9.5 Appeal to Court. If none of the preceding provisions concerning appealing or contesting an arbitrator's decision before FERC, a Canadian Regulatory Authority, or a Mexican Regulatory Authority apply to an arbitrated dispute, any party to an arbitrator's decision rendered in accordance with the provisions of Sections C.6 and C.7 may appeal the arbitrator's decision to a court of competent jurisdiction as provided under Section C.13 below.

C.10 Appealing or Contesting Arbitrator's Decision to FERC or a Presiding Authority. Subject to the conditions specified in Sections C.9.1 through C.9.5 above, any disputing party may appeal or contest an arbitrator's decision to FERC or an appropriate Presiding Authority as follows:

C.10.1 Record on Appeal. Except as otherwise provided in Section C.10.3 below, any appeal or action to contest an arbitrator's decision to FERC or a Presiding Authority shall be based solely upon the record assembled by the arbitrator. All parties to arbitrations conducted under Sections C.6 and C.7 intend that: (i) the FERC or other Presiding Authority should afford substantial deference to the factual findings of the arbitrator; (ii) the portion, if any, of the arbitrator's decision relating to issues not of first impression (i.e., matters previously decided by the FERC or other Presiding Authority or a court of competent jurisdiction in cases involving comparable facts and circumstances) should be afforded appropriate deference by the FERC or other Presiding Authority; and (iii) the

portion, if any, of the arbitrator's decision relating to issues of first impression should be afforded no deference by the FERC or other Presiding Authority.

C.10.2 No Expansion of Record on Appeal. Except as otherwise provided in Section C.10.3 below, no Member, non-Member, or WECC that has been a party to an arbitration under Sections C.6 and C.7 shall seek to expand the factual record before FERC or a Presiding Authority beyond that assembled by the arbitrator.

C.10.3 Exceptions to Limitations on Record on Appeal. If the arbitrator fails to assemble a complete record of the evidence submitted with respect to an arbitrated decision that is appealed pursuant to Sections C.9 through C.13, the parties to the appeal shall, notwithstanding the provisions of Sections C.10.1 and C.10.2 above, have the right to supplement the arbitrator's record before FERC or the Presiding Authority with any materials received into evidence by the arbitrator but omitted from the record assembled by the arbitrator. If an arbitrator's decision is appealed under Section C.9.1(iii) or (iv) above on the grounds that the arbitrator improperly excluded evidence so as to materially prejudice the outcome of the arbitration with respect to one or more of the parties to the dispute, any party to the appeal may submit the evidence asserted to be improperly excluded, but only as a basis to request that FERC or the Presiding Authority vacate the arbitrator's decision and remand the matter to the arbitrator (or, if FERC or the Presiding Authority determines that the arbitrator engaged in serious misconduct, to a newly selected arbitrator) for reconsideration of the matter with inclusion of the improperly excluded evidence. If an arbitrator's decision is appealed under Section C.9.1(iv)

above on the grounds of serious misconduct by the arbitrator, any party to the appeal may offer new evidence relating to the arbitrator's alleged misconduct.

C.11 Procedures for Appeals to Presiding Authority. If any party to an arbitration under Sections C.6 and C.7 desires to appeal an arbitrator's decision to an appropriate Presiding Authority, it shall provide written notice to that effect to all other parties to the arbitration, the arbitrator, and WECC's Chief Executive Officer within 14 calendar days following the date of the arbitrator's decision. If notice of appeal is timely provided:

C.11.1 Within 30 calendar days after the date of the appealing party's first notice of appeal, the party providing notice of appeal shall file its statement of position regarding the appeal with the Presiding Authority, together with the complete evidentiary record of the arbitration and a copy of the arbitrator's decision. The statement of position shall state that the appeal requested has been the subject of an arbitration pursuant to this Agreement.

C.11.2 Within 30 calendar days after the date of the appealing party's first notice of appeal, any other party that was a party to the arbitration may file its statement of position regarding the appeal with the Presiding Authority.

C.11.3 Copies of all materials filed with the Presiding Authority by any party during the course of an appeal shall be delivered to all other parties to the arbitration and to WECC's Chief Executive Officer.

C.11.4 Implementation of the arbitrator's decision shall be deemed stayed pending an appeal unless and until, at the request of a disputing party, the Presiding Authority issues an order shortening or extending the stay of implementation.

C.11.5 WECC's Chief Executive Officer shall publish (or cause to be published) a summary of each appeal in WECC's newsletter or electronic bulletin board.

C.11.6 The Members and WECC intend that any Presiding Authority's order resulting from an appeal under Sections C.9 and C.11 shall be subject to judicial review pursuant to laws governing the Presiding Authority and the matter in dispute that provide for judicial review of Presiding Authority action.

C.12 Procedures for Contesting or Appealing Arbitrator's Decision Before FERC. If any party to a dispute arbitrated under Sections C.6 and C.7 elects, subject to the limitations set forth in Sections C.9.1 through C.9.5 above, to contest or appeal an arbitrator's decision before FERC, the party so electing shall provide written notice to that effect to all other parties to the arbitration, the arbitrator, and WECC's Chief Executive Officer within 14 calendar days following the date of the arbitrator's decision. The provisions contained in Sections C.10.1, C.10.2, and C.10.3 above shall apply with respect to the record of the arbitration submitted to FERC. In addition, the following provisions shall apply:

C.12.1 FERC Filing by Prevailing Party. If the arbitrator's decision requires the prevailing party to take action that must have FERC approval or involves the provision of FERC-jurisdictional service by the prevailing party, the prevailing party shall file the arbitrator's decision or make an appropriate filing with FERC to implement the arbitrator's decision. Provided that it has given notice as required under Section C.12 above, any non-prevailing party may contest the prevailing party's filing in accordance's with FERC's applicable rules and regulations.

C.12.2 Complaint to FERC by Prevailing Party. If the arbitrator's decision requires a non-prevailing party to take action that must have FERC approval or involves the provision of FERC-jurisdictional service by any non-prevailing party, then, if the non-prevailing party has given notice as required under Section C.12 above, the prevailing party may submit the arbitrator's decision to FERC in the form of a complaint.

C.13 Appeal to Court. If none of the provisions that govern appealing or contesting an arbitrator's decision before FERC, a Canadian Regulatory Authority, or a Mexican Regulatory Authority as set forth in Sections C.9.2, C.9.3, or C.9.4 above apply, any disputing party may appeal an arbitrator's decision to any court of competent jurisdiction, subject to the conditions specified in Section C.9.1 above. Except as otherwise provided in Section C.10.3 above (substituting the words "court of competent jurisdiction" for "FERC or the Presiding Authority"), any appeal to a court shall be based solely upon the record assembled by the arbitrator, and no Member, non-Member, or WECC who is a party to an arbitration under Sections C.6 and C.7 shall seek to expand the factual record before the court beyond that assembled by the arbitrator.

Appendix of Additional Definitions Relating to
Alternative Dispute Resolution Provisions

Arbitration Notice has the meaning specified in Section C.7.1 of these Bylaws.

Canadian Regulatory Authority. The agency or agencies established under the laws of Canada or the applicable Provinces of Canada and having jurisdiction over facilities, interconnections, transmission rates, charges, terms, and conditions of service of a Canadian Member.

Dispute Notice has the meaning specified in Section C.5.1 of these Bylaws.

FERC. The Federal Energy Regulatory Commission or a successor agency.

FPA. The Federal Power Act (16 U.S.C. §§ 824 *et. seq.*), as it may be amended from time to time.

Mexican Regulatory Authority. The agency or agencies established under the laws of Mexico or the applicable states of Mexico and having jurisdiction over facilities, interconnections, transmission rates, charges, terms, and conditions of service of a Mexican Member.

Presiding Authority. As used in Sections C.10 and C.11, the term "Presiding Authority" has the following meanings: with respect to an appeal to an appropriate Canadian Regulatory Authority, "Presiding Authority" means the presiding Canadian Regulatory Authority or Canadian court with jurisdiction to hear the appeal; and with respect to an appeal to an appropriate Mexican Regulatory Authority, "Presiding Authority" means the presiding Mexican Regulatory Authority or Mexican court with jurisdiction to hear the appeal.

BYLAWS

Of

The

WESTERN ELECTRICITY COORDINATING COUNCIL

1. Vision and Mission.

1.1 Vision.

The Western Electricity Coordinating Council ("WECC") shall seek to achieve the appropriate level of Bulk Electric System reliability at least cost considering all costs throughout the economy.

1.2 Mission

WECC is a Utah nonprofit corporation with the mission to foster and promote reliability and efficient coordination in the Western Interconnection. WECC will lead the stakeholders in the Western Interconnection to achieve appropriate system reliability, be the premier source of unbiased information, and serve as the trusted thought leader for the Western Interconnection by providing, consistent with these Bylaws: 1) impartial independent review and analysis of reliability issues impacting the Western Interconnection 2) development of electric reliability standards incorporating Western Interconnection experience and knowledge; 3) consistent and fair monitoring and enforcement activities for compliance with reliability standards; 4) event analysis and lessons-learned from system events; and 5) value for its membership through cost effective and efficient services and practices through: a) being a centralized repository of reliable information relating to the planning and operation of the Bulk Electric System in the Western Interconnection, b) coordinating system planning and modeling, c) sharing of, and providing comment on adherence to, recognized industry best practices, d) facilitating resolution of market seams and coordination issues, e) secure sharing of critical reliability data, and f) providing a robust stakeholder forum.

2. Furtherance of WECC's Mission

2.1 Activities to Carry Out WECC's Mission.

2.1.1 Compliance with the Federal Power Act. WECC will carry out responsibilities and exercise rights of a Regional Entity organized on an interconnection-wide basis pursuant to Section 215 of the Federal Power Act, including any responsibilities and rights delegated to it by the ERO pursuant to a Delegation Agreement.

2.1.2 Agreements with Canada and Mexico. WECC will carry out responsibilities and exercise rights pursuant to International Reliability Agreements with Canadian or Mexican authorities.

2.1.3 Regional Coordination. WECC will act as a coordinating entity for the entire Western Interconnection for activities of regional organizations with responsibilities for reliability and market functions.

2.1.4 Standard Setting. WECC will develop and adopt reliability, operating, and planning standards, criteria and guidelines necessary to maintain the reliable operation of the Western Interconnection's interconnected Bulk Electric System, including seeking, as appropriate, variances from standards of the ERO (or any successor organization which may be created by legislation or otherwise), as well as providing a process for regional variances.

2.1.5 Certification of Grid Operating Entities. WECC will assist in certifying Grid Operating Entities in the Western Interconnection.

2.1.6 Reliability Assessment. WECC will ensure that interconnected Bulk Electric System reliability assessments are conducted as needed. WECC will do this work in conjunction with the Regional Entities to the greatest extent possible. WECC will also facilitate coordinated reliability assessments among Regional Entities.

2.1.7 Compliance Activities. With respect to enforcement of reliability standards, WECC will:

2.1.7.1 implement the Reliability Management System in effect as of WECC's formation and as the Reliability Management System may be subsequently modified in accordance with its terms;

2.1.7.2 implement any monitoring and enforcement mechanisms delegated to it pursuant to Section 215 of the Federal Power Act and any Delegation Agreement with the ERO, or required by any International Reliability Agreement with a Canadian or Mexican authority; and

2.1.7.3 administer any other monitoring and enforcement mechanisms where WECC is designated to perform administration.

2.1.8 Coordinated Regional Planning. With respect to the coordination of regional planning activities, WECC:

2.1.8.1 will develop coordinated planning policies and procedures for the Western Interconnection, including facilitation of market-based solutions, consistent with WECC/ERO standards and FERC policy.

2.1.8.2 will review and assess Local Regional Entity planning processes to determine whether WECC planning procedures have been satisfied;

2.1.8.3 will refer planning matters back to the originating Local Regional Entity for revision or other corrective actions when the WECC Board determines that WECC planning procedures have not been satisfied; and

2.1.8.4 may perform other interconnection-wide studies as needed.

2.1.9 Coordinated Operations. With respect to coordinating reliable operating activities within the Western Interconnection, WECC will develop, coordinate and promote consistent interregional operating policies and procedures for the Western Interconnection, consistent with WECC/ERO standards and FERC policy.

2.1.10 Market Interface Issues. With respect to Market Interface issues WECC will:

2.1.10.1 facilitate development of compatible and efficient practices across the Western Interconnection; and

2.1.10.2 exercise Backstop Authority where an unresolved Market Interface issue will cause Material External Impacts by taking some or all of the following actions: 1) providing a forum for and coordinating voluntary solutions among Members; 2) recommending specific solutions for voluntary adoption by Members; and 3) if necessary, proposing solutions to an Applicable Regulatory Authority.

2.1.11 Dispute Resolution. WECC will provide a process for the timely resolution of disputes between WECC Members as set forth in Section 11.

2.2 Organizational Characteristics.

As WECC carries out activities to fulfill its mission, it will seek to develop and maintain the following characteristics:

2.2.1 dedication to serving the individuals, businesses, and other organizations that generate, transmit, distribute, market, and use electrical energy in the Western Interconnection;

2.2.2 efficiency in its administration, decision-making, policy and standards development, and dispute resolution processes;

2.2.3 the ability to maintain status as an Interconnection-wide regional reliability entity and be afforded deference and delegation by ERO (or successor organization); and

2.2.4 fair and open processes through which practices, policies, and standards are developed and implemented based on sound technical and policy analysis.

2.2.5 Promote an efficient western electric market by reducing or eliminating conflict, duplication and overlap among electric organizations in the Western Interconnection.

2.2.6 Allow access to WECC data by individuals who can demonstrate a legitimate business need for the data, provided such individuals agree to such protections and non-disclosure restrictions which may be necessary due to the nature of the data sought to be accessed and agree to pay the incremental costs of providing the data which may be requested.

3. Definitions.

The capitalized terms used in these Bylaws shall have the meanings set forth below, or if not set forth below, shall have the meanings given them in the NERC Glossary of Terms Used in NERC Reliability Standards.

3.1 Affiliate.

An Entity that directly or indirectly through one (1) or more intermediaries, controls, or is controlled by, or is under common control with, another Entity. An Entity "controls" any Entity in which it has the power to vote, directly or indirectly, 5% or more of the voting interests in such entity or, in the case of a partnership, if it is a general partner. Notwithstanding the foregoing definition, for purposes of these Bylaws: 1) electric distribution cooperatives that are member-owners of a generation and transmission cooperative are not Affiliates of the generation and transmission cooperative or of each other; 2) an entity controlled by or operating as a unit, agency, or subdivision of a local, state, provincial, or U.S. federal or Canadian or Mexican national government will not be considered an Affiliate of any other entity controlled by or operating as a unit, agency, or subdivision of a local, state, provincial, or federal government; 3) separate agencies of a single state or province, or of the U.S. federal or Canadian or Mexican national government will not be considered Affiliates of each other, regardless of any commonality of political control; 4) members of any joint powers authority, and such joint powers authority, will not be considered Affiliates of each other; and 5) members of an RTO will not be considered Affiliates of such RTO or of each other solely as a result of such membership.

3.2 Annual Meeting.

The annual membership meeting of WECC, as described in Section 5.3.

3.3 Applicable Regulatory Authority.

The FERC or any state or provincial government agency with jurisdiction to regulate or directly affect the transmission of electricity within the Western Interconnection.

3.4 Backstop Authority.

The ability, obligation, or responsibility of WECC to address an issue when the WECC Board determines that a Local Regional Entity(ies) holding Primary Authority has not resolved an issue, has created incompatible resolutions or has not acted. In each case where these Bylaws authorize WECC to exercise Backstop Authority, the provisions that authorize Backstop Authority will also specify the conditions necessary to trigger Backstop Authority and the actions that fall within WECC's exercise of Backstop Authority.

3.5 Balancing Authority.
The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.

3.6 Ballot Body.
The Ballot Body consists of WECC members and non-members that have been determined eligible for the voting sectors described in ~~8.6.5.2~~the Reliability Standards Development Procedures and may, therefore, vote on Regional Criteria and Regional Reliability Standards.

~~**Ballot Pool.**~~
~~A Ballot Pool consists of a self-selected set of members of the Ballot Body who join the Ballot Pool for a given Regional Criterion or Regional Reliability Standard during a designated window of opportunity provided by WECC either prior to balloting or prior to the close of balloting.~~

3.7 Board of Directors (Board).
WECC Board of Directors, collectively, as described in Section 6.

3.8 Class.
A grouping of Members described in Sections 4.2.1 through 4.2.7 and 4.3.

3.9 Commercial Practices.
The products and practices involved in trading electricity. The term "Commercial Practices" only refers to an interaction among market entities that does not affect or require assistance from Grid Operating Entities that have grid reliability responsibilities.

3.10 Compliance Hearing Body.
The hearing body used for the purpose of providing a balanced compliance panel to conduct hearings for the resolution of disputes concerning compliance with or enforcement of Reliability Standards that may arise between WECC (acting as Compliance Enforcement Authority for the Western Interconnection) and a Registered Entity.

3.11 Delegation Agreement.
An agreement between the ERO and WECC pursuant to Section 215 of the Federal Power Act by which the ERO delegates to WECC designated powers, rights and

responsibilities regarding the administration within the Western Interconnection of electric Reliability Standards adopted or approved by the ERO and the FERC.

3.12 Director.
An individual member of the WECC's Board of Directors.

3.13 Electric Line of Business.
The generation, transmission, distribution, or trading of electricity or the provision of related energy services in the Western Interconnection.

3.14 Electric Reliability Organization (ERO).
The organization certified by FERC under 18 C.F.R. §39.3, the purpose of which is to establish and enforce Reliability Standards for the Bulk-Electric System in the United States, subject to FERC review.

3.15 Entity.
Any individual, person, corporation, partnership, association, governmental body or organization of any kind.

3.16 FERC.
The Federal Energy Regulatory Commission or any successor.

3.17 Grid Operating Entity.
Any operating entity, such as a Balancing Authority, that is certified pursuant to Section 2.1.5 of these Bylaws to be responsible for reliable operation of a portion of the Western Interconnection.

3.18 International Reliability Agreement.
An agreement between WECC and any appropriate Canadian or Mexican authority related to WECC's powers, rights and responsibilities regarding the administration of electric reliability standards applicable within such authority's geographic area of the Western Interconnection.

3.19 Local Regional Entity.
A regional transmission organization or some other formally or informally constituted regional organization or group within the Western Interconnection, including but not limited to a Balancing Authority, a group of Balancing Authorities acting in concert, or a group of Entities that own or operate Transmission Facilities acting in concert. These Local Regional Entity boundaries can be reevaluated or modified over time.

3.20 Market Interface.
Market Interface involves all interactions among market entities and Grid Operating Entities related to transmission service and physical delivery.

3.21 Material External Impacts (MEI).
Significant effects on another Local Regional Entity or market within the Western Interconnection but outside of the Local Regional Entity or market adopting a policy, standard, practice or procedure, or implementing an action.

3.22 Member.
Any entity that has applied and been accepted for membership in WECC and is current in the payment of dues.

3.23 Participating Stakeholder.
Any person or entity that is not a WECC Member, but is an interested stakeholder and has applied and been granted, pursuant to Section 8.7.2, the participation and voting rights set forth in Section 8.7.1.

3.24 Primary Authority.
The ability, obligation, or responsibility of an entity to address an issue in the first instance.

3.25 Regional Criteria
~~A WECC Board Approved document created to establish requirements to address NERC "fill-in-the-blank" reliability standards necessary to implement, to augment, or to comply with NERC or Regional Reliability Standards and any other documents that may precipitate attendant monitoring and compliance through the Compliance Monitoring and Enforcement Program in the United States, or by programs established by the Applicable Governmental Authority in Canada and Mexico, as applicable. New and revised Regional Criteria shall be established using the WECC Standards Development Procedures.~~ The term Regional Criteria shall have the definition set forth in the NERC Rules of Procedure as may be amended from time to time.

3.26 Regional Entity (RE).
An entity having enforcement authority pursuant to 18 C.F.R. §39.8.

3.27 Registered Entity.
An owner, operator, or user of the Bulk-Electric System or the entities registered as their delegates for the purpose of compliance in the North American Electric Reliability Corporation Compliance Registry or similar Entity operating in Canada or Mexico and which could be registered in the Compliance Registry if it operated in the United States.

3.28 Reliability Management System
The contracts, separate from these Bylaws, by which Members and other parties agree to certain procedures and sanctions intended to enforce specified Reliability Practices to maintain reliable electric service throughout the Western Interconnection.

3.29 Reliability Standard.
A requirement approved by FERC under section 215 of the Federal Power Act, to provide for reliable operation of the Bulk-Electric System in the United States. Regional

Reliability Standards are specific to the Western Interconnection and shall be established using the WECC Standards Development Procedures.

3.30 Reliability Standards Development Procedures.
The process for developing and approving WECC Regional Reliability Standards (or its successor) attached as Exhibit C to the Delegation Agreement between WECC and North American Electric Reliability Corporation.

3.31 Transmission Facilities.
Those facilities that are defined as "transmission facilities" by FERC for purposes of the open access requirements of Section 210 and 211 of the Federal Power Act or any facilities which would be so defined if the Member were subject to FERC jurisdiction.

3.32 Western Interconnection.
The geographic area containing the synchronously operated electric transmission grid in the western part of North America, which includes in the United States Arizona, California, Idaho, Nevada, Oregon, Utah, and Washington, as well as parts of Montana, Nebraska, New Mexico, South Dakota, Texas, Wyoming, and Colorado; parts of the Canadian Provinces of British Columbia and Alberta; and Baja California Norte, Mexico.

4. Members and Membership.

4.1 Voluntary Membership.
Except as otherwise may be required by applicable authority, membership in WECC is voluntary. A Member may withdraw upon giving the Secretary thirty (30) days' advance written notice. Notwithstanding such notice of withdrawal, all contracts, FERC orders, unpaid Member costs, and decisions of arbitration in effect or pending as of the date of the written notice of withdrawal will be followed through to completion, pursuant to these Bylaws, by the withdrawing Member; however. Nothing herein will relieve any Member withdrawing from WECC from any obligation it may have under applicable law including, but not limited to, Section 215 of the Federal Power Act. A Member that withdraws is obligated to pay any unpaid dues owed through the remainder of the fiscal year in which its withdrawal becomes effective.

4.2 Eligibility for Membership.
Subject to Section 4.5, any Entity that is an interested stakeholder or that meets the criteria for membership in the membership classes described in Sections 4.2.1 through 4.2.5 may be a Member of WECC:

4.2.1 Class 1. Electric Line of Business Entities owning, controlling or operating more than 1000 circuit miles of transmission lines of 115 kV and higher voltages within the Western Interconnection.

4.2.2 Class 2. Electric Line of Business Entities owning, controlling or operating transmission or distribution lines, but not more than 1,000 circuit miles of transmission lines of 115 kV or greater, within the Western Interconnection.

4.2.3 Class 3. Electric Line of Business Entities doing business in the Western Interconnection that do not own, control or operate transmission or distribution lines in the Western Interconnection, including power marketers, independent power producers, load serving entities, any other Entities whose primary business is the provision of energy services, and those Entities that are not eligible for membership in the other Member Classes and who have a substantial interest in the purposes of WECC.

4.2.4 Class 4. End users of significant amounts of electricity in the Western Interconnection, including industrial, agricultural, commercial and retail entities as well as organizations in the Western Interconnection that represent the interests of a substantial number of end users or a substantial number of persons interested in the impacts of electric systems on the public or the environment.

4.2.5 Class 5. Representatives of states and provinces in the Western Interconnection, provided that such representatives will have policy or regulatory roles and do not represent state or provincial agencies and departments whose function involves significant direct participation in the market as end users or in Electric Line of Business activities.

4.2.6 Sub-Class Organization. A Member Class may subdivide in up to three subclasses based on a majority desire within that class for purposes of electing Member Advisory Committee representation.

4.3 Designation of Membership Class.

A Member of WECC may not belong to more than one Class. An applicant for membership will designate the Class for which it qualifies based upon the criteria for membership set forth in Section 4.2, –however any Member owning, controlling or operating Transmission Facilities or distribution facilities must belong to Class 1 or 2 unless the Board grants the Member's petition for a change in Member Class pursuant to the provisions of Section 4.4 of these Bylaws. Applications for membership will be submitted to WECC. WECC staff will review the application to verify eligibility for membership and Member Class designation. An applicant whose application has been rejected or any Member who disputes the WECC staff's determination regarding the appropriate Member Class designation may request review by the Governance Committee. If the applicant or any Member disagrees with the Governance Committee's decision, the applicant or such Member may appeal this decision to the Board.

4.4 Changes in Membership Class.

Notwithstanding any other provision of these Bylaws, upon a petition from a Member, the WECC staff (subject to review by the Governance Committee and appeal to the Board) may allow the Member to change Member Class if the interest of the Member is more closely aligned with the proposed Class than the Member's current Class.

4.5 Affiliates and Distinct Business Entities.

An Affiliate of a Member that satisfies the membership qualifications may also become a Member provided:

4.5.1 The Affiliate applying for membership and the Member disclose to the Chief Executive Officer all Affiliates that are WECC Members and the Classes to which the Affiliates belong. Every Member will promptly notify the Chief Executive Officer whenever it becomes, or ceases to be, an Affiliate of any other Member.

4.5.2 Affiliates may be members of the same Class; provided, however, a group of Affiliates within a single Class may only have one vote in any WECC forum. Except as set forth in Section 8.7.6, ~~A~~a group of Affiliates within a single Class may, by providing~~,~~ at least three (3) business days~~,~~ advance written notice to the Chief Executive Officer, split their single vote equally amongst all Affiliates or designate a single Affiliate as the group's voting Member.

4.5.3 For good cause shown and with the express approval of the Board, a company or organization containing functionally distinct entities within it may obtain separate memberships for such entities; provided that such entities will be considered Affiliates.

4.5.4 The Board may adopt a policy regarding whether Members may share the benefits of membership (including the right to receive information that is only available to Members) with a non-member Affiliate.

~~Upon receiving applications from non-WECC members to join the Ballot Body, WECC staff shall require such non-WECC members to identify their affiliations with other Ballot Body members in their applications to join the Ballot Body. WECC staff shall limit voting of affiliated non-WECC members in the same manner that would be used to limit voting by WECC member organizations.~~

4.6 Rights and Obligations of Membership.

Except as otherwise provided in these Bylaws or other applicable authority, Members of WECC have the following general rights and obligations:

4.6.1 The right to elect and remove Directors as described in Section 6.5;

4.6.2 The right to amend these Bylaws, and to review and rescind any Board amendment of these Bylaws, in accordance with Section 12;

4.6.3 The right to receive appropriate meeting notices, as well as reports and information produced by WECC;

4.6.4 The right to attend, participate and vote in all WECC Member meetings and the right to attend Board meetings (other than closed sessions of Board meetings) and to comment upon all matters considered in such meetings;

4.6.5 The right to be a member of, attend meetings of, and to introduce motions, debate and to vote in the deliberations of WECC committees, subject to the limitations of these Bylaws and such other reasonable limitations as the Board may adopt from time to time;

4.6.6 The right to invoke the dispute resolution provisions of these Bylaws;

4.6.7 The right to petition the Board to take any action consistent with applicable law (including Section 215 of the Federal Power Act and implementing orders and regulations), these Bylaws and the articles of incorporation and to have such petition voted upon in a reasonable and timely manner;

4.6.8 The obligation to abide by these Bylaws, decisions resulting from the dispute resolution process, and all standards or decisions of WECC, subject to the exceptions set forth in Section 4.7 and the enforcement provisions of Section 4.8.

4.6.9 The obligation to notify the Chief Executive Officer promptly of changes with respect to Affiliates as provided in Section 4.5.1 of these Bylaws; and

4.6.10 The obligation to pay in a timely manner the membership dues pursuant to Section 11.

4.6.11 The obligation to provide system data that the Board has determined is necessary for WECC functions and does not impose an undue burden on the Members; provided, however, that the Board shall adopt appropriate limitations on this obligation or procedures that protect and avoid unnecessary collection of confidential, privileged, trade secret, cybersecurity or critical energy infrastructure information or other information that the Board determines merits such protection consistent with applicable law.

4.6.12 The obligation to support surfacing minority and majority opinions or views within their Member Class, along with supporting rationale to enable the Board of Directors to make decisions based on informed judgment aligned with WECC's vision, mission and these Bylaws.

4.7 Limitations on Member Obligations.

4.7.1 The obligation of Members pursuant to Section 4.6.8 will not require any Member to take any action which the Member in good faith determines: 1) would exceed the physical capabilities of the Member's electric system (or any part of another's electric system that the Member has the legal right to cause to comply with a WECC action governed by Section 4.6.8); 2) would create serious and immediate risks to public health or safety (provided, however, that the shedding of load shall not in and of itself be deemed a serious and immediate risk to public health and safety for the purpose of this section); 3) would create an immediate risk of serious damage to facilities or equipment within its electric system or cause it to

operate any of its electric facilities or equipment in an unsafe manner; 4) would cause the Member to violate or improperly implement an applicable law, regulation, rule, order, FERC license provision or other legal obligation; or 5) would conflict with any non-power requirement applicable to the Member (including without limitation any obligation under environmental laws, regulations, court and administrative decisions or biological opinions).

4.7.2 Each Member shall retain sole control of its facilities and the use thereof, and a Member shall not be required to construct or dedicate facilities for the benefit of any other Member, or be required to take action, or refrain from action, as may be deemed necessary to maintain reliable service to its own customers and/or to fulfill its obligations to third parties; provided, that a Member shall comply with duly-adopted reliability standards applicable to its system and shall comply with any directives under existing security coordination agreements. Nothing in these Bylaws is intended to preclude application of Section 210 or 211 of the Federal Power Act. The above limitations shall not be construed as altering a Member's obligation to comply with applicable Reliability Standards or enforcement orders, or any other obligation arising under 18 C.F.R. Part 39.

4.8 Compliance and Enforcement.

The power of WECC to enforce Member obligations other than compliance with Reliability Standards and other obligations arising under 18 C.F.R. Part 39 and applicable Canadian and Mexican regulatory requirements is limited to suspension or termination of membership as set forth in this Section; provided, however, that: 1) nothing in this Section will limit the power of Members to agree to additional enforcement provisions in separate contracts (such as contracts pursuant to the Reliability Management System); 2) nothing in this Section will limit the power of WECC to propose solutions regarding Market Interface issues to any Applicable Regulatory Authority as described in Section 2.1.10; and 3) nothing in this Section will limit WECC's delegated authority under Section 215 of the Federal Power Act and 18 C.F.R. Part 39 and applicable Canadian and Mexican regulatory requirements to enforce reliability standards and perform other delegated or contractual functions within the Western Interconnection. The Board may suspend or, to the extent consistent with applicable law, terminate the membership of any Member for a material failure to meet any obligation of membership set forth in these Bylaws, including, but not limited to: 1) non-payment of dues sixty (60) days after the dues become delinquent; 2) intentionally or repeatedly violating any WECC Bylaw; 3) materially breaching or intentionally violating any FERC order or arbitration decision issued pursuant to these Bylaws; 4) willfully obstructing any lawful purpose or activity of WECC; or 5) remaining inactive as described in Section 5.9. The Board will give the affected Member not less than twenty-one (21) days prior written notice of any proposed suspension or termination, which will include the specific basis for the proposed action and, if applicable, instructions on curing the problem. Prior to terminating a membership, the Board will consider any information provided by the Member in response to the notice described herein.

4.8.1 Suspension. The suspension of a Member will not affect the Member's rights and obligations other than that the Member will not be entitled to vote at any meeting of the Members, Classes, –subclasses, or any committee until the suspension is removed except that a suspended Member may participate in the WECC proposed Reliability Standards Development Procedure.

4.8.2 Termination. The termination of membership will have the same effect, and be subject to the same continuing obligations, as such Member's withdrawal pursuant to Section 4.1, except that it will be effective as of the issuance date of the notice provided pursuant to Section 4.8.

4.9 WECC Structure and Governance Review.

At least each five years, the Board of Directors will conduct a thorough assessment of whether WECC is fulfilling its purposes in a manner that is consistent with: 1) the provisions of Section 2.2 of these Bylaws; and 2) the then-current state and the expected future evolution of the electric power industry within the Western Interconnection. Unless determined otherwise by a majority vote of both the Board of Directors and the Members Advisory Committee (MAC), the initial review required under this Section 4.9 will commence after the completion of the first full year of operation under these Bylaws as amended in June 2013 and will be done collaboratively with the MAC and to the extent practical, will be coordinated with any similar structure and governance reviews being conducted by Peak Reliability. In particular, the Board will focus on whether the standards, obligations, processes, and decisions WECC imposes on its Members are timely, fair, effective, and reasonable in view of the commercial, legal, regulatory, and economic needs and objectives of the affected Members. The Board will evaluate WECC's Board composition, Member Class structure, committee structure and activities, and staff responsibilities as they relate to the foregoing considerations. The assessment required by this Section 4.9 will be accompanied by Board recommendations for any changes the Board determines are warranted by the assessment. The assessment and recommendations prepared by the Board in accordance with this Section 4.9 will be submitted in writing to the Members at the first annual Member meeting held after they are completed.

5. Procedures for Member Decisions.

5.1 Quorum and Alternative Voting.

With the exception of voting on Regional Reliability Standards and Regional Criteria under the oversight of the WECC Standards Committee, members may conduct business and take votes only at duly noticed Member meetings. Members may not conduct any business of the membership as a whole at any meeting unless a quorum is first established.

5.1.1 Quorum. A majority of all Members, including a majority in at least three (3) Classes, will constitute a quorum for all meetings of the membership as a whole. A majority of the members of a Class or subclass will constitute a quorum for all Member Class or subclass meetings. Members participating through a designated alternative representative or through submission of an absentee ballot will be

counted in determination of a quorum. Inactive Members, as defined in Section 5.9 of these Bylaws, will not be counted in determining a quorum at Member, Member Class or subclass meetings. A quorum, once established, will be deemed to continue for the balance of any Member, Member Class, or subclass meeting, except that no election of Directors may occur without a quorum being present. Members may designate an alternate representative or submit an absentee ballot in a form consistent with Section 5.1.2 for any Member, Member Class, or subclass meeting.

5.1.2 Alternate or Absentee Voting: In the event that a Member's designated voting representative cannot attend a meeting of the Membership or a Member Class meeting where Directors are being elected or amendments to these Bylaws are considered, a Member may designate an alternate voting Member representative, with two (2) days written notice to the Corporate Secretary, or a Member may cast an absentee ballot pursuant to the procedures established by the Corporate Secretary.

5.2 General Membership Meetings.

All business of the Members acting as a whole will be conducted at meetings called by advance notice to all WECC Members provided in accordance with Section 5.5. Unless stated otherwise in these Bylaws, decisions at all meetings of the Members, Member Classes, or subclasses will be by simple majority vote of the Members present or otherwise represented in accordance with these Bylaws, with each Member having one vote, unless other Bylaw provisions provide for the allocation of the Member's vote. The Chair of the Board will preside over all Members acting-as-a-whole meetings.

5.3 Annual Member Meetings.

WECC will hold an Annual Meeting of all Members at a time and place determined by the Board. At the Annual Meeting, and at other times as provided for in these Bylaws, in addition to such other actions the Members may take, Member Classes will elect Directors for vacant director positions.

5.4 Special Member Meetings.

Members may hold special meetings whenever called by the Board. The Board will call special Member meetings whenever a majority of the Members of any Class request a special meeting or at such other times as it deems appropriate. The Chair of the Board will preside over all special Member meetings.

5.5 Member Class and Subclass Meetings

An individual WECC Member Class or subclass may hold a meeting for any purpose relevant to the interests of Class or subclass Members. Such meeting will be initiated by request by one or more Class or subclass Member(s), and agreement by at least fifty percent (50%) of Class or subclass Members.

5.6 Notice of Member Meetings.

5.6.1 Annual Meeting. The Chief Executive Officer will provide at least thirty (30) days' advance notice to all Members and the Board of the date, place and time of the Annual Meeting of the Members and an agenda of the business to be conducted at such meeting.

5.6.2 Other Member Meetings. The Chief Executive Officer will provide notice of regularly scheduled and special meetings of the Members to the Members not less than fifteen (15) days before the meeting if delivered by first-class mail, or not less than ten (10) days before the meeting if the notice is delivered personally, by telephone, by facsimile, electronic mail or express mail. If mailed, such notice will be deemed given when deposited in the United States mail, with first-class postage thereon prepaid, addressed to a Member. Such notice will state the date, time and place of the meeting and the meeting agenda.

5.6.3 Public and Website Notice. Public notice of each meeting of the Members will be placed on WECC's website at least ten (10) days before such meeting. In addition, the Chief Executive Officer will provide notice in the same manner and time as set forth in Section 5.6.2 of each meeting to each member of the public who so requests and who has provided appropriate information regarding delivery of notice.

5.7 Open Meetings.

All Membership meetings are open to observation by the public.

5.8 Policymaking Authority.

The Board of Directors may adopt policies for the interpretation and implementation of the meeting and voting procedures established in this Section 5.

5.9 Minimum Participation Requirement.

In order to be counted for quorum purposes at a meeting of the membership as a whole, Class, or subclass meeting, a WECC Member must actively participate (by attending in person, sending an alternate, or voting absentee) in at least one WECC meeting (including meetings of the Board, committees and subcommittees) each year. If the Member does not meet this minimum participation requirement, the Member will be considered an "inactive" Member until its active status is restored by participation in at least one WECC meeting (including meetings of the Board, committees and subcommittees) by attending in person, sending an alternate, or voting absentee. An inactive Member will not be counted toward establishing a quorum of the membership as a whole, of a Class, or of a subclass. An applicant for WECC membership or a WECC Member may at any time self-designate itself an inactive Member. Such designation will be effective until the Member is reinstated to "active" status. If a Member does not participate for twenty four (24) consecutive months, the Member's membership will be terminated. If a Member's membership is so terminated, reapplication for membership may be made at any subsequent time.

6. Governance.

6.1 Board of Directors.

Subject to those matters expressly requiring approval of the Membership, a Board of Directors elected by the Members will govern WECC. The Board of Directors will elect its own Chair and Vice-Chair from those individuals serving as Directors.

6.2 Composition of the Board and Board Member Qualifications.

6.2.1 The Board of Directors shall consist of nine (9) Directors. At all times, subject to temporary vacancies, the Board of Directors shall include at least three directors who have at least ten years of experience in the utility industry, preferably in the Western Interconnection, including at least one director who has transmission operations experience, at least one director who has transmission planning experience, and at least one director who has generation operations experience. At any time where the membership of the Member Advisory Committee (MAC) is modified, as may be provided in other provisions of these bylaws, to include representation for Entities of the two Canadian Provinces of British Columbia and Alberta and the Mexican State of Baja California, at least one Director, elected subsequent to such MAC representation, shall have international experience corresponding to such geographic area(s) and/or representation in the MAC.

6.2.2 The remaining members of the Board of Directors shall be selected in an effort to ensure diversity of background and experience. Desirable categories of experience may include: regulatory or legal; accounting, finance or economics; environmental; end-user advocacy; information technology; compliance or standards; public sector; and international.

6.2.2.1 Transmission operations experience shall preferably include experience in control center operations at the senior management or officer level.

6.2.2.2 Transmission planning experience shall preferably include experience in modeling and/or planning transmission facilities, including economic and reliability modeling at the senior management or officer level.

6.2.2.3 Generation operations experience shall preferably include experience in development or operation of generation facilities, including economic and reliability modeling at the senior management or officer level.

6.2.2.4 Regulatory or legal experience shall preferably include at least one of the following types of experience: state, provincial or federal industry regulation; significant litigation experience ideally at the appellate level; evaluation of complex legal arguments; and advising clients with respect to settlements.

6.2.2.5 Accounting, finance or economic experience shall preferably include experience as a Chief Financial Officer, a Chief Account Officer, a

Corporate Risk Officer, a Certified Public Accountant, or the equivalent thereof.

6.2.2.6 Environmental experience shall preferably include experience advocating environmental interests before local, state or federal agencies or boards, and/or leadership experience in representing environmental interests in relation to energy issues.

6.2.2.7 End-user advocacy experience shall preferably include experience advocating end-user economic interests before local, state or federal ratemaking agencies or boards.

6.2.2.8 Information technology experience shall preferably include experience as a senior level manager responsible for integrating information technology services with organizational needs in areas such as capacity planning, budget and finance, acquisition and deployment, operations, change management, application development, trade ally relationships, user support, data quality, security and similar areas.

6.2.2.9 Compliance or standards experience shall preferably include experience as a senior level officer or manager for corporate compliance with internally and/or externally imposed requirements, rules or standards.

6.2.2.10 Public sector experience shall preferably include experience representing the public interests with respect to energy issues.

6.2.2.11 International experience shall preferably include experience as described in the previously listed experience categories, but in the Canadian provinces of British Columbia or Alberta, or the Mexican state of Baja California.

6.2.3 Director Affiliation Restrictions. A Director may not be a full time employee of a Registered Entity. Nor may a Director be affiliated with any Member or Registered Entity operating in the Western Interconnection, nor a Director of an entity performing the function of Reliability Coordinator in the Western Interconnection.

6.2.3.1 For the purposes of this section, "affiliated" shall mean (1) an employee of, (2) a contractor for, (3) an employee of a contractor for, or (4) an equity owner of Registered Entity or Member. For purposes of determining whether a Director is "affiliated" the term "Director" shall include a spouse and/or minor child of the Director.

6.2.3.2 A Director with an equity interest in private or publicly traded companies that are end-users of electricity in the Western Interconnection but are not

otherwise "affiliated" pursuant to the restrictions set forth in Section 6.2.2 shall not be considered to be "affiliated".

6.2.3.3 A Director with an equity ownership in a broadly diversified mutual fund which may from time to time include interests in one of the types of organizations described in Section 6.2.2, shall "not be considered to be "affiliated, provided that such equity interest cannot confer a controlling interest in a Member or Registered Entity within the Western Interconnection.

6.2.3.4 A Director receiving post-employment compensation, which compensation is not indexed to the success of the disbursing entity shall not be considered "affiliated".

6.2.3.5 A Director shall not be considered "affiliated" solely by having a contractual relationship with a state government that has one or more agencies that are Members, provided that the Director cannot be affiliated with the Member agency or agencies.

6.2.3.6 A Director shall not be considered "affiliated" for being a residential or small business end-user of electricity or for being affiliated with, a member of, or a contributor to an organization that represents a substantial number of end users or a substantial number of persons interested in the impacts of electric systems on the public interests or the environment, but a Director shall be considered "affiliated" if the Director is an employee of, or serves as a director, trustee, or officer or in any other policy-setting capacity with respect to any such organization.

6.2.3.7 The affiliation restrictions set forth in this Section are not all encompassing. Candidates and Board members are expected to disclose all known potential financial or relationship conflicts, including any known relationships between companies they have affiliation with and/or entities described in Section 6.2.2. Furthermore, any Nominating Committee will be expected to investigate and evaluate all potential conflicts, whether financial or otherwise.

6.2.4 In addition, the Board may provide for the Chief Executive Officer ("CEO") of WECC to be a voting, additional tenth, member of the Board through the inclusion of such a provision in the resolution the Board adopts appointing WECC's CEO. Such provision shall not permit the CEO to be a member of a Board committee or to cast either a tie-breaking vote or a vote that creates a tie. The CEO may not serve as the Chair or Vice-Chair of the Board.

6.3 Term of Office.

Directors will hold office for staggered terms of three (3) years, three Directors' terms ending each year. Each three (3) year term shall commence upon the adjournment of the portion of the Annual Member Meeting provided for in Section 5.3, in which all Members are counted for purposes of determining a quorum. Similarly, the three year terms of outgoing Directors shall end upon the adjournment of that portion of the Annual Member Meeting in which all Members are counted for purposes of determining a quorum, whether that results in a longer or shorter term than exactly three years.

6.4 Nomination, Selection and Compensation of Directors.

6.4.1 Nominating Committee. Candidates for a Director position shall be nominated by a Nominating Committee. The Nominating Committee shall consist of seven members. Three members shall be Directors, not standing for re-election, designated by the Board Chair. The remaining four Nominating Committee members shall be designated by the Member Advisory Committee and come from individuals serving on the Member Advisory Committee, with two (2) members being from Classes 1, 2, and/or 3, and two (2) members being from Classes 4 and/or 5.

6.4.1.1 If the Member Advisory Committee does not designate MAC members to serve on the Nominating Committee within 30 days of being notified of the Board Chair's designation of the three Directors to serve on the Nominating Committee, the Board Chair may designate MAC members to serve.

6.4.1.2 A Nominating Committee shall be formed each year not less than 180 days prior to the Annual Meeting. A Nominating Committee will continue to function until a replacement Nominating Committee is formed, but may not continue for a period longer than twelve (12) months from its creation, provided however, that the Board, by resolution, may authorize a Nominating Committee to function beyond twelve (12) months as the Board may determine is necessary.

6.4.2 Director Candidate Nominations.

6.4.2.1 The Nominating Committee shall develop candidate pools and make candidate nominations to the Members. The Nominating Committee may consider any qualified applicant in developing the candidate pool, and may identify applicants through the following process: (1) selecting and utilizing an independent search firm to provide the Nominating Committee with a list of qualified applicants for each Director position subject to election; (2) consider an incumbent Director who is willing to stand for reelection, including a review of such Director's tenure on the Board of Directors; (3) consider external nominations.

6.4.2.2 External parties, including but not limited to Members and Western Interconnection stakeholders, may recommend candidates (self-recommendations and third party recommendations) to the Nominating Committee for consideration, by submitting the following: the candidate's resume, a summary of the candidate's relevant experience, a disclosure statement from the candidate, and a letter of interest from the candidate. All recommendations from external parties must be submitted to the Nominating Committee within sufficient time for the Nominating Committee to evaluate the candidate prior to the notification required in Section 6.4.2.5.

6.4.2.3 The Nominating Committee shall review the qualifications of the potential candidates and put forth one nominee for each Director position up for election.

6.4.2.4 Five (5) affirmative votes of the Nominating Committee shall be necessary to put forth a nominee to the Members.

6.4.2.5 At least sixty (60) days in advance of the Annual Meeting, the Nominating Committee shall notify the Board Chair whether or not it has finalized all Director nominations. If the Committee fails to put forth a nomination for an open position, then the Board Chair may form a new Nominating Committee with different Board and Member Advisory Committee members, who shall be tasked with developing any remaining nominations for open Director positions.

6.4.2.6 Each nominee, put forth by the Nominating Committee, shall be presented for separate election by the Members.

6.4.3 Director Elections. Members will vote for each vacant Director position separately. A candidate will be elected to the Board upon majority vote of the Members as a whole in addition to a majority of the Classes (three of the five) having a majority vote from the Members of the individual Class.

6.4.4 Should a candidate fail to receive the required vote of the Members or Member Classes, the Board may:

6.4.4.1 conduct a new election of an alternate candidate put forward by the Nominating Committee, if any, or the Board may ask the Chair to establish a new Nominating Committee to recommence the nomination and election process. Where a candidate has not received the required vote of the Members and Member Classes, the director position shall remain vacant until a candidate is elected, except as provided in Section 6.7.2.

6.4.5 Annual Compensation of Directors. Every two years, or sooner if, in the discretion of the CEO, a new survey is required, the CEO shall contract with an appropriate firm to conduct a national compensation survey, which shall provide an independent review of the compensation paid independent directors. The latest survey so procured shall be used by the Nominating Committee to make an annual recommendation for the compensation of Directors for the following year. Any such recommendation shall require five (5) affirmative votes of Nominating Committee members. This recommendation shall be presented to the MAC no later than one hundred fifty (150) days prior to the Annual Meeting. The MAC shall set the compensation for the Directors at least one hundred and twenty (120) days prior to the Annual Meeting. When making this decision, the MAC shall consider the recommendation of the Nominating Committee and any other material relevant to setting Director compensation. If the Nominating Committee is unable to reach the five (5) vote majority necessary to make a compensation recommendation, the MAC shall make no changes to the compensation paid Directors for the following year.

6.5 Removal of Directors.

The Members or the Board may remove a Director before completion of the Director's term of office pursuant to the following provisions.

6.5.1 Removal by the Members. Directors may be removed only for gross negligence, violation of local, state, provincial, or federal laws, gross misconduct, or failure to meet the fiduciary obligations of Directors.

6.5.1.1 Removal of a Director will be by a vote of a majority of all the WECC Members, not just those Members voting, in addition to a majority of the Classes (three of the five) having a majority vote from the Members of the individual Class. Removal may only take place at a meeting called for that purpose by notice provided in accordance with the notice requirements for member meetings. A vote, by all Members, to consider removal of a Director will occur based upon a petition, for such an all-Member vote, supported by twenty percent (20%), each, of the Members of three of the five Member Classes.

6.5.2 Removal by the Board. The Board may remove any Director for gross negligence, violation of local, state, provincial, or federal laws, gross misconduct, or failure to meet the fiduciary obligations of Directors. Such removal will only occur upon the affirmative vote of not less than six (6) Directors.

6.6 Resignation.

Any Director may resign from their position at any time by written notice to the Board by delivery to the Chair. The acceptance of a resignation will not be required to make it effective.

6.7 Procedures for Filling Vacant Director Positions.

6.7.1 Director Vacancies. If the position of any Director becomes vacant prior to its normal term expiration, the remaining Directors may charge the Nominating Committee with selecting a successor immediately. The Nominating Committee will follow the requirements set out in Sections 6.2.1 and 6.2.2 in its selection of any successor Director. Alternatively, if less than one (1) year remains in the term of that Director, the remaining Directors may choose to leave the position vacant for the remainder of the term.

6.7.2 Holdover to Cure Procedural Vacancies. Whenever an incumbent Director is a candidate for a Director position and a vacancy would be created due to expiration of the Director's term-, the Director may continue to serve, for up to an additional 12 months, until such time as an election of the Director's position can be conducted, provided the vacancy arises from a lack of quorum or other procedural inability to elect a candidate for the Director position.

6.7.3 Should the number of serving Directors fall below seven (7), the Board may appoint one or more individuals to serve as temporary Directors until such time as replacement Directors can be elected by the Members.

6.7.3.1 In appointing temporary Directors, the Board shall select individuals who meet the requirements of Section 6.2.

6.8 Duties of Directors.

The Directors will have the following duties:

6.8.1 Fiduciary Obligation to WECC: All Directors, will have a fiduciary obligation to WECC consistent with the requirements for Directors of Utah non-profit corporations. Members of the Board will at all times act in conformance with such requirements, these Bylaws and the Standards of Conduct set forth in Appendix A.

6.8.2 Preserve Non-Affiliated Status: Throughout their terms, Directors will have a duty to avoid any affiliation that is inconsistent with the qualifications for Directors in Section 6.2.2 of these Bylaws. If a Director becomes aware of any intervening disqualification, he/she must either resign or eliminate the disqualification (e.g., dispose of securities) within sixty (60) days.

6.9 Powers of Directors.

The management of all the property and affairs of WECC will be vested in the Board of Directors. The Board will hold annual elections to select a Board Chair and to fill any other Board officer positions that may be created by the Board or required by applicable law. The Board may exercise all the powers of WECC and do all lawful acts and things (including the adoption of such rules and regulations for the conduct of its meetings, the exercise of its powers and the management of WECC) as are consistent with these Bylaws and the Articles of Incorporation. The Board will give serious consideration to the Member Advisory Committee's and the Western Interconnection Regional Advisory Board's (or any successor) recommendations. The Board will respond to Member

Advisory Committee and Western Interconnection Regional Advisory Board recommendations through a means which the Board determines appropriate.

6.10 Delegation of Board Authority.

The Board may delegate to the Chief Executive Officer or to any Board Committee formed pursuant to Section 7.7.3 any or all of its powers and authority except: 1) any power which it may not delegate pursuant to applicable Utah law; 2) the power to adopt any reliability standard; 3) the power to determine when to exercise the Backstop Authority of WECC; 4) the power to approve budgets; 5) the power to form committees; 6) the power to amend the Bylaws; 7) the power to elect the Chair and other officers of the Board; and 8) the power to hire, fire or set the terms of employment of the Chief Executive Officer. The Board may also delegate to any Member committee the power to make specific decisions, subject to the right of any Member to appeal any of such decisions to the Board within 30 days of the committee vote on the decision by writing a letter to the Chief Executive Officer that describes in reasonable detail the grounds for appeal, and requests that the appeal be considered by the Board at its next regularly scheduled meeting, subject to applicable notice requirements. Delegation will be by express decision and will require the affirmative vote of not less than a majority of the Directors. Any Director may call for a vote to rescind such delegation at any time and such delegation will be rescinded if a majority of the Directors vote to do so.

6.10.1 Notice to Members. Within seven (7) days of any decision delegated pursuant to Section 6.10, except for routine decisions of the Chief Executive Officer, Members will be notified of the decision by electronic mail, posting on the WECC website and any other means determined appropriate by the Board. Routine decisions of the Chief Executive Officer will be noticed in periodic reports to the Board and Members as determined by the Board, which will be sent to Members by electronic mail and posted on the WECC website.

6.10.2 Board Review of Delegated Decisions. Decisions delegated pursuant to Section 6.10 will be reviewed by the Board at the request of any Director, provided such request is lodged with the Secretary within thirty (30) days of the notice. Whenever it determines that a matter requires an urgent decision, the Board may shorten the deadline for requests for review, provided that: 1) the notice and opportunity for review will be reasonable under the circumstances; and 2) notices to Members will always contain clear notification of the procedures and deadlines for Board review. A request for review of a decision will stay the effect of the decision pending review unless the Board in making the delegation expressly determines otherwise.

7. Procedures for Board Decisions.

7.1 Quorum.

No business will be conducted by the Board unless at least five (5) Directors are present, or six (6) Directors if the CEO is counted to determine a Board quorum.

7.2 Majority Vote.

A decision of the Board will require an affirmative vote of a majority of Directors present and not abstaining; provided that no decision of the Board shall be made with fewer than three (3) affirmative votes, or four (4) affirmative votes if the CEO is counted to determine a Board quorum. Directors may not vote by proxy or by absentee ballot, but Directors may participate in Board meetings by telephone as provided in Section 7.3 of these Bylaws.

7.3 Attendance at Board Meetings by Teleconference.

Any or all of WECC's Directors may participate in any meeting of the Board by telephone conference or any other means of communication that enable all Directors participating in the meeting to simultaneously hear one another. Every Director participating in a meeting in the manner described in the preceding sentence will be deemed to be present in person at that meeting.

7.4 Board Action by Unanimous Consent.

7.4.1 Action Without a Meeting. Unless WECC's Articles of Incorporation or applicable law provides otherwise, action required or permitted to be taken at a meeting of the Board may be taken without a meeting through one or more written consents describing the action taken. Any Board action taken by written consent must be signed by all Directors in office at the time the action is taken. Such actions must be noticed to Members in accordance with Section 7.5 and Members must be given an opportunity to comment prior to the Board taking such actions through electronic mail, comments on the website or other appropriate means. The required notice of such meeting may generally describe the arrangements (rather than the place) for the holding of the meeting. All other provisions herein contained or referred to will apply to such meeting as though it were physically held at a single place. All Board actions by written consent must be filed with WECC's Board meeting minutes. Action taken under this Section is effective when the last Director signs the consent, unless the consent specifies an earlier or later effective date. Any action by written consent has the same effect as a meeting vote and may be described as such in any document.

7.4.2 Waiver of Procedures. For any specific action at any noticed meeting of the Board, and under exigent or unusual circumstances, the Board by unanimous vote of those present may waive any procedural requirement applicable to Board decision-making, including any requirement for notice of a specific potential action, except for the following: 1) the requirement for notice of the time and place of the meeting pursuant to Section 7.5; 2) the quorum and voting requirements of Sections 7.1 and 7.2; and 3) any non-procedural limitation on the power of the Board to make a decision, including, but not limited to, those restrictions in Sections 6.10 (limiting the power to delegate) and 12.1 (limiting the power to amend the Bylaws). Whenever such action is taken, a statement describing the action, the exigent or unusual circumstances, the specific procedure waived, the basis for the waiver and the votes of all Directors present shall be

posted on the website and communicated in writing or by e-mail to all Members within five (5) days.

7.5 Notice of Board Meetings.

7.5.1 Regular Meetings. Except as set forth in Section 7.5.2 regarding urgent business, all regular business of the Board will occur at the Board meetings, at least twenty-one (21) days' advance notice of which has been provided by the Chief Executive Officer to all Directors and all Members. Notice will include an agenda that will identify those matters on which a vote will be taken at the meeting. The foregoing requirement shall not preclude the Board from taking an action that is different from the specific proposed action identified in the agenda, as long as the relevant subject matter has been reasonably identified in the agenda. The Directors will establish a regular meeting schedule that will be made available to the Members. The schedule will include not less than two meetings of the Board annually.

7.5.2 Special Meetings. Whenever the Chair of the Board or any three (3) Directors find that there is urgent business requiring Board action before the next regular Board meeting, a special meeting of the Board may be called. Such special meetings will be held upon as much written notice to each Board Member and all Members as is possible under the circumstances, which will not be less than three (3) days. However, this notice of special meetings may be waived if: 1) the waiver is by a writing signed by a quorum of Board members; and 2) as much notice of the meeting as practicable has been given to WECC Members via e-mail and posting on the WECC website.

7.5.3 Public and Website Notice. Public notice of each meeting of the Board will be placed on WECC's website at least ten (10) days before such meeting (or such lesser time as provided pursuant to Section 7.5.2). In addition, the Chief Executive Officer will provide notice of each meeting by first-class mail, facsimile or electronic mail to each member of the public who so requests and who has provided appropriate information regarding delivery of notice.

7.6 Open Meetings.

Except as provided in Section 7.6.1, all regular and special meetings of the Board will be open to observation by any Member and any member of the public.

7.6.1 Closed Session. Notwithstanding the provisions of Section 7.6, upon an affirmative vote of two-thirds (2/3) of the Directors present, the Board may meet in closed session: 1) to consider the employment, evaluation of performance, or dismissal of an employee of WECC and to deliberate regarding decisions the Board may be called upon to make regarding the nomination, qualification, appointment, or removal of a member of the Board of Directors; 2) to discuss pending or proposed litigation and to receive confidential attorney-client communications from legal counsel; and 3) to receive and discuss any

information that is privileged, trade secret, cybersecurity, critical energy infrastructure information (as defined by the FERC), protected from public disclosure by law or that the Board determines should be confidential in order to protect a legitimate public interest.

7.6.1.1 Attendance by an Affected Director. Closed sessions of the Board may not be attended by a Director under the following circumstances: 1) where the qualifications or performance of the Director or the Director's spouse or children are being discussed; 2) where the Director is employed by an entity that is or is likely to become a party to the litigation being discussed; and 3) where the Director or the Board determines that the Director would have a serious and substantial conflict of interest by becoming privy to confidential attorney-client or trade secret information that is to be presented to the Board in closed session.

7.6.1.2 Announcement of Closed Session. Before adjourning into closed session, the Chair of the Board will announce the purpose of the closed session in a manner that provides the public an understanding of the general subject matter to be discussed but which does not reveal sensitive or personal information. The Board will not discuss additional items outside the scope of this description.

7.6.1.3 Confidentiality of Closed Session. All Directors and others present will maintain the confidentiality of discussions and decisions made in closed session. The Board will appoint a secretary for closed session to keep a minute book for the purpose of recording the subject matter discussed in closed session and any actions taken in closed session. After a closed session has ended, the Board Chair shall provide the public a general description of the business conducted during the closed session, without breaching the confidentiality of the information used in the session.

7.7 Board Committees.

7.7.1 Governance Committee. The Chair will appoint a Governance Committee that shall: oversee implementation and amendment of these Bylaws and address such other issues pertinent to Governance as the Board may choose to delegate to it. The Chair will designate one of the appointed Directors to be the Chair of the Governance Committee.

7.7.2 Nominating Committee. Constituted as described in Section 6.4.1 of these Bylaws.

7.7.3 Other Board Committees. The Board may appoint such Board committees as it deems necessary from time to time to carry out its business affairs. In appointing such committees, the Board will specify their purpose, membership, voting, notice and meeting procedures and such other direction as the Board may deem

appropriate. The Board may appoint one or more Members or other persons to participate in Board committees as full voting members or as non-voting advisory members.

7.7.4 Standards of Conduct for Board Committee Members. Members of Board committees shall comply with the Board Member Standards of Conduct set forth in Appendix A.

8. Member Committees.

8.1 Purpose.

WECC will have committees composed of its Members to advise and make recommendations to the Board. Such committees will include both standing committees required by these Bylaws and such other committees as the Board may choose to create.

8.2 Standing Committees.

WECC will have the following standing committees:

8.2.1 Member Advisory Committee. This committee is comprised of Member representatives elected by the Member Classes, or subclasses, as set forth herein.

8.2.1.1 The committee shall advise the Board on any matters the Board requests the committee to evaluate or consider; and advise the Board on matters as the committee deems appropriate.

8.2.1.2 The committee's Chair or designee will attend the Board's meetings to provide advice, clarifications or respond to Directors' questions. The Board Chair and committee Chair shall develop guiding principles and procedures as necessary, to ensure open, effective, and efficient dialog between the MAC and Board. Such guiding principles and procedures may be amended by the Board and committee's Chairs.

8.2.2 WECC Standards Committee. This committee will oversee the process for responding to requests for Regional Reliability Standards and Regional Criteria in accordance with the Reliability Standards Development Procedures. The WECC Standards Committee is responsible for determining if a request for a Regional Reliability Standard or a Regional Criteria is within the scope of WECC's activities, and for overseeing the drafting, comment and voting process for a Regional Reliability Standard or Regional Criteria. The WECC Standards Committee shall also oversee the process for responding to requests for interpretations of Regional Reliability Standards and Regional Criteria. The WECC Standards Committee shall consist of one member from each of the WECC Standards Voting Sectors set forth in ~~Section 8.6.5.2~~the Reliability Standard Development Procedures, and a member of the WECC Board who shall act as chair of this committee. The WECC Board shall approve a Charter for the

WECC Standards Committee that describes the WECC Standards Committee membership selection process.

8.2.3 Planning Coordination Committee. This committee will advise and make recommendations to the Board on all matters within the jurisdiction of WECC pertaining to maintaining reliability through evaluating generation and load balance and the adequacy of the physical infrastructure of the interconnected Bulk Electric System within the Western Interconnection.

8.2.4 Operating Committee. This committee will advise and make recommendations to the Board on all matters within the jurisdiction of WECC pertaining to maintaining reliability through the operation and security of the interconnected Bulk Electric System in the Western Interconnection.

8.2.5 Market Interface Committee. This committee will advise and make recommendations to the Board on the development of consistent Market Interface practices and compatible commercial practices within the Western Interconnection. It will consider matters pertaining to the impact of WECC's reliability standards, practices, and procedures on the commercial electricity market in the Western Interconnection, and facilitate analysis of the impact of electricity market practices on electric system reliability.

8.3 Other Committees.

8.3.1 The Board may create such other committees as it may desire from time to time. The Board will specify the functions, duties and responsibilities of any such committee at the time of its creation. The Board will also specify the membership rules, quorum requirements, voting levels and meeting and notice requirements at the time of creation. Any changes in the membership rules, quorum requirements, or voting levels of a committee, once established by the Board, will require a seventy-five percent (75%) vote of the Board to alter. The specific function or sunset date for a committee will be designated by the Board at the time of the committee's creation. The committee will terminate its activities upon the completion of its function or the expiration of the date set by the Board.

8.4 ~~Assessment of Standing Committee Activities.~~ [Repealed]

~~Within eighteen months of the Federal Energy Regulatory Commission (FERC) approval of Section 6 establishing an independent Board, and, thereafter, within no longer than a five year period after the previous review, the Board of Directors will conduct a thorough review of the activities of each of WECC's standing committees to assess whether they are effectively furthering WECC's purposes in a manner that is consistent with: 1) the provisions of Section 2.2 of these Bylaws; and 2) the then current state and the expected future evolution of the electric power industry within the Western Interconnection. The Board's review will assess whether there are any aspects of the standing committees' functions or~~

~~procedures that impede development of WECC standards, obligations, processes, and decisions that are timely, fair, effective, and reasonable in view of the commercial, legal, regulatory, and economic needs and objectives of the affected Members. The Board will propose to the membership, at the Members' annual meeting held after completion of a review required by this Section 8.4, any changes to standing committee structures, functions, or procedures that the Board determines are warranted by its review.~~

8.5 Procedures for Member Advisory Committee Decision-Making.

8.5.1 Member Advisory Committee (MAC). The committee shall be comprised of three representatives from each of the five (5) Member Classes, for a total of fifteen (15) members.

8.5.1.1 The Board, by resolution, may create up to three additional representative positions on the MAC, to include representation for Entities of the Canadian Provinces of British Columbia, and/or Alberta, and/or the Mexican State of Baja California. The Board resolution shall set forth the terms through which Canadian or Mexican representatives shall be selected and serve.

8.5.2 MAC Member Elections. At the Annual Members Meeting, each Member Class shall conduct elections to elect Class member representatives for the committee. As set forth herein, each Class may subdivide into up to three subclasses for purposes of electing a Class' MAC members.

8.5.2.1 Committee member terms. Each committee member will serve a three year term. Terms shall be staggered such that one of each Class' representative committee member's terms ends each year. Class committee members may have term limits as determined appropriate by the Class or subclass electing such committee member.

8.5.2.2 Subclasses. Each Class will determine the need for diversity within the Class (e.g., geographic, stakeholder issues, etc.) which may lead to the establishment of subclasses. A Class may subdivide into up to three subclasses. Each Class shall determine to establish or discontinue its subclasses, if any, by majority vote of the members in the Class.

8.5.2.3 Committee member nominations and elections. Only members of each Class, or subclass, if applicable, may nominate and vote on candidates for election as a MAC member representative for their respective Class or subclass.

8.5.2.3.1 A Class or subclass candidate need not be a member of the Class or subclass, neither an employee of a Class or subclass member.

8.5.2.3.2 A quorum of a majority of the members of a Class or subclass must be present in order to elect a MAC member for the Class or subclass; election shall be by simple majority of votes cast.

8.5.2.3.3 Where there are more candidates for election than positions to fill, absentee ballots shall allow voters to order the candidates by order of preference so that their wishes may be honored in case a runoff is required. Absentee ballots shall be counted in the first ballot based on the top choice, or the top two or three choices if more than one seat is being filled. In any runoff election, absentee ballots shall be counted based on the highest preferences indicated for the candidates who remain in the runoff election.

8.5.2.3.4 Other nomination and election procedures, beyond those contained in these bylaws, may be proposed for a Class or subclass. Contingent upon their approval, by the General Counsel, for their submission to Members, they may be adopted for implementation by majority vote of the Member Class or subclass.

8.5.3 MAC Member Vacancy by Resignation or Removal

8.5.3.1 Resignation. At any time, any MAC member may resign from their position by providing written notice of resignation to the MAC Chair. Such notice shall be effective as of the date the notice is submitted to the MAC chair.

8.5.3.2 Removal. The MAC or the Member Class or subclass which elected a MAC member may remove the MAC member prior to completion of the Mac member's term of office as set forth herein:

8.5.3.2.1 Removal by the MAC. The MAC may remove any MAC member for gross negligence, gross misconduct, violation of local, state, provincial, or federal law, or gross failure to carry out the duties of a MAC member. Such removal will only occur after the affirmative vote of at least two-thirds (2/3) of the MAC members.

8.5.3.2.2 Removal by the Electing Class or Subclass. The electing Member Class or subclass may remove any MAC member representing that respective Class or subclass. Such removal will occur after the affirmative vote of a majority of the Members of the electing Class or subclass.

8.5.3.3 Vacancy. Whenever a MAC vacancy occurs, the MAC Chair shall conduct a proper and effective election, allowing for a reasonable period to select candidates and to organize such an election.

8.5.3.3.1 Whenever a MAC vacancy occurs, the MAC Chair shall, as promptly as feasible, conduct an election consistent with these Bylaws for the Member Class or subclass from which the vacancy arose, allowing for a reasonable period to select candidates and to organize such an election.

8.5.3.3.2 Until an election can be held, the MAC Chair may appoint an interim MAC member to fill the vacancy as may be required to meet the MAC quorum requirements of 8.5.8. The appointee shall serve until an effective election can be held. Any interim appointment must come from Members of the same Class or subclass from which the vacancy arose.

8.5.4 MAC officers. At the Annual Meeting, after incoming MAC members have been duly elected by the Member Classes or subclasses, if applicable, the MAC will elect the MAC Chair and MAC Vice-Chair from the MAC members. The Chair and Vice-Chair must represent different Classes, and shall serve one year terms, measured from the Annual Meeting to the next Annual Meeting. In the event of the resignation or removal of the Chair or Vice-Chair, the MAC members shall, at their next regular or special meeting, whichever is sooner, elect a new MAC Chair or MAC Vice-Chair, respectively.

8.5.5 MAC Member Duties. All MAC members shall have a duty to represent the interests of their Member Class or subclass. All MAC members shall maintain regular contact with the members of their Member Class as issues are considered by the MAC, and shall make reasonable good faith efforts to present and discuss both majority and minority opinions from their Member Class on matters before the MAC.

8.5.6 Regular and Special Meetings.

8.5.6.1 Regular meetings. All regular business of the MAC shall occur at MAC meetings which are noticed pursuant to Section 8.5.7. The MAC shall meet in person not less than two times per year, including once in conjunction with the Annual Meeting. The MAC shall establish a regular meeting schedule, which will be made available to the Members and Directors electronically, and available to the public through posting on the WECC website.

8.5.6.2 Special Meetings. Whenever the MAC Chair finds, or upon request to the MAC Chair from any five (5) MAC Members, that there is urgent business requiring MAC consideration or action prior to the next regularly

scheduled meeting, then a special meeting shall be called with notice given in accordance with Section 8.5.7.

8.5.7 Notice.

8.5.7.1 Regular Meetings. All regular meetings of the MAC shall require at least twenty-one (21) days written notice to the MAC members, the Directors, and the Members. Such notice shall specify the time and place of the meeting, and an agenda of the business to be conducted including those matters upon which a vote will be taken. Notice of regular MAC meetings shall be effective upon electronic distribution, and shall be posted to the WECC website within one (1) business day of electronic distribution.

8.5.7.2 Special Meetings. Any special meetings of the MAC shall require at least ten (10) days written notice to the MAC members, the Directors, and the Members. Such notice shall specify the time and place of the meeting, and an agenda of the business to be conducted, including those matters upon which a vote will be taken. Notice of special MAC meetings shall be effective upon electronic distribution, and shall be posted to the WECC website within one (1) business day of electronic distribution.

8.5.8 Quorum. No business shall be conducted by the MAC unless a majority of the MAC members is present, including at least one MAC member from each Member Class which elects MAC members (not including subclass designations).

8.5.9 Majority Vote. A decision of the MAC shall be upon a simple majority vote of committee members voting unless otherwise required in other bylaw provisions.

8.5.10 Remote Participation at MAC Meetings. Any or all of the MAC members may participate in any meeting of the MAC electronically or by telephone, or by any other means of communications which enables the MAC members to simultaneously hear one another. Every MAC member participating in a meeting in this manner will be deemed to be present in person at the meeting.

8.5.11 Reporting to the Board. The MAC Chair, or designee, shall provide a report to the Board at each Board meeting detailing the business carried out by the MAC, and advising the Board of MAC recommendations on matters as set forth in Section 8.2.1 herein. In the event that there are dissenting MAC member opinions regarding a matter on which the MAC is advising or providing recommendations to the Board, the MAC Chair, or designee, shall present dissenting opinions and rationales in conjunction with the respective MAC advice or recommendations.

8.5.12 Open Meetings. Except as provided in Section 8.5.13, all regular and special meetings of the MAC will be open to observation by any Member, Director, and/or any member of the public.

8.5.13 Closed Session. Notwithstanding the provisions of Section 8.5.12, after a quorum has been established at any MAC meeting and upon an affirmative vote of two-thirds (2/3) of the MAC members present, the MAC may close an open meeting and reconvene in closed session in the following instances: (1) to receive and/or discuss confidential attorney-client privileged information from WECC's counsel; or (2) to receive and discuss any other information which is privileged, confidential, proprietary, trade secret, or otherwise protected from public disclosure by law.

8.5.13.1 Attendance by an Affected MAC Member. Closed sessions of the MAC may not be attended by a MAC member under the following circumstances: (1) when the qualification or performance of the MAC member is being discussed; (2) when the MAC member is employed by an entity that is or is likely to become a party to the litigation or legal issue being discussed; or (3) when the MAC Chair determines that the MAC member would have a conflict of interest by becoming privy to the privileged or confidential information that is to be presented to or discussed by the MAC in closed session.

8.5.13.2 Attendance by Directors. Any member of the Board may attend a closed session of the MAC unless the topic considered by the MAC concerns the Director.

8.5.13.3 Announcement and Adjournment of Closed Session. Prior to adjourning to a closed session, the MAC Chair will announce the purpose of the closed session in a manner that provides the public an understanding of the general subject matter to be discussed, but which does not reveal privileged, confidential or otherwise sensitive personal information. The closed session then shall be limited in scope to the publicly stated purpose of the closed session. After the closed session has ended, the MAC Chair shall provide the public a general description of the business conducted during the closed session, without breaching the confidentiality of the information used in the session.

8.5.13.4 Confidentiality of Closed Session. All MAC members and any others present at a closed session shall maintain the confidentiality of the information, discussions, and decisions made in closed session. Unless otherwise required, all MAC members and closed session attendees shall execute an appropriate confidentiality agreement provided by WECC's General Counsel. The MAC Chair will appoint a secretary for the closed session to take minutes of the closed session, which shall be delivered to the WECC Corporate Secretary. Minutes of the closed session will be maintained confidential by the Corporate Secretary.

8.5.14 MAC Committees. The MAC may appoint such subcommittees and work~~ing~~ groups as it deems necessary from time to time to carry out its business affairs. In

appointing such subcommittees or work~~ing~~ groups, the MAC will specify, in a charter, their purpose, membership, voting, notice and meeting procedures, and other such direction as the MAC deems appropriate. The MAC may appoint one or more MAC members or other persons to participate in MAC subcommittees or work~~ing~~ groups as full voting members or as non-voting advisory members.

8.5.15 MAC meetings and activities will be self-~~-~~funded by Members with respect to labor and travel expenses. However, WECC and WECC staff will provide facilitation and coordination support, including payment for the expenses of meeting facilities. A MAC member may seek reimbursement, from WECC, for reasonable and actual travel expenses arising from attendance at MAC meetings, consistent with WECC employee travel expense reimbursements, where such MAC member's travel expenses are not reimbursed by any Member or other source.

8.6 Procedures for Committees other than the Member Advisory Committee.

8.6.1 Reports to Board of Directors. Action by a committee will be in the form of a recommendation for Board action except in those instances in which the Board has, by resolution, specifically delegated to a committee the power to take action subject to an appeal to the Board by any Member. The recommendation of a committee must be forwarded to the Board for its action along with any minority or dissenting reports filed with the committee Chair or Vice-Chair.

8.6.2 Subcommittees, Task Forces and Ad Hoc Groups. Any Board or member committee may create such subcommittees, task forces or other ad hoc groups ("subcommittee") as it deems appropriate to carry out the committee's responsibilities consistent with these Bylaws and the direction of the Board. The composition, responsibilities and procedures of such groups shall be specified by the committee as appropriate; provided, however that: 1) the committee may only delegate to such subcommittee responsibilities that are within the scope of the committee's responsibilities pursuant to these Bylaws and direction of the Board; and 2) the subcommittee may only make recommendations to the committee. A committee may create a subcommittee without prior approval of the Board; provided, however, that the committee shall promptly inform the Board in writing and at the next Board meeting regarding the creation of the subcommittee. The notification to the Board shall include a charter for the subcommittee that describes how members of the subcommittee will be selected, the duties of the subcommittee, and whether the committee has established a sunset date for review of (1) the need for the subcommittee and (2) the charter of the subcommittee.

8.6.3 Committee Officers. The Board will appoint the Chair and Vice-Chair of each committee. The Committee Chair or Vice-Chair will preside over all meetings of the committee and will report recommendations of the committee to the Board of Directors. The Chair and Vice-Chair will be responsible for informing the Board regarding minority opinions and other information required by the Board along

with overall committee recommendations. Whenever the committee elects to form a subcommittee to represent regions or address specific tasks, the Chair (or in the absence of the Chair, the Vice-Chair) will have the power to appoint the members of such subcommittee from both members of the committees and non-members. Upon resignation of the Committee Chair, the Vice Chair shall serve as Chair until the Board appoints a replacement. Upon resignation of the Vice Chair, the Chair may appoint a temporary Vice Chair to serve until the Board appoints a replacement. Upon resignation of both the Chair and Vice Chair, the Chair of the Board may appoint one or more temporary replacements to serve until the Board appoints permanent replacements.

8.6.4 Committee Membership. Except as provided in Sections 8.2.2 and 8.6.4.1, any Member of WECC may designate one representative as its committee member to any standing committee or other committee. The WECC Member will have one vote at any committee meeting through that committee member. Any number of other persons may attend a committee meeting, but such persons will have no right to vote without a prior designation of representation by a WECC Member.~~, except that interested stakeholders may, under Section 8.6, vote on proposed Reliability Standards or revisions to Reliability Standards~~.

8.6.4.1 Dual Representation for Functionally-Separated Members. A Member which has distinct and functionally-separated interests as both a transmission provider and a transmission customer may designate two representatives as committee members to any standing committee, one to represent each functionally separate interest. Each such committee member will have one vote. The privilege granted by this Section is subject to revocation by the Board on a case-by-case basis or generally whenever the Board finds, upon petition from any Member or its own motion, that such dual representation creates unfairness or imbalance within a committee.

8.6.5 Committee Voting and Classes.

8.6.5.1 Classes. For purposes of voting, committees, excluding the WECC Standards Committee and the Member Advisory Committee, will have three classes of membership:

8.6.5.1.1 Transmission Provider Members;

8.6.5.1.2 Transmission Customer Members; and

8.6.5.1.3 States and Provincial Members (Member Class 5).

~~8.6.5.2 WECC Standards Voting Sectors. For purposes of voting on Regional Reliability Standards and Regional Criteria, a Ballot Body consisting of five registered sectors (8.6.5.2.1 through 8.6.5.2.5) and three non-~~

registered sectors (8.5.5.2.6 through 8.6.5.2.8) shall be established. If an Entity is eligible for a registered sector, then that Entity may be eligible for more than one registered sector. An Entity can only be in one non-registered sector. An Entity cannot be in both a registered and a non-registered sector. The first five sectors (8.6.5.2.1 through 8.6.5.2.5) shall be limited to Entities which are listed in the North American Electric Reliability Corporation ("NERC") compliance registry and to those Canadian and Mexican Entities that perform functions that, if performed in the United States, would allow these Entities to be registered for compliance in the NERC compliance registry. A WECC member or Participating Stakeholder who wishes to participate in voting on Reliability Standards and Regional Criteria shall apply for membership in the Ballot Body in any or all of the registered WECC Standards Voting Sector(s) for which it believes it is eligible, or one of the three non-registered sectors. WECC staff shall confirm Participating Stakeholder's eligibility for such Sector(s). Decisions of the staff to approve, deny, or restrict the admission of an entity to a voting sector may be appealed to the Governance and Nominating Committee. Decisions of the Governance and Nominating Committee to affirm or reverse such decisions of staff may be appealed to the Board. The following sectors are established:

8.6.5.4.0 Transmission Sector. This sector consists of Western Interconnection Entities registered in the NERC compliance registry as transmission owners, transmission operators, transmission service providers, or transmission planners;

8.6.5.6.0 Generation Sector. This sector consists of Western Interconnection Entities registered in the NERC compliance registry as generation owners or generation operators;

8.6.5.8.0 Marketers and Brokers Sector. This sector consists of Western Interconnection Entities registered in the NERC compliance registry as purchasing-selling Entities;

8.6.5.10.0 Distribution Sector. This sector consists of Western Interconnection Entities registered in the NERC compliance registry as distribution providers or load-serving Entities;

8.6.5.12.0 System Coordination Sector. This sector consists of Western Interconnection Entities registered in the NERC compliance registry as balancing authorities, reserve sharing groups, planning authorities, resource planners, interchange authorities, or reliability coordinators. WECC may cast a vote in this sector;

8.6.5.14.0 End Use Representative Sector. This sector consists of non-registered members of WECC Member Class Four;

~~8.6.5.16.0 State and Provincial Representatives Sector. This sector consists of non-registered WECC members of WECC Member Class Five;~~

~~8.6.5.18.0 Other non-registered WECC Members and Participating Stakeholders Sector. This sector consists of consultants and other members of WECC Member Class Three, or interested stakeholders who qualify for Participating Stakeholder status but are not registered in the NERC compliance registry.~~

~~8.6.5.20~~8.6.5.2 Voting. Except as provided in Section 4.5.2 ~~and 8.6.5.4~~, each committee member will have one vote. In order for a recommendation to be made to the Board, such recommendation must receive a simple majority vote of both: 1) committee members present and voting from the Transmission Provider Class; and 2) committee members present and voting from Transmission Customer Class. The Board will adopt voting and record-keeping procedures to ensure that committee voting is conducted consistent with these Bylaws. This requirement will also apply where decision making power has been delegated to a committee pursuant to Section 6.9.1.

~~8.6.5.20.1~~8.6.5.2.1 State and Provincial Votes. The position of the state and provincial Class committee members must be recorded, but the failure of a proposed recommendation or decision to obtain a simple majority vote of the state and provincial committee members will not prevent the recommendation or decision from being posted for due process comment or sent to the Board of Directors.

~~Voting on Regional Reliability Standards and Regional Criteria. Whenever the WECC Standards Committee determines that a draft Regional Reliability Standard or Regional Criteria is ready for consideration by the Ballot Body, it shall be presented for a vote. Members of the Ballot Body shall be provided an opportunity to opt into a Ballot Pool formed for purposes of voting on each of the proposed Regional Reliability Standards or Regional Criteria as described in the Reliability Standards Development Procedures. A two-thirds quorum of the specially formed Ballot Pool is required for a valid vote. Members of the Ballot Pool shall cast their vote in the WECC Standard Voting Sectors listed in 8.6.5.2. When members of the Ballot Body who are eligible to vote in more than one of the sectors defined in 8.6.5.2 join the Ballot Pool, they may cast one vote in each voting sector in which they are eligible. Calculation of the vote by the WECC Standard Voting Sectors will be pursuant to a weighted sector voting formula as described in the Reliability Standards Development Procedures. If the Ballot Pool~~

~~approves a proposed Regional Reliability Standard or Regional Criteria, then that proposed Regional Reliability Standard or Regional Criteria will be recommended to the WECC Board. The process of approving proposed Regional Reliability Standards and Regional Criteria is further guided by the Reliability Standards Development Procedures.~~

8.6.6 Notice and Review of Committee Recommendations and Decisions (Due Process). Committee recommendations or decisions delegated to a committee pursuant to Section 6.9.1 will be subject to the due process provisions of this Section. Following a committee's development of a proposed recommendation or decision, the committee will post the proposed recommendation or decision on the WECC website for review and comment by other WECC Members, and other interested parties. The committee will provide all Members e-mail notification of the posting and will allow at least thirty (30) days for comment on the proposal. The committee will consider all such additional input before reaching its final recommendation or decision. If the committee's recommendation or decision changes significantly as a result of comment received, the committee will post the revised recommendation or decision on the website, provide e-mail notification to Members and provide no less than ten (10) days for additional comment before reaching its final recommendation or decision. Upon reaching its final recommendation or decision, the committee will forward it to the Board. Whenever it determines that a matter requires an urgent decision, the Board may shorten any time period set forth in this Section, provided that: 1) notice and opportunity for comment on recommendations or decisions will be reasonable under the circumstances; and 2) notices to Members will always contain clear notification of the procedures and deadlines for comment.

8.7 Procedures for Developing and Voting on Reliability Standards.

8.7.1 Rights and Obligations of WECC Members and Participating Stakeholders. All WECC Members and Participating stakeholders are entitled to participate in the development of and to vote on Reliability Standards, Regional Criteria or revisions, subject to any applicable obligations, limitations and conditions set forth in these Bylaws, and in accordance with the WECC Reliability Standards Development Procedures.

8.7.1.1 Participation. The right to participate in Reliability Standards and Regional Criteria development and voting includes the right to request the development or revision of a Reliability Standard, the right to receive notice of, attend and participate in related WECC discussions, the right to review information relevant to a Reliability Standard or revision, the right to provide written comments on a proposed Reliability Standard, Regional Criteria, or revision, the right to participate in voting on a Reliability Standard, Regional Criteria, or revision and the right to file an appeal requesting review of any decision on a Reliability Standard, Regional Criteria, or revision.

8.7.2 Voting. The procedures and conditions for voting by WECC Members and Participating Stakeholders are set forth in the Reliability Standards Development Procedures. ~~and in Sections 8.6.5.2 and 8.6.5.4 of these Bylaws. A Participating Stakeholder may only vote on a proposed Reliability Standard or revision if they have applied for and been granted Participating Stakeholder status in accordance with Section 8.7.2 below. A Participating Stakeholder is only entitled to vote on Reliability Standards and revisions, and may only vote on Regional Criteria if the proposed Regional Criteria could result in sanctions to a non-WECC member. A Participating Stakeholder is not entitled to vote in any other WECC committee balloting process or in elections for WECC Directors.~~

8.7.3 ~~Special Procedures~~Board Authority to Address Regulatory Directives. The Board shall have backstop authority to address regulatory directives as described in the Reliability Standards Development Procedures. ~~If the Board determines that the procedures for drafting and voting on Reliability Standards did not result in a proposed Reliability Standard that addresses a directive issued by an Applicable Regulatory Authority, the Board shall have authority to take certain actions as described in the Reliability Standards Development Procedures to ensure that a Reliability Standard responsive to an Applicable Regulatory Authority's directive is drafted, approved and/or submitted to the Applicable Regulatory Authority. In the event that a Reliability Standard or revision that is proposed in response to an Applicable Regulatory Authority's directive fails to achieve a majority vote of the Ballot Pool, or if a quorum of the Ballot Pool was not established upon re-ballot of a proposed Reliability Standard, then the Board has the authority to take appropriate actions, as described in the Reliability Standards Development Procedures, to ensure that a Reliability Standard responsive to a regulatory directive can be submitted to NERC and FERC with a request that it be made effective. To exercise such authority, the Board must find that the proposed Reliability Standard or revision is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified. If the Board is unable to make this finding, then the Board may direct that the proposed Reliability Standard be filed with the Applicable Regulatory Authority as a compliance filing in response to the regulatory directive, along with a recommendation that the standard not be made effective and an explanation of the basis for the recommendation.~~

8.7.4 Participating Stakeholder Application Process. Any person or entity that is an interested stakeholder may apply to WECC for Participating Stakeholder status and, upon WECC's acceptance of such application, acquire the participation and voting rights set forth above in Section 8.7.1. WECC staff, under the direction of the CEO, will process applications and make the initial determination of eligibility for Participating Stakeholder status. Denial of Participating Stakeholder status may be appealed to the WECC Governance ~~and Nominating~~ Committee and, if denied by the Governance ~~and Nominating~~ Committee, to the

WECC Board. A person or entity's Participating Stakeholder status will be maintained so long as the Participating Stakeholder continues to meet the requirements set forth in Section 3.24 and participates in at least one WECC meeting per year at which a Reliability Standard or revision is discussed. In the event a person or entity's Participating Stakeholder status lapses due to failure to meet the above minimum participation requirement, the person or entity may restore Participating Stakeholder status by re-applying for Participating Stakeholder status and attending a WECC meeting at which a Reliability Standard is discussed.

8.7.5 WECC Standards Voting Sectors. WECC staff shall confirm eligibility for the WECC Standards Voting Sectors set forth in the Reliability Standards Development Procedures. Decisions of the staff to approve, deny, or restrict the admission of an entity to a voting sector may be appealed to the Governance Committee. Decisions of the Governance Committee to affirm or reverse such decisions of staff may be appealed to the Board.

8.7.6 WECC staff shall require Ballot Body members to identify their affiliations with other Ballot Body members. Affiliates within a single Standards Voting Sector may only have one vote in that Standards Voting Sector. Affiliates within a single Standards Voting Sector must designate a single Affiliate as the group's Ballot Pool member to vote in that Standards Voting Sector.

8.8 Notice of Committee Meetings.

8.8.1 Standing Committees. The committee Chair, with the assistance of the Chief Executive Officer, will ensure that not less than ten (10) days' notice of all standing committee meetings is posted on the WECC website and is also provided to: 1) members of the committee; 2) Participating Stakeholders (if the meeting concerns development or approval of a Reliability Standard or revision); and 3) any WECC Member or member of the public requesting notice. A committee may take up any matter at a duly noticed meeting including matters not expressly identified in the notice; provided, however, that a final recommendation to the Board must be made in accordance with Section 8.6.1.

8.8.2 Other Committees. Notice of other committee meetings will be provided in the manner adopted for such notice by the affected Members and in accordance with the requirements of Section 8.8.1.

8.9 Open Meetings.

All committee meetings of WECC will be open to any WECC Member, Director and for observation by any member of the public, except as set forth in these bylaws or in policies on closed sessions that the Board may adopt for the purpose of preventing public disclosure of information that the Board might more appropriately discussed in closed session.

9. The Chief Executive Officer, Officers, and Employees.

9.1 Designation of Officers and Terms of Office.

WECC will have a Chief Executive Officer, a Secretary, and any other officers specified by the Board from time to time. The Chief Executive Officer will also hold the title of President of WECC if applicable law requires WECC to have a President. Each officer will be appointed by the Board and will serve for the term of office specified in the Board action appointing the officer and until his or her successor is appointed. Any two or more offices may be held by the same person except the offices of Chief Executive Officer and Secretary.

9.2 Chief Executive Officer Qualifications.

The Chief Executive Officer will be a person with senior management level experience and knowledge of bulk power electric transmission systems reliability, planning and operations.

9.3 Standards Applicable to All Employees.

A person may not be an officer or employee of WECC if: 1) the person is also the employee of or has a contractual relationship with any Entity, or any Affiliate of any Entity, that is eligible for membership in WECC; or 2) the person has a financial interest that, in the judgment of the Board or the Chief Executive Officer, creates the fact or appearance of bias, undue influence or lack of objectivity regarding any action or decision of WECC. The Board will adopt Standards of Conduct for officers and employees setting forth their duty of care, duty of loyalty, duty to avoid conflicts of interest and related matters intended to promote their neutrality, objectivity and professionalism. Upon adoption, such standards shall be attached hereto as Appendix B.

9.3.1 Exemptions from the disqualification criteria found in Section 9.3 are as follows:

9.3.1.1 Status as a residential electricity customer will not disqualify a person from employment with WECC.

9.3.1.2 A candidate for Chief Executive Officer or employee of WECC will not be disqualified for owning shares in a mutual fund because the mutual fund owns an interest in a Member or an Affiliate of a Member.

9.3.1.3 The disqualification standards described in Section 9.3 will not apply to disqualify a candidate who is receiving payments from a pension plan of a Member or an Affiliate of a Member in a form other than securities of such Member or Affiliate if the pension plan payments bear no relationship to the economic performance of the Member or Affiliate.

9.3.2 If an officer or employee receives a gift or inheritance of securities in any Member or Affiliate, he/she must resign or dispose of such securities within six (6) months of the date of receipt. Within six (6) months of the time a new

Member is added in which an officer or employee owns securities, the officer or employee will resign or dispose of those securities.

9.4 Employment.

The Chief Executive Officer will be employed by the Board of Directors and will serve at the Board's pleasure. Any contract of employment with a Chief Executive Officer will permit the Board to dismiss the officer with or without cause.

9.5 Chief Executive Officer's Duties.

Subject to the Board's direction, the Chief Executive Officer or his/her designees will have the following duties, among others:

9.5.1 Execute policies at the direction of the Board and be responsible to the Board for the performance of the WECC functions described in Section 2;

9.5.2 Hire and fire staff within the constraints of the annual budget;

9.5.3 Perform administrative duties, such as preparing annual budgets for the approval of the Board, making employment decisions and ensuring conformance with regulatory requirements;

9.5.4 Develop and implement employment policies and standards of conduct; and

9.5.5 Accept or reject membership applications in accordance with the criteria of these Bylaws.

9.6 Secretary's Duties.

9.6.1 Maintain Member and Affiliates Lists. The Secretary will maintain continuously updated lists of all Members and Affiliates.

9.6.2 Maintain Official Records. The Secretary will keep minutes of all WECC Board and Member meetings and will receive and maintain minutes of committee meetings and all other official records of WECC. Within five (5) business days after any vote taken by Members, the Board, a Class or any committee, the Secretary will provide notice to all Members and Participating Stakeholders (if applicable) of the results of such a vote through postings on the website, email and/or other means of communication.

9.6.3 Maintain Website. The Secretary will oversee the creation, maintenance, and updating of the WECC's website and the information published through it.

10. Dispute Resolution.

Except as may be otherwise provided herein, and subject to the conditions set forth in Appendix C, Section A.1, disputes between Members and/or WECC will be resolved pursuant to the WECC Dispute Resolution Procedures set forth in Appendix C. Matters subject to the

jurisdiction of the WECC Compliance Hearing Body are not subject to the procedures in Appendix C.

11. Costs and Finances.

11.1 Funding of Reliability Activities.

11.1.1 U.S. Statutory Funding. WECC shall fund all activities undertaken pursuant to Section 215 of the Federal Power Act in accordance with the funding provisions and procedures of that law and related FERC regulations and orders. The Board shall approve a budget for such activities in time for submission to the ERO and to the FERC for approval of such funding in accordance with applicable requirements.

11.1.2 International Funding. WECC shall fund reliability activities undertaken in accordance with any agreements it enters into with Canadian or Mexican Entities. Specifically:

(a) Subject to (b), in the event that a Canadian or Mexican Entity seeks membership in the WECC, that Entity may elect to negotiate an agreement with WECC that provides the terms upon which that Entity will become a Member and, among other things, participate in and/or fund WECC. In such a case and unless agreed otherwise, the Canadian or Mexican Entity shall not be a Member of WECC and shall not have an obligation to fund activities undertaken by the WECC until the terms of such agreement are executed.

(b) Section 11.1.2(a) shall not apply to any Canadian or Mexican Entity that is a Member as of the date of the approval of these WECC Bylaws. Existing Canadian or Mexican Members shall continue as Members in accordance with the terms and conditions of their membership as of the date of the approval of the WECC Bylaws, including the terms and conditions of any agreements in place as of the date of the approval of these WECC Bylaws. Nothing in the Section precludes existing Canadian or Mexican Members from negotiating an agreement with WECC that modifies the terms of its participation in and funding of WECC at any time.

11.1.3 Equitable Allocation of Funding. In adopting budgets for the costs of reliability activities, the Board shall endeavor to achieve an equitable allocation as between funding through Sections 11.1.1 and 11.1.2 based upon the net energy to load and other relevant factors consistent with applicable law, the Delegation Agreement and any International Reliability Agreements.

11.2 Dues.

The Board may require Members and Participating Stakeholders to pay nominal annual dues consistent with applicable FERC requirements (or those of International Reliability Agreements as applicable) to cover reasonable costs of membership and/or participation

in standards development that are not funded through Sections 11.1.1 or 11.1.2. Initial dues of a Member or Participating Stakeholder will be submitted with a completed application for membership or Participating Stakeholder status and will be for the prorated share of the full annual amount based on the Member's or Participating Stakeholder's actual months of membership or participation in the calendar year. In determining nominal dues, the Board may consider all relevant factors including, but not limited to, the ability of different classes of membership or Participating Stakeholders to pay such dues. The Board may also reduce, defer or eliminate the dues obligation of an individual Member or Participating Stakeholder for good cause shown.

11.3 Funding of Non-Statutory Activities.

To the extent that WECC elects to fund any activities not eligible for funding pursuant to Sections 11.1.1 and 11.1.2, it shall do so through the use of service fees, charges or dues applicable to the persons or entities that voluntarily participate in such activities. Participation in or funding of such activities shall not be a condition of membership in WECC.

12. Amendments to these Bylaws.

These Bylaws may be amended by either the Board or by the Members in accordance with the following procedures.

12.1 Amendment by the Board.

Except for those provisions described below, the Board may approve an amendment of the Bylaws after providing not less than thirty (30) days' notice of the proposed amendment to all Members. Approval of such an amendment requires the affirmative votes of not less than two-thirds (2/3) of the Directors in office. Such amendment will become effective sixty (60) days after its approval by the Board (1) unless the vote is appealed to the Members prior to the sixtieth day, or (2) subsequent regulatory approval is required. A Member appeal shall be sufficient to hold implementation of an amendment if a majority of any Class files a petition with the Secretary seeking appeal of such amendment. If such an appeal is received, the membership will vote on whether to rescind the Board approved amendment at the next Annual Meeting unless the Board calls a special meeting of the Members beforehand. An appeal will only be successful if a majority of all Members and a majority (three of five) of Member Classes vote to rescind the amendment. If the appeal vote is not successful, then the amendment will be deemed approved as of the day of the failed Membership vote. If subsequent regulatory approval is required for the amendment, then the amendment shall be effective upon the effective date of such approval.

12.1.1 Notwithstanding the foregoing, both Board and Member approval is required to amend provisions of these Bylaws concerning Sections 1.1 and 1.2; Section 4.2; Sections 6.2 through 6.8, inclusive; Section 7.2; Section 10; Sections 12.1 through 12.4, inclusive; Appendix C, and any other sections as may be required by Utah law. In such case, the Board shall first vote on the proposed amendment. If approved by the Board by the majority specified in Section 12.1 necessary to attain Board approval, the amendment must then be noticed to Members at least sixty (60) days prior to the Annual Meeting or a Special Member Meeting at

which the Member vote will occur. The amendment will then be approved if approved by two thirds (2/3) or more of the Members who vote upon such amendment.

12.2 Amendment by the Members.

Upon petition filed with the Secretary by any Member or Director, at any Annual Meeting the Members may amend any provision of these Bylaws; provided: 1) the proposed amendment has first been presented to the Board and not adopted (this provision will not apply to amendments which the Board is prohibited from adopting); 2) Members have received not less than sixty (60) days' notice of the proposed amendment, the reasons there for and a statement of the Board's position regarding it; and 3) the amendment receives the affirmative votes of not less than two-thirds (2/3) of all Members and a majority of Member Classes.

12.3 Amendments in Response to Mandatory Membership.

If at any time, pursuant to legislation or otherwise, membership becomes mandatory for some or all Members, upon the request of the affected Member(s) the Board will consider amendments to these Bylaws appropriate to such mandatory membership.

12.4 Amendments proposed by FERC.

FERC, upon its own motion or upon complaint, may propose an amendment to these Bylaws pursuant to 18 C.F.R. § 39.10(b).

13. Termination of Organization.

WECC may be terminated upon a vote of a majority of the Members in accordance with the provisions of Utah law, the Federal Power Act and the requirements of the Delegation Agreement and applicable International Reliability Agreements. Immediately upon such a vote, the Board will, after paying all debts of WECC, distribute any remaining assets in accordance with the requirements of Utah law, the Internal Revenue Code and these Bylaws.

14. Miscellaneous Provisions.

14.1 Limitation on Liability.

It is the express intent, understanding and agreement of the Members that the remedies for nonperformance expressly included in Section 4.8 hereof shall be the sole and exclusive remedies available hereunder for any nonperformance of obligations under these Bylaws. Subject to any applicable state or federal law which may specifically limit a Member's ability to limit its liability, no Member, its directors, members of its governing bodies, officers or employees shall be liable to any other Member or Members or to third parties for any loss or damage to property, loss of earnings or revenues, personal injury, or any other direct, indirect, or consequential damages or injury which may occur or result from the performance or nonperformance of these Bylaws, including any negligence, gross negligence, or willful misconduct arising hereunder. This Section 14.1 of these Bylaws applies to such liability as might arise between Members under these Bylaws. This Section 14.1 does not apply to parties to the Agreement Limiting Liability Among Western Interconnected Systems ("WIS Agreement") with respect to matters covered by the WIS Agreement and does not apply to any liability provision in any other agreement.

14.2 Indemnification.

WECC shall indemnify and hold harmless its Directors, officers, employees, agents and advisors against any and all damages, losses, fines, costs and expenses (including attorneys' fees and disbursements), resulting from or relating to, in any way, any claim, action, proceeding or investigation, instituted or threatened, arising out of or in any way relating to any action taken or omitted to have been taken (or alleged to have been taken or omitted to have been taken) by such person in connection with actions on behalf of WECC, and against any and all damages, losses, fines, costs and expenses (including attorneys' fees and disbursements) incurred in connection with any settlement of any such claim, action, proceeding or investigation unless such action of such person is determined to constitute fraud, gross negligence, bad faith or willful misconduct with respect to the matter or matters as to which indemnity is sought.

14.3 No Third Party Beneficiaries.

Nothing in these Bylaws shall be construed to create any duty to, any standard of care with reference to or any liability to any third party.

14.4 Informal Inquiries for Information.

Nothing in these Bylaws shall preclude: 1) a Member from making an informal inquiry for information outside of the procedures outlined in Section 4.6.11 hereof to another Member and 2) that other Member from responding voluntarily to that informal inquiry, provided, however, that any such response to an informal inquiry for information shall not be binding upon that other Member and shall be used by the Member making the informal inquiry for informational purposes only.

15. Incorporation.

WECC shall organize itself as a non-profit corporation pursuant to the laws of the state of Utah regarding non-profit corporations under the name "Western Electricity Coordinating Council." All Members agree to take no actions that would contravene the ability of WECC to maintain its status as a non-profit corporation existing pursuant to the Utah Act. The Board shall adopt these Bylaws as the Bylaws of WECC as a non-profit corporation.

WECC is intended to qualify as an organization described in Section 501(c)(4) of the Internal Revenue Code. No part of any net earnings of WECC shall inure to the benefit of any Member or individual. Upon liquidation, to the extent consistent with the Internal Revenue Code and Utah law, any monies remaining from assessments paid by Members for the costs of WECC shall be rebated to Members in proportion to their payments. Any remaining assets of WECC shall be transferred to another organization exempt from tax under Section 501(a) of the Internal Revenue Code, or government agency, promoting the same purposes as WECC, as designated by the Board.

16. Governing Law.

Unless otherwise agreed, if any conflict of law arises under these Bylaws among the Members, the laws of the United States of America shall govern, as applicable. The venue for any legal

action initiated under these Bylaws shall be the city and state (or province) in which the headquarters of WECC is located.

17. WECC Transition

The provisions of this Section shall apply to that period of time and activities associated with the transition of WECC from a hybrid Board of Directors to an independent Board of Directors with a Member Advisory Committee.

17.1 Board of Directors transition.

17.1.1 The transition of WECC governance from a hybrid Board to an independent Board of Directors will be effective upon the effective date of Federal Energy Regulatory Commission approval of Section 6.1 establishing an independent Board ("Effective Date"). The non-affiliated directors of WECC, whose terms extend past the Effective Date, so willing to continue to serve, shall form part of the initial cadre of independent Directors. These continuing Directors shall be entitled to serve the remainder of their respective three-year terms of office.

17.2 Transition Exceptions

The nomination, election and term of additional independent Directors shall be in conformance with the requirements of these bylaws, as amended, except:

17.2.1 The requirement that the Nominating Committee notify the Board Chair of the committee's nominations sixty (60) days prior to an Annual Meeting shall not apply.

17.2.2 Appointments of Member Advisory Committee members to the Nominating Committee shall be made such that no one class can occupy more than one seat at a time and cannot have a representative on the committee more than two years in a row.

17.2.3 Director positions of non-affiliated directors of WECC, whose terms extend beyond the Effective Date, but whose directors resign or indicate they will resign prior to the Effective Date, will be filled through the same nomination and election process used to select additional independent directors as provided above.

17.2.4 Those Directors first elected as a result of this transition from a hybrid to an independent Board will draw lots to determine their term length determined to achieve the staggered terms required by Section 6.3.

17.2.5 The nomination and election of a number of additional Directors needed to seat the entire Independent Board as described in section 6.4 as of the Effective Date may occur prior to the Effective Date. While the nomination and election of an individual to a director position may occur prior to the Effective Date, such nomination and election shall have the full force and effect of these bylaws after the Effective Date.

17.3 Member Advisory Committee transition

17.3.1 Initial Formation. When there is a meeting where Members vote to amend the WECC bylaws to provide for a Member Advisory Committee (MAC), the MAC will initially be constituted through elections conducted in conjunction with the same meeting.

17.3.2 Election of the initial MAC member representatives shall be as provided in these bylaws, as amended, except:

17.3.3 Where what had been the Class Seven membership category is combined with the Class Three membership category, Class Seven Members will indicate, prior to the meeting, whether they intend to continue participation in WECC as a member of the newly combined Class Three category. Entities so indicating will be considered members of Class Three for purposes of the initial formation of the MAC and shall be entitled to participate in elections for Class Three member representatives of the MAC.

17.3.4 Member Classes will not be allowed to subdivide into subclasses for purposes of electing class representative MAC members at the meeting where the MAC is initially formed and where initial MAC member elections are conducted.

17.3.5 The terms of each Class' three (3) initial Class representative members on the MAC shall be allocated, by the drawing of lots, such that the intended staggered terms for MAC members will be obtained, with one of a Class' initial MAC member representatives serving an initial term of one year, another two years, and another three years.

C. WECC Dispute Resolution Procedures

Appendix A
Standards of Conduct for
Members of the WECC Board of Directors

By accepting appointment to the Board of Directors (the "Board") of the Western Electricity Coordinating Council ("WECC"), a Director agrees to abide by the duties required of corporate directors and trustees. Utah law (and similar law in other states) imposes quasi-fiduciary duties of care and loyalty on all corporate directors or trustees, including directors and trustees of nonprofit corporations. For as long as he or she remains a member of the Board of Directors of WECC, a Director will abide by the following standards of conduct.

I. Duty of care. The Directors of a corporation are bound to use due care and to be diligent in respect to the management and administration of the affairs of the corporation. This duty of care is generally thought to have two components: the time and attention devoted to corporate affairs and the skill and judgment reflected in business decisions.

A. Each Director will regularly attend Board of Directors meetings, digest the materials sent to him or her, participate in Board discussions and make independent inquiries as needed.

B. In voting on any matter before the Board or otherwise acting in his or her capacity as a Director, each Director will:

1. make reasonable inquiry to inform himself or herself of the nature and consequences of the matter or action at issue;

2. exercise, at a minimum, the degree of care, skill, and diligence that an ordinarily prudent business person would exercise under similar circumstances; and

3. act in a manner the Director, in the exercise of his or her independent judgment, believes to be in the best interests of WECC and the membership of WECC, taken as a whole.

C. In exercising the duty of care described in paragraphs IA and B above, a Director has the right to rely on statements by the persons immediately in charge of business areas of WECC, to rely on professionals and experts (such as engineers, accountants and lawyers) and to rely on committees of WECC, unless facts or circumstances appear which would prompt further concerns of the ordinarily prudent person.

II. Duty of loyalty. The duty of loyalty imposes on a Director the obligation to remain loyal to WECC, acting at all times in the best interests of WECC and its Members as a whole and unhampered by any personal pecuniary gain. This duty does not preclude a Director from being employed in a competing or related business so long as the Director acts in good faith and does not interfere with the business of WECC.

A. Each Director will carry out his or her duties as a Director in good faith.

B. Each Director will refrain from using any influence, access, or information gained through his or her service as a Director to confer any improper personal benefit (financial or otherwise) upon himself or herself, any family member, or any person living in the Director's household.

C. Each Director will refrain from using any influence, access, or information gained through his or her service as a Director to confer an improper benefit (financial or otherwise) on any organization:

1. for which the Director serves as an officer, director, employee, consultant, or in any other compensated or management position; or

2. in which the Director or any family member or person living in the Director's household has a material financial interest (whether as a shareholder, partner, or otherwise).

D. To the extent permitted by law, each Director will maintain the confidentiality of:

1. any confidential or proprietary information of WECC disclosed or available to the Director;

2. any confidential or proprietary information of WECC Member(s) to which the Director has access by virtue of his or her status as Director; and

3. any confidential or proprietary information of third parties that has been provided to WECC or the Board on condition of confidentiality.

E. Conflicts of Interest. Because conflicts of interest may arise from time to time, specific guidelines are provided. In general, conflicts of interest involving a Director are not inherently illegal nor are they to be regarded as a reflection on the integrity of the Board or of the Director. It is the manner in which the Director and the Board deal with a disclosed conflict that determines the propriety of the transaction.

Directors of nonprofit corporations may have interests in conflict with those of the corporation. The duty of loyalty requires that a Director be conscious of the potential for such conflicts and act with candor and care in dealing with these situations.

The following are guidelines for Directors with actual or potential conflicts of interest:

1. Each Director has a responsibility to recognize potential conflicts of interest and to be guided when acting as a Director by his or her independent judgment of what is in the best interests of WECC and the membership of WECC, taken as a whole. If any Director has questions about whether a conflict of interest exists, he or she may make inquiry to the Chief Executive Officer of WECC for advice.

2. Potential conflicts of interest may arise because of a Director's private, individual interests (personal conflicts of interest) or because of relationships the Director may have with other organizations or interest groups (organizational conflicts of interest). Current or past employment or other compensation-based relationships with one or more WECC Members are examples of potential organizational conflicts of interest. Whether a potential conflict of interest is personal or organizational, in all cases involving WECC affairs a Director's conflicting interests are subordinate to those of WECC and the membership of WECC, taken as a whole.

3. Personal conflicts of interest.

   a. Personal conflicts of interest exist if a Director, a member of the Director's family, or a person sharing the Director's household: 1) has a material financial interest in a matter or transaction that comes before the Board for action; or 2) stands to receive a benefit (in money, property, or services) from a transaction involving WECC to which the person is not legally entitled.

   b. In cases of personal conflicts of interest, the affected Director's obligations are to:

      (1) disclose to the Board, before the Board acts with respect to that matter, the material facts concerning the Director's personal conflict of interest; and

      (2) refrain from voting, and from attempting to influence the vote of any other Director(s), in those matters in which the Director has a personal conflict of interest.

4. Organizational conflicts of interest.

   a. An organization has a "direct" conflict of interest if a decision by the Board would confer material benefits on that organization that other WECC Members would not share, or impose material detriments or costs on that organization that other WECC Members would not share. The fact that many if not all Members are affected to some extent by Board decisions on core issues such as standards, new transmission lines and their ratings, does not create or constitute a "direct" conflict of interest.

   b. It is not a "direct" conflict of interest for a Director to be associated with an organization or an interest group that may stand to benefit from decisions made or actions taken by the Board, so long as the Director does not attempt to use his or her position as a Director to confer special

benefits on associated organizations or interest groups when other WECC Members would not share in those benefits.

c. In cases of potential "direct" organizational conflicts of interest, the affected Director's obligations are to:

(1) disclose to the Board, before the Board acts with respect to the matter, the material facts concerning the organizational conflict of interest; and

(2) refrain from voting and from attempting to influence the vote of any other Director(s) with respect to the proposed action or decision.

Appendix B
Officers and Employee
Standards of Conduct

By accepting employment with the Western Electricity Coordinating Council ("WECC"), an Employee agrees to abide by these Standards of Conduct. For the purpose of these Standards, an Employee includes each and all officers, employees and substantially full-time consultants and contractors of WECC.

I. Duty of care. The Employees of WECC are bound to use due care and to be diligent in respect to the management and administration of the affairs of the corporation. This duty of care is generally thought to have two components: the time and attention devoted to corporate affairs and the skill and judgment reflected in business decisions.

Employees shall not have any outside employment that limits in any way their ability to fulfill their employment responsibilities to WECC. If an Employee has any question about whether outside employment is consistent with this standard, they should consult with their supervisor.

II. Duty of loyalty. The duty of loyalty imposes on an Employee the obligation to remain loyal to the WECC, acting at all times in the best interests of WECC and its Members as a whole and unhampered by any personal pecuniary gain. WECC expects all Employees to avoid adversely affecting the public's confidence in the integrity and reputation of WECC. Any conduct or activities of any Employee should be capable of being justified and withstanding public scrutiny.

A. Each Employee will carry out his or her duties as an Employee in good faith, with integrity and in a manner consistent with these Standards and all applicable laws governing WECC.

B. Each Employee will refrain from using, or creating the appearance of using, any influence, access, or information gained through his or her service as an Employee to confer any improper personal benefit (financial or otherwise) upon himself or herself, or Family Member.[1] Employees shall not accept gifts or entertainment that would tend to affect, or give the appearance of affecting, the performance of their duties; provided, however, that Employees may accept de minimus food or entertainment or non-cash gifts received as part of a social or special occasion in amounts not to exceed $1000 per source per year.

C. Each Employee will refrain from using, or creating the appearance of using, any influence, access, funds or information gained through his or her service as an Employee to confer an improper benefit (financial or otherwise) on any organization. The obligation to avoid the appearance of impropriety shall apply in particular to any organization:

1 For purposes of these Standards, a Family Member includes a spouse, domestic partner, child of the Employee, or a relative living in the same home as the Employee.

1. for which the Employee is serving or has in the past served as an officer, director, employee, consultant, or in any other compensated or management position; or

2. in which the Employee, or Family Member has a material financial interest known to the Employee (whether as a shareholder, partner, or otherwise).

D. Employees shall not use their WECC position, WECC funds or WECC resources to support any political party, candidate or proposition except as expressly authorized by the Board.

E. To the extent permitted by law, each Employee shall maintain the confidentiality of:

1. any confidential or proprietary information of WECC disclosed or available to the Employee;

2. any confidential or proprietary information of WECC Member(s) to which the Employee has access by virtue of his or her status as Employee; and

3. any confidential or proprietary information of third parties that has been provided to WECC or the Board on condition of confidentiality.

F. Conflicts of Interest. The following conflicts of interest policy shall apply to all WECC Employees. Conflicts of interest may arise from time to time. In general, conflicts of interest involving an Employee are not inherently illegal, nor are they to be regarded as a reflection on the integrity of WECC or of the Employee. It is the manner in which the Employee and WECC deal with a disclosed conflict that determines the propriety of the transaction. The following are guidelines for Employees with actual or potential conflicts of interest:

1. In general, personal conflicts of interest exist if an Employee, or a Family Member, has a material financial interest in a matter or transaction that comes before WECC for action, or stands to receive a benefit (in money, property, or services) from a transaction involving WECC to which the person is not legally entitled. For purposes of determining whether stock constitutes a material financial interest, see Paragraph F(6) below.

2. Organizational conflicts of interest exist if an Employee, or a Family Member, has a relationship with an organization or interest group that would cause a reasonable person to believe such Employee's judgment, loyalty, or objectivity might be influenced in a way that is adverse to the interests of WECC.

3. Where there is any question about potential conflicts of interest, the Employee shall disclose to the Chief Executive Officer as soon as possible and prior to when WECC takes action with respect to that matter, the material facts concerning the Employee's personal conflict of interest, and refrain from participating in, or from

attempting to influence the action of any Directors or Employee(s) of WECC regarding those matters in which the Employee has a conflict of interest.

4. No Employee may be an employee, director of, or consultant to or provide services to or be associated in any way with any WECC Member without full disclosure to, and written consent of, the Chief Executive Officer. To the extent that an Employee becomes aware that a Family Member is or will in the future be engaged in activity described in this Paragraph F(4), the Employee shall promptly notify the Chief Executive Officer, who shall review all the material facts and determine whether they constitute a conflict of interest pursuant to Paragraphs F(1) and F(2), above.

5. No Employee shall participate in any electric energy transaction other than for ordinary personal use except to the extent necessary to, and consistent with, the functions of WECC. Participation in an energy transaction includes, but is not limited to, purchasing, selling, marketing, or brokering of electricity, ancillary services, electricity transmission or electricity distribution. To the extent that an Employee becomes aware that a Family Member is or will in the future be engaged in activity described in this Paragraph F(5), the Employee shall promptly notify the Chief Executive Officer who shall review all the material facts and determine whether they constitute a conflict of interest pursuant to Paragraphs F(1) and F(2), above.

6. All Employees shall promptly disclose to the CEO and the Chair of the Board any direct or indirect financial interest in excess of $5,000 (including the direct or indirect ownership of securities) held by the Employee or a Family Member living with the Employee[2] in any Electric Line of Business entity as defined in Section 3.15 of the Bylaws doing business in the Western Interconnection. Upon such disclosure, the CEO and the Chair of the Board shall determine whether such financial interest constitutes a conflict of interest, or the appearance thereof, in light of the duties of the Employee, the ability to divest such financial interest without undue hardship and the totality of the circumstances. In response to such disclosure, the CEO and the Chair may impose such remedies as are reasonable under the circumstances and consistent with section 9.3 of the Bylaws. Such remedies may include, but are not limited to, restrictions on the Employee's duties or involvement in certain matters, transfer of the Employee to another position, broader disclosure of the financial interest, voluntary or mandatory divestiture of the interest (in whole or in part) or other remedies. Pursuant to section 9.3.2 of the Bylaws, if an Employee (not a Family Member) receives a gift or inheritance of securities of a Member of WECC, or if a new Member joins WECC in which the

2 Nothing in this section shall require an Employee to investigate the financial interests of Family Members not living with the Employee. However, to the extent known to the Employee, the financial interests of a Family Member not living with the Employee may create a potential conflict of interest (or appearance thereof) subject to Sections II(B) and/or II(F)(1) of these standards, in which case disclosure pursuant to Section II(F)(3) is appropriate.

Employee (not a Family Member) holds securities, the Employee must resign or divest such securities within six months thereafter. For the purposes of this section, none of the following shall constitute a direct or indirect financial interest:

a. An interest that exists through diversified mutual funds;

b. An interest that exists for six months following receipt of a gift or inheritance of securities of a Market Participant or acceptance of employment with WECC, whichever is later (provided that employees of the WSCC shall have two years from WECC organizational meeting to divest securities in their possession as of that date);

c. An interest that exists through a pre-existing participation in a qualified defined benefits pension plan or health benefits plan of a Market Participant so long as the benefits under such plan do not vary with the economic performance or value of the securities of such Market Participant.

Appendix C

WECC Dispute Resolution Procedures

C. DISPUTE RESOLUTION.

C.1 Obligation To Comply with Dispute Resolution Procedures. If any dispute concerning one or more issues identified in Section C.2 below arises between a Member and one or more other Members, or between one or more Members and WECC, all of the parties to the dispute shall, to the extent permitted by law, be obligated to comply with the dispute resolution procedures specified in these Bylaws (except to the extent all of the parties to the dispute may agree otherwise as provided in Section C.4 below). Only Members and WECC have the right to invoke the provisions of this Appendix C and, except where all affected parties have separately agreed otherwise with respect to a particular dispute, only Members and WECC are obligated to carry out the dispute resolution procedures set forth herein. Any dispute subject to the provisions of this Appendix C to which WECC is made a party shall be subject to the additional requirements specified in Section C.3 below if the dispute is initiated by a party other than WECC. To the extent permitted by law (and except as otherwise permitted by the provisions of Section C.6.3), no party to a dispute subject to the provisions of this Appendix C may pursue any other available remedy with respect to the dispute until all of the parties to the dispute have fully complied with the dispute resolution procedures specified herein, *provided, however,* that if any party to a dispute subject to the provisions of this Appendix C refuses to comply with the dispute resolution procedures specified herein, all other parties to the dispute shall subsequently be relieved of any further obligation to comply with these dispute resolution procedures before pursuing other remedies in connection with that dispute.

C.2 Issues Subject to Dispute Resolution Procedures. Any dispute between or among the parties identified in Section C.1 above (that the parties to the dispute do not resolve through negotiations between or among themselves) shall be subject to the dispute resolution procedures set forth in this Appendix C if the dispute concerns: (i) the application, implementation, interpretation, or fulfillment of any guidelines, criteria, policies, procedures, or Bylaws of WECC or the North American Electric Reliability Council (or any successor organization); or (ii) any matter specified in Section C.6.2 below; except that any matter that is subject to the jurisdiction of the WECC Compliance Hearing Body is not subject to the requirements of this Appendix C. Notwithstanding the foregoing provisions of this Section C.2, however, neither WECC nor any Member shall be obligated to comply with the dispute resolution procedures of these Bylaws if: (a) the dispute is between two or more Members (or WECC), all of which, at the time of the dispute, are parties to the WECC Reliability Management System Agreement and the matter is within the scope of the dispute resolution procedures set forth in that agreement; or (b) the dispute is between two or more Members, all of which, at the time of the dispute, are parties to a separate agreement or treaty or where an applicable tariff, rate schedule, or other legal obligation of one of the parties provides for the parties to resolve the dispute in a manner other than in accordance with the provisions of this Appendix C of the Bylaws.

C.3 Limitations on Members' Rights To Make WECC a Party to a Dispute. In addition to the other provisions of this Appendix C of the Bylaws, any dispute (other than a dispute initiated by WECC) to which WECC is made a party shall be subject to the limitations set forth in Sections C.3.1 and C.3.2 below.

C.3.1 Bases for Using Dispute Resolution Procedures To Challenge WECC Action. Subject to any limitation set forth in these Bylaws or in applicable statute, regulation or FERC order, one or more Members may use the dispute resolution procedures specified in this Appendix C to challenge any final action of WECC only on one or more of the following bases: (i) the action is contrary to applicable law or regulation; (ii) the action is contrary to WECC's Articles of Incorporation or these Bylaws (including WECC's purposes as set forth in those documents); (iii) the action was taken in violation of applicable procedures of WECC governing that action; or (iv) the action encompasses a decision in which there was plain error material to the decision. For purposes of this Appendix C, action taken by WECC shall be deemed final if: (a) the action has been taken or adopted or approved or accepted by WECC's Board of Directors (other than by a motion specifically providing that the action is conditional or will have temporary application not to exceed six months); (b) all conditions specified to make any conditional action of WECC's Board of Directors effective have been fulfilled; or (c) the action has been taken or adopted or approved or accepted by a committee, subcommittee, task force, or other group or person acting under authority of WECC without any provision making the action subject to further approval or adoption or acceptance by the Board of Directors. Nothing contained in this Appendix C shall limit any rights any Member (or any other party) may have under applicable law or regulation to initiate or participate in an administrative or legal action to which WECC is made a party in accordance with applicable provisions of law or regulation.

C.3.2 Obligation to Bear WECC's Share of Facilitator Costs. If one or more Members initiate a dispute under this Appendix C to challenge an action of WECC, the Member(s) initiating the challenge shall be obligated to bear all of the costs of facilitators' services incurred to comply with the requirement of Section C.5 below, except to the extent WECC agrees to pay a share of the costs of facilitators' services.

C.4 Ability to Modify Dispute Resolution Procedures by Agreement. Any provision of the dispute resolution procedures set forth in this Appendix C may be modified, waived, or omitted by agreement of all of the parties to the dispute. Parties to a dispute subject to these provisions are obligated to comply with its procedures unless all of the parties to the dispute agree to do otherwise. The manner in which the dispute resolution procedures set forth in this Appendix C may be varied include (by way of example and not as limitation): the manner of selecting a facilitator or arbitrator; the procedures or time lines to be followed during mediation or arbitration; the grounds or forum or right to appeal an arbitrator's decision; the manner of allocating fees and costs associated with the dispute; whether the parties are obligated to proceed to arbitration if the dispute is not resolved through mediation; and whether a decision rendered through arbitration is binding on the parties. In addition, any dispute that does not fall within the scope specified in Section C.2 above may be resolved according to the procedures set forth in Appendix C of these Bylaws if all of the parties to the dispute agree to do so.

C.5 Mediation.

C.5.1 Notice to Other Parties and WECC's Chief Executive Officer. To initiate the dispute resolution process with respect to a dispute governed by the provisions of

this Appendix C, the Member or WECC that has elected to initiate the dispute shall deliver to all other parties to the dispute and to WECC's Chief Executive Officer (whether or not WECC is a party to the dispute) written notice invoking the dispute resolution procedures set forth in this Appendix C (a "Dispute Notice").

C.5.1.1 The Dispute Notice shall: (i) include a brief, general description of the matter(s) in dispute; (ii) include a complete list of all other Members the party submitting the Dispute Notice intends to make a party to the dispute; and (iii) state whether or not WECC is to be made a party to the dispute.

C.5.1.2 Within five business days of receiving a Dispute Notice, any party to the dispute may elect to deliver a brief supplemental description of the dispute to WECC's Chief Executive Officer.

C.5.1.3 Within 10 business days of receiving an initial Dispute Notice, WECC's Chief Executive Officer shall: (a) publish (or cause to be published) in WECC's newsletter or on its electronic bulletin board a notice containing a list of the parties to the dispute and a summary of the descriptions of the matter(s) in dispute provided by the parties to the dispute; and (b) deliver to each party to the dispute a copy of WECC's then-current standing list of qualified facilitators, knowledgeable in the matters addressed by WECC (as approved by the Board of Directors).

C.5.1.4 No person may be listed on WECC's standing list of qualified facilitators unless the person has agreed to: (i) disclose, at any time the

person is selected to serve as a facilitator under this Appendix C, any personal or financial interest the facilitator may have with respect to the matter(s) in dispute (including any indirect personal or financial interest that could arise because of interests or relationships affecting any of the facilitator's immediate family members); (ii) disclose any relationship the facilitator may have with any party to the dispute that is not permitted under Section C.5.2 below; and (iii) abide by all applicable provisions of these Bylaws, including restrictions on disclosure of matters discussed and information exchanged during mediation as provided in Section C.5.3 below.

C.5.2 Selection of a Facilitator. Within 10 calendar days after the delivery of a Dispute Notice, the parties to the dispute shall select a neutral facilitator by mutual agreement. If the parties to the dispute cannot agree on a facilitator within 10 calendar days after delivery of a Dispute Notice, the facilitator shall be selected from WECC's standing list of qualified facilitators as follows: The parties to the dispute shall take turns striking names from WECC's standing list of qualified facilitators until there is only one name remaining. (The parties to the dispute shall draw lots to determine the order in which they take turns striking names.) The last person whose name remains on the list shall serve as the facilitator. No facilitator other than a facilitator chosen by agreement of all the parties to the dispute may (i) have a personal or financial interest in the matter(s) in dispute (including any indirect personal or financial interest that could arise because of interests or relationships affecting any of the facilitator's immediate family

members); or (ii) be (or have an immediate family member who is) a past or present director, commissioner, officer, employee, consultant, agent, or other representative of any of the parties to the dispute. If the facilitator selected through the process of striking names specified above is disqualified under the preceding sentence, the facilitator whose name was stricken last shall serve in his or her place. In addition, if WECC is a party to a dispute initiated by one or more Members, turns striking names from the standing list of qualified facilitators shall alternate between WECC on the one hand and all other parties to the dispute on the other.

C.5.3 Mediation Process. The facilitator and representatives of all of the parties to the dispute shall meet within 14 calendar days after the facilitator has been selected and attempt in good faith to negotiate a resolution to the dispute. Each party's representative designated to participate in the mediation process must have the authority to settle the dispute (or, at a minimum, be authorized to negotiate on behalf of the party and make recommendations with respect to settlement of the dispute if final authority to approve a settlement is reserved to a party's board, executive committee, commission, or other governing body). At the parties' initial meeting with the facilitator, the facilitator shall, after soliciting input from the parties to the dispute, set the schedule for further meetings among the parties to the dispute (subject to the 60-day maximum mediation period specified in Section C.5.6 below). The parties to the dispute shall comply with the schedule set by the facilitator and attempt in good faith at every meeting to negotiate a resolution to the dispute. To the extent permitted by law, neither the facilitator nor any party to the dispute may publicly disclose, rely on, or introduce as evidence in any subsequent arbitration, FERC proceeding, Canadian Regulatory

Authority proceeding, proceeding before a Mexican Regulatory Authority, appeal, or litigation concerning the same or any related dispute: (i) any views expressed or suggestions made by another party to the dispute with respect to a possible settlement of the dispute; (ii) admissions made by another party to the dispute in the course of the mediation proceedings; (iii) proposals made or views expressed by the facilitator; or (iv) the fact that another party to the dispute has or has not indicated willingness to accept a proposal for settlement made by the facilitator. In those cases in which a party to a dispute subject to the provisions of this Appendix C of the Bylaws is a membership organization (including WECC, if applicable), nothing in the preceding sentence shall prohibit that organization from reasonably communicating with its members and governing body to share general information about the dispute, such as the parties, status, disputed issues, and positions of each of the parties with respect to the disputed issues.

C.5.4 Referral for Resolution. With the consent of all parties to the dispute, a resolution may include referring the matter to a technical body (such as a technical advisory panel of WECC) for resolution or an advisory opinion, to arbitration, directly to FERC or, in a dispute involving a Canadian Member, directly to the appropriate Canadian Regulatory Authority, or, in a dispute involving a Mexican Member, directly to the appropriate Mexican Regulatory Authority.

C.5.5 Mediation Participation by WECC Staff When WECC Not a Party. If, during the course of mediation to which WECC is not a party, the facilitator or any party to the dispute wishes to solicit the views of WECC concerning the application, implementation, interpretation, or fulfillment of any guidelines, criteria, standards, policies, or procedures of WECC, the facilitator may request or permit the submission of WECC staff views only if: (i) any participation by WECC staff

takes place exclusively in the presence of all parties to the dispute; (ii) participating WECC staff members agree to be equally available upon request to all parties to the dispute; and (iii) participating WECC staff members agree to comply with the restrictions on disclosure contained in Section C.5.3.

C.5.6 Mediation Deemed at Impasse After 60 Days. If the parties to the dispute have met and negotiated in good faith in accordance with the schedule set by the facilitator but have not succeeded in negotiating a resolution of the dispute within 60 calendar days after the first meeting with the facilitator pursuant to Section C.5.3 above, the parties to the dispute shall be deemed to be at impasse and, except as otherwise provided in Section C.5.6.2 below, shall also be deemed to have fulfilled their obligations under Section C.1 of these Bylaws to fully comply with the dispute resolution provisions before pursuing any other available remedy. If any party participating in the mediation process is subject to a contractual or statutory limitations period with respect to the matter in dispute, and the limitations period will expire before the 60-day period for mediation under this Section C.5.6 is completed, then the parties shall be deemed at impasse on the seventh calendar day preceding the expiration of the shortest applicable limitations period.

C.5.6.1 Disputes Not Subject to Provisions of Section C.6.2. Unless the matter in dispute is subject to the provisions of Section C.6.2 below, at any time after the parties to the dispute are deemed at impasse, the dispute may be submitted to binding arbitration in accordance with the procedures set forth in Section C.7 of these Bylaws (but only by agreement of all of the parties to the dispute). If the matter in dispute is subject to the provisions of Section C.6.2 below, the parties' obligations with respect to submitting the matter to binding arbitration under Sections C.6 and C.7 of these Bylaws shall be as specified in Section C.5.6.2 below. In

all other cases, if the parties to the dispute do not agree to submit the dispute to binding arbitration in accordance with the procedures set forth in Section C.7 of these Bylaws, any party to the dispute may at any time thereafter pursue any other remedy available under regulation, law, or equity (subject to the restrictions on disclosure set forth in Section C.5.3 above).

C.5.6.2 Disputes Covered by Section C.6.2. If the parties to a dispute concerning a matter subject to the provisions of Section C.6.2 either: (i) are deemed at impasse after attempting to resolve the matter through mediation as provided in Sections C.5.1 through C.5.6 above; or (ii) have agreed to submit the matter directly to binding arbitration without attempting to resolve the matter through mediation as provided in Sections C.5.1 through C.5.6 above, the parties to the dispute shall submit the matter to binding arbitration in accordance with the procedures set forth in Sections C.6 and C.7 of these Bylaws.

C.5.7 Costs of Facilitator's Services. Except as otherwise provided under Section C.3.2, the costs of the facilitator's services shall be born equally by all parties to the dispute unless the parties to the dispute agree otherwise, but the parties also intend that the costs of mediation should be taken into account in any resolution proposed through the mediation process.

C.5.8 Notice to WECC of Completion of Mediation. Within 10 calendar days after either: (i) reaching a negotiated resolution through the mediation process set forth in Section C.5; or (ii) reaching deemed impasse in accordance with Section C.5.6 above, the parties to the dispute shall jointly deliver to WECC's Chief Executive Officer a written notice briefly describing the outcome of the mediation process. Promptly after receiving written notice describing the outcome of a mediation conducted in accordance with Section C.5, WECC's Chief Executive Officer shall

publish (or cause to be published) in WECC's newsletter or on its electronic bulletin board a brief description of the outcome of the mediation, together with a list of all of the parties to the dispute.

C.6 General Provisions Relating to Binding Arbitration.

C.6.1 Matters for Which Binding Arbitration is Elective. Except with respect to any dispute that concerns one or more matters specified in Section C.6.2 below, the binding arbitration procedures set forth in Section C.7 may be invoked only by agreement of all of the parties to the dispute to be arbitrated and are solely for the convenience of WECC and its Members. If a dispute governed by this Appendix C does not concern a matter specified in Section C.6.2 below, a party to the dispute shall be deemed to have fulfilled its obligations to comply with Appendix C of these Bylaws (irrespective of whether the parties to the dispute agree to proceed with binding arbitration) to the extent that either: (i) that party has fully performed the obligations set forth in Sections C.1 through C.5.8; or (ii) all of the parties to the dispute have agreed to a different process for resolving the dispute and the agreed-upon process has been fully carried out.

C.6.2 Matters for Which Binding Arbitration Is Obligatory. If a dispute is governed by Appendix C of these Bylaws and is not resolved through the process of mediation in accordance with Sections C.5.1 through C.5.6 above, the parties shall be obligated to submit the matter to binding arbitration in accordance with the procedures set forth in Section C.7 (subject to the limitations on the arbitrator's authority set forth in Section C.6.3 below) if the dispute concerns one or more of the following matters:

C.6.2.1 a decision of WECC's Board of Directors or a Committee of the Board acting on the recommendation of, or on a matter within the jurisdiction of, the Operating Transfer Capability Policy Group ("OTCPG") or successor;

C.6.2.2 a transmission path rating, or a modification to a transmission path rating, assigned to one or more transmission paths operated by a Member (or jointly operated by more than one Member);

C.6.2.3 transmission access, pursuant to Sections 10.1.2, 10.1.3, and 10.5; or

C.6.2.4 any matter that, by vote of both WECC's Board of Directors and WECC's Membership, is designated as a matter to be subject to the provisions of Section C.6.2 of these Bylaws, provided that any matter submitted to WECC's Membership pursuant to this provision must be approved by at least the number of votes required to amend these Bylaws under Section 13.2.

C.6.3 Limitations on Arbitrator's Authority with Respect to Matters Specified in Section C.6.2. Unless all of the parties to a dispute agree otherwise, an arbitrator rendering a decision with respect to any matter specified in Section C.6.2 above shall have no authority to consider or award remedies for past economic harm or damages of any kind, including without limitation actual or direct damages; indirect, consequential, or incidental damages; or exemplary or punitive damages. Nothing in this Section C.6.3 shall: (i) limit any rights that a party to a dispute concerning a matter specified in Section C.6.2 above may have to pursue legal claims for damages or other economic remedies after the arbitrator has rendered

his or her decision on that matter (within the scope of his or her authority under this Section C.6.3); or (ii) limit an arbitrator's authority under Section C.8 below to shift costs or impose monetary sanctions for "good cause" (as that term is defined in Section C.8).

C.6.4 Arbitration Decisions Not To Modify Underlying Rights and Obligations. Unless all of the parties to a dispute agree otherwise, the resolution through binding arbitration of any dispute governed by this Appendix C shall not have the effect of increasing, decreasing, or otherwise modifying WECC's or any Member's obligation to abide by, or ability to enforce or impose penalties or sanctions with respect to, any guidelines, criteria, standards, policies, procedures, decisions, or Bylaws of WECC or any limitation on the foregoing, whether established by law; regulation; judicial, executive, or administrative order, decree, or decision; tariff; contract; course of performance; treaty; or otherwise.

C.6.5 Laws Relating to Binding Arbitration. WECC and its Members recognize that some Members may be subject to laws (including without limitation United States federal or state laws, Canadian or provincial laws, or Mexican laws) that limit or define those Members' ability to agree in advance to be subject to binding arbitration. If a Member has the right or obligation under applicable law to refuse to submit to binding arbitration in connection with any dispute that would otherwise be subject to binding arbitration under Section C.6.2 of these Bylaws, that Member shall not be obligated to comply with the binding arbitration procedures set forth in Sections C.6 and C.7. Any Member subject to any law or other legally binding authority that may limit (or permit the Member to limit) its

obligation to comply with the provisions requiring binding arbitration under Sections C.6 and C.7 or to fully comply with a valid arbitrator's decision rendered in accordance with this Appendix C shall provide notice to this effect to all other disputing parties and WECC's Chief Executive Officer upon initiation of any dispute involving that Member if the dispute is subject to Section C.6.2. Upon receiving a notice under Section C.6.5, any other party to the dispute shall thereafter be relieved of any obligation to comply with the provisions Sections C.6 and C.7 in connection with that dispute, except to the extent that the Member giving notice agrees to be fully bound by procedures governing and results of any arbitration proceeding. If there are more than two parties to a dispute covered by the preceding sentence, however, then all parties to the dispute other than the party giving notice under Section C.6.5 shall make good faith efforts to establish a mutually acceptable approach for resolving among themselves whatever aspects of the dispute can reasonably be resolved through the procedures set forth in this Appendix C without the participation of the party giving notice under Section C.6.5. If any Member fails to submit to binding arbitration, or fails to abide by a valid arbitrator's decision rendered in accordance with this Appendix C, that Member shall thereafter have no right to enforce any of the provisions of Section C.6.2 (concerning obligations to submit specified disputes to binding arbitration) against any other Member or WECC until such time as the WECC Board of Directors, or a delegate designated by the Board, determines that it is appropriate to restore the Member's ability to enforce the provisions of Section C.6.2.

C.6.6 Consistency with Laws, Regulatory Jurisdiction and Orders, Etc. Nothing contained in this Appendix C and no arbitrator's decision rendered in accordance with Section C.7 shall be construed to require or shall otherwise operate to cause any Member or WECC to incur any obligation or take any action that is contrary to: (i) any applicable law or regulation; (ii) any applicable authority, order, decree, rule, or decision of a regulatory, judicial, administrative, executive, or other governmental body having jurisdiction over one or more of the matters or parties subject to this Appendix C or covered by an arbitrator's decision; or (iii) any applicable rate schedule, tariff, treaty, or valid, pre-existing contractual obligation with which any party subject to this Appendix C or covered by an arbitrator's decision is legally obligated to comply.

C.7 Arbitration Procedures.

C.7.1 Notice to WECC of Initiation of Binding Arbitration. Within 10 calendar days after all of the parties to a dispute have agreed (or become obligated under Section C.6.2 above) to submit the dispute to binding arbitration under Sections C.6 and C.7, the parties to the dispute shall deliver written notice to WECC's Chief Executive Officer (an "Arbitration Notice").

C.7.1.1 The Arbitration Notice shall: (i) include a brief, general description of the issues to be arbitrated; and (ii) identify all parties who have agreed (or become obligated) to submit the dispute to binding arbitration under Sections C.6 and C.7.

C.7.1.2 Within five business days of receiving an Arbitration Notice, WECC's Chief Executive Officer shall: (a) publish (or cause to be published) in

WECC's newsletter or on its electronic bulletin board a notice containing a list of the parties to the arbitration and the parties' brief, general description of the issues to be arbitrated; and (b) deliver to each party to the dispute a copy of WECC's then-current standing list of qualified arbitrators, knowledgeable in matters addressed by WECC (as approved by the Board of Directors).

C.7.1.3 No person may be listed on WECC's standing list of qualified arbitrators unless the person has agreed to: (a) disclose, at any time the person is selected to serve as a arbitrator under this Appendix C, any personal or financial interest the arbitrator may have with respect to the matter(s) in dispute (including any indirect personal or financial interest that could arise because of interests or relationships affecting any of the arbitrator's immediate family members); (b) disclose any relationship the arbitrator may have with any party to the dispute that is not permitted under Section C.7.2 below; (c) assemble a complete record of the arbitration process and the materials received as evidence by the arbitrator if any of the parties to the dispute elect to appeal or contest the arbitrator's decision; and (d) abide by all applicable provisions of and procedures specified by Sections C.6 and C.7.

C.7.2 Selection of an Arbitrator. Within 10 calendar days after all of the parties to a dispute have agreed (or become obligated) to submit the dispute to binding arbitration under Sections C.6 and C.7, the parties to the dispute shall select an arbitrator by mutual agreement. If the parties cannot agree on an arbitrator within

10 calendar days after agreeing to arbitrate their dispute, the arbitrator shall be selected from WECC's standing list of qualified arbitrators as follows: The parties to the dispute shall take turns striking names from WECC's standing list of qualified arbitrators until there is only one name remaining. (The parties to the dispute shall draw lots to determine the order in which they take turns striking names.) The last person whose name remains on the list shall serve as the arbitrator. No arbitrator other than an arbitrator chosen by agreement of all the parties to the dispute may (i) have a personal or financial interest in the matter(s) in dispute (including any indirect personal or financial interest that could arise because of interests or relationships affecting any of the arbitrator's immediate family members); or (ii) be (or have an immediate family member who is) a past or present director, commissioner, officer, employee, consultant, agent, or other representative of any of the parties to the dispute. If the arbitrator selected through the process of striking names specified above is disqualified under the preceding sentence, the arbitrator whose name was stricken last shall serve in his or her place.

C.7.3 Initial Statements and Proposed Arbitration Decisions. Within 10 calendar days after the selection of an arbitrator under Section C.7.2 above, each party to the dispute shall submit a statement in writing to all other parties to the dispute and to the arbitrator. Each disputing party's statement shall set forth in reasonable detail the nature of the dispute, the issues to be arbitrated, and the party's reasonable, good faith proposal for resolving the dispute. As provided in Section C.5.3 above, to the extent permitted by law, no party to an arbitration conducted under

Sections C.6 and C.7 shall publicly disclose, rely on, or introduce as evidence in any arbitration, FERC proceeding, Canadian Regulatory Authority proceeding, proceeding before a Mexican Regulatory Authority, appeal, or litigation concerning the same or any related dispute any information required to be kept confidential by the terms of Section C.5.3.

C.7.4 Procedural Matters. The arbitrator shall determine discovery procedures, how evidence shall be taken, what written submittals may be made, and other such procedural matters, taking into account the complexity of the issues involved, the extent to which factual matters are disputed and the extent to which the credibility of witnesses is relevant to a resolution. Each party to the dispute shall produce all evidence determined by the arbitrator to be relevant and material to the issues presented. If such evidence involves proprietary or confidential information, the party submitting the evidence shall petition the arbitrator for a protective order, and to the extent the arbitrator determines there is good cause the arbitrator shall issue an appropriate protective order and all parties to the dispute shall comply with the protective order. The arbitrator may elect to resolve the arbitration matter solely on the basis of written evidence and arguments.

C.7.5 Out-of-Court Sworn Testimony. At the request of any disputing party, the arbitrator shall have the discretion to allow that party to examine witnesses through sworn out-of-court testimony (referred to in the United States as "deposition" and in Canada as "discovery") to the extent the arbitrator deems the evidence sought to be relevant and appropriate. In general, out-of-court witness examinations shall be limited to a maximum of three per party and shall be held

within 30 calendar days after the making of a request. Each witness examination shall be limited to a maximum of three hours' duration. The arbitrator shall have the discretion to permit the number and duration of examination sessions allowed under this Section C.7.5 to be increased, and to extend the 30-day time limit, upon request for good cause shown. All objections are reserved for the arbitration hearing except for objections based on privilege and proprietary or confidential information.

C.7.6 Intervention by Other Parties. Unless all of the parties to the dispute agree otherwise, no one (whether a Member, WECC, or any other entity or person) that is not a party to a dispute at the initiation of arbitration under Sections C.6 and C.7 shall have the right to intervene in the arbitration. Any party wishing to intervene in an arbitration under Sections C.6 and C.7 may petition the arbitrator for permission to intervene, provided that the petition is submitted to the arbitrator not more than 30 calendar days after notice of the arbitration is posted by WECC's Chief Executive Officer in accordance with Section C.7.1. The arbitrator shall have the discretion to permit a party to intervene if the arbitrator determines that the party petitioning to intervene has a direct and substantial interest in the outcome of the arbitration. In exercising his or her discretion concerning a requested intervention, the arbitrator shall also consider any additional complexity or delay that may be caused by allowing the intervention and also any other remedies available to the party requesting intervention. Any party that is granted the privilege of intervening in an arbitration under Sections C.6 and C.7 shall be permitted to intervene subject to the same terms, conditions,

limitations, rights, and obligations of all other parties to the dispute, including without limitation the binding effect of arbitrator's decision, limitations on rights of appeal, the obligation to share equally in the costs of the arbitrator, and the obligation to be subject to the provisions of Section C.8.

C.7.7 Consideration of WECC Criteria, Etc. The Arbitrator shall give due consideration to the reliability criteria, standards, guidelines, policies, and procedures of WECC and the North American Electric Reliability Council (or any successor organization) to the extent they are relevant to resolution of the matter(s) in dispute. If the arbitrator's decision will include interpretation of any of WECC's reliability criteria, standards, guidelines, policies, and procedures, (and WECC is not a party to the arbitration), the arbitrator shall, before rendering his or her decision, consult with WECC (subject to the provisions of Section C.7.10 below) concerning the interpretation of WECC's applicable reliability criteria, standards, guidelines, policies, and procedures.

C.7.8 Evidence and Rebuttal. The arbitrator shall consider all issues material to the matter(s) in dispute. The arbitrator shall take evidence submitted by the parties to the dispute in accordance with procedures established by the arbitrator and may request additional information the arbitrator deems material to the resolution of the dispute. With the consent of all parties to the dispute, the arbitrator's request for additional information may include the opinion of any individual or organization with recognized expertise in the matter(s) in dispute, subject to the following conditions: (i) any verbal communication with an expert consulted by the arbitrator must take place exclusively in the presence of all parties to the

dispute and copies of any written communications must be provided to all parties to the dispute; (ii) any expert consulted by the arbitrator must agree to be equally available upon request to all of the parties to the dispute; (iii) any expert consulted by the arbitrator must agree to comply with the restrictions on disclosure contained in Section C.5.3; and (iv) all parties to the dispute shall be afforded a reasonable opportunity to question the expert and to rebut any additional information submitted by the expert at the request of the arbitrator.

C.7.9 Arbitrator's Decision. The arbitrator shall make all reasonable efforts to complete hearings (if applicable) and submissions of written evidence not more than 90 calendar days after receiving initial statements submitted under Section C.7.3 above. As soon as practicable, but in no event more than 30 calendar days after the completion of hearings and evidence submittals, the arbitrator shall render his or her final decision for resolving the dispute. By agreement of all of the parties to the dispute or at the discretion of the arbitrator for good cause, the foregoing deadline for delivery of the arbitrator's decision may be extended. The arbitrator's decision shall be based on the arbitrator's good faith determination of a resolution that will: (i) be consistent with any laws, rules, and regulations applicable to the matter(s) in dispute; (ii) be consistent with any valid pre-existing agreements among the parties to the dispute that bear on the matter(s) in dispute; (iii) not require any party to the dispute to take action that is not in compliance with any of WECC's reliability criteria, standards, guidelines, policies, and procedures; and (iv) best serve to promote or maintain reliable operation of the interconnected Bulk Electric System of the Western Interconnection, without

imposing inequitable burdens or benefits on any of the parties to the dispute or others that may be affected by implementation of the arbitrator's decision. The arbitrator shall deliver to each of the parties to the dispute, along with his or her decision, a written statement including specific findings of fact, conclusions of law (if applicable), and an explanation of the arbitrator's basis for rendering his or her decision. Subject to any protective order that may have been issued under Section C.7.4 above, WECC's Chief Executive Officer shall publish (or cause to be published) in WECC's newsletter or electronic bulletin board a brief summary of the arbitrator's decision. An arbitrator's decision that is not appealed shall not be deemed to be precedential in any other arbitration related to a different dispute.

C.7.10 WECC Staff Participation in Arbitration When WECC Not a Party. If, during the course of binding arbitration conducted under Sections C.6 and C.7 (in which WECC is not a party) the arbitrator or any party to the dispute wishes to solicit the views of WECC staff concerning the application, implementation, interpretation, or fulfillment of any guidelines, criteria, standards, policies, or procedures of WECC, the arbitrator may request or permit the submission of WECC staff views only with the consent of all of the parties to the dispute and only if: (i) any participation by WECC staff takes place exclusively in the presence of all parties to the dispute; (ii) participating WECC staff members agree to be equally available upon request to all parties to the dispute; and (iii) participating WECC staff members agree to comply with the restrictions on disclosure contained in Section C.5.3.

C.7.11 Compliance and Costs. Unless one or more of the parties to the dispute initiates and notifies all other parties to the dispute that it has initiated a process to contest or appeal the arbitrator's decision under Sections C.9 through C.13, upon the decision by the arbitrator, the parties to the dispute shall, within the time frame specified by the arbitrator, and, subject to Section C.6.6 above, take whatever action is required to comply with the arbitrator's decision to the extent the arbitrator's decision does not require regulatory action. To the extent the arbitrator's decision affects jurisdictional rates, terms and conditions of service, or facilities or otherwise requires local, state, federal, or provincial approval or regulatory action, or a FERC filing or a Canadian Regulatory Authority filing by a Canadian Member or a Mexican Regulatory Authority filing by a Mexican Member, the affected Member (or WECC, if WECC is the party with the obligation to seek regulatory action) shall, within the time frame specified by the arbitrator, submit the arbitrator's decision or an appropriate filing to implement the arbitrator's decision and support the appropriate authority's acceptance or approval of the arbitrator's decision or implementation filing, except in cases where any party to the dispute has given notice of its intent to contest or appeal the arbitrator's decision. All costs associated with the arbitration (not including costs associated with attorney and expert witness fees incurred by the parties to the dispute) shall be divided equally among the parties to the dispute unless: (i) all of the parties to the dispute agree to an alternate method of allocating costs; or (ii) in rendering his or her decision, the arbitrator exercises his or her discretion

under Section C.8 below to assess fees, costs, or other monetary sanctions against one or more of the parties to the dispute for good cause.

C.7.12 Entry of Judgment. At any time after an arbitrator has rendered his or her decision in an arbitration conducted under Sections C.6 and C.7 (provided that the time provided for initiating an appeal under Sections C.11.1 and C.12 below has expired and no appeal or other means of contesting the arbitrator's decision has been initiated), judgment on the decision rendered by the arbitrator may be entered by any court of competent jurisdiction (subject to the provisions of Sections C.6.3, C.6.4, and C.6.6 above). If the award is against the United States, a party to the arbitration may apply to the United States District Court for the district in which the principal office of the applicable United States department or agency is located for an order confirming the award pursuant to 5 U.S.C. § 580.

C.8 Arbitrator's Discretion to Shift Costs or Impose Sanctions for Cause. Each party to any dispute submitted to arbitration under Sections C.6 and C.7 shall bear its own costs and fees associated with representation and participation in the arbitration process, and shall share equally in the arbitrator's fees except that the arbitrator shall have the discretion, to the extent permitted by law, to require one or more of the parties to the dispute to pay part or all of the costs and fees (including without limitation attorneys' and arbitrator's fees) of one or more other parties to the dispute, or to impose monetary sanctions on some other basis that is reasonable under the circumstances, for good cause. As used in this Section C.8, "good cause" means conduct involving serious abuse of or failure to comply with the dispute resolution process set forth in this Appendix C, willfully undertaken to harass or delay other parties to the dispute or to substantially impede the

arbitrator's ability to render a decision consistent with the provisions set forth in Section C.7.9.

C.9 Rights to Appeal Arbitration Decisions. Except to the extent otherwise provided by applicable United States state or federal law, applicable Canadian or provincial law, or applicable Mexican law, a party to a dispute resolved by arbitration under Sections C.6 and C.7 may appeal or contest the arbitrator's decision only on one or more of the bases specified in Section C.9.1 below and only in accordance with the procedures set forth in Sections C.9.2 through C.13.

C.9.1 Grounds for Appealing Arbitration Decisions. A party to a dispute resolved by arbitration under Sections C.6 and C.7 may contest or appeal the arbitrator's decision only on the basis that: (i) the arbitrator's decision is contrary to applicable law or regulation (including without limitation the FPA or FERC's then-applicable standards or policies, or comparable types of provisions that may apply under applicable Canadian, provincial, Mexican, or other laws and regulations); (ii) the arbitrator's decision is demonstrably arbitrary and capricious and without support in the record assembled during the arbitration; (iii) the arbitrator failed to afford one or more parties to the dispute an opportunity for a fair and meaningful hearing; (iv) the arbitrator engaged in serious misconduct in connection with the arbitration; (v) the arbitrator exceeded the authority conferred upon him or her under this Appendix C or as otherwise established by agreement of all the parties to the dispute; or (vi) the arbitrator's decision is contrary to the provisions of Section C.6.6.

C.9.2 Matter and One or More Parties to Dispute Subject to FERC Jurisdiction. If (i) the subject matter of a dispute arbitrated under Sections C.6 and C.7 is within the jurisdiction of FERC, and (ii) the conditions specified in Section C.12.1 or C.12.2 are satisfied, the rights of the parties to contest or appeal the arbitrator's decision shall be as set forth in Sections C.10 and C.12 below (subject also to the provisions of Section C.9.1 above). Notwithstanding the foregoing, nothing herein shall be construed or operate to require any Canadian or Mexican party or any other party that is not a "public utility" within the meaning of the FPA to make any filing with FERC under Sections 205 or 206 of the FPA.

C.9.3 All Parties and Matters in Dispute Subject to Jurisdiction of a Canadian Regulatory Authority. If all of the parties to an arbitrated dispute are subject to the jurisdiction of a particular Canadian Regulatory Authority, and if all matters in dispute are also subject to the jurisdiction of the same Canadian Regulatory Authority, any disputing party may appeal an arbitrator's decision to that Canadian Regulatory Authority, where such Canadian Regulatory Authority has jurisdiction to hear the appeal, or to the appropriate Canadian court. Any appeal to a Canadian Regulatory Authority or Canadian court shall be subject to the provisions set forth in Sections C.10 and C.11 below.

C.9.4 All Parties and the Matter in Dispute Subject to Jurisdiction of a Mexican Regulatory Authority. If all of the parties to an arbitrated dispute are subject to the jurisdiction of a particular Mexican Regulatory Authority, and if all matters in dispute are also subject to the jurisdiction of the same Mexican Regulatory Authority, any disputing party may appeal an arbitrator's decision to the

appropriate Mexican Regulatory Authority, subject to the provisions set forth in Sections C.10 and C.11 below.

C.9.5 Appeal to Court. If none of the preceding provisions concerning appealing or contesting an arbitrator's decision before FERC, a Canadian Regulatory Authority, or a Mexican Regulatory Authority apply to an arbitrated dispute, any party to an arbitrator's decision rendered in accordance with the provisions of Sections C.6 and C.7 may appeal the arbitrator's decision to a court of competent jurisdiction as provided under Section C.13 below.

C.10 Appealing or Contesting Arbitrator's Decision to FERC or a Presiding Authority. Subject to the conditions specified in Sections C.9.1 through C.9.5 above, any disputing party may appeal or contest an arbitrator's decision to FERC or an appropriate Presiding Authority as follows:

C.10.1 Record on Appeal. Except as otherwise provided in Section C.10.3 below, any appeal or action to contest an arbitrator's decision to FERC or a Presiding Authority shall be based solely upon the record assembled by the arbitrator. All parties to arbitrations conducted under Sections C.6 and C.7 intend that: (i) the FERC or other Presiding Authority should afford substantial deference to the factual findings of the arbitrator; (ii) the portion, if any, of the arbitrator's decision relating to issues not of first impression (i.e., matters previously decided by the FERC or other Presiding Authority or a court of competent jurisdiction in cases involving comparable facts and circumstances) should be afforded appropriate deference by the FERC or other Presiding Authority; and (iii) the

portion, if any, of the arbitrator's decision relating to issues of first impression should be afforded no deference by the FERC or other Presiding Authority.

C.10.2 No Expansion of Record on Appeal. Except as otherwise provided in Section C.10.3 below, no Member, non-Member, or WECC that has been a party to an arbitration under Sections C.6 and C.7 shall seek to expand the factual record before FERC or a Presiding Authority beyond that assembled by the arbitrator.

C.10.3 Exceptions to Limitations on Record on Appeal. If the arbitrator fails to assemble a complete record of the evidence submitted with respect to an arbitrated decision that is appealed pursuant to Sections C.9 through C.13, the parties to the appeal shall, notwithstanding the provisions of Sections C.10.1 and C.10.2 above, have the right to supplement the arbitrator's record before FERC or the Presiding Authority with any materials received into evidence by the arbitrator but omitted from the record assembled by the arbitrator. If an arbitrator's decision is appealed under Section C.9.1(iii) or (iv) above on the grounds that the arbitrator improperly excluded evidence so as to materially prejudice the outcome of the arbitration with respect to one or more of the parties to the dispute, any party to the appeal may submit the evidence asserted to be improperly excluded, but only as a basis to request that FERC or the Presiding Authority vacate the arbitrator's decision and remand the matter to the arbitrator (or, if FERC or the Presiding Authority determines that the arbitrator engaged in serious misconduct, to a newly selected arbitrator) for reconsideration of the matter with inclusion of the improperly excluded evidence. If an arbitrator's decision is appealed under Section C.9.1(iv)

above on the grounds of serious misconduct by the arbitrator, any party to the appeal may offer new evidence relating to the arbitrator's alleged misconduct.

C.11 Procedures for Appeals to Presiding Authority. If any party to an arbitration under Sections C.6 and C.7 desires to appeal an arbitrator's decision to an appropriate Presiding Authority, it shall provide written notice to that effect to all other parties to the arbitration, the arbitrator, and WECC's Chief Executive Officer within 14 calendar days following the date of the arbitrator's decision. If notice of appeal is timely provided:

C.11.1 Within 30 calendar days after the date of the appealing party's first notice of appeal, the party providing notice of appeal shall file its statement of position regarding the appeal with the Presiding Authority, together with the complete evidentiary record of the arbitration and a copy of the arbitrator's decision. The statement of position shall state that the appeal requested has been the subject of an arbitration pursuant to this Agreement.

C.11.2 Within 30 calendar days after the date of the appealing party's first notice of appeal, any other party that was a party to the arbitration may file its statement of position regarding the appeal with the Presiding Authority.

C.11.3 Copies of all materials filed with the Presiding Authority by any party during the course of an appeal shall be delivered to all other parties to the arbitration and to WECC's Chief Executive Officer.

C.11.4 Implementation of the arbitrator's decision shall be deemed stayed pending an appeal unless and until, at the request of a disputing party, the Presiding Authority issues an order shortening or extending the stay of implementation.

C.11.5 WECC's Chief Executive Officer shall publish (or cause to be published) a summary of each appeal in WECC's newsletter or electronic bulletin board.

C.11.6 The Members and WECC intend that any Presiding Authority's order resulting from an appeal under Sections C.9 and C.11 shall be subject to judicial review pursuant to laws governing the Presiding Authority and the matter in dispute that provide for judicial review of Presiding Authority action.

C.12 Procedures for Contesting or Appealing Arbitrator's Decision Before FERC. If any party to a dispute arbitrated under Sections C.6 and C.7 elects, subject to the limitations set forth in Sections C.9.1 through C.9.5 above, to contest or appeal an arbitrator's decision before FERC, the party so electing shall provide written notice to that effect to all other parties to the arbitration, the arbitrator, and WECC's Chief Executive Officer within 14 calendar days following the date of the arbitrator's decision. The provisions contained in Sections C.10.1, C.10.2, and C.10.3 above shall apply with respect to the record of the arbitration submitted to FERC. In addition, the following provisions shall apply:

C.12.1 FERC Filing by Prevailing Party. If the arbitrator's decision requires the prevailing party to take action that must have FERC approval or involves the provision of FERC-jurisdictional service by the prevailing party, the prevailing party shall file the arbitrator's decision or make an appropriate filing with FERC to implement the arbitrator's decision. Provided that it has given notice as required under Section C.12 above, any non-prevailing party may contest the prevailing party's filing in accordance's with FERC's applicable rules and regulations.

C.12.2 Complaint to FERC by Prevailing Party. If the arbitrator's decision requires a non-prevailing party to take action that must have FERC approval or involves the provision of FERC-jurisdictional service by any non-prevailing party, then, if the non-prevailing party has given notice as required under Section C.12 above, the prevailing party may submit the arbitrator's decision to FERC in the form of a complaint.

C.13 Appeal to Court. If none of the provisions that govern appealing or contesting an arbitrator's decision before FERC, a Canadian Regulatory Authority, or a Mexican Regulatory Authority as set forth in Sections C.9.2, C.9.3, or C.9.4 above apply, any disputing party may appeal an arbitrator's decision to any court of competent jurisdiction, subject to the conditions specified in Section C.9.1 above. Except as otherwise provided in Section C.10.3 above (substituting the words "court of competent jurisdiction" for "FERC or the Presiding Authority"), any appeal to a court shall be based solely upon the record assembled by the arbitrator, and no Member, non-Member, or WECC who is a party to an arbitration under Sections C.6 and C.7 shall seek to expand the factual record before the court beyond that assembled by the arbitrator.

Appendix of Additional Definitions Relating to
Alternative Dispute Resolution Provisions

Arbitration Notice has the meaning specified in Section C.7.1 of these Bylaws.

Canadian Regulatory Authority. The agency or agencies established under the laws of Canada or the applicable Provinces of Canada and having jurisdiction over facilities, interconnections, transmission rates, charges, terms, and conditions of service of a Canadian Member.

Dispute Notice has the meaning specified in Section C.5.1 of these Bylaws.

FERC. The Federal Energy Regulatory Commission or a successor agency.

FPA. The Federal Power Act (16 U.S.C. §§ 824 *et. seq.*), as it may be amended from time to time.

Mexican Regulatory Authority. The agency or agencies established under the laws of Mexico or the applicable states of Mexico and having jurisdiction over facilities, interconnections, transmission rates, charges, terms, and conditions of service of a Mexican Member.

Presiding Authority. As used in Sections C.10 and C.11, the term "Presiding Authority" has the following meanings: with respect to an appeal to an appropriate Canadian Regulatory Authority, "Presiding Authority" means the presiding Canadian Regulatory Authority or Canadian court with jurisdiction to hear the appeal; and with respect to an appeal to an appropriate Mexican Regulatory Authority, "Presiding Authority" means the presiding Mexican Regulatory Authority or Mexican court with jurisdiction to hear the appeal.

Attachment 5

Amended Exhibit C

of the Delegation Agreement between

North American Electric Reliability Corporation and

Western Electricity Coordinating Council

Clean Version

Exhibit C – Regional Standard Development Procedure

Exhibit C shall set forth WECC's standards development procedure, which NERC agrees meets the following common attributes:

COMMON ATTRIBUTE 1

Proposed regional reliability standards shall be subject to approval by NERC, as the electric reliability organization, and by FERC before becoming mandatory and enforceable under Section 215 of the FPA in the United States. In Canada and Mexico, regional standards must be approved by applicable governmental authorities before becoming mandatory in those respective jurisdictions. No regional reliability standard shall be effective within the WECC area unless filed by NERC with FERC, and any applicable authorities in Canada and Mexico, and approved by FERC and any applicable authorities in Canada and Mexico.

COMMON ATTRIBUTE 2

WECC regional reliability standards shall provide for as much uniformity as possible with reliability standards across the interconnected bulk power system of the North American continent. A WECC reliability standard shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. A regional reliability standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable.

COMMON ATTRIBUTE 3

WECC regional reliability standards, when approved by FERC and applicable authorities in Canada and Mexico, shall be made part of the body of NERC reliability standards and shall be enforced upon all applicable bulk power system owners, operators, and users within the WECC area, regardless of membership in the region.

COMMON ATTRIBUTE 4

Requester — The requester is the sponsor of the regional reliability standard request and may assist in the development of the standard. Any member of WECC, or group within WECC, shall be allowed to request that a regional reliability standard be developed, modified, or withdrawn. Additionally, any entity (person, organization, company, government agency, individual, etc.) that is directly and materially affected by the

reliability of the bulk power system in the WECC area shall be allowed to request a regional reliability standard be developed, modified, or withdrawn.

COMMON ATTRIBUTE 5

WECC Standards Committee — The WECC Standards Committee (WSC) manages the standards development process. The WSC will consider which requests for new or revised standards shall be assigned for development (or existing standards considered for deletion). The WSC will advise the WECC board on standards presented for adoption.

COMMON ATTRIBUTE 6

Ballot body — The ballot body consists of WECC members and non-members that have been determined eligible for the WECC Standards Voting Sectors. Each member of the ballot body is eligible to vote on Regional Reliability Standards and Regional Criteria, except that Participating Stakeholders may only vote on Regional Criteria that could result in a sanction to a non-WECC member. The WSC is responsible for overseeing the voting process for each document balloted.

COMMON ATTRIBUTE 7

WECC will coordinate with NERC such that the acknowledgement of receipt of a standard request identified in step 1, notice of comment posting period identified in step 5, and notice for vote identified in step 9 can be concurrently posted on both the WECC and NERC websites.

COMMON ATTRIBUTE 8

An acceptable standard request shall contain a description of the proposed regional reliability standard subject matter containing sufficiently descriptive detail to clearly define the purpose, scope, impacted parties, and other relevant information of the proposed standard.

COMMON ATTRIBUTE 9

Within 60 days of receipt of a completed standard request, the WSC shall determine the disposition of the standard request.

COMMON ATTRIBUTE 10

The WSC may take one of the following actions:

- Accept the standard request as a candidate for development of a new standard, revision of an existing standard, or deletion of an existing standard. The WSC may, at its discretion, expand or narrow the scope of the standard request under consideration.
- Reject the standard request. If the WSC rejects a standard request, a written explanation for rejection will be delivered to the requester within 30 days of the decision.
- Remand the standard request back to the requester for additional work. The standards process manager will make reasonable efforts to assist the requester in addressing the deficiencies identified by the WSC. The requester may then resubmit the modified standard request using the process above. The requester may choose to withdraw the standard request from further consideration prior to acceptance by the WSC.

COMMON ATTRIBUTE 11

Any standard request that is accepted by the WSC for development of a standard (or modification or deletion of an existing standard) shall be posted for public viewing on the WECC website within 30 days of acceptance by the committee.

COMMON ATTRIBUTE 12

The WSC will select members of the drafting team.

COMMON ATTRIBUTE 13

At the direction of the WSC, the standards process manager shall facilitate the posting of the draft standard on the WECC website, along with a draft implementation plan and supporting documents, for a no less than a 45-day comment period. The standards process manager shall provide notice to WECC stakeholders and other potentially interested entities, both within and outside of the WECC area, of the posting using communication procedures then currently in effect or by other means as deemed appropriate.

COMMON ATTRIBUTE 14

The drafting team shall prepare a summary of the comments received and the changes made to the proposed standard as a result of these comments. The drafting team shall summarize comments that were rejected by the drafting team and the reason(s) that these comments were rejected, in part or whole. The summary, along with a response to each comment received will be posted on the WECC website no later than the next posting of the proposed standard.

COMMON ATTRIBUTE 15

Upon recommendation of the WSC, the standards process manager shall post the proposed standard and implementation plan for ballot and shall announce the vote to approve the standard, including when the vote will be conducted and the method for voting. Once the notice for a vote has been issued, no substantive modifications may be made to the proposed standard unless the revisions are posted and a new notice of the vote is issued.

COMMON ATTRIBUTE 16

The standards process manager shall schedule a vote by the ballot pool. The vote shall commence no sooner than 15 days following the issuance of the notice for the vote.

COMMON ATTRIBUTE 17

The WECC ballot pool shall consist of Ballot Body entities that have opted to vote on a specific standard. The ballot pool shall be able to vote on the proposed standard during a period of not less than 15 days.

COMMON ATTRIBUTE 18

. Each standard action requires formation of a ballot pool of interested members of the registered ballot body.

COMMON ATTRIBUTE 19

A weighted majority vote of the Ballot Pool is required for a draft standard to be approved by the WECC membership and Participating Stakeholders. Abstentions and negative votes cast without an explanation shall not count toward the results but will be counted in determining whether a quorum of the Ballot Pool is achieved.

COMMON ATTRIBUTE 20

The WECC Board may only substantively modify the proposed regional reliability standard in accordance with its backstop authority as authorized by the WECC Bylaws.

COMMON ATTRIBUTE 21

Once a regional reliability standard is approved by the board, the standard will be submitted to NERC for approval and filing with FERC and applicable authorities in Canada and Mexico.

COMMON ATTRIBUTE 22

- **Open -** Participation in the development of a regional reliability standard shall be open to all organizations that are directly and materially affected by the WECC bulk power system reliability. There shall be no undue financial barriers to participation. Participation shall not be conditioned upon membership in WECC, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements. Meetings of drafting teams shall be open to the WECC members and others.

COMMON ATTRIBUTE 23

- **Balanced -** The WECC standards development process strives to have an appropriate balance of interests and shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter.

COMMON ATTRIBUTE 24

- **Inclusive** — Any entity (person, organization, company, government agency, individual, etc.) with a direct and material interest in the bulk power system in the WECC area shall have a right to participate by: a) expressing a position and its basis, b) having that position considered, and c) having the right to appeal.

COMMON ATTRIBUTE 25

- **Fair due process** — The regional reliability standards development procedure shall provide for reasonable notice and opportunity for public comment. At a minimum, the procedure shall include public notice of the intent to develop a

standard, a public comment period on the proposed standard, due consideration of those public comments, and a ballot of Participating Stakeholders.

COMMON ATTRIBUTE 26

- **Transparent** — All actions material to the development of regional reliability standards shall be transparent. All standards development meetings shall be open and publicly noticed on the regional entity's Web site.

COMMON ATTRIBUTE 27

- Does not unnecessarily delay development of the proposed reliability standard.

COMMON ATTRIBUTE 28

Each standard shall enable or support one or more of the reliability principles, thereby ensuring that each standard serves a purpose in support of the reliability of the regional bulk power system. Each standard shall also be consistent with all of the reliability principles, thereby ensuring that no standard undermines reliability through an unintended consequence.

COMMON ATTRIBUTE 29

While reliability standards are intended to promote reliability, they must at the same time accommodate competitive electricity markets. Reliability is a necessity for electricity markets, and robust electricity markets can support reliability. Recognizing that bulk power system reliability and electricity markets are inseparable and mutually interdependent, all regional reliability standards shall be consistent with NERC's market interface principles. Consideration of the market interface principles is intended to ensure that standards are written such that they achieve their reliability objective without causing undue restrictions or adverse impacts on competitive electricity markets.

COMMON ATTRIBUTE 30

To ensure uniformity of regional reliability standards, a regional reliability standard shall consist of the elements identified in this section of the procedure. These elements are intended to apply a systematic discipline in the development and revision of standards. This discipline is necessary to achieving standards that are measurable, enforceable, and consistent.

COMMON ATTRIBUTE 31

All mandatory requirements of a regional reliability standard shall be within the standard. Supporting documents to aid in the implementation of a standard may be referenced by the standard but are not part of the standard itself.

COMMON ATTRIBUTE 32

Applicability	Clear identification of the functional classes of entities responsible for complying with the standard, noting any specific additions or exceptions. If not applicable to the entire WECC area, then a clear identification of the portion of the bulk power system to which the standard applies. Any limitation on the applicability of the standard based on electric facility requirements should be described.

COMMON ATTRIBUTE 33

Measure(s)	Each requirement shall be addressed by one or more measures. Measures are used to assess performance and outcomes for the purpose of determining compliance with the requirements stated above. Each measure will identify to whom the measure applies and the expected level of performance or outcomes required demonstrating compliance. Each measure shall be tangible, practical, and as objective as is practical. It is important to realize that measures are proxies to assess required performance or outcomes. Achieving the measure should be a necessary and sufficient indicator that the requirement was met. Each measure shall clearly refer to the requirement(s) to which it applies.

COMMON ATTRIBUTE 34

Compliance Monitoring Process	Defines for each measure: • The specific data or information that is required to measure performance or outcomes. • The entity that is responsible for providing the data or information for measuring performance or

	outcomes. • The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes. • The entity that is responsible for evaluating data or information to assess performance or outcomes. • The time period in which performance or outcomes is measured, evaluated, and then reset. • Measurement data retention requirements and assignment of responsibility for data archiving. • Violation severity levels.

Attachment 6

Amended Exhibit C

of the Delegation Agreement between

North American Electric Reliability Corporation and

Western Electricity Coordinating Council

Redline Version

Exhibit C – Regional Standard Development Procedure

Exhibit C shall set forth WECC's standards development procedure, which NERC agrees meets the following common attributes:

COMMON ATTRIBUTE 1

Proposed regional reliability standards shall be subject to approval by NERC, as the electric reliability organization, and by FERC before becoming mandatory and enforceable under Section 215 of the FPA in the United States. In Canada and Mexico, regional standards must be approved by applicable governmental authorities before becoming mandatory in those respective jurisdictions. No regional reliability standard shall be effective within the WECC area unless filed by NERC with FERC, and any applicable authorities in Canada and Mexico, and approved by FERC and any applicable authorities in Canada and Mexico.

COMMON ATTRIBUTE 2

WECC regional reliability standards shall provide for as much uniformity as possible with reliability standards across the interconnected bulk power system of the North American continent. A WECC reliability standard shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. A regional reliability standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable.

COMMON ATTRIBUTE 3

WECC regional reliability standards, when approved by FERC and applicable authorities in Canada and Mexico, shall be made part of the body of NERC reliability standards and shall be enforced upon all applicable bulk power system owners, operators, and users within the WECC area, regardless of membership in the region.

COMMON ATTRIBUTE 4

Requester — The requester is the sponsor of the regional reliability standard request and may assist in the development of the standard. Any member of WECC, or group within WECC, shall be allowed to request that a regional reliability standard be developed, modified, or withdrawn. Additionally, any entity (person, organization, company, government agency, individual, etc.) that is directly and materially affected by the

reliability of the bulk power system in the WECC area shall be allowed to request a regional reliability standard be developed, modified, or withdrawn.

COMMON ATTRIBUTE 5

WECC Standards Committee ~~and Standing Committees~~ — The WECC Standards Committee (WSC) manages the standards development process. The WSC will consider which requests for new or revised standards shall be assigned for development (or existing standards considered for deletion). ~~The WSC, with assistance from the standing committees,~~The WSC will advise the WECC board on standards presented for adoption.

COMMON ATTRIBUTE 6

Ballot body — The ballot body consists of WECC members and non-members that have been determined eligible for the WECC ~~Standard~~Standards Voting Sectors. Each member of the ballot body is eligible to vote on Regional Reliability Standards and Regional Criteria~~.~~, except that Participating Stakeholders may only vote on Regional Criteria that could result in a sanction to a non-WECC member. The WSC is responsible for overseeing the voting ~~on~~process for each ~~standard.~~document balloted.

COMMON ATTRIBUTE 7

WECC will coordinate with NERC such that the acknowledgement of receipt of a standard request identified in step ~~2~~1, notice of comment posting period identified in step ~~4~~5, and notice for vote identified in step ~~6 below are~~9 can be concurrently posted on both the WECC and NERC websites.

COMMON ATTRIBUTE 8

An acceptable standard request shall contain a description of the proposed regional reliability standard subject matter containing sufficiently descriptive detail to clearly define the purpose, scope, impacted parties, and other relevant information of the proposed standard.

COMMON ATTRIBUTE 9

Within ~~14~~60 days of receipt of a completed standard request, the WSC shall determine the disposition of the standard request.

COMMON ATTRIBUTE 10

The WSC may take one of the following actions:

- Accept the standard request as a candidate for development of a new standard, revision of an existing standard, or deletion of an existing standard. The WSC may, at its discretion, expand or narrow the scope of the standard request under consideration.
- Reject the standard request. If the WSC rejects a standard request, a written explanation for rejection will be delivered to the requester within ~~14~~30 days of the decision.
- Remand the standard request back to the requester for additional work. The standards process manager will make reasonable efforts to assist the requester in addressing the deficiencies identified by the WSC. The requester may then resubmit the modified standard request using the process above. The requester may choose to withdraw the standard request from further consideration prior to acceptance by the WSC.

COMMON ATTRIBUTE 11

Any standard request that is accepted by the WSC for development of a standard (or modification or deletion of an existing standard) shall be posted for public viewing on the WECC website within 30 days of acceptance by the committee.

COMMON ATTRIBUTE 12

The WSC will select members of the drafting team.

COMMON ATTRIBUTE 13

At the direction of the WSC, the standards process manager shall facilitate the posting of the draft standard on the WECC website, along with a draft implementation plan and supporting documents, for a no less than a 45-day comment period. The standards process manager shall provide notice to WECC stakeholders and other potentially interested entities, both within and outside of the WECC area, of the posting using communication procedures then currently in effect or by other means as deemed appropriate.

COMMON ATTRIBUTE 14

The ~~WSC, with assistance from the~~ drafting team ~~as it requests,~~ shall prepare a summary of the comments received and the changes made to the proposed standard as a result of these comments. The ~~WSC~~drafting team shall summarize comments that were rejected by the ~~WSC~~drafting team and the reason(s) that these comments were rejected, in part or whole. The summary, along with a response to each comment received will be posted on the WECC website ~~within 30 days of~~no later than the ~~close~~next posting of the ~~comment period.~~proposed standard.

COMMON ATTRIBUTE 15

Upon recommendation of the WSC, the standards process manager shall post the proposed standard and implementation plan for ballot and shall announce the vote to approve the standard, including when the vote will be conducted and the method for voting. Once the notice for a vote has been issued, no substantive modifications may be made to the proposed standard unless the revisions are posted and a new notice of the vote is issued.

COMMON ATTRIBUTE 16

The standards process manager shall schedule a vote by the ~~WECC lead standing committee].~~ballot pool. The vote shall commence no sooner than ~~[30]~~15 days following the issuance of the notice for the vote. ~~Voting shall begin no sooner than [7] calendar days following the Joint Session of the Standing Committees at which the draft standard was considered.~~

COMMON ATTRIBUTE 17

The WECC ballot pool shall consist of Ballot Body entities that have opted to vote on a specific standard. The ballot pool shall be able to vote on the proposed standard during a period of not less than 15 ~~business~~ days.

COMMON ATTRIBUTE 18

~~All Ballot Body members are eligible to participate in voting on proposed new standards, standard revisions or standard deletions.~~ . Each standard action requires formation of a ballot pool of interested members of the registered ballot body.

COMMON ATTRIBUTE 19

A weighted majority vote of the Ballot Pool is required for a draft standard to be approved by the WECC membership and Participating Stakeholders. Abstentions and ~~non-responses~~negative votes cast without an explanation shall not count toward the results but will be counted in determining whether a quorum of the Ballot Pool is achieved.

COMMON ATTRIBUTE 20

The WECC Board may only substantively modify the proposed regional reliability standard in accordance with its backstop authority as authorized by the WECC Bylaws.

COMMON ATTRIBUTE 21

Once a regional reliability standard is approved by the board, the standard will be submitted to NERC for approval and filing with FERC and applicable authorities in Canada and Mexico.

COMMON ATTRIBUTE 22

- **Open** - Participation in the development of a regional reliability standard shall be open to all organizations that are directly and materially affected by the WECC bulk power system reliability. There shall be no undue financial barriers to participation. Participation shall not be conditioned upon membership in WECC, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements. Meetings of drafting teams shall be open to the WECC members and others.

COMMON ATTRIBUTE 23

- **Balanced** - The WECC standards development process strives to have an appropriate balance of interests and shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter.

COMMON ATTRIBUTE 24

- **Inclusive** — Any entity (person, organization, company, government agency, individual, etc.) with a direct and material interest in the bulk power system in the WECC area shall have a right to participate by: a) expressing a position and its basis, b) having that position considered, and c) having the right to appeal.

COMMON ATTRIBUTE 25

- **Fair due process** — The regional reliability standards development procedure shall provide for reasonable notice and opportunity for public comment. At a minimum, the procedure shall include public notice of the intent to develop a standard, a public comment period on the proposed standard, due consideration of those public comments, and a ballot of Participating Stakeholders.

COMMON ATTRIBUTE 26

- **Transparent** — All actions material to the development of regional reliability standards shall be transparent. All standards development meetings shall be open and publicly noticed on the regional entity's Web site.

COMMON ATTRIBUTE 27

- Does not unnecessarily delay development of the proposed reliability standard.

COMMON ATTRIBUTE 28

Each standard shall enable or support one or more of the reliability principles, thereby ensuring that each standard serves a purpose in support of the reliability of the regional bulk power system. Each standard shall also be consistent with all of the reliability principles, thereby ensuring that no standard undermines reliability through an unintended consequence.

COMMON ATTRIBUTE 29

While reliability standards are intended to promote reliability, they must at the same time accommodate competitive electricity markets. Reliability is a necessity for electricity markets, and robust electricity markets can support reliability. Recognizing that bulk power system reliability and electricity markets are inseparable and mutually interdependent, all regional reliability standards shall be consistent with NERC's market interface principles. Consideration of the market interface principles is intended to ensure that standards are written such that they achieve their reliability objective without causing undue restrictions or adverse impacts on competitive electricity markets.

COMMON ATTRIBUTE 30

To ensure uniformity of regional reliability standards, a regional reliability standard shall consist of the elements identified in this section of the procedure. These elements are intended to apply a systematic discipline in the development and revision of standards. This discipline is necessary to achieving standards that are measurable, enforceable, and consistent.

COMMON ATTRIBUTE 31

All mandatory requirements of a regional reliability standard shall be within the standard. Supporting documents to aid in the implementation of a standard may be referenced by the standard but are not part of the standard itself.

COMMON ATTRIBUTE 32

Applicability	Clear identification of the functional classes of entities responsible for complying with the standard, noting any specific additions or exceptions. If not applicable to the entire WECC area, then a clear identification of the portion of the bulk power system to which the standard applies. Any limitation on the applicability of the standard based on electric facility requirements should be described.

COMMON ATTRIBUTE 33

Measure(s)	Each requirement shall be addressed by one or more measures. Measures are used to assess performance and outcomes for the purpose of determining compliance with the requirements stated above. Each measure will identify to whom the measure applies and the expected level of performance or outcomes required demonstrating compliance. Each measure shall be tangible, practical, and as objective as is practical. It is important to realize that measures are proxies to assess required performance or outcomes. Achieving the measure should be a necessary and sufficient indicator that the requirement was met. Each measure shall clearly refer to the requirement(s) to which it applies.

COMMON ATTRIBUTE 34

Compliance Monitoring Process	Defines for each measure: • The specific data or information that is required to measure performance or outcomes. • The entity that is responsible for providing the data or information for measuring performance or outcomes. • The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes. • The entity that is responsible for evaluating data or information to assess performance or outcomes. • The time period in which performance or outcomes is measured, evaluated, and then reset. • Measurement data retention requirements and assignment of responsibility for data archiving. • Violation severity levels.

Washington, D.C. 20426

Re: Petition to Approve the Western Electricity Coordinating Council Data Request Process
Docket No. RR15-__-___

Dear Ms. Bose:

The North American Electric Reliability Corporation ("NERC"), in accordance with the *NERC Rules of Procedure* Section 1604.2,[1] respectfully submits the attached Western Electricity Coordinating Council ("WECC") Data Request Process to the Federal Energy Regulatory Commission ("FERC" or the "Commission") for approval.

With respect to Regional Entity data requests, the *NERC Rules of Procedure* Section 1604 provides that a Regional Entity may develop its own procedures for requesting data or information, so long as any such procedures include at least the same procedural elements as are included in Section 1600. Such Regional Entity procedures must also be submitted to NERC for approval and, upon approval, NERC must file the proposed procedures for approval to FERC and other applicable governmental authorities.

[1] The Commission-approved *NERC Rules of Procedure* Section 1604.2 states:

> A Regional Entity may also develop its own procedures for requesting data or information, but any such procedures must include at least the same procedural elements as are included in this Section 1600. Any such Regional Entity procedures or changes to such procedures shall be submitted to NERC for approval. Upon approving such procedures or changes thereto, NERC shall file the proposed procedures or proposed changes for approval by the Commission and any other Applicable Governmental Authorities applicable to the Regional Entity. The Regional Entity procedures or changes to such procedures shall not be effective in a jurisdiction until approved by, and in accordance with any revisions directed by, the Commission or other Applicable Governmental Authority.

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

On May 15, 2014, the WECC Board of Directors reviewed a proposed version of the WECC Data Request Process that was written to permit WECC staff to issue mandatory data requests for reliability data to entities in the Western Interconnection. WECC's Board of Directors deferred a decision on approving the process in order to allow its Member Advisory Committee ("MAC") to review and provide input. On June 25, 2014, the WECC Board of Directors approved the attached WECC Data Request Process, including amendments made by MAC during the review period. The MAC amendments added a provision to clarify that the process is not binding on entities outside of the United States. However, WECC may request comparable data or information from those entities on a voluntary basis.

On June 30, 2014, WECC submitted the proposed process to the NERC Board of Trustees for approval. On August 14, 2014, the NERC Board of Trustees approved the attached WECC Data Request Process.

Following FERC's approval of WECC's Data Request Process, WECC anticipates it may seek approval by its Board of Directors of such a data request as early as March 2015. Given the amount of time required to move a request through the process, and because the process included in the attachment is not controversial, NERC respectfully requests expedited action of this petition from the Commission by December 31, 2014.

Respectfully submitted,

/s/ Holly A. Hawkins

Counsel for North American Electric Reliability Corporation

ATTACHMENT

WECC Data Request Process

INTRODUCTION

Pursuant to Section 215 of the Federal Power Act and Section 1600 of the North American Electric Reliability Corporation ("NERC") Rules of Procedure, Western Electricity Coordinating Council ("WECC") has the authority to request data or information that is necessary to meet its obligations as a Regional Entity from owners, operators, and users of the Bulk Power System in the United States. This process is not binding on entities outside of the United States. However, WECC may request comparable data or information from those entities on a voluntary basis.

SCOPE

This WECC Data Request Process ("Process") shall not apply to or interfere with Requirements contained in any Reliability Standard to provide data or information. This Process shall also not apply to data or information requested in connection with a compliance or enforcement action or any procedures adopted applicable to such compliance or enforcement actions.

PROCESS

1. **Submission to NERC and FERC**: WECC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in Section 2 below as applicable, to NERC and the Federal Energy Regulatory Commission's ("FERC" or "Commission") Office of Electric Reliability ("Office of Electric Reliability") at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to NERC and the FERC Office of Electric Reliability is for the information of NERC and the Commission. WECC is not required to receive any approval from NERC or the Commission prior to posting the proposed request or modification for public comment in accordance with Section 2 below or issuing the request or modification to Reporting Entities following approval by the WECC Board of Directors.

2. **Posting for Comment**: WECC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.
    a. A proposed request for data or information shall contain, at a minimum, the following information:
        i. a description of the data or information to be requested;
        ii. how the data or information will be used;
        iii. how the availability of the data or information is necessary for WECC to meet its obligations as a Regional Entity;
        iv. a description of how the data or information will be collected and validated;
        v. a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("Reporting Entities");
        vi. the schedule or due date for the data or information;

vii. a description of any restrictions on WECC's dissemination of the data or information; and
viii. an estimate of the relative burden imposed on the Reporting Entities to accommodate the data or information request.

b. A proposed modification to a previously authorized request for data or information shall explain:
   i. the nature of the modifications;
   ii. an estimate of the burden imposed on the Reporting Entities to accommodate the modified data or information request; and
   iii. any other items from Section 2.a above that require updating as a result of the modifications.

3. **Submission to the WECC Board of Directors**: After the close of the comment period, WECC shall make any revisions it deems appropriate to the proposed request for data or information in light of the comments received. WECC shall submit the proposed request for data or information, as revised, along with the comments received, and an evaluation of the comments and revisions, to the WECC Board of Directors.

4. **WECC Board of Directors Determination**: In acting on the proposed request for data or information, the WECC Board of Directors may authorize WECC to issue it, modify it, or remand it for further consideration.

5. **Minor Revisions to Data Requests**: WECC may make minor changes to an authorized request for data or information without WECC Board of Director approval. However, if a Reporting Entity objects in writing to such changes to WECC within 21 days of issuance of the modified request, such changes shall require WECC Board of Director approval before they are implemented.

6. **Authorization and Appeals**: Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the WECC Board of Directors, an affected party appeals the authorization to the NERC Board of Trustees. Determinations of the NERC Board of Trustees may be appealed to the Commission.

7. **Owners, Operators and Users to Comply**: Owners, operators, and users of the Bulk Power System registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a Reporting Entity within the United States fails to comply with an authorized request for data or information under this Process, WECC may request that NERC request the Commission to exercise its enforcement authority to require the Reporting Entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. Such requests shall be made through non-public submissions to NERC and the Commission.

8. **Confidentiality**: If the approved data or information request includes a statement that the requested data or information will be treated as confidential, then the applicable

provisions of Section 1500 of the NERC Rules of Procedure will apply without further action by a Submitting Entity. A Submitting Entity may designate any other data or information in the request as Confidential Information pursuant to the provisions of Section 1500. WECC shall treat all such data or information in accordance with Section 1500.

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, D.C. 20426

OFFICE OF ELECTRIC RELIABILITY

North American Electric Reliability Corporation
Docket No. RD14-12-000

November 6, 2014

North American Electric Reliability Corporation
1325 G Street N.W., Suite 600
Washington, D.C. 20005

Attention: Stacey Tyrewala, Senior Counsel
North American Electric Reliability Corporation

Reference: Petition for Approval of Proposed Reliability Standards FAC-001-2 (Facility Interconnection Requirements) and FAC-002-2 (Facility Interconnection Studies)

Dear Ms. Tyrewala:

On August 22, 2014, the North American Electric Reliability Corporation (NERC) filed a petition (Petition) seeking approval of proposed Reliability Standards FAC-001-2 (Facility Interconnection Requirements) and FAC-002-2 (Facility Interconnection Studies), the associated implementation plan, violation risk factors and violation security levels, and the retirement of currently-effective Reliability Standards FAC-001-1 and FAC-002-1.

In its Petition, NERC states that the proposed Reliability Standards are intended to improve Bulk-Power System reliability by ensuring that there is appropriate coordination regarding the interconnection of facilities.[1] NERC explains that the standard drafting team's revisions to the currently-effective Reliability Standards FAC-001-1 and FAC-002-1 eliminate redundancies and clarify the actions required in the standards.[2] NERC further states that proposed Reliability Standard FAC-001-2 sets forth the requirements

[1] NERC Petition at 3.

[2] *Id.* at 4.

20141106-3036 FERC PDF (Unofficial) 11/06/2014

related to transmission owners and applicable generation owners[3] for making facility interconnection requirements available so that entities seeking to interconnect have the necessary information, and proposed Reliability Standard FAC-002-2 ensures that the reliability impact of interconnecting new or materially modified facilities is studied.[4]

Proposed Reliability Standard FAC-001-2 requires each transmission owner and applicable generator owner to document facility interconnection requirements, and to make them available upon request to entities seeking to interconnect. In addition, proposed Reliability Standard FAC-001-2 requires each transmission owner and applicable generator owner to include procedures for coordinating studies to determine the impact of interconnecting facilities on existing interconnections as well as on affected systems.

Proposed Reliability Standard FAC-002-2 requires each transmission planner and each planning coordinator to study the reliability impact of interconnecting new--or materially modifying existing-- generation, transmission, or electricity end-user facilities on affected systems. In particular, proposed Reliability Standard FAC-002-2 requires transmission planners and planning coordinators to perform steady-state, short-circuit, and dynamic studies to evaluate system performance under both normal and contingency conditions. In addition, proposed Reliability Standard FAC-002-2 requires each generator owner seeking to interconnect, each transmission owner, each distribution provider, and each load-serving entity that is seeking to interconnect new--or materially modifying existing--transmission facilities or end-user facilities to coordinate and cooperate on studies with its transmission planner and planning coordinator.

NERC's filing was noticed on August 26, 2014, with interventions, comments, and protests due on or before September 25, 2014. No interventions, comments or protests were filed.

NERC's uncontested filing is hereby approved pursuant to the relevant authority delegated to the Director, Office of Electric Reliability under 18 C.F.R. § 375.303 (2014), effective as of the date of this Order.

This action shall not be construed as approving any other application, including proposed revisions of Electric Reliability Organization or Regional Entity rules or procedures pursuant to 18 C.F.R. § 375.303(a)(2)(i). Such action shall not be deemed as

---

[3] An "applicable generation owner" is a generation owner "with a fully executed Agreement to conduct a study on the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System." Section 4.1.2.1 of Reliability Standard FAC-001-2 and section 4.1.6.1 of Reliability Standard FAC-002-2.

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, DC 20426

OFFICE OF ENERGY MARKET REGULATION

North American Electric Reliability Corporation
Docket No. RR14-6-001

October 28, 2014

Schiff Hardin LLP
233 South Wacker Drive, Suite 6600
Chicago, IL 60606

Attention: Owen E. MacBride
Attorney for North American Electric Reliability Corporation

Reference: Revisions to the 2015 Budget and Assessments of Peak Reliability, Inc.

Dear Mr. MacBride:

On October 14, 2014, North American Electric Reliability Corporation (NERC) submitted revisions to the 2015 Business Plan and Budget of Peak Reliability, Inc. (Peak), including a revised schedule of assessments that reflects an agreement with the British Columbia Hydro and Power Authority (BC Hydro), pursuant to which BC Hydro's Balancing Authority Area will remain a part of Peak's Reliability Coordination Area.

Notice of this filing was issued on October 15, 2014, with protests and interventions due on or before October 21, 2014. Notices of intervention and unopposed timely filed motions to intervene are granted pursuant to the operation of Rule 214 of the Commission's Rules of Practice and Procedure 18 C.F.R. § 385.214. No protests were filed.

NERC's uncontested filing is accepted pursuant to the relevant authority delegated to the Director, Office of Energy Market Regulation, under 18 C.F.R. § 375.307.

This action shall not be construed as approving any other application, including proposed revisions of Electric Reliability Organization or Regional Entity rules or procedures pursuant to 18 C.F.R. § 375.307(a)(2)(vi). This action does not constitute approval of any service, rate, charge, classification, or any rule, regulation, contract, or practice affecting such rate or service provided for in the filed documents. Such action

shall not be deemed as recognition of any claimed right or obligation associated therewith and such action is without prejudice to any findings or orders that have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the Electric Reliability Organization or any Regional Entity.

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order pursuant to 18 C.F.R. § 385.713.

Sincerely,

Penny S. Murrell, Director
Division of Electric Power Regulation-Central

Demand and Energy Data Reliability Standard

(September 18, 2014)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Commission proposes to approve Demand and Energy Data Reliability Standard MOD-031-1 developed by the North American Electric Reliability Corporation, which the Commission has certified as the Electric Reliability Organization responsible for developing and enforcing mandatory Reliability Standards.

DATES: Comments are due **[60 days after publication in the FEDERAL REGISTER].**

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.
- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC. 20426.

Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document.

148 FERC ¶ 61,192
UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Demand and Energy Data Reliability Standard Docket No. RM14-12-000

NOTICE OF PROPOSED RULEMAKING

(September 18, 2014)

1. Pursuant to section 215(d) of the Federal Power Act (FPA),[1] the Commission proposes to approve Reliability Standard MOD-031-1 (Demand and Energy Data) developed by the North American Electric Reliability Corporation (NERC), which the Commission has certified as the Electric Reliability Organization (ERO) responsible for developing and enforcing mandatory Reliability Standards. Reliability Standard MOD-031-1 provides authority for applicable entities to collect demand, energy and related data to support reliability studies and assessments and to enumerate the responsibilities and obligations of requestors and respondents of that data. In addition, the Commission proposes to approve NERC's proposed definitions for the terms Demand Side Management and Total Internal Demand. The Commission also proposes to approve the associated implementation plan, violation risk factors and violation severity levels, and NERC's proposed retirement of the currently-effective Reliability Standards MOD-016-1.1, MOD-017-0.1, MOD-018-0, MOD-019-0.1, and MOD-021-1 (Existing MOD C Standards).

[1] 16 U.S.C. § 824o(d) (2012).

I. Background

2. Section 215 of the FPA requires a Commission-certified ERO to develop mandatory and enforceable Reliability Standards, which are subject to Commission review and approval. Once approved, the Reliability Standards are enforced by the ERO, subject to Commission oversight, or by the Commission independently. In 2006, NERC submitted the initial version of Reliability Standards MOD-016-1.1, MOD-017-0.1, MOD-018-0, MOD-019-0.1, MOD-020-0, and MOD-021-1. The Existing MOD C Standards are designed to help ensure that historical and forecasted demand and energy data are available for past event validation and future system assessment. In particular, the Existing MOD C Standards, along with Reliability Standard MOD-020-0, require the collection of actual and forecast demand data necessary to analyze the resource needs to serve peak demand while maintaining a sufficient margin to address operating events.[2] In Order No. 693, the Commission approved the Existing MOD C Standards and Reliability Standard MOD-020-0. In addition, the Commission directed NERC to develop certain modifications to the standards.

II. NERC Petition

3. NERC states that proposed Reliability Standard MOD-031-1 provides planners and operators access to actual and forecast demand and energy data, as well as other

[2] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at PP 1223, 1235, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

related information, needed to perform resource adequacy studies.[3] NERC explains that the proposed Reliability Standard also supports the continued development of the reliability assessments prepared by NERC. NERC states that the proposed Reliability Standard improves the Existing MOD C Standards by: (1) streamlining them to clarify data collection requirements; (2) including transmission planners as applicable entities that must report demand and energy data; (3) requiring applicable entities to report weather normalized annual peak hour actual demand data from the previous year to allow for meaningful comparison with forecasted values; and (4) requiring applicable entities to provide an explanation of how their demand side management forecasts compare to actual demand side management for the prior calendar year and how their peak demand forecasts compare to actual demand for the prior calendar year with due regard to any relevant weather-related variations.[4]

4. Proposed Reliability Standard MOD-031-1 contains four requirements. Requirement R1 mandates that each planning coordinator or balancing authority that identifies a need for the collection of demand and energy data shall develop and issue a data request for such data to the relevant entities in its area. The requirement mandates that the data request identify: (i) the entities responsible for providing the data; (ii) the data to be provided by each entity; and (iii) the schedule for providing the data.

---

[3] NERC Petition at 3. The proposed MOD Reliability Standard is not attached to the NOPR. The complete text of the Reliability Standard is available on the Commission's eLibrary document retrieval system in Docket No. RM14-12 and is posted on the ERO's web site, *available at*: http://www.nerc.com.

[4] NERC Petition at 4.

Requirement R2 obligates the entities identified in a Requirement R1 data request to provide the requested data to their planning coordinator or balancing authority. Requirement R3 requires that the planning coordinator or the balancing authority provide the data collected under Requirement R2 to their Regional Entity, if requested, to facilitate NERC's development of reliability assessments. Requirement R4 requires entities to share their demand and energy data with any applicable entity that demonstrates a reliability need for such data, subject to applicable confidentiality, regulatory or security restrictions.[5]

5. The term Demand Side Management is currently defined in the NERC Glossary as: "[t]he term for all activities or programs undertaken by a Load-Serving Entity or its customers to influence the amount or timing of electricity they use." NERC proposes to modify the definition of "Demand Side Management" as "[a]ll activities or programs undertaken by any applicable entity to achieve a reduction in Demand." NERC states that, consistent with the Commission directive in Order No. 693, the proposed definition for Demand Side Management is not limited to "activities or program undertaken by Load Serving Entities or its customers" but is expanded to include "activities or programs undertaken by any applicable entity."[6]

6. NERC requests that the Commission approve the proposed Reliability Standard, the proposed new and modified NERC Glossary terms and the retirement of the Existing

[5] *Id.* at 5.

[6] *Id.* at 15-16.

MOD C Standards, effective on the first day of the first calendar quarter that is twelve months after Commission approval. NERC states that the 12-month implementation period is designed to provide applicable entities sufficient time to transition from compliance with the Existing MOD C Standards to proposed Reliability Standard MOD-031-1.[7]

III. Discussion

7. Pursuant to section 215(d)(2) of the FPA, the Commission proposes to approve Reliability Standard MOD-031-1 as just, reasonable, not unduly discriminatory or preferential, and in the public interest. We also propose to approve the new and modified glossary definitions, implementation plan, associated violation risk factors and violation severity levels as well as the retirement of the Existing MOD C Standards, as requested by NERC.

8. The Commission believes that the proposed Reliability Standard MOD-031-1 continues to provide planners and operators access to complete and accurate demand and energy data to allow such entities to conduct their own resource adequacy analyses to serve peak demand. The proposed Reliability Standard also appears to provide for consistent documentation and information sharing practices for demand and energy data, and promotes efficient planning practices across the industry and supports the identification of needed system reinforcements. The Commission believes that proposed Reliability Standard MOD-031-1 improves the Existing MOD C Standards by providing

[7] *Id.* at 31.

applicable entities the authority to collect demand and energy data, and related information, to support reliability assessments and also includes transmission planners as applicable entities that must report demand and energy data. Furthermore, the proposed Reliability Standard requires applicable entities to provide an explanation of current and previous demand side management forecasts and how their peak demand forecasts compare to actual demand for the prior calendar year.

9. While we propose to approve Reliability Standard MOD-031-1, we seek comment on the collection of data through mechanisms other than data requests. Requirements R1 through R3 specifically reference the obtaining of data through data requests as follows:

> R1. Each Planning Coordinator or Balancing Authority that identifies a need for the collection of Total Internal Demand, Net Energy for Load, and Demand Side Management data shall develop and issue a data request to the applicable entities in its area. The data request shall include:...
>
> R2. Each Applicable Entity identified in a data request shall provide the data requested by its Planning Coordinator or Balancing Authority in accordance with the data request issued pursuant to Requirement R1.
>
> R3. The Planning Coordinator or the Balancing Authority shall provide the data collected under Requirement R2 to the applicable Regional Entity within 75 calendar days of receiving a request for such data, unless otherwise agreed upon by the parties.

In its petition, NERC states that Requirement R1 applies when a planning coordinator or balancing authority "identifies a need" for the collection of demand and energy data.[8] According to NERC, this language of Requirement R1:

[8] NERC Petition at 22.

> is intended to reflect that certain Planning Coordinators and Balancing Authorities may not need to collect Demand and energy data through a data request issued pursuant to the proposed Reliability Standard. That is because certain Planning Coordinators and Balancing Authorities obtain the data through alternative mechanisms or develop the data themselves. For instance, many Planning Coordinators, such as independent system operators (ISOs) and regional transmission organizations (RTOs), collect the necessary data and information from entities within their footprint pursuant to requirements in their Open Access Transmission Tariffs. Additionally, ISOs/RTOs are often in a better position to develop the necessary Demand and energy forecasts or aggregate the historical data than the entities in their area. Accordingly, the requirement is drafted so as to only require a Planning Coordinator or Balancing Authority to issue a data request if there is a need to do so.[9]

10. The Commission understands NERC's explanation to mean that, while a planning coordinator or balancing authority may collect demand and energy forecast data under a tariff or other arrangement, the planning coordinator or balancing authority always retains the option to seek the necessary data through a Requirement R1 data request if, for example, the data are not forthcoming through other means. The Commission seeks comment on this understanding. Further, the Commission seeks clarification from NERC and other commenters whether a planning coordinator or balancing authority that receives data "through alternative mechanisms" remains obligated to provide such data (i.e., within the scope of Requirement R1) to a Regional Entity upon request, as set forth in Requirement R3.

[9] *Id.* at 22-23.

IV. Information Collection Statement

11. The collection of information contained in this Notice of Proposed Rulemaking (NOPR) is subject to review by the Office of Management and Budget (OMB) under section 3507(d) of the Paperwork Reduction Act of 1995.[10] OMB's regulations require approval of certain information collection requirements imposed by agency rules.[11] Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of a rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

12. We solicit comments on the need for this information, whether the information will have practical utility, the accuracy of the burden estimates, ways to enhance the quality, utility, and clarity of the information to be collected or retained, and any suggested methods for minimizing respondents' burden, including the use of automated information techniques. Specifically, the Commission asks that any revised burden or cost estimates submitted by commenters be supported by sufficient detail to understand how the estimates are generated.

13. Interested persons may obtain information on the reporting requirements by contacting the following: Federal Energy Regulatory Commission, 888 First Street, NE,

[10] 44 U.S.C. 3507(d) (2012).

[11] 5 CFR 1320.11.

Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].

14. Comments concerning the information collection proposed in this NOPR and the associated burden estimates should be sent to the Commission in this docket and may also be sent to the Office of Management and Budget, Office of Information and Regulatory Affairs [Attention: Desk Officer for the Federal Energy Regulatory Commission]. For security reasons, comments should be sent by e-mail to OMB at the following e-mail address: oira_submission@omb.eop.gov. Please reference FERC-725L and the docket number of this Notice of Proposed Rulemaking (Docket No. RM14-12-000) in your submission.

15. The Commission proposes to approve Reliability Standard MOD-031-1, which will replace MOD-016-1.1, MOD-017-.01, MOD-018-0, MOD-019-0.1 and MOD-021-1 (Existing MOD C Standards). As stated above, the Existing MOD C Standards were approved by the Commission in Order No. 693. All information collection estimates associated with the collection of demand and energy data and subsequent retention were assessed in Order No. 693 and will not be repeated here. The proposed Reliability Standard expands the actual data to be submitted in two areas: (1) weather normalized annual peak hour actual demand for the prior calendar year if this demand varies due to weather-related conditions (e.g., temperature, humidity or wind speed); and (2) summaries detailed in Requirement R1, Subparts 1.5.4 and 1.5.5. The additional data and summaries will increase reporting and preparation time for some applicable entities. Most entities already normalize their actual demand data based on weather. However,

some entities may have a one-time cost of determining the method to "weather normalize" the actual demand data. Accordingly, the information collection costs will consist of an annual cost for all applicable entities and, for a small percentage, additional costs will occur during the first year of implementation.

Public Reporting Burden: Reliability Standard MOD-031-1 requires each "Applicable Entity" to provide the data requested by its planning coordinator or balancing authority in accordance with the data request issued pursuant to Requirement R1.[12] Our estimate below regarding the number of respondents is based on the NERC Compliance Registry as of July 31, 2014. According to the NERC Compliance Registry, NERC has registered 478 distribution providers, 469 load-serving entities, 179 transmission planners and 107 balancing authorities. However, under NERC's compliance registration program, entities may be registered for multiple functions, so these numbers incorporate some double counting. The total number of unique entities that may be identified as a data provider (e.g. applicable entity) in accordance with proposed Reliability Standard MOD-031-1 will be approximately 561 entities registered in the United States as a distribution provider, load-serving entity, transmission planner and/or balancing authority.[13] The Commission estimates the annual reporting burden and cost as follows:

[12] Requirement R1, Subpart 1.1 refers to "Applicable Entities" as the list of transmission planners, balancing authorities, load-serving entities and distribution providers that are required to provide the data.

[13] This estimate assumes all of the unique entities will be identified to provide demand and energy data.

	Number and Type of Respondents (1)	**Annual Number of Responses per Respondent (2)**	**Total Number of Responses (1)*(2)=(3)**	**Avg. Burden & Cost Per Response (4)**	**Total Annual Burden Hours & Total Annual Cost (3)*(4)=(5)**	**Cost per Respondent[14] (5)÷(1)**
(One-time) Determine method to weather normalize annual peak hour actual demand.	28[15] (DP, LSE, TP and/or BA)[16]	1	28	240 hrs. & $14,309	6,720 hours & $400,646	$14,309
(On-going) Develop summary in accordance w/ Requirement R1, Subparts 1.5.4 and 1.5.5.	561 (DP, LSE, TP and/or BA)	1	561	8 hrs. & $477	4,488 hours & $267,575	$477
TOTAL			589		11,208 hours & $668,221	

[14] The estimated hourly costs (salary plus benefits) are based on Bureau of Labor Statistics (BLS) information (*available at* http://bls.gov/oes/current/naics3_221000.htm#17-0000) for an electrical engineer ($59.62/hour).

[15] This value represents the number of entities that have not already determined a method to weather normalize annual peak actual demand data. We estimate approximately 5 percent of the applicable entities fall into this category.

[16] DP = distribution provider, LSE = load-serving entity, TP = transmission planner and BA = balancing authority, are functions the applicable entities perform in conjunction or individually. We estimate the total number of unique entities performing one or more of these functions to be 561.

Title: Mandatory Reliability Standards for the Bulk-Power System: MOD Reliability Standards.

Action: Proposed FERC-725L.

OMB Control No: 1902-0261

Respondents: Businesses or other for-profit institutions; not-for-profit institutions.

Frequency of Responses: One-time and ongoing.

Necessity of the Information: Reliability Standard MOD-031-1, if adopted, would implement the Congressional mandate of the Energy Policy Act of 2005 to develop mandatory and enforceable Reliability Standards to better ensure the reliability of the nation's Bulk-Power System. Specifically, the purpose of the proposed Reliability Standard is to provide authority for applicable entities to collect demand, energy and related data to support reliability studies and assessments and to enumerate the responsibilities and obligations of requestors and respondents of that data.

Internal Review: The Commission has reviewed the requirements pertaining to the proposed Reliability Standard for the Bulk-Power System and determined that the proposed requirements are necessary to meet the statutory provisions of the Energy Policy Act of 2005. These requirements conform to the Commission's plan for efficient information collection, communication and management within the energy industry. The Commission has assured itself, by means of internal review, that there is specific, objective support for the burden estimates associated with the information requirements.

V. Regulatory Flexibility Act Certification

16. The Regulatory Flexibility Act of 1980 (RFA)[17] generally requires a description and analysis of proposed rules that will have significant economic impact on a substantial number of small entities. As shown in the information collection section, the proposed Reliability Standard applies to 561 entities. Comparison of the applicable entities with the Commission's small business data indicates that approximately 249 are small entities.[18] Of these, the Commission estimates that approximately five percent, or twelve of these small entities expect to be affected by the new requirements of the proposed Reliability Standard.[19]

17. Proposed Reliability Standard MOD-031-1 is designed to replace, consolidate and improve upon the Existing MOD C Standards in addressing the collection and aggregation of demand and energy data necessary to support reliability assessments performed by the ERO and Bulk-Power System planners and operators. The reliability of the Bulk-Power System is dependent on having an adequate amount of resources and transmission infrastructure available to serve peak demand while also maintaining a

[17] 5 U.S.C. 601-612 (2012).

[18] The Small Business Administration sets the threshold for what constitutes a small business. Public utilities may fall under one of several different categories, each with a size threshold based on the company's number of employees, including affiliates, the parent company, and subsidiaries. The possible categories for the applicable entities have a size threshold ranging from 250 employees to 1,000 employees. For the analysis in this proposed rule, we are using the 1,000 employee threshold for each applicable entity type.

[19] *See* n.15 *supra*.

sufficient margin to address operating events.[20] The Commission estimates that the small entities that will be affected by proposed Reliability Standard MOD-031-1 will incur one-time compliance costs ranging up to $14,309 (i.e. the cost of determining the method of weather normalizing annual peak hour actual demand), plus the annual development of summary narratives in accordance with Requirement R1, Subparts 1.5.4 and 1.5.5, resulting in costs of $477. These costs represent an estimate of the costs a small entity could incur if the entity is identified as an applicable entity; the entity's annual peak hour actual demand varies due to weather-related conditions; and the entity has not yet determined a method for weather normalizing actual demand data. The Commission does not consider the estimated costs per small entity to have a significant economic impact on a substantial number of small entities. Accordingly, the Commission certifies that this NOPR will not have a significant economic impact on a substantial number of small entities.

VI. Environmental Analysis

18. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[21] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment.

[20] NERC Petition at 2.

[21] *Regulations Implementing the National Environmental Policy Act of 1969*, Order No. 486, 52 FR 47897 (Dec. 17, 1987), FERC Stats. & Regs., Regulations Preambles 1986-1990 ¶ 30,783 (1987).

Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[22] The actions proposed herein fall within this categorical exclusion in the Commission's regulations.

VII. Comment Procedures

19. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due [**60 days after publication in the FEDERAL REGISTER**]. Comments must refer to Docket No. RM14-12-000, and must include the commenter's name, the organization they represent, if applicable, and their address in their comments.

20. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format. Commenters filing electronically do not need to make a paper filing.

21. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street NE, Washington, DC, 20426.

22. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section

[22] 18 CFR 380.4(a)(2)(ii).

below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VIII. Document Availability

23. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington, DC 20426.

24. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

25. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at 202-502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202)502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, D.C. 20426

OFFICE OF ELECTRIC RELIABILITY

North American Electric Reliability Corporation
Docket No. RD14-13-000

November 4, 2014

North American Electric Reliability Corporation
1325 G Street N.W., Suite 600
Washington, D.C. 20005

Attention: Brady A. Walker
Associate Counsel for North American Electric Reliability Corporation

Reference: Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standard NUC-001-3

Dear Mr. Walker:

On September 15, 2014, the North American Electric Reliability Corporation (NERC) filed a petition (Petition) seeking approval of the proposed Reliability Standard NUC-001-3 (Nuclear Plant Interface Coordination), the associated implementation plan, violation risk factors and violation security levels, and the retirement of currently-effective Reliability Standard NUC-001-2.1.

Proposed Reliability Standard NUC-001-3 requires coordination between nuclear plant generator operators and transmission entities for the purpose of ensuring safe operation and shutdown of nuclear power plants. The proposed Reliability Standard NUC-001-3 indicates that it is applicable to all nuclear plant generator operators and all transmission entities (including transmission operators, transmission owners, transmission planners, transmission service providers, balancing authorities, reliability coordinators, planning coordinators, distribution providers, load-serving entities, generator owners, and generator operators) that are responsible for providing services related to nuclear plant interface requirements. The Petition states that the proposed Reliability Standard represents the implementation of recommendations made by the five-year review team to revise the currently-effective Reliability Standard

NUC-001-2.1.[1] The Petition further states that the proposed standard includes several improvements, many of which are intended to provide clarity by improving the structure and language over the currently-effective Reliability Standard.[2]

NERC's filing was noticed on September 16, 2014, with interventions, comments and protests due on or before October 15, 2014. Dominion Resources Services, Inc. filed a motion to intervene raising no issues.

NERC's uncontested filing is hereby approved pursuant to the relevant authority delegated to the Director, Office of Electric Reliability under 18 C.F.R. § 375.303 (2014), effective as of the date of this Order.

This action shall not be construed as approving any other application, including proposed revisions of Electric Reliability Organization or Regional Entity rules or procedures pursuant to 18 C.F.R. § 375.303(a)(2)(i). Such action shall not be deemed as recognition of any claimed right or obligation associated therewith and such action is without prejudice to any findings or orders that have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the Electric Reliability Organization or any Regional Entity.

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order, pursuant to 18 C.F.R. § 385.713 (2014).

Sincerely,

Michael Bardee, Director
Office of Electric Reliability

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Cheryl A. LaFleur, Chairman;
Philip D. Moeller, Tony Clark,
and Norman C. Bay.

Reliability Standard for Geomagnetic Disturbance Operations — Docket No. RM14-1-001

ORDER NO. 797-A

ORDER DENYING REHEARING

(Issued October 16, 2014)

1. In Order No. 797, the Commission approved Reliability Standard EOP-010-1 (Geomagnetic Disturbance Operations) submitted by the North American Electric Reliability Corporation (NERC).[1] Foundation for Resilient Societies (Foundation) filed a request for rehearing of Order No. 797.[2] For the reasons discussed in the body of this order, we deny rehearing.

2. A number of Foundation's arguments are denied here because they address a later stage of efforts on geomagnetic disturbances (i.e., NERC's future filing of Second Stage GMD Reliability Standards) and Foundation may seek to present those arguments at an appropriate time in response to that filing. More generally, we acknowledge the concerns expressed by Foundation and others that, given the still evolving scientific and engineering knowledge on geomagnetic disturbances (GMDs) and the gaps in understanding of this issue, our decision on the Second Stage GMD Reliability Standards

[1] *Reliability Standard for Geomagnetic Disturbance Operations*, Order No. 797, 79 Fed. Reg. 35,911 (June 25, 2014), 147 FERC ¶ 61,209 (2014).

[2] On August 18, 2014, Foundation moved to supplement its request for rehearing. As Foundation's supplement was filed beyond the 30 days allowed by statute, 16 U.S.C. § 825l(a) (2012), the Federal Power Act does not allow us to consider the supplement here. *See also* 18 C.F.R. § 385.713(b) (2014)*; Public Service Company of New Hampshire*, 134 FERC ¶ 61,041, at P 7 n.13 (2011).

should at least be based on as much information as is currently known and available. In this regard, we expect interested parties to present all relevant information and analyses so our decision can be based on a full record of current knowledge on GMD issues.

I. Background

A. Order No. 779

3. In Order No. 779, the Commission directed NERC, pursuant to section 215(d)(5) of the Federal Power Act (FPA),[3] to develop and submit for approval proposed Reliability Standards that address the impact of GMDs on the reliable operation of the Bulk-Power System.[4] The Commission determined that the potentially severe, wide-spread impact on the reliable operation of the Bulk-Power System that can be caused by GMD events, and the then absence of Reliability Standards to address GMD events, justified the development of Reliability Standards.

4. The Commission ordered NERC to implement the directive in two stages. In the first stage, the Commission directed NERC to submit, within six months of the effective date of Order No. 779, one or more Reliability Standards (First Stage GMD Reliability Standards) that require owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the Bulk-Power System. The Commission directed that NERC, for the Second Stage GMD Reliability Standard, provide more comprehensive protections by requiring applicable entities to protect their facilities against a benchmark GMD event.

B. NERC Petition

5. On November 13, 2013, NERC petitioned the Commission to approve Reliability Standard EOP-010-1 and its associated violation risk factors and violation severity levels, implementation plan, and effective dates. NERC maintained that Reliability Standard EOP-010-1 satisfied the Commission's directive in Order No. 779 corresponding to the development and submission of the First Stage GMD Reliability Standards.

---

[3] 16 U.S.C. § 824o(d)(5) (2012).

[4] *Reliability Standards for Geomagnetic Disturbances*, Order No. 779, 78 Fed. Reg. 30,747 (May 23, 2013), 143 FERC ¶ 61,147, *reh'g denied*, 144 FERC ¶ 61,113 (2013).

C. NOPR

6. On January 16, 2014, the Commission issued a Notice of Proposed Rulemaking proposing to approve Reliability Standard EOP-010-1 as just, reasonable, not unduly discriminatory or preferential, and in the public interest based on the Commission's review of NERC's petition and supporting exhibits.[5] The NOPR stated that Reliability Standard EOP-010-1 satisfied the directive in Order No. 779 that NERC submit one or more Reliability Standards that require owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the Bulk-Power System.

7. In response to the NOPR, interested entities filed 20 comments.

D. Order No. 797

8. In Order No. 797, the Commission adopted the NOPR proposal to approve Reliability Standard EOP-010-1. The Commission determined that Reliability Standard EOP-010-1 addressed the directive in Order No. 779 that NERC submit one or more Reliability Standards that require owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the Bulk-Power System. The Commission also determined that the requirements in Reliability Standard EOP-010-1 were consistent with the guidance in Order No. 779 that NERC develop Reliability Standards that, rather than require specific operational procedures, require responsible entities to develop and implement entity-specific operational procedures because owners and operators of the Bulk-Power System are most familiar with their own equipment and system configurations. The Commission further determined that Reliability Standard EOP-010-1 required coordination of operational procedures and processes, overseen by a functional entity with a wide-area perspective (i.e., reliability coordinators), which was also consistent with the Commission's guidance in Order No. 779.

[5] *Reliability Standard for Geomagnetic Disturbance Operations*, Notice of Proposed Rulemaking, 79 Fed. Reg. 3547 (Jan. 22, 2014), 146 FERC ¶ 61,015 (2014) (NOPR).

II. Discussion

9. The Commission denies Foundation's rehearing request, for the reasons discussed below.

A. Applicability Criteria of Reliability Standard EOP-010-1

Order No. 797

10. Reliability Standard EOP-010-1 applies to reliability coordinators and transmission operators with a "Transmission Operator Area that includes a power transformer with a high side wye-grounded winding with terminal voltage greater than 200 kV." In Order No. 797, the Commission determined that the applicability criteria in Reliability Standard EOP-010-1 are technically justified and consistent with Order No. 779, both in terms of using a 200 kV threshold for determining applicable transmission operators and not including balancing authorities and generator operators as applicable entities.[6] Order No. 797 determined that the NERC petition and White Paper Supporting Network Applicability provided an adequate technical basis to conclude that transformers operating at 200 kV and below are likely to have a limited impact on the Bulk-Power System during a GMD event.[7] Order No. 797 also determined that NERC's petition and White Paper Supporting Functional Entity Applicability adequately justified excluding generator operators and balancing authorities from the applicability criteria of Reliability Standard EOP-010-1.[8]

Request

11. Foundation contends that the Commission erred in approving the applicability criteria in Reliability Standard EOP-010-1. Foundation maintains that the 200 kV threshold in the applicability criteria is arbitrary because a report from the Oak Ridge National Laboratory "make[s] the case that networks operating below 200 kV were in

[6] *See* Order No. 797, 147 FERC ¶ 61,209 at PP 16, 24-29 (citing NERC Petition, Exhibit D (White Paper Supporting Network Applicability); NERC Petition, Exhibit E (White Paper Supporting Functional Entity Applicability)).

[7] *See* Order No. 797, 147 FERC ¶ 61,209 at P 25 (citing NERC Petition, Exhibit E (White Paper Supporting Network Applicability)).

[8] *See* Order No. 797, 147 FERC ¶ 61,209 at PP 28-29 (citing NERC Petition, Exhibit E (White Paper Supporting Functional Entity Applicability)).

fact impacted by a moderate solar storm on March 13, 1989."[9] Foundation also cites to "PowerWorld modeling results," discussed in Foundation's NOPR comment, that, according to Foundation, show that "reactive power in networks at 200 kV and above left out more than 40 percent of cumulative reactive power (MVAR) consumed in solar storm modeling scenarios for some regions."[10]

12. In addition, Foundation contends that the 200 kV threshold is inconsistent with the 100 kV threshold in the Commission-approved definition of bulk electric system. Foundation also asserts that the applicability criteria improperly exclude balancing authorities and generator operators because Reliability Standard EOP-010-1 unreasonably relies on reliability coordinators to perform certain functions that reliability coordinators are unlikely to be able to perform. Foundation further contends that the exclusion of generator operators from the applicability criteria, and the lack of geomagnetic induced current monitoring and blocking requirements, does not "assure reliable 'black start' for all nuclear generating facilities."[11]

Commission Determination

13. We deny Foundation's rehearing requests regarding the applicability criteria of Reliability Standard EOP-010-1.

---

[9] Foundation Rehearing Request at 5 (citing Oak Ridge National Laboratory, Electromagnetic Pulse: Effects on the U.S. Power Grid: Meta-R-319 (January 2010), *available at* http://www.ornl.gov/sci/ees/etsd/pes/pubs/ferc_Meta-R-319.pdf (Oak Ridge Report)).

[10] Foundation Rehearing Request at 5. Foundation also argues that excluding balancing authorities is unreasonable because a report from the Electric Infrastructure Council (EIS) "indicates above-average risks of regional blackouts from solar storms in high latitude nations such as Canada." Foundation Comments at 15. Foundation did not address the EIS report in its NOPR comments. Moreover, the pages in the EIS report cited by Foundation only include a survey of GMD regulations and mitigation efforts in various countries, but do not address whether balancing authorities should be added to the applicable entities under Reliability Standard EOP-010-1. Electric Infrastructure Council, The International E-Pro Report (September 2013) at 117-118, *available at* http://eiscouncil.org/images/upload/media/The%20International%20EPRO%20Report.pdf.

[11] Foundation Rehearing Request at 18.

14. We first deny Foundation's request for rehearing of the 200 kV threshold in the applicability criteria of Reliability Standard EOP-010-1.[12] Order No. 797 determined that NERC's petition and White Paper Supporting Network Applicability "provide[d] an adequate technical basis to conclude that transformers operating at 200 kV and below are likely to have a limited impact on the Bulk-Power System during a GMD event."[13] Foundation does not contest the data in NERC's White Paper Supporting Network Applicability. Instead, Foundation contends that even a limited impact on the Bulk-Power System is inconsistent with the definition of "reliable operation" in FPA section 215 because "reliable operation" means that the Bulk-Power System must be operated so that "instability uncontrolled separation, or cascading failures of such system will not occur…." However, the Commission held in Order No. 779 that the "Second Stage GMD Reliability Standard should not impose 'strict liability' on responsible entities for failure to ensure the reliable operation of the Bulk-Power System in the face of a GMD event of unforeseen severity, as some commenters fear."[14] In addition, the "limited impact" discussed in Order No. 797 referred to the modelling analysis described in the White Paper Supporting Network Applicability, which showed only a minimal difference in geomagnetic induced current levels on transformers operating at voltages higher than 200 kV when transformers operating at 200 kV and below were excluded from the model.[15] Thus, the White Paper reasonably demonstrated that the exclusion of

[12] As the Commission noted in Order No. 797, the applicability criteria determine which transmission operators must comply with Reliability Standard EOP-010-1 (i.e., those with a power transformer with a high side wye-grounded winding with terminal voltage greater than 200 kV in the transmission operator area). Order No. 797, 147 FERC ¶ 61,209 at P 26. While the 200 kV threshold excludes transmission operators operating transformers 200 kV and below, the 200 kV threshold does not mean that applicable transmission operators will ignore reactive power supplies operating at 200 kV or below on their systems when developing the required GMD Operating Procedures or Operating Processes. *Id.*

[13] Order No. 797, 147 FERC ¶ 61,209 at P 25.

[14] Order No. 779, 143 FERC ¶ 61,147 at P 84.

[15] Order No. 797, 147 FERC ¶ 61,209 at P 27.

transformers operating at 200 kV or below on factors such as maximum transformer geomagnetic induced current, average transformer geomagnetic induced current, maximum VAR absorption and average VAR absorption was minimal.[16]

15. We also disagree with Foundation's assertion that the 200 kV applicability threshold is inconsistent with the Commission-approved definition of bulk electric system. Foundation misconstrues the purpose of the bulk electric system definition. The bulk electric system definition is the first step in determining what entities are subject to a NERC Reliability Standard. As the Commission stated in Order No. 693, the "[Electric Reliability Organization (ERO)] will identify those entities that must comply with Reliability Standards in three steps: (1) the ERO will identify and register those entities that fall under its definition of bulk electric system; (2) each registered entity will register in one or more appropriate functional categories and (3) each registered entity will comply with those Reliability Standards applicable to the functional categories in which it is registered." [17] In addition, Order No. 693 contemplated the use of electric facility characteristics to further refine the types of registered entities subject to Reliability

[16] Regarding Foundation's reference to the "PowerWorld modeling results," Foundation's NOPR comment only references PowerWorld in Appendix 1 (Comments of the Foundation for Resilient Societies relating to Proposed Standards for "Operating Procedures" to protect the bulk power system from geomagnetic disturbances – Proposed NERC Standard EOP-010-1) where Foundation states, without citation, that "PowerWorld has estimated that less than 60% of total MVAR enters the bulk power system through transformers at 230 kV or higher, in both New England and in Michigan." Foundation NOPR Comments at Appendix A1-5. This statement, however, does not support Foundation's argument that the 200 kV applicability threshold for transformers in Reliability Standard EOP-010-1 is arbitrary. Foundation's rehearing request also cites to the Oak Ridge Report, but the two cited pages do not support Foundation's rehearing request. Page 4-12 of the Oak Ridge Report addresses extra high-voltage (EHV) transformers operating at 765 kV, 500 kV, or 345 kV; it does not refer to transformers operating between 100 kV and 200 kV. Similarly, page 2-30 of the Oak Ridge Report only discusses GMD-related damage to a transformer operating at 500 kV.

[17] Order No. 797, 147 FERC ¶ 61,209 at P 25 n.36 (citing *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at PP 97-98, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007) (explaining that each Reliability Standard will identify the set of users, owners and operators that must comply with that standard and "NERC has indicated that in the future it may add to a Reliability Standard limitations on applicability based on electric facility characteristics such as generator nameplate ratings.")).

Standards. Since Order No. 693, the Commission has approved the use of electric facility characteristics in other NERC Reliability Standards. For example, the Reliability Standard on vegetation management also contains a 200 kV threshold.[18]

16. We next deny Foundation's request for rehearing regarding the exclusion of balancing authorities and generator operators from the applicability criteria of Reliability Standard EOP-010-1. In Order No. 797, the Commission considered and rejected Foundation's comment that balancing authorities should be listed as applicable entities because reliability coordinators allegedly cannot communicate quickly with transmission operators, generator operators, and balancing authorities. The Commission, citing NERC's Reliability Functional Model Technical Document and Reliability Standard COM-002-2, Requirement R1, stated that reliability coordinators are responsible for real-time system reliability and often must respond quickly or even immediately to Bulk-Power System events with little or no warning.[19] The Commission determined that there was no evidence from which to conclude that, unlike with other types of disturbances on the Bulk-Power System, reliability coordinators could not respond to a GMD event.

17. Foundation's rehearing request provides no basis to revisit that determination. Citing Reliability Standard IRO-001-1.1, Requirement R8, Foundation in its rehearing request, contends that the "likelihood that [generator operators and balancing authorities] will reliably execute the directives of Reliability Coordinators during fast-moving and wide-area solar storms is greatly diminished" because the Reliability Standard "allows Transmission Operators, Balancing Authorities, and Generator Operators to ignore the directives of Reliability Coordinators" under certain conditions.[20] However, Reliability

---

[18] *See Revisions to Reliability Standard for Transmission Vegetation Management*, Order No. 777, 78 Fed. Reg. 18,817 (Mar. 28, 2013), 142 FERC ¶ 61,208 (2013) (approving the use of a 200 kV applicability threshold in Reliability Standard FAC-003-2); *see also Version 5 Critical Infrastructure Protection Reliability Standards*, Order No. 791, 78 Fed. Reg. 72,755 (Dec. 3, 2013), 145 FERC ¶ 61,160 (2013) (approving the use of electric facility characteristics in the applicability criteria of Reliability Standard CIP-002-5).

[19] Order No. 797, 147 FERC ¶ 61,209 at P 28 (citing Reliability Standard COM-002-2, Requirement R1 ("Each Transmission Operator, Balancing Authority, and Generator Operator shall have communications (voice and data links) with appropriate Reliability Coordinators, Balancing Authorities, and Transmission Operators … [and] [s]uch communications shall be staffed and available for addressing a real-time emergency condition.)).

[20] Foundation Rehearing Request at 14.

Standard IRO-001-1.1, Requirement R8 does not allow transmission operators, balancing authorities, and generator operators to ignore a reliability coordinator's directives. Reliability Standard IRO-001-1.1, Requirement R8 provides that generator operators, transmission operators and balancing authorities, among other entities, "shall comply with Reliability Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements." In instances where compliance with a reliability coordinator's directive violates safety, equipment, or regulatory or statutory requirements, generator operators, transmission operators and balancing authorities cannot simply ignore the directive but, instead, "shall immediately inform the Reliability Coordinator of the inability to perform the directive so that the Reliability Coordinator may implement alternate remedial actions."

18. We also reject Foundation's assertion that two-way communications between reliability coordinators and generator operators would be unreliable during a GMD event. In Order No. 797, the Commission stated that Reliability Standard COM-002-2, Requirement R1 requires reliability coordinators, transmission operators, balancing authorities, generator operators, and reliability coordinators to have the technical capacity to communicate and coordinate with each other. We are not persuaded that reliability coordinators and generator operators could not comply with this requirement during a GMD event. To support its position regarding the alleged unreliability of two-way communications during a GMD event, Foundation cites Order No. 779, which only stated, by way of background, that GMD events in the past have "impacted" communication systems.[21] Foundation also cites a report addressing man-made electromagnetic pulses, which, as we stated in Order No. 797, are not at issue in this

[21] Order No. 779, 143 FERC ¶ 61,147 at P 6 (citing Oak Ridge National Laboratory, Electric Utility Industry Experience with Geomagnetic Disturbances at xiii (1991), *available at* http://www.ornl.gov/~webworks/cpr/v823/rpt/51089.pdf ("This disturbance, which results in distortions to the earth's magnetic field, can be of varying intensity and has in the past impacted the operation of pipelines, communications systems, and electric power systems.")).

rulemaking.[22] Even recognizing that GMD events could impact communication systems, Foundation has not established that reliability coordinators and generator operators would be unable to comply with Reliability Standard COM-002-2, Requirement R1 during a GMD event.

19. We further reject Foundation's contention that generator operators should be included within the scope Reliability Standard EOP-010-1 to ensure that sufficient black start resources exist to "bring back nuclear operations in time to safeguard radioactive materials."[23] In Order No. 797, the Commission credited NERC's justification for the exclusion of generator operators because some generator operators "would not have the technical basis for taking steps [to mitigate GMDs] on [their] own and would instead take steps based on the [reliability coordinator's] or [transmission operator's] Operating Plans, Processes, or Procedures."[24] Foundation does not contest that determination. Instead, Foundation appears to link the inclusion of generator operators in the applicability criteria of Reliability Standard EOP-010-1with the adoption of additional requirements that generator operators perform mandatory geomagnetic induced current monitoring and blocking. As discussed below, we believe that such requirements would be inconsistent with the Commission's guidance in Order No. 779 regarding the First Stage GMD Reliability Standards.[25]

---

[22] Foundation Rehearing Request at 19 (citing Report of the EMP Commission to Assess the Threat to the United States from Electromagnetic Pulse (EMP) Attack: Critical National Infrastructures (April 2008) at 43 ("The communications and control systems' functionality are at high risk of disruption and damage themselves during an EMP attack.")); Order No. 779, 143 FERC ¶ 61,147 at P 14 n.20 (determining that the impact of electromagnetic pulses was outside the scope of Order No. 779).

[23] Foundation Rehearing Request at 18.

[24] Order No. 797, 147 FERC ¶ 61,209 at P 16 (citing NERC Petition at 4).

[25] In Order No. 797, the Commission also recognized NERC's statement that generator owners and generator operators will be considered for inclusion in the Second Stage GMD Reliability Standards, "which will require applicable entities to conduct vulnerability assessment and develop appropriate mitigation strategies . . . [and that] [s]uch mitigation strategies could include the development of Operating Procedures for applicable [generator owners] and [generator operators]." *Id.* We also note that the Nuclear Regulatory Commission has the statutory responsibility for licensing and regulating commercial nuclear facilities operating in the United States. *See* 42 U.S.C. § 5801 *et seq.*

20. In sum, we deny Foundation's request for rehearing concerning the applicability criteria of Reliability Standard EOP-010-1.

B. Requirements of Reliability Standard EOP-010-1

Order No. 797

21. In Order No. 797, the Commission determined that Reliability Standard EOP-010-1 satisfied the directive in Order No. 779 that NERC submit one or more Reliability Standards that require owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the Bulk-Power System. The Commission also determined that the requirements in Reliability Standard EOP-010-1 are consistent with the guidance in Order No. 779 that NERC develop Reliability Standards that, rather than require specific operational procedures, require responsible entities to develop and implement entity-specific operational procedures because owners and operators of the Bulk-Power System are most familiar with their own equipment and system configurations. Further, the Commission determined that Reliability Standard EOP-010-1 required coordination of operational procedures and processes, overseen by a functional entity with a wide-area perspective (i.e., reliability coordinators), which was also consistent with the guidance in Order No. 779.[26]

Request

22. Foundation contends that the Commission erred in approving the requirements of Reliability Standard EOP-010-1. First, Foundation characterizes Reliability Standard EOP-010-1 as a "lowest common denominator" Reliability Standard because it lacks specific requirements such as "mandatory exercises, unscheduled drills, authentication of de-energizing orders, or practice of GMD operating procedures."[27] Second, Foundation contends that Order No. 797 failed to address Foundation's NOPR comments regarding the "lack of mandatory mitigative actions and lack of mandatory external review of GMD Operating Plans of Reliability Coordinators" in Reliability Standard EOP-010-1. Third, Foundation contends that the Commission erred in not requiring the installation of geomagnetic induced current monitoring and blocking devices in Reliability Standard EOP-010-1. Fourth, Foundation contends that the Commission erred by relying on a future Second Phase GMD Reliability Standard to correct the alleged defects with Reliability Standard EOP-010-1. Fifth, Foundation contends that the Commission erred

[26] *Id.* P 14.

[27] Foundation Rehearing Request at 3.

by not requiring applicable entities to conduct "quantified contingency planning," which Foundation defines as a "mathematical comparison of megawatt capacity of assets at risk during solar storms to power reserves."[28] Sixth, Foundation contends that the Commission erred by not requiring "failover responsibility" between generator operators and transmission operators.

Commission Determination

23. We deny Foundation's rehearing request regarding the requirements of Reliability Standard EOP-010-1.

24. In Order No. 779, the Commission directed NERC to develop First Stage GMD Reliability Standards that require applicable entities to mitigate the risks posed by GMD events to the Bulk-Power System by developing and implementing GMD operational procedures. In doing so, the Commission stated that:

> As we stated in the NOPR, "operational procedures, while not a complete solution, constitute[] an important first step to addressing the GMD reliability gap because they can be implemented relatively quickly." Operational procedures may help alleviate abnormal system conditions due to transformer absorption of reactive power during GMD events, helping to stabilize system voltage swings, and may potentially isolate some equipment from being damaged or misoperated.[29]

25. The Commission provided guidance to NERC as to what should be included in the First Stage GMD Reliability Standards. Specifically, the Commission stated that it was "not directing NERC to develop Reliability Standards that include specific operational procedures … [but instead the First Stage GMD Reliability Standards] should include a mechanism that requires responsible entities to develop and implement operational procedures because owners and operators of the Bulk-Power System are most familiar with their own equipment and system configurations."[30] Accordingly, the Commission's expectations regarding the First Stage GMD Reliability Standards were clearly set forth in Order No. 779. While Foundation filed comments in the Order No. 779 rulemaking process, Foundation did not seek rehearing of Order No. 779.

---

[28] *Id.* at 12.

[29] Order No. 779, 143 FERC ¶ 61,147 at P 36.

[30] *Id.* P 38.

26. Foundation's rehearing request regarding the requirements of Reliability Standard EOP-010-1 rests on a disagreement with the guidance in Order No. 779 that the First Stage GMD Reliability Standards should not require specific operational procedures that all applicable entities must follow. This disagreement is reflected in Foundation's contention that Reliability Standard EOP-010-1 should require applicable entities to implement specific operational procedures (e.g., mandatory exercises, unscheduled drills, "failover responsibility," "quantified contingency planning") and install equipment (e.g., geomagnetic induced current monitoring or blocking equipment). However, such requirements would be inconsistent with the Commission's explanation in Order No. 779 stating that the First Stage GMD Reliability Standards should not contain specific, "one-size-fits-all" operating procedures.[31] Instead, Order No. 779 stated that the First Stage GMD Reliability Standards should "include a mechanism that requires responsible entities to develop and implement operational procedures because owners and operators of the Bulk-Power System are most familiar with their own equipment and system configurations."[32]

27. Foundation contends that the Commission "has established a system of solar storm mitigation that might work for minor solar storms but it is altogether unworkable, unreasonable, imprudent, and unjust to utilize this design for 'operating procedures' in a severe solar storm."[33] However, we believe that Foundation's concern is better addressed in the Second Stage GMD Reliability Standard development process, in which NERC is developing a Reliability Standard that must identify "benchmark GMD events" that specify what severity GMD events a responsible entity must assess for potential impact

[31] For the same reason, we reject Foundation's contention that the GMD operational procedure templates for transmission operators and generator operators, developed by the NERC GMD Task Force, should have been included as requirements in Reliability Standard EOP-010-1. NERC, Geomagnetic Disturbance Operating Procedure Template Transmission Operator, *available at* http://www.nerc.com/docs/pc/gmdtf /Template_ TOP.pdf. While it is reasonable to anticipate that applicable transmission operators will use the transmission operator template as a reference in developing their own operational procedures, we see no reason why that reference should have been included in the requirements of Reliability Standard EOP-010-1.

[32] Order No. 779, 143 FERC ¶ 61,147 at P 38.

[33] Foundation Rehearing Request at 9-10.

on the Bulk-Power System.[34] Further, while Foundation suggests that the Commission meant for the First Stage GMD Reliability Standards to address a "severe solar storm," that was not the case. Rather, in the absence at that time of any mandatory and enforceable Reliability Standards addressing GMD events, the Commission directed NERC in Order No. 779 to develop Reliability Standards that address the risks posed by GMD to the reliable operation of the Bulk-Power System in two stages. With regard to the First Stage GMD Reliability Standards (i.e., the development of operational procedures), the Commission stated that "operational procedures, while not a complete solution, constitute an important first step to addressing the GMD reliability gap because they can be implemented relatively quickly."[35] The Commission expects the Second Stage GMD Reliability Standards, which the Commission allowed NERC more time to develop given its greater complexity, to provide more comprehensive protections by requiring applicable entities to protect their facilities against a benchmark GMD event.[36] Regarding geomagnetic induced current monitoring specifically, in Order No. 797 the Commission determined that geomagnetic induced current monitoring requirements should be addressed in the Second Stage GMD Reliability Standards.[37] We continue to

[34] Order No. 779, 143 FERC ¶ 61,147 at P 54. Foundation contends that the Commission erred by allowing defects in Reliability Standard EOP-010-1 (e.g., the lack of required geomagnetic induced current monitoring) to be remedied in the Second Stage GMD Reliability Standards. As noted above, the lack of specific operational procedures in the First Stage GMD Reliability Standards is not a defect; instead, it is consistent with the Commission's guidance in Order No. 797. Moreover, as noted in Order No, 797, the Commission's approval of Reliability Standard EOP-010-1 was not dependent on what the Commission expected NERC to propose in the Second Stage GMD Reliability Standards. Order No. 797, 147 FERC ¶ 61,209 at P 29 n.47. Moreover, in Order No. 797, the Commission stated that it would "also consider then the need for the Second Stage GMD Reliability Standard's planning requirements to integrate appropriately with the First Stage GMD Reliability Standard's operating requirements." *Id.* P 36 n.52.

[35] Order No. 779, 143 FERC ¶ 61,147 at P 36.

[36] The Commission noted that "[g]iven that the scientific understanding of GMDs is still evolving, we recognize that Reliability Standards cannot be expected to protect against all GMD-induced outages." Order No. 797, 147 FERC ¶ 61,209 at P 84.

[37] Order No. 797, 147 FERC ¶ 61,209 at P 36 ("[W]e directed NERC to develop only operational procedures in the First Stage GMD Reliability Standards, and to develop more comprehensive protections in the Second Stage GMD Reliability Standards. The issue of monitoring requirements properly belongs in the Second Stage GMD Reliability Standards.").

encourage NERC to address the collection, dissemination, and use of geomagnetic induced current data, by NERC, industry or others, in the Second Stage GMD Reliability Standards because such efforts could be useful in the development of GMD mitigation methods or to validate GMD models.

28. We reject Foundation's assertion that Reliability Standard EOP-010-1 lacks "mandatory mitigative actions" or "mandatory external review" because it lacks requirements for "mandatory exercises, unscheduled drills, authentication of de-energizing orders, or practice of GMD operating procedures."[38] While, as discussed above, Reliability Standard EOP-010-1 does not require specific operational procedures, Foundation's assertion that there are no "mitigative actions" or "mandatory external review" is contradicted by the requirements and compliance measures contained in the Reliability Standard. Reliability Standard EOP-010-1, Requirement R1 requires that "[e]ach Reliability Coordinator shall develop, maintain, and implement a GMD Operating Plan that coordinates GMD Operating Procedures or Operating Processes within its Reliability Coordinator Area." Reliability Standard EOP-010-1, Requirement R3 requires that "[e]ach Transmission Operator shall develop, maintain, and implement a GMD Operating Procedure or Operating Process to mitigate the effects of GMD events on the reliable operation of its respective system." Each of these requirements has associated compliance measures to provide the compliance enforcement authority with proof of compliance. For Requirement R1, Measure M1 states that "[e]ach Reliability Coordinator shall have a current GMD Operating Plan meeting all the provisions of Requirement R1; evidence such as a review or revision history to indicate that the GMD Operating Plan has been maintained; and evidence to show that the plan was implemented as called for in its GMD Operating Plan, such as dated operator logs, voice recordings, or voice transcripts." For Requirement R3, Measure 3 states that "[e]ach Transmission Operator shall have a GMD Operating Procedure or Operating Process meeting all the provisions of Requirement R3; evidence such as a review or revision history to indicate that the GMD Operating Procedure or Operating Process has been maintained; and evidence to show that the Operating Procedure or Operating Process was implemented as called for in its GMD Operating Procedure or Operating Process, such as dated operator logs, voice recordings, or voice transcripts." We believe that NERC and Regional Entities possess the necessary technical expertise to review and ensure compliance with the requirements and measures in Reliability Standard EOP-010-1. Accordingly, we reject Foundation's assertion that Reliability Standard EOP-010-1 lacks "mandatory mitigative actions" or "mandatory external review."

[38] Foundation Rehearing Request at 3.

29. With respect to Foundation's contention that Reliability Standard EOP-010-1 should "include provisions for failover responsibilities vesting in Generator Operators and Transmission Operators in their area," we note that Foundation does not explain what it means or proposes by recommending the inclusion of "failover responsibilities," nor did Foundation raise this issue in its NOPR comments.[39] In any case, as discussed above, Reliability Standard EOP-010-1 vests reliability coordinators with the responsibility of coordinating the GMD Operating Procedures or Operating Processes within its Reliability Coordinator Area, consistent with the Commission's guidance in Order No. 779. Thus, we deny Foundation's request for rehearing with respect to this issue.

30. In sum, we deny Foundation's request for rehearing concerning the requirements of Reliability Standard EOP-010-1.

C. Other Alleged Errors

Request

31. Foundation contends that Reliability Standard EOP-010-1 interferes with the authority of the President of the United States and Secretary of Energy. Foundation states that Reliability Standard EOP-010-1 "excludes Generator Operators and Balancing Authorities from mandatory participation; reduces incentives to install and operate geomagnetic induced current monitors; and makes it impractical and perhaps impossible for the President of the United States to exercise existing statutory and constitutional authority to protect the nation from a severe solar storm under existing Article II powers and specific statutory authorities."[40] Foundation also contends that excluding generator operators "from mandatory participation in 'operating procedures' to mitigate solar geomagnetic storms … [and] avoiding a mandate for cost-effective geomagnetic induced current monitoring at [generator step up (GSU)] transformers and key interconnections in the transmission networks of the Bulk-Power System[] creates barriers to effective use by

[39] *Transmission Relay Loadability Reliability Standard*, Order No. 733, 130 FERC ¶ 61,221 (2010), *order on reh'g and clarification*, Order No. 733-A, 134 FERC ¶ 61,127, *order on reh'g and clarification*, Order No. 733-B, 136 FERC ¶ 61,185, at P 57 (2011) (stating that the Commission looks with disfavor on parties raising issues for the first time on rehearing because other parties are not permitted to respond to a request for rehearing).

[40] Foundation Rehearing Request at 16.

the Secretary of Energy of pre-existing emergency interconnection authority [under FPA section 202(c)]."[41]

32. Foundation also contends that the Commission erred by "deferring to NERC on allegations of anti-competitive rulemaking[] and by creating barriers to competition to deliver higher reliability electric transmission services … by effectively grant[ing] Generator Operators a shield against financial liability for failure to participate in GMD operating procedures."[42] Foundation maintains that not requiring the use of geomagnetic induced current monitoring or blocking equipment "discourage[s] [the] purchase of hardware protective equipment for GMD, and [] discourage[s] installation of geomagnetic induced current monitors at all GSU transformers and other GMD-impacted equipment … [with] [t]he indirect impact of these barriers to solar storm protection [being] to render difficult or impossible the competition by one or more transmission companies that may wish to compete to provide higher standards of grid reliability."[43]

Commission Determination

33. We deny Foundation's rehearing request based on Foundation's assertion that Reliability Standard EOP-010-1 might interfere with any authority of the President of the United States and Secretary of Energy, or that Reliability Standard EOP-010-1 creates "anti-competitive barriers" in not requiring the installation of geomagnetic induced current monitoring or blocking equipment.

34. In Order No. 797, the Commission approved Reliability Standard EOP-010-1 pursuant to the Commission's authority under FPA section 215(d)(2). Reliability Standard EOP-010-1 contains no provision that purports to impair any authority of the President of the United States or Secretary of Energy. Foundations' assertion that the requirements of Reliability Standard EOP-010-1, or in this case the lack of specific requirements (i.e., not requiring geomagnetic induced current monitoring or blocking), might discourage the President or Secretary of Energy from exercising any authority is speculative and largely immaterial to the Commission's responsibility to review Reliability Standards pursuant to FPA section 215(d)(2). In addition, we find inadequate support for, and therefore, reject Foundation's claim that the lack of a geomagnetic induced current monitoring or blocking requirement in Reliability Standard EOP-010-1 creates "anti-competitive barriers." As the Commission stated in Order No. 797,

[41] *Id.* at 17.

[42] *Id.* at 20.

[43] *Id.*

"Reliability Standard EOP-010-1 does not preclude users, owners and operators of the Bulk-Power System from taking additional steps that are designed to mitigate the effects of GMD events, provided those additional steps are not inconsistent with the Commission-approved Reliability Standards."[44]

The Commission orders:

The Commission hereby denies rehearing, for the reasons discussed in the body of this order.

By the Commission.

Kimberly D. Bose,
Secretary.

and Norman C. Bay.

North American Electric Reliability Corporation Docket No. RR13-9-003

ORDER APPROVING SPECIAL ASSESSMENT
FOR PEAK RELIABILITY, INC.

(Issued September 30, 2014)

1. On July 23, 2014, North American Electric Reliability Corporation (NERC) filed a supplemental funding request seeking authority to collect a special assessment to fund the 2014 operations of Peak Reliability, Inc. (Peak Reliability). For the reasons discussed in the body of this order, we approve the special assessment requested by NERC. We also direct Peak Reliability to submit certain informational filings, as discussed below.

I. Background

A. Regulatory History

2. Section 215 of the Federal Power Act (FPA) requires the Commission to certify an Electric Reliability Organization (ERO) to develop mandatory and enforceable Reliability Standards, subject to Commission review and approval.[1] In July 2006, the Commission certified NERC as the ERO.[2]

[1] 16 U.S.C. § 824o (2012).

[2] *North American Electric Reliability Corp.*, 116 FERC ¶ 61,062, *order on reh'g and compliance*, 117 FERC ¶ 61,126 (2006), *order on compliance*, 118 FERC ¶ 61,030, *order on clarification and reh'g*, 119 FERC ¶ 61,046 (2007), *aff'd sub nom. Alcoa Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009).

3. FPA section 215(c)(2)(B) provides that the ERO must have rules that "allocate equitably reasonable dues, fees, and other charges among end users for all activities under this section."[3]

B. Peak Reliability 2014 Business Plan and Budget

4. On August 23, 2013, NERC filed the 2014 business plans and budgets for itself; each Regional Entity, including the Western Electricity Coordinating Council (WECC); Western Interconnection Regional Advisory Body; and Peak Reliability.[4]

5. On November 1, 2013, the Commission issued an order, *inter alia*, conditionally accepting the 2014 business plan and budget of Peak Reliability.[5] In that order, the Commission did not authorize Peak Reliability to issue invoices to fund its 2014 operations pending resolution of the WECC bifurcation proceedings in Docket Nos. EL13-52-001, RR13-10-000, and RR13-12-000.[6] On February 12, 2014, the Commission issued an order on compliance approving the bifurcation of WECC and Peak Reliability and authorizing Peak Reliability to issue billing invoices to fund its fiscal 2014 operations consistent with the 2014 Budget Order.[7]

II. Notice and Responsive Pleadings

6. Notice of NERC's July 23, 2014 filing was published in the *Federal Register*, 79 Fed. Reg. 44,761 (2014), with interventions and protests due on or before August 22, 2014. On July 25, 2014, the Commission issued an errata notice shortening the comment due date to August 13, 2014. No comments or protests were received.

---

[3] 16 U.S.C. § 824o(c)(2)(B).

[4] At the time of that proceeding, Peak Reliability was referred to as the Reliability Coordination Company or RC Company.

[5] *North American Electric Reliability Corp.*, 145 FERC ¶ 61,097, at PP 34-35 (2013) (2014 Budget Order).

[6] *Id.*

[7] *North American Electric Reliability Corp.*, 145 FERC ¶ 61,202 (2013), *order on compliance*, 146 FERC ¶ 61,092, at ordering para. (C), *reh'g denied*, 147 FERC ¶ 61,064 (2014).

III. Discussion

7. NERC requests authority to collect a special assessment of $4,030,696 from load-serving entities and designees in the United States portion of the WECC region to fund the 2014 budget of Peak Reliability.[8] NERC maintains that the special assessment is necessary because two Canadian entities, Alberta Electricity System Operator (AESO) and British Columbia Hydro & Power Authority (BC Hydro), have not paid their allocated assessments.[9] NERC contends that the resulting shortfall in funding was unforeseen in 2013, when Peak Reliability's 2014 budget was being developed for submission to the Commission. NERC also contends that the special assessment is warranted to "allow Peak to collect its full approved 2014 assessment and ensure that Peak will have sufficient funding to carry out its [reliability coordinator] and [interchange authority] responsibilities within the Western Interconnection throughout 2014."[10]

8. NERC states that AESO advised Peak Reliability in August 2013 that AESO intended to provide its own reliability coordinator and interchange authority functions effective January 1, 2014.[11] NERC also states that BC Hydro advised Peak Reliability in June 2014 that BC Hydro was "willing to negotiate an agreement for Peak to continue to provide some [reliability coordinator] and [interchange authority] services for the BC Hydro footprint."[12] NERC maintains that, prior to filing this petition, NERC discussed

---

[8] NERC's request is made pursuant to 18 C.F.R. § 39.4(d):

> (d) On a demonstration of unforeseen and extraordinary circumstances requiring additional funds prior to the next [ERO] fiscal year, the [ERO] may file with the Commission for authorization to collect a special assessment. Such filing shall include supporting materials explaining the proposed collection in sufficient detail to justify the requested funding…

[9] NERC states that the uncollected assessments from AESO and BC Hydro total $4,094,340, which constitutes 13.8 percent of Peak Reliability's total 2014 assessment and 12.4 percent of Peak Reliability's total Commission-approved 2014 budget. NERC Petition at 1. NERC states that the difference between the uncollected assessments and the special assessment on load-serving entities in the United States (i.e., $63,644) will be allocated to load-serving entities in the Mexico portion of the WECC region. *Id.* at 3.

[10] *Id.* at 13.

[11] These services were formerly provided by WECC as the reliability coordinator, Peak Reliability's predecessor entity.

[12] NERC Petition at 2.

these issues with Peak Reliability, AESO, and BC Hydro. NERC states that it was advised that Peak Reliability has had ongoing discussions with AESO and BC Hydro "to attempt to reach agreements with each of these entities as to what services and tools, if any, Peak will provide to the AESO and to BC Hydro and what payments the AESO and BC Hydro will make to Peak."[13] NERC represents that no agreement was reached as of the filing date of this petition.

9. According to NERC, Peak Reliability states that "it is not able to effectuate any material reductions in its budgeted 2014 costs in the short term, particularly given the ongoing negotiations and the unknown scope of Peak's ultimate [reliability coordinator] and [interchange authority] responsibilities for the AESO and BC Hydro footprints."[14] NERC concludes that "[b]ased on the information provided to NERC by Peak or otherwise available to NERC, it appears to NERC that, at this juncture, Peak's ability to sustain its operations through the end of 2014 without an infusion of funding to substantially replace the assessments that have not been collected is in question."[15]

10. While NERC contends that a special assessment to replace Peak Reliability's 2014 funding shortfall is necessary, NERC proposes three Commission actions related to the funding request. First, NERC proposes that, by October 31, 2014, Peak Reliability should submit to the Commission a report that summarizes the progress of Peak Reliability's discussions with AESO and BC Hydro and that presents Peak Reliability's plan for reducing the scope of its operations and its costs going forward under the assumption that AESO and BC Hydro do not pay their assessments or pay less than the full amount. Second, NERC proposes that if Peak Reliability has not reached agreements with AESO and BC Hydro by October 31, 2014, Peak Reliability should submit quarterly status reports until agreements are reached. Third, NERC proposes that if Peak Reliability receives any compensation from AESO or BC Hydro for 2014, Peak Reliability should be required to use the amount received as a funding source to reduce its requested assessment in the next year for which it submits a budget.

[13] *Id.* at 9.

[14] *Id.* at 10.

[15] *Id.* at 9-10. According to NERC, Peak Reliability represented that it would have to replace the uncollected assessment revenue "by about mid-November in order to have sufficient funds to continue its operations through the end of 2014." *Id.* at 3.

Commission Determination

11. We approve NERC's request for authority to collect a $4,030,696 special assessment from load-serving entities and designees in the United States portion of the WECC region to fund the 2014 budget of Peak Reliability. Based on the record before us, we find that NERC has demonstrated that Peak Reliability's inability to collect the budgeted assessments from AESO and BC Hydro and the resulting funding shortfall constitute "unforeseen and extraordinary circumstances requiring additional funds prior to the next [ERO] fiscal year."[16]

12. While we approve NERC's request for a special assessment to fund the 2014 operations of Peak Reliability, we also agree with and adopt NERC's proposals. To keep the Commission apprised of the ongoing negotiations between Peak Reliability, AESO, and BC Hydro, we direct Peak Reliability to submit an informational filing by October 31, 2014 that summarizes the progress of Peak Reliability's discussions with AESO and BC Hydro and explains Peak Reliability's plan for reducing the scope of its operations and its costs going forward under the assumption that AESO and BC Hydro do not pay their assessments or pay less than the full amount. If Peak Reliability does not reach agreements with AESO and BC Hydro by October 31, 2014, we direct Peak Reliability to submit informational quarterly status reports until agreements are reached.

13. We also direct that, if Peak Reliability receives any compensation from AESO or BC Hydro for 2014, Peak Reliability use the amount received as a funding source to reduce its requested assessment in the next year for which it submits a budget.[17]

The Commission orders:

(A) NERC's request for authority to collect a special assessment on load-serving entities in the United States portion of the WECC region to fund the 2014 operations of Peak Reliability is hereby approved, as discussed in the body of this order.

(B) Peak Reliability is directed to submit the informational filings, as discussed in the body of this order.

[16] 18 C.F.R. § 39.4(d) (2014).

[17] *See* NERC Petition at 4 and 15.

(C) Peak Reliability is directed to use any compensation received from AESO or BC Hydro as a funding source to reduce its requested assessment in the next year for which it submits a budget, as discussed in the body of this order.

By the Commission.

(S E A L)

Kimberly D. Bose,
Secretary.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Cheryl A. LaFleur, Chairman;
Philip D. Moeller, Tony Clark,
and Norman C. Bay.

North American Electric Reliability Corporation Docket No. RR14-6-000

ORDER ON 2015 BUSINESS PLANS AND BUDGETS

(Issued October 16, 2014)

1. On August 22, 2014, North American Electric Reliability Corporation (NERC) filed 2015 business plans and budgets for each Regional Entity,[1] the Western Interconnection Regional Advisory Body (WIRAB), Peak Reliability, Inc. (Peak Reliability), and itself (collectively, NERC Application). For the reasons discussed below, the Commission accepts the 2015 business plans and budgets of NERC, the Regional Entities, WIRAB, and Peak Reliability, as well as the associated attachments and updates. The Commission authorizes NERC to issue billing invoices to fund the fiscal year 2015 operations of the Regional Entities, WIRAB, Peak Reliability, and itself.[2]

I. Background

A. Regulatory History

2. Section 215 of the Federal Power Act (FPA) requires the Commission to certify an Electric Reliability Organization (ERO) to develop mandatory and enforceable

[1] The eight Regional Entities are Florida Reliability Coordinating Council, Midwest Reliability Organization, Northeast Power Coordinating Council, Inc., Reliability*First* Corporation, SERC Reliability Corporation, Southwest Power Pool Regional Entity, Texas Reliability Entity, and Western Electricity Coordinating Council (WECC).

[2] On October 14, 2014, NERC submitted a "Request to Submit Revisions to the 2015 Budget and Assessments of Peak Reliability, Inc. to Reflect Additional Revenues from British Columbia Hydro and Power Authority," in Docket No. RR14-6-001. The Commission will address this filing in a subsequent order.

Reliability Standards, subject to Commission review and approval.[3] In July 2006, the Commission certified NERC as the ERO.[4]

3. FPA section 215(c)(2)(B) provides that the ERO must have rules that "allocate equitably reasonable dues, fees, and other charges among end users for all activities under this section."[5] On February 3, 2006, the Commission issued Order No. 672 to implement the requirements of FPA section 215, which generally provides for Commission authorization of funding for "statutory" functions, (i.e., those functions carried out pursuant to FPA section 215).[6] Among other things, Order No. 672 sets forth requirements for funding the ERO and the approval of an ERO business plan and budget.[7] Moreover, the Commission's regulations require the ERO to file with the Commission the ERO's proposed annual budget for statutory and non-statutory activities 130 days before the beginning of its fiscal year.[8] Further, the ERO's filing must contain the annual budgets of each Regional Entity for statutory and non-statutory activities and provide supporting materials, including the ERO's and each Regional Entity's complete business plan and budget organizational chart. The filing must also explain the proposed collection of all dues, fees, and charges, as well as the proposed expenditure of funds collected.

B. NERC's 2015 ERO Business Plan and Budget Application

4. The NERC Application contains NERC's proposed business plan and budget for the year ending December 31, 2015, as well as the proposed business plans and budgets

---

[7] Order No. 672, FERC Stats. & Regs. ¶ 31,204 at P 197.

[8] 18 C.F.R. § 39.4(b) (2014).

of each of the eight Regional Entities, WIRAB, and Peak Reliability for the year ending December 31, 2015.

5. NERC states that the proposed assessment for the total ERO (i.e., NERC, the Regional Entities, and WIRAB) for 2015 is $163,582,428, which includes $55,308,375 for NERC funding; $107,215,895 for Regional Entity funding; and $1,058,158 for WIRAB funding. NERC states that the portion of statutory activities of NERC, the Regional Entities, and WIRAB allocable to the United States is $148,273,401. The proposed assessment for Peak Reliability for 2015 is $41,953,236; the portion of this assessment allocable to the United States is $41,302,627. NERC states that it will continue to allocate costs to end users in the United States based on Net Energy for Load.

6. In addition to the NERC, Regional Entity, WIRAB, and Peak Reliability business plans and budgets, the NERC Application includes various attachments: Discussion of Comments Received During Development of NERC's 2015 Business Plan and Budget (Attachment 13); Calculation of Adjustments for Alberta Electric System Operator, Ontario Independent Electric System Operator, New Brunswick and the Quebec NERC Assessment (Attachment 14); Status Report on NERC's 2014 Goals (Attachment 15); Regional Entity Budget Metrics (Attachment 16); and Metrics on NERC and Regional Entity Administrative (Indirect) Costs Based on the 2014 and 2015 Budgets (Attachment 17).

II. Notice and Responsive Pleadings

7. Notice of NERC's August 22, 2014 filing was published in the *Federal Register*, 79 Fed. Reg. 51,995 (2014), with interventions and protests due on or before September 12, 2014.

8. California Department of Water Resources State Water Project filed a timely motion to intervene. Exelon Corporation (Exelon) filed a timely motion to intervene and comments supporting approval of the NERC Application.

9. On September 17, 2014, WIRAB submitted its advice, recommending that the Commission accept WECC's and Peak Reliability's 2015 business plans and budgets.

III. Discussion

A. Procedural Matters

10. Pursuant to Rule 214 of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.214 (2014), the timely, unopposed motions to intervene serve to make the entities that filed them parties to this proceeding.

B. Substantive Issues

1. NERC Business Plan and Budget

11. NERC states that it prepared its 2015 business plan and budget, and worked with the Regional Entities in developing their business plans and budgets, through a rigorous process that provided ample opportunity for review and input by the Finance and Audit Committee of the NERC Board of Trustees (NERC Board) and stakeholders. According to NERC, successive versions of the 2015 business plans and budgets were discussed in meetings and conference calls of the Finance and Audit Committee and full NERC Board, in each case with opportunities for stakeholders to make comments.

12. NERC states that its principal goals in 2015 are focused on the following areas: (1) continuing to implement NERC's risk-based strategy, with a focus on a set of current high priority risk projects; (2) physical and cyber security of the Bulk-Power System; (3) continuing to implement NERC's Reliability Assurance Initiative; (4) implementing the revised bulk electric system definition that the Commission has approved; (5) developing and implementing a risk-based registration system; and (6) transforming the NERC Reliability Standards to a steady state.[9]

13. With respect to the Reliability Assurance Initiative, NERC describes that program as "a multiyear effort that involves compliance and enforcement process changes, development of new tools and training materials, and a variety of related efforts."[10] NERC states that it is implementing the Reliability Assurance Initiative "as part of its stated objectives of ensuring [bulk electric system] reliability, improving the efficiency and effectiveness of NERC and Regional Entity compliance and enforcement operations, and reducing unnecessary burdens to registered entities."[11] NERC describes the goal of the risk-based registration program as ensuring that "entities are properly registered or de-registered commensurate with risk to the [bulk electric system], are properly scoped, and are responsible for applicable Reliability Standards along with associated compliance obligations."[12]

---

[9] NERC Application at 7.

[10] *Id.* at Attachment 2 (NERC's Proposed 2015 Business Plan and Budget) at 9.

[11] *Id.*

[12] *Id.* at xiii.

14. NERC states that its 2015 business plan and budget is based on the following program areas: (1) Reliability Standards; (2) Compliance Monitoring and Enforcement Program and Organization Registration and Certification, which is comprised of Regional Entity Assurance and Oversight, Compliance Analysis, Registration and Certification, and Compliance Enforcement; (3) Reliability Assessment and Performance Analysis; (4) Reliability Risk Management, which is comprised of Situation Awareness and Event Analysis; (5) Critical Infrastructure Protection; (6) Electricity Sector Information Sharing and Analysis Center; and (7) Training, Education, and Operator Certification.[13] For these program areas, NERC describes each program, identifies the program's goals and objectives, and provides the number of full-time equivalent employees (FTEs), as well as the amount budgeted for 2015. NERC also provides 2014 approved budget data and 2014 year-end projected data for comparison.

15. NERC's proposed total funding for 2015 is $67,371,264, which is an increase of $13,635,882 (25.4 percent) over the 2014 budget. A significant portion of this increase is attributable to NERC's participation in the Cyber Risk Information Sharing Program (CRISP). NERC explains that CRISP is "a public-private partnership whose purpose is to facilitate timely information sharing of cyber threat information and to develop situation awareness tools that enhance the electricity sector's ability to identify, prioritize, and coordinate the protection of its critical infrastructure."[14] While the CRISP program will result in a significant increase in NERC's 2015 budgeted outlays, the CRISP program will be primarily funded by entities directly participating in the program (similar to the funding of certain training programs through participant fees) rather than through an increased assessment on all load-serving entities or their designees under FPA section 215.[15] Without CRISP, NERC's budget would increase by $1,328,097 (2.4 percent) over its 2014 budget. NERC's proposed 2015 net funding requirement is $55,308,375 (i.e., total budget less funding from other sources), of which $50,046,840 is allocated to the United States.[16] The net funding requirement allocated to the United States is an increase of $3,338,141 (7.1 percent) over the 2014 budget proposal. NERC states that its

[13] NERC Application at 4.

[14] *Id.* at 61.

[15] *Id.* at 7.

[16] *Id.* at 19-21. NERC's other funding sources are penalty payments, third-party funding for CRISP, revenue from services and software, testing and workshop fees, and interest. *Id.* at 13.

proposed total United States net funding requirement is equivalent to $0.000013 per kWh, based on the aggregate Net Energy for Load of the United States in 2013.[17]

16. NERC states that the proposed 2015 business plan and budget reflects a provision for working capital and operating reserve funding in the amount of $1,094,958.[18] Finally, NERC proposes a 2015 staffing level of 192.30 FTEs, which is an increase of 2.8 FTEs over the 2014 budget staffing level.

17. Exelon filed comments supporting the NERC budget, and the funding of CRISP in particular. Exelon states that "CRISP will enhance the electricity sector's ability to identify, prioritize, and coordinate the protection of industry's critical infrastructure."[19]

Commission Determination

18. We find that NERC's 2015 budget is reasonable and the associated costs of NERC's jurisdictional functions are equitably allocated among end users in the United States.[20] We note that while NERC's 2015 budget will increase by 25.4 percent over 2014, the vast majority of that increase is attributable to the CRISP program, which will be significantly funded in 2015 by participating entities rather than through increased assessments. Accordingly, the Commission accepts NERC's 2015 business plan and budget.

2. Regional Entity Business Plans and Budgets

19. NERC's Application includes the 2015 business plans and budgets of each Regional Entity. NERC states that it reviewed the Regional Entity business plans and budgets and concludes that each Regional Entity proposes necessary and adequate resources to carry out its delegated functions.[21]

---

[17] *Id*. at 21.

[18] *Id.* at Attachment 2 (NERC's Proposed 2015 Business Plan and Budget) at xxiii.

[19] Exelon Comments at 2.

[20] 16 U.S.C. § 824o(c)(1)(B).

[21] NERC Application at 28.

Commission Determination

20. The Commission finds that each submission reasonably supports the level of expenditures identified in the budgets. We are satisfied that the Regional Entities are focused on adequately staffing and funding all of their program areas to perform the delegated, statutory functions. Accordingly, the Commission accepts the Regional Entity business plans and budgets.

3. WIRAB Budget

21. WIRAB proposes statutory expenses of $1,013,851 in 2015, which is a $309,881 increase from its 2014 budget. WIRAB also proposes an incremental adjustment for working capital reserves of $45,027. To fund its operations in 2015, WIRAB proposes a statutory assessment of $1,058,158, of which $898,314 would be allocable to end users in the United States.

22. WIRAB notes that its key activities in 2015 include: (1) rectifying shortcomings in grid reliability practices of balancing authorities, transmission operators and other key registered entities; (2) improving the ability of western reliability organizations to identify, analyze, and recommend actions to address current and looming reliability challenges; (3) encouraging WECC and Peak Reliability to adopt more open and transparent data sharing practices; (4) ensuring that both Peak Reliability and WECC can effectively identify and disseminate best practices to maintain physical and cyber security of the Western Interconnection; and (5) collaborating with the Commission and NERC to identify future grid reliability challenges. WIRAB's budget includes four FTEs for 2015, which is an increase of 1.25 FTEs over 2014.

Commission Determination

23. Based on the information provided in the instant filing, the Commission concludes that WIRAB's 2015 budget is reasonable and, accordingly, the Commission accepts the WIRAB 2015 budget.

4. Peak Reliability Business Plan and Budget

24. NERC's Application includes the 2015 business plan and budget for Peak Reliability. NERC states that it has not substantively reviewed and approved Peak Reliability's Business Plan and Budget in the same manner that NERC reviews the business plans and budgets of the Regional Entities.[22]

[22] *Id.* at 110.

25. Peak Reliability's proposed budget for 2015, before provision for working capital, is $38,926,722, which is an increase of $5,968,073 (18.1 percent) over its 2014 budget. Peak Reliability states that the primary drivers of the increase in its statutory budget and personnel count are the new activities Peak Reliability will undertake to address recommendations from the WECC Board-appointed Reliability Coordination Task Force. NERC states that Peak Reliability will employ 161.67 FTEs, which is an increase of 12.57 FTEs.

26. WIRAB recommends approval of Peak Reliability's proposed 2015 budget, asserting that "Peak's 2015 budget will restore the Reliability Coordination function to sound budgeting practices."[23]

Commission Determination

27. Based on the information provided in the instant filing, the Commission concludes that Peak Reliability's 2015 budget is reasonable and, accordingly, the Commission accepts Peak Reliability's 2015 business plan and budget.

The Commission orders:

(A) NERC's 2015 business plan and budget is hereby accepted.

(B) The Regional Entity 2015 business plans and budgets are hereby accepted.

(C) The WIRAB 2015 business plan and budget is hereby accepted for funding.

(D) The Peak Reliability 2015 business plan and budget is hereby accepted.

By the Commission.

(S E A L)

Kimberly D. Bose,
Secretary.

[23] WIRAB Advice at 3.

149 FERC ¶ 61,061
UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Cheryl A. LaFleur, Chairman;
Philip D. Moeller, and Tony Clark.

Southern California Edison Company Docket No. IN14-8-000

ORDER APPROVING STIPULATION AND CONSENT AGREEMENT

(Issued October 21, 2014)

1. The Commission approves the attached Stipulation and Consent Agreement (Agreement) between the Office of Enforcement (Enforcement), the North American Electric Reliability Corporation (NERC), and Southern California Edison Company (SCE). This order is in the public interest because it resolves on fair and reasonable terms an investigation of SCE, conducted by Enforcement in coordination with NERC and the Commission's Office of Electric Reliability (OER), into possible violations of Reliability Standards associated with SCE's operation of a portion of the Bulk Power System (BPS) and a blackout that occurred on September 8, 2011. SCE agrees to pay a civil penalty of $650,000, of which $250,000 will be paid to the United States Treasury and NERC, divided in equal amounts, and $400,000 will be invested in reliability enhancement measures that go above and beyond mitigation of the violations and the requirements of the Reliability Standards. SCE also agrees to commit to mitigation and compliance measures necessary to mitigate the violation described in this Agreement, and to make semi-annual compliance reports to Enforcement and NERC for at least one year.

I. Background

2. SCE, a wholly-owned subsidiary of Edison International, is an investor-owned utility providing electricity in central, coastal, and southern California. Among other NERC registrations, SCE operates as a Transmission Owner (TO) and Operator (TOP) within the California Independent System Operator's (CAISO) Balancing Authority area, and has delegated part of its responsibilities as TOP to CAISO under a Coordinated Functional Registration. SCE owns approximately 5,490 circuit miles of transmission lines, including 500, 230, and 161 kV lines. At the time of the event, SCE owned more than 5,600 MW of generation, including a majority share in the San Onofre Nuclear Generating Station (SONGS) in Southern California.[1] SCE's peak load exceeds 22,000 MW. SCE is subject to the Commission's regulation under section 215 of the Federal Power Act (FPA).[2]

[1] In June 2013, SONGS permanently ceased power operations.

[2] 16 U.S.C. § 824o (2012).

3. On March 16, 2007, in Order No. 693,[3] the Commission approved the initial Reliability Standards, which became mandatory and enforceable within the contiguous United States on June 18, 2007.

4. The investigation of SCE arose out of a system disturbance that occurred on the afternoon of September 8, 2011 in the Pacific Southwest, which resulted in cascading outages and left approximately 2.7 million customers (equivalent to five million or more individuals) without power, some for multiple hours extending into the next day. The total load loss for the event was in excess of 30,000 MWh. The event started with a three-phase fault which led to the loss of Arizona Public Service Company's Hassayampa-N. Gila 500 kV transmission line (H-NG). This transmission line is a segment of the Southwest Power Link (SWPL), a major transmission corridor transporting power in an east-west direction, from generators in Arizona, through Imperial Irrigation District's (IID) service territory, into Southern California.

5. With the SWPL's major east-west corridor broken by the loss of H-NG, power flows instantaneously redistributed throughout the electric system in the Pacific Southwest and Southern California, increasing flows through lower voltage systems parallel to the SWPL as power continued to flow on a hot day during hours of peak demand.

6. These redistributed flows traveled through IID's and Western Area Power Administration-Desert Southwest's (Western-DSW) facilities, onto Western Electricity Coordinating Council (WECC)[4] Path 44, an aggregation of five 230 kV transmission lines that deliver power in a north-south direction from SCE's territory in Los Angeles to San Diego. The increased power flows parallel to the SWPL, together with lower than peak generation levels in California and Mexico, led to significant voltage deviations and transmission equipment overloads. The flow redistributions, voltage deviations, and resulting overloads had a cascading effect, as transmission and generation equipment tripped offline in a relatively short time period. Just seconds before the blackout, Path 44 carried all flows into San Diego as well as parts of Arizona and Mexico. This excessive loading on Path 44 initiated an intertie separation scheme owned and operated by SCE at

[3] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

[4] At the time of the event, WECC was registered with NERC as the Reliability Coordinator (RC) for all of the entities affected by the event, as well as serving as the Regional Entity (RE) under a delegation agreement with NERC. Since the event, the Regional Entity and Reliability Coordinator functions have been bifurcated, with WECC remaining the Regional Entity, and Peak Reliability becoming the independent Reliability Coordinator. *See Order on Compliance*, 146 FERC ¶ 61,092 (2014) (accepting compliance filings submitted by NERC and WECC and eliminating all final obstacles to bifurcation).

the San Onofre switchyard. Initiation of this intertie separation scheme separated San Diego Gas & Electric (SDG&E) from Path 44, contributed to tripping the SONGS nuclear units offline, and eventually resulted in the complete blackout of San Diego and Comisión Federal de Electricidad's (CFE) Baja California Control Area in Mexico.

7. Before the September 8 event, system conditions had never exceeded the threshold for triggering the intertie separation scheme at the San Onofre switchyard, and SCE had never conducted any studies to assess the scheme's impact on reliability or the scheme's impact on an already severely compromised system.

8. Operation of the scheme simultaneously opened all five 230 kV transmission lines—Path 44—connecting SCE and SDG&E, as it was designed to do, and the resulting cut in power to SDG&E's system caused a rapid frequency decline indicative of a severe imbalance between generation and load in SDG&E's system. This rapid frequency decline affected SDG&E's Underfrequency Load Shedding (UFLS) program. Prior to this point in the event, SDG&E had already lost its intertie to the east, and with the opening of Path 44, SDG&E was effectively separated from the rest of the Western Interconnection.

9. The operation of the separation scheme under the extreme power flow conditions resulted in a sudden change in the angle of the generator rotors at SONGS. This resulted in the activation of turbine control logic to prevent over speed of the equipment which tripped both SONGS units.

II. Investigation

10. On September 9, 2011, the Commission and NERC announced a joint inquiry to determine how the blackout occurred and to make recommendations to avoid similar situations in the future. The inquiry team, comprised of Commission and NERC staff, used on-site visits and interviews, detailed computer modeling, event simulations, and system analyses to make its findings and recommendations for preventing similar events in the future. The inquiry determined that entities responsible for planning and operating the BPS were not prepared to ensure reliable operation or prevent cascading outages in the event of a single contingency. On May 1, 2012, the inquiry team published a report entitled *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (the Report), which is hereby incorporated by reference.[5] The Report discusses a detailed sequence of events, simulations, and findings related to the causes of the cascading outages. The Report also makes twenty-seven recommendations related to next-day planning, seasonal planning, near- and long-term planning, situational

[5] *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (April 2012), *available at* http://www.ferc.gov/legal/staff-reports/04-27-2012-ferc-nerc-report.pdf.

awareness, consideration of bulk electric system (BES) equipment, System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs), and protection systems.

11. Following publication of the Report, Enforcement, OER, and NERC staff reviewed the data gathered during the inquiry for compliance implications. At the direction of the Commission, Enforcement initiated non-public investigations of several entities, including SCE, under Part 1b of the Commission's regulations, 18 C.F.R. Part 1b (2014), which were conducted jointly with NERC.

12. Enforcement and NERC determined that SCE violated the Protection and Control (PRC-) group of Reliability Standards. The PRC standards cover a range of topics related to the protection and control of power systems, including the design, coordination, and maintenance of functional protection systems.

13. Enforcement and NERC determined that SCE failed to adequately coordinate the intertie separation scheme at the San Onofre switchyard with protection systems, including (1) the acceleration limits within the turbine control systems on the two SONGS generators; and (2) the UFLS program of its neighbor, SDG&E, in violation of Reliability Standard PRC-001-1 R4. Enforcement and NERC found SCE's violation to be a serious deficiency undermining reliable operation of the BPS.

III. Stipulation and Consent Agreement

14. Enforcement, NERC, and SCE resolved this matter by means of the attached Agreement. SCE stipulates to the facts recited in the Agreement and agrees to pay a civil penalty of $650,000, of which $250,000 will be paid to the United States Treasury and NERC, divided in equal amounts, and $400,000 will be invested in reliability enhancement measures that go above and beyond the requirements of the Reliability Standards, as described in the Agreement. SCE neither admits nor denies that its actions constituted violations of the Reliability Standards.

15. SCE also agrees to additional mitigation measures, and to submit to compliance monitoring, as specified in the Agreement.

16. In consideration of the appropriate sanction, Enforcement considered that SCE has made significant efforts to date to address reliability concerns identified in the inquiry and investigation and also by SCE on its own initiative. SCE also fully and comprehensively cooperated with Enforcement and NERC during the investigation.

IV. Determination of the Appropriate Sanctions

17. The civil penalty amount is consistent with the Penalty Guidelines.[6] Enforcement considered that the event caused a loss of 10,000 or more MWh of firm load, and SCE

[6] *Enforcement of Statutes, Orders, Rules and Regulations,* 132 FERC ¶ 61,216 (2010).

was allocated a share of the base penalty. The civil penalty amount reflects credit for SCE's full cooperation during the course of the investigation as well as credits for avoiding a trial-type hearing and having an effective compliance program.

18. The Commission concludes that the penalties and other sanctions set forth in the Agreement are a fair and equitable resolution of this matter and are in the public interest. The Commission also concludes that the reliability enhancement measures set forth in the Agreement will enhance the reliability of the BPS and are therefore also fair and in the public interest.

The Commission orders:

The attached Stipulation and Consent Agreement is hereby approved without modification.

By the Commission. Commissioner Bay is not participating.

(S E A L)

Kimberly D. Bose,
Secretary.

.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Southern California Edison Company) Docket No. IN14-8-000

STIPULATION AND CONSENT AGREEMENT

I. INTRODUCTION

1. Staff of the Office of Enforcement (Enforcement) of the Federal Energy Regulatory Commission (Commission), the North American Electric Reliability Corporation (NERC), and Southern California Edison Company (SCE) enter into this Stipulation and Consent Agreement (Agreement) to resolve a non-public investigation conducted by Enforcement and NERC pursuant to Part 1b of the Commission's regulations, 18 C.F.R. Part 1b (2014). The investigation examined possible violations of NERC Reliability Standards by SCE related to a system event in the Pacific Southwest on September 8, 2011 (September 8 event or event). SCE neither admits nor denies that it violated the Reliability Standard described in the Agreement, but agrees to pay a total civil penalty of $650,000, of which $250,000 will be paid to the United States Treasury and NERC, divided in equal amounts, and $400,000 will be invested, subject to Enforcement and NERC approval, by SCE in reliability enhancement measures identified below that go above and beyond the Agreement's mitigation commitments or what that Reliability Standards require (Reliability Enhancements). SCE also commits to mitigation and compliance measures, subject to compliance monitoring, as detailed in the Agreement.

II. STIPULATED FACTS

2. Enforcement, NERC, and SCE hereby stipulate and agree to the following facts.

A. SCE

3. SCE, a wholly-owned subsidiary of Edison International, is an investor-owned utility providing electricity in central, coastal, and southern California. Among other NERC registrations, SCE operates as a Transmission Owner (TO) and Operator (TOP) within the California Independent System Operator's (CAISO) Balancing Authority area, and has delegated part of its responsibilities as TOP, including seasonal, next-day, and current-day planning, to CAISO under a

Coordinated Functional Registration.[1] SCE owns approximately 5,490 circuit miles of transmission lines, including 500, 230, and 161 kV lines. At the time of the event, SCE owned more than 5,600 MW of generation, including a majority share in the San Onofre Nuclear Generating Station (SONGS) in Southern California.[2] SCE's peak load exceeds 22,000 MW.

B. Event Description

4. During an 11-minute period on the afternoon of September 8, 2011, a system disturbance occurred in the Pacific Southwest, resulting in cascading outages and leaving approximately 2.7 million customers without power, some for multiple hours extending into the next day. The total load loss for the event was in excess of 30,000 MWh. The event started with a three-phase fault which led to the loss of Arizona Public Service's (APS's) Hassayampa-N. Gila 500 kV transmission line (H-NG). This transmission line is a segment of the Southwest Power Link (SWPL), a major transmission corridor transporting power in an east-west direction, from generators in Arizona, through the service territory of Imperial Irrigation District (IID), into Southern California.

5. With the SWPL's major east-west corridor broken by the loss of H-NG, power flows instantaneously redistributed throughout the electric system in the Pacific Southwest and Southern California, increasing flows through lower voltage systems parallel to the SWPL as power continued to flow on a hot day during hours of peak demand.

6. These redistributed flows traveled through IID's and Western Area Power Administration – Desert Southwest's (Western-DSW's) territories onto Western Electricity Coordinating Council (WECC)[3] Path 44, an aggregation of five 230 kV

---

[1] JRO00009 was originally entered into on September 11, 2008 and most recently updated on May 24, 2012. JRO00009 delineates compliance responsibility for the Standards and Requirements associated with the TOP function between CAISO and SCE.

[2] In June 2013, SONGS permanently ceased power operations.

[3] At the time of the event, WECC was registered with NERC as the Reliability Coordinator (RC) for all of the entities affected by the event, as well as serving as the Regional Entity (RE) under a delegation agreement with NERC. Since the event, the Regional Entity and Reliability Coordinator functions have been bifurcated, with WECC remaining the Regional Entity, and Peak Reliability becoming the independent Reliability Coordinator. *See Order on Compliance*, 146 FERC ¶ 61,092 (2014) (accepting compliance filings submitted by NERC and WECC and eliminating all final obstacles to bifurcation). The Agreement will

transmission lines that deliver power in a north-south direction from SCE's territory in Los Angeles to San Diego Gas & Electric (SDG&E). The increased power flows parallel to the SWPL, together with lower than peak generation levels in California and Mexico, led to significant voltage deviations and transmission equipment overloads. The flow redistributions, voltage deviations, and resulting overloads had a cascading effect, as transmission and generation equipment tripped offline in a relatively short time period. Just seconds before the blackout, Path 44 carried all flows into San Diego as well as parts of Arizona and Mexico. This excessive loading on Path 44 initiated an intertie separation scheme, owned and operated by SCE, located at the San Onofre switchyard.[4] CAISO is responsible for many of the TOP functions for SCE under a Coordinated Functional Registration. Initiation of the intertie separation scheme at the San Onofre switchyard separated SDG&E from Path 44, contributed to tripping the SONGS nuclear units offline, and eventually resulted in the complete blackout of San Diego and Comisión Federal de Electricidad's Baja California Control Area.

7. SCE's role in the September 8 event centers on its ownership and operation of the intertie separation scheme at the San Onofre switchyard that initiated approximately 10 minutes and 40 seconds into the 11-minute event. Operation of the scheme simultaneously opened all five 230 kV transmission lines—Path 44—connecting SCE and SDG&E, as it was designed to do, and the resulting cut in power to SDG&E's system caused a rapid frequency decline indicative of a severe imbalance between generation and load in SDG&E's system. This rapid frequency decline affected SDG&E's Underfrequency Load Shedding (UFLS) program. Prior to this point in the event, SDG&E had already lost its intertie to the east, and with the opening of Path 44, SDG&E was effectively separated from the rest of the Western Interconnection. Before the September 8 event, system conditions had never exceeded the threshold for triggering the intertie separation scheme at the San Onofre switchyard, and SCE had never conducted any studies to assess the scheme's impact on reliability or the scheme's impact on an already severely compromised system.

8. The operation of the separation scheme under the extreme power flow conditions resulted in a sudden change in the angle of the generator rotors at SONGS. This resulted in the activation of turbine control logic to prevent over speed of the equipment which tripped both SONGS units.

---

refer to WECC when relevant to the event, and will otherwise refer to the relevant function (RE or RC) rather than using the entity names WECC or Peak Reliability.

[4] Since the September 8 event, Enforcement and NERC have referred to this intertie separation scheme as the SONGS Separation Scheme.

III. INQUIRY AND INVESTIGATION

9. On September 9, 2011, the Commission and NERC announced a joint inquiry to determine how the blackout occurred and to make recommendations to avoid similar situations in the future. The inquiry team, comprised of Commission and NERC staff, used on-site visits and interviews, detailed computer modeling, event simulations, and system analyses to make its findings and recommendations for preventing similar events in the future. The inquiry determined that entities responsible for planning and operating the Bulk-Power System (BPS) were not prepared to ensure reliable operation or prevent cascading outages in the event of a single contingency. On May 1, 2012, the inquiry team published a report entitled *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (the Report), which is hereby incorporated by reference.[5] The Report discusses a detailed sequence of events, simulations, and findings related to the causes of the cascading outages. The Report also makes twenty-seven recommendations related to next-day planning, seasonal planning, near- and long-term planning, situational awareness, consideration of Bulk Electric System (BES) equipment, system operating limits (SOLs) and Interconnection Reliability Operating Limits (IROLs), and protection systems.

10. Following publication of the Report, Enforcement and NERC reviewed the data gathered during the inquiry for compliance implications. As a result of that review, Enforcement and NERC initiated non-public investigations of several entities, including SCE, under Part 1b of the Commission's regulations, 18 C.F.R. Part 1b (2014). Enforcement and NERC determined that SCE violated Reliability Standard PRC-001-1 R4 and found that this violation undermined the reliability of the BPS and contributed to the September 8 event. Enforcement and NERC recognized, however, that after the event, and during the inquiry and investigation, SCE voluntarily began making improvements in its planning and operations, and implementing recommendations from the Report, that addressed many of the findings arising from the Report. In addition, SCE fully cooperated with Enforcement and NERC during the investigation.

11. As part of the investigation, Enforcement and NERC reviewed SCE's compliance program and discovered that SCE satisfies the criteria for an effective compliance program under the Commission's Penalty Guidelines.[6] Enforcement

---

[5] *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (April 2012), *available at* http://www.ferc.gov/legal/staff-reports/04-27-2012-ferc-nerc-report.pdf.

[6] *Enforcement of Statutes, Orders, Rules and Regulations*, 132 FERC ¶ 61,216, § 1B2.1 (2010).

and NERC considered the following elements of SCE's compliance program: (1) SCE's NERC Compliance Program office is staffed by seventeen full time employees devoted to ensuring compliance with each Reliability Standard; (2) SCE conducts an annual self-assessment of its overall NERC compliance as well as monthly assessments of compliance with specific Reliability Standards; (3) Five of SCE's senior Officers are a part of SCE's NERC Executive Steering Team (EST). The EST team members are fully engaged in the compliance program and attend monthly status meetings with the director of the compliance program; and (4) SCE employees attend annual training sessions on NERC compliance and have opportunities to report and raise compliance issues, including through an anonymous Hotline maintained by a third party.

IV. VIOLATION

12. Enforcement and NERC determined that SCE violated Reliability Standard PRC-001-1 R4 because prior to the September 8 event it did not adequately coordinate the intertie separation scheme at the San Onofre switchyard with protection systems, including (1) the acceleration limits within the turbine control systems on the two SONGS generators; and (2) the UFLS program of its neighbor, SDG&E. Prior to the event, SCE had not conducted studies to assess the scheme's impact on reliability. Prior to the event, SCE also had not conducted studies to assess the scheme's impact on the acceleration of the SONGS units, or the impact to an already severely compromised system. As a result, SCE did not know how the initiation of the scheme would impact reliability, including whether the scheme would result in the tripping of the SONGS generators or how it might affect the ability of SDG&E's UFLS program to arrest extreme frequency decline, as described in paragraphs 6, 7, and 8 above.

V. REMEDIES AND SANCTIONS

13. SCE stipulates to the facts as described in Section II of the Agreement, but neither admits nor denies Enforcement's and NERC's findings that its conduct violated the Reliability Standard specified in Section IV. For purposes of settling any and all civil and administrative disputes within the jurisdiction of the Commission arising from reliability issues related to the September 8 event and Enforcement and NERC's investigation, SCE agrees to the remedies set forth in the following paragraphs.

A. Civil Penalty

14. SCE shall pay a total civil penalty of $650,000, of which $250,000 shall be paid, divided in equal amounts, to the United States Treasury and NERC within ten days of the Effective Date of the Agreement. Enforcement and NERC agree to give SCE a partial civil penalty offset for the remaining $400,000 in exchange for

SCE agreeing to implement the Reliability Enhancements set forth in Section V.B. The value of the Reliability Enhancements is expected to substantially exceed the amount of the offset.

B. Reliability Enhancements

15. In exchange for the $400,000 offset, as Reliability Enhancements, SCE shall provide the RE and/or RC with three Full-Time Equivalent (FTE) technical employees for a total of 6,240 hours to assist the RE and/or RC with their efforts in response to the September 8 event.

16. As part of the Reliability Enhancements, SCE employees will participate in regional study groups and various RE, RC, and/or NERC reliability initiatives, created in response to and for the purpose of improving reliability after the September 8 event. SCE, the RE, and/or RC will agree on the skill set of the employees to be shared and the employees' projects and tasks.

17. The scope and nature of the projects and tasks to be performed by the aforementioned SCE employees shall be approved by Enforcement and NERC, such approval not to be unreasonably withheld. SCE shall complete the Reliability Enhancements by December 31, 2016.

18. If SCE has not performed the Reliability Enhancements by December 31, 2016, or determines, prior to December 31, 2016, that it cannot reach an agreement with the RE and/or RC on the projects or tasks to be performed, SCE shall subtract from $400,000 the cash value of the services, if any, already performed, and pay the remaining sum in equal shares to the United States Treasury and NERC. The calculation of the sum due to Treasury and NERC, including the cash value of the services, and the identification of the services to be credited, are subject to review and approval by Enforcement and NERC.

C. Completed and Required Mitigation

19. SCE commits to the following actions, designed to mitigate the Reliability Standard violations and to improve overall reliability of the BES. As indicated below, SCE affirms that it has already completed most of the mitigation measures and shall complete all remaining mitigation measures no later than December 31, 2015, unless otherwise stated in this Section. In those instances where SCE has already implemented mitigation measures prior to entering into the Agreement, it shall continue operating under the practices and procedures implemented as part of the mitigation, until such time as it implements improved practices and procedures, as determined by Enforcement and NERC. SCE will report on the status of all mitigation measures described in this Section and submit evidence of

status and progress in its compliance monitoring reports to be submitted to Enforcement and NERC pursuant to Section V.C of the Agreement.

i. Mitigation Related to Protection Systems

Protection System Coordination[7]

20. SCE has completed multiple mitigation measures and has also agreed to implement multiple additional mitigating measures aimed at improving its coordination of Covered Protection Systems, including intertie overload separation schemes.[8]

21. Following the September 8 event, SCE undertook an expedited technical and physical evaluation of all its intertie overload separation schemes, to ensure that such schemes and the schemes' settings were properly coordinated across its transmission system. Based on this evaluation and to the extent necessary to ensure proper coordination, SCE changed the settings on some schemes, and disabled and removed others.

22. In addition to any requirements under the Reliability Standards related to protection systems, starting in 2014, SCE agrees to conduct a detailed study of twenty percent of its existing and planned Covered Protection Systems each year with 100 percent of the studies to be completed by December 31, 2018. SCE will prioritize its assessment of intertie overload separation schemes and will complete its assessment of such schemes by December 31, 2015. This assessment shall consider (1) the purpose and limitations of Covered Protection Systems; (2) the necessity of Covered Protection Systems; (3) the classification of Covered Protection Systems; (4) coordination of Covered Protection Systems with other devices and systems; (5) impact of Covered Protection Systems on internal and external elements; (6) whether Covered Protection Systems have unintended reliability consequences; (7) whether SCE's Underfrequency Load Shedding program is effective and consistent with the RE's Off-Nominal Frequency Load

[7] This section on Protection System coordination applies to the following Protection Systems: (1) internal to SCE's system, Special Protection Systems (including intertie overload separation schemes), overload Protection Systems on transmission equipment, and overload Protection Systems that studies show affect the BPS; and (2) external to SCE's system, Protection Systems that are known to affect SCE's operations (referred to as "Covered Protection Systems").

[8] SCE has identified its intertie overload separation schemes that remain in service, and Enforcement, NERC, and SCE maintain a list of such schemes confidentially.

Shedding plan; and (8) affected generators' response to activation of Covered Protection Systems.

23. SCE further agrees to share relevant information, including Covered Protection System settings, from the foregoing assessments with impacted entities and the Reliability Coordinator. To the extent SCE learns from the assessments that any Covered Protection Systems have degraded or have the potential to not operate as designed, SCE will immediately share this information with impacted entities and the Reliability Coordinator.

Effect of Protection Systems on Transmission Facility Loadability

24. SCE agrees to implement mitigation measures aimed at ensuring that its protection system relay settings do not limit the loadability of its transmission facilities. Specifically, in its 2016 Annual Transmission Reliability Assessment, and each year thereafter, SCE will review its transmission facility SOLs to ensure that they account for protection system relay settings and that they are equal to the most limiting operating criteria during all timeframes, including restoration. SCE will also identify instances where its relay trip points are set too close to transmission facility emergency ratings and to develop plans to mitigate such instances.

Protection System Training

25. SCE agrees to broaden its protection system training program. SCE has provided its transmission operators training on internal protection systems since before the September 8 event. Within six months of the Effective Date of the Agreement, SCE agrees to review this training to ensure it covers the purpose and limitations of Covered Protection Systems, the settings of Covered Protection Systems, and the impact of Covered Protection Systems on internal and external elements. SCE also agrees to expand this training within one year of the completion of the assessment described in Paragraph 22 to cover external protection systems, as identified by SCE, the CAISO, or any adjacent entity, that are likely to impact SCE's system reliability.

ii. Mitigation Related to Long-Term Planning

Consideration of Critical System Conditions in Long-Term Planning Assessments

26. Within one year of the Effective Date of the Agreement, SCE agrees to implement several steps (described below in paragraphs 27-30) to ensure that its long-term planning assessments consider critical system conditions, including expected system transfers above firm, expected internal and external generation dispatch, the impact of internal and external facilities, transmission facilities

operated below 100 kV, local distribution facilities operated below 100 kV that are known to impact the BPS, and the impact of active protection and control devices.

27. Regarding expected system transfers above firm, SCE agrees to include in its long-term studies additional sensitivities by varying generation and load to stress system transfers.

28. To ensure it considers expected internal and external generation dispatch levels in its long-term planning studies, SCE agrees to simulate combinations of various generator outages in its transmission area as well as neighboring areas that could impact its system.

29. SCE also agrees to improve its long-term planning process by ensuring that it considers internal and external facilities operated below 100 kV, where those facilities operate in parallel with facilities above 100 kV or have the potential to affect BPS reliability.[9] For example, SCE agrees to begin utilizing the RE's new base case coordination system to develop cases that include 69 kV facilities and to monitor contingencies involving facilities operated at 69 kV and above in SDG&E's, IID's, and APS's territories that have an impact on SCE's system.

30. SCE agrees to update its contingency files of its various Special Protection Systems (SPS)/Remedial Action Schemes (RAS) for its annual long-term planning studies. Also, it will continue to support the work and respond to data requests of the RE's Modeling SPS and Relays Ad-hoc Task Force to incorporate selected relays into base cases.

Analyses and Benchmarking of Past Planning Studies

31. On a going forward basis, SCE agrees to benchmark annually the prior year's planning studies against actual system operating conditions and look and account for higher stress conditions not captured in its annual assessments, such as unusual generation and import patterns, higher than expected load patterns, and contingencies that may have occurred and were not evaluated. SCE agrees to share information from its benchmarking analyses with impacted entities, CAISO, and the Reliability Coordinator.

iii. Mitigation Related to Situational Awareness

Greater Coordination to Improve Situational Awareness

[9] Inclusion of transmission facilities operated below 100 kV in the mitigation measures pursuant to the Agreement shall have no effect on any current or future analysis regarding whether these facilities comprise part of the BPS.

32. SCE agrees to implement various mitigating measures to improve its coordination efforts with neighboring entities as a way of strengthening its situational awareness. When provided with additional system information for coordination, SCE will have greater capability to assess information, including in the next-day and real-time timeframes, that could impact its system.

33. When released by Peak Reliability for usage, SCE agrees to ensure that its operators and operating engineers utilize, on a daily basis, relevant elements of Peak Reliability's new data sharing portal, which contains next-day studies, historical archives, and data from the Western Interconnection Synchrophasor Project. When released for entity use by Peak Reliability the phasor measurement data will provide operators visibility of system conditions in near real-time and may enable early detection of problems that could lead to cascading outages.

Expanded Situational Awareness

34. To the extent SCE has not already done so, within six months of the Effective Date of the Agreement, SCE also agrees to undertake efforts to identify internal and external elements that impact its portion of the BPS, including facilities operated below 100 kV. In addition, to the extent it has not already done so, SCE agrees to identify all internal elements, including elements operated below 100 kV, that impact external BPS elements, and to notify impacted entities and the Reliability Coordinator of such elements. All such elements shall be included in its models for monitoring in its seasonal, next-day, current-day, and real-time studies. SCE has also received and continues to receive Inter-Control Center Communications Protocol (ICCP) data from neighbors to further improve its transmission models with real-time, verified data on facilities that impact its system.

Response to Impaired Situational Awareness

35. Within six months of the Effective Date of the Agreement, SCE agrees to improve its procedures for responding to the impairment of its monitoring capabilities. These procedures maintain plans for the loss of SCADA/EMS, RTCA, and the loss of communication. They also cover plans for communicating with the Reliability Coordinator and neighboring entities in case SCE loses situational awareness. SCE also agrees to revise its procedures governing the exchange of information regarding the loss or change in service status of critical facilities with the Reliability Coordinator and other impacted entities. SCE will complete operator training on all of these new processes within one year of the Effective Date of the Agreement.

D. Compliance Monitoring

36. SCE shall make semi-annual reports to Enforcement and NERC until all of the mitigation measures and Reliability Enhancements, identified in the Agreement, have been fully implemented and verified by Enforcement and NERC. The first semi-annual report shall cover the first six month period after the Effective Date of the Agreement and shall be submitted to Enforcement and NERC staff within thirty days of the expiration of that period. The subsequent report(s) shall be due in six month increments thereafter. Each report shall detail the following: (1) actions taken as of the date of the report to satisfy the terms of the Agreement, including all mitigation items and Reliability Enhancements; (2) actions taken to improve reliability compliance, including investments in new measures and training activities during the reporting period; and (3) any additional violations of Reliability Standards that have occurred and whether and how SCE has addressed those new violations. The reports must include an affidavit executed by an officer of SCE that the compliance reports are true and accurate and also include corroborative documentation or other satisfactory evidence demonstrating or otherwise supporting the content of these reports. Enforcement and NERC staff may require additional semi-annual reporting if circumstances indicate the need for further monitoring or if SCE has not yet completed all the mitigation measures described in this Section.

VI. TERMS

37. The "Effective Date" of the Agreement shall be the date on which the Commission issues an order approving the Agreement without material modification. When effective, the Agreement shall resolve all reliability matters relating to the September 8 event within the jurisdiction of the Commission, and that arose on or before the Effective Date, as to SCE or any affiliated entity.

38. Commission approval of the Agreement without material modification shall release SCE and forever bar the Commission and NERC from holding SCE, any affiliated entity, and any successor in interest to SCE liable for any and all administrative or civil claims arising out of the reliability issues related to the September 8 event or conduct addressed and stipulated to in the Agreement that occurred on or before the Agreement's Effective Date.

39. Failure to make timely civil penalty payments or to comply with the mitigation, Reliability Enhancements, and monitoring agreed to herein, or any other provision of the Agreement, shall be deemed a violation of a final order of the Commission issued pursuant to the Federal Power Act (FPA), 16 U.S.C. §792, *et seq.*, and may subject SCE to additional action under the enforcement provisions of the FPA.

40. If SCE does not make the civil penalty payment described above at the time

agreed by the parties, interest payable to the United States Treasury and NERC shall begin to accrue pursuant to the Commission's regulations at 18 C.F.R. § 35.19(a)(2)(iii) (2014) from the date that payment is due, in addition to the penalty specified above and any other enforcement action and penalty that the Commission or NERC may take or impose.

41. The Agreement binds SCE and its agents, successors, and assignees. The Agreement does not create any additional or independent obligations on SCE, or any affiliated entity, its agents, officers, directors, or employees, other than the obligations identified in the Agreement.

42. The signatories to the Agreement agree that they enter into the Agreement voluntarily and that, other than the recitations set forth herein, no tender, offer or promise of any kind by any member, employee, officer, director, agent or representative of Enforcement, NERC, or SCE has been made to induce the signatories or any other party to enter into the Agreement.

43. Unless the Commission issues an order approving the Agreement in its entirety and without material modification, the Agreement shall be null and void and of no effect whatsoever, and Enforcement, NERC, and SCE shall not be bound by any provision or term of the Agreement, unless otherwise agreed to in writing by Enforcement, NERC, and SCE.

44. SCE agrees that the Commission's order approving the Agreement without material modification shall be a final and unappealable order assessing a civil penalty under the Federal Power Act. SCE waives findings of fact and conclusions of law, rehearing of any Commission order approving the Agreement without material modification, and judicial review by any court of any Commission order approving the Agreement without material modification.

45. The Agreement can be modified only if in writing and signed by Enforcement, NERC, and SCE, and any modifications will not be effective unless approved by the Commission.

46. Each of the undersigned warrants that he or she is an authorized representative of the entity designated, is authorized to bind such entity and accepts the Agreement on the entity's behalf.

47. The undersigned representative of SCE affirms that he or she has read the Agreement, that all of the matters set forth in the Agreement are true and correct to the best of his or her knowledge, information and belief, and that he or she understands that the Agreement is entered into by Enforcement and NERC in express reliance on those representations.

48. The Agreement may be signed in counterparts.

49. The Agreement is executed in triplicate, each of which so executed shall be deemed to be an original.

[Docket No. RM14-15-000; Order No. 802]

Physical Security Reliability Standard

(Issued November 20, 2014)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Final rule.

SUMMARY: The Federal Energy Regulatory Commission (Commission) approves Reliability Standard CIP-014-1 (Physical Security). The North American Electric Reliability Corporation, the Commission-certified Electric Reliability Organization, submitted Reliability Standard CIP-014-1 for Commission approval in response to a Commission order issued on March 7, 2014. The purpose of Reliability Standard CIP-014-1 is to enhance physical security measures for the most critical Bulk-Power System facilities and thereby lessen the overall vulnerability of the Bulk-Power System against physical attacks. In addition, the Commission directs NERC to develop one modification to Reliability Standard CIP-014-1 and submit an informational filing.

EFFECTIVE DATE: This rule will become effective **[INSERT DATE 60 days after publication in the FEDERAL REGISTER]**.

Physical Security Reliability Standard Docket No. RM14-15-000

ORDER NO. 802

FINAL RULE

(Issued November 20, 2014)

1. Pursuant to section 215 of the Federal Power Act (FPA), the Commission approves Reliability Standard CIP-014-1 (Physical Security).[1] The North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO), submitted Reliability Standard CIP-014-1 for Commission approval in response to a Commission order issued on March 7, 2014.[2] The purpose of Reliability Standard CIP-014-1 is to enhance physical security measures for the most critical Bulk-Power System facilities and thereby lessen the overall vulnerability of the Bulk-Power System facilities against physical attacks. In addition to approving Reliability Standard CIP-014-1, as discussed below, the Commission directs NERC to submit an

[1] 16 U.S.C. 824o.

[2] *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014) (March 7 Order).

informational filing and, pursuant to FPA section 215(d)(5), directs NERC to develop a modification to Reliability Standard CIP-014-1.[3]

I. Background

A. Section 215 and Mandatory Reliability Standards

2. Section 215 of the FPA requires the Commission to certify an ERO to develop mandatory and enforceable Reliability Standards, subject to Commission review and approval. Once approved, the Reliability Standards may be enforced in the United States by the ERO, subject to Commission oversight, or by the Commission independently.[4]

B. March 7 Order

3. In the March 7 Order, the Commission determined that physical attacks on the Bulk-Power System could adversely impact the reliable operation of the Bulk-Power System, resulting in instability, uncontrolled separation, or cascading failures. Moreover, the Commission observed that the then current Reliability Standards did not specifically require entities to take steps to reasonably protect against physical security attacks on the Bulk-Power System. Accordingly, to carry out section 215 of the FPA and to provide for the reliable operation of the Bulk-Power System, the Commission directed NERC, pursuant to FPA section 215(d)(5), to develop and file for approval proposed Reliability

[3] 16 U.S.C. 824o(d)(5).

[4] *Id.* 824o(e).

Standards that address threats and vulnerabilities to the physical security of critical facilities on the Bulk-Power System.

4. The March 7 Order indicated that the Reliability Standards should require owners or operators of the Bulk-Power System to take at least three steps to address the risks that physical security attacks pose to the reliable operation of the Bulk-Power System. Specifically, the March 7 Order directed that the Reliability Standards should require: (1) owners or operators of the Bulk-Power System to perform a risk assessment of their systems to identify their "critical facilities"; (2) owners or operators of the identified critical facilities to evaluate the potential threats and vulnerabilities to those identified facilities; and (3) those owners or operators of critical facilities to develop and implement a security plan designed to protect against attacks to those identified critical facilities based on the assessment of the potential threats and vulnerabilities to their physical security.

5. The March 7 Order stated that the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator, such as by NERC, the relevant Regional Entity, a reliability coordinator, or another entity.[5] In addition, the March 7 Order indicated that the Reliability Standards should include a procedure for the verifying entity, as well as the Commission, to add or remove

[5] March 7 Order, 146 FERC ¶ 61,166 at P 11.

facilities from an owner's or operator's list of critical facilities.[6] The March 7 Order further stated that the determination of threats and vulnerabilities and the security plan should be reviewed by NERC, the relevant Regional Entity, the reliability coordinator, or another entity with appropriate expertise.

6. The March 7 Order stated that, because the three steps of compliance with the contemplated Reliability Standards could contain sensitive or confidential information that, if released to the public, could jeopardize the reliable operation of the Bulk-Power System, NERC should include in the Reliability Standards a procedure that will ensure confidential treatment of sensitive or confidential information but still allow for the Commission, NERC and the Regional Entities to review and inspect any information that is needed to ensure compliance with the Reliability Standards.[7]

7. The Commission directed NERC to submit the proposed Reliability Standards to the Commission for approval within 90 days of issuance of the March 7 Order (i.e., June 5, 2014).

C. NERC Petition

8. On May 23, 2014, NERC petitioned the Commission to approve Reliability Standard CIP-014-1 and its associated violation risk factors and violation severity levels,

[6] *Id.*

[7] *Id.* P 10.

implementation plan, and effective date.[8] NERC maintains that the Reliability Standard is just, reasonable, not unduly discriminatory, or preferential, and in the public interest. In addition, NERC asserts that the proposed Reliability Standard complies with the Commission's directives in the March 7 Order.

9. NERC explains that Reliability Standard CIP-014-1 "serves the vital reliability goal of enhancing physical security measures for the most critical Bulk-Power System facilities and lessening the overall vulnerability of the Bulk-Power System to physical attacks."[9] NERC maintains that the "appropriate focus of the proposed Reliability Standard is Transmission stations and Transmission substations, which are uniquely essential elements of the Bulk-Power System."[10] The Reliability Standard is applicable to transmission owners that satisfy the Applicability Sections 4.1.1.1, 4.1.1.2, 4.1.1.3, or

[8] NERC explains that, to meet the 90-day deadline in the March 7 Order, the NERC Standards Committee approved waivers to NERC's Standard Processes Manual to shorten the comment and ballot periods for the Standards Authorization Request and draft Reliability Standard. NERC Petition at 13-14. Reliability Standard CIP-014-1 is not attached to this Final Rule. The complete text of Reliability Standard CIP-014-1 is available on the Commission's eLibrary document retrieval system in Docket No. RM14-15-000 and is posted on the ERO's web site, *available at* http://www.nerc.com.

[9] NERC Petition at 15-16.

[10] *Id.* at 18. NERC states that, although the terms "Transmission stations" and "Transmission substations" are sometimes used interchangeably, Reliability Standard CIP-014-1 uses the term "Transmission substation" to refer to a facility contained within a physical border (e.g., a fence or wall) that contains one or more autotransformers. *Id.* According to NERC, the term "Transmission station," as used in Reliability Standard CIP-014-1, refers to a facility that functions as a switching station or switchyard but does not contain autotransformers. *Id.* at 18-19.

4.1.1.4, and to transmission operators. NERC states that the transmission facilities covered by Applicability Sections 4.1.1.1 through 4.1.1.4 match the "Medium Impact" transmission facilities listed in Attachment 1 (Impact Rating Criteria), specifically, the "Medium Impact" facilities described in Sections 2.4, 2.5, 2.6, and 2.7, of Reliability Standard CIP-002-5.1,[11] According to NERC, the "standard drafting team determined that using the criteria for 'Medium Impact' Transmission Facilities set forth in Reliability Standard CIP-002-5.1 is an appropriate applicability threshold as the Commission has acknowledged that it is a technically sound basis for identifying Transmission Facilities, which, if compromised, would present an elevated risk to the Bulk-Power System."[12]

10. Reliability Standard CIP-014-1 has six requirements. Requirement R1 requires applicable transmission owners to perform risk assessments on a periodic basis to identify their transmission stations and transmission substations that, if rendered inoperable or damaged, could result in widespread instability, uncontrolled separation, or cascading within an Interconnection. Requirement R1 also requires transmission owners to identify the primary control center that operationally controls each of the identified transmission stations or transmission substations.

11. Requirement R2 requires that each applicable transmission owner have an unaffiliated third party with appropriate experience verify the risk assessment performed

[11] *Id.* at 25 (citing Reliability Standard CIP-002-5.1 (Cyber Security — BES Cyber System Categorization), Attachment 1 (Impact Rating Criteria)).

[12] *Id.*

under Requirement R1. Requirement R2 states that the transmission owner must either modify its identification of facilities consistent with the verifier's recommendation or document the technical basis for not doing so. In addition, Requirement R2 requires each transmission owner to implement procedures for protecting sensitive or confidential information made available to third-party verifiers or developed under the Reliability Standard from public disclosure.

12. Requirement R3 requires the transmission owner to notify a transmission operator that operationally controls a primary control center identified under Requirement R1 of such identification to ensure that the transmission operator has notice of the identification so that it may timely fulfill its obligations under Requirements R4 and R5 to protect the primary control center.

13. Requirement R4 requires each applicable transmission owner and transmission operator to conduct an evaluation of the potential threats and vulnerabilities of a physical attack on each of its respective transmission stations, transmission substations, and primary control centers identified as critical in Requirement R1.

14. Requirement R5 requires each transmission owner and transmission operator to develop and implement documented physical security plans that cover each of their respective transmission stations, transmission substations, and primary control centers identified as critical in Requirement R1.

15. Requirement R6 requires that each transmission owner and transmission operator subject to Requirements R4 and R5 have an unaffiliated third party with appropriate experience review its Requirement R4 evaluation and Requirement R5 security plan.

Requirement R6 states that the transmission owner or transmission operator must either modify its evaluation and security plan consistent with the recommendation, if any, of the reviewer or document its reasons for not doing so. In addition, Requirement R6 requires each transmission owner to implement procedures for protecting sensitive or confidential information made available to third-party reviewers or developed under the Reliability Standard from public disclosure.

D. Notice of Proposed Rulemaking

16. On July 17, 2014, the Commission issued a Notice of Proposed Rulemaking proposing to approve Reliability Standard CIP-014-1 as just, reasonable, not unduly discriminatory or preferential, and in the public interest.[13] In addition, the NOPR proposed to direct NERC to develop two modifications to the Reliability Standard. First, the NOPR proposed to direct NERC to develop a modification to allow applicable governmental authorities (i.e., the Commission and any other appropriate federal or provincial authorities) to add or subtract facilities from an applicable entity's list of critical facilities under Requirement R1.[14] Second, the NOPR proposed to direct NERC to modify the Reliability Standard to remove the term "widespread" as it appears in the phrase "widespread instability" in Requirement R1.[15] The NOPR also proposed to direct

[13] *Physical Security Reliability Standard*, Notice of Proposed Rulemaking, 79 Fed. Reg. 42,734 (July 23, 2014), 148 FERC ¶ 61,040 (2014) (NOPR).

[14] *Id.* P 23.

[15] *Id.* P 29.

NERC to submit two informational filings, one addressing the protection of "High Impact" control centers and the other addressing resiliency measures, to be submitted, respectively, within six months and one year following the effective date of a final rule in this proceeding.[16]

17. In response to the NOPR, the Commission received 33 sets of initial comments and six sets of reply comments. We address below the issues raised in the NOPR and comments. The Appendix to this final rule lists the entities that filed comments in response to the NOPR.

II. Discussion

18. Pursuant to FPA section 215(d)(2), we approve Reliability Standard CIP-014-1 as just, reasonable, not unduly discriminatory or preferential, and in the public interest. The Commission also approves the associated violation risk factors, violation severity levels, implementation plan, and effective date proposed by NERC (i.e., the "first day of the first calendar quarter that is six months beyond" the effective date of the final rule in this proceeding).[17] As discussed below, the Commission determines that Reliability Standard CIP-014-1 satisfies the directives in the March 7 Order concerning the development and submittal of physical security Reliability Standards.

[16] *Id.* PP 35, 57.

[17] NERC Petition, Exhibit B (Implementation Plan) at 1.

19. In addition to approving Reliability Standard CIP-014-1, the Commission adopts in part the NOPR proposal directing NERC to develop and submit modifications to the Reliability Standard concerning the use of the term "widespread" in Requirement R1. The Commission determines that the term "widespread" is unclear with respect to the obligations it imposes on applicable entities; how it would be implemented by applicable entities; and how it would be enforced. Accordingly, the Commission directs NERC, pursuant to FPA section 215(d)(5), to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. We direct that NERC submit a responsive modification within six months from the effective date of this final rule.

20. The Commission does not adopt the NOPR proposal that would have required NERC to develop and submit modifications to Reliability Standard CIP-014-1 to allow applicable governmental authorities (i.e., the Commission and any other appropriate federal or provincial authorities) to add or subtract facilities from an applicable entity's list of critical facilities under Requirement R1. We determine that the Commission's enforcement authority under FPA section 215(e), and particularly the use of targeted auditing following implementation of Reliability Standard CIP-014-1, will allow us to address the concerns raised in the NOPR.

21. With respect to the informational filings proposed in the NOPR, the Commission adopts the proposal to direct NERC to make an informational filing addressing whether Reliability Standard CIP-014-1 provides physical security for all "High Impact" control centers, as that term is defined in Reliability Standard CIP-002-5.1, necessary for the

reliable operation of the Bulk-Power System. However, the Commission extends the deadline for that informational filing until two years following the effective date of Reliability Standard CIP-014-1. The Commission, at this time, does not adopt the NOPR proposal to direct NERC to make an informational filing addressing resiliency. Instead, the Commission will continue to consider ways for industry to best inform the Commission of its current and future resiliency efforts, which could take the form of reports and/or technical conferences to address specific areas of concern (e.g., spare parts, fuel security, and advanced technologies).

22. We address below the following issues raised in the NOPR and in the comments: (A) removal of the term "widespread"; (B) applicable governmental authorities' ability to add or subtract facilities from an entity's list of critical facilities; (C) informational filing on "High Impact" control centers; (D) informational filing on resiliency; (E) third-party verification and review; (F) exclusion of generators from the applicability section of Reliability Standard CIP-014-1; (G) confidentiality; (H) other issues raised in comments; (I) violation risk factors and violation severity levels; and (J) implementation plan and effective date.

A. Removal of the Term "Widespread"

March 7 Order

23. The March 7 Order stated that a critical facility is "one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System."[18]

NERC Petition

24. Reliability Standard CIP-014-1 states that its purpose is to "identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection."[19] Requirement R1 states that the "initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection."

NOPR

25. The NOPR proposed to direct NERC to modify Reliability Standard CIP-014-1 to remove the term "widespread" as it appears in the phrase "widespread instability." The

[18] March 7 Order, 146 FERC ¶ 61,166 at P 6.

[19] NERC Petition at 17.

NOPR stated that the phrase "widespread instability" is undefined by NERC and is inconsistent with the March 7 Order's explanation of "critical facility" and the definition of "reliable operation" in FPA section 215(a)(4).[20]

26. The NOPR stated that the use of "widespread instability" in Requirement R1 could, depending on the meaning of "widespread," narrow the scope (and number) of identified critical facilities under Reliability Standard CIP-014-1 beyond what was contemplated in the March 7 Order. The NOPR also stated that the use of the term "widespread" could potentially render the Reliability Standard unenforceable or lead to an inadequate level of reliability by omitting facilities that are critical to the reliable operation of the Bulk-Power System.

Comments

27. NERC comments that it does not oppose the NOPR directive but that the modification should be developed through NERC's standards development process and NERC should be allowed to propose alternative clarifying language "to ensure the proposed Reliability Standard remains focused on Interconnection impacts and not local

[20] "[A facility] that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System." March 7 Order, 146 FERC ¶ 61,166 at P 6; 16 U.S.C. 824o(a)(4) ("The term 'reliable operation' means operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.").

impacts."[21] NERC states that the term "widespread" was used to focus applicable entities' security efforts on facilities whose loss would have more than a local area impact.

28. SIA, Idaho Power, Pa PUC, SmartSenseCom, Foundation and Pepco support the NOPR proposal because they believe that the term "widespread" is vague or inconsistent with the definition of "reliable operation" in FPA section 215.[22] Pepco, for example, states that the term "widespread" is ambiguous, will require requests for clarification or interpretation and will expose applicable entities to "second-guessing" from auditors. KCP&L, while it does not state that it supports the proposal, acknowledges that the term "widespread" is vague and that the term "introduces interpretive language that may be problematic for compliance and enforcement interpretations as well as unintentionally narrow the scope of facilities."[23]

29. Other commenters do not support the proposed directive largely because they contend that the proposal may have the unintended consequence of expanding the scope of Reliability Standard CIP-014-1 to include localized events that have no impact on an

[21] NERC Comments at 19.

[22] *See* SIA Comments at 2; Idaho Power Comments at 2; Pa PUC Comments at 5; Pepco Comments at 4-5; SmartSenseCom Comments at 7-8; Foundation Reply Comments at 7.

[23] KCP&L Comments at 4.

Interconnection.[24] APS, SCE, SDG&E, and G&T Cooperatives also maintain that while the term "widespread" is not defined by NERC, it appears elsewhere in the Reliability Standards, including in NERC's definition of "Cascading" and in the TPL Reliability Standards, and is understood by industry. Associations also state that the Commission should withdraw the NOPR proposal; however, Associations state that, in the alternative, the Commission should clarify that removal of the term "widespread" is not intended to bring within the scope of Reliability Standard CIP-014-1 "a substation or station unless the applicable Transmission Owner determines through technical studies and analyses that include the application of engineering judgment and practice that the loss of such facility would have a critical impact on the operation of the [bulk electric system] in the event the asset is rendered inoperable or damaged."[25] NARUC states that the proposal will add costs without necessarily improving reliability.

30. ITC, while agreeing that the term "widespread" is not well-defined and would render the Reliability Standard vague, contends that the definition of critical facility in Requirement R1 should be replaced by defining as critical all physical facilities that

[24] *See* APS Comments at 3; SCE Comments at 3; SDG&E Comments at 4-5; TVA Comments at 9-10; Tallahassee Comments at 1; Oncor Comments at 3-4; Ohio PUC Comments at 4-5; BPA Comments at 3; NARUC Comments at 11; G&T Cooperatives Comments at 8-11; Southern Comments at 7-10.

[25] Associations Comments at 14-15; *see also* APS Comments at 3-4, Southern Comments at 11.

contain "High Impact" or "Medium Impact" BES Cyber Systems as those terms are defined in Reliability Standard CIP-002-5.1.

Commission Determination

31. The Commission adopts the NOPR proposal in part and directs NERC to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. The differing views expressed in the comments validate the concern raised in the NOPR that the meaning of the term "widespread" is unclear and subject to interpretation.

32. We stated in the March 7 Order that "the Reliability Standards that we are ordering today apply only to critical facilities that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System.[26] We affirm the March 7 Order's statement that "[m]ethodologies to determine these facilities should be based on objective analysis, technical expertise, and experienced judgment."[27]

33. However, incorporating the undefined term "widespread" in Reliability Standard CIP-014-1 introduces excessive uncertainty in identifying critical facilities under Requirement R1.[28] As the Commission stated in the March 7 Order, only an instability

[26] March 7 Order, 146 FERC ¶ 61,166 at P 6 n.5.

[27] *Id.* P 6.

[28] *See Version 5 Critical Infrastructure Protection Reliability Standards*, Order No. 791, 78 Fed. Reg. 72,755 (Dec. 3, 2013), 145 FERC ¶ 61,160, at P 67 (2013), *order*

(continued ...)

that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1. The March 7 Order did not intend to suggest that the physical security Reliability Standards should address facilities that do not have a "critical impact on the operation of the interconnection." This understanding is, we believe, unintentionally absent in Requirement R1 because the requirement only deems a facility critical when, if rendered inoperable or damaged, it could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The definition in Requirement R1 should not be dependent on how an applicable entity interprets the term "widespread" but instead should be modified to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1.

34. While some commenters contend that the meaning of the term "widespread" is well-understood by industry, we find that there is ample evidence in the record to support the conclusion that the term is susceptible to different interpretations by applicable entities. Notably, KCP&L states that, while it was a participant in the standards drafting process for Reliability Standard CIP-014-1, it agrees that the term requires interpretation. Moreover, KCP&L and Pepco share our concern that compliance enforcement authorities

---

granting clarification in part and denying rehearing, Order No. 791-A, 146 FERC ¶ 61,188 (2014) (directing removal or clarification "identify, assess and correct" language).

may find it difficult to consistently enforce compliance with Requirement R1 without a clear understanding of the term's meaning.

35. Accordingly, pursuant to FPA section 215(d)(5), the Commission directs NERC to develop a modification to Reliability Standard CIP-014-1 that either removes the term "widespread" from Requirement R1 or, in the alternative, proposes changes that address the Commission's concerns. Further, we direct that NERC submit a responsive modification within six months from the effective date of this final rule. We recognize that certain entities commented on how NERC could modify Reliability Standard CIP-014-1 to address the Commission's stated concerns.[29] However, we conclude that it is appropriate to allow NERC to develop and propose a modification in the first instance. With respect to ITC's more general comments regarding the scope of critical facilities in Requirement R1, we address the potential for applying the impact designations in Reliability Standard CIP-002-5.1 to Reliability Standard CIP-014-1, Requirement R1 in the section below regarding the NOPR's proposed informational filing on "High Impact" control centers.

[29] *See*, *e.g.*, BPA Comments at 2; Ohio PUC Comments at 5; TVA Comments at 9, ITC Comments at 9.

B. Applicable Governmental Authority's Ability to Add or Subtract Facilities from an Entity's List of Critical Facilities

March 7 Order

36. In the March 7 Order, the Commission stated that:

> [T]he risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. Such verification could be performed by NERC, the relevant Regional Entity, a Reliability Coordinator, or another entity. The Reliability Standards should include a procedure for the verifying entity, as well as the Commission, to add or remove facilities from an owner's or operator's list of critical facilities….[30]

NERC Petition

37. Reliability Standard CIP-014-1 does not include a procedure that allows the Commission to add or subtract facilities from an applicable entity's list of critical facilities under Requirement R1. Instead, NERC states that the Commission has the existing authority to enforce NERC Reliability Standards pursuant to FPA section 215(e)(3).[31] NERC explains that a transmission owner must be able to demonstrate that its method for performing its risk assessment under Requirement R1 "was technically sound and reasonably designed to identify its critical Transmission stations and Transmission substations."[32] NERC maintains that if "in the course of assessing an entity's compliance with the proposed Reliability Standard, NERC, a Regional Entity or

[30] March 7 Order, 146 FERC ¶ 61,166 at P 11.

[31] NERC Petition at 37.

[32] *Id.*

[the Commission] finds that the entity's transmission analysis was patently deficient and the Requirement R2 verification process did not cure those deficiencies, they could use their enforcement authority to compel Transmission Owners to re-perform the risk assessment using assumptions designed to identify the appropriate critical facilities."[33]

NOPR

38. The NOPR stated that Reliability Standard CIP-014-1 does not include a procedure that allows the Commission to add or subtract facilities from an applicable entity's list of critical facilities. The NOPR stated that if the Commission determined through an audit of an applicable entity, or through some other means, that a critical facility does not appear on the entity's list of critical facilities, there is no provision in Reliability Standard CIP-014-1 to allow the Commission to require its inclusion. In the NOPR, the Commission proposed to direct NERC to modify the physical security Reliability Standard to "include a procedure that would allow applicable governmental authorities, i.e., the Commission and any other appropriate federal or provincial authorities, to add or subtract facilities from an applicable entity's list of critical facilities."[34]

[33] *Id.*

[34] NOPR, 148 FERC ¶ 61,040 at P 23.

Comments

39. NERC asserts that the Commission should not adopt the NOPR proposal. NERC maintains that the proposal is unnecessary because it duplicates existing Commission compliance monitoring and enforcement authority.[35] Moreover, NERC contends that the NOPR's concerns surrounding the use of existing compliance and enforcement methods to ensure compliance with Requirement R1 are unsubstantiated. NERC states that if the NOPR proposal is adopted, then the Commission must better justify the reasons for the directive and limit and clarify the scope and content of the proposed directive.

40. Pa PUC, Foundation, SmartSenseCom and Paschall state that they support the NOPR proposal.[36] Other commenters do not oppose the proposal but maintain that it should be clarified or modified if adopted by the Commission.[37]

41. The majority of commenters do not support the NOPR proposal for various legal and policy reasons.[38] Associations' comments are representative of this viewpoint in that

[35] NERC Comments at 8 ("the Commission can use its broad enforcement authority to make certain that the applicable entity re-performs the risk assessment on whatever timeline the Commission deems appropriate or face penalties or sanctions under the FPA").

[36] Pa PUC Comments at 5; Foundation Comments at 3; SmartSenseCom Comments at 6; Paschall Comments at 2.

(continued ...)

they address: (1) the statutory authority to modify critical facility lists or otherwise allow the Commission (or any other governmental authority) an operational role in the performance of a Reliability Standard; (2) how the Commission would afford entities due process in determining whether to direct the addition or removal of facilities while still maintaining confidentiality; and (3) what constitutes "any other appropriate federal or provincial authorities" and the legal authority and advisability of delegating responsibility to another government entity. Like NERC, Associations contend that the Commission already possesses the compliance and enforcement authority to ensure that applicable entities comply with Requirement R1.[39] Specifically, Associations state that the "Commission has sufficient existing enforcement authority under the FPA to take actions to address concerns raised in the NOPR regarding the sufficiency of decisions made to identify critical facilities under CIP-014-1 … includ[ing] the use of traditional enforcement authority under Section 215(e)(3), including audits and investigations,

[39] Associations Comments at 9; *see also* TAPS Comments at 5 ("If the Commission finds a Registered Entity's risk assessment study to be inadequate because it lacks a critical facility, the Registered Entity will be in violation of [Requirement] R1 of the Physical Security standard … [t]he Commission could then direct a specific method of compliance … and impose daily penalties until the Registered Entity complies. If despite the threat of penalties, the Commission were concerned about the need for timely action, it could order the Registered Entity to come into compliance within a specified reasonable timeframe.").

which it has used on several occasions."[40] Associations also request a technical conference in two years that addresses the implementation of Reliability Standard CIP-014-1.

Commission Determination

42. Based on our review of the comments, we determine not to adopt the NOPR proposal.

43. We are persuaded by commenters that the NOPR directive would present NERC, as the entity that would have to develop the proposed modification, and the Commission, which would have to approve any NERC proposal, with a number of substantial policy issues. Ultimately, we believe that the NOPR proposal would require NERC and the Commission to expend resources that could be better applied elsewhere.

44. The Commission, instead, will focus its resources on carrying out compliance and enforcement activities to ensure that critical facilities are identified under Requirement R1. In its comments, NERC indicated that NERC staff will submit to the NERC Board of Trustees a report three months following implementation of Requirements R1, R2 and R3 concerning the scope of facilities identified as critical, including the number of facilities identified as critical and their defining characteristics.[41] NERC also committed

[40] Associations Comments at 9.

[41] NERC Comment at 27-28. NERC's post-implementation reports are further discussed below.

to sending this report to Commission staff.[42] Based on the results reported by NERC, we expect Commission staff to audit a representative number of applicable entities to ensure compliance with Reliability Standard CIP-014-1. Depending on the audit findings, the Commission will determine if there is a need for any further action by the Commission including, but not limited to, directing NERC to develop modifications to Reliability Standard CIP-014-1 to provide greater specificity to the methodology for determining critical facilities. At this time, we will not direct Commission staff to convene a technical conference on implementation of Reliability Standard CIP-014-1 in two-years' time, as requested by Associations. We may revisit that proposal at a later time.

C. Informational Filing on "High Impact" Control Centers

March 7 Order

45. The March 7 Order stated that a "critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System."[43] The March 7 Order, while not mandating that a minimum number of facilities be deemed critical under the physical security Reliability Standards, explained that the "Commission

[42] *Id.* at 28.

[43] March 7 Order, 146 FERC ¶ 61,166 at P 6.

expects that critical facilities generally will include, but not be limited to, critical substations and critical control centers."[44]

NERC Petition

46. NERC states that Reliability Standard CIP-014-1 addresses the protection of primary control centers, which NERC defines as facilities that "operationally control[] a Transmission station or Transmission substation when the electronic actions from the control center can cause direct physical actions at the identified Transmission station or Transmission substation, such as opening a breaker."[45]

47. NERC maintains that "[c]ontrol centers that provide back-up capability and control centers that cannot operationally control a critical Transmission station or Transmission substation do not present similar direct risks to Real-time operations if they are the target of a physical attack," and thus they are not covered by Reliability Standard CIP-014-1.[46] NERC explains that the destruction of a back-up control center would "have no direct reliability impact in Real-time as the entity can continue operation … from its primary control center."[47] With respect to control centers that do not physically operate Bulk-Power System facilities, such as control centers operated by reliability

[44] *Id.* P 6, n.6.

[45] NERC Petition at 19.

[46] *Id.*

[47] *Id.* at 20.

coordinators, NERC states that, while "certain monitoring and oversight capabilities might be lost as a result of a physical attack on such control centers, the Transmission Owner or Transmission Operator that operationally controls the critical Transmission station or Transmission substation would be able to continue operating its transmission system to prevent widespread instability, uncontrolled separation, or Cascading within an Interconnection."[48]

48. NERC acknowledges that certain control centers categorized as "High Impact" or "Medium Impact" under Reliability Standard CIP-002-5.1 (Cyber Security — BES Cyber System Categorization) would not be covered control centers under Reliability Standard CIP-014-1.[49] NERC explains that this situation:

> reflects the different nature of cyber security risks and physical security risks at control centers … [a] primary cyber security concern for control centers is the corruption of data or information and the potential for operators to take action based on corrupted data or information … [and] [t]his concern exists at control centers that operationally control Bulk-Power System facilities and those that do not. As such, there is no distinction in CIP-002-5.1 between these control centers … however, such a distinction is appropriate in the physical security context.[50]

49. NERC points out that Reliability Standard CIP-006-5 already requires physical security protections that are "designed to restrict physical access to locations containing

---

[48] *Id.* at 20-21.

[49] Reliability Standard CIP-002-5.1 (Cyber Security – BES Cyber System Categorization), Attachment 1 (Impact Rating Criteria).

[50] NERC Petition at 22 n.55.

High and Medium Impact Cyber Systems," which include control centers and backup control centers for reliability coordinators, balancing authorities, transmission operators and generation operators irrespective of their ability to operationally control Bulk-Power System facilities.[51]

NOPR

50. The NOPR proposed to direct NERC to make an informational filing within six months of the effective date of a final rule in this proceeding indicating whether the development of Reliability Standards that provide physical security for all "High Impact" control centers, as that term is defined in Reliability Standard CIP-002-5.1, is necessary for the reliable operation of the Bulk-Power System.

51. The NOPR stated that primary and back-up control centers of functional entities other than transmission owners and operators identified as "High Impact" may warrant assessment and physical security controls under this Reliability Standard because a successful attack could prevent or impair situational awareness, especially from a wide-area perspective, or could allow attackers to distribute misleading and potentially harmful data and operating instructions that could result in instability, uncontrolled separation, or cascading failures.

52. The NOPR stated that the proposed informational filing should address whether there is a need for consistent treatment of "High Impact" control centers for cybersecurity

[51] *Id.* at 21.

and physical security purposes through the development of Reliability Standards that afford physical protection to all "High Impact" control centers. The NOPR also stated that the development of physical security protections for all "High Impact" control centers would not be without precedent because, as noted above, Reliability Standard CIP-006-5 already requires that "High Impact" control centers have some physical protections, including restrictions on physical access, to protect BES Cyber Assets. However, the NOPR further stated that the security measures required by Reliability Standard CIP-006-5 may not be comparable to those required by Reliability Standard CIP-014-1, and thus may not be sufficient to "deter, detect, delay, assess, communicate, and respond to potential threats and vulnerabilities" as required in Requirement R5 of Reliability Standard CIP-014-1. Further, the NOPR stated that Reliability Standard CIP-006-5 does not require an "unaffiliated third party review" of the evaluation and security plan required by Reliability Standard CIP-014-1.

Comments

53. NERC states that it does not oppose submitting an informational filing to address whether "High Impact" control centers warrant assessment and physical security controls under Reliability Standard CIP-014-1. However, NERC requests that the Commission modify the NOPR proposal to give NERC at least 12 months from the effective date of a final rule in this proceeding to submit the informational filing.

54. Other commenters, while not necessarily agreeing that all "High Impact" control centers should be subject to Reliability Standard CIP-014-1, support the NOPR proposal for various reasons.[52] Associations state that the informational filing "will provide a more granular mapping of the strategic considerations embedded in the CIP standards … as well as consideration of the issues relating to control centers not covered by CIP-014-1."[53] MISO and SDG&E state that the informational filing could be a useful way for identifying areas of possible improvement in the future. Some commenters, including Associations, recommend that the Commission direct NERC to submit the informational filing as critical energy infrastructure information (CEII).

55. ITC supports the proposed informational filing but states that the Commission should widen the scope of the informational filing to assess the benefits of extending Reliability Standard CIP-014-1 to all "High Impact" and "Medium Impact" BES Cyber Assets. ITC states that the definition of "critical" assets is insufficiently comprehensive because it fails to provide physical security for facilities that contain crucial Cyber Assets. ITC further states that identifying critical facilities under Requirement R1 is unnecessary because applicable entities already have a list of facilities containing "High Impact" and "Medium Impact" Cyber Assets, which could also serve as the list of critical

[52] *See* Associations Comments at 16; KCP&L Comments at 4; Foundation Comments at 7; SDG&E Comments at 5; Pa PUC Comments at 6; SCE Comments at 4; MISO Comments at 6-7.

[53] Associations Comments at 16.

facilities for the purposes of Reliability Standard CIP-014-1. SIA agrees that Requirement R1 should be modified to include all "High Impact" control centers.

56. Commenters opposed to the NOPR proposal contend that the informational filing is unnecessary or would be burdensome.[54] Trade Associations state that Reliability Standard CIP-014-1 correctly focuses on the protection of primary control centers that operationally control transmission stations or substations identified under Requirement R1. Idaho Power states that Reliability Standard CIP-006-5 contains enough physical access controls to meet the expectations of "deter, detect, delay, assess, communicate, and respond" because there are extensive monitoring and alerting requirements that must be applied to all "High Impact" control centers. Reclamation states that Reliability Standard CIP-014-1 will capture all "High Impact" control centers as currently drafted. Pepco states that an informational filing would divert resources from implementation and compliance with Reliability Standard CIP-014-1.

Commission Determination

57. The Commission adopts the NOPR proposal and directs NERC to submit an informational filing that addresses whether there is a need for consistent treatment of "High Impact" control centers for cybersecurity and physical security purposes through the development of Reliability Standards that afford physical protection to all "High Impact" control centers. The Commission, however, modifies the NOPR proposal and

[54] Trade Associations Comments at 12; Pepco Comments at 7.

extends the due date for the informational filing to two years following the effective date of Reliability Standard CIP-014-1.

58. While we approve Reliability Standard CIP-014-1 in this final rule, including the Reliability Standard's treatment of control centers, the Commission, for the reasons set forth in the NOPR, finds that NERC should assess whether all "High Impact" control centers should be protected under Reliability Standard CIP-014-1.[55] We recognize that NERC and applicable entities will be in a better position to provide this assessment after implementation of Reliability Standard CIP-014-1 and Reliability Standard CIP-006-5, the latter of which provides some physical protection to "High Impact" control centers. Accordingly, the Commission directs NERC to submit the informational filing two years following the effective date of Reliability Standard CIP-014-1. The Commission, while not directing NERC to submit the informational filing as CEII, recognizes the concerns raised by commenters regarding confidentiality. The Commission expects NERC to prepare the informational filing and submit it in such a way as to protect any critical information from public disclosure.

59. At this time, the Commission will not direct NERC to address in the informational filing whether all "High Impact" and "Medium Impact" BES Cyber Assets should be considered critical for the purposes of Reliability Standard CIP-014, Requirement R1. We are sympathetic to several points raised in ITC's comments, which echo some of the

[55] *See* NOPR, 148 FERC ¶ 61,040 at PP 35-39.

statements in the NOPR. However, as stated in the NOPR, the basis for directing an informational filing regarding control centers is found in the March 7 Order, where the Commission stated that it "expects that critical facilities generally will include, but not be limited to, critical substations and critical control centers."[56] While NERC explained why not all "High Impact" control centers may be critical for the purposes of Reliability Standard CIP-014-1, we conclude that this issue requires close attention and should be addressed in the informational filing. The broader concerns raised by ITC regarding the scope of Requirement R1 can be evaluated by NERC and industry as part of the implementation process. As we noted above, the Commission will devote resources to compliance with and enforcement of Reliability Standard CIP-014-1 to ensure that all critical facilities are identified pursuant to Requirement R1. Should the Commission find through these efforts, or through the post-implementation reports and informational filing that NERC will submit, that Requirement R1 as currently written is not capturing all critical facilities, then the Commission will act upon that information.

D. Informational Filing on Resiliency

March 7 Order

60. In the March 7 Order, the Commission stated that the development of physical security Reliability Standards "will help provide for the resiliency and reliable operation of the Bulk-Power System. To that end, the proposed Reliability Standards should allow

[56] NOPR, 148 FERC ¶ 61,040 at P 44 (quoting March 7 Order, 146 FERC ¶ 61,166 at P 6 n.6).

owners or operators to consider resiliency of the grid in the risk assessment when identifying critical facilities, and the elements that make up those facilities, such as transformers that typically require significant time to repair or replace. As part of this process, owners or operators may consider elements of resiliency such as how the system is designed, operated, and maintained, and the sophistication of recovery plans and inventory management."[57]

NERC Petition

61. Reliability Standard CIP-014-1 mentions resiliency in Requirement R5, stating in Requirement R5.1 that the physical security plans that entities develop shall include, among other attributes: "Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4." The NERC petition describes Requirement R5.1, with regard to resiliency, as referring to "steps an entity may take that, while not specifically targeted as hardening the physical security of the site, help to decrease the potential adverse impact of a physical attack … including modifications to system topology or the construction of a new Transmission station … that would lessen the criticality of the facility."[58]

[57] March 7 Order, 146 FERC ¶ 61,166 at P 7.

[58] NERC Petition at 42.

NOPR

62. The NOPR stated that the NERC petition describes resiliency measures that could be included in the required physical security plans. The NOPR also stated, however, that specific resiliency measures are not required by Reliability Standard CIP-014-1, which is consistent with the March 7 Order. Instead, the NOPR noted that Reliability Standard CIP-014-1 allows the security plans to be flexible in order to meet different threats and protect varying Bulk-Power System configurations.

63. The NOPR stated that resiliency is as, or even more, important than physical security given that physical security cannot protect against all possible attacks. The NOPR also stated that, in the case of the loss of a substation, the Bulk-Power System may depend on resiliency to minimize the impact of the loss of facilities and restore blacked-out portions of the Bulk-Power System as quickly as possible. The NOPR further stated that some entities may implement resiliency measures rather than security measures, such as by adding facilities or operating procedures that reduce or eliminate the importance of existing critical facilities, which could significantly improve reliability and resiliency.

64. The NOPR stated that the NERC petition indicated that the NERC Board of Trustees expects NERC management to monitor and assess the implementation of Reliability Standard CIP-014-1 on an ongoing basis, which would include: the number of assets identified as critical under the Reliability Standard; the defining characteristics of the assets identified as critical; the scope of security plans (i.e., the types of security and resiliency measures contemplated under the various security plans); the timelines included in the security plan for implementing the security and resiliency measures; and

industry progress in implementing the Reliability Standard. The NOPR also stated that NERC explained that this information could be used to provide regular updates to Commission staff.[59] The NOPR proposed to rely on NERC's ongoing assessment of Reliability Standard CIP-014-1's implementation and to require NERC to make such information available to Commission staff upon request.

65. In addition, the NOPR proposed to direct NERC to submit an informational filing that addresses the resiliency of the Bulk-Power System when confronted with the loss of critical facilities. The NOPR stated that the informational filing should explore what steps can be taken, in addition to those required by Reliability Standard CIP-014-1, to maintain the reliable operation of the Bulk-Power System when faced with the loss or degradation of critical facilities. The NOPR proposed to direct NERC to submit the informational filing within one year after the effective date of the final rule in this proceeding.[60]

[59] NOPR, 148 FERC ¶ 61,040 at P 56.

[60] NERC issued a report on severe impact resilience in 2012. *See* NERC, Severe Impact Resilience: Considerations and Recommendations (May 2012), *available at* http://www.nerc.com/comm/OC/SIRTF%20Related%20Files%20DL/SIRTF_Final_May_9_2012-Board_Accepted.pdf. The NOPR stated that the proposed informational filing could draw on the report but should also reflect subsequent work and development on this topic, particularly including supply chain, transporting and other logistical issues for equipment such as large transformers. NOPR, 148 FERC ¶ 61,040 at P 57.

Comments

66. NERC requests that the Commission not direct it to submit an informational filing on resiliency. NERC contends that an informational filing on resiliency would divert resources from NERC's oversight of the implementation of Reliability Standard CIP-014-1 and NERC's efforts to assess the Reliability Standard's effectiveness. NERC states that it will monitor and assess implementation of Reliability Standard CIP-014-1, as described in NERC's petition, and will prepare two initial reports for the NERC Board of Trustees, the first report being submitted three months following implementation of Requirements R1, R2 and R3 and the second report being submitted three months after implementation of Requirements R4, R5 and R6. With respect to the second report, NERC states that "[g]iven the NOPR's discussion of resiliency, this report will pay particular attention to the resiliency measures included in entities' security plans."[61] NERC further states that it commits to provide both reports to Commission staff.

67. Pepco does not support the proposed informational filing because of the burden Pepco contends it would impose on NERC and registered entities, including diverting resources from the implementation of Reliability Standard CIP-014-1. Pepco asserts that resiliency is already addressed in Reliability Standard CIP-014-1.

[61] NERC Comments at 28.

68. SDG&E, MISO and Idaho Power support directing NERC to submit the proposed informational filing on resiliency as a way of determining next steps for enhancing the reliability of the Bulk-Power System.[62]

69. Other commenters, including Associations, while generally agreeing that the issue of resiliency needs to be considered, recommend that the Commission convene a technical conference rather than require NERC to submit an informational filing because, they maintain, a technical conference would be more effective.[63]

Commission Determination

70. The Commission determines not to adopt the NOPR proposal requiring NERC to submit an informational filing concerning resiliency of the Bulk-Power System. While commenters expressed differing views on whether an informational filing is needed, the comments recognized the importance of Bulk-Power System resiliency. In addition, NERC committed to providing the Commission with two reports following implementation of Reliability Standard CIP-014-1, which, NERC indicates, will address the issue of resiliency.

71. Rather than require NERC to submit an informational filing at this time, the Commission will review the NERC reports and will consider ways for industry to best

[62] *See* SDG&E Comments at 5; MISO Comments at 6-7; Idaho Power Comments at 4; *see also* Paschall Comments at 2.

[63] *See* Associations Comments at 17; KCP&L Comments at 6-7; SCE Comments at 4; Trade Associations Comments at 13-14; GridWise Comments at 3.

inform the Commission of its current and future resiliency efforts, which could take the form of reports and/or technical conferences to address specific areas of concern (e.g., spare parts, fuel security, and advanced technologies).

E. Third-Party Verification and Review

March 7 Order

72. In the March 7 Order, the Commission stated that "the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator ... [and] [s]imilarly, the determination of threats and vulnerabilities and the security plan should also be reviewed by NERC, the relevant Regional Entity, the Reliability Coordinator, or another entity with appropriate expertise."[64]

NERC Petition

73. Requirement R2 of Reliability Standard CIP-014-1 requires transmission owners to have their risk assessments verified by an unaffiliated third party. Requirement R6, likewise, requires each transmission owner and transmission operator to have their vulnerability and threat assessment(s) along with their security plan(s) for any critical facilities reviewed by an unaffiliated third party.

74. Regarding how an applicable entity is supposed to address any recommendations by a third-party verifier, Reliability Standard CIP-014-1, in Requirement R2.3, states that the transmission owner must either (a) "modify its identification … consistent with the

[64] March 7 Order, 146 FERC ¶ 61,166 at P 11.

recommendation" or (b) "document the technical basis for not modifying the identification in accordance with the recommendation." Similarly, Requirement R6.3 sets forth the procedure for considering any recommendations from the reviewing entity as to the threat assessments and security plans: the applicable entity must either (a) "modify its evaluation or security plan(s) consistent with the recommendation" or (b) "document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation."

75. NERC states that "[r]equiring documentation of the technical basis for not modifying the identification in accordance with the recommendation will help ensure that a Transmission Owner meaningfully considers the verifier's recommendations and follows those recommendations unless it can technically justify its reasons for not doing so. To comply with Part 2.3, the technical justification must be sound and based on acceptable approaches to conducting transmission analyses."[65] The NERC petition contains a similar explanation for the third-party review (Requirement R6) of the threat assessments and security plans mandated in Requirements R4 and R5.[66]

NOPR

76. The NOPR proposed to approve the third-party verification and review method proposed by NERC in Requirements R2 and R6. The NOPR stated that failure to provide

[65] NERC Petition at 36.

[66] *Id.* at 50.

a written, technically justifiable reason for rejecting a third-party recommendation would render the applicable entity non-compliant. With that understanding, the NOPR proposed to approve NERC's proposed third-party verification and review in Requirements R2 and R6 of Reliability Standard CIP-014-1 as an equally efficient and effective alternative to the directive in the March 7 Order.

Comments

77. NERC states that it supports the NOPR proposal. NERC states that third-party verification and review will provide another layer of expertise and independence to the identification of critical assets, the evaluation of threats and vulnerabilities, and the development of effective security plans. NERC reiterates that an applicable entity's failure to provide a reasonable, written explanation for declining to follow a third-party recommendation would constitute non-compliance.

78. MISO, Reclamation, KCP&L, ITC, and G&T Cooperatives support the NOPR proposal but each suggest modifications or request clarification of Reliability Standard CIP-014-1.[67]

79. MISO states that entities like itself, that are both reliability coordinators and planning coordinators, may be subject to substantial, simultaneous demands by many transmission owners for concurrent verification of risk assessments. MISO notes that Requirement R2.2 requires applicable entities to have their risk assessment verified

[67] *See also* Paschall Comments at 2; Foundation Comments at 7.

within 90 days of completion of the risk assessment. MISO states that firm adherence to the 90-day deadline could undermine the protections in Reliability Standard CIP-014-1 by requiring verifying entities (e.g., MISO) to conduct hurried or shorter-than-optimal assessments. Accordingly, MISO seeks clarification that NERC has the discretion to extend the implementation deadline, especially with respect to the 90-day verification deadline in Requirement R2.2. Likewise, G&T Cooperatives, NIPSCO and KCP&L state that there should be flexibility regarding the 90-day deadline because of the limited pool of qualified third-party verifiers.

80. Reclamation states that transmission owners should have discretion to make decisions regarding third-party recommendations based on cost and risk analyses. Reclamation also states that Requirement 2.1 should be modified to require that third-party verifications be conducted by a transmission owner's planning coordinator or transmission planner. If the transmission owner is also the planning coordinator and transmission planner, then Reclamation states that the verification should be conducted by the reliability coordinator.

81. KCP&L states that NERC should develop a pre-approved list of qualified third-party contractors or require third parties to register with NERC. KCP&L also seeks clarification that an independent system operator (ISO) or regional transmission operator (RTO) concurrent with its role as reliability coordinator could provide third-party review services. KCP&L states that it does not oppose having an RTO that is also a reliability coordinator or planning coordinator serve as a third-party reviewer but would not support

a mandate requiring a specific third-party reviewer. KCP&L also seeks clarification of the meaning of the phrase "unaffiliated third-party."

82. ITC states that the Commission should "confirm that the verification of a responsible entity's risk assessment, threat assessment, and security plan, as specified in Requirements R2 and R6, constitutes full compliance by that responsible entity with respect to the risk assessment and security plan."[68]

83. NIPSCO, TVA and Idaho Power do not support the NOPR proposal. NIPSCO contends that third-party verification is "inconsistent with the approach to entity self-assessment applied in other Reliability Standards" and notes that the Version 5 CIP Reliability Standards do not include a provision for third-party review.[69] NIPSCO also contends that the use of third parties could raise confidentiality concerns. Idaho Power maintains that the proposal should not be adopted because it does not require third parties to include a written or technical justification with their recommendations. Idaho Power also states that "if a third-party verification and review process is incorporated in to the Standard, it should clearly describe the specific methodology and performance criteria to be applied."[70] TVA states that FPA section 215 does not contemplate the use of third-party verifiers and reviewers acting in an enforcement role. TVA also contends that

[68] ITC Comments at 10.

[69] NIPSCO Comments at 2.

[70] Idaho Power Comments at 3-4.

Reliability Standard CIP-014-1 does not contain any qualification criteria that third-party verifiers and reviewers must meet. TVA further states that using third-party verifiers and reviewers could compromise the confidentiality of critical information.

Commission Determination

84. We adopt the NOPR proposal and approve the third-party verification and review provisions found in Requirements R2 and R6 of Reliability Standard CIP-014-1. These provisions, as stated by NERC, provide an important, independent layer of expertise in the identification, assessment and protection of critical facilities.

85. We disagree with the arguments raised in the comments submitted by NIPSCO, TVA and Idaho Power. The use of third-party verification and review in Reliability Standard CIP-014-1 is not inconsistent with other Commission-approved Reliability Standards merely because third-party review is not used in other Reliability Standards. NIPSCO is correct that the Version 5 CIP Reliability Standards do not include third-party review provisions. However, as NIPSCO acknowledges, the Version 5 CIP Reliability Standards contain bright-line criteria that guide the determinations made by applicable entities in identifying BES Cyber Assets.[71] By contrast, Reliability Standard CIP-014-1 contains no such criteria and instead requires applicable entities to develop their own

[71] We also note that in Order No. 706, the Commission directed NERC to develop an external review procedure for the identification of critical assets by responsible entities. *See Mandatory Reliability Standards for Critical Infrastructure Protection*, Order No. 706, 122 FERC ¶ 61,040, at PP 322-329, *order on reh'g*, Order No. 706-A, 123 FERC ¶ 61,174 (2008), *order on clarification*, Order No. 706-B, 126 FERC ¶ 61,229 (2009), *order on clarification*, Order No. 706-C, 127 FERC ¶ 61,273 (2009).

analysis. In addition, the threat evaluation in Requirement R4 and security plan in Requirement R6 involve areas of expertise that applicable entities in the electric industry may not possess and thus would strongly benefit from the experience of qualified third parties.

86. Similarly, we disagree with TVA that the use of third-party verifiers and reviewers is inconsistent with FPA section 215. As discussed above, we reject TVA's view that third-party verifiers and reviewers will be acting in an enforcement capacity. These third parties will have no authority to determine whether an applicable entity has violated a requirement of Reliability Standard CIP-014-1, require compliance, or issue penalties. Moreover, as stated in the NOPR, an applicable entity in some cases could be found to be in violation of a requirement even if the applicable entity's actions were verified by a third party.[72] We also determine that the requirements in Reliability Standard CIP-014-1 (i.e., Requirements R2.1 and R6.1) establishing the qualifications for third-party verifiers and reviewers are sufficient. As discussed below, as Reliability Standard CIP-014-1 is implemented, we are satisfied that NERC and Regional Entities will provide additional assistance to applicable entities to identify qualified third-party verifiers and reviewers if the need arises. We are also satisfied that Requirements R2.4 and R6.4 provide adequate protection against the disclosure of sensitive or confidential information.

[72] NOPR, 148 FERC ¶ 61,040 at P 23.

87. In response to Idaho Power's concern, we expect that third-party verifiers and reviewers will articulate a reasonable basis for their recommendations. The absence of such a basis for a recommendation could justify an applicable entity's decision to decline to adopt the recommendation. We also see no reason to include in Reliability Standard CIP-014-1 "specific methodology and performance criteria" for third-party verification and review beyond what is already contained in the requirements and compliance measures recited in the Reliability Standard.

88. With respect to the other comments, there is no evidence in the record to support the conclusion that an insufficient number of qualified third-party verifiers and reviewers exists such that applicable entities will be unable to meet the 90-day deadline in Requirements R2 and R6. To the extent an applicable entity requires additional time to comply, that situation should be addressed on a case-by-case basis.[73] Reclamation has not explained why Requirement R2.1 should be modified to require that a transmission owner use its planning coordinator or transmission planner as a verifier, and thus we reject that proposal. In addition, addressing Reclamation's second point, while risk and cost could be aspects of an applicable entity's technical justification for declining to follow a third-party recommendation, ultimately there must be a sufficient objective basis

[73] For similar reasons, we reject Entergy's suggestion that Reliability Standard CIP-014-1 include language providing for flexibility concerning delays in compliance with deadlines contained in the Reliability Standard due to acts of nature. *See* Entergy Comments at 1.

in the justification document from which to determine that the applicable entity acted reasonably in declining to follow the recommendation.

89. With respect to KCP&L's comments, there may be value in NERC developing a list of qualified third-party verifiers and reviewers or otherwise requiring some form of registration process for third-party verifiers and reviewers. The Commission, however, will not direct NERC to do so at this time. We expect that NERC could, as Reliability Standard CIP-014-1 is implemented, pursue or, if necessary, propose such an effort if warranted. Indeed, Reliability Standard CIP-014-1 appears to contemplate such a role for NERC by indicating in Requirement R6.1 that an entity is qualified to serve as a reviewer if "approved by the ERO." In addition, we see no reason why an ISO or RTO could not serve as a third-party verifier or reviewer provided it satisfies the qualifications stated in Requirements R2.1 and R6.1. We also conclude that the term "unaffiliated third party" is sufficiently clear. As NERC stated in its petition, "the term 'unaffiliated' means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying entity cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit."[74] KCP&L does not indicate what, in this explanation, is ambiguous or requires clarification.

[74] NERC Petition at 34-35.

90. With respect to ITC's comment, third-party verification under Requirement R2 adds an important layer of expertise and independence in the identification of critical facilities. However, verification under Requirement R2 is not intended to and, indeed, cannot cure an applicable entity's failure to comply with Requirement R1 if it is determined by the compliance enforcement authority that the applicable entity failed to do so, a situation that ITC concedes could happen.[75] We anticipate that a properly verified critical facility list will normally result in compliance with Requirement R1, but the Commission cannot foreclose the possibility that that may not be the case.[76]

F. Generators

March 7 Order

91. The March 7 Order did not direct NERC to make the physical security Reliability Standards applicable to specific functional entity types. The March 7 Order stated that "some of the requirements imposed by these newly proposed Reliability Standards may

[75] ITC Comments at 9 ("ITC further doesn't disagree that, in extremely dire circumstances, a risk assessment which has been verified by a third-party may nonetheless be so deficient (and the third-party review be similarly inadequate) that it could be considered non-compliant."); *see also* NERC Petition at 37 ("If, in the course of assessing an entity's compliance with the proposed Reliability Standard, NERC, a Regional Entity, or FERC finds that the entity's transmission analysis was patently deficient and that the Requirement R2 verification process did not cure those deficiencies, they could use their enforcement authority to compel Transmission Owners to re-perform the risk assessment using assumptions designed to identify the appropriate critical facilities.").

[76] *See* Order No. 706, 122 FERC ¶ 61,040 at P 320 (denying "safe harbor" for good faith compliance with CIP Reliability Standards).

best be performed by the owner and other activity may best be performed by the operator," and that NERC should clearly indicate which entity is responsible for each requirement.[77] With regard to the applicable types of facilities, the Commission stated that it "is not requiring NERC to adopt a specific type of risk assessment, nor is the Commission requiring that a mandatory number of facilities be identified as critical facilities under the Reliability Standards."[78]

NERC Petition

92. In explaining why the Reliability Standard does not include generator owners and generator operators as applicable entities, the standard drafting team found that:

> it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2 … Second, the transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the [March 7] order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities.[79]

[77] March 7 Order, 146 FERC ¶ 61,166 at P 6, n.4.

[78] *Id.* P 6.

[79] NERC Petition, Exhibit A (Proposed Reliability Standard) at 23. The standard drafting team provided the following example: "a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500 kV or greater or if

(continued ...)

93. NERC explains that generator owners and generator operators were not included in the applicability section because, "while the loss of a generator facility due to a physical attack may have local reliability effects, the loss of the facility is unlikely to have the widespread, uncontrollable impact" contemplated for loss of a critical facility in the March 7 Order.[80] NERC maintains that a "generation facility does not have the same critical functionality as certain Transmission stations and Transmission substations due to the limited size of generating plants, the availability of other generation capacity connected to the grid, and planned resilience of the transmission system to react to the loss of a generation facility."[81]

NOPR

94. The NOPR proposed to approve the applicability section of the Reliability Standard CIP-014-1 without the inclusion of generator owners and generator operators. The NOPR stated that omitting generator owners and generator operators from the applicability section is consistent with the March 7 Order. The NOPR affirmed the statement in the March 7 Order that the "number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power

---

it is connected at 200 kV – 499 kV to three or more other Transmission stations or Transmission substations and has an 'aggregate weighted value' exceeding 3000 according to the table in Applicability Section 4.1.1.2." *Id.* at 23.

[80] NERC Petition at 22.

[81] *Id.*

System."[82] The NOPR proposed to accept NERC's justification for excluding generator owners and operators because it is in keeping with the March 7 Order's focus on protecting the most critical facilities. The NOPR stated that, according to NERC, a generation facility "does not have the same critical functionality as certain Transmission stations and Transmission substations due to the limited size of generating plants, the availability of other generation capacity connected to the grid, and planned resilience of the transmission system to react to the loss of a generation facility."[83] The NOPR also noted that Requirement R1 mandates a transmission analysis that accounts for transmission owner- or transmission operator-owned substations that connect generating stations to the Bulk-Power System with step-up transformers.

95. While proposing to accept the applicability section of the proposed Reliability Standard, the NOPR stated that NERC's proposed omission of generator owners and generator operators could potentially exempt substations owned or operated by generators. The NOPR sought comment on the potential reliability impact of excluding generator owned or operated substations.

Comments

96. NERC states that it supports the NOPR proposal to approve the applicability criteria in Reliability Standard CIP-014-1 without the inclusion of generator owners and

[82] NOPR, 148 FERC ¶ 61,040 at P 44 (quoting March 7 Order, 146 FERC ¶ 61,166 at P 12).

[83] NOPR, 148 FERC ¶ 61,040 at P 45 (quoting NERC Petition at 22).

generator operators. NERC, reiterating the justification in the NERC petition, states that the loss of a generation facility is unlikely to result in critical impacts on the Bulk-Power System.

97. Associations, Trade Associations, Reclamation, G&T Cooperatives, KCP&L, Idaho Power, and APS also support the NOPR proposal.[84] Associations' comments are representative of the comments supportive of the NOPR proposal in that Associations state that generation facilities will be considered in Reliability Standard CIP-014-1, even without generator owners and generator operators included in the applicability criteria, because all generators interconnected to applicable transmission stations or substations will be in included in the transmission analysis under applicability sections 4.1.1.1 and 4.1.1.2.

98. Paschall states, without elaboration, that generation facilities should be included within the scope of Reliability Standard CIP-014-1. Foundation comments that it supports Reliability Standard CIP-014-1, as modified in the NOPR, and also advocates for the inclusion of certain generation facilities in a second stage physical security Reliability Standard (discussed in Section H below).

[84] Associations Comments at 16-17; Trade Associations Comments at 12-13; Reclamation Comments at 1; G&T Cooperatives Comments at 13-14; KCP&L Comments at 5; Idaho Power Comments at 3; APS Comments at 4-5.

Commission Determination

99. We adopt the NOPR proposal and approve the applicability criteria in Reliability Standard CIP-014-1 without the inclusion of generator owners and generator operators. As the Commission stated in the NOPR, we agree with NERC that a generation facility "does not have the same critical functionality as certain Transmission stations and Transmission substations due to the limited size of generating plants, the availability of other generation capacity connected to the grid, and planned resilience of the transmission system to react to the loss of a generation facility."

100. Paschall provides a conclusory statement that generation facilities should be included in Reliability Standard CIP-014-1, but does not provide a rationale for this position. Thus, we find Paschall's comments unpersuasive.

G. Confidentiality

March 7 Order

101. The March 7 Order stated that:

> All three steps of compliance with the Reliability Standard described above could contain sensitive or confidential information that, if released to the public, could jeopardize the reliable operation of the Bulk-Power System. Guarding sensitive or confidential information is essential to protecting the public by discouraging attacks on critical infrastructure. Therefore, NERC should include in the Reliability Standards a procedure that will ensure confidential treatment of sensitive or confidential information but still allow for the Commission, NERC and the Regional Entities to review and inspect any information that is needed to ensure compliance with the Reliability Standards.[85]

[85] March 7 Order, 146 FERC ¶ 61,166 at P 10.

NERC Petition

102. Reliability Standard CIP-014-1 includes two requirements addressing the concerns over confidentiality. Requirements R2.2 and R6.4, which are substantially the same, state that "[e]ach Transmission Owner shall implement procedures, such as the use of non- disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party [verifier or reviewer] and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure."

Comments

103. Associations, GridWise, Duke, Seattle, ITC, and Trade Associations state that the Commission should explicitly address the issue of confidentiality in the final rule. Associations state that the Commission should state that any data produced or collected by an RTO in accordance with a requirement of Reliability Standard CIP-014-1 are protected and should not be made available to a market monitor pursuant to a RTO tariff or market monitor agreement. Associations state that, at a minimum, a market monitor should have to make a filing with the Commission explaining the need for such information and indicating how the market monitor would protect such information from disclosure. GridWise and ITC state that they share Associations' concerns regarding confidentiality.

104. Trade Associations and Seattle comment that the final rule should contain an explicit statement that Reliability Standard CIP-014-1 is intended to preempt any state or local public disclosure laws. SWTDUG's reply comments question the Commission's

legal authority to preempt state or local public disclosure laws, as suggested by Trade Associations and Seattle, without further Congressional action.

105. Duke comments that the Commission should take all necessary steps to protect the confidential information related to the activities of applicable entities, the Commission, NERC and Regional Entities in performance of their obligations under Reliability Standard CIP-014-1. Duke states that, pursuant to the Commission's regulations, the "disposition of each violation or alleged violation that relates to a Cybersecurity Incident or that would jeopardize the security of the Bulk-Power System if publicly disclosed shall be nonpublic unless the Commission directs otherwise."[86] Duke recommends interpreting this provision to include violations of Reliability Standard CIP-014-1 or to revise the regulation to do so. Duke also maintains that: (1) the risk assessment required under Requirement R1; (2) the third-party verification performed under Requirement R2; (3) the notification provided to transmission operators under Requirement R3; (4) the evaluation of threats and vulnerabilities performed under Requirement R4; (5) the development of physical security plans performed under Requirement R5; and (6) the third-party review performed under Requirement R6 all qualify as CEII. In addition, Duke states that this information is also exempt from the Freedom of Information Act under the (b)(4) exemption for "trade secrets and commercial or financial information obtained from a person and privileged or confidential."

[86] 18 CFR 39.7(b)(4).

Commission Determination

106. In the March 7 Order, the Commission recognized that compliance with the contemplated physical security Reliability Standards would likely require the development or sharing of confidential or sensitive material that, if disclosed to the public, could jeopardize the reliable operation of the Bulk-Power System. As a result, the Commission directed NERC to include adequate procedures in the Reliability Standards to prevent the dissemination of confidential or sensitive information.

107. We find that NERC has included sufficient safeguards in Reliability Standard CIP-014-1 to ensure that confidential or sensitive information produced in compliance with the Reliability Standard will not be publicly disclosed. Reliability Standard CIP-014-1 includes requirements regarding the sharing of information between applicable entities and third-party verifiers and reviewers in Requirements R2.4 and R6.4. Moreover, the "Compliance" section of Reliability Standard CIP-014-1 provides: "Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities."

108. The Commission will take all necessary and appropriate steps, as provided for in our governing statutes and regulations, to preserve an applicable entity's confidential or sensitive information when the public disclosure of such information could jeopardize the reliable operation of the Bulk-Power System. However, we decline to address in this final rule issues of preemption or the specific mechanism for treating confidential or sensitive information. Moreover, we find that it would be inappropriate to address

Associations' request concerning the disclosure of information related to compliance with Reliability Standard CIP-014-1 to market monitors pursuant to a market monitor agreement or RTO tariff. No such agreements or tariffs are before us in this rulemaking proceeding.

H. Other Issues

109. Entergy seeks clarification as to whether the requirement in Reliability Standard CIP-014-1, Requirement R5 that an applicable entity "shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) . . . [and] shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s)" means that the actions called for in the security plan must be completed within 120 days. We see no ambiguity in Requirement R5 as the requirement only states that the security plan, not the actions called for in the plan, must be developed within 120 calendar days.

110. Reclamation proposes that the term "risk assessment" in Requirement R1 of Reliability Standard CIP-014-1 be changed to "impact assessment" because the requirement contemplates an assessment on the impact of the loss of facilities on the stability of the bulk electric system rather than a "risk assessment." Reclamation further states that, based on the generally accepted meaning of the term "risk assessment," that term better correlates to Requirement R4. We see no practical reason to require NERC to modify the nomenclature used in Requirement R1. Similarly, we see no reason to require NERC to change "risk assessment" to "threat risk assessment," as suggested by Paschall,

or to require NERC to define "risk assessment" because the term is largely defined in Requirement R1.

111. Foundation recommends that the Commission direct NERC to begin development of a second phase physical security Reliability Standard. Foundation maintains that such a Reliability Standard would address deficiencies in Reliability Standard CIP-014-1, including the exclusion of generation facilities and certain control centers. For example, Foundation maintains that the loss of a single generation facility could cause cascading outages on the Bulk-Power System. However, for the reasons discussed in Sections C and F above, we are not persuaded that there is a sufficient factual basis at this time to direct NERC to develop a second phase physical security Reliability Standard. While we decline to direct NERC to develop a second phase physical security Reliability Standard at this time, the informational filing on "High Impact" control centers required in this final rule, the post-implementation reports that NERC has committed to provide to the Commission, the Commission's compliance and enforcement efforts, and other outreach with NERC, industry and the public, will inform the Commission's views going forward as to what additional steps, if any, might be required to help ensure the reliable operation of the Bulk-Power System in the face of physical security threats.

I. Violation Risk Factors and Violation Severity Levels

112. Each requirement of Reliability Standard CIP-014-1 includes one violation risk factor and has an associated set of at least one violation severity level. The ranges of penalties for violations will be based on the sanctions table and supporting penalty determination process described in the Commission-approved NERC Sanction

Guidelines, according to the NERC petition. The NOPR proposed to approve the violation risk factors and violation severity levels for the requirements in Reliability Standard CIP-014-1 consistent with the Commission's established guidelines.[87] The Commission did not receive any comments regarding this aspect of the NOPR. Accordingly, the Commission approves the violation risk factors and violation severity levels for the requirements in Reliability Standard CIP-014-1.

J. Implementation Plan and Effective Date

NERC Petition

113. The NERC petition proposes that Reliability Standard CIP-014-1 become effective the "first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities" (i.e., the effective date of a final rule in this proceeding approving the proposed Reliability Standard).[88] NERC states that the initial risk assessment required under Requirement R1 must be completed by or

[87] *North American Electric Reliability Corp.*, 135 FERC ¶ 61,166 (2011).

[88] NERC Petition, Exhibit B (Implementation Plan) at 1. Exhibit B also delineates the completion timelines for Requirements R2 through R6. Parts 2.1, 2.2, and 2.4 of Requirement R2 shall be completed within 90 calendar days of the effective date of the Reliability Standard. Part 2.3 of Requirement R2 shall be completed within 60 calendar days of the completion of performance under Requirement R2 part 2.2. Requirement R3 shall be completed within 7 calendar days of completion of performance under Requirement R2. Requirements R4 and R5 shall be completed within 120 calendar days of completion of performance under Requirement R2. Parts 6.1, 6.2, and 6.4 of Requirement R6 shall be completed within 90 calendar days of completion of performance under Requirement R5. Part 6.3 of Requirement R6 shall be completed within 60 calendar days of Requirement R6 part 6.2.

before the effective date of the proposed Reliability Standard.[89] As described in the requirements of the Reliability Standard, NERC also identifies when Requirements R2, R3, R4, R5, and R6 must be complied with following the effective date of Reliability Standard CIP-014-1.

NOPR

114. The NOPR proposed to approve NERC's implementation plan and effective date for Reliability Standard CIP-014-1.

Comments

115. KCP&L states that the Commission should make it clear if the effective date of Reliability Standard CIP-014-1 will be earlier than April 2016, which KCP&L states is the effective date of Reliability Standard CIP-002-5. KCP&L states that the "basis for determination of criticality in CIP-014-1 references the same applicability as found in the CIP-002-5 … [and the] potential disconnect in implementation dates may impact registered entities adversely in preparations for Critical Infrastructure Protection standards or in application of physical security improvements given the work required to identify critical assets."[90]

[89] *Id.*

[90] KCP&L Comments at 7.

Commission Determination

116. We approve the implementation plan and effective date proposed by NERC for Reliability Standard CIP-014-1. In response to KCP&L's comment, we understand that, pursuant to the implementation plan and effective date proposed by NERC and approved herein, Reliability Standard CIP-014-1 will become effective before April 2016.

III. Information Collection Statement

117. The Paperwork Reduction Act (PRA)[91] requires each federal agency to seek and obtain Office of Management and Budget (OMB) approval before undertaking a collection of information directed to ten or more persons or contained in a rule of general applicability. OMB regulations require approval of certain information collection requirements imposed by agency rules.[92] Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of an agency rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

Comments

118. Associations state that developing a security plan will cost more than $19,000 per company and "should include a more realistic estimate of costs to comply with the

[91] 44 U.S.C. 3501-3520.

[92] *See* 5 CFR 1320.10.

proposed standard because of the influence that the Commission's assessment may have on the judgment of state utility commission or other regulatory authorities determining the prudence of costs incurred to comply with the proposed standard."[93] Associations also state "that it understands that one medium-sized investor-owned utility anticipates that third-party contract support will cost approximately $270,000 for conducting transmission studies under R1, third-party verification under R2, analyses of threats under R4, and support for security plan development under R5."[94] Associations further state that the Commission's estimate did not include the cost of implementing the actual security measures included in applicable entity security plan. KCP&L states that it supports Associations' comments.

Commission Determination

119. We adopt the Information Collection Statement estimates contained in the NOPR. As we have previously stated, the estimates provided in an Information Collection Statement are meant to quantify the paperwork burden imposed by a final rule.[95] The

[93] Associations Comments at 19.

[94] *Id.* at 19 n.19.

[95] As defined in the PRA, "the term ''burden'' means time, effort, or financial resources expended by persons to generate, maintain, or provide information to or for a Federal agency, including the resources expended for— (A) reviewing instructions; (B) acquiring, installing, and utilizing technology and systems; (C) adjusting the existing ways to comply with any previously applicable instructions and requirements; (D) searching data sources; (E) completing and reviewing the collection of information; and (F) transmitting, or otherwise disclosing the information."

Information Collection Statement is not intended to estimate the cost of compliance with the requirements of a Reliability Standard approved in a final rule.[96] Associations has not explained why it believes the Commission's paperwork burden estimate is not "realistic" or what would be a "realistic" figure other than to relate, in a footnote, that it understands that an unidentified medium-sized utility anticipates that compliance with requirements of Reliability Standard CIP-014-1, rather than the paperwork burden imposed by a final rule approving the Reliability Standard, will cost approximately $270,000. Associations' comments do not provide any creditable evidence or analysis to cause us to reevaluate the paperwork burden estimate contained in the NOPR. Accordingly, as set forth below, we adopt the NOPR's Information Collection Statement burden and cost estimates.

120. The Commission based its estimates on the number of respondents on the NERC compliance registry as of May 28, 2014. According to the registry, there are 357 transmission owners (TOs) and 197 transmission operators (TOPs). The NERC compliance registry also shows that there are only 19 transmission operators that are not also registered as a transmission owner.

121. The burden associated with the final rule is included in FERC-725U (Mandatory Reliability Standards: Reliability Standard CIP-014, OMB Control Number 1902-

[96] *Version 5 Critical Infrastructure Protection Reliability Standards*, Order No. 791, 78 Fed. Reg. 72,755 (Dec. 3, 2013), 145 FERC ¶ 61,160, at P 235 (2013), *order granting clarification in part and denying rehearing*, Order No. 791-A, 146 FERC ¶ 61,188 (2014).

.

0274).[97] The following table shows the Commission's burden and cost estimates, broken down by requirement and year:

FERC-725U					
Requirements in Reliability Standard CIP-014-1 over Years 1-3	**Number and Type of Respondents (1)**	**Number of Responses per Respondent (2)**	**Total Number of Responses (1)*(2)=(3)**	**Average Burden Hours & Cost Per Response[98] (4)**	**Total Burden Hours & Total Cost (3)*(4)**
Year 1					
R1	357 TOs	1	357	20 $1,220	7,140 $435,540
R2	357 TOs	1	357	34 $2,342	12,138 $836,094
R3	2 TOPs	1	2	1 $128	2 $256

[97] The requirement for NERC to make the informational filing is part of the responsibilities related to being the nation-wide Electric Reliability Organization. The burden related to that filing is part of FERC-725 (OMB Control Number 1902-0225).

[98] The estimates for cost per response are derived using the following formula: Average Burden Hours per Response * XX per Hour = Average Cost per Response.

The hourly cost figures are based on data for wages plus benefits from the Bureau of Labor Statistics (as of September 4, 2014) at http://www.bls.gov/oes/current/naics3_221 000.htm and http://www.bls.gov/news.release/ecec.nr0.htm. The figures are rounded for the purposes of calculations in this table and are:

- for electrical engineers: $60.87/hr., rounded to $61/hr.
- for attorneys: $128/hr.
- for administrative staff: $31.86/hr., rounded to $32/hr.

R4	30 TOs 2 TOPs	1	32	80 $4,880	2,560 $156,160
R5	30 TOs 2 TOPs	1	32	320 $19,520	10,240 $624,640
R6	30 TOs 2 TOPs	1	32	304 $18,812	9,728 $601,984
Record Retention	357 TOs 2 TOPs	1	359	2 $64	718 $22,976
Year 2					
Record Retention	357 TOs 2 TOPs	1	359	2 $64	718 $22,976
Year 3					
R1	30 TOs	1	30	20 $1,220	600 $36,600
R2	30 TOs	1	30	34 $2,342	1,029 $70,260
R3	2 TOPs	1	2	1 $128	2 $256
R4	30 TOs 2 TOPs	1	32	80 $4,880	2,560 $156,160
R5	30 TOs 2 TOPs	1	32	80 $4,880	2,560 $156,160
R6	30 TOs 2 TOPs	1	32	134 $8,442	4,288 $270,144
Record Retention	357 TOs 2 TOPs	1	359	2 $64	718 $22,976
Year 1 Total					42,526 $2,677,650
Year 2 Total					718 $22,976
Year 3 Total					11,748 $712,556
TOTAL (for Years 1-3)					**54,992** **$3,413,182**

122. In arriving at the figures in the above table, the Commission made the following assumptions:

a. Requirement R1: We assume that responsible entities will complete the required risk assessment at approximately the same time as they complete

the assessments required under the existing TPL Reliability Standards. Accordingly, the burden for Reliability Standard CIP-014-1 only represents the documentation required in addition to what entities currently prepare. Conservatively, we assume that in the first year all transmission owners and transmission operators will complete the required risk assessment.[99] In the third year, we assume that only 30 transmission operators will be required to do another risk assessment and that the entities with critical facilities after the first risk assessment will still have critical facilities after the second risk assessment.

b. Requirement R5: We assume that developing physical security plans in the first year will be more time consuming than in later years because in later years the plans will likely only need to be updated.

123. Title: FERC-725U, Mandatory Reliability Standards: Reliability Standard CIP-014-1.

Action: Proposed Collection of Information.

OMB Control No: 1902-0274.

Respondents: Business or other for profit, and not for profit institutions.

Frequency of Responses: Ongoing.

[99] While it is likely that only large transmission owners and transmission operators will have critical facilities under Requirement R1, the Commission's estimate includes all transmission owners and operators because reliable data on what percentage of large owners and operators control critical facilities is unavailable.

Necessity of the Information: Reliability Standard CIP-014-1 implements the Congressional mandate of the Energy Policy Act of 2005 to develop mandatory and enforceable Reliability Standards to better ensure the reliability of the nation's Bulk-Power System. Specifically, Reliability Standard CIP-014-1 ensures that applicable entities with critical Bulk-Power System facilities develop and implement physical security plans to address physical security threats and vulnerabilities that could result in widespread instability, uncontrolled separation, or cascading within an Interconnection. Internal review: The Commission has reviewed Reliability Standard CIP-014-1 and has determined that the Reliability Standard is necessary to ensure the reliability and integrity of the nation's Bulk-Power System.

124. Interested persons may obtain information on the reporting requirements by contacting: Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, Phone: (202) 502-8663, fax: (202) 273-0873]. Comments on the requirements of this rule may also be sent to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503 [Attention: Desk Officer for the Federal Energy Regulatory Commission]. For security reasons, comments should be sent by e-mail to OMB at oira_submission@omb.eop.gov. Comments submitted to OMB should refer to FERC-725U and OMB Control No. 1902-0274.

IV. Environmental Analysis

125. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect

on the human environment.[100] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[101] The actions here fall within this categorical exclusion in the Commission's regulations.

V. Regulatory Flexibility Act

126. The Regulatory Flexibility Act of 1980 (RFA)[102] generally requires a description and analysis of proposed rules that will have significant economic impact on a substantial number of small entities.

127. The Small Business Administration (SBA) revised its size standard (effective January 22, 2014) for electric utilities from a standard based on megawatt hours to a standard based on the number of employees, including affiliates.[103] Under SBA's new size standards, transmission owners and transmission operators likely come under the

[100] Order No. 486, *Regulations Implementing the National Environmental Policy Act of 1969*, 52 FR 47897 (Dec. 17, 1987), FERC Stats. & Regs. Regulations Preambles 1986-1990 ¶ 30,783 (1987).

[101] 18 CFR 380.4(a)(2)(ii).

[102] 5 U.S.C. 601-612.

[103] SBA Final Rule on "Small Business Size Standards: Utilities," 78 FR 77,343 (Dec. 23, 2013).

following category and associated size threshold: Electric bulk power transmission and control, at 500 employees.[104]

128. The NOPR stated that, based on U.S. economic census data, the approximate percentage of small firms in this category is 57 percent.[105] The NOPR also stated that the Commission did not have information concerning how the economic census data compares with entities registered with NERC and is unable to estimate the number of small transmission owners and transmission operators using the new SBA definition. However, the NOPR stated that Reliability Standard CIP-014-1 only applies to transmission owners and transmission operators that own and/or operate certain critical Bulk-Power System facilities. In the NOPR, the Commission stated that it believes that Reliability Standard CIP-014-1 will be applicable to a relatively small group of large entities. No comments were received addressing the Commission's proposed certification.[106]

---

[104] 13 CFR 121.201, Sector 22, Utilities.

[105] NOPR, 148 FERC ¶ 61,040 at P 70. Data and further information are available on the SBA website. *See* SBA Firm Size Data, *available at* http://www.sba.gov/advocacy/849/12162. Since issuance of the NOPR, the Commission has obtained data that enables us to estimate more closely the number of small entities affected by this final rule. We now estimate that 28 percent (or 103 out of the 359 entities) are small entities.

[106] To the extent that Associations' comments, which we addressed above in the Information Collection Statement section, were also directed to the Commission's proposed certification regarding the Regulatory Flexibility Act, Associations' comments do not dispute any of the assumptions underlying the proposed certification or contest the proposed certification itself.

129. Accordingly, the Commission certifies that Reliability Standard CIP-014-1 will not have a significant impact on a substantial number of small entities. Accordingly, no regulatory flexibility analysis is required.

VI. Document Availability

130. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington DC 20426.

131. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 40

[Docket No. RM14-10-000]

Real Power Balancing Control Performance Reliability Standard

(Issued November 20, 2014)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of Proposed Rulemaking.

SUMMARY: The Federal Energy Regulatory Commission proposes to approve Reliability Standard BAL-001-2 (Real Power Balancing Control Performance) and proposed new definitions submitted by the North American Electric Reliability Corporation (NERC). The proposed Reliability Standard is designed to ensure that applicable entities maintain system frequency within narrow bounds around a scheduled value. In addition, the Commission proposes that NERC submit an informational filing that would address the impact of the proposed Reliability Standard on inadvertent interchange and unscheduled power flows.

DATES: Comments are due [INSERT DATE 60 days after publication in the **FEDERAL REGISTER**].

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.
- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Real Power Balancing Control Performance Reliability Standard — Docket No. RM14-10-000

NOTICE OF PROPOSED RULEMAKING

(Issued November 20, 2014)

1. Under section 215 of the Federal Power Act (FPA),[1] the Commission proposes to approve Reliability Standard BAL-001-2 (Real Power Balancing Control Performance) that the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO), submitted for approval. The proposed Reliability Standard applies to balancing authorities and regulation reserve sharing groups, and is designed to maintain Interconnection frequency within predefined frequency limits. The Commission also proposes to approve the retirement of currently-effective Reliability Standard BAL-001-1 immediately prior to the effective date of BAL-001-2.

2. Further, the Commission proposes to approve NERC's four proposed definitions, associated violation risk factors and violation severity levels, implementation plan, and effective dates. The Commission also proposes that NERC submit an informational

[1] 16 U.S.C. 824(o) (2012).

filing that would address the impact of the proposed Reliability Standard on inadvertent interchange[2] and unscheduled power flows.[3]

I. Background

A. Mandatory Reliability Standards and Order No. 693 Directive

3. Section 215 of the FPA requires a Commission-certified Electric Reliability Organization (ERO) to develop mandatory and enforceable Reliability Standards that are subject to Commission review and approval. Specifically, the Commission may approve, by rule or order, a proposed Reliability Standard or modification to a Reliability Standard if it determines that the Standard is just, reasonable, not unduly discriminatory or preferential and in the public interest.[4] Once approved, the Reliability Standards may be enforced by NERC, subject to Commission oversight, or by the Commission independently.[5]

[2] NERC defines "Inadvertent Interchange" in the NERC Glossary of Terms Used in Reliability Standards (Glossary) as "[t]he difference between the Balancing Authority's Net Actual Interchange and Net Scheduled Interchange. ($I_A - I_S$)"

[3] "Unscheduled power flows" generally refers to the power flows that result from the law of physics that causes power from a given source to flow over all possible paths to its destination.

[4] 16 U.S.C. 824o(d)(2).

[5] 16 U.S.C. 824o(e).

4. Pursuant to section 215 of the FPA, the Commission established a process to select and certify an ERO,[6] and subsequently certified NERC.[7] On March 16, 2007, the Commission issued Order No. 693, approving 83 of the 107 Reliability Standards filed by NERC, including BAL-001-0 and a companion standard BAL-002-0.[8] When approving BAL-002-0, the Commission directed NERC "to modify this Reliability Standard to define a significant deviation and a reportable event, taking into account all events that have an impact on frequency, e.g., loss of supply, loss of load and significant scheduling problems, which can cause frequency disturbances and to address how balancing authorities should respond."[9]

B. Proposed Reliability Standard BAL-001-2

5. On April 2, 2014, NERC filed a petition (Petition) seeking approval of proposed Reliability Standard BAL-001-2, four new definitions to be added to the Glossary of Terms used in NERC Reliability Standards (NERC Glossary of Terms) and the

[7] *North American Electric Reliability Corp.*, 116 FERC ¶ 61,062, *order on reh'g and compliance*, 117 FERC ¶ 61,126 (2006), *aff'd sub nom. Alcoa, Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009).

[8] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007). The Commission approved Reliability Standard BAL-001-1 in an unpublished letter order, October 16, 2013 in Docket No. RD13-11-000.

[9] *Id.* P 355.

associated violation risk factors and violation severity levels, effective dates, and implementation plan.[10] NERC states that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest because it satisfies the factors set forth in Order No. 672, which the Commission applies when reviewing a proposed Reliability Standard.[11] Also, NERC asserts that proposed Reliability Standard BAL-001-2 addresses the Commission's Order No. 693 directive pertaining to BAL-002-0.

6. NERC proposes to revise Reliability Standard BAL-001-2 by replacing the Control Performance Standard 2 (CPS2) in currently-effective Requirement R2 with a new term, "Balancing Authority ACE Limit (BAAL)."[12] The Balancing Authority ACE Limit, unique for each balancing authority, contains dynamic limits as a function of Interconnection frequency and provides the basis for a balancing authority's obligation to balance its resources and demand in real-time so that its clock-minute average ACE does

[10] Proposed Reliability Standard BAL-001-2 is available on the Commission's eLibrary document retrieval system in Docket No. RM14-10-000 and on the NERC website, www.nerc.com.

[11] NERC Petition at 6 and Exhibit C (citing Order No. 672, FERC Stats. & Regs. ¶ 31,204 at PP 323-335, 444).

[12] Area Control Error (ACE) is the instantaneous difference between a Balancing Authority's Net Actual and Scheduled Interchange, taking into accounts the effects of Frequency Bias, correction for meter error, and Automatic Time Error Correction, if operating in that mode.

not exceed its Balancing Authority ACE Limit for more than 30 consecutive clock-minutes.[13]

7. Proposed Reliability Standard BAL-001-2 has two requirements and two attachments containing the mathematical equations for calculating the Control Performance Standard 1 (CPS1) in Requirement R1,[14] the Balancing Authority ACE Limit in Requirement R2, and associated measures. NERC states that the only proposed change to Requirement R1 is to move the equation and explanation of the individual components of CPS1 to Attachment 1. NERC explains that the proposed revisions to Requirement R1 "are administratively efficient and clarify the intent of the Requirement."[15] NERC states that the "underlying performance aspect" of Requirement R1 remains the same: "to measure how well a Balancing Authority is able to control its generation and load management programs, as measured by its ACE, to support its Interconnection's frequency over a rolling one-year period."[16]

8. Proposed Requirement R2 is new and replaces the existing Control Performance Standard 2 requirement. The current Reliability Standard BAL-001-1 Requirement R2 requires each balancing authority to operate such that for at least 90 percent of the ten-

[13] NERC Petition at 12.

[14] The "Responsible Entity" designated in proposed Reliability Standard BAL-001-2 Requirement R1 is the balancing authority and/or regulation reserve sharing groups.

[15] NERC Petition at 11.

[16] *Id.*

minute periods in a calendar month (using six non-overlapping periods per hour), the average area control error (ACE) must be within a specific limit, referred to as L_{10}.[17]

9. Requirement R2 of the proposed Reliability Standard BAL-001-2 states:

> Balancing Authority shall operate such that its clock-minute average of Reporting ACE does not exceed its clock-minute Balancing Authority ACE Limit (BAAL) for more than 30 consecutive clock-minutes, calculated in accordance with Attachment 2, for the applicable Interconnection in which the Balancing Authority operates.

10. NERC explains that the Balancing Authority ACE Limits are unique for each balancing authority and provide dynamic limits for the balancing authority's ACE value as a function of its Interconnection frequency.[18] NERC states that the proposed Reliability Standard is intended to enhance the reliability of each Interconnection by maintaining frequency within predefined limits under all conditions. Furthermore, NERC states that proposed Reliability Standard BAL-001-2 and accompanying definitions include the benefits of the Automatic Time Error Correction (ATEC) equation in the WECC-specific regional variance in Reliability Standard BAL-001-1.[19]

11. NERC also proposes violation risk factors and violation severity levels for each requirement of the proposed Reliability Standard and an implementation plan and

[18] NERC Supplemental Filing at 1.

[19] NERC Petition at 2.

effective dates. NERC states that these proposals were developed and reviewed for consistency with NERC and Commission guidelines.

12. NERC proposes an effective date for the proposed Reliability Standard that is the first day of the first calendar quarter that is twelve months after the date of Commission approval. NERC states that its proposed implementation date will allow entities to make any software adjustment that may be required to perform the Balancing Authority ACE Limit calculations.[20]

13. On May 9, 2014, NERC submitted a supplemental filing (Supplemental Filing) to address the status of the Commission directive in Order No. 693 pertaining to Reliability Standard BAL-002-0 and update the Commission regarding the status of a field trial undertaken for proposed Reliability Standard BAL-001-2.[21] In its Supplemental Filing, NERC reiterates the importance of the proposed revision establishing dynamic limits for a balancing authority's ACE as a function of the Interconnection frequency, stating that "[o]ne of the reliability benefits of the proposed Reliability Standard is that it allows Balancing Authorities to calculate their position within these boundaries on a real-time basis and take action to support reliability."[22] Further, NERC states that proposed Reliability Standard BAL-001-2 addresses the Commission's directive related to

[20] NERC Petition at 3.

[21] NERC Supplemental Filing at 1.

[22] *Id.* at 2.

BAL-002-0 "in an equally efficient and effective manner"[23] NERC adds that revisions to Reliability Standard BAL-002-1 are currently being developed and will complement proposed Reliability Standard BAL-001-2 that is the subject of the immediate proceeding.[24] Regarding the ongoing field trial, NERC stated that "the widespread participation of Balancing Authorities has provided insight into how the changes in proposed Reliability Standard BAL-001-2 will impact reliability."[25]

14. On July 31, 2014, NERC submitted an informational filing (Informational Filing) of its Preliminary Field Trial Report (Field Trial Report) evaluating the effects of proposed Reliability Standard BAL-001-2. NERC states that the Field Trial Report results to date demonstrate that the correlation between Requirements R1 and R2 of proposed Reliability Standard BAL-001-2 drive corrective actions to support Interconnection frequency and reliability.[26] NERC also states that the Balancing

[23] *Id.* at 3.

[24] The Commission notes that the currently-effective Reliability Standard BAL-002-1 requires balancing authorities to return its ACE to zero within 15 minutes following a reportable disturbance. However, the Field Trial Report does not provide any information whether compliance with Reliability Standard BAL-002-1 had any impact on the proposed Balancing Authority ACE Limits in Reliability Standard BAL-001-2. Any future modifications to BAL-002 should take this into consideration.

[25] NERC Supplemental Filing at 6, noting that 47 balancing authorities participated in the Field Trial Report: 16 in the Eastern Interconnection, 29 in the Western Interconnection, ERCOT and Quebec.

[26] NERC Field Trial Report at 1.

Authority ACE Limit, in conjunction with currently-effective Reliability Standard BAL-003-1 (Frequency Response and Frequency Bias Setting), satisfies the directive.[27]

II. Discussion

15. Pursuant to FPA section 215(d)(2), we propose to approve Reliability Standard BAL-001-2 as just, reasonable, not unduly discriminatory or preferential, and in the public interest. We propose to approve NERC's four proposed definitions, violation risk factor and violation severity level assignments, and the retirement of currently-effective BAL-001-1.[28] Likewise, we propose to approve NERC's implementation plan, in which NERC proposes an effective date of the first day of the first calendar quarter, twelve months after the date of Commission approval.[29]

16. The purpose of proposed Reliability Standard BAL-001-2 is to control Interconnection frequency within defined limits. Proposed Reliability Standard BAL-001-2 includes both long and short term performance measures for Interconnection frequency control by providing dynamic (i.e., real-time) limits that are specific for each balancing authority and Interconnection. By basing Balancing Authority ACE Limits on

[27] *Id.* at 14.

[28] NERC proposes four definitions for inclusion in the Glossary of Terms Used in NERC Reliability Standards: Regulation Reserve Sharing Group, Reserve Sharing Group Reporting ACE, Reporting ACE, and Interconnection. As stated in Exhibit G, Consideration of Comments at 13, "Regulation Reserve Sharing Group" would be added to the NERC Compliance Registry prior to implementation of the proposed standard.

[29] NERC Petition Exhibit B at 4.

pre-defined frequency trigger limits for each Interconnection, we believe the real-time measurements established in proposed Reliability Standard BAL-001-2 will help ensure the Interconnection frequency returns to a reliable state should a balancing authority's ACE, or the Interconnection's frequency, exceed acceptable bounds.

17. We agree with NERC's assertion that the Balancing Authority ACE Limit is a real-time measure of a balancing authority's required performance and encourages operation in support of the Interconnection frequency and drives corrective action back within predefined ACE limits when helpful for adjusting Interconnection frequency.[30]

18. Further, we believe that the NERC proposal satisfies the directive set forth in Order No. 693 that NERC modify Reliability Standard BAL-002 "…to define a significant deviation and a reportable event, taking account all events that have an impact on frequency, e.g., loss of supply, loss of load and significant scheduling problems…."[31] In particular, we believe that NERC's statement that the Balancing Authority ACE Limit, in conjunction with currently-effective Reliability Standard BAL-003-1, satisfies the directive.[32] We also believe that Reliability Standard BAL-003-1 addresses the Commission's Order No. 693 directive with regard to events that have an impact on frequency due to the loss of supply and proposed Reliability Standard BAL-001-2

[30] NERC Field Trial Report at 23**.**

[31] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 355.

[32] NERC Field Trial Report at 4.

addresses aspects of the same directive with regard to loss of load. Further, we accept NERC's explanation that proposed Reliability Standard BAL-001-2 addresses the Commission's Order No. 693 directive with regard to the need to more broadly define reportable events and that the proposed standard sets a variable joint megawatt limit (i.e., real-time) that is dependent on concurrent Interconnection frequency. With regard to the aspect of the Order No. 693 directive requiring that reportable events account for loss of load, we agree with NERC's statement that loss of load can cause a mismatch in supply and demand that results in a positive change in frequency.[33] We accept NERC's explanation that the Balancing Authority ACE Limit has been shown to be effective in limiting the duration that the Interconnection frequency is impacted by loss of supply, loss of load or any other conditions causing a balancing authority to exceed its Balancing Authority ACE Limit.[34]

19. In sum, we believe the statements in NERC's Petition, Supplemental Filing, and Informational Filing provide sufficient technical support that NERC has addressed the Commission's Order No. 693 directive in an equally and effective manner.[35] While we propose to approve Reliability Standard BAL-001-2, we also propose that NERC submit an informational filing - discussed immediately below - regarding the potential of

[33] *Id*. at 7.

[34] *Id.* at 27.

[35] NERC Supplemental Filing at 3.

proposed Reliability Standard BAL-001-2 to contribute to unscheduled power flows and inadvertent interchange.

Potential for Proposed Reliability Standard BAL-001-2 to Contribute to Unscheduled Power Flows and Inadvertent Interchange

20. NERC states that, as a proof of concept for the Balancing Authority ACE Limit requirement, a field trial was endorsed by the NERC Operating committee and subsequently approved by the NERC Standards Committee in June 2005.[36] During the development of the proposed Reliability Standard, some stakeholders that participated in the field trial commented to the NERC standard drafting team that the proposed Balancing Authority ACE Limit established in Requirement R2 of BAL-001-2 has caused increased system operating limit violations, particularly in the Western Interconnection. For example, one large transmission operator commented that the proposed Balancing Authority ACE Limit could increase the number of system operating limit violations, and could possibly cause large unscheduled power flows resulting in an increased ACE.[37] Another NERC stakeholder commented that the proposed Reliability Standard could provide opportunities for entities to create unscheduled power flows within the standard's boundaries, without regard to the impacts and which could lead to system operating limit violations due to large ACEs.[38] The same stakeholder commented

[36] *Id*. at 3.

[37] NERC Petition, Exhibit G, Consideration of Comments April 2013, at 43.

[38] *Id.* at 77.

that the Western Electricity Coordinating Council has decided to apply a limit of four times a balancing authority's L_{10} to limit ACE deviations from balancing authority flows that negatively impact the transmission system.

21. In addition, in the Field Trial Report, NERC asserts that there is no relationship between the Balancing Authority ACE Limit field trial and accumulated inadvertent interchange in either the Eastern or Western Interconnections.[39] However, due to a large allowance in ACE deviations in real-time while still complying with the proposed Balancing Authority ACE Limit, an increase in the amount of inadvertent interchange on the bulk electric system of all Interconnections may result.[40] In other words, proposed BAL-001-2 could allow balancing authorities to have a very large deviation from an ACE of zero and still be compliant with the dynamic values of the Balancing Authority ACE Limits in the proposed Reliability Standard.

22. The Commission is concerned that the Balancing Authority ACE Limit in proposed Reliability Standard BAL-001-2 may have an unintended consequence of (i) allowing significant amounts of unscheduled power flows, creating an undue burden for transmission operators and reliability coordinators to address power flows approaching or exceeding system operating limits or interconnection reliability operating

[39] NERC Field Trial Report at 20.

[40] A comparison between the existing Control Performance Standard 1 curves and the Balancing Authority ACE Limit curves shown in NERC's Field Trial Report indicates that there are large ACE deviations at the boundaries of 60 +/- 0.02 Hz. *Id.* Figure 5 at 24.

limits, and (ii) the significant increase in inadvertent interchange could result in an adverse reliability impact between real-time operations and day and/or hour-ahead analysis performed by reliability coordinators and transmission operators.

23. Based on the concerns discussed above, the Commission proposes to direct that NERC submit an informational filing following implementation of the proposed Reliability Standard to monitor unscheduled power flows and inadvertent interchange in the Western and Eastern Interconnections. Specifically, for the two-year period following implementation (i.e., the effective date) of the standard, the Commission proposes to direct NERC to provide the number of SOL/IROL violations, the date and time, location, the duration and magnitude, due to unscheduled power flows and inadvertent interchange within Western and the Eastern Interconnections. This information will provide NERC, the Commission, and other interested entities with the material to evaluate the effect of Reliability Standard BAL-001-2 on unscheduled power flows and inadvertent interchange and the resulting consequences on the Bulk-Power System. Accordingly, the Commission proposes to direct that NERC provide data on unscheduled power flows and inadvertent interchange for a two-year period following implementation of the proposed Reliability Standard.

24. The Commission proposes to direct NERC to submit the informational filing 90 days after the end of the two-year period following implementation. Should the data indicate reliability issues due to increases in unscheduled power flows and inadvertent interchange under the new Balancing Authority ACE Limit at any time during the two-year period of study, the Commission expects that NERC will immediately propose and

implement adequate remedies. The Commission seeks comments from NERC, and other interested entities on the proposed informational filing. The Commission also seeks comment whether any additional data would support the analysis and, thus, should be provided with the informational filing. Furthermore, the Commission also seeks comment on whether a regional variance would be necessary for those regions that experienced adverse impacts during the field trial due to inadvertent interchange.[41]

III. Information Collection Statement

25. The Office of Management and Budget (OMB) regulations require that OMB approve certain reporting and recordkeeping (collections of information) imposed by an agency.[42] Upon approval of a collection(s) of information, OMB will assign an OMB control number and expiration date. Respondents subject to the filing requirements of this rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

26. The Commission is submitting these reporting and recordkeeping requirements to OMB for its review and approval under section 3507(d) of the PRA. Comments are solicited on the Commission's need for this information, whether the information will have practical utility, the accuracy of the provided burden estimate, ways to enhance the

[41] The Western Interconnection applies a limit of four times a balancing authority's L_{10} to limit ACE deviations from balancing authority flows that negatively impact the transmission system. *Id.* at 14.

[42] 5 C.F.R. 1320.11.

quality, utility, and clarity of the information to be collected, and any suggested methods for minimizing the respondent's burden, including the use of automated information techniques.

27. This Notice of Proposed Rulemaking proposes to approve revisions to Reliability Standard BAL-001-2. NERC states in its petition that the proposed Reliability Standard defines a new concept: Balancing Authority ACE Limit, which is unique for each balancing authority and provides dynamic limits for a balancing authority's ACE value as a function of the Interconnection frequency.[43] NERC states that the proposed Reliability Standard improves reliability by adding a frequency component to the measurement of a balancing authority's ACE, and allows for the formation of "Regulation Reserve Sharing Groups." NERC's proposed Reliability Standard requires a balancing authority to balance its resources and demand in real-time so that the clock-minute average of its ACE does not exceed its Balancing Authority ACE Limit for more than 30 consecutive clock-minutes. Furthermore, NERC states that proposed Reliability Standard BAL-001-2 and accompanying definitions include the benefits of the Automatic Time Error Correction equation in the WECC-specific regional variance in Reliability Standard BAL-001-1.[44] The proposed Reliability Standard and related reporting requirements are applicable to balancing authorities and regulation reserve sharing groups.

[43] NERC Petition at 12.

[44] *Id.* at 2.

28. Public Reporting Burden: Our estimate below regarding the number of respondents is based on the NERC Compliance Registry as of October17, 2014. According to the NERC Compliance Registry, there are 71 balancing authorities in the Eastern Interconnection, 34 balancing authorities in the Western Interconnection and one balancing authority in the Electric Reliability Council of Texas (ERCOT). The Commission bases individual burden estimates on the time needed for balancing authorities to develop tools needed to facilitate reporting that are required in the Reliability Standard. These burden estimates are consistent with estimates for similar tasks in other Commission-approved Reliability Standards. The following estimates relate to the requirements for this Notice of Proposed Rulemaking in Docket No. RM14-10-000.

RM14-10-000 Final Rule (BAL-001-2: Real Power Balancing Control Performance) [45]						
	Number of Respondents (1)	**Annual Number of Responses per Respondent (2)**	**Total Number of Responses (1)*(2)=(3)**	**Average Burden & Cost Per Response (4)**	**Total Annual Burden Hours & Total Annual Cost [46] (3)*(4)=(5)**	**Cost per Respondent ($) (5)÷(1)**
BA/RRSG:[47] Update and Maintain Energy Management Systems	106	1	106	8 hours per response $1030 (8 x $128.76)	848 (106*8) $109,180 (1030*106)	$1030
BA: Record Retention [48]	106	1	106	4 $112	424 $11,872	$112
TOTAL			**212**		**1,272** **$121,052**	**$1,142**

Title: Mandatory Reliability Standards for BAL-001-2.

Action: Proposed Collection FERC-725R.

OMB Control No.: 1902-0268.

Respondents: Businesses or other for-profit institutions; not-for-profit institutions.

Frequency of Responses: On Occasion.

[45] Proposed Reliability Standard BAL-001-2 applies to balancing authorities and regulation reserve sharing groups. However, the burden associated with the BA complying with Requirement R1 is not included within this table because the Commission accounted for it under Commission-approved Reliability Standards BAL-001-1.

[46] The estimated hourly costs (salary plus benefits) are based on Bureau of Labor Statistics (BLS) information (*available at* http://www.bls.gov/oes/current/naics2_22.htm) for an electrical engineer ($60.87/hour) and a lawyer ($128.76).

[47] BA=Balancing Authority; RRSG=Regulation Reserve Sharing Group.

[48] $28/hour, based on a Commission staff study of record retention burden cost.

Necessity of the Information: This proposed rule proposes to approve the Reliability Standard pertaining to requiring balancing authorities to operate such that its clock-minute average reporting ACE does not exceed its clock-minute Balancing Authority ACE Limits for more than 30 consecutive clock-minutes. The proposed Reliability Standard Requirement R2 provides each balancing authority a dynamic ACE limit that is a function of Interconnection frequency. The proposed Reliability Standard will provide dynamic limits that are balancing authority and Interconnection specific. In addition, these ACE limits are based on identified Interconnection frequency limits to ensure the Interconnection returns to a reliable state when an individual balancing authority's ACE or Interconnection frequency deviation contributes undue risk to the Interconnection.

Internal Review: The Commission reviewed the proposed Reliability Standard and made a determination that its action is necessary to implement section 215 of the FPA. These requirements, if accepted, should conform to the Commission's expectation for generation and demand balance throughout the Eastern and Western Interconnections as well as within the ERCOT Region.

29. Interested persons may obtain information on the reporting requirements by contacting the following: Federal Energy Regulatory Commission, 888 First Street, NE Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].

30. For submitting comments concerning the collection(s) of information and the associated burden estimate(s), please send your comments to the Commission and to the Office of Management and Budget, Office of Information and Regulatory Affairs,

Washington, DC 20503 [Attention: Desk Officer for the Federal Energy Regulatory Commission, phone: (202) 395-4638, fax: (202) 395-7285]. For security reasons, comments to OMB should be submitted by e-mail to: oira_submission@omb.eop.gov. Comments submitted to OMB should include FERC-725R and Docket Number RM14-10-000.

IV. Environmental Analysis

31. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[49] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[50] The actions proposed here fall within this categorical exclusion in the Commission's regulations.

V. Regulatory Flexibility Act Certification

32. The Regulatory Flexibility Act of 1980 (RFA)[51] generally requires a description and analysis of proposed rules that will have significant economic impact on a substantial number of small entities. As shown in the information collection section, the proposed

[49] *Regulations Implementing the National Environmental Policy Act of 1969*, Order No. 486, FERC Stats. & Regs., Regulations Preambles 1986-1990 ¶ 30,783 (1987).

[50] 18 C.F.R. 380.4(a)(2)(ii).

[51] 5 U.S.C. 601-612.

Reliability Standard applies to 106 entities. Comparison of the applicable entities with the Commission's small business data indicates that approximately 23[52] are small business entities. Of these, the Commission estimates that approximately five percent, or one of these small entities, will be affected by the new requirements of the proposed Reliability Standard.

33. The Commission estimates that the small entities that will be affected by proposed Reliability Standard BAL-001-2 will incur one-time compliance cost up to $109,180 (i.e. the cost of updating and maintaining energy management systems), resulting in cost of approximately $1,030 per balancing authority and/or regulation reserve sharing groups. These costs represent an estimate of the costs a small entity could incur if the entity is identified as an applicable entity. The Commission does not consider the estimated cost per small entity to have a significant economic impact on a substantial number of small entities. Accordingly, the Commission certifies that this NOPR will not have a significant economic impact on a substantial number of small entities.

VI. Comment Procedures

34. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due [INSERT DATE 60 days after publication in the **FEDERAL REGISTER**]. Comments must refer to

[52] 21.4 percent of the total number of affected entities.

Docket No. RM14-10-000, and must include the commenter's name, the organization they represent, if applicable, and their address in their comments.

35. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format. Commenters filing electronically do not need to make a paper filing.

36. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street NE, Washington, DC 20426.

37. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VII. Document Availability

38. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington, DC 20426.

39. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

40. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at (202) 502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

By direction of the Commission.

Nathaniel J. Davis, Sr.,
Deputy Secretary.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Cheryl A. LaFleur, Chairman;
Philip D. Moeller, Tony Clark,
and Norman C. Bay.

North American Electric Reliability Corporation Docket No. RR14-5-000

ORDER ON THE ELECTRIC RELIABILITY ORGANIZATION'S FIVE-YEAR PERFORMANCE ASSESSMENT

(Issued November 20, 2014)

1. On July 21, 2014, North American Electric Reliability Corporation (NERC) filed its Five-Year Electric Reliability Organization Performance Assessment Report (Performance Assessment) in accordance with the requirements of the Commission's regulations.[1] The Performance Assessment is the second such assessment filed by NERC as the Commission-certified Electric Reliability Organization (ERO). The Performance Assessment discusses whether and how NERC satisfies the criteria for ERO certification under 18 C.F.R. § 39.3(b), evaluates the effectiveness of each Regional Entity in carrying out its delegated functions, and addresses stakeholder comments on NERC's performance as the ERO. NERC highlights activities and accomplishments demonstrating how the ERO is improving the performance of, and mitigating risks to, the Bulk-Power System as related to avoidable outages, and how NERC's compliance monitoring and enforcement efforts have matured to provide industry with greater certainty on actions, outcomes, and reliability consequences.

2. In this order, we accept NERC's Performance Assessment, find that NERC continues to satisfy the statutory and regulatory criteria for certification as the ERO, and find that the Regional Entities continue to satisfy applicable statutory and regulatory criteria. In addition, we find that NERC should take several actions to continue improving its performance as the ERO. Specifically, we direct NERC to submit an informational filing addressing specific matters and direct or encourage NERC to take certain additional actions as discussed in this order. These action items provide practical

[1] 18 C.F.R. § 39.3(c) (2014).

steps to improve the effectiveness of the ERO and Regional Entity functions and programs, and to improve the quality of NERC's Performance Assessment process going forward. These action items address important concerns, such as continued development of performance and reliability metrics for the ERO and Regional Entities; improvement in the development and periodic review of Reliability Standards; and improvement in efforts to ensure appropriate consistency across and coordination among all regions.

I. Background

A. Section 215 of the Federal Power Act

3. Section 215 of the Federal Power Act (FPA) requires the Commission to issue regulations that, among other things, provide for certification of an entity as the ERO if it meets certain criteria.[2] Specifically, FPA section 215(c) establishes that an ERO candidate must have the ability to develop and enforce mandatory Reliability Standards that provide for an adequate level of reliability of the Bulk-Power System.[3] The statute also requires that an ERO candidate have established rules that: (1) assure independence, while assuring fair stakeholder representation and balanced decision-making; (2) equitably allocate reasonable dues, fees, and other charges; (3) provide fair and impartial procedures for enforcing Reliability Standards through imposition of penalties; (4) provide reasonable notice and opportunity for public comment, due process, and balance in developing Reliability Standards and otherwise exercising its duties; and (5) provide appropriate steps to gain recognition in Canada and Mexico.

4. Additionally, FPA section 215(e)(4) provides that the ERO may delegate authority to a Regional Entity for the purpose of proposing regional Reliability Standards and enforcing Reliability Standards. Regional Entities must meet the same statutory criteria as those required for Commission certification of an ERO, except that more flexibility is allowed in the composition of a Regional Entity board of directors. The Commission must approve a delegation agreement between the ERO and a Regional Entity, and the Commission is authorized to modify such delegation.

[2] 16 U.S.C. § 824o (2012).

[3] *Id.* § 824o(c).

B. Order No. 672

5. On February 3, 2006, the Commission issued Order No. 672, which, among other things, amended the Commission's regulations to implement the requirements of FPA section 215.[4] Order No. 672 sets forth the process for certifying a single independent ERO to oversee the reliability of the United States' portion of the interconnected North American Bulk-Power System, subject to Commission oversight. Further, in Order No. 672, the Commission mandated that the ERO submit periodic assessments of its performance that require the ERO to "affirmatively demonstrate to the Commission that it satisfies the statutory and regulatory criteria for an ERO and is not only maintaining but improving the quality of its activities and those of the Regional Entities to which it has delegated such activities."[5]

6. In Order No. 672, the Commission also stated that the performance assessments should employ regular and systematic measurement and reporting of the ERO's performance, including information regarding: (1) the ERO's ability to develop and enforce Reliability Standards providing for an adequate level of reliability of the Bulk-Power System; (2) how the ERO effectively enforced Reliability Standards, including statistical information on its investigations, findings, and assessments of penalties, on a regional and continent-wide basis; and (3) how the ERO provided for fair and impartial procedures for enforcement of Reliability Standards and provided for openness, due process, and balance of interests in developing Reliability Standards.[6]

7. The specific requirements for the performance assessments are set out in the Commission's regulations at 18 C.F.R. § 39.3(c), and provide that the ERO file an assessment of its performance three years from the date of initial certification, and every five years thereafter. Each performance assessment filing is required to include the following: (1) an explanation of how the ERO satisfies the requirements of § 39.3(b); (2) recommendations by Regional Entities, users, owners, and operators of the Bulk-Power System, and other interested parties for improvement of the ERO operations, activities, oversight and procedures, and the ERO's response to such recommendations; and (3) the ERO's evaluation of the effectiveness of each Regional Entity, recommendations by the

[5] Order No. 672, FERC Stats. & Regs. ¶ 31,204 at P 186.

[6] *Id.* P 189.

Electric Reliability Organization, users, owners, and operators of the Bulk-Power System, and other interested parties for improvement of the Regional Entity's performance of delegated functions, and the Regional Entity's response to such evaluation and recommendations.[7]

8. The specific requirements in section 39.3(c)(2) of the Commission's regulations explain that the Commission will review the periodic performance assessments and may require follow-up actions by the ERO to comply or improve compliance with the statutory and regulatory qualifications for the ERO, if the Commission determines that the ERO has not satisfied specific criteria. Moreover, that subsection requires the Commission to assess the performance of each Regional Entity and issue an order addressing Regional Entity compliance.[8]

C. Certification of NERC as the ERO

9. On July 20, 2006, the Commission certified NERC as the ERO for the continental United States under FPA section 215(c).[9] The Commission found that NERC satisfied the criteria to be the ERO responsible for developing and enforcing mandatory Reliability Standards for the United States.

10. In April 2007, in accordance with FPA section 215(e)(4) and the Commission's regulations at 18 C.F.R. § 39.8, NERC entered into a separate delegation agreement with each of the eight Regional Entities[10] by which NERC delegated certain authority to the

[7] 18 C.F.R. § 39.3(c) (2014).

[8] *Id.* § 39.3(c)(2); *see also* Order No. 672, FERC Stats. & Regs. ¶ 31,204 at PP 33, 187.

[9] *North American Electric Reliability Corp.*, 116 FERC ¶ 61,062 (ERO Certification Order), *order on reh'g and compliance*, 117 FERC ¶ 61,126 (2006), *order on compliance*, 118 FERC ¶ 61,030, *order on compliance*, 118 FERC ¶ 61,190, *order on reh'g*, 119 FERC ¶ 61,046 (2007), *aff'd sub nom. Alcoa Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009).

[10] The eight Regional Entities currently are: Florida Reliability Coordinating Council, Inc. (FRCC); Midwest Reliability Organization (MRO); Northeast Power Coordinating Council, Inc. (NPCC); Reliability*First* Corporation (RFC); SERC Reliability Corporation (SERC); Southwest Power Pool, Inc. (SPP); Texas Reliability Entity (TRE); and Western Electricity Coordinating Council (WECC).

Regional Entities.[11] Specifically, NERC delegated authority to the Regional Entities to audit, investigate, and otherwise ensure that users, owners, and operators of the Bulk-Power System comply with NERC's mandatory Reliability Standards, subject to ERO oversight.[12] In addition, the delegation agreements address such matters as: (1) regional Reliability Standards development; (2) registration of entities that must comply with Reliability Standards; and (3) other services supporting NERC's statutory reliability functions, including reliability assessments, event analysis, and training and education.

D. NERC Initial Performance Assessment

11. On July 20, 2009, NERC filed its Initial Performance Assessment in accordance with the Commission's regulations.[13] On September 16, 2010, the Commission accepted NERC's Initial Performance Assessment and found that NERC continued to satisfy the statutory and regulatory criteria for ERO certification, and that each of the Regional Entities met the relevant statutory and regulatory criteria.[14] The Commission also directed NERC to submit an informational filing to address specific concerns discussed in the 2010 Performance Assessment Order.[15]

12. The Commission also explained, among other things, that according to Order No. 672, the purpose of the ERO's performance assessments is not only to determine whether the ERO is satisfying the statutory criteria for certification, but also to identify areas in which the ERO can improve performance. The Commission also noted that it sees the performance assessments as an opportunity not only to demonstrate that the ERO has maintained, but also is improving, the quality of its activities and those of the Regional Entities.[16] In that vein, NERC identified in its Initial Performance Assessment filing

[13] North American Electric Reliability Corp., Filing, Docket No. RR09-7-000 (filed July 20, 2009) (Initial Performance Assessment).

[14] *North American Electric Reliability Corp.*, 132 FERC ¶ 61,217, at P 35 (2010) (2010 Performance Assessment Order).

[15] *Id.* P 1 and Appendix A.

[16] 2010 Performance Assessment Order, 132 FERC ¶ 61,217 at P 5 (citing Order No. 672, FERC Stats. & Regs. ¶ 31,204 at PP 186-188).

specific "action items" to address "opportunities for improvement" in the various NERC programs. The Commission stated that "generally, the action items are reasonable and provide practical steps to improve the effectiveness of the ERO and Regional Entity functions and programs," addressing important concerns such as accelerating and prioritizing the Reliability Standards development process, enhancing stakeholder communications, improving registration consistency across regions, eliminating the backlog of audit reports and compliance violations, promoting self-reporting of non-compliance, and providing compliance guidance to registered entities.[17]

II. NERC Five-Year Performance Assessment

13. On July 21, 2014, NERC submitted its Performance Assessment as required by the Commission's regulations. NERC states that the Performance Assessment describes NERC's efforts to maintain and improve the quality of its activities as the ERO since its Initial Performance Assessment. Specifically, NERC explains how it continues to meet the criteria for ERO certification under 18 C.F.R. § 39.3(b), evaluates the effectiveness of each Regional Entity in carrying out its delegated functions, and addresses stakeholder comments on NERC's performance as the ERO.

14. NERC explains that, unlike its Initial Performance Assessment, NERC is not presenting a program area-by-program area discussion of its activities; rather, NERC highlights activities and accomplishments in support of its strategic plan initiatives for the Performance Assessment period, which include reforming the Reliability Standards program, developing the Reliability Assurance Initiative, and revising the "bulk electric system" definition. NERC also states that the Performance Assessment demonstrates how the ERO is improving the performance of, and mitigating the risks to, the Bulk-Power System as related to avoidable outages, and how NERC's compliance monitoring and enforcement efforts have matured to provide industry with greater certainty on actions, outcomes, and reliability consequences.

15. NERC's Performance Assessment includes attachments that provide additional information on the following matters: how NERC meets the ERO certification criteria (Attachment 1); joint Regional Entity self-assessments (Attachment 2); NERC's assessment of Regional Entity delegated functions (Attachment 3); NERC's

[17] *Id.* P 4.

consideration of industry feedback (Attachment 4); status of areas for improvement identified in the 2010 Performance Assessment Order (Attachment 5); and NERC's plans and initiatives for improving coordinated operations across the ERO Enterprise (Attachment 6).[18]

III. Notice and Responsive Pleadings

16. Notice of NERC's filing was published in the *Federal Register*, with comments due on or before August 20, 2014.[19] On August 18, 2014, Eric S. Morris filed a motion to intervene and request for extension of time, identifying a number of issues raised by NERC's filing and requesting additional time to more fully respond to those issues. On August 19, 2014, the Commission granted Mr. Morris's request, extending the comment deadline for all interested parties to August 29, 2014.

17. Timely motions to intervene were filed by the National Rural Electric Cooperative Association, American Public Power Association, Eric S. Morris, and, jointly, the eight Regional Entities.

18. Mr. Morris, who identifies himself as a ratepayer, was the only party to submit comments on NERC's Performance Assessment, both in his motion to intervene filed on August 18, 2014, and in subsequent comments filed on August 26, 2014. On August 27, 2014, NERC filed Reply Comments to Mr. Morris's August 18, 2014 Comments.

IV. Procedural Matters

19. Pursuant to Rule 214 of the Commission's Rules of Practice and Procedure, the timely, unopposed motions to intervene serve to make the entities that filed the motions parties to this proceeding.[20] Rule 213(a)(2) of the Commission's Rules of Practice and Procedure prohibits an answer to an answer or protest unless otherwise ordered by the decisional authority.[21] We will accept NERC's Reply Comments because they have provided information that assisted us in our decision-making process.

---

[18] NERC states that the term "ERO Enterprise" encompasses both NERC and the eight Regional Entities.

[19] 79 Fed. Reg. 44,761 (Aug. 1, 2014).

[20] 18 C.F.R. § 385.214 (2014).

[21] *Id.* § 385.214(a)(2).

V. Discussion

A. NERC's Satisfaction of the Criteria for Certification as the ERO and Evaluation of the Regional Entities

20. Under section 215(c) of the FPA and section 39.3(b)(1) of the Commission's regulations, the ERO must demonstrate that it has the ability to develop and enforce Reliability Standards that provide for an adequate level of Bulk-Power System reliability.[22] In addition, the ERO must show that it has established rules that: (1) assure independence, while assuring fair stakeholder representation and balanced decision-making; (2) equitably allocate reasonable dues, fees, and other charges; (3) provide fair and impartial procedures for enforcing Reliability Standards through imposition of penalties; (4) provide reasonable notice and opportunity for public comment, due process, and balance in developing Reliability Standards and otherwise exercising its duties; and (5) provide appropriate steps to gain recognition in Canada and Mexico.[23]

21. In addition, the ERO is required under section 39.3(c)(1)(ii) of the Commission's regulations to provide a response to recommendations by the Regional Entities and users, owners, and operators of the Bulk-Power System for improvement in the ERO's operations. In addition, under section 39.3(c)(1)(iii), the ERO is required to evaluate each Regional Entity's effectiveness, including how the Regional Entity responded to recommendations for improvement as suggested by the ERO and by users, owners, and operators of the Bulk-Power System.

NERC Performance Assessment

22. NERC provides a detailed narrative describing how it satisfies the statutory and regulatory requirements for certification on an ongoing basis.[24] NERC explains that, as the ERO, it has undertaken initiatives during the Performance Assessment period to "enhance the reliability of the [Bulk-Power System] and to increase the effectiveness and efficiency of the operations of the ERO Enterprise."[25] NERC states that these initiatives have included, among other things: (1) development of clear, reasonable, and technically sound Reliability Standards; (2) registration of entities with functional responsibilities for

[22] *Id.* § 39.3(b)(1).

[23] *Id.* § 39.3(b)(2).

[24] *See* Performance Assessment at 82-89.

[25] *Id.* at 7.

Bulk-Power System reliability; (3) monitoring and enforcing compliance with Reliability Standards; (4) identification and prioritization of, and communicating information on, risks to Bulk-Power System reliability; and (5) collecting and sharing information on threats to the cyber and physical security of the Bulk-Power System. According to NERC, it started several initiatives during the Performance Assessment period to further improve the Reliability Standards, including: (1) the results-based Reliability Standards initiative; (2) the removal of duplicative or otherwise unnecessary provisions from Reliability Standards, referred to as the "Paragraph 81" project; (3) internal reorganization of NERC's Reliability Standards department; and (4) establishment of the Independent Experts Review Panel. In addition, NERC states that during this Performance Assessment period, it addressed 128 directives by year-end 2013, reducing the number of open directives involving Reliability Standards to 107. NERC also states that it anticipates that 90 percent of Commission directives issued to date will be resolved during the first half of 2015.[26]

23. NERC provides a detailed evaluation of the Regional Entities' effectiveness at performing their delegated functions and of NERC's response to recommendations for improvement, as required by the Commission's regulations.[27] In addition, NERC provides a joint evaluation conducted by the Regional Entities, which includes self-evaluations and suggestions for improvements.[28] NERC also includes suggestions for improvement from users, owners, and operators of the Bulk-Power System, and other interested parties, as well as NERC's and the Regional Entities' responses to these suggestions.[29]

1. Development and Enforcement of Reliability Standards under Section 39.3(b)(1)

24. Section 39.3(b)(1) of the Commission's regulations requires that the ERO have the ability to develop and enforce Reliability Standards that provide for an adequate level of Bulk-Power System reliability. In the Performance Assessment, NERC states that it "continues to have the ability to develop and enforce, subject to 18 C.F.R. § 39.7, Reliability Standards that provide for an adequate level of reliability of the [Bulk-Power

[26] *Id.* at 7-12.

[27] *See* Performance Assessment, Att. 3.

[28] *See* Performance Assessment, Att. 2.

[29] *See* Performance Assessment, Att. 4.

System].”[30] NERC notes that as of December 1, 2013, NERC developed and submitted to the Commission a total of 293 continent-wide Reliability Standards that have been approved by the Commission, a number which have been retired or superseded by revised Reliability Standards. In addition, NERC approved and submitted to the Commission a total of 23 regional Reliability Standards that have been approved by the Commission.[31] These Reliability Standards encompass a broad range of subjects relating to Bulk-Power System reliability. NERC states that it made improvements to the Commission-approved, American National Standards Institute-accredited Standard Processes Manual during the Performance Assessment period and that the “Reliability Standards development process contains the essential attributes of the standards development process as set forth in prior Commission orders.”[32] NERC indicates that it systematically manages the development and revision of Reliability Standards in the areas of highest need and importance through the rolling three-year Reliability Standards Development Plan.

25. NERC states that monitoring and enforcing compliance with the mandatory Reliability Standards is conducted through the Compliance Monitoring and Enforcement Program (CMEP). NERC explains that section 6(a) of the Regional Delegation Agreements between NERC and each of the eight Regional Entities requires each Regional Entity to enforce mandatory Reliability Standards within its specific geographic boundaries. NERC states that, to further that effort, NERC and the Regional Entities have increased the number of budgeted compliance program staff approximately 191.72 percent from 2009 to 2014, and increased the budgeted compliance program direct expenses by 175.84 percent over the same period.[33] In addition, NERC explains that it conducts an audit at least once every five years to evaluate each Regional Entity’s implementation of the NERC CMEP, in addition to spot checks, as required by section 402.1.1.3 of the NERC Rules of Procedure.[34]

[30] Performance Assessment at 83.

[31] Performance Assessment, Att. 1 at 7.

[32] Performance Assessment at 83.

[33] Performance Assessment, Att. 1 at 16.

[34] *See id.* at 9-17.

2. Certification Criteria under Section 39.3(b)(2)

a. Independence and Fair Stakeholder Representation

26. NERC states that it "continues to have in place rules that assure its independence from users, owners, and operators of the [Bulk-Power System] while assuring fair stakeholder representation in the selection of its directors and balanced decision making in any ERO committee or subordinate organizational structure."[35] Specifically, NERC states that its Bylaws provide that NERC's business and affairs are managed by a Board of Trustees consisting of ten independent trustees plus the President of NERC. NERC explains that, pursuant to the Bylaws, a NERC trustee cannot be an officer, director, or employee of any entity "that would be perceived as having a direct financial interest in the outcome of board decisions, and may not have any other relationship that would interfere with the exercise of independent judgment in carrying out the responsibilities of a trustee."[36] Candidates for a trustee role are selected by a nominating committee, which is established annually, composed of the independent trustees whose terms will not expire during the current year, and at least three members of the NERC Member Representatives Committee. In addition, the NERC *Conflict of Interest and Business Ethics Policy for Trustees, Officers and Employees* provides that NERC representatives shall refrain from participation in situations where there is an actual conflict of interest or where there is the appearance of a conflict of interest.[37]

b. Equitable Allocation of Reasonable Dues, Fees, and Other Charges

27. NERC explains that, under its Bylaws and Rules of Procedure, the annual funding requirements for the statutory activities of NERC and the Regional Entities are allocated based on net energy for load.[38] In instances where a direct assignment of costs to a specific interconnection, Regional Entity, or group of entities is appropriate, NERC states

[35] Performance Assessment at 85.

[36] Performance Assessment, Att. 1 at 18.

[37] *See generally* Performance Assessment, Att. 1 at 17-23.

[38] NERC defines net energy for load as "[n]et generation of an electric system plus energy received from others less energy delivered to others through interchange. It includes system losses but excludes energy required for the storage of energy at energy storage facilities." Performance Assessment, Att. 1 at 24 (citing NERC Rules of Procedure, App. 2).

that such costs are assigned to the appropriate entities based on net energy for load. NERC explains further that the allocation of the annual assessments based on net energy for load is submitted to the Commission for approval in NERC's annual business plan and budget filing.[39]

c. Rules that Provide Fair and Impartial Procedures for Enforcing Reliability Standards Through Imposition of Penalties

28. NERC states that it has established rules that provide fair and impartial procedures for monitoring and enforcing compliance with Reliability Standards, set forth in section 400 of the NERC Rules of Procedure, NERC's CMEP, and the individual CMEP of each Regional Entity. NERC explains that the CMEP includes provisions allowing registered entities to participate in settlement discussions with NERC or the Regional Entity related to notices of alleged violations, proposed penalties or sanctions, and mitigation plans. [40]

29. NERC states that the CMEP includes rules regarding the determination and imposition of financial penalties on registered entities that have violated Reliability Standards. NERC explains that penalties are to be commensurate to the reliability impact of the violation and to those levied for similar violations, but still reflect any unique facts and circumstances related to the registered entity or specific violation. NERC states that it "evaluates the facts and circumstances of every violation that is part of a settlement to ensure that the penalty for that violation, and for the group of violations in the settlement, is within a range of reasonableness that displays consistency."[41]

30. With regard to the penalty determination, NERC explains that the Commission-approved Sanction Guidelines establish a base penalty amount established by the associated Violation Risk Factor (VRF) and Violation Severity Level (VSL) tables. The base penalty amount can be adjusted up or down based on factors such as a registered entity's compliance history, the violation time horizon, entity size, the operating condition of the Bulk-Power System at the time of the violation, and any mitigating factors. NERC explains that a penalty may be mitigated based on factors such as the quality of the registered entity's internal compliance program, amount of cooperation in resolving the violation, and whether the registered entity self-reported the violation.

---

[39] *See* Performance Assessment at 86; and Att. 1 at 23-24.

[40] Performance Assessment, Att. 1 at 24-25.

[41] *Id.* at 27.

31. NERC also describes the hearing procedures included in the uniform CMEP that apply when a registered entity requests a hearing concerning a disputed notice of alleged violation, disputed proposed penalty or sanction, disputed mitigation plan provisions, or disputed remedial action directive. NERC also explains that it adopted guidelines in 2013 to provide practical guidance to the Regional Entity hearing body members regarding the hearing process. NERC states that the guidelines outline the duties of the hearing officer and hearing body, and discuss the appropriate standard of review to be used throughout the hearing process.[42]

d. Rules that Provide Notice and Opportunity for Public Comment, Due Process, and Balance in Developing Reliability Standards and Otherwise Exercising Duties

32. NERC states that it has established rules, reflected in its Bylaws, Rules of Procedure, and Standard Processes Manual, that provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing Reliability Standards and exercising its other duties, such as compliance monitoring and enforcement. NERC explains that participation in the development of Reliability Standards is open to all persons who are directly and materially affected by the reliability of the North American Bulk-Power System. NERC states that the ballot body established for voting on a proposed Reliability Standard is organized in ten segments to reflect a balance of interests.[43]

33. NERC provides a detailed description of the Reliability Standards development process, which is overseen by a Standards Committee. NERC explains that the Standards Committee, which represents the interests of the industry as a whole, was established to ensure stakeholder interests are fairly represented in the Reliability Standards development process. NERC further explains that the Standard Processes Manual details the steps for developing a new or modified Reliability Standard. NERC states that once a draft Reliability Standard has been developed, NERC posts the proposed new or revised Reliability Standard for public comment, and the Reliability Standard drafting team must address any comments received. After the comment period is complete, the ballot pool for that Reliability Standard votes on the final proposed new or revised Reliability Standard. Approval of a proposed new or revised Reliability Standard requires both a

[42] *Id.* at 25.

[43] *Id.* at 28-30.

quorum, consisting of 75 percent of the ballot pool membership submitting a vote, and an affirmative vote by a two-thirds majority of the weighted-segment votes.[44]

34. NERC states that other rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in other areas of NERC's duties. NERC explains that these rules apply to, among other things, the election of trustees, revisions to the NERC Rules of Procedure, meetings of the Board of Trustees and associated committees, development of NERC's annual business plan and budget, and compliance monitoring and enforcement process.[45]

e. Appropriate Steps to Gain Recognition in Canada and Mexico

35. NERC states that it continues to engage in significant efforts to gain and maintain recognition as the ERO in Canada and Mexico. With respect to Canada, NERC explains that, depending on the particular circumstances of each Canadian province, it gained recognition as the ERO through statutes or other provisions of provincial law, or through a memorandum of understanding with the appropriate provincial entities. In addition, NERC explains that it also signed a memorandum of understanding with the Canadian National Energy Board, which has jurisdiction over international transmission lines within Canada. As for Mexico, NERC states that the Comisión Federal de Electricidad, which is responsible for reliable operation of the electric system in Mexico, and the Area de Control Baja California have entered into a membership and operating agreement with WECC with respect to the portion of the grid in Baja California Norte that is part of the Western Interconnection. NERC explains that WECC monitors compliance with the ten approved Mexico Reliability Standards, but does not have enforcement or registration authority within Mexico. NERC explains further that as to Mexico, WECC "provides compliance monitoring, reviews proposed and completed mitigation plans, and provides assessment recommendations with respect to alleged violations."[46]

Commission Determination

36. We find that NERC's Performance Assessment demonstrates that NERC continues to satisfy the statutory and regulatory requirements set forth in section 215(c) of the FPA and section 39.3(b) of our regulations. As discussed above, NERC provides a

[44] *Id.* at 30-32.

[45] *Id.* at 33-34.

[46] Performance Assessment at 88-89.

detailed description of how it meets the statutory and regulatory requirements established for the Commission-approved ERO. We conclude that NERC demonstrated that it has the ability to develop and enforce Reliability Standards. In addition, the Performance Assessment reflects improvements made to NERC's processes and procedures since our issuance of the 2010 Performance Assessment Order, such as revisions to the Standard Processes Manual to streamline the Reliability Standards development process and the adoption of standardized hearing procedures.

37. We also find that each of the Regional Entities continues to meet the relevant statutory and regulatory criteria. As directed in the 2010 Performance Assessment Order, NERC addressed each Regional Entity's performance in light of the relevant statutory and regulatory criteria.[47] We particularly note the increase in budgeted compliance program staff across NERC and the eight Regional Entities, demonstrating the increased commitment to monitoring and enforcement as the entities mature to a "steady state."[48]

38. While we acknowledge the improvements that NERC and the Regional Entities have made with regard to their compliance and enforcement responsibilities over the Performance Assessment period, we believe that there are still opportunities for additional improvement. With regard to compliance enforcement processing, NERC and the Regional Entities have made significant efforts to prioritize and reduce their outstanding pre-2012 caseload. According to NERC's Performance Assessment, as of December, 2013, only 65 violations older than 24 months remain to be processed.[49] However, the average violation age has only marginally improved, from 11.86 months in 2012 to 11.2 months in 2013.[50] In light of increased enforcement staffing and improved enforcement processes at NERC and the Regional Entities, we expect that violation processing times and the average violation age will continue to decline. In addition, to ensure that the ERO Enterprise and the Commission are both able to effectively perform their duties under section 215 of the FPA, we expect NERC to continue to cooperate with and share all appropriate data and information with Commission staff.

---

[47] *See North American Electric Reliability Corp.*, 132 FERC ¶ 61,217, at P 36 (2010).

[48] NERC and the Regional Entities' approved business plans and budgets for 2009 provided for approximately 158 full-time staff in compliance, monitoring, and enforcement programs. For 2014, the number of full-time staff devoted to compliance, monitoring, and enforcement programs increased to 303.

[49] Performance Assessment at 49, Att. 3 at 63.

[50] *Id.*

39. Additionally, it is unclear from NERC's Performance Assessment whether the compliance and enforcement program is effectively reducing repeat violations in a meaningful way. Monitoring recidivism among registered entities can provide a key indicator of whether NERC's CMEP is effective in deterring and mitigating violations. Therefore, we direct NERC to include an analysis of repeat violations in its next Performance Assessment that will allow NERC, the Regional Entities, and the Commission to evaluate whether NERC's compliance and enforcement efforts have been effective in improving registered entities' compliance and overall reliability.

40. With regard to the equitable allocation of reasonable dues, fees and other charges, we continue to agree with NERC that its allocation based on net energy for load is a reasonable and equitable allocation method.[51] The Commission found application of the net energy for load allocation methodology in Order No. 672 to be fair and reasonable,[52] and approved NERC's specific net energy for load proposal in the ERO Certification Order.[53] Thus, we believe that NERC's continued use of the net energy for load methodology is well justified, and we note its equitable benefits (including the elimination of double counting), and its relatively simple application compared to other apportionment methods. Further, we believe that NERC's budget development process and the Commission's approval of the ERO and Regional Entity annual business plans and budgets support the reasonableness of the charges.

41. Likewise, the Commission generally is satisfied with other features of NERC's Rules of Procedure, including rules that provide fair and impartial procedures for enforcing Reliability Standards and rules that provide for broad participation, notice, and opportunities for comment in developing Reliability Standards. Pursuant to FPA section 215(f), the Commission approved the initial submission of the NERC Rules of Procedure, as well as each subsequent revision. Thus, along with the individual findings that the NERC Rules of Procedure are just, reasonable, not unduly discriminatory or preferential, and in the public interest, we conclude here that the NERC Rules of Procedure are fair

[51] *See, e.g.*, Order No. 672, FERC Stats. & Regs. ¶ 31,204 at P 213; ERO Certification Order, 116 FERC ¶ 61,062, at P 167; *North American Electric Reliability Corp.*, 128 FERC ¶ 61,025, at P 38 (2009); *North American Electric Reliability Corp.*, 132 FERC ¶ 61,217, at P 56 (2010).

[52] *See* Order No. 672, FERC Stats. & Regs. ¶ 31,204 at PP 35, 213.

[53] ERO Certification Order, 116 FERC ¶ 61,062 at P 167. The net energy for load allocation method was upheld on appellate review. *See Alcoa Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009).

and impartial and generally support the varied functions and programs of the ERO. Further, we recognize NERC's efforts to gain and maintain recognition as the ERO in Canada and Mexico, and urge NERC to continue its efforts to support the reliability of the North American Bulk-Power System through work with our international partners.

42. We also find that NERC and the Regional Entities responded to suggestions for improvement from users, owners, and operators of the Bulk-Power System and other interested parties as required by section 39.3(c) of our regulations. However, we believe that having access to the original comments from stakeholders in addition to the comment summaries provided by NERC will aid the Commission in its evaluation of the ERO and Regional Entities.[54] Therefore, we will direct NERC to include the original comments from interested stakeholders in its future performance assessment filings, beginning in 2019.

B. Assessment of NERC's Performance and Areas for Improvement

1. Commenter Concerns

Comments

43. Mr. Morris, the sole commenter, identified three areas of concern in his August 18, 2014 comments. First, Mr. Morris raises questions about NERC's protection of confidential information, and asks questions concerning one specific instance in which an Unidentified Registered Entity's identity was revealed in a separate penalty proceeding.[55] Second, Mr. Morris questions the consistency of penalties as imposed across the regions, and as compared to NERC's VRF and VSL tables and other penalty guidelines.[56] To address these concerns, he asks that NERC provide (1) an analysis of the penalties imposed on a per dollar per day basis as compared to the VRF and VSL tables; (2) an analysis to show that NERC is treating multiple violations appropriately and consistently

[54] *See* Performance Assessment, Att. 4 (which, in table format, includes a "Summary of Key Stakeholder Comments").

[55] Mr. Morris cites Docket No. NP12-27-000, which he believes inadvertently revealed the identity of the Unidentified Registered Entity sanctioned for violations of the Critical Infrastructure Protection (CIP) Reliability Standards in Docket No. NP12-16-000.

[56] Morris August 18, 2014 Comments at 2 ("I am really seeking data that [NERC's] penalty guidelines are being followed, and whether they are being applied consistently across the regions.").

across regions; and (3) tables providing information on a regional basis similar to that provided in NERC's "Violations for all Regional Entities 2009-2013 by Year Reported to NERC U.S. Violations Only" and "Data on Regional Entity Compliance Resources" reports. Third, Mr. Morris questions whether the entire regional model is appropriate, given "its inherent administrative cost," and asks that NERC provide a cost-benefit analysis of the Regional Entity model as compared to a single unified ERO.[57]

44. In his August 26, 2014 Comments, Mr. Morris requests that NERC use net energy for load in developing its comparison of penalty amounts among the regions. In addition, he reiterates his request for a cost-benefit analysis of the regional model versus a single ERO model, pointing to NERC's statements about the difficulty of developing and analyzing Regional Entity compliance program data as evidence that "managing these entities in an oversight capacity is probably more trouble than it is worth."[58] In addition, he supports the need for such a cost-benefit analysis based on NERC's own statements regarding the need for consistency in the ERO Enterprise's compliance, enforcement, and event analysis program. Finally, he suggests that "a significant portion" of the current levels of compensation for senior leadership of the Regional Entities would not be necessary under a unified ERO.[59]

45. On August 27, 2014, NERC filed Reply Comments to Mr. Morris's August 18, 2014 Comments. NERC responds to Mr. Morris's request for a cost-benefit analysis of the Regional Entity model by noting that FPA section 215 and Commission regulations implementing that section contemplate the delegation of certain authority from the ERO to a Regional Entity.[60] In addition, NERC states that its Performance Assessment meets the requirements of FPA section 215(e)(4) and its implementing regulations, none of which require submission of a cost-benefit analysis. NERC responds to Mr. Morris's questions about NERC's protection of confidential information by stating that it improved its internal procedures on redaction guidelines since the 2012 incident referenced by Mr. Morris, and notes that its procedures for protecting confidentiality are

[57] Morris August 18, 2014 Comments at 2.

[58] Morris August 26, 2014 Comments at 1.

[59] *Id.*

[60] NERC states that Mr. Morris's August 26 Comments reiterated his concern with the regional model and that Mr. Morris cited a single Internal Revenue Service Form 990 for Reliability*First* Corporation to suggest that the regional model is unnecessarily wasteful. *See* NERC Comments at fn.5.

reviewed at least once per year.[61] Finally, NERC maintains that the comparison of actual penalties imposed by the Regional Entities, versus NERC's VRF and VSL tables, would not be meaningful in assessing the fairness of NERC's and the Regional Entities' enforcement methods. NERC asserts that the tables provide base penalty amounts only, while NERC's Sanction Guidelines contemplate that NERC and the Regional Entities consider a number of other factors in setting penalty amounts. In addition, NERC states that it encourages the Regional Entities to consider the imposition of non-monetary sanctions or acceptance of certain activities "above and beyond those required to ensure compliance . . . in lieu of full monetary penalties permitted by the NERC *Sanction Guidelines* (where it is appropriate)."[62]

46. On August 28, 2014, Mr. Morris submitted additional comments responding to NERC's Reply Comments. First, Mr. Morris requests that NERC withdraw its comment that he stated that "the benefits of managing the Regional Entities are grossly outweighed by the costs," and "the [R]egional [E]ntity model is inherently wasteful." Rather, Mr. Morris states that he made no arguments regarding the outcome of a cost-benefit analysis, and merely believes that it should be done.[63] Second, responding to NERC's statement that Mr. Morris provided limited data to support the need for a cost-benefit analysis, Mr. Morris provides additional information on key leader compensation of the Midwest Reliability Organization.[64]

Commission Determination

47. With respect to concerns and questions raised regarding NERC's protection of information deemed to be confidential, particularly as related to cybersecurity incidents or CIP violations, we believe that NERC currently has adequate rules and procedures in place to protect against improper disclosure of sensitive information, and note that NERC

[61] NERC acknowledges it has an obligation to ensure that the disposition of each violation or alleged violation that relates to a cybersecurity incident will remain nonpublic. NERC also states that the Rules of Procedure provide that NERC will not disclose any confidential information, including cybersecurity incidents, and will redact such information in any public filings unless disclosure is otherwise permitted by the Rules of Procedure.

[62] NERC Comments at 1 (footnotes omitted).

[63] Morris August 28, 2014 (citing NERC Comments at 2).

[64] *Id.*

improved its redaction procedures since the dockets referenced by Mr. Morris were filed with the Commission.[65]

48. Regarding Mr. Morris's requests for a comparison of penalty amounts imposed across regions as compared to NERC's VRF and VSL tables, we agree with NERC that such a comparison would have limited utility, as it fails to reflect the many other penalty factors that NERC and the Regional Entities must consider under NERC's Sanction Guidelines. These factors include, among other things, the violator's compliance history, degree of cooperation during the enforcement process, quality of the entity's overall compliance program, and whether the violation was self-reported. We have repeatedly endorsed this approach to the imposition of penalties,[66] and find that, as long as NERC continues to oversee the Regional Entities' application of the Sanction Guidelines to promote consistency as and when appropriate, NERC is satisfying its obligations with respect to enforcement.[67]

49. With respect to concerns about the value of the Regional Entity model, we decline to grant Mr. Morris's request for NERC to perform a cost-benefit analysis. As an initial matter, we do not find that such an analysis is required under FPA section 215 or our implementing regulations as part of NERC's performance assessment obligations. Also, FPA section 215 explicitly contemplates the delegation of certain enforcement and other authorities by the ERO to Regional Entities.[68] Mr. Morris provides no evidence to support his request other than implying that the costs of a unified ERO could be lower than the current Regional Entity model due to fewer salaries, and a suggestion that the Regional Entity model is more costly due to "its inherent administrative cost."

---

[65] NERC notes that the dockets referenced in Mr. Morris's August 18, 2014 comments were filed in 2012, and that NERC "improved its internal procedures when it documented its redaction guidelines in early 2013 and incorporated them by reference into its internal Compliance Enforcement Manual." NERC Reply Comments at 5.

[66] *See, e.g., North American Electric Reliability Corp*., 132 FERC ¶ 61,182 (2010) (providing guidance on the application of one of the aggravating factors identified in NERC's Sanction Guidelines); *see also North American Electric Reliability Corp.*, 141 FERC ¶ 61,241, at P 71 (2012) (accepting revised Sanction Guidelines, and their nine adjustment factors for use in determining penalties).

[67] We continue to encourage NERC to develop performance metrics that will be meaningful in evaluating the consistency of the various Regional Entities' approaches to enforcement and imposition of penalties, as further discussed below.

[68] *See* 16 U.S.C. § 824o(e)(4).

Accordingly, we conclude that the comments are not persuasive and do not provide adequate support to direct NERC to take further action on the matter.

2. ERO Enterprise Performance Metrics

NERC Performance Assessment

50. NERC states that it made substantial progress in structuring the ERO Enterprise and improving the reliability of the Bulk-Power System during this Performance Assessment period. NERC explains that, "despite the achievements to date, the … ERO Enterprise … is not without certain challenges and risks. Going forward, NERC needs and intends to focus attention on actions necessary to reach an end-state of a fully-integrated ERO Enterprise that can exercise effective and well-coordinated reliability oversight that mitigates reliability risks to the BPS."[69] NERC states that in order to achieve this end-state, it must increase clarity about the allocation of roles and responsibilities between NERC and the Regional Entities, improve coordination of goals, and establish more uniform work processes, tools, and performance.[70]

51. NERC states that "coordinated strategic planning" is one of five areas that NERC needs to focus on to achieve excellence in the oversight and execution of its statutory functions. NERC explains that its Board of Trustees recently approved ERO Enterprise Performance Metrics that will be used to assess the overall effectiveness of the ERO Enterprise in achieving the goals and objectives outlined in the ERO Enterprise Strategic Plan for 2014-2017, which include addressing risk to the Bulk-Power System, achieving reliability results, assuring Reliability Standards and compliance effectiveness, and improving risk mitigation and program execution.[71] NERC explains that the ERO Enterprise Performance Metrics include four overarching metrics that focus on the overall effectiveness in addressing Bulk-Power System risks and improving reliability, and a number of supporting measures that focus on the effectiveness of key operational elements of the ERO Enterprise.[72] NERC states that its intent is to report the results of

[69] Performance Assessment at 96.

[70] *Id.*

[71] Performance Assessment at 98 (citing ERO Enterprise Performance Metrics, approved by the NERC Board May 2014, *available at* http://www.nerc.com/gov/bot/FINANCE/Hidden%20Documents/ERO%20Enterprise%20Performance%20Metrics%20-%20Board%20Approved%2005%2007%202014.pdf).

[72] *Id. See also* Performance Assessment, Attachment 4 at 24-25, 33.

these metrics on an ERO Enterprise-wide basis, and distinguish results for NERC and individual Regional Entities.[73]

Commission Determination

52. The Commission supports NERC's goal of improving coordinated operations across the ERO and Regional Entities by, among other things, developing a set of common performance measures focused on Bulk-Power System reliability outcomes and effectiveness of statutory programs. The Commission explained in Order No. 672 that the ERO should "affirmatively demonstrate to the Commission that it satisfies the statutory and regulatory criteria for an ERO and is not only maintaining but improving the quality of its activities and those of the Regional Entities to which it has delegated such activities" and continued that it "expects the performance assessment to include regular and systemic measurements and reporting of the ERO's performance."[74] NERC's Performance Assessment has demonstrated that it is improving the quality of its activities. However, we believe that NERC's future Performance Assessments could be improved by including regular and systematic measurements of its performance, including setting performance targets. Accordingly, as discussed further below, we will direct NERC to include its performance measures in future assessment filings.

53. The Board of Trustees' recent adoption of ERO Enterprise Performance Metrics, which will be used to compare performance with future targets and objectives as set forth in the ERO Strategic Plan, and NERC's intent to regularly report the results, should help NERC improve coordinated operations across the ERO and Regional Entities. Additionally, we believe that a common set of performance metrics that will serve as indicators of the overall effectiveness of the ERO in achieving its mission and goals will help both NERC and the Commission assess ERO performance and identify any areas for improvement. Therefore, we encourage NERC to continue tracking, measuring, and reporting its performance using the ERO Enterprise Performance Metrics as adopted by the Board of Trustees. Further, we will direct NERC to incorporate the ERO Enterprise Performance Metrics, and any associated performance measures into its future

[73] Performance Assessment at 98, 102.

[74] Order No. 672, FERC Stats. & Regs. ¶ 31,204 at P 187.

performance assessment filings, beginning in 2019. More immediately, we expect NERC will continue to post these ERO Enterprise Performance Metrics as the metrics are further developed, and associated metrics, measures, and targets on at least an annual basis.[75]

3. Reliability Metrics

54. In addition to the ERO Enterprise Performance Metrics discussed above, NERC uses certain reliability metrics to assess the performance of the Bulk-Power System. NERC's State of Reliability 2014 Report discusses two primary types of metrics: (1) event-driven metrics that measure the cumulative stress on the grid from events resulting in transmission loss, generation loss, and load loss; and (2) condition-driven metrics that quantify deviations from the adequate level of reliability established by NERC. Along with these two groups of metrics, NERC is also creating a new metric to quantify the impact of violations of Reliability Standards that are considered to have serious risk to the Bulk-Power System. NERC states that, in addition to reliability metrics, NERC's State of Reliability 2014 Report assesses grid reliability based on performance trends identified through data and analysis of system disturbances.[76]

55. The Commission supports NERC's efforts to develop reliability performance metrics and recognizes the benefit of such metrics, as NERC analyzes the emerging risks facing the Bulk-Power System, such as a rapidly changing fuel mix, unit retirements, continued advancement of variable resources, and a growing dependence on demand side management programs. Beyond assessing the overall reliability of the Bulk-Power System and identifying trends that could affect the industry's risk profile, reliability metrics that measure grid performance can also assist in evaluating the effectiveness of Reliability Standards. Therefore, we encourage NERC to continue developing its reliability metrics as described in its Performance Assessment and State of Reliability 2014 Report, and tie the results of grid performance-related metrics to ongoing Reliability Standards development efforts. Creating this feedback loop to the Reliability Standards development process will further support NERC's goal of developing results-based Reliability Standards.

---

[75] *See* Performance Assessment at 98 ("[t]he intent is to report the results of these metrics on an ERO Enterprise-wide basis, and also as applicable, distinguish results for NERC and individual Regional Entities").

[76] *See* Performance Assessment at 69-71 (citing NERC's State of Reliability 2014 Report, *available at* http://www.nerc.com/pa/RAPA/PA/Performance%20Analysis%20DL/2014_SOR_Final.pdf).

56. We also encourage NERC to continue its effort to develop metrics to address other areas, such as situational awareness measures. Situational awareness was identified as a significant contributing factor in major events and as such, continued improvement in this area will further improve reliability.[77] In addition, we encourage NERC to refine its current reliability metrics to more effectively analyze risks to the Bulk-Power System. For example, NERC could refine its current metrics to incorporate additional data, such as an analysis of cause codes from the event analysis program, transmission availability data system, generating availability data system, protection system misoperations reporting, and progress of resolution of any gaps found in Reliability Standards. In addition, NERC could consider developing performance targets (i.e., normal or acceptable levels of performance) and tying such targets to the reliability metrics in order to enhance understanding of the state of reliability across the Bulk-Power System. Finally, as NERC continues its efforts to refine these reliability metrics, the Commission encourages NERC to collaborate with Commission staff in this area.

4. Reliability Standards Development

Performance Assessment

57. In its Performance Assessment, NERC addresses how it satisfies the requirements of section 39.3(b) of the Commission's regulations regarding NERC's ability to develop Reliability Standards that provide for an adequate level of reliability.[78] NERC also describes at length the improvements in its Reliability Standards development program since filing its Initial Performance Assessment.[79] Specifically, NERC highlights its efforts to transform Reliability Standards to a steady-state (i.e., a "stable set of clear, concise, high-quality, and technically sound Reliability Standards"),[80] including efforts to complete revisions to Reliability Standards in response to Commission directives and a comprehensive review of all Reliability Standards by the Independent Experts Review Panel. NERC adds that, "to set the foundation for a steady-state body of Reliability Standards, NERC established the [Independent Experts Review Panel] to evaluate the existing families of Reliability Standards and Requirements."[81] NERC explains that five

[77] *See, e.g.,* FERC and NERC Joint Staff Report, *Arizona-Southern California Outages on September 8, 2011* at 85 (2012).

[78] Performance Assessment, Att. 1 at 1-9.

[79] Performance Assessment at 22-32.

[80] *Id.* at 7.

[81] *Id.* at 14.

independent consultants with an array of electric industry experience presented a report to the NERC Board of Trustees in August 2013 that outlined a vision for transforming the NERC Reliability Standards to a steady-state, including short-term and long-term recommendations, recommending retirement of certain provisions, identification of "gaps" not currently addressed by Reliability Standards, and recommendation of a new construct to consolidate Reliability Standards and required actions.

58. NERC describes the Paragraph 81 project, a Commission-initiated project to identify and remove requirements from existing Reliability Standards that either: (1) provide little protection for Bulk-Power System reliability or (2) are redundant with other aspects of the Reliability Standards. NERC highlights other improvements to the Reliability Standards development process, including revisions to NERC's Standard Processes Manual to provide for a more efficient development process, formation of the Reliability Issues Steering Committee, and realignment of NERC's resources to "focus[] resources on the production of Reliability Standards rather than on executing and monitoring the development process."[82]

Commission Determination

59. The development of Reliability Standards is a fundamental responsibility of the ERO and a function that must be addressed as part of NERC's periodic performance assessment filings.[83] We recognize NERC's efforts to improve both the efficiency of its Reliability Standards development process as well as the quality of the Reliability Standards developed. While it appears that many of the initiatives described in NERC's Performance Assessment improved (or will improve) NERC's Reliability Standards development process, we believe NERC must continue to improve its programs as it moves forward into the next performance assessment period, as further discussed below.

60. We believe that NERC's formation of the Independent Experts Review Panel was particularly valuable. NERC tasked the Independent Experts Review Panel with evaluating the entire existing set of Reliability Standards, making recommendations on how to transition to a steady state, and identifying high-level gaps in reliability not currently addressed by existing Reliability Standards. As NERC states, the Independent Experts Review Panel's recommendations have been "pivotal" in NERC's evaluations of Reliability Standards by the Reliability Standard drafting teams. We are encouraged that the Independent Experts Review Panel's recommendations are, according to NERC,

[82] *Id.* at 30; *see generally id.* at 7-24.

[83] *See, e.g.*, 2010 Performance Assessment Order, 132 FERC ¶ 61,217 at P 67; Order No. 672, FERC Stats. & Regs. ¶ 31,204 at P 189.

either assigned to active drafting projects or to teams that conduct periodic reviews of Reliability Standards for future consideration.[84]

61. We also commend NERC on the improvements in the efficiency of its Reliability Standards development process, as reflected in the reduction of average time to revise or develop a new Reliability Standard. Specifically, NERC states that the average time for revising an existing Reliability Standard and development of a new Reliability Standard fell from a historical baseline of 27 and 40 months, respectively, to a period of 6 and 10 months, respectively, for projects completed since approval of NERC's revised Standard Processes Manual in 2013.[85]

62. Despite these apparent improvements to NERC's Reliability Standards processing times, the process for developing interpretations of Reliability Standards does not appear to be experiencing similar improvements in total processing time. Rather, over the Performance Assessment period, the average time for NERC to process a request for interpretation (i.e., time between the initial interpretation request and subsequent filing of the interpretation with the Commission) is approximately 21 months,[86] with processing times ranging from approximately 6 months to 50 months.

63. We understand that the processing time for interpretations may be affected by other considerations, including a possible preference for addressing ambiguities through the Reliability Standards development process. However, with NERC's stated goal of bringing the Reliability Standards program to a "steady state" (i.e., with fewer Reliability Standards under development or modification), the ability to efficiently resolve possible ambiguities through the interpretation process may take on added importance. Accordingly, we encourage NERC to explore ways to reduce the time needed to process a request for interpretation.

64. In addition, we believe that additional granularity in the measurement of Reliability Standards development would be beneficial. First, we note that the six and ten month average development time reported for recent projects includes projects for which

---

[84] *See* Performance Assessment at 16-17.

[85] *Id.* at 25.

[86] These statistics are derived from data filed in each petition for Commission approval during the Performance Assessment period. *See also* Quarterly Reports on Standards Development submitted in compliance with the 2010 Performance Assessment Order (Docket No. RR09-7-001).

the Commission imposed a specific deadline.[87] While we recognize the significant effort put in by NERC and stakeholders in meeting those deadlines, it is not clear whether these projects are representative of the improvements to the Reliability Standards process more generally. Instead, as we noted in the 2010 Performance Assessment Order, information regarding average total processing times for the development of Reliability Standards is of limited use where it reflects both "urgent" and "non-urgent" projects.[88] We continue to believe that total time for development as reported may need to reflect the overall complexity of the project and be compared to the initial expected time for completion. Thus, we will direct NERC to track, on a going-forward basis, actual project completion times as compared to estimated time for completion at the outset of a given project. We will also direct NERC to incorporate these more granular measures into its future performance assessment filings, beginning in 2019, and post them as developed prior to 2019.

65. Finally, we recognize that NERC made significant improvements in its Reliability Standards development process through redeployment of its and stakeholders' resources and other adjustments to the Reliability Standards development process. Among other things, NERC revised the composition of Reliability Standard drafting teams to include legal and compliance experts, and incorporated quality review and compliance assessment tool development in parallel or in conjunction with the Reliability Standards development process.[89] In addition to the technical expertise provided by industry volunteers, we believe NERC technical staff has an important role to play in providing feedback on proposed Reliability Standards throughout the development process.[90]

---

[87] *See, e.g., Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014) (requiring NERC to develop and submit within 90 days a proposed Reliability Standard addressing threats and vulnerabilities to the physical security of critical facilities on the Bulk-Power System).

[88] *See* 2010 Performance Assessment Order, 132 FERC ¶ 61,217 at PP 81, 85.

[89] Performance Assessment at 23. NERC staff is responsible for conducting a quality review of a Reliability Standard under development, prior to posting for formal comment and ballot to assess whether the documents are within the scope of the associated Standard Authorization Request, whether the Reliability Standard is clear and enforceable as written, and whether the Reliability Standard meets the criteria specified in NERC's Benchmarks for Excellent Standards and criteria for governmental approval. NERC Standards Process Manual, Section 4.3.

[90] For example, NERC staff submitted useful comments on several draft Reliability Standards during the Performance Assessment period. *See, e.g.,*

(continued…)

Among other things, we believe NERC staff has unique expertise based on its compliance and enforcement experience, and unique insight into emerging reliability issues gained through NERC's administration of the events analysis program. Therefore, we encourage NERC's technical staff to provide feedback to the Reliability Standard drafting teams as early as possible in the drafting process so the drafting team can consider NERC staff's unique insights, particularly prior to comment or ballot periods.

5. Regional Entity Performance and Coordination

Performance Assessment

66. In its Performance Assessment, NERC explains its ongoing efforts to increase consistency and promote coordination throughout the ERO Enterprise. NERC states that the ERO Enterprise has been effective in mitigating important risks to the Bulk-Power System since its inception in 2006. NERC highlights the ability of the Regional Entities to identify trends and leading indicators of potential reliability problems to be addressed. NERC notes efforts to address protection system misoperations and transmission right-of-way clearances as examples of situations where the ERO Enterprise was able to use information from the Regional Entities to develop strategies to address potential risks.[91]

67. NERC states that the compliance monitoring and enforcement program implemented by NERC and the Regional Entities "has been effective in ensuring that compliance violations are identified and mitigated, thereby reducing reliability risk."[92] NERC states that the ERO Enterprise has uniform procedures for compliance and enforcement, including standardized penalty guidelines. For example, NERC states that all Regional Entities utilize the Find, Fix, Track and Report (FFT) process to resolve a high number of minimal risk issues and that NERC, through its monthly reviews and annual spot checks, verifies that the parameters for identifying minimal risk issues are consistently applied throughout the ERO Enterprise.

68. NERC also states the Reliability Assurance Initiative will help NERC foster greater consistency and efficiency in its compliance monitoring and enforcement process, providing a greater level of predictability for registered entities to understand how the

---

Docket Nos. RM14-13-000 (COM-001-2 and COM-002-4), RM13-15-000 (CIP Version 5), and RM12-16-000 (Generator Requirements at the Transmission Interface).

[91] Performance Assessment, Att. 6 at 5.

[92] *Id.* at 6.

Reliability Standards are applied and enforced.[93] Moreover, NERC explains that it and the Regional Entities no longer create nine separate CMEP implementation plans, but rather have consolidated these documents into a single, integrated CMEP implementation plan for the ERO Enterprise, which eliminates redundant information, improves transparency of CMEP activities, and promotes consistency among Regional Entities.[94]

69. NERC states that, in order to achieve excellence in the oversight and execution of its statutory functions, it must improve coordinated operations across the ERO Enterprise by focusing on six areas relating to the relationships and allocations of responsibilities between and among NERC and the Regional Entities. These areas include (1) clarifying roles and responsibilities, (2) coordinating strategic planning, (3) coordinating operational decision-making, (4) achieving consistency, (5) sharing tools and infrastructure for delegated functions, and (6) coordinating communications.[95] NERC identifies 11 action items aimed at achieving these goals. NERC also states that, to improve the delegation process, NERC and the Regional Entities should work together to update and refine the regional delegation agreements, which are due for renewal in May 2015, to provide a clearer division of responsibilities.[96] In the development of the Performance Assessment, numerous stakeholder comments focused on the need for consistency and coordination across the ERO Enterprise.[97]

Commission Determination

70. The Commission recognizes and supports NERC's efforts to increase consistency and promote coordination across the ERO Enterprise. A key element of consistency is the transparency of the ERO Enterprise's processes and its outcomes. Improved consistency and coordination helps to clarify the roles and responsibilities of NERC and the Regional Entities and should lead to more efficient and uniform work practices. Specifically, we believe that a focus on achieving consistent compliance and enforcement outcomes (e.g., monetary penalties, registration decisions, and consistent understanding of Reliability Standard requirements) while not equating consistency with a "lowest common denominator" approach would provide the greatest benefit to registered entities.

---

[93] *Id.*

[94] Performance Assessment at 55.

[95] Performance Assessment, Att. 6 at 7-8.

[96] *See id.*, at 7-16.

[97] *See* Performance Assessment, Att. 4 at 13-15, 21, 29, and 32.

Accordingly, we are pleased to see NERC's efforts in this area such as the adoption of a single, integrated CMEP implementation plan for the ERO Enterprise. We believe that actions such as the integrated CMEP are a step toward addressing the concerns raised by stakeholders regarding potential inconsistencies across the Regional Entities.[98]

71. However, to better understand NERC's ongoing efforts, we direct NERC to submit an informational filing within 12 months of the date of this order that describes NERC's progress in increasing consistency and promoting coordination across the ERO Enterprise. Specifically, NERC should address how it is improving coordinated operations and describe any efforts it has made to improve such operations, including, but not limited to the 11 action items described in Attachment 6 of the Performance Assessment.

72. In addition, NERC should continue to promote transparency in its enforcement programs, particularly as it moves forward with its Reliability Assurance Initiative, given the value of transparency in encouraging full and adequate mitigation practices and in providing assurance to the Commission, registered entities, and the public that the program is being fairly and consistently implemented across all regions. We note that the FFT program created efficiencies in the ERO Enterprise's enforcement process, without the need to sacrifice any degree of transparency in the form of current public disclosure regarding FFT-processed violations. Therefore, we expect NERC to continue making information publicly available concerning possible non-compliance (other than those involving physical security or cybersecurity concerns) resolved through any and all processing methods.

73. We also support NERC's efforts to develop metrics to measure the overall effectiveness of the ERO Enterprise. While we recognize that enforcement metrics developed to date aid in promoting consistency and measuring the performance of NERC and the individual Regional Entities,[99] they represent only one aspect of consistency across the ERO Enterprise. Therefore, we will direct NERC to continue developing performance metrics that measure consistency, coordination, and efficiency between and among NERC and the Regional Entities in order to achieve predictable, timely, and consistent results across the ERO Enterprise and incorporate these metrics into its future performance assessment filing, beginning in 2019. In developing such metrics, we

[98] We note that the Commission also supported such efforts in the 2010 Performance Assessment Order. *See* 2010 Performance Assessment Order, 132 FERC ¶ 61,217 at P 138.

[99] *See* Performance Assessment, Att. 5 at 24-26.

encourage NERC to focus on achieving consistent outcomes on issues such as assessing monetary penalties, assessing non-monetary penalties, registering entities, and exhibiting a consistent understanding of requirements in the auditing process.

The Commission orders:

(A) The Commission hereby accepts NERC's Performance Assessment and finds that NERC continues to meet the statutory and regulatory requirements for ERO certification set forth in section 215(c) of the FPA and section 39.3(b) of our regulations, as discussed in the body of this order.

(B) The Commission hereby finds that the Regional Entities continue to meet the statutory and regulatory requirements set forth in section 215(e) of the FPA and section 39.3(c) of our regulations, as discussed in the body of this order.

(C) NERC is hereby directed to submit an informational filing within 12 months of the date of this order, as discussed in the body of this order.

(D) NERC is hereby directed to include additional information in its future performance assessment filings, as discussed in the body of this order.

By the Commission.

A free webcast of this event is available through www.ferc.gov. Anyone with Internet access who desires to view this event can do so by navigating to www.ferc.gov's Calendar of Events and locating this event in the Calendar. The event will contain a link to its webcast. The Capitol Connection provides technical support for the free webcasts. It also offers access to this event via television in the DC area and via phone bridge for a fee. If you have any questions, visit www.CapitolConnection.org or contact Danelle Springer or David Reininger at 703-993-3100.

Immediately following the conclusion of the Commission Meeting, a press briefing will be held in the Commission Meeting Room. Members of the public

may view this briefing in the designated overflow room. This statement is intended to notify the public that the press briefings that follow Commission meetings may now be viewed remotely at Commission headquarters, but will not be telecast through the Capitol Connection service.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

July 21, 2014

VIA ELECTRONIC FILING

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

Re: North American Electric Reliability Corporation
Five-Year Electric Reliability Organization Performance Assessment Report
Submitted in Accordance with 18 C.F.R. § 39.3(c)

Dear Ms. Bose:

The North American Electric Reliability Corporation (NERC) respectfully submits its Five-Year Electric Reliability Organization (ERO) Performance Assessment Report in accordance with the requirements of the Commission's regulations at 18 C.F.R. § 39.3(c).

The filing consists of this transmittal letter and the following documents:

- **Overview of NERC Activities and Accomplishments in the Five-Year Period**
- **Attachment 1:** Discussion of How NERC Meets the ERO Certification Criteria of 18 C.F.R. §39.3(b)
- **Attachment 2:** Joint Regional Entity Self-Assessment
- **Attachment 3:** NERC Assessment of Regional Entity Delegated Functions
- **Attachment 4:** NERC Consideration of Industry Feedback
- **Attachment 5:** Status of Areas for Improvement Identified in the Order on the Three-Year ERO Performance Assessment
- **Attachment 6:** NERC's Plan and Initiatives for Improving Coordinated Operations Across the ERO Enterprise

These documents are transmitted in two PDF files.

Please place the following persons on the Commission's official service list on behalf of NERC with respect to this submittal and the proceeding that we understand the Commission will open pursuant to 18 C.F.R. § 39.3(c) to consider this report:

Charles A. Berardesco
Senior Vice President and General Counsel
North American Electric Reliability Corporation
1325 G Street, N.W., Suite 600
Washington, D.C. 20005
(202) 400-3000

Attachment 5: Status of Areas for Improvement Identified in the Order on the Three-Year ERO Performance Assessment

Attachment 6: NERC's Plan and Initiatives for Improving Coordinated Operations Across the ERO Enterprise

I. INTRODUCTION

A. Contents of Five-Year ERO Performance Assessment

The North American Electric Reliability Corporation (NERC) is submitting this *Five-Year Electric Reliability Organization (ERO) Performance Assessment Report* in accordance with the Commission's regulations at 18 C.F.R. §39.3(c). NERC was certified by the Commission as the ERO, pursuant to §215(c) of the Federal Power Act (FPA), by Commission order issued July 20, 2006.[1] The Commission's regulations at 18 C.F.R. Part 39 require the ERO to submit an assessment of its performance three years from the date of certification and every five years thereafter.[2] On July 20, 2009, NERC filed its initial, Three-Year ERO Performance Assessment Report with the Commission. On September 16, 2010, the Commission issued an order accepting the three-year performance assessment of NERC and the Regional Entities and found that they continue to satisfy the statutory and regulatory criteria for certification.[3] NERC now submits this *Five-Year ERO Performance Assessment Report* in accordance with the Commission's regulations.

In this *Five-Year ERO Performance Assessment Report*, NERC describes its activities and accomplishments during the assessment period[4] in carrying out its statutory and regulatory responsibilities as the ERO, with a particular focus on the latter part of the assessment period and on NERC's current and planned initiatives. As required by 18 C.F.R. §39.3(c)(1), this report: (i) describes how NERC continues to meet the certification criteria of 18 C.F.R. §39.3(b); (ii)

[1] *Order Certifying the North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing*, 116 FERC ¶ 61,062 (2006).

[2] 18 C.F.R. §39.3(c).

[3] *Order on the Electric Reliability Organization's Three-Year Performance Assessment*, 132 FERC ¶ 61,217 (2010).

[4] NERC defines the assessment period as January 1, 2009 through May 31, 2014.

evaluates of the effectiveness of each Regional Entity in carrying out its delegated functions;[5] and (iii) addresses stakeholder comments on NERC's performance that were collected in the preparation of this report. As noted, this report identifies actions that NERC and the Regional Entities are currently taking and plan to take to continue to improve their operations to enhance the reliable operation of the bulk power system (BPS). Unlike the three-year performance assessment report, NERC has not presented a program area-by-program area discussion of activities because NERC's annual business plan and budgets (and those of the Regional Entities) provide the Commission with an annual, detailed look at NERC's and each Regional Entity's current and planned activities by program area. Instead, this *Five-Year ERO Performance Assessment Report* highlights activities and accomplishments in support of the ERO Enterprise[6] Strategic Plan (Strategic Plan) initiatives applicable to this assessment period. These initiatives include: (i) Reliability Standards reform (both as to the number and content of Reliability Standards and the processes for developing them); (ii) the Reliability Assurance Initiative (RAI) which involves identifying risks to reliability and reformulating the compliance monitoring and enforcement processes to have a risk-based focus; and (iii) the revision of the bulk electric system (BES) definition.

In this *Five-Year ERO Performance Assessment Report*, NERC also demonstrates how the ERO is improving the performance of, and mitigating risks to, the BPS as related to avoidable outages. As detailed in NERC's *State of Reliability 2014* report, the number of BPS transmission-related events resulting in loss of firm load, other than events caused by factors

[5] The eight Regional Entities are: (i) Florida Reliability Coordinating Council, Inc.; (ii) Midwest Reliability Organization; (iii) Northeast Power Coordinating Council, Inc.; (iv) ReliabilityFirst Corporation; (v) SERC Reliability Corporation; (vi) Southwest Power Pool Regional Entity; (vii) Texas Reliability Entity, Inc.; and (viii) Western Electricity Coordinating Council (WECC).

[6] NERC uses the term "ERO Enterprise" to encompass both NERC and the eight Regional Entities.

external to the transmission system's actual performance (i.e., weather-initiated events), decreased from an average of ten per year over a ten year period (2002 through 2011) to seven in 2013. The daily severity risk index value (SRI), a metric created by NERC that measures risk impact or "stress" from events resulting in the loss of transmission, generation, and load, has been stable from 2008 to 2013. Including weather-initiated events, 2013 had no high-stress days, which is within the range of zero to seven days experienced during 2008 through 2013. The availability of the bulk transmission system, as measured by the SRI and other metrics, continues to remain high with no statistically significant change from 2008 to 2013.[7]

Despite the progress made to date in improving the reliability of the BPS and reducing the risks to reliability, opportunities remain for enhancements to ensure that the BPS remains reliable. NERC describes these opportunities, and its initiatives designed to pursue them, in this *Five-Year ERO Performance Assessment Report*. Additionally, in this assessment report, NERC evaluates the effectiveness of each Regional Entity in performing its delegated functions, drawing from NERC's ongoing oversight activities, the Regional Entities' self-assessments, and feedback solicited from industry through an industry survey and posting the Regional Entity self-assessments for stakeholder comment.

Finally, NERC describes how its compliance monitoring and enforcement efforts have matured into a robust program providing industry with greater certainty on actions, outcomes, and reliability consequences. The actions taken by the ERO to identify, correct, and prevent violations of NERC's Reliability Standards have promoted the reliability of the BPS. For example, the adoption, modification, and rigorous enforcement of NERC's transmission vegetation management Reliability Standard (FAC-003), which became mandatory and

[7] NERC's *State of Reliability 2014* report is available at: http://www.nerc.com/pa/RAPA/PA/Performance%20Analysis%20DL/2014_SOR_Final.pdf.

enforceable in 2007, has dramatically reduced the number of outages caused by vegetation growing into high voltage lines. From 2004 through 2008, there were 58 reported outages. By contrast, from 2009 through 2013, only six instances were reported.[8]

B. Industry Engagement

The electric industry has made tremendous strides towards improving reliability since the August 2003 Northeast blackout, which left 50 million customers without power. Enactment of §215 of the FPA, NERC's certification as the ERO, and the adoption of mandatory and enforceable Reliability Standards renewed the industry's focus on reliability. This focus, which includes proactive steps by the ERO to identify and address risks and avoid preventable events, has had a demonstrable and positive impact on reliability.

In passing the Energy Policy Act of 2005, which included the enactment of §215, Congress recognized the importance of an international ERO across North America to ensure the reliability of the BPS. As the ERO, NERC plays a unique role in facilitating industry engagement to create effective approaches for reliability initiatives. For example, industry participation in Reliability Standards development from start to finish is critical. Industry stakeholders participate in Reliability Standards development with increasing frequency since changes to the *Standard Processes Manual* (SPM) became effective June 26, 2013.[9] Stakeholders participate directly by joining standard drafting teams or participating as observers; attending and discussing Reliability Standards at webinars, committee meetings or technical conferences with standard drafting team members and NERC staff; communicating technical opinions directly to standard drafting teams or NERC staff; and commenting and voting on

[8] NERC's quarterly *Vegetation-Related Transmission Outage Reports* are available at: http://www.nerc.com/pa/comp/CE/Pages/vegetation-management-reports.aspx.

[9] The SPM is Appendix 3A to the NERC Rules of Procedure (NERC ROP) and is available at: http://www.nerc.com/pa/Stand/Documents/Appendix_3A_StandardsProcessesManual.pdf.

proposed Reliability Standards. As of May 2014, 858 stakeholder representatives had registered their eligibility to vote on proposed Reliability Standards as members of the Registered Ballot Body, and in 2013 alone NERC hosted 43 Reliability Standard industry webinars attended by an average of 360 participants. During the last six months of 2013, standard drafting teams and five-year review teams made up of 195 industry volunteers participated in 60 team meetings to advance standard development activities.[10]

Industry engagement is also a critical component of NERC's strategic initiatives, such as RAI. Through RAI, NERC and the Regional Entities are adopting a risk-based approach to compliance monitoring and enforcement activities.[11] NERC and the Regional Entities are spearheading RAI, with substantial input from industry representatives on important RAI projects. For example, the ERO Enterprise is examining information flow requirements for registered entity self-reporting and is developing criteria to evaluate the various approaches to reliability risk assessments and internal controls review and testing. Similarly, industry played an important role in the development and implementation of NERC's Find, Fix, Track and Report (FFT) process, an enforcement mechanism that differentiates and processes noncompliance occurrences according to their significance to the reliability of the BPS.

Preparation of this *Five-Year ERO Performance Assessment Report* has benefited from considerable input from industry. On October 31, 2013, NERC distributed a 36-question online survey soliciting numerical ratings and free-form responses from registered entities regarding the performance of NERC and the Regional Entities in carrying out their responsibilities. On March 3, 2014, NERC posted a draft statement of its activities and accomplishments, as well as drafts of

[10] As described later in this *Overview of NERC Activities and Accomplishments in the Five-Year Period*, five-year review teams are engaged in the five-year reviews of those Reliability Standards that have been adopted by the American National Standards Institute (ANSI) as national standards, in accordance with §13.0 of the SPM.

[11] NERC expects to submit an informational filing in 2014 fully describing RAI.

the Regional Entities' self-assessments, on NERC's website for industry comment. On June 17, 2014, NERC posted a complete draft of the *Five-Year ERO Performance Assessment Report* on its website for stakeholder comment. A compilation of the responses to the survey questions and of the comments received on the March 3, 2014 and June 17, 2014 postings, are included as **Attachment 4** to this report.[12]

This *Five-Year ERO Performance Assessment Report* includes the following attachments:

Attachment 1: Discussion of How NERC Meets the ERO Certification Criteria of 18 C.F.R. §39.3(b)

Attachment 2: Joint Regional Entity Self-Assessment[13]

Attachment 3: NERC Assessment of the Regional Entities' Delegated Functions

Attachment 4: NERC Consideration of Industry Feedback

Attachment 5: Status of Areas for Improvement Identified in the Order on the Three-Year ERO Performance Assessment

Attachment 6: NERC's Plan and Initiatives for Improving Coordinated Operations Across the ERO Enterprise

NERC requests that the Commission accept this filing as satisfying NERC's obligation under 18 C.F.R. §39.3(c) to file a performance assessment every five years after the three-year anniversary of its certification as the ERO. Pursuant to 18 C.F.R. §39.3(c), the Commission will initiate a proceeding, with opportunity for public comment, on NERC's *Five-Year ERO Performance Assessment Report*. At the conclusion of the proceeding, the Commission will either issue an order finding that NERC and the Regional Entities meet the statutory and regulatory criteria, or direct them to come into or improve their compliance with

[12] Issues raised by stakeholders, and the responses of NERC and the Regional Entities, are addressed in this report. Industry responses to the survey were discussed at the February 28, 2014 NERC Member Representatives Committee (MRC) meeting, and industry responses to the survey and comments received on the March 3, 2014 posting were discussed at the May 6, 2014 NERC Board of Trustees (NERC Board) meeting.

[13] **Attachment 2** contains both an overall self-assessment of the Regional Entities' collective performance during the assessment period, and individual discussions of how each Regional Entity satisfied the applicable statutory and regulatory criteria including those specified in the Commission's regulations at 18 C.F.R. §39.8.

the requirements of Part 39. Because considerable opportunity has been provided for stakeholder input through the industry survey and the posting of drafts of this report, NERC suggests that the Commission initiate its proceeding by setting a comment period of no more than 45 days on the filed report. Conducting the Commission's proceeding pursuant to §39.3(c) in an expeditious manner will allow NERC and the Regional Entities both to receive timely feedback from commenters and the Commission and to move forward and devote time and resources to the various initiatives outlined in the report. NERC will use the contents of this *Five-Year ERO Performance Assessment Report* and the results of the proceeding to guide the continuing implementation and evolution of its programs in the years ahead.

II. NERC ACTIVITIES AND ACCOMPLISHMENTS

This section describes activities and initiatives that NERC has completed during the assessment period, has in progress, or plans to commence in the near future, to enhance the reliability of the BPS and to increase the effectiveness and efficiency of the operations of the ERO Enterprise. NERC focuses this discussion on the following five areas: (i) development of clear, reasonable and technically sound Reliability Standards; (ii) registration of entities with functional responsibilities for the reliability of the BPS; (iii) monitoring and enforcing compliance with Reliability Standards; (iv) identification, prioritization and dissemination of information on risks to the reliability of the BPS; and (v) collecting and sharing information on cybersecurity and threats to the cyber and physical security of the BPS.

A. The ERO Is Transitioning NERC Reliability Standards to a Steady-State

Since the three-year performance assessment, NERC has made great strides in transforming Reliability Standards to a steady-state, which NERC defines as a stable set of clear, concise, high-quality, and technically sound Reliability Standards. Steady-state Reliability Standards are results-based and include requirements that promote reliability. They are

sustainable (stable), necessary for accountability, and sufficient to maintain the reliability of the BPS. After a set of steady-state Reliability Standards is fully developed, it is expected that Reliability Standards will only need to be amended in response to changes in risks, technology, practices, and similar changes. In support of this objective, during the assessment period, NERC focused on addressing FERC directives and conducting periodic reviews of Reliability Standards. NERC expects to complete the development of a set of steady-state Reliability Standards in 2015.

NERC's efforts to arrive at steady-state Reliability Standards would not have been possible without strong participation from industry stakeholders, FERC staff, the NERC Standards Committee (SC), and other NERC committees and working groups, including the Reliability Issues Steering Committee (RISC) and the Standards Process Improvement Group (SPIG), the NERC Board, and the NERC MRC. Arriving at a set of steady-state Reliability Standards required changes in NERC's Reliability Standards development process. The SPIG identified needed changes to the process. These changes were implemented through amendments to the SPM that became effective on June 26, 2013, upon Commission approval.[14]

The currently effective *Reliability Standards Development Plan 2014-2016* (RSDP), approved by the NERC Board in November 2013, endorses the objective of arriving at steady-state Reliability Standards.[15] It specifically defines "steady-state" as a stable set of clear, concise, high quality, and technically sound Reliability Standards that are results-based and that exclude requirements that do little to promote reliability. The 2014-2016 RSDP prioritizes future Reliability Standards projects as high, medium, low or pending technical committee input based

[14] *Order Approving Revisions to Electric Reliability Organization's Standard Processes Manual*, 143 FERC ¶ 61,273 (2013).

[15] *Reliability Standards Development Plan 2014-2016* is available at: http://www.nerc.com/pa/Stand/Pages/ReliabilityStandardsDevelopmentPlan.aspx.

on a series of inputs, which include the Standards Independent Expert Review Panel's (IERP or Panel) content and quality assessments (discussed later in this document). Prioritization considerations were influenced by: (i) RISC category rankings (also described later in this document); (ii) outstanding regulatory directives; (iii) regulatory deadlines; (iv) Paragraph 81 retirement candidates (also described below); (v) content and quality assessments by the IERP (also described below); and (vi) additional considerations such as fill-in-the-blank status and five-year review assessment commitments.

During the assessment period, NERC launched several initiatives to improve Reliability Standards, including: (i) the results-based Reliability Standards initiative; (ii) the Paragraph 81 project; (iii) the reorganization of the Reliability Standards department; and (iv) the establishment of the IERP. Each of these initiatives built upon the prior initiative, resulting in a comprehensive set of criteria by which to evaluate whether a Reliability Standard has reached its steady-state.

Since the three-year performance assessment, NERC initiated the results-based concept for developing the content of Reliability Standards. Each requirement of a results-based Reliability Standard identifies a measurable outcome such as: (i) a stated level of reliability performance; (ii) a reduction in a specified reliability risk (prevention); or (iii) a necessary competency. In 2011, NERC began training standard drafting teams to write results-based Reliability Standards. In 2013, the Commission approved the first Reliability Standard that resulted from that effort, FAC-003-2 – Transmission Vegetation Management.[16] NERC is in the process of converting major families of Reliability Standards into results-based Reliability

[16] *Revisions to Reliability Standard for Transmission Vegetation Management*, 142 FERC ¶ 61,208 (2013).

Standards.[17] These Reliability Standards include those dealing with long-term planning, reliability coordination, and real-time operations.[18]

In 2012, in response to FERC's invitation to NERC in a March 15, 2012 Order, NERC and industry conducted the Paragraph 81 project, which identified and retired requirements from Reliability Standards that did little to support reliability.[19] The criteria developed to scrutinize existing requirements in Reliability Standards in response to the Commission's Paragraph 81 invitation continue to be used by standard drafting teams to evaluate the need for proposed requirements in new Reliability Standards development projects.[20]

In further support of the development of steady-state Reliability Standards, NERC reorganized its Standards department in 2013 to focus resources on addressing FERC directives, conducting periodic reviews of Reliability Standards, and completing ongoing Reliability Standards development projects. NERC also conducted a parallel effort to identify future work necessary to transform the Reliability Standards to steady-state, by establishing the IERP to evaluate the content and quality of every requirement in the NERC Reliability Standards. The Panel established its own criteria, which included those developed in the Paragraph 81 project, to

[17] The terms "families of standards" refers to groupings of Reliability Standards that address a common subject matter area, e.g., Emergency Preparedness and Operations (EOP), Personnel Performance, Training and Qualifications (PER), and Protection and Controls (PRC).

[18] NERC revised the Transmission Planning (TPL) Reliability Standards and a single consolidated Reliability Standard approved by FERC; revisions to the Transmission Operations (TOP), Interconnection Reliability Operations and Coordination (IRO), Modeling (MOD), and Voltage and Reactive (VAR) standards are pending FERC approval.

[19] "Paragraph 81" refers to P 81 of the Commission's March 15, 2012 Order on NERC's FFT process, in which the Commission invited NERC (as well as the Regional Entities and other stakeholders) to identify specific standards requirements that could be revised or removed because they provide little protection for BPS reliability or are redundant. *Order Accepting with Conditions the Electric Reliability Organization's Petition Requesting Approval of New Enforcement Mechanisms and Requiring Compliance Filing*, 138 FERC ¶ 61,193 (2012) (March 2012 FFT Order), at P 81. *See* §II.A.3 below for a more detailed description of the Paragraph 81 initiative.

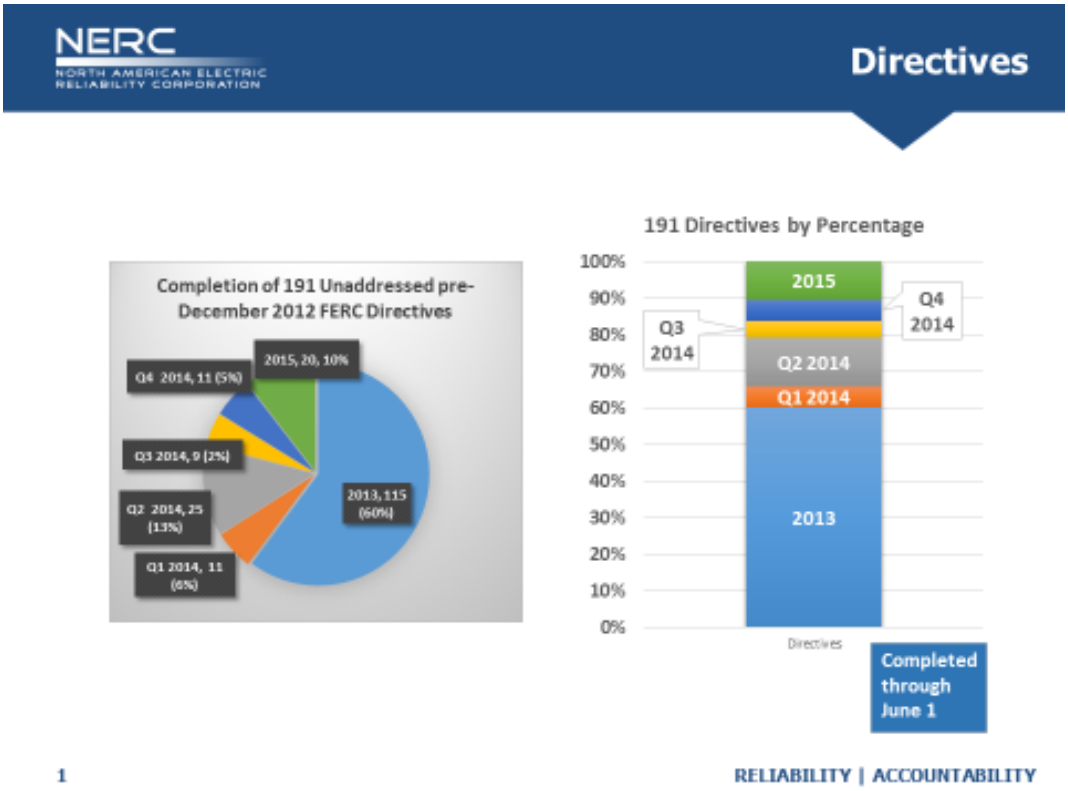
[20] The Paragraph 81 criteria are outlined in the Phase I *Paragraph 81 Project Technical White Paper* available at: http://www.nerc.com/pa/Stand/Project%20201302%20Paragraph%2081%20RF/P81_Phase_I_technical_white_paper_FINAL.pdf.

determine whether a requirement was steady-state or needed further revisions. The Panel's recommendations set the course for arriving at high quality, results-based Reliability Standards with sustainable requirements. NERC is preparing training materials for standard drafting teams to highlight the use of the Panel's methods for content and quality assessments of Reliability Standards.

NERC has also been diligent in assessing the need for Reliability Standards that address reliability gaps. Sections II.A.8.a through e below discuss five important areas of Reliability Standards development focusing on reliability risk: (i) the Critical Infrastructure Protection (CIP) Version 5 Reliability Standards; (ii) vegetation management (formerly a top ten cause of outage events); (iii) protection system maintenance and testing; (iv) geomagnetic disturbances (GMD) (a high-impact, low-frequency risk to the BPS which does not readily manifest in reliability performance data, but nonetheless represents a significant risk to the BPS); and (v) the physical security Reliability Standard.

A more recent initiative to assist with the achievement of steady-state Reliability Standards is the development of a template for enhanced periodic reviews of Reliability Standards that have not yet been revised through other Reliability Standards development projects. NERC is working with industry stakeholders to develop the necessary criteria for determining which Reliability Standards will be subject to these enhanced periodic reviews as well as whether the Reliability Standards have reached their steady-state. NERC expects the criteria to include those from the results-based Reliability Standards initiative, the Paragraph 81 project and the IERP. Upon reaching a consensus with industry on the criteria for evaluating whether a requirement is steady-state, and after completing the projects identified in the ERO's 2014-2016 RSDP and the ERO's 2015-2017 RSDP, NERC will apply the criteria to the

Reliability Standards through enhanced periodic reviews beginning in 2015.[21]



1. Completing Commission Directives

During this assessment period, NERC made significant progress in reducing the number of Commission directives involving Reliability Standards. Addressing these directives is a priority to facilitate the transformation to steady-state.[22] The status of NERC's efforts in addressing Reliability Standards-related directives is reported on a quarterly basis to the NERC Standards Oversight and Technology Committee (SOTC). At the February 2014 SOTC meeting, NERC reported that 128 directives had been addressed by year-end 2013, with 107 directives remaining to be addressed. NERC continues to report the status of completion at every SOTC meeting and anticipates that 90% of FERC directives issued to date will be resolved during the first half of 2015.

[21] The 2014-2016 RSDP identified 18 Reliability Standard development projects completed in 2013 or scheduled to be completed by the first quarter of 2014. It also identified 13 projects that were to be completed thereafter.

On June 20, 2014, the draft 2015-2017 RSDP was posted for industry comment. Currently, it identifies 27 projects that have been completed or are in progress, many of which were newly introduced in 2014. Eight of these 27 projects have been approved by the Registered Ballot Body, approved by the NERC Board, and filed with FERC for approval, and 12 are anticipated to be completed in 2014. The draft 2015-2017 RSDP identifies the remaining seven projects that will extend into 2015, with completion anticipated in the first half of the year. Additionally, four new projects for 2015 are identified. Completion of these projects will position NERC to begin enhanced periodic reviews in late 2015.

[22] Directives may be addressed by: (i) completing the directive as assigned; (ii) addressing the reliability concern of the directive in an equally effective and efficient manner; or (iii) providing persuasive reasoning as to why the directive is no longer necessary.

FERC has been instrumental in reducing the number of outstanding directives, as well. On November 21, 2013, in its order addressing the Paragraph 81 project, the Commission withdrew 41 directives, 24 of which were related to Reliability Standards, effective January 21, 2014.[23] The Commission identified Reliability Standards-related directives for withdrawal based on the following three guidelines:

(1) Whether the reliability concern underlying the outstanding directive has been addressed in some manner, rendering the directive stale;

(2) Whether the outstanding directive provides general guidance for Reliability Standards development rather than a specific directive; and

(3) Whether the outstanding directive is redundant with another directive.

[23] *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, 145 FERC ¶ 61,147 (2013).

FERC staff participation on standard drafting teams has also been instrumental in addressing Reliability Standards directives. Increased participation by FERC staff allows their concerns to be raised early in the Reliability Standard development process and for issues to be vetted with industry. This open dialogue translates into fewer directives in FERC orders.

2. The Standards Independent Experts Review Panel

To set the foundation for a steady-state body of Reliability Standards, NERC established the IERP to evaluate the existing families of Reliability Standards and requirements. The Panel consisted of five independent industry experts and a sixth participant from FERC staff. Their areas of experience and competence included power systems engineering, relaying, transmission system planning, transmission and power system operations (including control center operations and dispatching, generation operations, transmission operations, and maintenance). The independent consultants brought executive leadership, experience from all three U.S. interconnections, experience with investor-owned utilities and public power as well as with vertically integrated and regional transmission organizations/independent system operator (RTO/ISO) market environments and small entities. The Panel also had experience working with Canadian provinces and Mexico. The Commission participant offered thorough knowledge of previous FERC orders and an understanding of the contributions of the requirements of various Reliability Standards to BPS reliability.

Due to the ongoing evolution of NERC's Reliability Standards, the Panel addressed requirements from two groups of Reliability Standards: (i) Reliability Standards that were, or would become, enforceable in 2013 (Enforceable in 2013 Standards); and (ii) Reliability Standards that will be enforceable in the future (Future Enforceable Standards). The Future Enforceable Standards and requirements included both Enforceable in 2013 Reliability Standards and those that, at the time of the Panel's report, had been approved by the NERC Board or by the

FERC and were currently pending enforceability.[24] Requirements pending replacement by approved Reliability Standards were not included in this group.

The Panel issued its report in June 2013 and presented the report to the NERC Board in August 2013. In the report, the Panel outlined a vision for how to transform the NERC Reliability Standards to steady-state. The Panel made seven short-term recommendations, three longer-term recommendations and seven additional recommendations.[25] The Panel's main recommendation was to retire 147 existing requirements of Reliability Standards, address seven areas (high-level gaps) not currently addressed by the Reliability Standards, and complete Reliability Standards development projects to address gaps within individual requirements. The Panel also made recommendations regarding compliance monitoring, prioritization for addressing the identified gaps, using risk to determine whether a future Reliability Standard is needed, and use of the Panel's identified criteria to determine quality and content as future Reliability Standards are developed. Finally, the Panel recommended a new construct to further consolidate Reliability Standards and required actions.

In evaluating whether a requirement should be retired, the Panel assessed whether each requirement: (i) did not support a reliability principle; (ii) met the Paragraph 81 criteria for retirement; or (iii) was better suited as a guideline rather than as a part of a Reliability Standard. For the requirements that the Panel did not recommend for retirement, the Panel applied content and quality criteria to examine whether they were steady-state or needed additional work. Specifically, the Panel examined the following content criteria: (i) whether the content of the

[24] The June 2013 report, *Standards Independent Experts Review Project – An Independent Review by Industry Experts*, is available at: http://www.nerc.com/pa/Stand/Standards%20Development%20Plan%20Library/Standards_Independent_Experts_Review_Project_Report.pdf.

[25] *Id*., p. 16-17.

requirement is technically correct, including identifying who does what and when; (ii) whether the requirement identifies the correct functional entities; and (iii) whether there are appropriate actions for which there should be accountability included or there is a gap. Additionally, the Panel examined the following quality criteria:

(1) Whether the requirement should stand alone or be consolidated with other Reliability Standards;

(2) Whether the requirement was drafted as a results-based standard;

(3) Whether a requirement is technologically neutral;

(4) Whether the requirement aligns with the purpose of the Reliability Standard;

(5) Whether the requirement is a higher solution than the lowest common denominator;

(6) Whether the requirement is measureable;

(7) Whether the requirement has a technical basis in engineering and operations;

(8) Whether the requirement is complete and self-contained;

(9) Whether the language is clear and does not contain ambiguous or outdated terms;

(10) Whether the requirement can be practically implemented; and

(11) Whether the requirement uses consistent terminology.

The Panel evaluated whether these remaining requirements addressed a risk to reliability by examining: (i) the ranking developed by the NERC RISC; (ii) the violation risk factor (VRF) for each requirement; and (iii) the Panel members' professional judgment.

These recommendations have been pivotal in NERC's evaluations of the Reliability Standards by standard drafting team subject matter experts (SME). Furthermore, the Panel's recommendations have been used to inform standard drafting teams and NERC's annual RSDPs, including the current, 2014-2016 RSDP. The potential reliability gaps identified by the IERP have been evaluated by the RISC and are assigned in some cases to active drafting projects. The

IERP recommendations that apply to Reliability Standards that are not part of active drafting projects are assigned to teams that conduct periodic reviews of Reliability Standards in the future for consideration.[26]

3. Implementation of the Paragraph 81 Project

The Paragraph 81 project was a separate project, carried out during the assessment period, in which requirements were recommended for retirement. This project stemmed from paragraph 81 of the Commission's March 15, 2012 FFT Order, in which the Commission invited NERC (and other interested entities) to propose specific Reliability Standards or requirements for revision or retirement if they did not provide meaningful benefit to BPS reliability. In response, NERC began the Paragraph 81 project to identify and retire Reliability Standards requirements that have little or no effect on reliability. As discussed above, the project established a set of criteria for evaluating whether a requirement should be considered for retirement.[27]

This initiative is reducing and simplifying the set of Reliability Standards with which registered entities must comply and which the ERO must monitor and enforce. This reduction in the body of requirements enables both the ERO and registered entities to redirect resources to matters posing greater risks to the reliability of the BPS and to ensure that the costs of reliability are proportionate to the benefits.

[26] These future periodic reviews are required by §13 of the SPM.

[27] For a detailed discussion of criteria used to determine if a Reliability Standard requirement should be retired, *see Paragraph 81 Project Technical White Paper* (December 20, 2012), available at: http://www.nerc.com/pa/Stand/Project%20201302%20Paragraph%2081%20RF/P81_Phase_I_technical_white_paper_FINAL.pdf.

In February 2013, NERC filed a petition with FERC to retire 34 requirements or sub-requirements within 19 Reliability Standards.[28] In its June 20, 2013 notice of proposed rulemaking (NOPR), the Commission indicated agreement that the requirements proposed for retirement either: (i) provided little protection for BPS reliability; or (ii) were redundant with other aspects of Reliability Standards. In addition, in the NOPR, the Commission proposed to withdraw several outstanding Commission directives relating to Reliability Standards.[29] On November 21, 2013, the Commission issued an order approving, as proposed in the NOPR, the retirement of 34 requirements and sub-requirements within 19 Reliability Standards, and withdrawing the identified directives effective January 21, 2014 (the Retirement Effective Date).[30] As noted above, the retirement of these requirements is enabling both the ERO and registered entities to redirect resources to matters posing greater risks to the reliability of the BPS and to ensure that the costs of reliability are proportionate to the benefits.

In the period leading up to the Retirement Effective Date, Regional Entities did not actively monitor compliance with the 34 retired requirements, nor did they process any new or existing possible violations of these retired requirements. Regional Entities also documented removal of any of the 34 retired requirements from Compliance Audit scopes in the final Compliance Audit reports for those audits. Within 30 days of the Retirement Effective Date, Regional Entities dismissed existing possible violations of the requirements being retired and issued dismissal letters to the registered entities.

[28] *Petition of the North American Electric Reliability Corporation for Approval of Retirement of Requirements in Reliability Standards*, Docket No. RM13-8-000 (Feb. 28, 2013).

[29] *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, Notice of Proposed Rulemaking, 143 FERC ¶ 61,251 (2013).

[30] *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, 145 FERC ¶ 61,147 (2013).

In addition to the 34 requirements that the Commission approved for retirement, stakeholders submitted an additional 217 requirements for consideration for retirement. NERC is examining whether to retire these requirements through individual Reliability Standards development projects. Progress on this retirement effort is reported to the SOTC on a quarterly basis. As of the February 2014 SOTC meeting, 179 out of 281 recommendations had been addressed, 79 were under consideration in either a current project or in a periodic review, and 23 had not yet been assigned to a project.

4. Development of Compliance Assessment Tools Concurrently with Reliability Standards Development

Over time, one of the key improvement opportunities identified for NERC Reliability Standards has been to strengthen the connection between standard drafting teams and the compliance program, in order to clarify the expectations of Reliability Standard requirements. Two efforts at clarifying Reliability Standard requirements, but which ultimately illustrated the need for greater involvement of the Compliance department in the Reliability Standards development process, were the Compliance Application Notice (CAN) initiative and the Reliability Standard Audit Worksheets (RSAWs). CANs were notices drafted to respond to questions regarding how to assess compliance with specific Reliability Standards. CANs were posted on the NERC website to provide transparency to industry; however, since they were drafted well after the Reliability Standard was developed, the compliance assessment positions articulated in the CANs often varied from industry's perspective of the intent of the Reliability Standard or requirement. Similarly, prior to 2013, NERC developed RSAWs after regulatory approval of a Reliability Standard.

The CAN process demonstrated the need for concurrent development and dialogue between standard drafting teams and NERC Compliance Operations staff. As a result, in 2013,

NERC began incorporating the development of compliance assessment information into the Reliability Standards development process. After June 2013, informal development project teams began posting documents during standards development titled "compliance input." These documents provided questions from industry and answers developed by Compliance staff regarding how to assess compliance for specific requirements, or phrases in the requirements. This basic tool opened the door for conversation between the standard drafting teams and Compliance staff. It also allowed for conversation regarding the wording of requirements and the effect of that wording on how compliance would be assessed.

NERC then created an inter-departmental team to examine the development of RSAWs, which resulted in an internal policy on the development of RSAWs concurrent with Reliability Standards development projects. The policy included the following provisions:

(1) Coordinating input between standard drafting teams and NERC Compliance staff;

(2) Posting a draft RSAW during the formal comment period and prior to the ballot period for a Reliability Standard, allowing stakeholders to provide comments or to raise concerns at that time;[31] and

(3) Continuing to involve Regional Entity Compliance staffs in drafting RSAWs to strengthen compliance consensus throughout the ERO and capture additional subject matter expertise.

Today, RSAWs are written concurrently with new Reliability Standard development projects. They provide information regarding compliance assessment and testing. Reliability Standards staff leads coordination between the Standards and Compliance departments. Each Reliability Standards project is assigned dedicated staff support led by Compliance staff. Additionally, NERC Compliance staff are coordinating with Regional Entity Compliance staffs. This increased and ongoing coordination will help ensure that standard drafting teams, NERC

[31] The RSAWs themselves are not subject to the ballot.

and Regional Entity Compliance staffs and RSAWs are aligned as to the intent of Reliability Standards. By creating a uniform understanding of compliance expectations for each Reliability Standard early in the development process, the need for interpretations or other forms of subsequent compliance guidance should be reduced.

NERC Compliance staff will continue to supply standard drafting teams with compliance and enforcement information, statistics, and perspectives to help develop Reliability Standards that provide an increased reliability benefit and clarify compliance risks. Compliance staff will continue collaborating with industry and Reliability Standards staff early in the Reliability Standards development process in order to understand the intent of Reliability Standards under development and provide feedback on the proposed language of Reliability Standards. Finally, as described in greater detail in §II.C.2 and 4 below, NERC is working to provide training to auditors and industry on how to assess compliance with a new or revised Reliability Standard. This training is provided following FERC approval of a Reliability Standard, but well before its effective date.

5. Review of Regional Reliability Standards

A Regional Entity can propose adoption of a regional Reliability Standard to implement requirements that are more stringent than the continent-wide requirement, and/or to address a reliability concern that is unique to that Regional Entity and not addressed in a continent-wide Reliability Standard.[32] Today, a regional Reliability Standard requirement may be developed as a separate regional Reliability Standard or as an addendum to a continent-wide Reliability Standard. NERC is considering, based on the recommendations from the Panel, commissioning a team to evaluate regional Reliability Standards to identify candidates for retirement,

[32] **Attachment 3**, NERC Assessment of the Regional Entities' Delegated Functions, contains a discussion of each Regional Entity's regional Reliability Standards development activity during the assessment period.

consolidation with continent-wide Reliability Standards, or incorporation as variances within continent-wide Reliability Standards. The regional Reliability Standards that are not identified as candidates for retirement or consolidation should align with continent-wide Reliability Standards.

6. Improvements in the Reliability Standards Development Process

Transforming NERC Reliability Standards to a steady-state required changes to how NERC identified and resolved issues through the Reliability Standards development process. Implementing these changes was possible due to strong participation from industry stakeholders, the NERC SC and other NERC committees and workgroups, specifically the RISC, the SPIG, and the NERC technical committees, as well as FERC staff. The NERC Board and the NERC MRC also provided strong support to implement the changes.

a. Revisions to the *Standard Processes Manual* and Related Improvements

NERC's Reliability Standards development process is defined in the SPM, Appendix 3A to the NERC ROP. The SPM governs all NERC activities related to the development, approval, revision, reaffirmation, and withdrawal of Reliability Standards, interpretations, VRFs, violation severity levels (VSLs), definitions, variances, and reference documents developed to support Reliability Standards. It also addresses the respective roles of the NERC SC, standard drafting teams, and Registered Ballot Body members in the stakeholder process. Upon FERC's approval of revisions to the SPM in June 2013, NERC, the NERC SC, and stakeholders began implementing the approved changes into the Reliability Standards development process.

The revisions to the SPM were initiated in February 2012, when the NERC Board, in consultation with the NERC MRC, formed the SPIG.[33] The NERC Board tasked the SPIG with achieving the following objectives: (i) provide clarity on the reliability objectives, technical parameters, scope and relative priority of Reliability Standards; (ii) review the Reliability Standard drafting process to ensure that Reliability Standards contain specific technical content; and (iii) assess Reliability Standards project management.

After gathering input from stakeholders, the SPIG made five recommendations to modify the way NERC develops Reliability Standards.[34] Based on these recommendations, NERC worked with stakeholders to develop revisions to the SPM. In these revisions, NERC:

(1) Revised the composition of standard drafting teams to ensure that they are appropriately equipped to meet reliability objectives, namely by adding legal and compliance experts;

(2) Incorporated references to compliance assessment tool development, such as RSAWs, cooperatively and in parallel with Reliability Standard drafting;

(3) Streamlined commenting and balloting provisions as follows:

  (a) Allowing summary responses to comments;

  (b) Eliminating the obligation to respond in writing at every stage of the comment process; and

  (c) Eliminating negative votes without comments in the calculation of consensus.

(4) Incorporated the following provisions:

  (a) Quality review conducted in parallel with Reliability Standards development;

  (b) Guidance for the appropriate role and scope of interpretations, to be consistent with guidance from the NERC Board; and

[33] The SPIG is composed of the MRC chair and vice chair, other MRC members, two members of the NERC Board, the NERC chief executive officer (CEO), and the NERC SC chair.

[34] The SPIG's *Recommendations to Improve the NERC Standards Development Process* report is available on the NERC website at: http://www.nerc.com/pa/Stand/Standards%20Processes%20Manual%20revisions%20SPIG%20Recommen/Standards_Process_Input_Group_04.24.12_ver_8_FINAL.pdf.

(c) A waiver provision to allow for modifications to the Reliability Standards development process for good cause, with five days' notice and reporting of the exercise of a waiver to the NERC SOTC.

(5) Reduced the requirement for periodic reviews to be consistent with ANSI minimum requirements.

These improvements provide a balanced flexibility to the process, enabling NERC and industry to address pressing reliability issues on accelerated timeframes if necessary. Further, with the changes, the Reliability Standards development process continues to meet ANSI requirements. The Commission approved the proposed revisions on June 26, 2013, agreeing that these changes enable greater flexibility and efficiency.[35] Reliability Standards development projects initiated and completed after FERC's approval of the SPM changes have shown both significant increases in efficiency and improvements in the quality of the product.

In addition to the revisions to the SPM, NERC has implemented additional enhancements to the Reliability Standards development process. In conjunction with implementing changes to the SPM, in 2013, NERC spearheaded an "informal development" effort, which uses informal groups composed of industry subject matter experts to conduct early outreach to industry stakeholders prior to initiating formal development of new or revised Reliability Standards. This early outreach encourages stakeholder conversations to obtain inputs on the proposed Reliability Standards development project. This approach is positively affecting how standard drafting teams are conducting their work. The periodic reviews conducted in 2013 followed this same approach, acting as a tool for gathering stakeholder input. Recommendations from each periodic review team are then implemented through subsequently-formed standard drafting teams.

The most significant improvement from the changes to the Reliability Standards development process has been in the amount of time required to develop a quality Reliability

[35] *Order Approving Revisions to Electric Reliability Organization's Standard Processes Manual*, 143 FERC ¶ 61,273 (2013), at P 18.

Standard. As reported in the *Analysis of NERC Standards Process Results, Fourth Quarter 2013* filing,[36] the baselines for the amounts of time to revise an existing Reliability Standard and to develop a new Reliability Standard were approximately 27 months and 40 months, respectively. The amount of time to produce each of the Reliability Standard development projects that began formal development under the revised SPM was dramatically reduced.[37] Approximately six projects completed formal development, from posting the standard authorization request to being adopted by the NERC Board, in less than seven months.[38] Two other projects completed formal development in ten months.[39]

The changes to the standard development process have provided benefits in terms of standard drafting team management and staffing. The reduced time needed to develop a Reliability Standard combined with the fact that standard drafting team meetings are held closer together in time provide registered entities and other participants with increased flexibility in staffing standard drafting teams. As a result, standard drafting team members are able to stay more focused on the Reliability Standard development project.

The speed and efficiency of the process, particularly at the standard drafting team stage, have also benefited from the following process improvements:

- Smaller standard drafting teams with appropriate expertise have increased the ability to conduct activities and respond to stakeholders in a more-timely and effective manner;

---

[36] Available at: http://www.nerc.com/FilingsOrders/us/NERC%20Filings%20to%20FERC%20DL/Analysis_of_NERC_Standards_Process_Results_Q4_FINAL.pdf.

[37] The projects were: (i) 2010-01 – Training (PER); (ii) 2010-03 – Modeling Data (MOD B); (iii) 2010-04 – Demand Data (MOD C); (iv) 2012-05 – ATC Revisions (MOD A); and (v) 2013-04 – Voltage and Reactive Control (VAR).

[38] The six projects were: (i) GMD Phase 1; (ii) INT; (iii) Physical Security (CIP-014); (iv) MOD A; (v) MOD B; and (vi) PER projects; one of the two Reliability Standards in the VAR project (VAR-001) also met this benchmark.

[39] The two other projects were: (i) the remaining Reliability Standard in the VAR project (VAR-002); and (ii) the MOD C project.

- Open communication and concurrent development of compliance assessment tools have addressed compliance questions and allowed for clarification of compliance intentions during Reliability Standards development;

- Summary responses to comments has allowed standard drafting teams to consider stakeholder inputs, modify the draft Reliability Standard in response to those inputs, and repost it for industry review more quickly (as short as 1.5 weeks); summary responses are more concise while still addressing the issues, and provide visibility into the concerns in an easily digestible format;

- Not considering negative votes without comments in the calculation of consensus encourages entities to provide constructive comments, providing better insight into the issues for the standard drafting teams;

- Coordinating quality review in parallel with standard development has eliminated an additional step (that previously could require 4 to 6 weeks) from the process and improved focus on quality at an earlier stage; and

- Granting the NERC SC authority to waive provisions in the SPM for good cause gives the SC the ability to respond to urgent reliability issues. A recent example, discussed in §II.A.8.e below, is the development of Reliability Standard CIP-014-1 – Physical Security, in less than 90 days.

Another improvement resulting from the SPM revisions, which is also associated with increased outreach and communication, is the partnership created between NERC staff, standard drafting teams, and the NERC SC. Additionally, FERC staff has been providing early input regarding their perspectives during the standards development process, thereby giving standard drafting teams the opportunity to weigh those inputs early in the process. Based on experience to date, NERC anticipates that this open dialogue will result in FERC orders with either no directives or a significantly reduced number of directives.

The NERC SC, under the NERC Board's direction, also developed a strategic plan and work plan, as well as a revised charter, all of which were approved by the NERC Board on February 6, 2014.[40] These actions were designed to increase the NERC SC's effectiveness, efficiency, and ability to deliver high quality Reliability Standards. The *Standards Committee*

[40] The *Standards Committee Strategic Work Plan 2014-2016*, *Standards Committee Strategic Plan*, and amended *Standards Committee Charter* are available at: http://www.nerc.com/comm/SC/Pages/default.aspx.

Strategic Plan is a five-year plan that sets the vision and mission for the NERC SC, describes the guiding principles for the NERC SC, and sets the foundation for refocusing the activities of the NERC SC. The *Standards Committee Strategic Work Plan* is the tactical implementation of the *Standards Committee Strategic Plan*. The revised *Standards Committee Charter* clarifies the NERC SC's role in the development of steady-state Reliability Standards that provide for the reliability of the BPS, and ensures that the NERC SC develops a multi-year strategic vision that describes the goals and direction for the development of Reliability Standards consistent with the strategic and business plans of NERC.

Additionally, the NERC SC created a new subcommittee, the Process Management and Oversight Subcommittee (PMOS), that acts as an industry and standard drafting team partner. This subcommittee assigns a representative to each standard drafting team for the purpose of oversight. The oversight includes such actions as assisting the standard drafting team in understanding any stakeholder concerns, reaching out to stakeholders if they do not understand the actions being taken by the standard drafting team, being partners in reviewing the Reliability Standards for quality, and assisting with advice on a range of topics from direction to posting schedules. The PMOS has assisted standard drafting teams in avoiding or overcoming hurdles during the process.

The revisions made to the SPM and other changes made to the Reliability Standards development process, including strengthened partnerships among standard drafting teams, the NERC SC, and NERC staff, are showing great promise as improvements to the process, in terms of improving efficiency, speed and quality. These improvements have allowed the ERO to make significant progress towards achieving a body of steady-state Reliability Standards. The 2015-2107 RSDP will reflect that most, if not all, FERC directives and recommendations for

retirement (both from the Paragraph 81 project and the IERP review) will be addressed in 2015, and it will provide an opportunity for a strategic review of the Reliability Standards.

b. Formation and Work of the Reliability Issues Steering Committee

In response to the SPIG's recommendations, the NERC Board formed the NERC RISC in August 2012 to establish a collaborative effort at the industry leadership level to set priorities on issues of importance to the BPS. The RISC is composed of industry executives and thought leaders, including representatives from the NERC Operating, Planning, Standards, Critical Infrastructure Protection, and Compliance and Certification Committees. The RISC is an advisory committee that reports directly to the NERC Board, focusing on triaging and providing front-end, high-level leadership and accountability for issues of strategic importance to BPS reliability. The RISC assists the NERC Board, NERC technical committees, NERC staff, regulators, Regional Entities, and industry stakeholders in establishing a common understanding of the scope, priority, and goals for the development of solutions to address these issues. In doing so, the RISC provides a framework for steering, developing, formalizing, and organizing recommendations to help NERC and the industry effectively focus their resources on the critical means to improve the reliability of the BPS. In some cases, that includes recommending reliability solutions other than the development of new or revised Reliability Standards and offering high-level stakeholder leadership engagement and input on issues that enter the Reliability Standards process. In other cases, the development of a new Reliability Standard or modification of an existing Reliability Standard may be the best way to address a particular issue.

The NERC SC works closely with the RISC and the NERC technical committees, creating an alignment of focus on specific issues. The chairs of the technical committees and NERC SC are members of the RISC, which strengthens the needed coordination.

The RISC is developing a triage process to address other reliability issues that are brought to the NERC SC, whether through a standards authorization request or another mechanism. This process will include a review by the RISC to determine whether the issue is a risk to the reliability of the BPS and, if so, the priority of investing ERO and stakeholder resources to resolve the issue. This review will aid in focusing resources on the resolution of the most important issues.

The RISC also provides input into prioritizing Reliability Standards development activities by providing input to the RSDP in two ways: first, by considering whether the projects identified in the RSDP address areas of risk for the BPS; and second, by developing a priority rank for each of the projects.

In considering whether each of the projects addresses an area of risk for the BPS, the NERC RISC considers whether there are outstanding FERC directives or any recommendations for retirement, either from the Paragraph 81 project or the IERP, that could be addressed by the project.

In reviewing the priority of each project, the RISC provides a mechanism for addressing any scheduling conflicts between projects through the development process.[41] In its initial analysis, the RISC identified four high-priority focus areas for Reliability Standards: (i) cyber attacks; (ii) workforce capability and human error; (iii) protection systems; and (iv) monitoring and situational awareness. The RISC presented these priorities to the NERC Board in February 2013. In response, the NERC Board directed the RISC to conduct further analysis of the issues identified as high and medium priority. The NERC Board also directed that the RISC's input be integrated into the overall ERO planning process. NERC staff is implementing process steps to

[41] RISC reviewed and provided input on the use of RISC's rankings in project prioritization.

meet this objective. Subsequently, the RISC issued an updated report in August 2013 identifying a fifth area of focus: adaptation and planning for change.[42]

In addition to the activities described above, in November 2012, the RISC participated in a NERC-sponsored conference in which reliability topics were discussed with technical experts. The conference, conducted as a series of panel discussions, highlighted several existing and emerging reliability risks and created an opportunity for informed dialogue about technical topics. A second conference, the Reliability Leadership Summit, was held in October 2013, with key industry decision-makers gathering to discuss reliability priorities and industry trends.[43]

Efforts to review the risk areas identified by the RISC and to develop appropriate risk management strategies are ongoing. Integrating these priorities into the annual business plan and budget process will be a cornerstone of NERC's annual planning process going forward. To effect this change in planning, NERC has developed the Reliability Risk Management (RRM) process, a multi-year strategy development method that uses industry expertise through the RISC and other standing committees to develop actionable, measureable efforts to manage reliability risk. The RRM process is discussed in detail below in §II.D.1.

c. Realignment of Resources in the Reliability Standards Program

NERC is constantly assessing the alignment of resources to be responsive to the changes necessary to move the NERC Reliability Standards to a steady-state. In 2013, NERC realigned resources in its Reliability Standards department by creating multiple small teams of Reliability Standards developers and one team focused on information management. This realignment focused resources on the production of Reliability Standards rather than on executing and

[42] *ERO Priorities – RISC Updates and Recommendations* is available at: http://www.nerc.com/comm/RISC/Related%20Files%20DL/RISC_Priority_Recommendations-Jul_26_2013.pdf.

[43] NERC intends for this summit meeting to be an annual event; the next Reliability Leadership Summit is scheduled for September 2014.

monitoring the development process, thereby increasing the throughput to complete outstanding projects and resolve outstanding directives. In 2013, each of the three "developer" teams was assigned one of the following high-level goals:

(1) Resolving directives;

(2) Conducting the required five-year reviews for current Reliability Standards;[44] or

(3) Overseeing emerging issue projects and the completion of remaining open projects.

The small developer teams closely coordinate with one another to ensure a balance in workload and to create an expertise in each of the major work areas.

Additionally, NERC has improved the composition of standard drafting teams by enhancing the selection process to identify, for each project, the necessary technical, writing, and project management expertise to form a balanced team that will foster improved effectiveness and enhanced efficiency. Standard drafting teams also now receive increased NERC staff support, including dedicated legal support, for each project. Each standard development project is staffed by a lead standard developer, and many projects have a second supporting standard developer. Standard developers provide project management and facilitation experience as well as additional skills, including technical writing, legal skills, and outreach/consensus-building skills, to the standard drafting team, which contributes to the development of high-quality Reliability Standards. With this enhanced staffing, standard drafting teams are better able to reach milestones and build consensus among industry stakeholders in advance of balloting. Further, NERC now provides facilitation training to all newly appointed standard drafting team leaders. Finally, NERC has developed a Standards Development Process Participant Conduct

[44] Section 13.0 of the revised SPM now requires periodic reviews every five years for those Reliability Standards that have been adopted by ANSI as an American national standard, and every ten years for all other Reliability Standards.

Policy to ensure that the Reliability Standards development process is conducted in a professional and constructive environment.

d. Developing and Implementing Procedures for the Cost-Effective Analysis Process

NERC has developed the Cost-Effective Analysis Process (CEAP) in response to requests by registered entities and regulators to incorporate consideration of costs more directly into Reliability Standard development activity.[45] The CEAP affords stakeholders an opportunity to share projected cost information regarding implementation of draft Reliability Standards and provides the opportunity to offer alternatives that would be equally, or more, efficient at achieving the reliability objective of the draft Reliability Standard while also taking into consideration implementation costs. CEAP has been used for a limited number of new and revised Reliability Standards projects, with limited success. NERC continues to explore options for improving both the process and the quality of the resulting information.

The current CEAP process provides for a two-phase process for identifying projected implementation costs. The first phase of the CEAP, identified as the Cost Impact Analysis, is conducted during the standard authorization request stage of Reliability Standard development. It provides an opportunity to identify approximate implementation costs associated with a proposed Reliability Standard prior to its development. Information related to the mission and forecasted implementation costs of the proposed Reliability Standard is collected from the industry during the initial standard authorization request comment period. The information collected is shared with the NERC SC and the standard drafting team, and is posted on the NERC website.

[45] This was an issue raised in response to the five-year performance assessment survey.

The second phase of the CEAP, identified as the cost effective analysis, typically comes after the draft Reliability Standard is developed by the standard drafting team and is ready for the first combined formal comment period and ballot. During this phase, NERC again solicits industry to provide forecasted implementation costs of the proposed requirements and to propose alternative methods to achieve the proposed Reliability Standard's reliability objective more efficiently. Any alternative proposals provided by industry during this phase should contain sufficient technical justification, and if possible, cost comparison data for consideration.

7. Improved Stakeholder Access to Reliability Standards Information

All Reliability Standards are available to stakeholders through NERC's public website, including: (i) Reliability Standards that are currently enforceable in specific jurisdictions (i.e., in the U.S. and Canadian provinces); (ii) Reliability Standards pending regulatory approval; (iii) Reliability Standards approved by the NERC Board and pending regulatory filing; and (iv) Reliability Standards no longer subject to enforcement. In 2012, NERC launched an improved interface to allow stakeholders to filter the complete set of Reliability Standards so that they could identify which Reliability Standards are applicable to their respective registered functions. Work is ongoing to improve the completeness and timeliness of this information for non-U.S. jurisdictions (i.e., Canadian provinces or Mexico).

Additionally, beginning in 2013, interested entities can track current Reliability Standards development projects in a publicly posted spreadsheet, the *Project Tracking Spreadsheet*.[46] NERC updates this spreadsheet monthly. The spreadsheet also provides a link to the projects page, the deliverables, the number of Paragraph 81 requirements, the number of regulatory directives or guidance, the PMOS liaison assigned to the project, the NERC standards developer,

[46] NERC regularly updates the *Project Tracking Spreadsheet: 2014 Project Work Plan* and the link to the file is located on the left side of NERC's Standards webpage available at: http://www.nerc.com/pa/Stand/Pages/Default.aspx.

and a month-by-month timeline. Also in 2013, NERC began posting the *Projected Standards Posting Schedule*, which provides the industry with an outlook of near term postings.

8. Specific Reliability Standards Projects

a. Critical Infrastructure Protection Version 5 Reliability Standards

On November 22, 2013, the Commission issued Order No. 791 approving the Critical Infrastructure Protection Version 5 (CIP Version 5) Reliability Standards.[47] The CIP Version 5 Reliability Standards provide a cybersecurity framework for the categorization and protection of BES cyber systems to support the reliable operation of the grid. NERC worked with industry to ensure that the CIP Version 5 Reliability Standards address the differing roles of each registered entity in the operation of the BES, the criticality and vulnerability of the BES cyber systems needed to support BES reliability, and the risks to which the BES cyber systems are exposed. In Order No. 791, the Commission found that CIP Version 5 is an improvement over the currently approved CIP Reliability Standards. The Commission also determined that categorizing BES cyber systems based on their impact on the reliable operation of the BES (Low, Medium, or High), with all BES cyber systems categorized as at least Low Impact, offers more comprehensive protection of the BES.[48] The Commission directed NERC to address several new directives, some of which must be addressed within a year. To meet these directives, NERC has established a standard drafting team and set an aggressive schedule to address all the Commission's concerns, consistent with the timeline set by the Commission.

In Order No. 791, the Commission also approved NERC's proposal to bypass CIP Version 4 and move directly to implement CIP Version 5. Recognizing that registered entities

[47] *Version 5 Critical Infrastructure Protection Reliability Standards*, Order No. 791, 145 FERC ¶ 61,160 (2013).

[48] In Order No. 791, the Commission directed NERC to develop modifications to address specified concerns with the CIP Version 5 standards, including: (i) the "identify, assess, and correct" language; (ii) protections for Low Impact BES Cyber Systems; (iii) the risks posed by transient devices; and (iv) the protection of communication networks.

are in various stages of implementation of CIP Versions 3 and 4, NERC tackled the need for flexibility as well as the need to identify and address the associated transition challenges for industry. In October 2013, NERC launched the CIP Version 5 Transition Implementation Study (CIP Version 5 Study) to collect and to evaluate relevant data from select responsible entities regarding their experience in implementing CIP Version 5 requirements. Through this study, NERC is identifying successful implementation methods and challenges that the industry faces in transitioning to CIP Version 5. On October 11, 2013, NERC submitted an informational filing to the Commission that described how the CIP Version 5 Study would assist responsible entities in making the transition to CIP Version 5.[49] As part of the CIP Version 5 Study, NERC selected a group of six responsible entities, based on factors including willingness to participate, past performance under the CIP Reliability Standards, and expected relevance to the CIP Version 5 Study's goals. NERC is sharing the experience and information obtained through the CIP Version 5 Study with industry throughout the study period. NERC will also prepare a final report that synthesizes the study participants' experiences in applying CIP Version 5. The report will focus on the effectiveness of meeting the CIP Version 5 requirements and the methods employed during implementation. The report will also focus on the following:

(1) Methods, approaches, and policies that were effective in implementing the technical controls of CIP Version 5;

(2) Tools, policies, and training that were effective in aligning employees' skills and cooperation with the responsible entity's mission and the CIP Version 5 Reliability Standards;

(3) Hurdles encountered by the participating responsible entities and the relevant outcomes; and

(4) Requirements and concepts of CIP Version 5 that the responsible entities had difficulty implementing and why.

[49] *Informational Filing of the North American Electric Reliability Corporation Regarding the CIP Version 5 Reliability Standards Implementation Study*, Docket No. RM13-5-000 (Oct. 11, 2013).

b. Transmission Vegetation Management

During the assessment period, the Commission approved two new versions of the FAC-003 Reliability Standard. In Order No. 777,[50] the Commission approved NERC's proposed FAC-003-2, a Reliability Standard that requires responsible entities to minimize encroachments from vegetation located adjacent to transmission rights-of-way and within a transmission owner's control. Historically, vegetation-related outages have been a recurring contributor to blackouts. In fact, inadequate vegetation management practices causing tree contact was one of the initiating causes of the 2003 Northeast blackout. Industry compliance with FAC-003-2, together with a continued industry focus on best practices for vegetation management, enhances the reliability of the BPS.

FAC-003-2 is the first results-based Reliability Standard approved by the Commission, and contains several improvements over FAC-003-1. For example, while FAC-003-2 continues to apply to overhead transmission lines operated at or above 200 kV, it additionally applies to any lower voltage overhead transmission line that is either an element of an interconnection reliability operating limit or a major WECC transfer path. Another improvement is that FAC-003-2 makes explicit a transmission owner's obligation to prevent an encroachment into the minimum vegetation clearance distance for a line subject to this standard, regardless of whether that encroachment results in a sustained outage or fault. FAC-003-2 also requires transmission owners, for the first time, to annually inspect all transmission lines subject to the Reliability Standard and complete 100 percent of their annual vegetation management work plan.

[50] *Revisions to Reliability Standard for Transmission Vegetation Management*, Order No. 777, 142 FERC ¶ 61,208 (2013) (Order No. 777).

On September 19, 2013, the Commission approved FAC-003-3,[51] which extends FAC-003-2 vegetation management requirements to certain generator interconnection facilities to address a reliability gap that existed when the requirements only applied to transmission owners. Certain generator owners with overhead lines, particularly those with generator interconnection facilities longer than one mile and which run through areas that may be densely populated with trees and other plants, are now also required to perform vegetation management of those lines. For purposes of this Reliability Standard, these lines are treated as transmission lines.

NERC is conducting additional research relating to vegetation management issues in response to Commission directives in Order No. 777. The Commission directed NERC to conduct or contract testing to develop empirical data regarding the flashover distances between conductors and vegetation.[52] To carry out this project, NERC is contracting support to conduct the necessary research and testing that will provide empirical evidence to statistically validate the calculation of the minimum vegetation clearance distances (MVCD), as specified in Reliability Standard FAC-003-3. Significant industry support for the application of the Gallet Equation, which uses the gap factor to calculate MVCD, was a key factor in achieving approval for this NERC Reliability Standard. A final report summarizing this research will be filed with the Commission in June 2015 and will advise the Commission about the issues encountered and how best to address them.

c. Protection System Maintenance and Testing

NERC has identified protection systems, and in particular reduction of protection system misoperations, as a top reliability priority. Likewise, the RISC has named protection systems as one of four high priority areas to be addressed in Reliability Standards. In particular, properly

[51] *Generator Requirements at the Transmission Interface*, 144 FERC ¶ 61,221 (2013).

[52] Order No. 777 at P 59.

maintaining protection systems supports the ERO's goal of reducing protection systems misoperations. By reducing misoperations, maintenance and testing of protection systems helps provide reliable system performance when responding to abnormal system conditions.

In 2007, NERC initiated Project 2007-17 – Protection System Maintenance and Testing – to consolidate four currently enforceable Reliability Standards[53] that pertain to various aspects of maintenance and testing of protection and control systems into a single Reliability Standard, PRC-005-2. This project also seeks to address: (i) certain Commission directives from Order No. 693 related to these four Reliability Standards;[54] and (ii) fundamental issues identified by the NERC System Protection and Control Task Force (SPCTF) in its assessment of these four Reliability Standards.

On December 19, 2013, the Commission approved Reliability Standard PRC-005-2,[55] Protection System Maintenance, which establishes requirements for a time-based maintenance program, where all relevant devices are maintained according to prescribed maximum

[53] The four Reliability Standards at issue were PRC-005-1, PRC-008-0, PRC-011-0, and PRC-017-0. *See NERC SPCTF Assessment of Standards: PRC-005-1 — Transmission and Generation Protection System Maintenance and Testing, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs, PRC-011-0 — UVLS System Maintenance and Testing, PRC-017-0 — Special Protection System Maintenance and Testing*, Mar. 8, 2007 (SPCTF Assessment), available at: http://www.nerc.com/docs/standards/sar/PRC-005-008-011-017_Report_Approved_by_PC.pdf.

A supplement to the SPCTF Assessment was also considered. *See NERC SPCTF Supplemental Assessment Addressing FERC Order 693 Relative to PRC-005-1 — Transmission and Generation Protection System Maintenance and Testing, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs, PRC-011-0 — UVLS System Maintenance and Testing, PRC-017-0 — Special Protection System Maintenance and Testing*, May 17, 2007, available at: http://www.nerc.com/docs/pc/spctf/Supplemental_Report_on_PRC-005-008-011-017_Approved_by_PC_2.pdf.

[54] The Commission approved Reliability Standard PRC-005-1 in Order No. 693 and directed NERC "to develop a modification … through the Reliability Standards development process that includes a requirement that maintenance and testing of a protection system must be carried out within a maximum allowable interval that is appropriate to the type of the protection system and its impact on the reliability of the Bulk-Power System." The Commission also directed NERC to consider suggestions made by commenters to "combine PRC-005, PRC-008, PRC-011, and PRC-017 into a single Reliability Standard." Order No. 693 at P 1475.

[55] On March 30, 2011, NERC submitted a petition for Commission approval of a proposed modification to the definition of "Protection System" to close a reliability gap created by an omission in the prior definition. The Commission approved the modified definition, which is used in PRC-005-2. *See North American Electric Reliability Corporation*, 138 FERC ¶ 61,095 (2012).

intervals.[56] It also establishes requirements for a condition-based maintenance program, where the hands-on maintenance intervals are adjusted to reflect the known and reported condition of the relevant devices. For a performance-based maintenance program, the hands-on maintenance intervals are adjusted to reflect the historical performance of the relevant devices. PRC-005-2 also provides a comprehensive set of requirements that define a strong protection systems maintenance program. It also includes detailed tables of minimum maintenance activities and maximum maintenance intervals for all five component types addressed within the NERC definition of protection system. Functional entities that monitor the actual condition of their protection system components are further empowered to utilize monitoring to improve the efficiency and effectiveness of their protection systems maintenance program. With the benefit of extensive protection system performance data, these entities will improve the efficiency and effectiveness of their programs.

This Reliability Standard will go into effect on April 1, 2015, and implementation will continue over a twelve-year phased-in period, which includes milestones for implementation during the implementation timeframes. In furtherance of the important issues surrounding the maintenance and testing of protection systems, the System Protection and Control Subcommittee (SPCS) issued a report that suggested improving commissioning practices through: (i) analysis of protection system misoperations; (ii) sharing of lessons learned; and (iii) development of an industry reference document on protection system commissioning practices.[57]

[56] *Protection System Maintenance Reliability Standard*, 145 FERC ¶ 61,253 (2013)

[57] *See* the Planning Committee-approved final report, *SPCS Response to Standards Committee Request for Research*, (Mar. 5, 2013), available at: http://www.nerc.com/docs/pc/spctf/SPCS%20Commissioning%20Testing%20Response_Final.pdf.

d. Geomagnetic Disturbances

As high-impact, low-frequency (HILF) events, severe GMDs pose a unique threat to BPS reliability. NERC is committed to working with stakeholders and the Commission to mitigate the risks posed by such events. The science concerning GMDs is still maturing and there is significant disagreement in the scientific and manufacturing communities about the most likely effects of a GMD event on the BPS, but NERC recognizes the potential for GMDs to adversely affect the BPS. Occurrences such as the 1989 event in Hydro-Québec demonstrate that severe solar storms have potential to cause loss of reactive power support, voltage instability, relay misoperations, and possibly equipment loss of life or damage to the BPS.

Through the efforts of the Geomagnetic Disturbance Task Force (GMDTF), NERC released the *2012 Special Reliability Assessment Interim Report: Effects of Geomagnetic Disturbances on the Bulk Power System* in February 2012.[58] The GMDTF identified four recommendations for industry in the report:

(1) Improve tools for industry planners to develop geomagnetic mitigation strategies;

(2) Improve tools for system operators to manage geomagnetic impacts;

(3) Develop education and information exchanges between researchers and industry; and

(4) Review the need for enhanced NERC Reliability Standards.

With implementation of these recommendations well underway, the Commission issued Order No. 779 concerning Reliability Standards for GMDs on May 16, 2013.[59] In Order No. 779, the Commission directed NERC to submit for approval proposed Reliability Standards that address the impact of GMD on the reliable operation of the BPS, in two stages. In the first stage,

[58] Available at: http://www.nerc.com/pa/stand/pages/geomagnetic-disturbance-resource.aspx.

[59] *Reliability Standards for Geomagnetic Disturbances*, Order No. 779, 143 FERC ¶ 61,147 (2013).

NERC was directed to develop one or more Reliability Standards that require owners and operators of the BPS to implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the BPS. On November 14, 2013, well within the six-month time frame directed by the Commission, NERC submitted a petition requesting Commission approval of the first GMD Reliability Standard.[60] The proposed standard, EOP-010-1, requires entities to develop tailored operating plans, processes, and procedures.

In the second stage, NERC was directed to submit one or more Reliability Standards that require owners and operators of the BPS to conduct initial and on-going assessments of the potential impact of benchmark GMD events on BPS equipment and the BPS as a whole. NERC and the standard drafting team assigned to develop GMD Reliability Standards have completed development of a technically justified benchmark GMD event during the first half of 2014 in preparation for completion of Reliability Standard development in late 2014.

The following efforts resulting from implementation activities have been important in supporting development of technically sound Reliability Standards, as ordered by the Commission:

(1) Development of operating procedure templates for transmission operators that reflect best practices and consensus among technical experts;

(2) Improved ground conductivity models that represent the geological regions of North America and a published guidance for modeling geomagnetically-induced current; and

(3) Initiation of a transformer modeling and testing project to validate models used to assess the effects of geomagnetically-induced current on transformers.

NERC is continuing efforts to expand the technical foundation for understanding the potential impact of GMD by supporting the work of the GMDTF and collaborative research with

[60] *Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standard EOP-010-1 – Geomagnetic Disturbance Operations*, Docket No. RM14-1-000 (Nov. 14, 2013).

the Electric Power Research Institute, U.S. Geological Survey, Natural Resources Canada, and other public and private research organizations. The GMDTF and the Electric Power Research Institute are giving focused attention toward improving the suite of publicly available and technically valid tools, guidelines, and transformer models to evaluate potential impacts of GMD. The results of this work will support registered entities in conducting vulnerability assessments as required by the second stage Reliability Standards being developed in response to Order No. 779.

e. Physical Security Reliability Standard

On March 7, 2014, FERC issued an order directing NERC to submit for approval, within 90 days of the order, one or more Reliability Standards to address physical security risks and vulnerabilities of critical facilities on the BPS. FERC's order focused on critical facilities, directing steps to evaluate physical security threats and implement security plans that continues NERC's ongoing physical security efforts. In the order, FERC stated, among other things, that the proposed Reliability Standard(s) should require entities to take at least the following three steps:

(1) Perform a risk assessment to identify facilities that, if damaged or rendered inoperable, could result in instability, uncontrolled separation, or cascading failures on the BPS;

(2) Evaluate the potential threats and vulnerabilities to those identified facilities; and

(3) Develop and implement a security plan designed to protect against physical attacks to those identified facilities based on the assessment of the potential threats and vulnerabilities to their physical security.

The Commission's order also specified that the Reliability Standard should require procedures for a third party to verify the list of identified facilities and add or remove facilities from the list, procedures for a third party to review the evaluation of threats and vulnerabilities and the

physical security plan, and that the three steps listed above be periodically re-evaluated and revised.

In response to the order, NERC staff and the NERC SC worked together to develop an action plan for meeting the June 5, 2014 deadline. The NERC SC approved several waivers to facilitate meeting the required timelines and formed the eleven member standard drafting team on March 21, 2014. Also on March 21, 2014, the NERC SC approved waivers to support drafting activities to meet the June 5, 2014 deadline. Additionally, on March 21, 2014, the NERC SC also accepted the Project 2014-04 standard authorization request for a seven calendar-day informal comment period posting, pursuant to the NERC SC-approved waiver. On April 1, 2014, NERC staff convened a technical conference to focus stakeholder discussion on developing a draft of a Physical Security Reliability Standard, with the intent of assisting the standard drafting team to quickly develop and post a Reliability Standard for comment and ballot. The conference provided a forum for industry input on the concepts in the draft Reliability Standard, to include criteria for determining applicable entities, identification of critical facilities, evaluation of potential threats and vulnerabilities, development and implementation of physical security plans, and the proposed standard's implementation plan. NERC Compliance staff also provided an overview of the RSAW approach.

The Physical Security standard drafting team developed the proposed Reliability Standard, CIP-014-1 through the Reliability Standards development process. The Reliability Standard was posted under a NERC SC-approved waiver for a 15-day concurrent comment and initial ballot period from April 10, 2014 through April 24, 2014. The initial ballot achieved a quorum of 88.60 percent and an industry approval of 82.07 percent. The final ballot was posted, under an SC-approved waiver, for a 5-day period from May 1, 2014 through May 5, 2014 and

achieved a quorum of 92.53 percent and an industry approval of 85.61 percent. The NERC Board adopted the standard on May 13, 2014, and it was filed with FERC by NERC on May 23, 2014.

B. The ERO Is Implementing Processes to Register Entities Commensurate with Risk to the Bulk Power System

The starting point for the ERO's program for monitoring and enforcing compliance with Commission-approved Reliability Standards is its processes for comprehensively identifying and registering owners, operators and users of the BPS that are responsible for performing reliability-related functions in accordance with the approved Reliability Standards. This section discusses major enhancements to the registration process initiated during the assessment period.

1. Improved Registration Processes, Information Systems, and Methods Across Regional Entities

NERC's organization registration process identifies entities that are responsible for compliance with the Commission-approved Reliability Standards. Entities that are registered are included on the NERC Compliance Registry (NCR) and are responsible for compliance with all applicable Reliability Standards. Pursuant to Section 500 of the NERC ROP and the terms of the approved Regional Entity delegation agreements (RDAs), the Regional Entities are responsible to provide timely and accurate information to NERC relating to registrations to enable NERC to maintain a NCR that is accurate and up-to-date.[61] To further consistency and increase transparency in registrations across the Regional Entities, as well as to address the problem of obtaining timely updates of registration information from entities, NERC developed a Common Registration Form (CRF) which registered entities use to provide the Regional Entities with real-

[61] The amended and restated RDAs, effective January 1, 2011, included revisions to the provisions concerning the Regional Entities' responsibilities in the registration process. In addition, revisions to the registration criteria and registration processes were effectuated through amendments to NERC ROP Section 500, Appendix 5A, *Organization Registration and Certification Manual*, and Appendix 5B, *Statement of Compliance Registry Criteria*, during the assessment period.

time updates of the information recorded in the NCR pertaining to ownership, operations, contact information, asset lists and other information that may affect registration status. A corollary benefit of the CRF is that it serves as a check for the Regional Entities to ensure that owners, users, and operators of the BPS are appropriately registered. NERC is also undertaking an effort to map all the inter-relationships between registered entities on the NCR, to ensure that all owners, users and operators of the BPS are registered in the NCR.

In January 2014, NERC launched the Risk-based Registration Assessment Initiative to enhance the compliance registration and certification program to be more efficient and better aligned with reliability benefit. Through this initiative, NERC will register entities and assign appropriate Reliability Standard requirements commensurate with the need to mitigate the risk that each entity poses to the BES, by scaling registration criteria based on their contributions to reliability. NERC will also develop tools that will enhance registered entities' understanding of the relevant Reliability Standards and requirements that apply to them. Scoping compliance responsibilities according to BPS reliability risks equates to better use of resources at both the registered entity level in the implementation of compliance programs, and at the Regional Entity level in their overall compliance monitoring efforts.

2. BES Definition

During the assessment period, NERC revised the definition of the BES in the NERC *Glossary of Terms Used in Reliability Standards*, in response to Commission directives in Order Nos. 743 and 743-A.[62] The objective of the revisions is to ensure consistent inclusion or exclusion of entities and elements that are subject to Reliability Standard requirements. With the strong support and participation of industry representatives and the Regional Entities, NERC

[62] *Revision to Electric Reliability Organization Definition of Bulk Electric System*, Order No. 743, 133 FERC ¶ 61,150 (2010), *order on reh'g*, Order No. 743-A, 134 FERC ¶ 61,210 (2011).

delivered a technically grounded and legally supportable foundation for identifying the elements and facilities that comprise the BES.

In Phase 1 of this process, NERC proposed to eliminate regional discretion and establish a bright-line threshold that includes in the BES all facilities operated at or above 100 kV. The Commission accepted the revised definition in Order No. 773.[63] NERC also identified specific categories of facilities and configurations as inclusions and exclusions to the BES definition. These inclusions and exclusions are set forth in the revised BES definition. The process for requesting an inclusion or exclusion in or from the BES, is set forth in Appendix 5C, *Procedure for Requesting and Receiving an Exception from the Definition of the Bulk Electric System*, of NERC's ROP, which FERC has also approved.[64] Appendix 5C establishes an exception process to bring elements within, or remove elements from, the BES definition on a case-by-case basis.

In Phase 2 of the BES definition process, NERC addressed additional regulatory directives from Order Nos. 773 and 773-A, as well as industry comments received during Phase 1. As part of Phase 2, and with industry input, NERC proposed substantive changes to Inclusion I4 (dispersed power producing resources), Exclusion E1 (radial systems), Exclusion E3 (local networks), and Exclusion E4 (reactive power devices). The Commission approved the additional proposed revisions to the BES definition in an order issued March 20, 2014.[65]

The Commission-approved revised BES definition enables NERC and the Regional Entities to identify assets that are material to the reliability of the interconnected transmission

[64] Available at: http://www.nerc.com/FilingsOrders/us/RuleOfProcedureDL/Appendix_5C_ProcForReqAndRecExFromAppOfNERCDefBES_20140701.pdf.

[65] *North American Electric Reliability Corporation, Order Approving Revised Definition*, 146 FERC ¶ 61,199 (2014).

network. By using a set of continent-wide, "bright line" criteria that eliminates regional discretion, the revised definition effectively ensures that the users, owners and operators of BES assets are identified and registered on a consistent basis in order to comply with applicable Reliability Standards. The revised BES definition provides improved clarity for industry by identifying specific categories of facilities and configurations as inclusions and exclusions to the BES. Additionally, the case-by-case exception process to add elements to, and to remove elements from, the BES provides transparency and uniformity to the determinations of what constitutes the BES.

To implement the revised BES definition, which became effective on July 1, 2014, NERC developed a web-based, ERO Enterprise-wide application, the BESnet Enterprise Application Tool (BESnet tool), to provide a consistent platform for registered entities to submit self-determined notifications and to submit exception requests for inclusions in or exclusions from the BES. Once a registered entity applies the BES definition to a specific element within its system, it must notify its applicable Regional Entity of any newly identified system elements that are inclusions or exclusions (i.e., system elements with changed BES classifications under the revised BES definition). Inclusion and exception decisions on the self-determined notifications are made by the Regional Entity through the BESnet tool in order to support uniform reviews and evaluations by the Regional Entity and NERC. If a Regional Entity receives notification of a self-determined exclusion, then it must evaluate whether that registered entity can stop its compliance obligations for that excluded system element. If a Regional Entity receives notification of a self-determined inclusion, then the Regional Entity must evaluate whether that registered entity should take steps to bring that system element into compliance with applicable Reliability Standard requirements within a fixed implementation period. NERC

will also use the BESnet tool to manage associated support materials and records related to technical reviews by the Regional Entities and NERC.

NERC is finalizing implementation materials that will guide the consistent evaluation of inclusions, exclusions and self-notifications of BES elements across the ERO Enterprise. NERC has created a single portal location to provide a central site to obtain useful materials to support registered entities' review of their BES elements. Additionally, the BES exception process was identified by NERC and the Regional Entity Management Group as having sufficient similarities in business processes and function across the ERO to be deemed an ERO Enterprise application, which will be used by both NERC and the Regional Entities to eliminate disparate applications across the ERO. NERC is also developing a Reliability Standard reference document to explain the intended application of the BES definition to yield consistent results. Development of additional reference documents to promote further consistency across the ERO Enterprise includes:[66]

(1) *BES Definition Reference Document*, which addresses how to apply the BES definition using several examples;

(2) *BES Definition Implementation Guidance*, which shows how the Regional Entities and NERC will review self-determined notifications and includes a high-level summary of notification requirements; and

(3) *BES Exception Request Evaluation Guideline*, which demonstrates how the Regional Entities and NERC will evaluate exception requests, and provides a high-level summary of the exception request evidentiary requirements.

During the first two quarters of 2014, NERC held communications and training sessions for Regional Entities, registered entities, and NERC staff to address, among other things: (i) evidentiary requirements for BES determinations; (ii) review and appeal mechanisms; and (iii) Reliability Standards applicability. These sessions included workshops and webinars.

[66] *See* the Bulk Electric System (BES) Definition, Notification, and Exception Process Page at: http://www.nerc.com/pa/rapa/pages/bes.aspx.

C. The ERO Monitors and Enforces Compliance with Reliability Standards in an Efficient and Transparent Manner Using Enforcement Processes that Match the Risk and Importance of Possible Violations to BPS Reliability

A key, strategic transformation that NERC, in collaboration with the Regional Entities and stakeholders, embarked upon during the assessment period is the construction of a risk-based model for compliance monitoring and enforcement. This risk-based approach enables NERC to focus ERO and industry resource investment on the most important issues to BPS reliability. In this section of the assessment report, NERC highlights initiatives to improve the Compliance Monitoring and Enforcement Program (CMEP) during the assessment period, including the FFT program. The FFT program and its subsequent enhancements began to implement this risk-based approach. The FFT program enables the ERO Enterprise to achieve major efficiencies in enforcement. Through the use of FFT, the ERO resolves noncompliances that pose a lesser risk to BPS reliability more efficiently, recognizing that efficient disposition of such issues allows the ERO Enterprise and industry to devote its emphasis and resources to more important reliability matters. Further, through careful planning and coordination and collaboration between NERC and the Regional Entities, NERC has achieved major enforcement efficiencies. These efforts have also resulted in a drastically reduced NERC caseload; for the past two years, NERC and the Regional Entities have worked to eliminate all items in the caseload which are older than 24 months. In 2012, that effort resulted in a reduction of those items by 80%. In 2013, the ERO Enterprise reduced those items by 93%. By the end of 2013, only 65 violations in inventory were older than 24 months. Additionally, taking advantage of the FFT process, which provides incentives for self-reporting, registered entities continue to aggressively self-identify, self-report and mitigate reliability issues.

Building upon the success of FFT through the RAI, NERC and the Regional Entities created additional incentives to discourage poor performance and encourage positive behaviors

that contribute to higher accountability and improved reliability performance. RAI processes that promote more effective reliability risk mitigation by encouraging development and enhancement of internal management controls and corrective action programs at registered entities began to be implemented in 2013.[67]

1. Compliance Enforcement Initiative and Find, Fix, Track and Report

Recognizing the need and the importance of ensuring that reliability risks are addressed properly through a scaled approach, NERC devised the FFT initiative in 2011 as a risk control strategy that differentiates and addresses compliance issues according to their significance to the reliability of the BPS. FFT emphasizes proportionality and enforcement discretion. The FFT process enables NERC to report lesser-risk possible violations of Reliability Standards through a streamlined process that results in the posting of a minimal record associated with the noncompliance on NERC's website.[68] The FFT initiative illustrates that NERC continually reevaluates, redirects and rebalances its CMEP implementation efforts.

NERC developed FFT in conjunction with the Regional Entities. The development of the process benefited from collaboration with representatives of registered entities through a series of focus groups. During these focus group sessions, participants indicated that registered entities typically allocated time and resources equally among violations, regardless of the risk to reliability posed by each violation. Implementation of the FFT initiative was the first step towards addressing this mis-allocation of resources.

Since the launch of FFT in 2011, NERC has implemented additional enhancements to the process. Specifically, NERC expanded FFT treatment to: (i) a limited pool of possible moderate

[67] As noted previously, NERC will submit a separate informational filing to the Commission describing these processes.

[68] In contrast, NERC submits violations that pose a greater risk to reliability or do not otherwise meet the FFT criteria to the Commission in a spreadsheet Notice of Penalty (SNOP) or full Notice of Penalty (NOP) format.

risk violations; and (ii) some unmitigated possible violations so long as mitigation occurs within 90 days from the date the FFT item is filed or posted. To streamline processing of FFT items, NERC now posts FFTs collected by the Regional Entities on its website at the end of each month without prior review of such items. This replaces the prior procedure in which NERC submitted monthly informational filings to the Commission describing FFT items. While the Regional Entities post FFT items on a monthly basis, NERC maintains its enforcement oversight by reviewing a representative sample of FFTs during the 60-day window following the Regional Entities' monthly postings and by conducting an annual spot check of FFTs.

The FFT program has been highly successful in promoting a risk-based approach to resolving noncompliance. All Regional Entities utilize FFT to resolve a large number of minimal risk issues. Further, through its monthly reviews and annual spot checks, NERC verifies that the parameters for identifying minimal risk issues are consistently applied throughout the ERO Enterprise.

2. Reliability Assurance Initiative

In November 2012, NERC management proposed RAI as a multi-year effort to identify and implement changes to enhance the effectiveness of the ERO Enterprise's compliance and enforcement functions. RAI will help NERC foster consistency and efficiency in its compliance monitoring and enforcement processes. NERC expects RAI to improve BPS reliability by refocusing efforts on serious and substantial reliability risks and promoting the development and enhancement of the internal controls that mitigate those risks. Increased consistency in the ERO Enterprise's compliance and enforcement efforts yields a level of predictability for registered entities to understand how Reliability Standards are applied and enforced and to model positive behaviors.

To foster dialogue and seek industry feedback on the various aspects of RAI, NERC hosted a series of workshops in 2013 that addressed defining internal controls, conducting risk assessment, launching pilot programs, enhancing the FFT process, and improving self-reporting.

a. RAI Improvements to Compliance Monitoring Processes

The core concept of risk-based compliance monitoring is intended to guide Regional Entities in allocating resources for compliance monitoring activities and methods based on a registered entity's potential impact on the BPS. Compliance-related activities under the RAI program will help achieve a risk-based approach for compliance monitoring by evaluating current compliance monitoring practices, identifying improvements, and addressing the consistent application of audit techniques and the use of uniform tools to carry out compliance monitoring activities.

In 2013, NERC and the Regional Entities began to develop and implement tools that will define techniques and methods to perform compliance monitoring in a consistent manner across the ERO Enterprise. The Regional Entities began using the first of these tools, the *Compliance Auditor Checklist*, in August 2013. In December 2013, NERC and the Regional Entities completed the first draft of a companion document for the *Compliance Auditor Checklist*, specifically, the *Compliance Auditor Handbook*, as found in the *ERO Enterprise Compliance Auditor Manual* (Auditor Manual). NERC disseminated the Auditor Manual and provided initial training to Regional Entity auditors during the first quarter of 2014. In the second quarter of 2014, the Regional Entities began to use the Auditor Manual and its related processes and procedures on a select number of audits. Throughout 2014, NERC and the Regional Entities will revise and expand the Auditor Manual to address additional audit topics, reflect additional processes developed through RAI activities, and include lessons learned.

A second key RAI compliance activity, the Prototypes and Pilot program, focuses on the development and implementation of a formalized approach to risk assessments and testing of management controls. NERC and the Regional Entities initiated the first phase of the Prototypes and Pilot program during 2013. This phase explored different approaches to applying risk-based auditing concepts (e.g., audit scoping, reliability risk assessments, and management controls review and testing). For 2014 and beyond, a team consisting of NERC, Regional Entity, and industry representatives as well as an independent audit consultant will evaluate the findings and determine the best audit approach to implement throughout the ERO enterprise.

NERC and the Regional Entities are also developing and implementing activities that will address the transition to CIP Version 5 and redesign the tools and information available for compliance monitoring. In addition, and as discussed in further detail below, NERC and the Regional Entities have consolidated the annual CMEP Implementation Plans with the goal of implementing certain risk-based compliance enhancements.

b. RAI Improvements to Compliance Enforcement Processes

The enforcement aspect of the RAI builds on the success of FFT to develop incentives for registered entities to distinguish between poor performance and positive behaviors that contribute to higher accountability and improved reliability performance. The RAI calls for NERC to do the following by 2016: (i) exercise discretion to focus resources on the most serious and substantial risks to the reliability of the BPS; and (ii) empower registered entities to self-identify, mitigate and record noncompliance subject to NERC and Regional Entity oversight.

Similar to the RAI compliance monitoring effort, the enforcement element of RAI seeks to align the ERO's enforcement processing activities with levels of risk to the reliability of the BPS. Achieving this alignment will promote efficiencies for both the ERO Enterprise and

registered entities by eliminating undue regulatory burdens, streamlining documentation and filing requirements, and substantially improving the processing of noncompliance and related mitigating activities.

In 2013, NERC began implementing a series of activities in connection with RAI. These activities consisted of both short-term and long-term solutions to address registered entity concerns and improve enforcement processes. For example, in 2013, NERC and the Regional Entities developed the *ERO Self-Report User Guide*. This document explains the type and quality of information that a registered entity should submit with a self-report in order to allow for a prompt evaluation of noncompliance, and, if appropriate, a prompt disposition of the noncompliance if it poses a minimal risk to the reliability of the BPS. A companion *ERO Mitigation Plan Guide* document was also developed. NERC posted the draft guides in January 2014 for public review and comment. The final user guides are now available on the RAI page on the NERC website.[69]

Second, NERC and the Regional Entities began two pilot programs to test RAI enforcement concepts. The first pilot, the Aggregation of Minimal Risk Issues program, tests selected registered entities' ability to proactively self-address, identify, and mitigate minimal risk issues. The second pilot is testing the application of enforcement discretion; the purpose of this pilot is to identify minimal risk issues that would be recorded and mitigated without triggering an enforcement action. These pilot programs began a six-month testing cycle in October 2013. NERC and the Regional Entities are gradually expanding the programs to include additional registered entities.

[69] Available at: http://www.nerc.com/pa/comp/Pages/Reliability-Assurance-Initiative.aspx.

In addition, as of January 2014, all Registered Entities implemented the triage process. Under this process, all Regional Entities will review instances of noncompliance and make an initial determination as to whether an issue will proceed through enforcement or whether additional information is needed.

Going forward, NERC will continue to implement and evaluate these enforcement concepts. These processes will be further discussed in an informational filing on the RAI that NERC will submit to the Commission in 2014.

3. Development of a Consolidated CMEP Implementation Plan

NERC and the Regional Entities no longer create nine separate CMEP Implementation Plans, but rather have consolidated these documents into a single integrated CMEP Implementation Plan for the ERO Enterprise. The consolidated CMEP Implementation Plan uses a streamlined format that eliminates redundant information, improves the transparency of CMEP activities, and promotes consistency among the Regional Entities' Implementation Plans.

During the implementation year, NERC or a Regional Entity (with NERC approval) may update the Implementation Plan to change the *Actively Monitored List of Reliability Standards*, compliance monitoring processes, Regional Entity processes, or to provide updates. When updates occur, NERC will post a revised Implementation Plan to its website and issue a compliance communication. A Regional Entity may also update its Implementation Plan, with NERC approval. NERC is responsible for updating the ERO CMEP Implementation Plan to reflect any Regional Entity's changes and for posting the updated plan to its website and issuing compliance communications.

Following each implementation year, the Regional Entities will complete a CMEP Implementation survey due in January of the following implementation year (e.g., the 2014

CMEP Implementation Plan survey is due in January 2015). This survey will provide Regional Entity-specific information on compliance monitoring, outreach, enforcement, CMEP program effectiveness, and other regional activities. NERC will use this information to monitor Regional Entity CMEP implementation and to plan for the following implementation year.

4. Improvements in Processing of Compliance and Enforcement Items by NERC and the Regional Entities

a. NERC and the Regional Entities Have Improved the Speed and Efficiency of Processing Enforcement Items

During the assessment period, NERC and the Regional Entities have continued to hold industry accountable for violations that create serious risk to the BPS, and to implement improvements to ensure that enforcement actions are timely and transparent to industry. As discussed in further detail in the "Enforcement" section of the NERC Assessment of Regional Entity Delegated Functions (**Attachment 3**), by the end of 2013, NERC had reduced the number of active violations older than 24 months (excluding those held by appeal, a regulator, or a court)[70] so that only 65 such active violations remained. There has been consistent progress since 2012 in achieving the goal of processing all violations within 24 months following discovery.

By working to reduce the number of aging violations while improving the processing speed for newer violations, NERC and the Regional Entities reduced the average age of violations in the ERO caseload by six percent in 2013, from 11.86 months in 2012 to 11.2 months.

NERC's successes in improving the efficiency of violation processing can be attributed to several factors, including the implementation and use of streamlined enforcement processing

[70] "Held by appeal, a regulator or a court" (or "on hold") refers to violations that are not currently being processed by NERC or the Regional Entities as a result of a court or administrative proceeding that will impact the resolution of the violation.

mechanisms, such as FFT and the SNOP. The use of streamlined enforcement processing mechanisms has allowed NERC to increase substantially the number of violations filed in a given year, reducing the caseload and in turn, improving processing times.

In 2009 and 2010, NERC filed NOPs with the Commission for a combined total of 1,540 violations. In 2011, after implementing the use of streamlined enforcement processing mechanisms, NERC filed a total of 1,697 violations – more than the two previous years combined. In 2012, NERC filed a total of 1,767 violations. In 2013, NERC filed a total of 1,862 violations. NERC processed approximately 43 percent of the violations filed in 2013 using the FFT mechanism.

In addition to the use of streamlined enforcement mechanisms, NERC has dedicated substantial resources to improving its enforcement processing activities and performance. In fact, during the period covered by this *Five-Year ERO Performance Assessment Report,* NERC has more than doubled the size of its enforcement processing staff, going from four full time equivalent personnel (FTEs) in 2010 to nine FTEs as of January 1, 2014.

Lastly, NERC has taken several steps to enhance collaboration and consistency across the entire ERO Enterprise. NERC enforcement processing has assigned staff to work closely with each Regional Entity to enhance the relationships with each Regional Entity and to develop greater knowledge and expertise concerning each Regional Entity and identify areas for collaboration and process enhancement. In addition, NERC is continuing to provide training to the Regional Entities with the goal of increasing the consistency of enforcement processes and documents. Through collaboration with the Regional Entities, NERC expects to build on its past successes and continue to work toward reducing aging caseload, reducing enforcement processing times, and ensuring consistency in enforcement processes and procedures.

NERC and the Regional Entities have continued to work collaboratively to develop and implement a set of metrics to measure the efficiency with which enforcement items are processed. Development of these performance items was an area for improvement identified in the Commission's order on NERC's Three-Year ERO Performance Assessment.[71] A set of final metrics has been agreed upon and a set of common parameters was developed to ensure that metrics measurements by NERC and the Regional Entities remain consistent. To that end, in the third quarter of 2013, NERC and the Regional Entities developed a set of business rules to ensure integrity and alignment across NERC and Regional Entity data. Ensuring the integrity of this data is important for analyzing trends and calculating processing metrics.

The four metrics developed to monitor the performance of NERC and the Regional Entities in processing enforcement items are:

(1) Caseload Index – computes the number of months it would take to clear the violations in a Compliance Enforcement Authority's (CEA, i.e., NERC or a Regional Entity) inventory based on the CEA's average monthly processing rate for the preceding twelve month period;

(2) Violations in Inventory – reports the number of violations in the CEA's caseload;

(3) Violation Aging – reports, by Regional Entity, the number of violations discovered in each year beginning with 2007 that have not been filed with the Commission or otherwise resolved;[72] and

(4) Mitigation Activity Aging – identifies the status of mitigation activity based upon age of violations.

NERC will continue to analyze and evaluate violation processing data. The purpose of analyzing violations and violation processing information is to identify trends and emerging risks. This analysis will provide NERC with insight into the effectiveness of NERC's and the

[71] *Order on the Electric Reliability Organization's Three-Year Performance Assessment*, 132 FERC ¶ 61,217 (2010) at PP 138 and 217.

[72] NERC also monitors Violation Aging by Disposition Method. This includes the average turnaround time for each disposition method for violations discovered within a specified time horizon (i.e., discovery to date filed with NERC, date filed with NERC to date filed with the Commission, and discovery to date filed with the Commission).

Regional Entities' processes and programs. The analysis informs the development of enforcement policies and processes and offers feedback for other departments such as Standards.

NERC's departments collaborate to leverage analytics as a risk management and resource allocation tool. As an example of this effort, NERC is closely monitoring the status of mitigation activity completion, regardless of whether or not the violation is on hold. NERC aims to work with the Regional Entities to reduce the amount of time from discovery of a violation to completion of the mitigating activity, thereby reducing the ongoing risk that these violations may pose to reliability.

b. Oversight of Regional Entity Processes and Actions

NERC is continuously evaluating and improving its methods of overseeing the Regional Entities' implementation of CMEP processes and procedures. During the assessment period, NERC adopted a more methodical approach to evaluating Regional Entity performance with respect to enforcement activities. NERC has also enhanced its approach to evaluating Regional Entity compliance activities. These oversight activities ensure that the Regional Entities are meeting their obligations under the NERC ROP and the RDAs. These oversight activities also promote transparency and consistency, and drive the identification and implementation of best practices across the ERO Enterprise.

For additional information regarding NERC's oversight of Regional Entity enforcement program and processes, see the "Enforcement" section of the NERC Assessment of Regional Entity Delegated Functions, **Attachment 3** to this *Five-Year ERO Performance Assessment Report.*

c. Developing Common Compliance Auditor Qualifications Across the ERO Enterprise

NERC and the Regional Entities are developing common ERO auditor qualification

requirements and auditor job descriptions that will be consistently used across the ERO Enterprise. Establishing common ERO auditor qualifications is an initiative specified in the 2013-2016 ERO Strategic Plan.[73] NERC and the Regional Entities will establish key attributes and skill sets that audit team members should possess to ensure the audit team composition includes competencies needed to complete an effective audit. Establishing common ERO job descriptions promotes a consistent approach in attracting and retaining the necessary talent for auditor positions. Common auditor qualification criteria, training, and audit approach help promote high-quality audits and consistency in CMEP implementation activities across the ERO Enterprise.

d. Enhancing the Training Program for Auditors so that Processes and Procedures Developed in the RAI are Implemented Consistently Across the ERO Enterprise

As part of its Regional Entity Assurance and Oversight function, NERC is responsible for supporting the development of qualified and trained compliance operations and auditing staffs at both NERC and the Regional Entities. In addition to the development of a common set of auditor qualifications, described in the immediately preceding subsection, NERC ensures the proper qualifications of personnel for auditing and other essential compliance roles through training. As noted above, NERC and the Regional Entities collaborated to create the *Compliance Auditor Checklist* and *Compliance Auditor Handbook*, as found in the Auditor Manual.[74] These documents will be reviewed and revised to incorporate lessons learned from the RAI pilots. NERC will train auditors to ensure that Regional Entities are consistently applying the

[73] The *Electric Reliability Organization Enterprise Strategic Plan 2013-2016* is available at: http://www.nerc.com/gov/bot/FINANCE/Documents/ERO%20Enterprise%20Strategic%20Plan%202013-2016%20FINAL%2005%2009%2013.pdf

[74] Available at: http://www.nerc.com/pa/comp/ERO%20Enterprise%20Compliance%20Auditor%20Manual%20DL/ERO_Enterprise_Compliance_Auditor_Manual_version_1.pdf.

procedures and methodologies of these documents. Auditor training will also incorporate relevant changes related to enforcement processing, including changes to the self-reporting process and enhancements to the FFT process. Setting clear expectations for registered entities regarding audit practices and procedures should also allow registered entities to increase the efficiency and effectiveness of their pre-audit preparation.

D. Identification, Prioritization, and Dissemination of Information on Risks to the BPS

NERC is an expert resource for industry on reliability risks and information because it is uniquely positioned to assess potential impacts to reliability and raise awareness of threats to reliability. NERC draws upon a plethora of resources, discussed below, to make its assessments, including the RISC priorities, robust databases of information on transmission, generator and demand-response availability, the annual NERC *State of Reliability* report, and other assessments and reports, as well as internal core analyses of events. In its risk-informed approach, NERC uses performance analysis, solid technical foundation, sophisticated statistical analyses, and integrated validation with actual system events to enhance BPS reliability. As described in §II.D.1 below, at the direction of its Board of Trustees, NERC has developed and is implementing a specific RRM process to create and execute plans for managing reliability risks.

As an example of risk identification, NERC's *2013 Long-Term Reliability Assessment* (LTRA) identified significant emerging reliability issues that industry will face over the next decade.[75] These challenges stem from, among other things, a changing resource mix comprised of significant increases in variable energy resources to meet renewable portfolio standards, increased reliance on natural gas-fired generation and demand-side management primarily driven by economics, and the retirement of nearly 10% of North America's generation capacity.

[75] Available at: http://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/2013_LTRA_FINAL.pdf.

Another resource for identifying and prioritizing risks is NERC's Event Analysis process. This process, which is described in greater detail in §II.D.3 below, establishes a systematic approach to capturing details about all BPS events, from minor Category 1 Events that typically do not have a significant impact on electricity users, to Category 4 and 5 Events that result in widespread customer outages.

Collectively, these resources provide an independent and complete picture of risks to reliability and key BPS reliability indicators such as resource adequacy, peak demand, energy forecasts and transmission developments. These efforts and well-developed resources are critical to how NERC approaches reliability, learns from events on the BPS, and prioritizes resources.

NERC draws upon these resources to inform industry and policymakers about trends and challenges to reliability. One example is the work of the NERC Integration of Variable Generation Task Force (IVGTF), which developed several recommendations that support the reliability considerations for accommodating large amounts of variable generation.[76] These recommendations guided the California Independent System Operator (CAISO) in finding solutions to how it will ensure reliability given the significant development of variable energy resources in that region of the country. Another example is the *Accommodating an Increased Dependence on Natural Gas for Electric Power* report that examined the different risks, arising out of the interdependence of the BPS and the natural gas delivery system, which can affect reliability.[77] Recommendations from this report are being used by WECC, the CAISO, and the Midcontinent Independent System Operator, among others, to identify approaches to minimize vulnerabilities due to electric system-gas system interdependence.

[76] Information about the IVGTF is available at: http://www.nerc.com/comm/PC/Pages/Integration-of-Variable-Generation-Task-Force-(IVGTF)-2013.aspx.

[77] Available at: http://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_PhaseII_FINAL.pdf

1. Establishing a Structured Reliability Risk Management Process

In response to direction from the NERC Board in February 2013, NERC has developed a RRM process to create and execute plans for managing reliability risk and to integrate these plans with the business planning and budgeting process. The RRM process leverages: (i) the business acumen of the RISC; (ii) the technical knowledge of the NERC Operating Committee, Planning Committee, and CIP Committee (CIPC); (iii) the diverse set of tools that can be employed by the ERO to manage risk; and (iv) the open and transparent nature of the ERO. The RRM process is comprised of the following stages:

(1) Strategic Planning: In this phase, the RISC works to collection information and to identify broad areas of reliability risk to be recommended to the NERC Board for further analysis and study.

(2) Analysis: In this phase, members of the RISC work with the technical committees they represent to identify specific risks within the broad areas accepted by the NERC Board. This phase includes problem definition, gap analysis, and selection of measurement approaches.

(3) Solution Design: In this phase, members of the RISC develop potential solutions to the problems identified in the previous stage. NERC uses this information to develop the *ERO Top Priority Reliability Risks* for the upcoming business planning and budget cycle.

(4) Business Planning and Budgeting: In this phase, NERC staff and the Regional Entities work together to include in the annual business plans and budgets descriptions of the reliability risks that are to be addressed in the coming year and the resources needed to support those efforts.

(5) Preparation: In this phase, ERO staff, stakeholders, and third parties[78] discuss the plans identified in the latest business plan and budget. At this stage, NERC's committees have an opportunity to align their work plans with the business plan and budget.

(6) Execution: In this phase, stakeholders, staff, and third parties execute the detailed plans developed in the prior phase.

Specific documentation or other aids to assist in the implementation of the RRM

[78] "Third parties" in this context might refer to industry manufactures and service vendors, who might be asked to work on a specific problem, tool or application.

process,[79] document templates, and detailed instructions and training are being developed to support the execution of this process. NERC intends that the RRM process will become an integral part of ERO operations.

NERC will continue the work of the RISC to develop risk profiles (including HILF issues) for the ERO. These profiles of the BPS will inform how the ERO prioritizes and ranks reliability risks. For high priority risks, NERC will develop project plans and business case assessments outlining initiatives to address those risks.

2. ERO Top Priority Reliability Risks for 2014-2017

As described immediately above, the RRM process includes the identification of the *ERO Top Priority Reliability Risks* for each upcoming business planning and budget cycle. The development of the list of top ten high priority reliability risks is intended to focus the efforts of the ERO Enterprise program areas, including training and education, Reliability Standards development, and compliance. NERC developed a set of the ten top priority reliability risks to be focused on in the development of the *ERO Enterprise Strategic Plan 2014-2017*. The development of this list started with a reliability gap analysis that the RISC presented to the NERC Board in August 2013. NERC staff then undertook further review and analysis to identify any additional reliability risk areas of strategic importance for the ERO. Next, qualitative estimates of probability, consequence, and current level of risk management were prepared for each of the identified reliability risks within the chosen areas. NERC used this information to identify ten top priority reliability risks requiring increased attention or additional activity. Following this analysis, recommendations were developed based on previous committee discussions; industry dialogue at the Reliability Leadership Summit; and past work products such

[79] This documentation and other aids may include worksheets, diagrams, task descriptions, and similar items.

as the LTRA, the *State of Reliability* report, and various special reports and assessments. The ten high priority reliability risks are:

(1) Changing Resource Mix: As the generation and load on the power system changes (e.g., integrated variable resources, increased dependence on natural gas, increased demand-side management, new technologies deployed), the system is being brought into states that are significantly different than those considered when the system was designed and planned, exposing new vulnerabilities not previously considered. Fundamental operating characteristics and behaviors are no longer a certainty.

(2) Resource Planning: Plant retirements (largely due to implemented environmental regulations; increased uncertainty in future resources due to other potential environmental regulations; and lower natural gas prices, which significantly affect power plant economics) are leading to cases where resources may be inadequate to ensure firm demand is served at all times. As the system continues to change, some regional assessments identify concerns with insufficient reserve margins as early as 2014 and 2015 in the ERCOT and Midcontinent ISOs.

(3) Protection System Reliability: A fault accompanied by a failure of any protection system component could in some cases result in instability, violation of applicable thermal or voltage ratings, unplanned or uncontrolled loss of demand or curtailment of firm transfers, or cascading outages.

(4) Uncoordinated Protection Systems: A lack of protection system coordination has the potential to increase the size and magnitude of events due to unnecessary trips. Uncoordinated protection systems were identified as contributing to the September 8, 2011, and August 14, 2003 events.

(5) Extreme Physical Events: While the probability of extreme physical events (such as physical attack, GMD, or severe weather) that lead to extensive damage is low, the potential consequences are significant enough that risk avoidance (reducing the probability) is insufficient as a sole risk management strategy.[80]

(6) Availability of Real-Time Tools and Monitoring: Not having the right tools and monitoring available to manage reliability in real time is a latent problem waiting for the right combination of events to exploit it.

(7) Protection System Misoperations: NERC's 2012 and 2013 *State of Reliability* reports identified protection system misoperations as a significant threat to BPS reliability.

(8) Cold Weather Preparedness: Lack of generator preparedness for cold weather extremes may result in forced outages, de-ratings, and failures to start.

[80] Additional strategies may incorporate factors like improving resiliency and reducing restoration times.

Insufficient availability of intra-regional generation and limits on import transfer capability may result in insufficient generation to serve forecasted load, resulting in load shedding.

(9) Right-of-Way Clearances: Transmission owners and applicable generation owners may have established incorrect ratings based on design documents, rather than on the actual facilities built. Managing to stay within system operating limits and interconnection reliability operating limits that are based on incorrect ratings may be inadequate to prevent equipment damage and/or instability, cascading outages, or separation. Ensuring clear right-of-ways can reduce adverse impacts to reliability even when SOLs and IROLs are based on incorrect ratings.

(10) 345-kV Breaker Failures: NERC has identified a potential trend of 345 kV SF6 puffer type breakers failing. Circuit breaker failures, in conjunction with another fault, may lead to more BES facilities removed from service than required to clear the original fault.

3. NERC Event Analysis Process and How it is Used to Identify Risks to the BPS and Disseminate Lessons Learned

NERC has developed a voluntary Event Analysis process that delivers quality, timely and actionable lessons learned to registered entities. Development of the Event Analysis process was led by the Event Analysis Subcommittee (EAS), a cross-functional group of industry experts.[81]

The Event Analysis process begins with a registered entity making an initial assessment of an occurrence and determining if the occurrence falls within one of five qualifying event categories.[82] The event category is determined by weighing the level of significance of a qualifying event and its impact on the interconnected BPS. After a qualifying event occurs, the applicable Regional Entity holds a planning meeting with all involved parties, including other registered entities. If a qualifying event is categorized as Category 3 or higher, the registered entity will prepare an Event Analysis Report (EAR), in which the registered entity describes the

[81] The EAS is a subcommittee of the NERC Operating Committee.

[82] A description of each event category is included in the *Electric Reliability Organization Event Analysis Process – Version 2* report, available at: http://www.nerc.com/pa/rrm/ea/Pages/EA-Program.aspx.

sequence of events and identifies causal factors and appropriate corrective actions. The registered entity then submits the EAR to the applicable Regional Entity(ies) for review, and then to NERC. The registered entity, in collaboration with the ERO, drafts the proposed lessons learned from the event and submits them to the applicable Regional Entity. Once the event analysis is complete, NERC shares any lessons learned with industry by publishing them as soon as practical. NERC staff analyzes EARs to identify reliability risks, trends, and potential gaps in Reliability Standards, compliance, and other programs. NERC also reviews the EARs to assign descriptive cause codes, which assist in identifying trends and corrective actions that will prevent recurrence of similar events.

Since initial implementation of the Event Analysis process in 2010, there have been more than 388 qualified events reported to the ERO and more than 77 lessons learned produced, including 14 published in 2013.

NERC

Non-Qualified Occurrences reported	**1711**	**338**	

RELIABILITY | ACCOUNTABILITY

Participation in the voluntary Event Analysis process does not relieve registered entities of their obligation to comply with NERC Reliability Standards. While performing the steps of the Event Analysis process, the registered entity is encouraged to continue performing critical self-assessments of compliance with Reliability Standards in connection with the event and to conduct compliance self-assessments for review by applicable Regional Entities. If a registered entity discovers a possible violation in the process of analyzing an event, it is encouraged to self-report that possible violation to the applicable Regional Entity.

NERC is continuously improving how it defines, catalogs and trends the causes of system events. NERC assesses every event submitted through the voluntary Event Analysis process to identify and share possible risks to reliability with industry. Further, the cause code assignment allows for greater historical trending and predictive analysis.

NERC provides Regional Entity and registered entity staff with cause analysis training. As of December 2013, 164 personnel from all eight Regional Entities and over 600 people from 115 different registered entities have received more than 4,000 hours of cause analysis training, with 432 hours of continuing education hours awarded to 54 NERC-certified system operators in connection with this training. NERC is adding a training and education component to the Event Analysis process to increase the relevance and impact of lessons learned for the Regional Entities, industry, and other stakeholders. Through the Event Analysis process, NERC continues to establish the appropriate balance of data reporting for analysis and use by industry.

NERC continues to work with the Regional Entities to obtain from and review with registered entities information regarding qualifying events and disturbances. The primary goal of this process is to identify reliability risks through robust data gathering, validation, rigorous analysis, and rapid dissemination to industry of information on identified risks and remediation

options. NERC is working collaboratively with the Regional Entities to prioritize analytical efforts based on the Event Analysis process categories. Determining root and contributing causes for each event allows for trend and risk identification. NERC plans to further facilitate event analysis by merging its event-driven databases and defining the relationships between various system cause codes. This analysis of system events will inform NERC of gaps in Reliability Standards, compliance monitoring and enforcement effectiveness, registration, and risk controls effectiveness.

Additionally, NERC is collaborating with the North American Transmission Forum and the North American Generator Forum to further enhance the Event Analysis process and lessons learned dissemination in identifying risks to the BPS. Further, NERC plans to improve the timeliness of the availability of and access to final event reports by creating a secure portal that will be accessible by industry to obtain these reports.

4. Reports on Reliability

In May 2012, NERC released its first *State of Reliability* report assessing grid reliability based on performance trends identified through data and analysis of system disturbance events. The report presented NERC's integrated view of ongoing BPS reliability and performance trends. It assessed 18 reliability performance metrics that measure whether an adequate level of reliability exists in North America. The report also included an analysis from the frequency response initiative, the 2011 demand response availability assessment, event analysis trends, and post-seasonal assessments. The initial *State of Reliability* report included the following key findings:

(1) Reliability of the BPS remains adequate with little change in trends between 2008 and 2011;

(2) Frequency response is stable with no deterioration;

(3) Protection system misoperations are a significant reliability issue;

(4) Equipment failure warrants further analysis; and

(5) Resource mix changes necessitate new metrics.

Subsequently, *State of Reliability* reports have been issued for 2013 and 2014.[83] Going forward, NERC will continue to prepare its annual *State of Reliability* report and the associated reliability metrics.

As noted earlier, for many years NERC has prepared and issued an annual 10-year LTRA Report for the North American BPS. The LTRA provides an independent view of the reliability of the BPS and identifies trends, emerging issues, and potential concerns. Recent LTRAs have focused on a variety of emerging issues expected to impact BPS reliability. Most notably, a rapidly changing resource mix with substantial retirements of coal-fired and nuclear capacity, paralleled by a growing reliance on natural gas-fired generation that has created fuel transportation concerns in certain areas. Ongoing unit retirements are also contributing to diminishing reserve margins that fall below reference reserve margin levels during the 10-year outlook. Finally, continued penetration of variable resources and a growing dependence on demand-side management programs create uncertainties for system planners and operators. Each LTRA report also provides high-level recommendations for each emerging issue and tracks ongoing industry progress.

In addition to the annual LTRA, NERC issues two seasonal (i.e., summer and winter) assessment reports each year in which it identifies, assesses, and reports on the industry's preparations to manage potential seasonal issues such as significant generation or transmission

[83] NERC's *State of Reliability 2014* report is available at: http://www.nerc.com/pa/RAPA/PA/Performance%20Analysis%20DL/2014_SOR_Final.pdf.

constraints or potential fuel-related impacts. NERC also issues other, special reports from time to time that focus on current or emerging technical or other reliability concerns, such as changing resource mix (increasing amounts of variable generation and potential retirements of fossil-fueled generation), misoperations, HILF event concerns, and smart grid considerations.

NERC has implemented several enhancements to the LTRA processes and reports in response to areas for improvement identified in the three-year ERO performance assessment. NERC has revised its reliability assessment guidelines to establish a requirement for an annual scenario analysis.[84] Scenario analyses are typically included in separate special assessments prepared by the Reliability Assessment program, including the following reports that NERC issued during the assessment period:

- *Reliability Impacts of Climate Change Initiatives: Technology Assessment and Scenario Development* (2010);
- *Special Reliability Scenario Assessment: Potential Reliability Impacts of Swift Demand Growth After a Long-Term Recession* (2010);
- *Special Reliability Scenario Assessment: Resource Adequacy Impacts of Potential U.S. Environmental Regulations* (2010);
- *Potential Impacts of Future Environmental Regulations* (2011); and
- *Special Reliability Assessment: Accommodating an Increased Dependence on Natural Gas for Electric Power* (2013).

5. Bulk Power System Awareness Department

Previously a functional responsibility of the Electricity Sector Information Sharing and Analysis Center (ES-ISAC),[85] NERC created the Bulk Power System Awareness department

[84] *See Order on the Electric Reliability Organization's Three-Year Performance Assessment*, 132 FERC ¶ 61,217 (2010), at P 180.

[85] The activities of ES-ISAC are described in §II.E.2 below.

(BPSA) in 2012 to improve NERC's capability to monitor BPS conditions, significant events, and emerging risks to reliability across the 15 reliability coordinator regions in North America.

BPSA develops and disseminates timely, accurate and complete information regarding the status of the BPS from a near-term operational reliability perspective, complementary to RAPA's seasonal and long-term assessments and ES-ISAC's cyber and physical security perspective. BPSA shares this continuous assessment across NERC, the eight Regional Entities and FERC staff through a number of channels, including a *System Awareness Daily Report* that highlights current day potential risks to wide-area reliability, significant operational and security occurrences for the previous day, and high-level information on forecasted loads and reserves.

During major system disturbances, BPSA facilitates information sharing and a common operational picture of BPS status with a broader audience of industry and governmental agencies. BPSA provides ES-ISAC operational reliability information in support of its government and cross-sector coordination activities, and hosts periodic update conference calls for technically oriented government agencies including FERC, the Department of Energy, the Nuclear Regulatory Commission, the Department of Homeland Security, and the Federal Emergency Management Agency.

BPSA administers the NERC Alerts program, which is used to disseminate important reliability and security information to industry, pursuant to §810 of the NERC ROP. Additionally, BPSA actively participates in the Event Analysis Process described in §II.D.3 above, by identifying qualifying events and other items of interest for further trending and analysis.

E. The ERO Facilitates Information Sharing on Cybersecurity and Cyber and Physical Threats to the BPS among Industry, Regional Entities, and Government

Section 215(a) of the FPA and the Commission's regulations at 18 C.F.R. §39.1 define "reliable operation" of the BPS as "operating the elements of the Bulk-Power System within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a Cybersecurity Incident, or unanticipated failure of system elements." The FPA and the regulations define "Cybersecurity Incident" as "a malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmatic electronic devices and communications networks including hardware, software and data that are essential to the Reliable Operation of the Bulk-Power System." As the Commission is fully aware, identifying, assessing, and preventing threats and risks to both the physical security and the cybersecurity of the BPS, while always matters of concern, have attained increasing significance in the last three to four years.

Two of NERC's principal programs focused on these areas are the Critical Infrastructure department (CID) and the ES-ISAC. The CID supports efforts to develop and administer critical infrastructure standards, conducts security and reliability outreach visits, provides training and exercise opportunities, and coordinates between industry and governmental entities on CIP matters. The CID accomplishes these activities through active CIP standards drafting team participation, and programs such as the Sufficiency Review Program (SRP),[86] the annual Grid Security Conference (GridSecCon), and the biennial Grid Security Exercise (GridEx). The CID also leverages public-private partnerships to examine CIP policy issues, and it provides staff-

[86] In 2014, CID renamed the SRP to "Security Readiness Program" to reflect the program's focus.

level support to NERC's CIPC, an industry-led committee comprised of industry experts in the areas of cybersecurity, physical security, and operational security. The ES-ISAC monitors the physical security and cybersecurity of the electricity sub-sector, gathers information on threats to the physical security and cybersecurity of the sub-sector, and actively disseminates information on such threats and means to avoid or mitigate them to users, owners, and operators of the BPS as well as to applicable government entities and other stakeholders.

Both programs focus significant attention on public-private partnerships, which are critical to effective information sharing. CID and the ES-ISAC work closely with NERC entities, industry trade associations, national and international government departments and agencies, and other sectors to share information, discuss sector priorities, and respond to legislative and executive branch requests. Recent partnership activity includes sector responses to Executive Order (EO) 13636, *Improving Critical Infrastructure Cybersecurity*, and Presidential Policy Directive (PPD) 21, *Critical Infrastructure Security and Resilience*. This work included coordinating with government and across sectors to develop a voluntary cybersecurity framework, based on existing standards, guidelines, and practices, for reducing cyber risks to critical infrastructure. In addition, NERC worked closely with government and industry to rewrite the *National Infrastructure Protection Plan*, which outlines how government and private sector participants in the critical infrastructure community work together to manage risks and achieve security and resilience outcomes.

This section of this *Five-Year ERO Performance Assessment Report* describes NERC's activities in these areas during the assessment period, with an emphasis on activities during the latter part of the period. Included in this section are descriptions of CID programs, such as the

CIPC, the SRP, the GridSecCon, and the GridEx, as well as ES-ISAC activities, including the Cyber Risk Preparedness Assessment (CRPA) program.

1. Critical Infrastructure Department Activities

a. Critical Infrastructure Protection Committee

NERC's CIPC focuses on advancing the physical and cybersecurity of the critical electricity infrastructure of North America. The committee consists of both NERC–appointed regional representatives and technical subject matter experts. The CIPC coordinates NERC's security initiatives and serves as an expert advisory panel to the NERC Board, to the ES-ISAC, and to NERC standing committees, in the areas of cybersecurity and physical security. During quarterly CIPC meetings, CIPC members receive security training and participate in briefings regarding the latest security issues. To address issues related to cybersecurity and physical security, the CIPC establishes working groups or task forces comprised of subject matter experts who review and examine specific issues and develop reports and recommendations.

In 2012, the CIPC reorganized and expanded to allow it to produce more deliverables. This reorganization established new subcommittees and created new task forces and working groups to address emerging issues and initiative requests from the NERC CEO and NERC Board. The reorganization included forming task forces to address cybersecurity-related subjects identified in the 2010 *High-Impact, Low-Frequency Event Risk to the North American Bulk Power System* report.[87] One CIPC task force, the Cyber Attack Task Force, considered the impact of a coordinated cyber-attack on the BPS and developed flexible options for detecting, operating, and recovering from such an attack. A key component of the resulting Cyber Attack

[87] Available at: http://www.nerc.com/pa/ci/resources/documents/hilf_report.pdf.

Task Force report was the development and use of an attack tree tool that provides key insight into the attack surface of the interconnected BPS of North America.

Following NERC Board approval of the Cyber Attack Task Force report, the CIPC established a High-Impact, Low-Frequency Implementation Task Force to review the recommendations in this and other related reports, and to determine which recommendations the CIPC should address. The High-Impact, Low-Frequency Implementation Task Force determined that the CIPC should continue its analysis of cyber attack trees and analyze issues relating to information sharing, security clearances, security metrics, and physical security guidelines. The CIPC established task forces for all of these issue areas, and most groups have completed their reviews and issued recommendations.

b. Security Readiness Program

NERC conducts SRP visits, which consist of visits to registered entities to focus on the sufficiency of industry implementation of the CIP Standards. An SRP visit both examines CIP Version 3 compliance in a retrospective review and helps registered entities address transitioning from CIP Version 3 to CIP Version 5 in a prospective view. While compliance with CIP Version 3 and its risk-based assessment methodology remains mandatory until March 31, 2016, many registered entities are concerned about how to transition their compliance and security efforts to Version 5 to meet the April 1, 2016, compliance deadline. Registered entities are exploring how to best manage the transition process to CIP Version 5 while remaining compliant with CIP Version 3. NERC invites Regional Entity representatives to participate in SRP discussions; however, no content from those discussions may be used during a subsequent audit or compliance action unless that content reveals an imminent threat to the BES. NERC staff,

Regional Entity representatives, and outside consultants sign non-disclosure agreements to ensure strict confidentiality of all discussions and materials.

c. Grid Security Conferences

In 2011, NERC hosted the first GridSecCon focusing on physical security and cybersecurity issues facing the electricity sub-sector. NERC has continued to hold these conferences annually to achieve the following objectives:

- Build on NERC's mission to ensure the reliability of the North American BPS through education and training;
- Discuss and provide solutions to emerging industrial control system security issues;
- Deliver expert analysis on social engineering and phishing attacks;
- Focus strategically on public-private partnerships; and
- Provide an update on ES-ISAC activities and issue a call for increased industry participation and communication.

Over 300 industry and government stakeholders attended the most recent GridSecCon in October 2013. More than 20 speakers led discussions focused on industry being transformational, strategic, and tactical in its approach to securing systems. Participants were asked to consider different information sharing techniques; determine if their organizations are resilient through self-assessments; test response activities through exercises; work to ensure that security is built into operations; and enhance the workforce by recruiting, training, and retaining individuals who can address these and other issues. Additionally, almost 200 stakeholders attended credentialed training sessions in cybersecurity and physical security.

d. Grid Security Exercises

In 2011, NERC hosted the first GridEx, which focused on analyzing industry's response to a physical and cybersecurity scenario. NERC now holds a biennial distributed play exercise and executive tabletop discussion to achieve the following:

- Exercise the current readiness of the electricity industry to respond to a security incident, incorporating lessons learned;
- Review existing command, control, and communication plans and tools for NERC and its stakeholders;
- Identify potential improvements in cybersecurity and physical security plans, programs, and responder skills; and
- Explore senior leadership policy decisions and triggers in response to a coordinated cyber and physical event of national significance with long-term grid reliability issues.

Over 200 organizations participated in GridEx II, which took place November 13, 2014 through November 14, 2013. During the exercise, participants identified five key lessons learned:

- Information sharing has increased;
- NERC has improved ES-ISAC and BPSA coordination functions;
- Simultaneous cyber and physical attacks pose significant challenges;
- Industry continues to refine and enhance its all-hazard incidence response plans and protocols; and
- Industry and government information-sharing stakeholders can better inform incident response through coordination and consolidation of content.

GridEx II included an executive tabletop exercise involving about 30 participants, including electricity industry executives representing a broad cross-section of the industry and senior officials from the federal government. Participants considered a severe cyber and physical

attack scenario of national and international significance, and discussed the policy-level challenges that would need to be addressed by industry and government.

e. Electricity Sub-sector Coordinating Council

NERC established the Electricity Sub-sector Coordinating Council (ESCC) in 1998 at the request of the Department of Energy to foster and facilitate the coordination of sector-wide, policy-related activities and initiatives designed to improve the reliability and resilience of the Electricity Sub-sector, including physical and cyber infrastructure. In 2010, NERC restructured the ESCC to consist of industry senior executives with NERC's CEO as the ESCC chair. The ESCC provided advice to the NERC Board on policy-level matters related to critical infrastructure, developed a Critical Infrastructure Strategic Roadmap, and provided oversight on several NERC and industry initiatives to address HILF events and other critical infrastructure risks to the BPS.

In August 2013, the NERC Board approved a new ESCC charter, which amended, superseded, and terminated the existing charter. The new charter provides for a total of 30 CEO-level representatives, including members of the ESCC Steering Committee. NERC's CEO continues to serve on the ESCC and its Steering Committee. The transition formally recognized the significant increased CEO interest and participation on cybersecurity issues, focused industry association activities through an existing channel recognized by government agencies, and provided a unified industry framework upon which to build in response to President-issued orders and directives, such as EO-13636 and PPD-21.

2. ES-ISAC Tools and Activities

a. ES-ISAC Portal

The ES-ISAC has seen a tremendous leap in its user base since its inception in 1998, with

more reporting from organizations and more information sharing between members of industry. The ES-ISAC portal, which became functional in April 2012, is the industry's first and often primary interface with the ES-ISAC. The portal is continuously updated with technical and trend reports, watch lists, advanced sector information sharing tools, and other relevant resources. The portal receives "Indicators of Compromise" from various sources, including U.S. government departments and agencies, and NERC distributes this information to electricity sector entities. The portal allows the ES-ISAC to reach thousands of users and hundreds of organizations across industry to discuss and exchange security-related information. The ES-ISAC is concentrating its efforts on increasing the user base of this important portal. The success of this effort relies on the value of information available on the portal as well as the timeliness with which information reaches users. To achieve this goal, the ES-ISAC is enhancing portal capabilities to improve the ease of use and to improve analytic collaboration across the sub-sector.

Current capabilities of the portal include publishing alerts and other informational products, exchanging threat indicator information, and providing self-service access to portal users. Upgrades underway will increase flexibility to support additional functionality and capacity using a cloud-based, secure platform solution. The improved portal will facilitate direct data exchange with other ISACs and government partners. The portal will also support ES-ISAC analysts in their information analysis functions and tie the ES-ISAC analysts together with their counterparts in other sectors and in national laboratories. Finally, the portal will add private social media information sharing tools, automated access to enhanced cybersecurity information flows, and predictive analytics.

b. Analytics

The ES-ISAC has also improved its analytic capabilities by building out its operations

room to include data feeds from multiple sources, such as NERC's situation awareness monitoring tool, and procuring services that deliver cyber awareness information. As a result, the ES-ISAC is uniquely positioned to enhance grid and sector-level resilience by quickly evaluating and addressing potential cybersecurity impacts to BPS operations.

c. Industry and Government Coordination

The ES-ISAC was initiated to gather information from industry participants about security-related events, disturbances, and off-normal occurrences in the electricity sub-sector. The ES-ISAC shares that information with industry as a whole and with government partners. In turn, government entities provide information regarding risks, threats, and warnings to the ES-ISAC. The ES-ISAC adds analytic value to shared information and coordinates with other sectors. It is also responsible for developing industry and government products, including the NERC crisis action plan and the U.S. Department of Homeland Security incident response analysis. In addition, the ES-ISAC co-hosts annual cleared briefings to industry to ensure the electricity sub-sector maintains awareness of new and ongoing threats to the BPS.

Most recently, the ES-ISAC collaborated with the Department of Homeland Security, the Department of Energy, and the Federal Bureau of Investigation to host a series of briefings focused on tactics and tools of emerging cyber threat actors. In addition, in the wake of the April 16, 2013 Metcalf substation incident in California, the ES-ISAC worked with these agencies and other organizations and governmental partners to raise awareness of physical attack threats, to increase local, regional and federal security partnerships, and to support mitigation efforts. These briefings continued through the first quarter of 2014.

d. Cyber Risk Preparedness Assessments

The ES-ISAC conducts CRPAs to assess the cybersecurity capabilities of registered

entities through facilitated tabletop exercises. Conducting these assessments allows the ES-ISAC staff to gain a better understanding of industry capabilities, identify key sector level areas for improvement, and share best practices across industry. Through CRPA exercises, participants gain an improved understanding of their cybersecurity programs and capabilities. These exercises also help participants identify areas for improvement and enhance their abilities to respond to and recover from cybersecurity events. The CRPA also educates participants through defined deliverables and best practices. During 2013, the ES-ISAC incorporated elements of the Electricity Sub-sector Cybersecurity Capability Maturity Model program into the CRPA. Additionally, the ES-ISAC has developed a CRPA kit for entities to use in developing and running their own CRPAs. The kit allows more entities to leverage the CRPA methodology to enhance their preparedness. In February 2013, ES-ISAC staff hosted initial training and education sessions on the kit to accelerate adoption of the methodology across the sector and move the program towards self-sustainment within industry.

III. NERC CONTINUES TO MEET THE §39.3(b) CRITERIA

An explicit requirement for the five-year ERO performance assessment is that it include an explanation of how the ERO satisfies the requirements of 18 C.F.R. §39.3(b). Section 39.3(b) sets forth the requirements for certification as the ERO, which specify that the entity:

(1) Has the ability to develop and enforce, subject to 18 C.F.R. §39.7, Reliability Standards that provide for an adequate level of reliability of the BPS;[88] and

(2) Has established rules that:

(a) Assure its independence from users, owners and operators of the BPS while assuring fair stakeholder representation in the selection of its directors and balanced decisionmaking in any ERO committee or subordinate organizational structure;

[88] 18 C.F.R. §39.7 sets forth the Commission's regulations concerning the enforcement of Reliability Standards by the ERO, including provisions pertaining to the imposition of penalties for violations of Reliability Standards.

(b) Allocate equitably reasonable dues, fees, and charges among end users for all activities under Part 39;

(c) Provide fair and impartial procedures for enforcement of Reliability Standards through the imposition of penalties in accordance with 18 C.F.R. §39.7, including limitations on activities, functions, operations, or other appropriate sanctions or penalties;

(d) Provide reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing Reliability Standards and otherwise exercising its duties; and

(e) Provide appropriate steps to gain recognition in Canada and Mexico.

Attachment 1 to this *Five-Year ERO Performance Assessment Report* shows in detail that NERC continues to satisfy the requirements of §39.3(b).

With respect to the requirements of §39.3(b)(1), NERC continues to have the ability to develop and enforce, subject to 18 C.F.R. §39.7, Reliability Standards that provide for an adequate level of reliability of the BPS. This requirement encompasses two distinct functions of the ERO: (i) the ability to develop reliability Standards that provide for an adequate level of reliability of the BPS, and (ii) the ability to enforce those Reliability Standards. NERC develops Reliability Standards pursuant to §300 of its ROP and its SPM, Appendix 3A to the ROP. These documents have been revised since NERC was certified as the ERO, including during the current assessment period, and the current versions of §300 and Appendix 3A have been approved by the Commission as ERO Rules. Further, NERC's SPM has been accredited by the ANSI as meeting ANSI's essential requirements for standards development. Moreover, as shown in detail in **Attachment 1**, NERC's Reliability Standards development process contains the essential attributes of the standards development process as set forth in prior Commission orders. As noted, during this assessment period, NERC has made improvements to its SPM, which the Commission has approved.

Further, NERC systematically manages the development of new Reliability Standards

and revisions to standards, in areas of highest need and importance, through its rolling three-year RSDP. The RSDP is revised annually and identifies and prioritizes Reliability Standards development projects in the immediate three-year time horizon, taking into account, among other information, perceived gaps in the Reliability Standards, proposals for closing those gaps, and timing priorities for standards development projects.

NERC enforces compliance with approved Reliability Standards through its CMEP, which is embodied in §400 and Appendix 4C of the ROP; its Organization Registration and Certification Program, which is embodied in §500 and Appendices 5A and 5B of the ROP; and its *Sanction Guidelines*, Appendix 4B of the ROP (all of the foregoing have been approved by the Commission as ERO Rules), as well as through its RDAs with the Regional Entities, which have also been approved by the Commission. Through the organization registration provisions of its ROP, NERC and the Regional Entities identify the users, owners, and operators of the BPS that are obligated to comply with Commission-approved Reliability Standards.

Monitoring and enforcement of compliance with Reliability Standards is conducted primarily by the eight Regional Entities pursuant to §401.4 of the ROP and the RDAs, subject to NERC oversight. Provisions of the ROP describe in detail the required attributes of Regional Entity compliance programs, including compliance program structure, resources and design. The controlling document for NERC's compliance monitoring and enforcement activities is the *Compliance Monitoring and Enforcement Program*, Appendix 4C to the ROP. Appendix 4C specifies compliance monitoring methods to be used and the detailed process steps for each method. Additionally, Appendix 4C specifies the process steps to be followed when a potential violation of a Reliability Standard by a registered entity is identified; as well as the actions required of the registered entity if it is found to be in violation of a Reliability Standard. The

Sanction Guidelines, which were significantly revised during this assessment period, specify the factors to be taken into account by the ERO in determining the financial penalty to be assessed for a violation of a Reliability Standard.

Pursuant to the RDAs, each Regional Entity has either adopted the NERC CMEP or a modified version of the CMEP as its compliance monitoring and enforcement program. Compliance monitoring and enforcement activities are further guided by the annual NERC and Regional Entity CMEP Implementation Plans (as described earlier, now combined into a single annual CMEP Implementation Plan document).

As detailed in **Attachment 1**, over this assessment period, NERC and the Regional Entities have continued to increase the resources devoted to compliance monitoring and enforcement activities. In their approved business plans and budgets for 2009, NERC and the Regional Entities provided for, collectively, 158.25 FTE staff and approximately $32.5 million of direct expenditures in their CMEPs. In their business plans and budgets for 2014, NERC and the Regional Entities provided for, collectively, 303.40 FTE staff and approximately $57.1 million of direct expenditures in their CMEPs.

With respect to the requirements of §39.3(b)(2)(i), NERC continues to have in place rules that assure its independence from users, owners, and operators of the BPS while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organizational structure. This criterion encompasses three distinct considerations: (i) independence of NERC from users, owners and operators of the BPS; (ii) fair stakeholder representation in the selection of NERC's directors (i.e., its trustees); and (iii) provision for balanced decision-making in any NERC committee or organizational structure.

As described in detail in **Attachment 1**, provisions of NERC's Commission-approved Bylaws,[89] along with several NERC policy documents[90] assures NERC's independence from users, owners, and operators of the BPS. Provisions of the NERC Bylaws also assure fair stakeholder representation in the selection of NERC's trustees. Finally, provisions of the NERC Bylaws and of §1300 of the ROP specify requirements for selection of members for and voting procedures on, NERC committees and sub-groups, that provide for balanced decision-making.

With respect to the requirements of §39.3(b)(2)(ii), NERC's Bylaws and §1102 of its ROP provide for equitable allocation of reasonable dues, fees and charges among end users for all of the ERO's statutory activities. Section 1102 provides for the assessments to recover NERC's approved funding requirements to be allocated among countries, regions, and load-serving entities in the North American BPS based on Net Energy for Load (NEL), except where direct assignment of costs to a specific country or region(s) is appropriate. The NEL-based allocation of the annual assessments to cover NERC's and the Regional Entities' annual funding requirements is provided to the Commission for approval in NERC's annual business plan and budget filing.

With respect to the requirements of §39.3(b)(2)(iii), NERC's rules also continue to provide fair and impartial procedures for enforcement of Reliability Standards through the imposition of penalties in accordance with 18 C.F.R. §39.7. These rules and procedures include §400 of the ROP; Appendix 4B, *Sanction Guidelines*, of the ROP; and Appendix 4C, the *Compliance Monitoring and Enforcement Program*, of the ROP, which includes the Hearing

[89] NERC's Bylaws are considered "ERO Rules." 18 C.F.R. §39.1.

[90] NERC's *Governance Guidelines* is available at: http://www.nerc.com/gov/Annual%20Reports/Governance%20Guidelines%20-%20Approved%202.6.14.pdf; NERC's *Employee Code of Conduct* is available at*:* http://www.nerc.com/gov/Annual%20Reports/Employee-Code-of-Conduct.pdf; and NERC's *Policy on Reporting Complaints Regarding Accounting and Code of Conduct Matters*, is available at: http://www.nerc.com/gov/Annual%20Reports/Whistleblower_Policy_Final-May%202014.pdf.

Procedures to be followed by Regional Entity Hearing Bodies in presiding over and ruling on disputes raised by a registered entity with respect to a Regional Entity's proposed finding of a violation or the proposed amount of penalty for a violation. All of these provisions have been approved by the Commission as ERO Rules. All of these provisions have been extensively revised, and the revisions approved by the Commission, during this assessment period. **Attachment 1** to this report describes in detail NERC's rules and procedures for the determination and imposition of penalties for violations of Reliability Standards and how they comply with the requirements of §215(e)(6) of the FPA and §39.3(b)(2)(iii) and §39.7 of the Commission's regulations.

With respect to the requirements of §39.3(b)(2)(iv), NERC continues to maintain rules that provide reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing Reliability Standards and otherwise exercising its duties. NERC's Bylaws require that Reliability Standards be developed through an open, transparent, and public process that provides for reasonable notice and opportunity for public comment, due process, and balancing of interests; and that participation in the Reliability Standards development process shall not be limited to NERC members but rather shall be open to all persons and entities with an interest in the reliable operation of the BPS. As noted in the discussion of the first §39.3(b)(1) criterion, above, NERC's Reliability Standards development process is embodied in §300 and Appendix 3A of the ROP. The ROP specify "Essential Principles for the Development of Reliability Standards," which include openness, transparency, consensus-building, fair balance of interest, due process, and timeliness. With respect to balance of interests, the ROP provide for balloting on proposed Reliability Standards to be conducted on the basis of a broad set of ten industry segments, which collectively encompass persons and

entities with an interest in the reliable operation of the BPS. The detailed process steps for developing and approving new or revised Reliability Standards, set forth in the NERC SPM, is based on the procedures of the ANSI and other standards-setting organizations in the U.S. and Canada.

In addition to its rules and procedures for the development of Reliability Standards, NERC's rules provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in the exercise of NERC's other duties, including in the appointment and election of trustees, meetings of trustees, approving amendments to the Bylaws and amendments to the ROP, selection of members for and the conduct of business by committees and subgroups, development and approval of annual business plans and budgets, and the conduct of compliance monitoring and enforcement activities.

Finally, with respect to the requirements of §39.3(b)(2)(v), NERC continues to engage in substantial efforts to gain and maintain recognition as the ERO in Canada and Mexico. One of NERC's corporate purposes, as set forth in its Certificate of Incorporation, is "to act as the electric reliability organization for the United States as certified by the Federal Energy Regulatory Commission and for Canada and Mexico as recognized by applicable government and regulatory authorities in Canada and Mexico, all pursuant to law." In Canada, where by its Constitution the regulation of electricity is primarily within the jurisdiction of each province rather than the national government, NERC's activities to obtain and maintain recognition are conducted on a province-by-province basis. **Attachment 1** details NERC's efforts and accomplishments in the provinces of Alberta, British Columbia, Manitoba, New Brunswick, Nova Scotia, Ontario, Québec, and Saskatchewan, as well as at the National Energy Board. Depending on the particular circumstances of each province, NERC has gained recognition

through statutes or other provisions of provincial law, or through a memorandum of understanding with appropriate entities in the province. As described in **Attachment 1**, NERC's efforts in each province fall into three areas: recognition of NERC Reliability Standards; provisions for sharing of information on issues related to compliance with NERC Reliability Standards; and monitoring and enforcement of compliance with Reliability Standards.

With respect to Mexico, the Comisión Federal de Electricidad (CFE), through the Centro Nacional de Control de Energia (CENACE), and the Area de Control Baja California (ACBC), have entered into a membership and operating agreement (MOA) with WECC. The MOA provides for WECC to assist CENACE and ACBC in monitoring compliance by Designated Entities (the Mexican equivalent of U.S. registered entities) with Mexico Reliability Standards for Baja California, Mexico. CENACE has approved ten Mexico Reliability Standards. Pursuant to the MOA, WECC monitors compliance with Mexico Reliability Standards, but does not have enforcement or registration (designation) authority for CFE. WECC provides compliance monitoring, reviews proposed and completed mitigation plans, and provides assessment recommendations with respect to alleged violations.

In summary, and as shown in detail in **Attachment 1** to this *Five-Year ERO Performance Assessment Report*, the Commission should find that NERC continues to satisfy the requirements of 18 C.F.R. §39.3(b).

IV. REGIONAL ENTITY PERFORMANCE AND EFFECTIVENESS CONTINUES TO IMPROVE

Attachment 3 provides NERC's evaluation of the performance of the Regional Entities in carrying out their delegated authorities and responsibilities during the assessment period.

The Commission's regulation specifying the required contents of the ERO's periodic performance assessment reports states that the performance assessment must include, among

other subjects, the ERO's evaluation of the effectiveness of each Regional Entity and recommendations by the ERO for improvement of the Regional Entity's performance of delegated functions.[91] In its September 16, 2010 Order on NERC's *Three-Year ERO Performance Assessment Report*, the Commission stated that future assessments should include, among other things, separate sections addressing each Regional Entity's satisfaction of statutory and regulatory criteria.[92]

In this five-year performance assessment, NERC organized its evaluation of the Regional Entities' performance based on their principal delegated authorities and responsibilities under the RDAs and the NERC ROP. These segments also correspond to the programmatic organization structures generally followed by NERC and the Regional Entities:

- Regional Reliability Standards Development (**Attachment 3**, §I)
- Compliance Monitoring and Enforcement (**Attachment 3**, §II)
  - Organization Registration and Certification (**Attachment 3**, §II.A)
  - Compliance Monitoring[93] (**Attachment 3**, §II.B)
  - Compliance Investigations (**Attachment 3**, §II.C)
  - Compliance Enforcement (**Attachment 3**, §II.D)
- Reliability Assessments (**Attachment 3**, §III)
- Reliability Risk Management (Situation Awareness and Event Analysis) (**Attachment 3**, §IV)
- Business Planning and Budgeting, Finance and Accounting (**Attachment 3**, §V).

[91] 18 C.F.R. §39.3(c)(1)(iii).

[92] *North American Electric Reliability Corporation, Order on the Electric Reliability Organization's Three-Year Performance Assessment*, 132 FERC ¶ 61,217 (2010), at P 36.

[93] The evaluation of the Regional Entities' performance in Compliance Monitoring includes evaluation of their efforts in providing training, education, and outreach to registered entities and other industry stakeholders on compliance-related matters.

To evaluate the Regional Entities' performance during the assessment period, NERC believed it to be important to use assessment criteria that were well-known to the Regional Entities and that were established at the beginning of, or early in, the assessment period. Accordingly, NERC has generally used the Regional Entities' obligations and responsibilities under the RDAs and the NERC ROP as the basis for evaluating the Regional Entities' performance or as the source for more specific assessment criteria. Although, during the assessment period, the RDAs were significantly revised through a collaborative process among NERC and the Regional Entities, with the revised RDAs going into effect on January 1, 2011 (i.e., approximately 18 months into the assessment period), the Regional Entities' fundamental delegated authorities and responsibilities under the RDAs were not changed in the revised RDAs.

Further, in evaluating the Regional Entities' performance during the assessment period, NERC placed greater emphasis on each Regional Entity's performance during the latter half of the assessment period rather than earlier in the assessment period. Although the assessment is intended to cover the entire five-year period, NERC views the success of a Regional Entity in improving its programs over the course of the period – particularly where improvements have been implemented in response to specific comments, criticisms or recommendations from NERC, the Commission, or the Regional Entity's stakeholders – as especially important to the evaluation. The quality of a Regional Entity's programs and performance as of the end of the assessment period is much more important to the objectives of this review than is a historical review of the Regional Entity's programs and performance at the start of, or in the early portion of, the assessment period. Further, a Regional Entity's willingness to cooperate in implementing new ERO Enterprise initiatives and improvements intended to improve the reliability of the BPS and increase consistency and efficiency across the ERO Enterprise is particularly important to

the evaluation. This focus on improvements, responses to comments and recommendations, and the state of the Regional Entities' programs and performance as of the end of the assessment period, is consistent with the emphasis in the Commission's applicable regulation on comments and recommendations from stakeholders for improvements and the Regional Entity's responses to such comments and recommendations.

In this evaluation of the Regional Entities' performance in the various program areas, NERC has also provided a significant amount of description of NERC's oversight activities of the Regional Entities. NERC's oversight of the Regional Entities' programs and activities provides important context for the performance assessment because, for almost all of the Regional Entities' delegated authorities and responsibilities, NERC's oversight is frequent, and in some areas, virtually continuous. NERC's oversight activities are a significant component of the informational and observational basis for NERC's evaluation of the Regional Entities' performance. Moreover, although this *Five-Year ERO Performance Assessment Report* is appropriately required by the Commission's regulations, it is NERC's ongoing oversight of the Regional Entities' activities that gives NERC both an up-to-date basis for evaluation, and a continuous platform to evaluate the need for and make recommendations for improvements, both in the performance of discrete tasks by individual Regional Entities and on a programmatic, ERO Enterprise-wide basis.

V. NERC HAS SURVEYED STAKEHOLDERS FOR COMMENTS AND SUGGESTIONS FOR IMPROVEMENTS

One of the components of the ERO's periodic assessment reports as specified in 18 C.F.R. §39.3(c) is that the assessment include "[r]ecommendations by Regional Entities, users, owners, and operators of the Bulk-Power System, and other interested parties for improvement of the ERO's operations, activities, oversight and procedures, and the ERO's response to such

recommendations."[94] NERC has addressed this component by soliciting comments and recommendations through (i) a stakeholder survey conducted for purposes of the five-year ERO performance assessment, and (ii) posting drafts of the five-year performance assessment report for stakeholder comment.

The stakeholder survey was initiated on October 31, 2013, near the end of the five-year assessment period, when NERC distributed an online survey seeking stakeholder responses. The survey contained 36 specific questions on topics relating to (i) Reliability Standards development; (ii) compliance monitoring; (iii) compliance enforcement; (iv) organization registration and certification; (v) reliability assessment; (vi) performance analysis and metrics; (vii) training, education and personnel certification; (viii) event analysis; (ix) critical infrastructure protection; (x) shareholder communications, public relations and information technology; (xi) business plan and budget; and (xii) independence and stakeholder input. Stakeholders were invited to respond to the questions using a numerical scoring system and, more importantly, to provide free-form narrative comments on the topics covered by the survey. A total of 326 registered entity responses were received. The respondents were located in all Regional Entities, ranging from a low of 23 responses to a high of 97 responses from respondents located within particular Regional Entities. **Attachment 4** provides the text of the questions that were asked in the survey and also provides summary data on the numbers and distribution of respondents.

With respect to posting drafts of the five-year performance assessment for stakeholder comment, on March 3, 2014, NERC posted a draft statement of its activities and accomplishments during the five-year assessment period, as well as drafts of the Regional

[94] 18 C.F.R. §39.3(c)(1)(ii).

Entities' self-assessments, on the NERC website for stakeholder comment. Subsequently, on June 17, 2014, NERC posted a draft of the *Five-Year ERO Performance Assessment Report* and attachments on its website for stakeholder comment.[95]

Attachment 4 to this *Five-Year ERO Performance Assessment Report* provides the content specified by 18 C.F.R. §39.3(c)(1)(ii). As noted above, **Attachment 4** provides the questions included in the stakeholder survey, reports the average scores from the responses, and provides summary information on the number and distribution of respondents.[96] More importantly, **Attachment 4** provides the significant narrative comments and recommendations submitted by stakeholders and NERC's responses to those comments. To focus on the key issues, questions and recommendations posed or raised by commenters, and for simplicity, NERC has attempted to summarize the comments and to combine them where appropriate, in order to report the gist of the comments and recommendations. The comments are organized in **Attachment 4** in table format by subject matter area: Reliability Standards; Compliance Operations; Enforcement; Registration and Certification; Reliability Assessment & Performance Analysis Metrics; Training, Education and Personnel Certification; Event Analysis; Critical Infrastructure Protection; Stakeholder Communications, Public Relations and IT; and Business Plan and Budget. A separate table, organized into the same topical sections, provides a summary of key stakeholder comments of the Regional Entities. For each stakeholder comment reported in one of the two tables, NERC has provided in the table, opposite the comment, (i) where applicable, the section or sections of the *Overview of NERC Activities and Accomplishments in*

[95] The June 17, 2014 posted draft of **Attachment 4** was incomplete, since completion of that attachment required receipt of the stakeholder comments in response to the posting of the draft report and the preparation of responses to the comments for inclusion in the attachment.

[96] Some of the questions by their nature, pertained only to NERC, while others of the questions pertained to both NERC and the Regional Entities. Average scores are reported for NERC or for NERC and the individual Regional Entities as applicable to the particular survey questions.

the Five-Year Period or of an attachment to this report in which the subject matter of the comment is addressed, and (ii) for most of the comments, a brief narrative response to the comment as well. NERC submits that the tables provided in **Attachment 4** show that NERC has responded to and addressed, or is in the process of responding to and addressing, the key stakeholder comments and recommendations provided in connection with the development of this *Five-Year ERO Performance Assessment Report*.

VI. NERC HAS MADE SUBSTANTIAL PROGRESS IN COMPLETING ACTIONS ON ITEMS IN THE COMMISSION'S ORDER ON THE *THREE-YEAR ERO PERFORMANCE ASSESSMENT REPORT*

NERC's *Three-Year ERO Performance Assessment Report*, filed on July 20, 2009, identified and listed a number of actions to be taken in response to comments received from stakeholders as part of the three-year assessment process.[97] Additionally, the Commission's Order on the three-year ERO performance assessment, issued on September 16, 2010, identified a number of areas for improvement.[98] NERC was directed to submit an informational report to the Commission within six months addressing the directives, concerns and requests for information and/or feasibility reports discussed in the Order. NERC filed the Informational Report on March 16, 2011.[99] NERC was able to report either completion or significant progress with respect to many of the items listed in the Commission's Order.

As part of this *Five-Year ERO Performance Assessment Report*, NERC is providing a further report on its progress in addressing the directives, concerns and requests for information

[97] These actions were listed in Appendix A to **Attachment 1** of the *Three-Year ERO Performance Assessment Report*.

[98] *Order on the Electric Reliability Organization's Three-Year Performance Assessment*, 132 FERC ¶ 61,217 (2010). Appendix A to that Order provided an "Index of Directives" in the Order.

[99] *Informational Filing of the North American Electric Reliability Corporation in Response to the Federal Energy Regulatory Commission's September 16, 2010 Order*, filed March 16, 2011 in Docket Nos. RR09-7-000 and AD10-14-000.

and/or feasibility reports discussed in the Commission's Order on the three-year ERO performance assessment that were not discussed in the March 2011 informational filing. This information is provided in a chart format in **Attachment 5** to this report. As noted in the chart provided as **Attachment 5**, NERC's actions in connection with a number of the items are also discussed in the body of this five-year assessment report.

VII. NERC HAS A VISION AND PLAN FOR IMPROVING COORDINATED OPERATIONS ACROSS THE ERO ENTERPRISE TO REACH THE END STATE OF A HIGHLY EFFECTIVE AND EFFICIENT ERO ENTERPRISE

As described above and in the Attachments to this report, since being certified as the ERO in 2006 and, in particular, during this five-year assessment period, NERC has made substantial progress and recorded significant accomplishments in structuring the ERO Enterprise organization and improving the reliability of the BPS. Despite the achievements to date, the nine-entity structure of the ERO Enterprise, NERC and the eight Regional Entities, is not without certain challenges and risks. Going forward, NERC needs and intends to focus attention on the actions necessary to reach an end-state of a fully-integrated ERO Enterprise that can exercise effective and well-coordinated reliability oversight that mitigates reliability risks to the BPS. Achieving the end-state of a fully integrated ERO Enterprise entails creating greater clarity about the allocation of roles and responsibilities between NERC and the Regional Entities, achieving improved coordination of goals, and establishing more uniform work processes, tools and performance across the ERO Enterprise.

NERC has a vision and plan for achieving this end state of a fully integrated, highly effective and efficient ERO Enterprise. This vision and plan are described in detail in **Attachment 6** to this report.

Reaching this end state necessitates adherence to certain fundamental principles. The ERO Enterprise must:

- Apply technical expertise that is focused on risks to the BPS and important reliability outcomes;
- Achieve results and methods across the ERO Enterprise that are predictable, consistent and timely;
- Share common goals, objectives and measures of success;
- Build relationships that are founded on candor and mutual trust, openness and cooperation;
- Apply collaborative decision-making;
- Ensure efficiencies while minimizing duplication and any activities not affecting reliability outcomes; and
- Avoid undue burden, discrimination, or capriciousness for affected regulated entities.

As detailed in **Attachment 6**, NERC's plan for achieving excellence in the oversight and execution of its statutory functions and in the mitigation of BPS reliability risks requires actions in five areas relating to the relationships and allocations of responsibilities between and among NERC and the Regional Entities:

(1) Clarifying roles and responsibilities. A clear understanding of the roles and responsibilities of NERC and the Regional Entities is required, as well as a clear set of expectations in the execution of the activities performed across the ERO Enterprise. This in turn will necessitate ERO Enterprise program oversight that includes the following essential oversight elements to be provided by NERC in consultation with the Regional Entities:

- An overall program design indicating the program purpose and goals, and design of controls to manage risks;
- Documentation of common methods, practices and procedures to be applied in the program, and performance expectations for each;
- Statements of necessary qualifications of key positions within the Regional Entities for conducting certain statutory activities, and identification of any standards for critical positions;

- Training of NERC and Regional Entity staff for select positions in the conduct of delegated functions;

- A documented and transparent set of process controls and measures to assure delegated responsibilities are properly completed, and to assess the effectiveness of the delegated activities in managing BPS and ERO Enterprise risk; and

- Periodic reporting of results and feedback to Regional Entities on trends and providing opportunities to enhance consistency and effectiveness of results.

To improve the delegation process, it will be important that NERC and the Regional Entities work together to update and refine the RDAs, due for renewal as of January 1, 2016, to provide a clearer division of responsibilities, both related to the division of performance of statutory functions and oversight of those functions, and to provide effective mechanisms to resolve routine differences.

(2) Coordinating strategic planning. NERC and the Regional Entities have collaboratively made significant progress in developing a shared, rolling three-year strategic plan for the ERO Enterprise. However, adoption of the ERO Enterprise goals and objectives into business plans at all of the Regional Entities has varied. In May 2014, the NERC Board approved the 2014 performance metrics. These performance metrics will be used to assess the overall effectiveness of the ERO Enterprise in addressing risk to the BPS, achieving reliability results, assuring Reliability Standards and compliance effectiveness and improving risk mitigation and program execution. They include four overarching metrics focused on overall effectiveness in addressing BPS risks and improving reliability. They also include a number of supporting measures that assess the effectiveness of the key operational elements of the ERO Enterprise. The intent is to report the results of these metrics on an ERO Enterprise-wide basis, and also as applicable, distinguish results for NERC and individual Regional Entities.[100]

[100] *See* http://www.nerc.com/gov/Annual%20Reports/ERO%20Enterprise%20Strategic%20Plan%202014-2017%20and%20Performance%20Metrics.pdf.

(3) Coordinating operational decision-making. The ERO Enterprise model depends on successful delegation of activities, but also requires coordination of operational decisions that arise in the execution of these activities. To date, coordination of policy and directional decisions has been achieved through: (i) coordination meetings between NERC and Regional Entity CEOs, which have become more routinized in recent years and include an agreed-upon protocol for reaching consensus decisions; and (ii) the activities of approximately two dozen working groups collaborating across various functional areas of the ERO Enterprise. The preferred approach going forward is to proactively establish a more collaborative model and recognize that Regional Entity staffs for most functions typically have valuable first-hand experience in implementing the activities on the front lines with registered entities. However, success depends on collaboration that results in timely and effective decisions that all entities in the enterprise agree to implement, and the avoidance of unilateral decision-making that steers portions of the ERO Enterprise into alternative methods and practices for delegated functions.

(4) Achieving consistency. Achieving consistency of methods, practices, procedures and tools has been a challenge throughout the history of the ERO Enterprise. At the outset, given a lack of common processes and procedures from NERC, Regional Entities developed their own methods, practices, procedures and tools. While there has been significant progress made, through the leadership and working groups referred to in the preceding paragraph, in addressing substantive differences, there remain significant variations in methods, practices, procedures and tools across NERC and the eight Regional Entities. Today, the biggest challenge in addressing consistency is gaining common agreement on processes and procedures with the backdrop of years of institutionalized differences among NERC and the Regional Entities.

The ultimate success of the ERO Enterprise depends on there being one compliance

program, one enforcement program, one event analysis program, and so forth. Registered entities will have greater confidence and trust in the ERO Enterprise if they believe regulatory oversight is not subject to arbitrary variations and possible discrimination from one region to the next. Outcomes will be more predictable and consistent if each statutory function is conducted in a unified fashion across the ERO Enterprise. Outcomes will also be more readily measurable to demonstrate the reliability impacts and benefits of the ERO Enterprise programs. In the long term, after the transition from legacy approaches, there will be significant efficiencies.

This transition requires the development of a core set of common methods, practices, procedures, and tools, which NERC is principally responsible to produce, working in collaboration with the Regional Entities. Consistency does not necessarily require identical internal procedures at each Regional Entity, and some flexibility must be maintained to allow for progress through innovation. However, consistency does mean that the approach, methods and practices are the same across the ERO Enterprise and that outcomes produced from application of the local and regional expertise and judgment of the Regional Entity staffs are fair, reasonable and without bias. In other words, the goal is consistent methods, practices, procedures and tools that deliver fair and reasonable outcomes. The move to greater consistency must occur under the close scrutiny of the ERO Executive Management Group, with accountability for progress to the NERC and Regional Entity boards, and all entities must be prepared to adopt changes to drive to more consistent methods, practices, procedures and tools.

(5) Coordinating external and cross-ERO Enterprise communications. Communications are important to the effectiveness of the ERO Enterprise. Communications can help set expectations for registered entities and stakeholders and demonstrate a common and consistent approach for regulators and the public. To facilitate effective communications across the ERO

Enterprise, in May 2013 the NERC Board initiated a practice of meeting twice yearly as a group with all the chairs and vice-chairs of the Regional Entities, with a portion of these meetings conducted with the NERC and Regional Entity CEOs also present. Additionally, a NERC-Regional Entity communications working group has been active for several years, coordinating consistent messaging across the ERO Enterprise. Further, NERC and the Regional Entities have coordinated outreach to FERC Commissioners and staff and to Canadian governments. However, although efforts to coordinate key messages and direction have been successful, areas for improvement remain. Thus, going forward, this area requires further attention to arrive at a desired end-state for the ERO Enterprise.

To reach the desired end-state for the ERO Enterprise in the five areas described above, NERC intends to focus on the following eleven action items:

(1) NERC includes in its review of Regional Entity business plans adequacy of resources and alignment of the plans for achieving delegated function objectives and outcomes described in the three-year plan.

(2) NERC, in collaboration with the Regional Entities:

(a) Develops a comprehensive overarching design and set of controls, reporting requirements, and feedback mechanisms for each delegated statutory function, including the essential oversight elements listed above;

(b) Re-evaluates its organizational structure and leadership qualifications necessary to provide effective design and oversight of statutory activities;

(c) Identifies functional qualifications for select delegated activities, such as auditors and investigators;

(d) Adopts risk-based approaches to monitoring performance of delegated functions and providing effective feedback and coaching to continuously improve overall ERO Enterprise performance; and

(e) Re-evaluates the ERO working group structure to enhance effectiveness.

(3) Regional Entities:

(a) Work in a coordinated fashion to support NERC in the development of comprehensive functional program designs and controls;

(b) Adapt existing regional programs for delegated functions to conform with emerging program designs provided by NERC; and

(c) Ensure Regional Entity staffs meet qualification and training requirements.

(4) NERC and the Regional Entities develop and maintain a joint three-year strategic plan for the ERO Enterprise describing the goals and deliverables for statutory functions and this plan should guide the development of each Regional Entity's annual business plans. Additional goals and deliverables that are complimentary or supplemental to the strategic plan may be developed at the Regional Entity level.

(5) NERC and the Regional Entities transparently report results, based on a common set of performance measures focused on BPS reliability outcomes and effectiveness of the statutory programs. These measures are considered in the performance management program at each entity.

(6) ERO Enterprise senior leadership continues maturing the collaborative decision-making process and setting the direction and policy for the enterprise as well as driving this collaboration throughout the ERO Enterprise organizations.

(7) All nine ERO entities abide by the joint enterprise decisions of the ERO Enterprise senior leadership, and the NERC CEO should make final determinations if consensus is not otherwise achievable for an action that is required.

(8) With NERC leading, the ERO Enterprise develops a core set of methods, practices, procedures, and tools to support unified implementation of the major statutory functions of NERC. In doing so, the ERO Enterprise commits to put the best talent available throughout the collective organizations to achieve this goal.

(9) The ERO Enterprise senior leadership develops ERO Enterprise Information Technology applications, where appropriate, to support common processes, to enhance the efficiency and effectiveness of Regional Entities' practices, to increase the consistency of the interface with registered entities, and to facilitate NERC's oversight function.

(10) All parties of the ERO Enterprise, including leadership and staffs, convey shared and consistent messages from the enterprise perspective and communicate together to minimize messages emphasizing self-importance or uniqueness.

(11) NERC and Regional Entities continue the joint board coordination to ensure oversight and accountability of all elements of the enterprise and should continue to refine and expand coordinated outreach to government entities in the U.S. and Canada, stakeholders, and media.

VIII. CONCLUSION

As detailed in this *Five-Year ERO Performance Report* and its Attachments, NERC has reached an important level of development in identifying, understanding and addressing reliability risks to the BPS. NERC has implemented targeted initiatives that benefit the electric industry and its customers through improved BPS reliability. These initiatives also allow NERC to measure and be accountable for the effectiveness and value of the investments made by the industry to enhance and maintain reliability. NERC's approach allows it to target results around specific issues that benefit the industry and its customers through improved BPS reliability. Further, NERC's programs are continuing to evolve, thereby sharpening its focus on reliability and accountability through risk-based processes.

FIVE-YEAR ELECTRIC RELIABILITY ORGANIZATION PERFORMANCE ASSESSMENT REPORT

DISCUSSION OF HOW NERC MEETS THE ERO CERTIFICATION CRITERIA OF 18 C.F.R. §39.3(b)

JULY 21, 2014

Attachment 1

TABLE OF CONTENTS

I. DISCUSSION OF HOW NERC MEETS THE ERO CERTIFICATION CRITERIA OF 18 C.F.R. §39.3(b) 1

A. Criterion 1 - The ERO has the ability to develop and enforce, pursuant to 18 C.F.R. §39.7, Reliability Standards that provide for an adequate level of reliability of the BPS. 1

B. Criterion 2 - The ERO has established rules that assure its independence of users, owners and operators of the BPS while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committees and subordinate organizational structure. 17

C. Criterion 3 - The ERO has established rules that allocate equitably reasonably equitable dues, fees and charges among end users for all statutory activities. 23

D. Criterion 4 - The ERO has established rules that provide fair and impartial procedures for enforcement of Reliability Standards through the imposition of penalties in accordance with 18 C.F.R. §39.7, including limitations on activities, operations, or other appropriate sanctions or penalties. 24

E. Criterion 5 - The ERO has established rules that provide reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing Reliability Standards, and otherwise exercising its duties. 28

F. Criterion 6 - The ERO has established rules that provide appropriate steps to gain recognition in Canada and Mexico. 34

I. DISCUSSION OF HOW NERC MEETS THE ERO CERTIFICATION CRITERIA OF 18 C.F.R. §39.3(b)

A. Criterion 1 - The ERO has the ability to develop and enforce, pursuant to 18 C.F.R. §39.7, Reliability Standards that provide for an adequate level of reliability of the BPS.

This criterion encompasses two distinct functions of the ERO: (i) the ability to develop Reliability Standards that provide for an adequate level of reliability of the bulk power system (BPS); and (ii) the ability to enforce those Reliability Standards.

Development of Reliability Standards

NERC develops Reliability Standards pursuant to §300 of its Rules of Procedure (ROP) and its *Standard Processes Manual* (SPM), Appendix 3A to the ROP, both of which have been approved by the Commission as ERO Rules.[1] In addition to having been approved by the Commission, the SPM has been accredited by the American National Standards Institute (ANSI) as meeting ANSI's essential requirements for standards development.

The overall purpose of NERC's Reliability Standards development process, as stated in §301 of the NERC ROP, is to develop and maintain Reliability Standards that apply to BPS owners, operators, and users and that enable NERC and the Regional Entities to measure the reliability performance of the owners, operators, and users and to hold them accountable for the reliable operation of the BPS. Section 301 of the ROP requires that Reliability Standards developed by NERC must be technically excellent, timely, just, reasonable, not unduly discriminatory or preferential, in the public interest, and consistent with other applicable standards of governmental authorities.[2]

In Order No. 672 and the *ERO Certification Order*, the Commission stated that the ERO's Reliability Standards development process must ensure that each Reliability Standard is technically sound; that its operational specifications are designed to achieve a valuable reliability goal; that the standard is clear and unambiguous regarding what is required and who is required to comply; and that there be clear criteria to measure whether an entity is in compliance with the Reliability Standard, so that enforcement can be applied in a consistent and non-preferential manner.[3] Consistent with these requirements, §302 of the ROP specifies the essential attributes of

[1] Sections 304 and 308.1 of the ROP specify that "NERC shall develop Reliability Standards in accordance with the NERC *Standard Processes Manual*, which is incorporated into these Rules of Procedure as Appendix 3A." The current version of the SPM is version 3 which became effective June 26, 2013.

[2] Section 304 of the ROP sets forth NERC's "Essential Principles for the Development of Reliability Standards." These principles, which include openness, transparency, consensus-building, fair balance of interests, due process and timeliness, are discussed under criterion 5, below.

[3] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204 (2006), at PP 258, 262, 325, 327; *Order Certifying North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing*, 116 FERC ¶ 61,062 (*ERO Certification Order*), at PP 239, 241.

technically excellent Reliability Standards to be developed by NERC.[4] These essential attributes include:[5]

1. **Applicability** — Each Reliability Standard shall clearly identify the functional classes of entities responsible for complying with the Reliability Standards, with any specific additions or exceptions noted.[6]

2. **Reliability Objectives** — Each Reliability Standard must have a clear statement of purpose that describes how the Reliability Standard contributes to the reliability of the BPS. Section 302.2 of the ROP lists the general objectives for the BPS that provide a foundation for determining the specific objective(s) of each Reliability Standard:[7]

    2.1. **Reliability Planning and Operating Performance** — Bulk Power Systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions.

    2.2. **Frequency and Voltage Performance** — The frequency and voltage of Bulk Power Systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.

    2.3. **Reliability Information** — Information necessary for the planning and operation of reliable Bulk Power Systems shall be made available to those entities responsible for planning and operating Bulk Power Systems.

    2.4. **Emergency Preparation** — Plans for emergency operation and system restoration of Bulk Power Systems shall be developed, coordinated, maintained, and implemented.

---

[4] In the *ERO Certification Order*, the Commission recognized that NERC's proposed ROP provided that the characteristics for technical excellence of a Reliability Standard must be met for a proposed Reliability Standard to be approved. *ERO Certification Order* at P 235.

[5] The descriptions of the essential attributes that follow are summaries, not direct quotes from §302.

[6] The functional classes of entities, or reliability functions, have been developed through NERC's functional model of the BPS, and are defined in its: (i) *Glossary of Terms Used in NERC Reliability Standards*, and (ii) *Statement of Compliance Registry Criteria* which is incorporated into the ROP as Appendix 5B. Currently, the functional classes of entities are: Balancing Authorities (BAs), Distribution Providers, Generator Operators (GOPs), Generator Owners (GOs), Interchange Authorities, Load-Serving Entities, Planning Authorities, Purchasing-Selling Entities, Reliability Coordinators (RCs), Resource Planners, Reserve Sharing Groups, Transmission Operators (TOPs), Transmission Owners (TOs), Transmission Planners, and Transmission Service Providers.

[7] In the *ERO Certification Order*, the Commission recognized that NERC's proposed rules provided that the purpose of a Reliability Standard, or its reliability objective, should derive from one or more of these eight general objectives. *ERO Certification Order* at P 236.

2.5. **Communications and Control** — Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of Bulk Power Systems.

2.6. **Personnel** — Personnel responsible for planning and operating Bulk Power Systems shall be trained and qualified, and shall have responsibility and authority to implement actions.

2.7. **Wide-Area View** — The reliability of Bulk Power Systems shall be assessed, monitored, and maintained on a Wide-Area basis.

2.8. **Security** — Bulk Power Systems shall be protected from malicious physical or cyber attacks.

3. **Performance Requirement or Outcome** — Each Reliability Standard shall state one or more performance Requirements, which if achieved by the applicable entities, will provide for a reliable BPS, consistent with good utility practices and the public interest. Each Requirement is not a "lowest common denominator" compromise, but instead shall achieve an objective that is the best approach for BPS reliability, taking account of the costs and benefits of implementing the proposal.

4. **Measurability** — Each performance Requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by the Requirement. Each performance Requirement shall have one or more associated measures used to objectively evaluate compliance with the Requirement. If performance can be practically measured quantitatively, metrics shall be provided to determine satisfactory performance.

5. **Technical Basis in Engineering and Operations** — Each Reliability Standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that field.

6. **Completeness** — Reliability Standards shall be complete and self-contained. The Reliability Standards shall not depend on external information to determine the required level of performance.

7. **Consequences for Noncompliance** — In combination with guidelines for penalties and sanctions and other ERO and Regional Entity compliance documents, the consequences of violating a Reliability Standard are clearly presented to the entities responsible for complying with the Reliability Standards.

8. **Clear Language** — Each Reliability Standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of required performance.

9. **Practicality** — Each Reliability Standard shall establish Requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.

10. **Consistent Terminology** — To the extent possible, Reliability Standards shall use a set of standard terms and definitions that are approved through the NERC Reliability Standards development process.[8]

In the *ERO Certification Order*, the Commission concluded that by specifying the eight general objectives for which a Reliability Standard must be intended, and by incorporating other requirements for Reliability Standards development into the essential attributes of technically excellent Reliability Standards, NERC's ROP satisfied the requirements of Order No. 672 for the ERO's Reliability Standards development process.[9]

The NERC SPM also specifies the performance elements of a Reliability Standard.[10] The requirement that each Reliability Standard contain these elements applies a systematic discipline in the development and revision of standards, in order to produce standards that are measurable, enforceable, and consistent. The SPM allows for a clear statement of the purpose, requirements, measures, and compliance elements associated with each standard. The performance elements of a Reliability Standard, as specified in the SPM §2.5, are as follows:

- Title: A brief, descriptive phrase identifying the topic of the Reliability Standard.
- Number: A unique identification number assigned in accordance with a published classification system to facilitate tracking and reference to the Reliability Standards.
- Purpose: The reliability outcome achieved through compliance with the Requirements of the Reliability Standard.
- Applicability: Identified which entities are assigned reliability requirements. The specific Functional Entities and Facilities to which the Reliability Standard applies.
- Effective Dates: Identification of the date or pre-conditions determining when each Requirement becomes effective in each jurisdiction.
- Requirement: An explicit statement that identifies the Functional Entity responsible, the action or outcome that must be achieved, any conditions achieving

[8] In furtherance of the essential attribute of "Consistent Terminology," NERC has developed and maintains the *Glossary of Terms Used in NERC Reliability Standards*, containing definitions of terms that are used in one or more Reliability Standards.

[9] *ERO Certification Order* at PP 239, 241.

[10] SPM at pp. 6-9.

the action or outcome, and the reliability-related benefit of the action or outcome. Each Requirement shall be a statement for which compliance is mandatory.

- Compliance Elements: Elements to aid in the administration of ERO compliance monitoring and enforcement responsibilities.

- Measure: Provides identification of the evidence or types of evidence that may demonstrate compliance with the associated requirement.

- Violation Risk Factors and Violation Severity Levels: Violation risk factors (VRFs) and violation severity levels (VSLs) are used as factors when determining the size of a penalty or sanction associated with the violation of a requirement in an approved Reliability Standard. Each requirement in each Reliability Standard has an associated VRF and a set of VSLs. VRFs and VSLs are developed by the drafting team, working with NERC staff, at the same time as the associated Reliability Standard, but are not part of the Reliability Standard. The Board of Trustees is responsible for approving VRFs and VSLs.

    - Violation Risk Factors: VRFs identify the potential reliability significance of noncompliance with each requirement. Each requirement is assigned a VRF in accordance with the last approved set of VRF criteria.
    - Violation Severity Levels: VSLs define the degree to which compliance with a requirement was not achieved. Each requirement shall have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs. Each requirement is assigned one or more VSLs in accordance with the latest approved set of VSL criteria.

- Version History: The version history is provided for informational purposes and lists information regarding prior versions of Reliability Standards.

- Variance: A Requirement (to be applied in the place of the continent-wide Requirement) that is applicable to a specific geographic area or to a specific set of registered entities.

- Compliance Enforcement Authority: The entity that is responsible for assessing performance or outcomes to determine if an entity is compliant with the associated Reliability Standard. The Compliance Enforcement Authority [(CEA)] will be NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

- Application Guidelines: Guidelines to support the implementation of the associated Reliability Standard.

- Procedures: Procedures to support implementation of the associated Reliability Standard.

The NERC SPM sets forth the detailed process steps for the development and approval of a new Reliability Standard or a revision to an existing standard; the SPM also sets forth the detailed roles of the different persons and groups in in the process.[11] Under the ROP and the SPM, the key groups involved in development of a proposed new Reliability Standard or revision to an existing standard are: (i) the NERC Standards Committee; (ii) the standards authorization request (SAR) drafting team; (iii) the standard drafting team; and (iv) the Registered Ballot Body (RBB).

The Standards Committee is an elected body comprised of two members from each segment of the RBB.[12] The Standards Committee, with the assistance and facilitation of the professional staff of the NERC Reliability Standards development program, oversees the overall standards development process. The Standards Committee ensures that standard development teams have the technical resources and capabilities required to develop technically sound standards that will gain industry support. Among other things, the Standards Committee determines whether SARs submitted by interested persons and entities should be pursued for development, and it appoints members to SAR drafting teams and standard drafting teams.[13] A SAR drafting team is a team of technical experts that, among other responsibilities, assists in refining a SAR and considers and responds to comments.[14] The standard drafting team is a team of technical experts that develops the details of the proposed new or revised Reliability Standard, analyzes results of field tests of the standard (if applicable), and considers and responds to comments.[15] The RBB, which is open to any person or entity and is organized by industry segments, votes on the adoption or rejection of proposed Reliability Standards or revisions to existing standards.[16]

The SPM also specifies roles in the standards development process for the NERC Reliability Standards staff, which is led by the director of standards.[17] Staff provides support to the Standards Committee in managing the Reliability Standards processes and in supporting the work of all drafting teams. More specifically, staff is responsible for ensuring that development

[11] The ROP also provides for an expedited standards development process in the event an applicable governmental authority directs the development of a Reliability Standard within a certain timeframe. This process is described in §309.3 of the ROP.

[12] The segment organization of the RBB is set forth in detail in the *Registered Ballot Body Criteria,* Appendix 3D to the ROP.

[13] *See* SPM at §§3.4 and 3.6.

[14] *See* SPM at §4.2.

[15] SPM at §4.3.

[16] ROP §305; SPM at §§3.2 and 4.7-4.15 (pp. 10, 20-24). Following successful balloting by the ballot pool, a proposed standard is submitted to the NERC Board of Trustees for approval, and if approved by the Board, is filed with the Commission for approval in accordance with §215(d) of the FPA and 18 C.F.R. §39.5. NERC Bylaws, Article IX, §1; ROP §§308.2, 308.3, and 309; and SPM at §§4.0 and 4.16.

[17] SPM at §3.5; *see also* ROP §307.

and revision of standards is in accordance with the SPM, works to ensure the integrity of the Reliability Standards development process and the consistency of quality and completeness of NERC Reliability Standards, and facilitates all steps in the standards development process.

The NERC standards development process relies on the legal and technical expertise provided by the industry experts comprising the SAR drafting teams and standard drafting teams, the technical and administrative assistance provided by the NERC standards process managers and the NERC standards process staff, and the overall oversight and direction of the Standards Committee. Thus, the NERC standards development process ensures that the essential attributes of technically excellent Reliability Standards, including the accomplishment of one of the eight general reliability objectives specified in §§302.2.1 through 302.2.8 of the ROP, are represented in each Reliability Standard that is developed or revised through the process and submitted to the NERC Board of Trustees and, ultimately, to the Commission for approval.

As demonstrated by the table below, NERC has invested significant resources to support its Reliability Standards program. Since 2009, NERC has increased its budgeted resources (direct expenses) for the Reliability Standards program by approximately 143.10% percent from 2009 to 2014:[18]

Year	**Amount**	**Increase over 2009**
2009:	$3,599,454	N/A
2010:	$4,189,050	116.38%
2011:	$4,863,139	135.11%
2012:	$5,307,943	147.47%
2013:	$5,134,738	142.65%
2014:	$5,150,854	143.10%

Leveraging its resources and standards development process, NERC has developed and submitted to the Commission a total of 293 continent-wide Reliability Standards that, as of December 1, 2013, have been approved by the Commission pursuant to §215(d) of the Federal Power Act (FPA) and 18 C.F.R. §39.5 to be mandatory and enforceable. NERC has also approved and submitted to the Commission, and the Commission has approved, a total of 23 regional Reliability Standards as of December 1, 2013. NERC's success to date in developing Reliability Standards that the Commission subsequently approved as mandatory and enforceable

[18] *See December 2008 Budget Compliance Filing* Attachment 1 at 1; *NERC 2010 Business Plan and Budget* at 36 and Attachment 2 at 15; *NERC 2011 Business Plan and Budget* at 35 and Attachment 2 at 27; *NERC 2012 Business Plan and Budget* at 37 and Attachment 2 at 26; *NERC 2013 Business Plan and Budget* at 42 and Attachment 2 at 34; *NERC 2014 Business Plan and Budget* at 43 and Attachment 2 at 29. The amounts cited are direct expenses only and do not include NERC indirect expenses (General and Administrative, Information Technology, Legal and Regulatory, Human Resources, and Finance and Accounting) allocated to the Reliability Standards Program Area.

demonstrates that NERC has, and has exercised, the ability to develop Reliability Standards that provide for an adequate level of reliability of the BPS.

Further, the continent-wide Reliability Standards that have been developed by NERC and approved by the Commission cover the full range of reliability objectives specified in §302 of the NERC ROP:

- Resource and Demand Balancing (25 approved standards)
- Communications (3 approved standards)
- Critical Infrastructure Protection (55 approved standards)
- Emergency Preparedness and Operations (21 approved standards)
- Facilities Design, Connections and Maintenance (21 approved standards)
- Interchange Scheduling and Coordination (18 approved standards)
- Interconnection Reliability Operations and Coordination (29 approved standards)
- Modeling, Data, and Analysis (33 approved standards)
- Nuclear (2 approved standards)
- Personnel Performance, Training and Qualifications (9 approved standards)
- Protection and Control (29 approved standards)
- Transmission Operations (21 approved standards)
- Transmission Planning (15 approved standards)
- Voltage and Reactive Power (12 approved standards)

In accordance with the template and performance elements specified in the SPM, each approved Reliability Standard contains the following clearly-identified sections and subsections: (i) Applicability — stating the title of the standard, its identification number, its purpose, the reliability functional entities to which it is applicable, and its effective date; (ii) Requirements; (iii) Measures; (iv) Compliance — stating the entity responsible for monitoring compliance; the compliance monitoring period and reset timeframe; data retention requirements for the registered entities; and the levels of noncompliance for specified types of violations of the standard; and (v) Regional Differences, if any.

The inclusion of these elements helps to ensure that Reliability Standards clearly state who is responsible for compliance with a Reliability Standard, the Requirements for which compliance is required, and how compliance may be measured by the CEA.

NERC systematically manages the development of new standards and revisions to standards, in areas of highest need and importance, through its rolling three-year *Reliability Standards Development Plan*. The *Reliability Standards Development Plan* identifies and prioritizes the Reliability Standards development projects in the immediate three-year time horizon. The three-year *Reliability Standards Development Plan* is revised annually, based on input from NERC staff, the standard drafting teams, the NERC technical committees and subgroups, other industry participants, and government authorities. The annual *Reliability Standards Development Plan* revision considers: (i) perceived gaps in NERC's Reliability Standards and proposals for closing those gaps; (ii) timing priorities of the projects in the *Reliability Standards Development Plan* and recommendations for adjusting the timing of individual projects; and (iii) potential new projects for development of new standards or revisions to existing standards. The three-year rolling *Reliability Standards Development Plan*, as revised each year, is submitted to the NERC Board of Trustees for approval and then filed with the Commission for information. The *Reliability Standards Development Plan 2014-2016* was approved by the NERC Board of Trustees on November 7, 2013 and continues the approach set forth in the *Reliability Standards Development Plan 2013-2015*; namely, to facilitate the transformation of NERC Reliability Standards to "steady-state," a set of standards that are stable, clear, concise, high-quality, results-based, and technically sound, while emphasizing addressing outstanding regulatory directives and the retirement of Reliability Standards that do little to promote reliability.[19]

Enforcement of Reliability Standards

NERC's program for monitoring and enforcing compliance with Commission-approved Reliability Standards is implemented through its *Compliance Monitoring and Enforcement Program* (CMEP) (§400 and Appendix 4C to the ROP), its Organization Registration and Certification Programs (§500 to the ROP), its *Sanction Guidelines* (Appendix 4B to the ROP), and its delegation agreements with the eight Regional Entities.[20]

Section 6(a) of NERC's delegation agreements with the Regional Entities specifies that the Regional Entity shall enforce Reliability Standards within its geographic boundaries through the compliance enforcement program set forth in Exhibit D to the agreement, and that the Regional Entity's compliance monitoring and enforcement program meets all applicable requirements of the FPA, Commission Order No. 672, and the Commission's regulations, including, *inter alia*, the requirement for an audit program pursuant to 18 C.F.R. §39.7(a), the assessment of penalties pursuant to 18 C.F.R. §39.7(c) through 39.7(g), and the requirements for due process. Additionally, §6(f) of the delegation agreements requires the Regional Entity to maintain the

[19] The *Reliability Standards Development Plan 2014-2016*, along with previous versions of the plan, are available at: http://www.nerc.com/pa/Stand/Pages/ReliabilityStandardsDevelopmentPlan.aspx.

[20] The delegation agreements were originally approved by the Commission in an order issued April 19, 2007 (*Order Accepting ERO Compliance Filing, Accepting ERO/Regional Entity Delegation Agreements, and Accepting Regional Entity 2007 Business Plans*, 119 FERC ¶ 61,060 (2007)), subject to various compliance requirements, which have been addressed in subsequent compliance filings and Commission orders. The currently-effective delegation agreements will expire on December 31, 2015.

capability to conduct investigations of potential violations of Reliability Standards and to conduct such investigations in a confidential manner. It also requires the Regional Entity to maintain a program of proactive enforcement audits, including procedures for spot checks of self-reported compliance and periodic audits of all registered entities.

Through the NERC Organization Registration and Certification Programs, NERC and the Regional Entities have identified users, owners, and operators of the BPS that are obligated to comply with Commission-approved NERC Reliability Standards.[21] Section 500 of the NERC ROP governs the registration of users, owners, and operators of the BPS as responsible for compliance with the requirements of Reliability Standards that are applicable to the reliability function for which the entity is registered. The purpose of the NERC Compliance Registry, established pursuant to §501 of the ROP, is to clearly identify those entities that are responsible for compliance with Reliability Standards. The NERC Compliance Registry identifies the reliability functions to be performed by each organization responsible for meeting the requirements of Reliability Standards. Organizations listed in the NERC Compliance Registry are responsible for knowing the contents of, and complying with, Reliability Standards applicable to the reliability function(s) for which the entity is registered.[22] The criteria upon which users, owners and operators of the BPS will be registered for one or more reliability functions are specified in §501 of the ROP and in NERC's FERC-approved *Statement of Compliance Registry Criteria* (Appendix 5B to the ROP). The purpose of the *Organization Registration and Certification Manual* (Appendix 5A) is twofold: (i) to define the process utilized in the Organization Registration Program by identifying which functional entities must register as owners, operators, and users of the BPS for compliance with Reliability Standards; and (ii) to define the process utilized in the Organization Certification Program for certifying the following entities: RC, BA, and TOP.

Typically, a user, owner or operator of the BPS is identified, in the first instance, for placement on the NERC Compliance Registry by the Regional Entity in whose territory the user, owner or operator is located. Upon the entity being notified by NERC that it is being placed on the NERC Compliance Registry, the entity may challenge its inclusion on the NERC Compliance Registry by filing a written objection with NERC.[23] Challenges to inclusion on the NERC Compliance Registry are heard and decided by the NERC Board of Trustees Compliance Committee (BOTCC). If the entity is not satisfied with the decision of the BOTCC, the entity may appeal the registration determination to the Commission.[24] NERC may remove a registered entity from the NERC Compliance Registry for one or more of the reliability functions for which the

[21] Section 215(b)(2) of the FPA requires all users, owners and operators of the BPS to comply with Reliability Standards approved by the Commission. Similarly, the Commission's regulations at 18 C.F.R. §39.2 and §40.2 require all users, owners, and operators of the BPS to comply with applicable Reliability Standards and applicable rules of the ERO and Regional Entities approved by the Commission.

[22] ROP §501. The current categories of reliability functional entities are listed in ROP Appendix 5B, *Statement of Compliance Registry Criteria*. *See also supra* n. 6.

[23] A user, owner, or operator of the BPS may be listed on the NERC Compliance Registry for several reliability functions. A registered entity may challenge its listing for one or more of the reliability functions for which it has been registered while accepting its listing for other reliability function(s).

[24] The registration, challenge, and appeal process described in this paragraph is set forth in §501.1.3 of the ROP.

entity is listed, based on changed circumstances. As of December 31, 2013, there were 1,920 organizations listed on the NERC Compliance Registry, registered for 4,794 reliability functions.

Monitoring and enforcement of compliance with Reliability Standards is conducted primarily by the eight NERC Regional Entities, pursuant to §401.4 of the NERC ROP and the delegation agreements between NERC and the Regional Entities. Each Regional Entity is responsible for compliance monitoring and enforcement activities within its regional footprint.[25] The ROP provide for NERC to take responsibility for CMEP activities where a Regional Entity is unable to perform those functions, as well as to be responsible for overseeing the CMEP activities of the Regional Entities.[26] Section 403 of the ROP describes in detail the required attributes of Regional Entity compliance programs, covering compliance program structure, compliance program resources, and compliance program design. Section 403 emphasizes the requirement that the Regional Entity's governance of its compliance program, and its compliance program staff, be independent.[27] Each Regional Entity must develop a Regional Entity Compliance Enforcement Implementation Plan that identifies the Reliability Standards to be actively monitored by the Regional Entity (both those required by NERC and any additional Reliability Standards the Regional Entity proposes to monitor), and how the identified Reliability Standards will be monitored, evaluated, reported, sanctioned, and appealed.[28] These plans must be developed on an annual basis and submitted to NERC for approval. In its annual Implementation Plan, each Regional Entity must also report to NERC how the Regional Entity carried out its delegated compliance enforcement authority in the previous year, the effectiveness of its CMEP, and changes expected to correct any identified deficiencies.[29]

NERC is required to conduct an audit, at least once every five years, to evaluate how each Regional Entity implements the NERC CMEP.[30] The evaluation is based on the ROP including the NERC CMEP, the delegation agreement with the Regional Entity, the approved Regional Entity annual CMEP Implementation Plans, the required CMEP attributes, and the CMEP procedures. NERC must provide its evaluations to the Commission and other appropriate ERO

[25] ROP §401.4.

[26] ROP §§401.5, 402, and 404. The Commission has also approved the practice of one Regional Entity entering into an agreement with another Regional Entity to administer the compliance processes in the NERC CMEP with respect to the Regional Entities' registered functions. *See*, e.g., *Order Conditionally Accepting Compliance Monitoring and Enforcement Program Agreements and Revised Delegation Agreements, and Ordering Compliance Filing*, 132 FERC ¶ 61,024 (2010).

[27] ROP §§403.1 and 403.6.

[28] ROP §§402.1.1.1 and 403.16.

[29] ROP §403.16.

[30] ROP §402.1.1.3.

governmental authorities to demonstrate the effectiveness of each Regional Entity in compliance monitoring and enforcement.[31]

NERC has also conducted spot checks of different aspects of the Regional Entities' implementation of the CMEPs in 2013 and 2014. In 2013, NERC conducted a spot check of Regional Entity dismissal procedures. NERC also conducted a spot check of Regional Entity processes and procedures relating to settlement agreements and notices of confirmed violation. In 2014, NERC plans to conduct a spot check of Regional Entity processes regarding mitigation plans. These spot checks are in addition to NERC's ongoing spot check of issues filed pursuant to NERC's Find, Fix, Track and Report (FFT) program.

The controlling document for NERC's compliance monitoring and enforcement activities is the NERC CMEP, Appendix 4C to the ROP. Pursuant to Exhibit D to its delegation agreement with NERC, each Regional Entity has either adopted the NERC CMEP or a modified version of the CMEP; in the latter case, the modified CMEP, or an enumeration of any deviations in the Regional Entity's CMEP from the uniform CMEP, is included in Exhibit D to the Regional Entity's delegation agreement. All CMEPs have been approved by the Commission.[32]

The NERC CMEP (as well as each of the modified Regional Entity CMEPs) provides for seven compliance monitoring methods: (i) audits of registered entities for compliance with Reliability Standards;[33] (ii) self-certifications by registered entities of their compliance with standards;[34] (iii) spot checks of registered entities' compliance with Reliability Standards;[35] (iv) compliance investigations (CIs), which may be conducted and led by the Regional Entity or by NERC;[36] (v) self-reports by registered entities of violations of Reliability Standards;[37] (vi) periodic

[31] ROP §402.1.3. The audit procedure for NERC's audits of the Regional Entity CMEPs is contained in *Audit of Regional Entity Compliance Programs*, Appendix 4A to the ROP.

[32] The Commission initially approved the NERC CMEP and modified CMEPs adopted by certain Regional Entities in their respective delegation agreements, subject to various compliance requirements, in its Order issued April 19, 2007. *Order Accepting ERO Compliance Filing, Accepting ERO/Regional Entity Delegation Agreements, and Accepting Regional Entity 2007 Business Plans*, 119 FERC ¶ 61,060 (2007). Subsequent Commission orders have approved modifications to the NERC CMEP and Regional Entity CMEPs (both modifications in response to Commission directives and modifications initiated by NERC and/or Regional Entities). *See*, e.g., *Order Conditionally Approving Revised Pro Forma Delegation Agreement, Revised Delegation Agreements with Regional Entities, Amendments to Rules of Procedure and Certain Regional Entity Bylaws*, 133 FERC ¶ 61,061 (2010); *Order Conditionally Accepting Compliance Monitoring and Enforcement Program Agreements and Revised Delegation Agreements, and Ordering Compliance Filings*, 132 FERC ¶ 61,024 (2010); *Order Conditionally Approving Revisions to North American Electric Reliability Corporation Rules of Procedure*, 141 FERC ¶ 61,241 (2012).

[33] CMEP §3.1.

[34] CMEP §3.2.

[35] CMEP §3.3.

[36] CMEP §3.4.

[37] CMEP §3.5.

data submittals by registered entities as requested by the CEA;[38] and (vii) investigation of complaints.[39] The NERC CMEP sets forth detailed process steps for each of the seven compliance monitoring methods, including requirements for the results of the processes to be reported by the Regional Entity to NERC and ultimately to the Commission. The NERC CMEP provides for due process for a registered entity by including provisions that address avoidance of conflicts of interest,[40] preservation of confidentiality,[41] provision of notice, and opportunities to respond.[42]

As specified by §4.1 of the NERC CMEP, NERC develops and posts an annual CMEP Implementation Plan each year. The annual NERC CMEP Implementation Plan specifies, among other information, the Reliability Standards to be actively monitored during the upcoming year and the compliance process(es) to be used by the CEAs to monitor each Reliability Standard. The annual NERC CMEP Implementation Plan is used by the Regional Entities in developing their individual annual regional Compliance Enforcement Program Implementation Plans.

The NERC CMEP also specifies the processes to be followed when an alleged violation of a Reliability Standard by a registered entity is identified,[43] including notification to the registered entity of an alleged violation and the required contents of the notice;[44] the registered entity's response to the notification of alleged violation;[45] the opportunity for the registered entity to obtain a hearing on the alleged violation and/or proposed penalty or sanction before the CEA hearing

[38] CMEP §3.6. The CEA is the entity (either NERC or the Regional Entity, as applicable) responsible for monitoring and enforcing the registered entity's compliance with Reliability Standards. CMEP §1.1.7.

[39] CMEP §3.7.

[40] For example, the registered entity is notified in advance of a compliance audit as to the members of the audit team (who are required to be free of conflicts of interest) and their backgrounds and is given the opportunity to object to individual members of the audit team on grounds of a conflict of interest or other circumstance that could interfere with the team member's impartial performance of his or her duties. *See* CMEP §3.1.5. Similar notice and opportunity to object is provided with respect to spot checking teams (*id.* at §3.3.1) and CI teams (*id.* at §3.4.1). In addition, §6 of the NERC-Regional Entity delegation agreements requires the Regional Entity to maintain a conflict of interest policy that assures the integrity of its compliance enforcement program and the independence of the compliance program staff from those subject to enforcement actions.

[41] CMEP §§2.0 and 9.3. In addition, §6 of the NERC-Regional Entity delegation agreements specifies that each violation or alleged violation of a Reliability Standard shall be treated as nonpublic until the matter is filed with the Commission as a notice of penalty or resolved by an admission that the owner, operator, or user of the BPS violated a Reliability Standard or by a settlement or other negotiated disposition.

[42] For example, the CEA must notify the registered entity in advance of a compliance audit as to the Reliability Standards to be covered by the audit, and must provide a pre-audit questionnaire to the registered entity at least two months before commencement of the audit. NERC uniform CMEP §3.1.1. At the conclusion of the audit, the compliance audit team is required to provide a draft audit report to the registered entity for comment. *Id.* §3.1.6. Similarly, in the spot check and periodic data submittal processes, the CEA is required to provide its draft assessment of compliance to the registered entity for comment. *Id.* §3.3.1 and §3.6.1.

[45] CMEP §5.4.

body;[46] the process the registered entity may engage in to negotiate a settlement with the CEA;[47] the registered entity's right to appeal a hearing body decision to NERC;[48] and the process for reporting a penalty or sanction to the Commission for confirmation.[49]

The NERC CMEP requires that a registered entity found to be in violation of a Reliability Standard must file a mitigation plan with the CEA to correct the violation, or a description of how the violation has been mitigated.[50] The NERC CMEP describes the required contents of the registered entity's proposed mitigation plan;[51] the processes for submittal of the proposed mitigation plan by the Regional Entity[52] and for review and acceptance or rejection of the proposed mitigation plan by the Regional Entity and review and approval or disapproval by NERC (and, in the latter event, modification of the mitigation plan by the registered entity);[53] the timetable for completion of an accepted mitigation plan;[54] and the process for completion and confirmation by the CEA of implementation of the registered entity's mitigation plan.[55] Key components required by the NERC CMEP to be in any mitigation plan are the registered entity's action plans to correct the violation(s) and to prevent recurrence.[56]

Additionally, the NERC CMEP provides the procedure for the CEA to issue a remedial action directive to a registered entity.[57] A remedial action directive may be issued, when immediately necessary to protect the reliability of the BPS from an imminent threat, to a registered entity the CEA believes is committing or has committed a violation of a Reliability Standard. The remedial action directive may include, but is not limited to, specifying operating or planning

[46] CMEP §5.5 and Attachment 2, *Hearing Procedures*. The *Hearing Procedures* set forth the detailed procedures for the hearing to be conducted before the CEA hearing body should a registered entity dispute a notice of alleged violation, proposed penalty or sanction, proposed mitigation plan, or a remedial action directive.

[47] CMEP §5.6.

[48] CMEP §5.7. The NERC appeal process is addressed in §§408 and 409 of the ROP.

[49] CMEP §5.9.

[50] CMEP §6.1.

[51] CMEP §6.2.

[52] CMEP §6.4.

[53] CMEP §6.5.

[54] CMEP §6.3.

[55] CMEP §6.6.

[56] CMEP §6.2.

[57] CMEP §7.0. A remedial action directive is "[a]n action (other than a [p]enalty or sanction) required by a Compliance Enforcement Authority that (1) is to bring a [r]egistered [e]ntity into compliance with a Reliability Standard or to avoid a Reliability Standard violation, and (2) is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat." CMEP §1.1.27.

criteria, limits or limitations; requiring specific system studies; defining operating practices or guidelines; requiring confirmation of data, practices or procedures through inspection, testing or other methods; requiring specific training for personnel; requiring development of specific operating plans; directing a registered entity to develop and comply with a plan to remediate a violation; imposing increased auditing or additional training requirements; and requiring the registered entity to cease an activity that may constitute a violation of a Reliability Standard.[58]

As a key component of the enforcement of compliance with mandatory Reliability Standards, a violation of a standard can result in the imposition of a financial penalty or other penalty or sanction on the registered entity. NERC has established, and is applying, rules and procedures for determining the amount of financial penalties, or other penalties or sanctions, to be imposed on registered entities for violations of Reliability Standards. These rules and procedures are embodied in the NERC *Sanction Guidelines*, Appendix 4B to the ROP. The *Sanction Guidelines* must be followed by the Regional Entities in the implementation of their CMEPs.[59] Penalties and sanctions must bear a reasonable relation to the seriousness of the violation and take into consideration timely remedial efforts by the registered entity.[60] NERC's rules and procedures for determining appropriate penalties and sanctions for violations of Reliability Standards are discussed in greater detail under criterion 4.[61]

In order to carry out their responsibilities to monitor and enforce compliance with Reliability Standards, NERC and the Regional Entities, over the period from 2009 to date, have developed substantial professional staffs for, and are devoting substantial resources to, their CMEP and Organization Registration Programs. The following table shows the direct expenses and the numbers of full-time equivalent (FTE) staff budgeted by NERC and each Regional Entity in 2009 and in 2014.[62]

[58] CMEP §7.0.

[59] ROP §§403.14 and 407.

[60] ROP §401.7.

[61] The ERO has established rules that provide fair and impartial procedures for enforcement of Reliability Standards through the imposition of penalties in accordance with 18 C.F.R. §39.7, including limitations on activities, operations, or other appropriate sanctions or penalties.

[62] *See NERC 2009 Business Plan and Budget; December 2008 Budget Compliance Filing; NERC 2014 Business Plan and Budget.* The amounts cited are direct expenses only and do not include NERC indirect expenses (General and Administrative, Information Technology, Legal and Regulatory, Human Resources, and Finance and Accounting) allocated to the Compliance Monitoring and Enforcement and Organization Registration and Certification Program Area.

Regional Entity	2009 Budgeted FTEs	2009 Budgeted Direct Expense ($)
NERC	35.50	7,358,536
FRCC	9.10	1,991,643
MRO	10.00	2,071,510
NPCC	9.00	2,095,204
ReliabilityFirst	23.00	5,099,328
SERC	21.50	4,805,617
SPP RE	6.00	1,283,653
Texas RE	14.15	1,628,935
WECC	30.00	6,165,303
Totals	**158.25**	**32,499,729**

Regional Entity	2014 Budgeted FTEs	2014 Budgeted Direct Expense ($)
NERC	41.28	7,902,272
FRCC	19.26	4,281,909
MRO	21.26	3,864,192
NPCC	16.00	5,080,485
ReliabilityFirst	43.00	9,788,246
SERC	42.50	7,389,556
SPP RE	22.10	4,258,217
Texas RE	40.00	5,991,654
WECC	58.00	8,592,053
Totals	**303.40**	**57,148,584**

As demonstrated in the tables above, the number of budgeted FTEs increased approximately 191.72% across NERC and the Regional Entities from 2009 to 2014, while the budgeted direct expense increased by nearly 175.84%.

In addition to their compliance program staffs, NERC and a number of the Regional Entities have also made use of consultants and contractors to assist in compliance audits, CIs, and other compliance monitoring and enforcement activities, and to provide subject matter expertise as needed to supplement the expertise of their staffs.

As explained in the *Joint Regional Entity Self-Assessment*, included in **Attachment 2** of this *Five-Year ERO Performance Report*, the Regional Entities describe how they execute their delegated function of enforcing Reliability Standards. Also in **Attachment 2**, the Regional Entities describe their compliance monitoring activities during the 2009 through 2013 assessment period.

NERC has participated in some Regional Entity compliance audits and will continue to do so as an observer to observe the performance of audits by the Regional Entities and to help ensure

consistent implementation and application of the CMEP and consistent application of the requirements of standards across the Regional Entities.

The foregoing discussion amply demonstrates that NERC has developed and is implementing the ability to develop and enforce Reliability Standards that provide for an adequate level of reliability of the BPS.

B. Criterion 2 - The ERO has established rules that assure its independence of users, owners and operators of the BPS while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organizational structure.

This criterion encompasses three distinct considerations: (i) independence of NERC from users, owners and operators of the BPS; (ii) fair stakeholder representation in the selection of NERC's directors (trustees); and (iii) provision for balanced decision-making in any NERC committee or subordinate organizational structure.

Independence of Users, Owners, and Operators of the BPS

NERC's Bylaws provide that NERC's business and affairs shall be managed by a Board of Trustees.[63] The Bylaws provide that the Board of Trustees shall consist of ten independent trustees plus the President of NERC.[64] The Bylaws define "independent trustee" as follows:

> An independent trustee is a person (i) who is not an officer or employee of the Corporation [i.e., NERC], a member or an officer, director, or employee of a member of the Corporation, or an officer, director, or employee of any entity that would reasonably be perceived as having a direct financial interest in the outcome of board decisions and (ii) who does not have any other relationship that would interfere with the exercise of independent judgment in carrying out the responsibilities of a trustee. Provided, that upon initial election to the board, an independent trustee shall within ten (10) days terminate any employee, officer, or director position that conflicts with this subparagraph and shall within sixty (60) days terminate any financial interest or other relationship that conflicts with this subparagraph, and prior to such termination shall not participate in discussion of or voting on any matter involving the entity of which the trustee is an employee, officer or director or in which the trustee has the financial interest or other relationship giving rise to the conflict.[65]

[63] NERC Bylaws Article III, §1.

[64] NERC Bylaws Article III, §1. On October 14, 2009, the Commission approved in a letter order, in Docket No. RR09-8-000, new §§1a and 1b that allows the Board of Trustees to exercise the authority to increase the number of trustees from eleven to twelve, and decrease from twelve to eleven, respectively.

[65] NERC Bylaws Article III, §3a. The last sentence of §3a, providing for brief time periods for a newly-elected trustee to terminate any employment, officer or director position or financial interest or other relationship that would prevent

In the *ERO Certification Order*, the Commission found that the NERC Bylaws definition of "independent trustee" was sufficient to provide for independence from users, owners and operators of the BPS, subject to one clarification.[66]

Thus, a NERC trustee cannot be an officer, director, or employee of a member of NERC nor of any other entity that would be perceived as having a direct financial interest in the outcome of board decisions, and may not have any other relationship that would interfere with the exercise of independent judgment in carrying out the responsibilities of a trustee. The "responsibilities of a trustee" include, among other things, voting on: (i) board approval of proposed Reliability Standards;[67] (ii) board approval of the NERC ROP and amendments to the ROP;[68] and (iii) board approval of NERC and Regional Entity budgets.[69] Committees of the NERC Board, such as the BOTCC, are responsible for decisions such as hearing and deciding challenges by a user, owner or operator of the BPS to placement of the entity on the NERC Compliance Registry,[70] hearing and deciding appeals from a Regional Entity hearing body decision on a registered entity's challenge to a notice of alleged violation of a Reliability Standard and/or proposed penalty or sanction,[71] and approving the imposition of penalties or other sanctions for violations of Reliability Standards on registered entities, including by settlements.

In addition, the NERC *Conflict of Interest and Business Ethics Policy for Trustees, Officers and Employees* specifies that NERC Representatives "shall avoid and refrain from involvement in or situations where there is actually a conflict of interest (Conflict). A Conflict arises where the NERC Representative's personal financial interest is significantly affected or may reasonably appear to be significantly affected by his or her actions or decisions in his or her capacity at

---

the trustee from being independent, is a 2008 amendment to the Bylaws that was approved by the Commission by a letter order issued October 7, 2008 in Docket No. RR08-5-000.

[66] *ERO Certification Order*, 116 FERC ¶61,062 at P 42. The clarification is that the definition prohibits an independent trustee from having a relationship that would interfere with his or her exercise of independent judgment in carrying out the responsibilities of a trustee, regardless of whether he or she is an officer, director, or employee of an entity with an interest in the outcome of NERC Board of Trustees decisions. NERC confirmed this clarification in a compliance filing dated September 18, 2006, and made a modification, consistent with the clarification, to the definition of "independent trustee" in its Bylaws. *Compliance Filing of the North American Electric Reliability Council and the North American Electric Reliability Corporation Addressing Governance Issues and Request for Expedited Treatment*, Docket No. RR06-1, filed September 18, 2006 (*NERC ERO Governance Compliance Filing*) at 3-4.

[67] NERC Bylaws Article IX, §1; ROP §308.2.

[68] NERC Bylaws Article XI, §2; ROP §1402.

[69] NERC Bylaws Article XIII, §§2, 3, 4, and 5; ROP §1101. Each of the matters just listed, upon being approved by the NERC Board of Trustees, must then be submitted to the Commission for approval or confirmation. Sections 215(d) and (f) of the FPA and 18 C.F.R. §§39.4(b), (c), and (d), and 39.5.

[70] ROP §501.1.3.

[71] ROP §409.

NERC." NERC's *Process for Reviewing Conflicts of Interes*t outlines how potential conflicts of interest of the independent trustees, officers and employees are evaluated beginning in December of each calendar year.[72] The *NERC Employee Code of Conduct* mandates an "employee's faithful pursuit of the interests of NERC rather than his or her own financial or other interests of another person or organization." Finally, NERC's *Policy on Reporting Complaints Regarding Accounting and Code of Conduct Matters* prohibits retaliation against any NERC employee who lodges a code of conduct complaint about fraud, unethical business conduct, questionable accounting, problems with internal accounting controls, financial reporting or auditing, violations of NERC's codes of conduct for trustees and employees, or violations of law occurring within NERC.

Fair Stakeholder Representation in the Selection of NERC's Trustees

NERC's Bylaws provide for fair stakeholder representation in the selection of NERC's trustees. Candidates for election as a trustee are selected by a nominating committee. The nominating committee is appointed annually (or more frequently if needed in the event of a special election to fill a board vacancy) by the board. The nominating committee is to consist of those independent trustees whose terms do not expire during the current year and such number of other persons with such qualifications as the board shall specify, including at least three members of the NERC Member Representatives Committee (MRC).[73] The procedures to be followed by the nominating committee must include a means of permitting members of NERC to recommend to the nominating committee candidates for consideration as nominees for independent trustees.[74] NERC's Bylaws specify that the nominating committee "shall also endeavor to nominate candidates for election to the board consistent with the objectives that the board as an entity reflects expertise in the areas of technical electric operations and reliability, legal, market, financial, and regulatory matters, and familiarity with regional system operations issues; and reflects geographic diversity."[75]

NERC's Bylaws provide that the independent trustees shall be elected by the NERC MRC, from nominees proposed by the nominating committee. To be elected an independent trustee, a nominee must receive the affirmative vote of two-thirds of the members of the MRC.[76] The MRC

[72] On February 6, 2014, the NERC Board of Trustees approved *Governance Guidelines*, which consolidated NERC's (i) *Conflict of Interest and Business Ethics Policy for Trustees, Officers and Employees* and (ii) *Process for Reviewing Conflicts of Interest* into a single cohesive document.

[73] NERC Bylaws Article III, §5.

[74] NERC Bylaws Article III, §5.

[75] NERC Bylaws Article III, §5.

[76] NERC Bylaws Article III, §6. The NERC Bylaws also require that the number of trustees from Canada shall not be less than the percentage of the net energy for load (NEL) of Canada to the total NEL of the United States and Canada, times eleven (or twelve if the number of trustees has been increased to twelve pursuant to NERC Bylaws Article III, §1a), rounded up to the nearest whole number, with the management trustee (i.e., the president of NERC) counted as a trustee from Canada if he or she is a Canadian citizen. NERC Bylaws Article III, §2a. In the *ERO Certification Order*, the Commission approved this provision as "adequately provid[ing] for an international ERO," stating that "appropriate country representation helps to ensure that the ERO is truly international in addressing Bulk-

is comprised of representatives from the various sectors of the NERC membership.[77] As specified by Article II, §4 of the NERC Bylaws, the sectors of the NERC membership are: (i) investor-owned utilities; (ii) state/municipal utilities; (iii) cooperative utilities; (iv) federal or provincial utilities/federal power marketing administrations; (v) transmission-dependent utilities; (vi) merchant electricity generators; (vii) electricity marketers; (viii) large end-use electricity customers; (ix) small end-use electricity customers; (x) independent system operators/regional transmission organizations; (xi) regional entities; and (xii) government representatives.[78] The composition of the MRC, as specified in Article VIII, §2 of the NERC Bylaws, is as follows:

(1) Two representatives from each sector except the government representative sector and the regional entity sector;

(2) Two voting representatives from the regional entity sector, with the remaining members of that sector being non-voting members of the MRC;[79]

(3) The chairman and vice chairman of the MRC;[80]

(4) Any additional Canadian representatives as are selected pursuant to Article VIII, §4 of the Bylaws;[81] and

---

Power System reliability and considering the concerns of stakeholders in each of the three countries." *ERO Certification Order* at P 47.

[77] Membership in NERC is voluntary and is open to any person or entity that has an interest in the reliable operation of the North American BPS, registers as a member, and complies with the other conditions and obligations of membership specified in the NERC Bylaws (which do not include payment of any membership or initiation dues or fees). NERC Bylaws Article II, §1. In the *ERO Certification Order*, the Commission stated the availability of membership to any person or entity with an interest in the reliable operation of the North American BPS created an open membership structure that is consistent with the statutory requirement that the ERO establish rules that assure fair stakeholder representation. *ERO Certification Order* at P 54. Each member is assigned to one of the 12 membership sectors of NERC. NERC Bylaws Article II, §4.

[78] Article II, §4a of the NERC Bylaws specifies the types of persons or organizations that would be included in each of the membership sectors.

[79] The representation of Regional Entities in the MRC reflects changes made by NERC to the originally-proposed composition of the MRC in response to concerns expressed by the Commission in P 75 of the *ERO Certification Order*. *See NERC ERO Governance Compliance Filing* at 6-9. The Commission accepted these changes in an Order issued October 30, 2006. The Commission also accepted the overall structure and composition of the MRC in that Order. *North American Electric Reliability Corporation, Order on Petitions for Rehearing and Clarification; Order on Compliance Filing*, 117 FERC ¶ 61,126 (2006), at PP 30 and 44.

[80] The chairman and vice chairman of the MRC are selected annually by majority vote of the members of the MRC, and may not be from the same membership sector. Upon being selected as chairman and vice chairman, these individuals cease to be representatives of the MRC sectors to which they were originally elected, and are thereafter responsible to act in the best interests of the members of NERC as a whole. NERC Bylaws Article VIII, §5.

[81] Article VIII, §4 of the Bylaws contains provisions for the election of additional Canadian members to the MRC as and when necessary to ensure that the percentage of Canadian members on the MRC is approximately equal to the percentage the NEL of Canada is of the total NEL of the United States and Canada. See page 24 below for the definition of NEL.

(5) The following representatives of the government representatives sector: two representatives of the United States federal government, one representative of the Canadian federal government, two representatives of state governments, and one representative of a provincial government, all of whom shall be nonvoting members of the MRC except the two representatives of state governments.

The MRC is therefore comprised of 26 voting members when at full complement (or more if the election of additional Canadian members has been necessary in accordance with Article VIII, §4 of the Bylaws). The members of the MRC from each sector are nominated from, and elected by, the NERC members in that sector pursuant to the processes specified in Article VIII, §3 of the NERC Bylaws, which generally call for election of the two candidates from each sector receiving the highest numbers of votes in the sector. The members of the MRC are elected annually (or between annual elections if needed to fill a vacancy).[82]

In summary, NERC's trustees are nominated by a nominating committee comprised of independent trustees whose terms are not expiring, members of the MRC, and possibly others. NERC's trustees are elected by a two-thirds vote of the MRC, which is a committee established pursuant to the Bylaws to fairly represent the sectors of NERC's membership and is open to any person or entity with an interest in reliable operation of the North American BPS. Thus, the NERC Bylaws provide for fair stakeholder representation in the selection of NERC's trustees.

Balanced Decision-Making in any NERC Committee or Subordinate Organizational Structure

NERC's Bylaws authorize the Board of Trustees to create standing committees of NERC and such other committees as the Board deems necessary to carry out the purposes of NERC:

> In addition to those committees specified by these Bylaws, to which the board shall appoint members in accordance with the requirements of these Bylaws, the board may by resolution create standing committees of the Corporation; and may in addition by resolution appoint such other committees as the board deems necessary to carry out the purposes of the Corporation. *The board shall appoint standing committees and other committees of the Corporation that are representative of members, other interested parties and the public, that provide for balanced decision making, and that include persons with outstanding technical knowledge and experience. All appointments of committees of the Corporation shall provide the opportunity for an equitable number of members from the United States and Canada (and from Mexico after the Corporation receives recognition by appropriate governmental authorities in Mexico as its electric reliability organization) to be appointed to each committee in approximate proportion to each country's percentage of the total NEL*. All committees shall have such scope and duties, not inconsistent with law, as are specified in these Bylaws and the Rules of

[82] NERC Bylaws Article VIII, §3.

> Procedure of the Corporation or otherwise determined by the board. (Emphasis added.)[83]

Section 1300 of the NERC ROP provides additional criteria for the creation and appointment of NERC standing committees. In creating a standing committee, the NERC Board of Trustees must approve the charter of the committee and assign specific authority to each committee necessary to conduct business within its charter.[84] Each committee shall have a defined membership composition that is explained in its charter. The specified committee membership composition can provide for balanced decision-making (i) by providing for representatives from each sector of the NERC membership, or (ii) where sector-based membership will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area, by bringing together a wide diversity of opinions from industry experts with outstanding technical knowledge and experience in a particular subject area.[85] Committee membership shall also provide the opportunity for an equitable number of members from the United States and Canada, based approximately on proportionate NEL.[86]

The NERC ROP require that committee members shall be selected in a manner that is open, inclusive, and fair.[87] Unless otherwise stated in the NERC ROP or approved by the NERC Board of Trustees, all committee member appointments are to be approved by the board, and committee officers are to be appointed by the Chairman of the Board.[88]

Further, the NERC ROP require that all NERC committees and other subgroups (except for those organized on other than a sector basis because sector representation will not bring together the necessary diversity of opinions, technical knowledge, and experience in a particular subject area) must ensure that no two stakeholder sectors are able to control the vote on any matter,

[83] NERC Bylaws Article VII, §1. "Committees specified by these Bylaws" include the MRC and the Nominating Committee for the NERC Board of Trustees (discussed above under "fair stakeholder representation in the selection of NERC's trustees"), and the Personnel Certification Governance Committee (PGCC) provided for in Article XII of the Bylaws. The purpose of the PGCC is to provide oversight to the policies and processes used to implement and maintain the integrity and independence of the NERC System Operator Certification Program. NERC Bylaws Article XII, §1. The members of the PGCC are appointed by the Board from candidates nominated by a nominating task force; nominations and appointments are to take into account the need to include representatives of all geographic regions of North America on the PGCC. *Id*., Article XII, §2. In addition to the aforementioned committees, NERC standing committees include the Standards Committee, Compliance and Certification Committee, Critical Infrastructure Protection Committee, Operating Committee, Planning Committee, and the Reliability Issues Steering Committee.

[84] ROP §1301.

[85] ROP §1302.

[86] ROP §1302.

[87] ROP §1303.

[88] ROP §1303.

and no single sector is able to defeat a matter.[89] Any committees and subgroups organized on other than a membership-sector basis must be reported to the NERC Board of Trustees and the MRC, along with the reason for constituting the committee or subgroup in the manner chosen. The ROP provide that for any committee or subgroup organized on other than a membership-sector basis, a reasonable opportunity for additional participation (as members or observers) shall be provided for sectors not represented on the committee or subgroup (subject to any reasonable restrictions as may be necessary to accomplish the mission of the committee or subgroup).[90] Additionally, a reasonable opportunity must be provided for membership from sectors desiring to participate in any committees and subgroups pertaining to development of, interpretation of, or compliance with Reliability Standards.[91]

The NERC ROP provide that NERC standing committees may appoint subgroups using the same principles as specified in §1302 of the ROP (summarized in the immediately preceding paragraph).[92]

The provisions of §§1301 and 1302 of the NERC ROP regarding committee composition reflect revisions to these provisions that were approved or directed by the Commission in its October 30, 2006 order on the *NERC ERO Governance Compliance Filing*.[93]

The requirement for balanced decision-making is also applicable to the Reliability Standards development process, and is discussed below under criterion 5, "The ERO has established rules that provide reasonable notice and opportunity for public comment, due process, openness and balance of interests in developing Reliability Standards, and otherwise exercising its duties."

C. Criterion 3 - The ERO has established rules that allocate equitably reasonable dues, fees and charges among end users for all statutory activities.

NERC's Bylaws require that the funding mechanism used to recover its net annual budget requirement (i.e., net of fees and other revenues received by NERC from users and purchasers of NERC products and services, and net of prior-period funding surplus or deficiency) "shall consist of such assessments as determined by the [NERC] board that result in an equitable allocation of the Corporation's funding requirement among end users of the North American electric utility system as established in the Corporation's Rules of Procedure."[94] Section 1102 of the NERC ROP,

[89] ROP §1302.

[90] ROP §1302.

[91] ROP §1302.

[92] ROP §1305.

[93] *See North American Electric Reliability Corporation, Order on Petitions for Rehearing and Clarification; Order on Compliance Filing*, 117 FERC ¶ 61,126 (2006), at PP 75-87.

[94] NERC Bylaws Article XIII, §3. NERC charges users/purchasers of some of its products and services directly for the products and services, at prices that cover some or all of the cost of providing the product or service. Examples include charges to purchasers of data sets from the Generating Availability Data System, charges to candidates for

"NERC Funding and Cost Allocation," prescribes the allocation methods to be used to recover NERC's funding requirements among regions of the United States and among countries in the North American BPS. Section 1102 specifies that NEL shall be used to allocate funding requirements among interconnections and Regional Entities except in those instances in which direct assignment of costs to a particular interconnection, Regional Entity, or group of entities is appropriate; however, in the case of direct assignment, NEL must be used to allocate the directly-assigned costs within the interconnection, Regional Entity, or group of entities:

> (1) In order that NERC's costs shall be fairly allocated among Interconnections and among Regional Entities, the NERC funding mechanism for all statutory functions shall be based on NEL.
>
> (2) NERC's costs shall be allocated so that all load (or, in the case of costs for an Interconnection or Regional Entity, all load within that Interconnection or Regional Entity) bears an equitable share of such costs based on NEL.
>
> (3) Costs shall be equitably allocated between countries or Regional Entities thereof for which NERC has been designated or recognized as the Electric Reliability Organization.
>
> (4) Costs incurred to accomplish the statutory functions for one Interconnection, Regional Entity, or group of entities will be directly assigned to that Interconnection, Regional Entity, or group of entities provided that such costs are allocated equitably to end-users based on NEL.

The NERC ROP define NEL as:

> [N]et generation of an electric system plus energy received from others less energy delivered to others through interchange. It includes system losses but excludes energy required for the storage of energy at energy storage facilities.[95]

In business plan and budget filings with the Commission, actual assessments for Canadian and Mexican entities vary after taking into account polices regarding the allocation of certain compliance and enforcement costs.

D. Criterion 4 - The ERO has established rules that provide fair and impartial procedures for enforcement of Reliability Standards through the imposition of penalties in accordance with 18 C.F.R. §39.7, including limitations on activities, operations, or other appropriate sanctions or penalties.

NERC has established rules that provide fair and impartial procedures for monitoring and enforcement of compliance with Reliability Standards. These rules and procedures are embodied

---

certification as NERC-certified operators for examinations and for renewal of credentials, and charges to continuing education providers for certification of their education programs.

[95] ROP Appendix 2.

primarily in §400 of the NERC ROP, the NERC CMEP (Appendix 4C to the ROP), and individual Regional Entity CMEPs (which conform generally to the NERC CMEP), all of which have been approved by the Commission. These rules and procedures were discussed in detail above under criterion 1, relating to the ERO's ability to develop and enforce Reliability Standards that provide for an adequate level of reliability of the BPS. As discussed above under criterion 1, §400 of the ROP, and the NERC uniform CMEP, include provisions for avoidance of conflicts of interest on the part of the CEA personnel conducting compliance monitoring processes, provisions for notice to registered entities and opportunity to respond to compliance monitoring processes, and provisions allowing registered entities to engage in settlement discussions with the CEA concerning notices of alleged violations, proposed penalties or sanctions, and mitigation plans.

In addition, Attachment 2, *Hearing Procedures*, to the uniform CMEP contains detailed due process procedures for the conduct of hearings before the CEA hearing body, when requested by the registered entity, concerning a disputed notice of alleged violation and/or proposed penalty or sanction, disputed mitigation plan provisions, or disputed remedial action directive. The *Hearing Procedures*, which were initially approved by the Commission in two orders, subject to various specific compliance requirements,[96] are based on, and in most respects are quite similar to, the Commission's Rules of Practice and Procedure[97] and to the rules of practice and procedure used by many state public utility commissions.

In 2013, the Regional Entity representatives to the ERO Legal Group developed *Hearing Body Manual – Guidance for Conducting Hearings at the Regional Entities* (Hearing Body Manual) to provide practical guidance to hearing body members at the eight Regional Entities regarding the hearing process. The Hearing Body Manual outlines the specific duties of the hearing officer and the hearing body and discusses the standard of review that should govern the hearing body's consideration of the hearing officer's decisions throughout the hearing process. The particulars of the hearing process, including the roles of the hearing officer and the hearing body, are set forth in Attachment 2 to the CMEP. To the extent that there is a conflict between the Hearing Body Manual and the CMEP, the CMEP, as applicable, prevails.

The remainder of this discussion of NERC's compliance with criterion 4 addresses NERC's rules and procedures for the determination and imposition of penalties for violations of Reliability Standards.

Section 215(e)(6) of the FPA, and §39.7(g) of the Commission's regulations,[98] requires that any penalty imposed for violation of a Reliability Standard shall (a) bear a reasonable relation to the seriousness of the violation; and (b) take into consideration the efforts of the user, owner or

[96] *Order Addressing Revised Delegation Agreements*, 122 FERC ¶61,245 (2008); *Order Accepting Compliance Filings, Subject to Conditions*, 125 FERC ¶61,330 (2008).

[97] 18 C.F.R. Part 385.

[98] 18 C.F.R. §39.7(g).

operator to remedy the violation in a timely manner.[99] This fundamental requirement is embodied in §401.7 of the NERC ROP and in §3.8 of the NERC *Sanction Guidelines*, Appendix 4B to the ROP. Section 39.7(c) of the Commission's regulations[100] requires that NERC or a Regional Entity may, after notice and opportunity for hearing, impose a penalty on a user, owner or operator of the BPS for a violation of a Reliability Standard if NERC files a notice of penalty and record of the proceedings with the Commission and serves a copy on the user, owner or operator. The notice of penalty must contain: (i) the name of the entity on whom the penalty is imposed; (ii) identification of each Reliability Standard violated; (iii) findings of fact with respect to any act or practice resulting in violation of the standard; (iv) a description of the penalty imposed; (v) the record of the proceeding; and (vi) any other matters NERC or the Regional Entity may find relevant.[101] The penalty may not take effect earlier than the 31st day after NERC files the notice of penalty and record of proceeding with the Commission,[102] and it is subject to review by the Commission on its own motion or on application of the user, owner or operator.[103] Section 5.9 of the NERC CMEP provides for the filing of a notice of penalty with the Commission, and for a 30-day period to run before the penalty becomes effective, in accordance with 18 C.F.R. §39.7(d) through (e).[104]

Section 39.7(g) of the Commission's regulations[105] requires the ERO to submit for Commission approval penalty guidelines that set forth a range of penalties for violations of Reliability Standards, and specifies that a penalty imposed by the ERO or a Regional Entity must be within the range set forth in the penalty guidelines. The NERC *Sanction Guidelines* comprise the penalty guidelines established by NERC, which the Commission has approved pursuant to §39.7(g).

---

[99] 18 C.F.R. §39.7(g)(1) also specifies that a penalty may be monetary or non-monetary, and may include, but is not limited to, a limitation on an activity, function, operation, or other appropriate sanction, including being added to a reliability watch list composed of major violators that is established by the ERO, a Regional Entity or the Commission.

[100] 18 C.F.R. §39.7(c).

[101] 18 C.F.R. §39.7(d).

[102] 18 C.F.R. §39.7(e).

[103] 18 C.F.R. §39.7(e).

[104] Certain instances of noncompliance with the Reliability Standards may be resolved outside of the notice of penalty process set forth in the NERC CMEP. Beginning in September 2011, NERC began tracking certain lesser-risk remediated possible violations in the FFT program. Following the Commission's *Order Accepting with Conditions the Electric Reliability Organization's Petition Requesting Approval of New Enforcement Mechanisms and Requiring Compliance Filing*, 138 FERC ¶ 61,193 (2012), the Commission considered all FFT matters closed sixty days after the FFT informational filing was submitted to the Commission unless the Commission sought to review a specific matter. In June 2013, the Commission approved expanding the scope of the FFT Program to include a limited pool of moderate risk issues (in addition to the minimal risk issues already permitted under the program), as well as issues with ongoing mitigation activities, provided the mitigation would be completed within 90 days. In addition, the Commission approved the practice of publicly posting FFT matters on a common website in lieu of a monthly informational filing to the Commission. The Commission indicated that it would consider an FFT matter closed 60 days following the public posting. *Order on Compliance Filing*, 143 FERC ¶ 61,253 (2013).

[105] 18 C.F.R. §39.7(g)(2).

Under the *Sanction Guidelines*, penalties are to be commensurate to the reliability impact of the violation and to those levied for similar violations, while still reflecting unique facts and circumstances related to the violation or the violator. NERC is charged with ensuring "acceptable similarity" in penalties for comparable violations.[106]

Significantly, however, the *Sanction Guidelines* also state, "Any provisions within a settlement regarding Penalties or sanctions can supersede any corresponding Penalties or sanctions that would otherwise be determined pursuant to these Sanction Guidelines."[107] As such, the negotiation of settlements and determination of penalties involve compromise and the weighing of multiple considerations to arrive at a penalty agreeable to the Regional Entity and the registered entity. Even with this available flexibility, NERC still evaluates the facts and circumstances of every violation that is part of a settlement to ensure that the penalty for that violation, and for the group of violations in the settlement, is within a range of reasonableness that displays consistency.

When evaluating every violation, NERC starts with a base penalty amount that is provided by the VRF/VSL matrix. If the registered entity has a previous violation of a same or similar Reliability Standard Requirement, then the penalty may be aggravated.[108] NERC next considers the violation time horizon for the violation, with multipliers applied to the penalty based on the effect on operations. The highest multiplier applies to real-time operations, while long-term planning is on the opposite end of the spectrum. The registered entity's ability to impact reliability determines the next multiplier, with small facilities or entities having their penalty reduced by a significant amount. A multiplier can be applied based on the condition of the BPS at the time of the violation, with aggravation for a violation occurring during stressed conditions.[109] Among the mitigating factors in penalty determination are the quality of the registered entity's internal compliance program, the degree of the registered entity's cooperation in resolution of the violation, and whether the registered entity self-reported the violation.[110]

NERC will aggregate the results of the violation-by-violation analysis for comparison with the penalty included in the settlement submitted by the Regional Entity. NERC also evaluates how the penalty for the violations in the instant settlement compares to penalties for similar violations included in settlements that have already been approved by NERC and subject to review by the Commission. The evaluation of settlements provides an evolving store of knowledge to use when considering new settlements submitted to NERC. In the end, if the penalty included in the settlement falls within a range of reasonableness for penalties associated with violations involving similar reliability risks, similar entities, and similar facts and circumstances, then the penalty is deemed consistent enough for approval by NERC.

[106] *Sanction Guidelines* §1.

[107] *Sanction Guidelines* §2.1.

[108] *Sanction Guidelines* §§3.1 and 3.2.

[109] *Sanction Guidelines* §2.7; *see also* §3.2.

[110] *Sanction Guidelines* §3.3.

E. Criterion 5 - The ERO has established rules that provide reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing Reliability Standards, and otherwise exercising its duties.

NERC has established rules that provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing Reliability Standards, and otherwise exercising its duties. With respect to the development of Reliability Standards, NERC's Bylaws require that:

> The Corporation shall develop Reliability Standards pursuant to procedures and processes that shall be specified in the Rules of Procedure of the Corporation. The Rules of Procedure shall provide for the development of Reliability Standards through an open, transparent, and public process that provides for reasonable notice and opportunity for public comment, due process, and balancing of interests and is designed to result in Reliability Standards that are technically sound. Participation in the process for developing Reliability Standards shall not be limited to members of the Corporation but rather shall be open to all persons and entities with an interest in the reliable operation of the BPS.[111]

NERC's process for developing and modifying Reliability Standards, which the Commission accepted as meeting the criteria for certifying NERC as the ERO pursuant to §215 of the FPA and §39.3(b) of the Commission's regulations,[112] is embodied in §300 of the NERC ROP and the SPM, Appendix 3A to the ROP. Section 304 of the ROP states that NERC shall develop Reliability Standards in accordance with the NERC SPM. The SPM sets forth the detailed process steps for development and approval of a new Reliability Standards or revision to a Reliability Standard.

Section 304 of the NERC ROP sets forth NERC's "Essential Principles for the Development of Reliability Standards," which include openness, transparency, consensus-building, fair balance of interests, due process, and timeliness:

> 1. **Openness** — Participation shall be open to all persons who are directly and materially affected by the reliability of the North American BPS. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in NERC or any other organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.
>
> 2. **Transparency** — The process shall be transparent to the public.

[111] NERC Bylaws Article IX, §2.

[112] *ERO Certification Order*, 116 FERC ¶61,062, at PP 239, 241, 250.

3. **Consensus-building** — The process shall build and document consensus for each standard, both with regard to the need and justification for the Reliability Standard and the content of the Reliability Standard.

4. **Fair Balance of Interests** — The process shall fairly balance interests of all stakeholders and shall not be dominated by any two segments as defined in Appendix 3D, *Development of the Registered Ballot Body*, of these Rules of Procedure, and no single segment, individual or organization shall be able to defeat a matter.

5. **Due Process** — Development of Reliability Standards shall provide reasonable notice and opportunity for any Person with a direct and material interest to express views on a proposed Reliability Standard and the basis for those views, and to have that position considered in the development of the Reliability Standards.

6. **Timeliness** — Development of Reliability Standards shall be timely and responsive to new and changing priorities for reliability of the BPS.

Section 305 of the NERC ROP specifies that "NERC Reliability Standards shall be approved by a Registered Ballot Body prior to submittal to the [NERC] Board and then to [a]pplicable [g]overnmental [a]uthorities for their approval," and that "[a]ny person or entity may join the Registered Ballot Body to vote on Reliability Standards." The RBB is organized on an industry segment basis, and persons or organizations joining the RBB must select membership in the appropriate segment (subject to periodic review by NERC).[113] The RBB segments and the criteria for membership in each segment are set forth as follows:[114]

- Segment 1: Transmission Owners
- Segment 2: Regional Transmission Organizations and Independent System Operators
- Segment 3: Load-Serving Entities
- Segment 4: Transmission Dependent Utilities
- Segment 5: Electric Generators

[113] ROP §305.

[114] ROP Appendix 3D at 2-3. The segments of the RBB are different from the NERC membership segments established by Article II, §4 of the NERC Bylaws (discussed above under criterion 2). The Commission approved the use of segments for the RBB that are different from the NERC membership segments. *North American Electric Reliability Corporation, Order on Petitions for Rehearing and Clarification, Order on Compliance Filing*, 117 FERC ¶ 61,126 (2006), at P 30.

- Segment 6: Electricity Brokers, Aggregators, and Marketers
- Segment 7: Large Electricity End Users
- Segment 8: Small Electricity Users
- Segment 9: Federal, State, and Provincial Regulatory or other Government Entities
- Segment 10: Regional Entities

Section 306 of the ROP provides for the standards development process to be overseen by a Standards Committee, which is an elected body comprised of two members of each segment of the RBB and two officers elected to represent the interests of the industry as a whole.[115] The Standards Committee is to ensure stakeholder interests are fairly represented in the Reliability Standards development process. Section 308.2 of the ROP specifies that proposed Reliability Standards or revisions to Reliability Standards shall be submitted to the NERC Board of Trustees for approval after being approved by the RBB pool voting on the standard.

The NERC SPM sets out the detailed steps in the process for developing and approving Reliability Standards or revisions to Reliability Standards. The process is based on the procedures of the ANSI and other standards-setting organizations in the United States and Canada.[116] The standards development process is intended to develop consensus on both the need for and content of a proposed standard.[117] As detailed in the SPM, the process includes the following key elements:

- Nomination of a proposed standard, revision to a standard, or withdrawal of a standard, using a SAR, which may entail appointing a SAR drafting team.[118]
- Public posting of the SAR to allow interested persons and entities to review and comment on the need for the proposed standard and the expected outcomes and impacts from implementing it, and to identify if there is stakeholder consensus on the need, scope and applicability of the standard proposed by the SAR.[119]

[115] Election of the members of the Standards Committee is governed by the *Procedures for Election of Members of the Standards Committee*, Appendix 3B to the ROP.

[116] SPM §§1.4, 10.0, 13.0, and 16.0. ANSI accredited NERC's Reliability Standards development process in 2003.

[117] SPM §§1.4. 3.8, 3.10, and 4.0.

[118] SPM §§4.0, 4.2, and 4.3.

[119] SPM §§4.0, 4.1, and 4.2.

- Review of the public comments in response to the SAR and prioritization of proposed standards, leading to authorization to develop standards for which there is a stakeholder consensus-based need.[120]

- Appointment of a standard drafting team to draft the new or revised standard. The appointed standard drafting team is to have the expertise, competencies and diversity of views needed to develop the standard. The appointment process includes a public solicitation for nominees.[121]

- Drafting the new or revised standard. The standard will be drafted by the standard drafting team with the assistance and administrative support of the NERC standards process manager (a NERC professional staff member), who will review the draft standard for consistency of quality and completeness and to ensure the standard is within the scope and purpose identified in the SAR.[122]

- Public posting of the draft standard to allow interested parties to review and comment on it, to receive specific comments from interested parties on the text of the standard, to assess stakeholder consensus on the draft standard, and to determine if the draft standard should be modified to increase consensus.[123]

- Field testing (if any) of the draft standard and its measures.[124]

- Analysis of public comments and field test results (if any) by the standard drafting team, giving consideration to the written views and objections of all participants, to determine if there is consensus the proposed standard should go to ballot, or requires further work.[125]

- Balloting of the standard by the industry stakeholder ballot pool formed from the RBB for purposes of balloting the new or revised standard.[126] (The voting process is described below.)

---

[120] SPM §§4.0, 4.1, 4.2, and 4.3.

[121] SPM §§4.0, 4.3, and 4.4.

[122] SPM §§4.0 and 4.4.

[123] SPM §§4.0, 4.5, and 4.7.

[124] SPM §§4.0 and 6.0.

[125] SPM §§4.0, 4.5, 4.6, 4.7, 4.12, and 6.0.

[126] SPM §§4.0, 4.7, 4.8, and 4.9.

- Re-balloting of the standard to consider specific comments by those submitting negative votes with comments.[127]

- Vote by the NERC Board of Trustees to approve or reject the standard that has been approved by the ballot pool. The NERC Board of Trustees may adopt or reject a Reliability Standard that has been approved by the ballot pool, but may not modify the standard; however, if the NERC Board of Trustees chooses not to adopt a proposed standard, the board shall provide its reasons.[128]

- Submission of the RBB-approved and board-approved Reliability Standard to the Commission and other applicable governmental authorities for approval.[129]

As provided in the SPM, voting on a proposed Reliability Standard or revision to a standard is done by the RBB ballot pool formed for that standard, and is tallied on a weighted segment basis. At least 30 days prior to the start of a ballot, the NERC standards process manager issues a notice to the entities in the RBB advising them of the upcoming ballot on the new or revised standard, so that entities may elect to join the ballot pool for balloting the standard. Any member of the RBB may join (or leave) the ballot pool for the standard until the ballot period begins.[130] The balloting is conducted electronically with voting allowed during a specified ballot period, typically 10 days.[131] Approval of a proposed standard or revision to a standard requires both (i) a quorum, which is established by at least 75 percent of the members of the ballot pool submitting a response with an affirmative vote, a negative vote, or an abstention,[132] and (ii) affirmative votes by a two-thirds majority of the weighted segment votes.[133] The calculation of the weighted segment voting results is described in detail in the SPM.[134]

The foregoing demonstrates that NERC's rules provide reasonable notice and opportunity for public comment, due process, openness, and balance of interests in the development of

[127] SPM §§4.0, 4.13, and 4.14. Voters on the first ballot are allowed to submit comments with affirmative ballots and reasons for their votes with negative ballots (although inclusion of a statement of reasons with a negative ballot is not required).

[128] SPM §§4.0, 4.15, and 4.16.

[129] SPM §§4.0, 4.16, and 4.17.

[130] SPM §4.8.

[131] SPM §§4.0 and 4.9.

[132] SPM §4.10.

[133] SPM §§4.10 and 4.11. For this purpose the number of votes cast is the sum of the affirmative and negative votes cast by the ballot pool, excluding abstentions, non-responses and negative votes without comments.

[134] SPM §§4.10 and 4.11.

Reliability Standards. In finding that NERC met the statutory and regulatory criteria to be certified as the ERO, the Commission found NERC's Reliability Standards development process met the ERO certification requirement that the ERO candidate have rules providing for reasonable notice and opportunity for public comment, due process, openness, and balancing of interests in developing Reliability Standards.[135]

Other NERC rules provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in the exercise of NERC's duties other than developing Reliability Standards. As discussed under criterion 2 above, NERC's Bylaws provide for its trustees to be elected by the MRC, which (again per the NERC Bylaws) is comprised of representatives of the sectors of the NERC membership as defined in the Bylaws. The Bylaws also provide that amendments to the Bylaws must be adopted by majority vote of both the Board of Trustees and the MRC, conducted after at least 10 days and no more than 60 days' notice of the vote on the proposed amendment. Additionally, the NERC membership may adopt new Bylaws, or alter, amend, or repeal amendments adopted by vote of the board and the MRC, by vote of two-thirds of the sectors voting on the alteration, amendment, repeal or adoption.[136]

The Bylaws further provide that revisions to the NERC ROP may be proposed by: (i) any 50 members of NERC, which must include members from at least three membership sectors; (ii) the MRC; (iii) a committee of NERC to whose function and purpose the ROP to be amended pertains; or (iv) an officer of NERC. A proposed revision to the NERC ROP must be posted on the NERC website for public comment for a minimum of 45 days prior to the NERC Board of Trustees vote on the proposed revision.[137]

The NERC Bylaws require that notice of meetings of the NERC Board of Trustees and of the MRC, and notice of calls for action without a meeting by the board or the MRC, along with all non-confidential materials to be considered by the board or MRC at a meeting or in an action without a meeting, shall be posted on the NERC website at least 24 hours prior to the meeting or within 24 hours after the call for action without a meeting.[138] The ROP provide that notice of meetings of NERC committees, and all non-confidential materials relating to the meeting, shall be posted on the NERC website at approximately the same time(s) the notice and materials are provided to the committee members.[139] Additionally, the Bylaws require that, except for discussions of certain specified non-public topics, meetings of the NERC Board of Trustees and of the MRC shall be open to the public (subject to reasonable space limitations).[140] Similarly, the

[135] *ERO Certification Order* at P 250.

[136] NERC Bylaws Article XIV, §1.

[137] NERC Bylaws Article XI, §2.

[138] NERC Bylaws Article V, §§4 and 6; Article VIII, §§10 and 12.

[139] ROP §1304.1.

[140] NERC Bylaws Article V, §4; Article VIII, §10.

NERC ROP require that, except for discussions of certain specified non-public topics, meetings of NERC standing committees shall be open to the public (subject to reasonable space limitations).[141]

With respect to the preparation of NERC's annual business plan and budget, the NERC Bylaws provide that NERC shall post a draft business plan and budget for comment by the NERC membership, the MRC, and the NERC standing committees for at least 30 days prior to the board meeting at which the annual business plan, budget and funding requirement is to be approved for submission to the Commission. The Board shall also consult with the members of the MRC on the proposed business plan and budget before it is adopted.[142] Should a supplemental or modified budget or assessment be considered for adoption during the course of the year, the Bylaws require that the procedures for posting, receipt of comments, and consultation with the MRC shall be followed to the extent possible in the board's judgment in light of the exigency of the circumstances necessitating preparation and approval of the supplemental or modified budget, funding and assessment.[143]

With respect to compliance monitoring and enforcement, as discussed above under criteria 1 and 4, the NERC CMEP and Regional Entity CMEPs, the NERC *Hearing Procedures* (Attachment 2 to the CMEP), and the NERC *Sanction Guidelines*, provide for reasonable notice to and due process for users, owners, and operators of the BPS in the conduct of compliance monitoring and enforcement activities of NERC and the Regional Entities. These activities include the implementation of the compliance monitoring processes, the conduct of hearings on disputed notices of alleged violations, proposed penalties, disputed mitigation plan components and disputed remedial action directives, and the imposition of penalties and sanctions for violations of Reliability Standards.

Finally, as discussed above under criterion 2, the NERC Bylaws and ROP require members to be selected for NERC standing committees and other committees and subgroups so as to (subject to specified exceptions) provide for balanced decision making, such that no two stakeholder sectors can control the voting on the committee and no single stakeholder sector is able to defeat a matter; and to provide the opportunity for an equitable number of members from the United States and Canada.

F. Criterion 6 - The ERO has established rules that provide appropriate steps to gain recognition in Canada and Mexico.

As stated in its Certificate of Incorporation, one of the corporate purposes of NERC is "to act as the electric reliability organization for the United States as certified by the Federal Energy Regulatory Commission and for Canada and Mexico as recognized by applicable government and regulatory authorities in such countries, all pursuant to law." The efforts of NERC to seek recognition in Canada and Mexico are described below.

---

[141] ROP §1304.1.

[142] NERC Bylaws Article XIII, §4; *see also* ROP §1103.1.

[143] NERC Bylaws Article XIII, §5.

Canada

Under the Constitution of Canada, regulation of electricity is primarily within the jurisdiction of each province. Canada does not have a 'FERC-equivalent' with plenary jurisdiction over electricity matters, although the National Energy Board (NEB) does have jurisdiction over international power lines. Accordingly, beginning before its certification as the ERO for the United States and continuing to the present time, NERC has devoted significant efforts to developing relationships with each of the relevant provincial authorities, as well as the NEB. Where possible, NERC has devoted efforts attempting to obtain recognition as the electric reliability organization. NERC's progress in this regard is described below.

Alberta

Reliability Standards

The Alberta Electric System Operator (AESO) is the independent system operator, a statutory corporation pursuant to Alberta's *Electric Utilities Act*, *2003* (EUA).[144] AESO's statutory mandate requires that it direct the operation of the Alberta interconnected electric system, plan for the future of the transmission system, and operate the wholesale electricity market in the province.

Pursuant to the Alberta *Transmission Regulation* (made pursuant to the EUA),[145] Alberta Reliability Standards include reliability standards[146] enacted by WECC, NERC, or any similar entity that is recognized by the AESO, to the extent that these reliability standards are adopted by the AESO in accordance with the *Transmission Regulation*. The AESO also has the authority under the *Transmission Regulation* to adopt other reliability standards subject to certain process requirements.

In order for a reliability standard to be adopted in Alberta, the *Transmission Regulation* requires that the AESO consult with those market participants that it considers likely to be directly affected by one or more reliability standards and make a recommendation to the Alberta Utilities Commission to approve or reject the reliability standards being considered for approval. The Alberta Utilities Commission must follow the AESO's recommendation unless an interested person satisfies the Alberta Utilities Commission that the recommendation of the AESO is either "technically deficient" or "not in the public interest." When the AESO considers NERC Reliability Standards for adoption in Alberta, the AESO is required to determine whether the NERC

[144] Alberta's EUA is available at: http://www.qp.alberta.ca/documents/Acts/E05P1.pdf.

[145] Alberta's *Transmission Regulation* is available at: http://www.qp.alberta.ca/documents/Regs/2007_086.pdf.

[146] In this context, where not capitalized, the phrase "reliability standards" refers to standards relating to reliability generally, whether or not they were developed or approved by NERC.

Reliability Standards can be applied in Alberta, including whether approval would be appropriate for the Alberta electric energy market framework.[147]

The AESO's *Alberta Reliability Standards Program Work Plan* is intended to help manage and track the adoption of NERC Reliability Standards in Alberta. It was last revised in June 2014, and it reflects a risk-based prioritization approach.[148] The Alberta Reliability Standards, as approved, bear the same identifiers as the original NERC Reliability Standards (COM, BAL, FAC, etc.), but have an "AB" added to the name.[149]

An Alberta Reliability Standard may incorporate modifications from the original NERC Reliability Standard to recognize the physical characteristics of the Alberta system or for other reasons.[150]

When presented to the Alberta Utilities Commission by the AESO for approval, a proposed Alberta Reliability Standard will contain an explanation for any proposed modifications, which are not intended to change the intent or substance of the NERC Reliability Standards. Where there have been changes from a NERC Reliability Standard to an Alberta Reliability standard, it is noted in a quarterly update report that is provided to WECC and to NERC.

Effective January 1, 2014, the AESO assumed all responsibilities related to the functions of a Reliability Coordinator, effective January 1, 2014. The AESO has indicated that it remains an active member and supporter of the WECC (the former Reliability Coordinator for the AESO), and it looks forward to a strong working relationship with the proposed independent WECC RC, Peak Reliability. Additional Alberta Reliability Standards will be adopted, and this work is underway.

Data Sharing

Under §8.4 of the WECC/AESO membership and operating agreement (MOA), if WECC determines that the AESO is not in compliance with an Alberta Reliability Standard, WECC must promptly refer the matter to the Market Surveillance Administrator (MSA). Pursuant to the

---

[147] Alberta has developed an Alberta Functional Model that integrates with the Alberta regulatory and market framework. The Alberta Functional Model defines entity types that perform functions that impact the reliability of the transmission system. Functional entity types are used to identify if an Alberta Reliability Standard is applicable to that functional type.

[148] The *Alberta Reliability Standards Program Work Plan* can be found at: http://www.aeso.ca/rulesprocedures/25052.html. Alberta Reliability Standards currently in effect and their effective dates are listed on the AESO website at: http://www.aeso.ca/rulesprocedures/17006.html. A number of NERC Reliability Standards have been rejected as not being applicable to entities in Alberta. These are listed at: http://www.aeso.ca/rulesprocedures/16426.html.

[149] An example of a current Alberta Reliability Standard is BAL-001-AB-0a, Real Power Balancing Control Performance.

[150] *See* Project Charter for Alberta Reliability Standards Implementation at p.1, available at: http://www.aeso.ca/downloads/ARS_Project_Charter_2011-12-05_final.pdf.

WECC/MSA services agreement, WECC, on behalf of the MSA, will monitor AESO's compliance with Alberta Reliability Standards and report its findings to the MSA.

Sections 2.13, 6.1, and 6.5 of the WECC/MSA services agreement address WECC's ability to report possible violations[151] to NERC. Under §2.13, NERC and FERC are not allowed to participate in or observe WECC's actions taken according to the WECC/MSA services agreement, without the express approval of the MSA. Section 6.1 establishes that all records pertaining to WECC's services will be considered confidential and should be treated as strictly confidential at all times.[152]

Based on its agreement with the MSA, WECC is prohibited from disclosing information related to the AESO's compliance with Alberta Reliability Standards without the permission of the MSA. However, as noted in the NERC/WECC/AESO memorandum of understanding (MOU),[153] disclosing information related to confirmed contraventions would occur as such information is made public by the Alberta Utilities Commission. In addition, as there is value to the North American electric industry of receiving information on lessons learned from such contraventions, the AESO will work with NERC and WECC to provide information on lessons learned as made public by the Commission.

Compliance

The NERC/WECC/AESO MOU commits the AESO to appropriate compliance monitoring and enforcement "in a manner determined in Alberta." With regard to entities (other than the AESO) that are subject to Alberta Reliability Standards, the AESO carries out its mandate to monitor compliance according to a compliance monitoring plan. Matters of noncompliance with an Alberta Reliability Standard must be referred by the AESO to the MSA for consideration and possible action.

The Alberta Utilities Commission adopted specified penalties for contraventions of Alberta Reliability Standards effective November 2010. If warranted, the MSA is empowered by §52 of the *Alberta Utilities Commission Act* to issue a notice of specified penalty for contravention of an Alberta Reliability Standard. Specified penalties are defined in AUC Rule 027 and range from $500 to $25,000, depending upon the severity of the contravention and the applicable Alberta

[151] The terms "possible violation," confirmed violation," and "violation" are not defined in Alberta. Rather, Alberta uses the terms "suspected contravention" and "contravention."

[152] Section 6.5 is even more explicit with respect to WECC's authority to share information with NERC and mandates the following:

> WECC further acknowledges that this Agreement clearly stipulates that in no event will Confidential Records received or generated by WECC in respect of the Services or this Agreement be disclosed or made available to persons outside WECC, including to any representative of FERC, NERC or any other person, without the express written approval of the MSA.

[153] MOU between NERC, WECC, and AESO, effective July 15, 2010, at p. 7, available at: http://www.nerc.com/files/NERC-WECC-AESO_MOU_Executed%20Version_071510.pdf.

Reliability Standard.[154] Specified penalties can be appealed to the Alberta Utilities Commission. Alternatively, the MSA can pursue an administrative penalty before the Alberta Utilities Commission. The maximum administrative penalty amount is $1 million per day on which a contravention occurs or continues.

British Columbia

Reliability Standards

The British Columbia Utilities Commission (BCUC) is an independent, quasi-judicial regulatory agency that operates under and administers the *Utilities Commission Act*.[155] The BCUC adopts or rejects reliability standards in British Columbia and is responsible for the administration of the Mandatory Reliability Standards Program. The British Columbia Hydro and Power Authority (BC Hydro), a provincial crown corporation, is a regulated integrated utility and transmission provider that acts as a balancing authority and applicant for Reliability Standards to the BCUC.

To provide the necessary information required for determinations and in accordance with the *Utilities Commission Act*, BC Hydro submits a *Mandatory Reliability Standard Assessment Report* to the BCUC assessing the new and revised reliability standards adopted in the United States by FERC within the annual assessment period (December 1 to November 30). The assessment report is developed in consultation with Registered Entities in the Mandatory Reliability Standards Program. Further, in consultation with stakeholders regarding the estimated time required for the entities to implement and come into compliance with the reliability standards, BC Hydro suggests effective dates for each of the Reliability Standards assessed. After a public comment process, the BCUC reviews BC Hydro's analysis and then may either approve or reject Reliability Standards. The BCUC does not have authority to alter or amend a standard. To date no standards have been rejected, although the provincial process can lead to delays before a FERC-approved Reliability Standard is adopted.

In Order G-171-10, issued on November 25, 2010, the BCUC approved an annual Implementation Plan created by WECC for 2011 that includes "a list of minimum [R]eliability [S]tandards to be actively monitored, methods to be used for monitoring, an Audit Plan, Self-Certification Program and Schedule, Periodic Information Submittal requirements and Exception Reporting process."[156] The BCUC has also issued orders approving annual Implementation Plans for subsequent years.[157]

---

[154] The specified penalties for contravention of Alberta Reliability Standards are available at: http://www.auc.ab.ca/rule-development/rule-027-specified-penalties-for-reliability-standards/Pages/default.aspx.

[155] The *Utilities Commission Act* is available at: http://www.bclaws.ca/Recon/document/ID/freeside/00_96473_01.

[156] Order No. G-171-10, issued by the BCUC, at p. 1, available at: http://www.bcuc.com/Documents/Orders/2010/DOC_26511_G-171-10_MRS-2011-Implementation-Plan.pdf.

[157] *See*, e.g., Order No. R-39-13, available at: http://www.bcuc.com/Documents/Orders/2013/DOC_38047_R-39-13_BC-Reliability_2014-Implementation-Plan.pdf (approving the Implementation Plan for the 2014 calendar year).

The standards in effect in British Columbia are generally listed in an attachment to the most recent order approving new or amended standards. NERC Reliability Standards and WECC regional Reliability Standards effective in British Columbia are also listed on the WECC website.[158] British Columbia has vested the BCUC with authority to levy monetary penalties for violations.

Data Sharing

WECC's relationship with the BCUC is governed by the Administration Agreement between the parties (dated October 8, 2009), the BCUC's *Rules of Procedure for Reliability Standards in British Columbia* (BCUC ROP), and BCUC's compliance monitoring program.[159] Under §3.2 of the Administration Agreement, WECC is required to immediately advise the BCUC and an applicable entity who has provided information to WECC if that information has been requested by NERC or a foreign government agency, unless disclosure of the request is prohibited by law. Therefore, WECC can only disclose confidential information related to possible violations if the BCUC approves the disclosure or by compulsion of law.

Under §6.3.1 of the BCUC ROP, the BCUC, in its discretion and upon request, may designate information as restricted.[160] If such designation is made, §3.6 of the Administration Agreement and the BCUC ROP prohibit WECC from transmitting the information outside of British Columbia. WECC can review the restricted information only at the offices of the applicable entity or at the BCUC. The applicable entity is not required to give WECC a copy of the restricted documents.

Under §3.1 of the Administration Agreement, WECC shall maintain the confidentiality of the confidential information and shall not disclose it even under conditions of confidence, except as provided in the Rules of Procedure, namely with BCUC approval. Section 3.1.1(ii) also prohibits WECC from disclosing documents or portion of documents that would potentially identify the source of the information. Finally, WECC cannot disclose any information if the BCUC directs WECC to keep it confidential.

Compliance

Under a contract with the BCUC, WECC performs compliance oversight for the province, including registration, monitoring and auditing functions and activities. However, the violations, enforcement, and penalty assessment functions remain with BCUC. Until recently, the BCUC had no monetary sanctions authority. BCUC now has authority to assess fines of up to $1 million per day. The process for imposing penalties for confirmed violations of reliability standards is under development.

---

[159] *See* Attachments 1 and 2 to Order No. G-123-09, issued by the BCUC, available at: http://www.bcuc.com/Documents/Orders/2009/DOC_23219_G-123-09_BCUC%20MRS.pdf.

[160] *See* http://www.bcuc.com/Documents/MRS/Rules-of-Procedure.pdf.

Manitoba

Reliability Standards

The *Manitoba Hydro Act* establishes the framework for Manitoba Hydro to adopt NERC Reliability Standards by authorizing Manitoba Hydro, subject to Lieutenant Governor in Council approval, to adopt:

> in whole or in part, any standards, rules, terms, conditions, guidelines or schedules, which are related to the planning, design or operation of generation or transmission facilities within an integrated regional power grid, established by [the North American Electric Reliability Council, Mid-Continent Area Power Pool or…] an industry organization, regional transmission group, regulatory body or other association or group or any other person.[161]

The *Manitoba Hydro Amendment and Public Utilities Board Amendment Act (Electricity Reliability)*[162] and its implementing regulations, which came into force on April 1, 2012, set the basis for the adoption of mandatory and enforceable NERC Reliability Standards in Manitoba. This legislation gives the Public Utilities Board of Manitoba (PUB) the authority to make determinations of noncompliance with Reliability Standards, to impose sanctions, and to remand a standard to NERC for reconsideration.

On April 1, 2012, all then-current NERC Reliability Standards became mandatory and enforceable in Manitoba. These standards are listed in Schedule 1 to the *Reliability Standards Regulation*.[163] The province reserved the right to adopt new or amended standards by regulation. The government is consulting with stakeholders as to the best process for considering and approving standards for application in Manitoba.

Compliance

The *Compliance Monitoring and Enforcement Program Province of Manitoba*, based on the NERC CMEP, was adopted as Schedule 2 to the *Reliability Standards Regulation*. MRO and NERC, as compliance bodies, will monitor Manitoba Hydro's compliance with NERC Reliability Standards. If a compliance body alleges that a violation of standards has occurred in Manitoba, it must apply to the PUB with a recommended enforcement action for a determination on whether a standard has been violated. MRO also makes recommendations to PUB regarding the imposition

---

[161] *See The Manitoba Hydro Act*, C.C.S.M. c.H190, s.16.3(1)(a), available at: http://web2.gov.mb.ca/laws/statutes/ccsm/h190e.php. The bracketed language above was stricken in *The Manitoba Hydro Amendment and Public Utilities Board Amendment Ac*t (dated June 11, 2009), and replaced with "an industry organization."

[162] Statutes of Manitoba 2009, c. 17.

[163] Available at: http://web2.gov.mb.ca/laws/regs/annual/2014/098.pdf.

of associated penalties or sanctions. The PUB will decide whether a violation of a standard has taken place and the penalty, if any, which should apply for noncompliance. The PUB can impose a penalty, with enforcement through a board order. When the PUB issues an order confirming a violation, NERC may make this fact and any attached penalties public.

NERC or MRO, in advising the PUB that they believe a violation has occurred, is also to advise on appropriate remedial actions, sanctions, or penalties.

Data Sharing

The compliance program requires timely data from registered entities to effectively monitor compliance with Reliability Standards.

All findings by PUB related to electricity reliability proceedings are made public through the issuance of orders. These orders will include the name of the registered entity, the Reliability Standard(s) and requirements(s) violated, whether the PUB agrees with MRO's findings and recommendations, and any penalties or sanctions imposed.

When the PUB issues an order confirming a violation, NERC may make this fact and any attached penalties public. The mitigation plan will not be made public until there is a confirmed violation. Similarly, final audit reports will be released to the public, but only after any alleged violations have become confirmed violations. Lastly, while compliance investigations are confidential, confirmed violations resulting from a compliance investigation will be made public.

New Brunswick

Reliability Standards

On October 3, 2008, NERC, the Minister of Energy of the Province of New Brunswick, and the New Brunswick System Operator (NBSO) signed a MOU that recognized NERC's role as the ERO and found that NERC is a "standards authority" within the meaning of the *New Brunswick Electricity Act*. NERC, NPCC, and NBSO have signed an MOU under which NERC and NPCC would monitor compliance and carry out enforcement as to NBSO. Under the MOU, NBSO was to monitor and enforce compliance with Reliability Standards by those entities within New Brunswick as a part of its market rules.

In October 2013, New Brunswick's legislation that amends how Reliability Standards are approved, monitored, and enforced received Royal Assent and was proclaimed (i.e., became effective). The *New Brunswick Electricity Act*[164] led to the amalgamation of NBSO with the NB Power Group of Companies. The system operation functions performed by NBSO are now performed within the vertically integrated New Brunswick Power Corporation (NBPC). In addition to its responsibility to comply with reliability standards applicable to its function, NBPC is also responsible for making filings to the New Brunswick Energy and Utilities Board (NBEUB) to update Reliability Standards, maintain a list of BPS elements, and to make recommendations on

[164] The *New Brunswick Electricity Act* is available at: http://laws.gnb.ca/en/ShowPdf/cs/2013-c.7.pdf.

compliance registrations. The NBSO's role in the adoption, monitoring, and enforcement of North American Reliability Standards has been transferred to the NBEUB.

The NBEUB may adopt FERC-approved NERC Reliability Standards that have been filed by NBPC. NERC Reliability Standards are filed and adopted with an accompanying NB Appendix to describe the specific application of the standard in New Brunswick. The NBEUB posts proposed Reliability Standards on its website for a 60-day review period prior to adoption. If the proposed Reliability Standard contains substantive revisions to the FERC-approved version, or if there are substantive comments received during the review period, the NBEUB may hold a hearing and may determine to approve, not approve, or remand the proposed Reliability Standard back to NBPC. A list of enforceable Reliability Standards is available on the NBEUB's website.[165]

Data Sharing

Confidentiality and public disclosure is governed by Part 7 of the *New Brunswick Compliance Monitoring and Enforcement Program* (NB CMEP) – Schedule A to the *Reliability Standards Regulation – Electricity Act*.[166] Any information that a registered entity provides to the NBEUB, NPCC, or NERC may be marked as confidential and may not be released to a third party without the written consent of the registered entity. The regulation provides for the public disclosure of finalized audit reports, confirmed violations, penalties, sanctions, and settlement agreements, including the name of the registered entity. The NBEUB is required to keep all CIP information confidential in accordance with §1500 of the NERC ROP.

Pursuant to the MOU, NERC provides information relevant to New Brunswick on issues relating to reliability, Reliability Standards, and compliance with Reliability Standards.

Compliance

The NBEUB implements a compliance monitoring system for reliability standards that is based on the requirements of the NERC compliance program. The NB program is documented as the NB CMEP – Schedule A to the *Reliability Standards Regulation – Electricity Act*. As a recognized compliance body under the regulations, NPCC assists the NBEUB with compliance monitoring activities according to a service agreement the NBEUB has executed with NPCC. The NBEUB will initiate enforcement action if it has reason to believe that a violation of a reliability standard has occurred. NBEUB requires that the entity take action to remove the risk the violation poses to the reliability of the BPS and to implement a plan that will prevent a future occurrence of the violation. Registered entities are subject to financial penalties and sanctions for violations of adopted reliability standards. A penalty matrix, provides ranges for penalties corresponding to VRFs and VSLs, is provided in the *Reliability Standards Regulation*.

[165] *See* http://www.nbeub.ca/index.php/en/electricity/reliability-compliance/118.

[166] New Brunswick's *Reliability Standards Regulation – Electricity Act* is available at: http://laws.gnb.ca/en/ShowPdF/cr/2013-66.pdf.

Nova Scotia

Reliability Standards

The Nova Scotia Utility and Review Board (NSUARB) is an independent, quasi-judicial body which exercises general supervision over all electric utilities operating as public utilities within the Province of Nova Scotia, pursuant to the *Nova Scotia Public Utilities Act*.[167] Nova Scotia Power Incorporated (NPSI) is a public utility in Nova Scotia and is a member of NERC and NPCC. The Nova Scotia Department of Energy is responsible for energy and electricity policy in the province.

NERC has signed two separate MOUs with entities in Nova Scotia: one with NSUARB, and one with NSPI.[168]

NERC submits standards to NSUARB and NSPI for approval; each organization may approve, modify, remand or dismiss the standard as not applicable, though final approval authority rests with NSUARB. NSUARB has a quarterly review process allowing the submission, by NERC, of standards already approved by FERC. NSUARB will only process an application after FERC has approved or remanded the Reliability Standard in the United States.[169] NERC made an initial filing of Reliability Standards on June 30, 2010 along with the *Glossary of Terms Used in NERC Reliability Standards*. Nova Scotia approved this filing on July 20, 2011. None of the proposed standards were changed or rejected.

On September 2, 2011, NERC made its first quarterly filing to Nova Scotia that included a list of Standards approved by FERC in the period of time since the June 30, 2011 filing. This filing was approved.

In June 2012, the NSUARB proposed an expedited process for its review of NERC quarterly filings. This was approved for implementation in August 2012. With respect to the quarterly filing, NSPI and NPCC have 10 days to comment if they wish. At the end of the comment period, the NSUARB will decide if, based on any comments, a more rigorous review is required. If a more rigorous review is deemed required it will be undertaken; otherwise, the NSUARB will issue its decision. To date, all filings have been approved without additional review.

Under the MOU with NPSI, NSPI agrees to comply with NERC's Reliability Standards. NPSI also committed to review and provide recommendations on the adoption of Reliability Standards.

---

[167] The *Nova Scotia Public Utilities Act* is available at: http://nslegislature.ca/legc/statutes/public%20utilities.pdf.

[168] The NSUARB and NERC signed an MOU on December 22, 2006, in which NERC and the NSUARB agreed to a cooperative relationship to improve the reliability of the North American BPS. On May 11, 2010, NERC, NPCC, and NSPI signed an MOU which memorializes the working relationship between the three entities to improve reliability of the grid in Nova Scotia and North America. Both MOUs are available at: http://www.nerc.com/filingsorders/ca/pages/canadian-mous.aspx.

[169] The date of the order is considered the effective date for the adopted Reliability Standards.

Data Sharing

The MOU states that NSPI will provide NPCC all information respecting reporting requirements in the CMEP for NERC Reliability Standards.

Under the MOU, NERC has agreed to share relevant information on issues related to reliability compliance with the NSUARB. Examples of such information include:

(1) Compliance audits and spot checks;

(2) Readiness evaluations;

(3) Disturbance reports;

(4) Reliability assessments and benchmarking information; and

(5) Reports by regional reliability organizations, where applicable.[170]

There is also a data sharing requirement relevant to the Reliability Standards process. The MOU with NSUARB calls for NERC to submit all NERC Board of Trustees-approved Reliability Standards to the NSUARB. NERC also agreed to notify NSUARB immediately if a Reliability Standard has been remanded in another jurisdiction.

With respect to enforcement matters, the MOU states that the NSUARB and NERC will work together to establish a system for disclosure by NERC of violations to provide for assessment and reporting by NERC of inter-region reliability risks to or from entities outside of Nova Scotia where coordinated action is required to address those risks.

Compliance

Compliance is mandatory in Nova Scotia. NPCC as the regional Entity maintains the list of all market participants of the BES who must comply with approved reliability standards. NPCC provides recommendations to NSPI and may also identify organizations that may be candidates for registration and assign them to the compliance registry. The registry is based on the NERC functional model and registry criteria. The NSUARB will monitor compliance and accept compliance information and recommendations from NERC. NERC, NPCC and NSUARB may all suggest compliance violation; proceedings shall be conducted under the NSUARB's direction and control. NERC may recommend a particular penalty for any violation, but NSUARB will be responsible for determining if a violation occurred and what penalties should be imposed.

NSPI is subject to NERC's CMEP as implemented by NPCC.

[170] *See* MOU between the NSUARB and NERC at pp. 2-3.

Ontario

Reliability Standards

The Ontario Minister of Energy is responsible for the legislation that governs the Ontario Energy Board (OEB) and the Independent Electricity System Operator (IESO) and for energy and electricity policy in the province. The IESO of Ontario is a not-for-profit corporate entity established under the *[Ontario] Electricity Act, 1998*,[171] and is subject to the oversight authority of the OEB. The OEB is responsible for regulating the electricity sector, and it has the legislative authority to stay or revoke the operation of a reliability standard in Ontario and refer it back to NERC or NPCC for further consideration.

On October 25, 2006, the OEB and NERC signed an MOU[172] setting forth the mutual understanding of each party's responsibilities with respect to reliability in the Province of Ontario. The MOU states that Ontario's legislative framework does not expressly contemplate approval of NERC Reliability Standards, By-laws or Rules of Procedure. The MOU recognizes that, under the Ontario Electricity Act, one of the IESO's objectives is to participate in the development of standards relating to the transmission system and to enforce those standards. The MOU confirms that NERC Reliability Standards are referenced generically in the Market Rules written and administered by the IESO, and they are considered in effect in Ontario upon expiration of the remand period. On November 28, 2006, the Ontario Ministry of Energy formally recognized NERC as the entity named as a "standards authority" in the *Electricity Act, 1998*. Subsequently, in 2008, the *Electricity Act, 1998* was amended, allowing for NPCC to be recognized as a standards authority.

An MOU between the IESO, NPCC, and NERC was signed on November 29, 2006 and amended on February 5, 2010. This MOU documents the roles of the parties in conformance with the Ontario reliability framework and commits the IESO to carry out a compliance enforcement program for Ontario entities. The MOU also acknowledges that the NERC Rules of Procedure have effect in Ontario, provided they do not conflict with the established reliability and compliance framework in Ontario. The amended MOU includes provisions for investigations, organization registration, and NERC certification.[173] The IESO is subject to NERC's CMEP processes in accordance with the MOU. Monitoring and enforcement activities, with the exception of financial sanctions, are performed by NPCC.

While there continues to be no formal approval of NERC Reliability Standards in Ontario, there is a process for a Reliability Standard to be rejected or remanded. This process provides for market participants, the IESO, or the OEB itself to initiate a review that could result in a standard

[171] Ontario's *Electricity Act, 1998* is available at: http://www.e-laws.gov.on.ca/html/statutes/english/elaws_statutes_98e15_e.htm.

[172] Both the 2006 MOU and the 2010 MOU described in the following paragraph are available at: http://www.nerc.com/filingsorders/ca/pages/canadian-mous.aspx.

[173] In general, such NERC compliance processes do not involve direct participation by Ontario market participants.

being remanded or revoked for application in the province. Only Reliability Standards approved by the NERC Board of Trustees on or after May 14, 2008 are subject to this process.

Ontario was the first jurisdiction in North America to adopt NERC Reliability Standards as mandatory and enforceable. Until July 2011, a NERC Reliability Standard became effective on the date specified by the NERC Board of Trustees when it approved the standard. Because of the uncertainties in the timing of FERC approvals, a standard typically came into effect earlier in Ontario than in adjoining U.S. jurisdictions. An Ontario Market Rule amendment effective July 8, 2011 addressed this mismatch. Under this Market Rule,[174] a NERC Reliability Standard will become effective when it is declared mandatory and enforceable in the U.S., unless the OEB remands the Reliability Standard or otherwise stays its enforceability. In addition, any Reliability Standard approved by the NERC Board of Trustees under NERC Rule 321 (i.e., a standard responsive to a regulatory directive that has not been approved by the NERC RBB) must be approved by IESO before it can comes into effect in Ontario.

To date, Ontario has neither remanded nor modified any NERC Reliability Standards. Information regarding Reliability Standards in Ontario can be found on the IESO's website.[175]

Data Sharing

Under the MOU, NERC will provide the OEB with information relevant to Ontario on issues related to compliance with NERC Reliability Standards, including reports on:

(1) Compliance audits and spot checks;

(2) Readiness audits;

(3) Disturbance reports;

(4) Reliability assessments and benchmarking information; and

(5) Reports by regional reliability organizations, where applicable.

The MOU also calls for NERC to inform the OEB of Reliability Standards approved by NERC and submitted to appropriate regulatory authorities, and to notify the OEB of NERC Reliability Standards that are remanded to NERC in any jurisdiction outside of Ontario. The MOU states that the IESO is the only Ontario entity directly accountable to NERC for its own compliance and will be accountable to NERC for compliance by all Ontario entities with NERC Reliability Standards.

In the MOU, there is also an undertaking that, subject to confidentiality requirements, the IESO will advise NERC of the functional responsibilities of Ontario entities.

---

[174] *See Market Rules for the Ontario Electricity Market*, ch. 5, Bulk Power System Reliability, available at: http://ieso-public.sharepoint.com/Documents/marketRules/mr_marketRules.pdf.

[175] *See* https://www.ieso.ca/imoweb/ircp/reliabilityStandards.asp.

Compliance

The IESO is subject to NERC's CMEP, with the exception that the IESO is not subject to financial sanctions.

Compliance enforcement within Ontario, i.e., of Ontario market participants, is conducted by the IESO's Market Assessment and Compliance Division, which is "ring-fenced" from the rest of the organization. The IESO is subject to assessments of compliance with NERC Reliability Standards, including audits performed by NPCC. The MOU provides NPCC and NERC the right to draw their own conclusions with respect to a compliance investigation of Ontario entities, but with limited authority to impose financial sanctions on the IESO only.

The IESO carries out a compliance enforcement program and can issue a monetary order, finding, or remedial action with respect to a violation of a Reliability Standard in Ontario, subject to appeal to the OEB. The IESO has delegated enforcement accountability to the Market Assessment and Compliance Division, which exercises independent discretion in terms of enforcement decision-making.

The Market Assessment and Compliance Division establishes and executes procedures and programs for monitoring, investigating, and imposing sanctions, including financial penalties, against market participants and the IESO itself. The MOU acknowledges the Market Assessment and Compliance Division as the enforcement body in Ontario for Reliability Standards with full sanctioning powers as afforded under the Market Rules for breaches committed by the IESO and Ontario market participants.

In the event that a violation is confirmed under the Market Rules, the name of the responsible entity is made public. The Market Assessment and Compliance Division has the authority to levy sanctions for reliability violations. These sanctions may include financial penalties and are subject to appeal to the OEB. The Market Assessment and Compliance Division has established sanctions guidelines similar to those of NERC using severity/impact criteria. It has authority for "Extraordinary Financial Penalties" under certain circumstances to assess penalties of up to $1 million per occurrence. The OEB can impose administrative penalties of up to $20,000 per day.

Québec

Reliability Standards

The Régie de l'énergie du Québec (Régie) is an independent agency established under the *Act Respecting the Régie de L'Énergie* (Régie Act) to regulate the province's electricity and natural gas sectors. On December 8, 2006, NERC and the Régie signed an MOU that contemplated a future amendment to Québec's reliability legislation to grant the Régie the power to adopt and enforce NERC standards and allow for NERC funding and oversight in the province of Québec.[176]

[176] NERC-Canadian MOUs are available at: http://www.nerc.com/filingsorders/ca/pages/canadian-mous.aspx.

The MOU noted that §73.1 of the Régie Act provides that the "electric power carrier," or Hydro-Québec, will establish reliability standards for its electric power transmission system and submit them to the Régie for approval. According to the MOU, the standards will become mandatory after approval by the Régie.

On December 13, 2006, Québec implemented *An Act Respecting the Implementation of the Québec Energy Strategy and Amending Various Legislative Provisions*,[177] which grants the Régie jurisdiction over a mandatory reliability standards framework in the Province of Québec. This act formalizes the ability of the Régie to approve reliability standards after reviewing an evaluation of the relevance and impact of the proposed standards. Under the act, the Régie may request that the Reliability Coordinator modify a standard or submit a new one. Further, the Reliability Coordinator must submit guidelines to the Régie describing criteria to be taken into account in determining sanctions for noncompliance with reliability standards and identify owners or operators that will be subject to the standards approved by the Régie.

On June 2, 2009, the RC filed an application seeking the adoption of 95 NERC Reliability Standards applicable in Québec, in French and English, along with an evaluation of the relevance and impacts of standards filed with the Régie. The filing also called for the approval of Registers of Entities and of Facilities, and approval of a *Glossary of Terms Used in NERC Reliability Standards*, among other things. The entities' and facilities' registers, as filed for approval, also provide interpretations regarding standard applications within Québec, and among other matters, a BES definition for the Québec Interconnection that is more stringent than NPCC's BPS definition.

In a partial decision issued on May 13, 2011, the Régie approved the content of the submitted NERC Reliability Standards.[178] In addition, the Régie accepted the Main Transmission System to be the system that defines the transmission and generation facilities to which Reliability Standards are applicable (TO, GO, GOP, TOP). The partial decision also called for a number of changes in how the standards and appendices are presented and for a review of the translation of the standards into French. The Régie is working to ensure the French version of the standards is as close in meaning to the English version as possible. The Régie will establish a timetable for filing of revised versions of the standards in English and French for final adoption. Accordingly, no NERC Reliability Standards have been formally adopted nor made effective in Québec.

The second agreement among NERC, the Régie, and NPCC regarding implementation of mandatory Reliability Standards in Québec has been developed, and the agreement is under consideration by the Québec provincial government. The Régie has issued a decision to adopt a second group of Reliability Standards for Québec, which brings the total number of adopted standards in Québec to 35. Following public hearings which took place in October 2013, it is expected that the Régie will issue a decision concerning a third group of standards. Hydro-Québec

[177] Available at: http://www2.publicationsduquebec.gouv.qc.ca/dynamicSearch/telecharge.php?type=5&file=2006C46A.PDF.

[178] A list of these approved Reliability Standards is available at: http://www.regie-energie.qc.ca/audiences/3699-09/Demande_3699-09/B-1_HQCME-2Doc1_3699_02juin09.pdf.

TransÉnergie, the Québec RC, has initiated a consultation process on 18 NERC Reliability Standards that will be filed with the Régie once its decision on the third group of standards is issued. This filing is expected before the end of 2014. The review of the Sanction Guide proposed by Hydro-Québec TransÉnergie and the determination of Reliability Standards enforcement dates remains pending.

Data Sharing

Under the MOU, NERC has agreed to share relevant information on issues related to reliability compliance with the Régie. The MOU further states NERC will be invited to participate in compliance audits and readiness evaluations done in Québec. Under the MOU, NERC and the Régie also agreed to discuss issues relating to: (i) Reliability Standard approval and remand; (ii) penalties for noncompliance with standards; and (iii) funding. For instance, NERC has agreed to notify the Régie when a new or modified standard is approved in the U.S. or remanded by any other jurisdiction outside of Québec. Additionally, although it is recognized that NERC cannot impose financial penalties for violations of Reliability Standards in Québec, NERC has agreed to inform the Régie of any violations and of the corresponding amount of penalties associated with such a violation in the United States.

Compliance

The Régie is responsible for compliance and enforcement. If NERC or NPCC determines that an entity subject to a Reliability Standard is not in compliance with the Reliability Standard, it shall report to the Régie on its findings and may recommend the application of a sanction. Ultimately, the Régie will determine if there has been a violation and will determine any appropriate penalty.

The RC must submit guidelines to the Régie describing criteria to be taken into account in determining sanctions for noncompliance with Reliability Standards and identify owners or operators that will be subject to the standards approved by the Régie. The intent, once all agreements are in place, is that NPCC and NERC will act as the Régie's agents in developing and delivering a comprehensive CMEP, subject to the approval of the Régie. As the first limited list of mandatory standards have only recently come into effect, and as the governmental authorities have not approved the agreement covering compliance arrangements, there has been limited compliance activity under the formal Québec regime.

The agreements note that NERC cannot impose financial penalties, but should recommend to the Régie what would be an appropriate sanction for a particular violation. The RC did submit a sanctions guide to the Régie as required. However, the regulator decided to postpone considering this until the second agreement covering compliance monitoring is approved by the governmental authorities. Under the provincial regime, the Régie may impose, if appropriate, a sanction that may not exceed $500,000 per day and set a deadline for payment.

Saskatchewan

Reliability Standards

Pursuant to *The Power Corporation Act*,[179] Saskatchewan Power Corporation (SaskPower) has the authority to adopt, set, and administer standards for the planning, design, or operation of transmission lines, equipment, or other facilities within the Saskatchewan integrated regional power grid, and to maintain a membership in an integrated regional power organization. NERC, MRO, and SaskPower entered into an MOU that became effective on February 3, 2009 and was amended on January 15, 2012.[180] The MOU reflects the intent of Saskatchewan to support common North American BPS standards and to describe the protocols to achieve such a goal. For purposes of the MOU, NERC, and MRO are recognized to be Saskatchewan's electric Reliability Standard setting bodies.

Reliability Standards approved by the NERC Board of Trustees are automatically adopted in Saskatchewan, unless one of the following two conditions applies. First, if a particular standard has been remanded by any jurisdiction, the Reliability Standard will not be applicable in Saskatchewan. Second, a Reliability Standard will not be applicable in Saskatchewan if is remanded, set aside, or a variance has been requested. Under the MOU, once the Reliability Standard is adopted, compliance with the standard is required in Saskatchewan.

Data Sharing

The MOU between MRO, SaskPower, and NERC does not have an explicit provision regarding public disclosure of violations.

Compliance

Under SaskPower's legislative authority, the oversight unit within SaskPower serves as the monitoring, compliance, and enforcement authority for the province. MRO currently performs on-site compliance audits for SaskPower. While not delegating its reliability authority, SaskPower aligns its compliance program, to the degree reasonable, to the compliance and monitoring processes established by NERC and MRO.

The process includes, but is not limited to, the following three functions:

(1) Oversight (including remand, set aside, and compliance findings);

(2) Standards development (including the coordination of assessments, communication, and internal education); and

[179] Available at: http://www.qp.gov.sk.ca/documents/English/Statutes/Statutes/P19.pdf.

[180] NERC-Canadian MOUs are available at: http://www.nerc.com/filingsorders/ca/pages/canadian-mous.aspx.

(3) Compliance and enforcement (including management of an internal and external auditing function, which will give Saskatchewan the ability to make formal findings of compliance and noncompliance and to order and enforce mitigation plans to be implemented).

The oversight unit within SaskPower would make any determination of a violation. There is no provision for financial or other sanction. The oversight unit can impose a mitigation plan on a noncompliant entity.

National Energy Board

Reliability Standards

NERC and the NEB signed an MOU in 2006. The MOU recognizes NERC as the ERO. In the MOU, NERC and the NEB commit to coordinate in the promotion of a reliable North American BPS.

The NEB regulates the construction and operation of international power lines in accordance with, among other things, the *National Energy Board Act* and the *National Energy Board Electricity Regulations*.[181] The NEB has authority under its legislative framework to take certain enforcement measures in the case of noncompliance to the conditions of a permit or a certificate that was issued for an international power line.

While initially the NEB did not have an authority to make Reliability Standards mandatory and enforceable on international power lines, this was changed with the passage of NEB's *General Order MO-036-2012 for Electricity Reliability Standards* and five amending orders for Electricity Reliability Standards in December 2012 (NEB General Order).[182]

The provisions of the NEB General Order contain twelve Reliability Standards requirements that correspond to the main categories of Reliability Standards developed by NERC. The requirements are defined broadly so that they may include regional variations and can be harmonized with provincial regulatory frameworks as they relate to Reliability Standards.

In the NEB General Order, the NEB did not itself adopt any NERC Reliability Standards. Rather, the NEB General Order requires that international power line owners file with the NEB a list of Reliability Standards adopted by the provincial system to which the international power line connects. The NEB General Order requires international power line owners or permit holders to identify these Reliability Standards and to keep the NEB advised of any changes. Accordingly, there is no list of the NEB-approved Reliability Standards, nor does the NEB make determinations of effective dates. The NEB also committed to working with the provinces, utilities and other reliability authorities including NERC to avoid, to the extent possible, the generation of duplicate

[181] NEB maintains a list of acts and regulations that set forth its mandate, responsibilities, and powers at: http://www.neb-one.gc.ca/clf-nsi/rpblctn/ctsndrgltn/lstctsndrgltn-eng.html.

[182] The NEB General Order is available at: http://www.neb-one.gc.ca/clf-nsi/rpblctn/ctsndrgltn/rrggnmgpnb/lctrcty/lctrcty-eng.html.

reporting requirements. However, international power line owners are required to submit to the NEB reports of noncompliance with Reliability Standards.

Data Sharing

NERC and the NEB have committed to exchange of experience, information and data relating to the development and compliance with Reliability Standards as applicable to international power lines. The MOU commits NERC to informing and seeking input from the NEB on proposed changes to NERC's Bylaws or ROP. The MOU also commits NERC to inform the NEB when a SAR has been approved and assigned to a drafting team, and to notify NEB when a Reliability Standard is approved.

Under the MOU, NERC commits to notify the NEB at the stage of its development process where the Standards Committee approves a SAR and assigns it for development by a drafting team. The NEB agrees to inform NERC about any changes in its regulatory processes to allow formal approval of NERC Reliability Standards.

Compliance

Consistent with its approach to adopting standards, the NEB has not imposed its own additional compliance monitoring and enforcement regime. The NEB General Order requires international power line permit holders to provide the NEB with certain compliance information, based on the compliance program of the jurisdiction where the international power line is located. In 2012, legislation was passed to provide the NEB with authority to establish a system of Administrative Monetary Penalties (AMP) through regulations in order to promote compliance with the *National Energy Board Act*. The penalties can be up to $100,000 per day for violations levied on companies. Lesser amounts can be levied on individuals. The NEB's regulations on how the AMP would be applied came into force in mid-2013.

There currently is no specific provision that violations would be made public.

Mexico

Baja California

Reliability Standards

The Comisión Federal de Electricidad (CFE), through the Centro Nacional de Control de Energia (CENACE), and the Area de Control Baja California (ACBC) have entered into a MOA with WECC. The MOA provides that WECC assist CENACE and ACBC in monitoring compliance with Mexico Reliability Standards for Baja California, Mexico. CENACE has approved the following Mexico Reliability Standards:

- BAL-001-MX-0 (Real Power Balancing Control Performance)
- BAL-006-MX-0 (Inadvertent Interchange)

- CIP-001-MX-0 (Sabotage Reporting)
- INT-001-MX-0 (Interchange Information)
- INT-003-MX-0 (Interchange Transaction Implementation)
- PER-001-MX-0 (Operating Personnel Responsibility and Authority)
- PER-002-MX-0 (Operating Personnel Training)
- PER-003-MX-0 (Operating Personnel Credentials)
- VAR-002-WECC-MX-0 (Automatic Voltage Regulators (AVR))
- VAR-501-WECC-MX-0 (Power System Stabilizer (PSS))

CFE participates in the NERC Reliability Standards and WECC regional standards development process to develop standards.

Compliance

WECC uses a compliance monitoring program[183] to monitor and assess compliance with Mexico Reliability Standards applicable to Designated Entities,[184] consistent with the applicable law of Mexico and relevant agreements. If there is any conflict between the MOA and the CMP, the MOA prevails.

WECC does not have enforcement or registration/designation authority for CFE. WECC provides compliance monitoring, reviews mitigation plans and completed mitigation plans, and provides assessment recommendations with respect to alleged violations.

[183] The 2014 implementation plan for Mexico Reliability Standards, together with other CFE-related documents and compliance information, is available at: http://www.wecc.biz/compliance/Baja_CFE/Pages/Baja-English.aspx.

[184] "Designated Entities" are the Mexican equivalent of registered entities in the United States.

Appendix A: Description of Regional Entities

Appendix B: Regional Entity Responses to Specific Concerns Raised in the Commission's September 16, 2010 Order on the Three-Year ERO Performance Assessment

Appendix C: Regional Entities' Satisfaction of Statutory and Regulatory Criteria

INTRODUCTION

The Regional Entities are pleased to have the opportunity to submit jointly a self-assessment of their performance for 2009 through 2013, to the Federal Energy Regulatory Commission (Commission or FERC), as part of the *Five-Year Electric Reliability Organization (ERO) Performance Assessment Report* prepared by the North American Electric Reliability Corporation (NERC).[1] While their corporate structures may vary, the Regional Entities are uniformly committed to working together and with the ERO to ensure the reliability of the bulk power system (BPS) in the U.S., and, where applicable, in Canada and Mexico. They are likewise dedicated to create seamless implementation of the law and policies administered by the Commission and the ERO. In light of the commonality of these overarching objectives, under the leadership of the Regional Entity Management Group (REMG), the Regional Entities prepared this 2014 Joint Regional Entity Self-Assessment (JRESA), which they respectfully request that the Commission accept.

The main purpose of this self-assessment is to demonstrate that the Regional Entities continued during the assessment period to satisfy the statutory and regulatory criteria for certification as part of the ERO. In this regard, in its order accepting the ERO's Three-Year Performance Assessment, the Commission explicitly directed that future assessments of the Regional Entities include a separate section assessing each Regional Entity's satisfaction of those criteria.[2] This self-assessment also provides an update on issues and concerns raised in the 2009 JRESA, specifically with respect to regional Reliability Standards, organization registration and certification, the compliance monitoring and enforcement program, and additional statutory functions.[3]

A. Satisfaction of Statutory and Regulatory Criteria

Section 215(e)(4) of the Federal Power Act (FPA), 16 U.S.C. §824o(e)(4), as reiterated in §39.8 of the Commission's regulations, 18 C.F.R. §39.8 (2013), provides that a Regional Entity must satisfy the following criteria to be delegated "authority for the purpose of proposing reliability standards to the ERO and enforcing reliability standards:"

---

[1] The eight Regional Entities are: (i) Florida Reliability Coordinating Council, Inc. (FRCC); (ii) Midwest Reliability Organization (MRO); (iii) Northeast Power Coordinating Council, Inc. (NPCC); (iv) ReliabilityFirst Corporation (ReliabilityFirst or RF); (v) SERC Reliability Corporation (SERC); (vi) Southwest Power Pool Regional Entity (SPP RE) — an independent and functionally separate division of Southwest Power Pool, Inc. (SPP); (vii) Texas Reliability Entity, Inc. (Texas RE or TRE); (viii) and Western Electricity Coordinating Council (WECC). A description of each of the individual Regional Entities can be found at Appendix A.

[2] *See North American Electric Reliability Corporation*, Order on the Electric Reliability Organization's Three-Year Performance Assessment, 132 FERC ¶ 61,217 (2010), at P 36. The Commission also discussed specific concerns regarding each of the individual Regional Entities in the order on the three year assessment. *Id*. PP 198-244. The responses of the individual Regional Entities to those concerns can be found at Appendix B.

[3] The instant self-assessment will not repeat the discussion on the framework of self-regulation and delegation, found at pp. 12-18 of the 2009 JRESA, as that discussion was more appropriate for an assessment of the initiation of the reliability paradigm; however, opportunities to improve that structure are discussed *infra* pp. 6-8.

(1) The Regional Entity is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board.

(2) The Regional Entity meets the requirements otherwise applicable to the ERO in FPA §215(c)(1)(2), 16 U.S.C. §824o(c)(1)(2), namely that it (a) has the ability to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk-power system; and (b) has established rules that (i) assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure, (ii) allocate equitably reasonable dues, fees, and other charges among end users for all activities, (iii) provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties, (iv) provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties, and (v) provide for taking appropriate steps to gain recognition in Canada and Mexico.

(3) The Regional Entity operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability.

Each of the eight Regional Entities continued to satisfy the statutory and regulatory criteria during the assessment period, as demonstrated with specificity on Appendix C and summarized briefly here.

The Regional Entities met the first criterion by being governed by an independent board (SPP RE and WECC (as of January 1, 2014)), a balanced stakeholder board (FRCC and SERC), or a combination independent and balanced stakeholder board (MRO (as of January 1, 2013), NPCC, RF, TRE, and WECC (during the assessment period)).

The Regional Entities fulfilled the next requirement to develop and enforce Reliability Standards that provide an adequate level of reliability of the BPS by working closely with NERC and stakeholders in the development of continent-wide standards and in the implementation and improvement of the Compliance Monitoring and Enforcement Program (CMEP). In particular, although each Regional Entity had a regional Reliability Standards Development Procedure (RRSDP), with the exception of WECC, they developed few regional Reliability Standards during the assessment period. They preferred to support NERC's efforts to develop continent-wide standards and focus their resources primarily on monitoring compliance with, and enforcement of, the mandatory Reliability Standards. Illustratively, during the assessment period, the Regional Entities conducted 2,358 compliance audits and 1,612 compliance spot checks, and processed 4,740 self-reports. They discovered nearly 6,900 violations or possible violations of the mandatory Reliability Standards, and submitted through NERC 5,128 confirmed violations in 633 Notices of Penalty (NOPs) to the Commission. They also explored ways to approach their compliance and enforcement responsibilities with a greater emphasis on

measuring the risk of noncompliance on the reliability of the BPS. In this regard, in collaboration with NERC, they developed the Reliability Assurance Initiative (RAI).[4]

The Regional Entities also established rules to ensure impartiality in the conduct of their business and due process in the performance of their compliance and enforcement functions, and, where applicable, took the appropriate steps to gain recognition in and otherwise work with entities in Canada and Mexico. To start with, they followed the NERC Rules of Procedure (ROP), as approved by the Commission, and adopted additional procedures and policies for their own areas. Thus, for example, they all relied on NERC ROP *Sanction Guidelines*, Appendix 4B, CMEP, Appendix 4C, and *Hearing Procedures,* Attachment 2 to Appendix 4C to carry out their compliance, enforcement, and hearing responsibilities fairly and impartially. They augmented those rules with policies and procedures to prevent conflicts of interest in the operation of their boards of directors or trustees, the exercise of their statutory duties, and the activities of their employees and contractors. They also followed NERC's lead, again as approved by the Commission, in equitably recovering their funding from end users through a formula based on net energy for load (NEL), and developed annual business plans and budgets for Commission approval to assure that they properly and adequately accounted for those funds. As noted, while they generally forwent the development of regional Reliability Standards during the assessment period, the Regional Entities participated in the development and improvement of the NERC Reliability Standards while maintaining their RRSDPs in the event they were needed. Finally, three of the Regional Entities with international footprints—MRO, NPCC, and WECC—made appropriate arrangements with Canadian border provincial authorities and utilities to coordinate the oversight of Canadian and U.S. reliability efforts, and WECC entered into a memorandum of understanding with the Mexican energy regulator under which WECC acts as a compliance monitor for certain activities in Baja California, Mexico.

Finally, the Regional Entities satisfied the statutory and regulatory criterion for maintaining their delegated authority by operating under agreements with NERC that promoted effective and efficient administration of BPS reliability. As described by the Commission when it first approved NERC's delegation agreements with the Regional Entities (RDAs) in 2007, NERC delegated authority under those agreements to the Regional Entities to audit, investigate, and otherwise ensure that users, owners, and operators of the BPS comply with NERC's mandatory Reliability Standards, subject to ERO oversight.[5] The RDAs further addressed regional Reliability Standards development, registration of entities that must comply with Reliability Standards, and other services supporting NERC's functions, including reliability assessments, event analysis, and training and education. In October 2010, the Commission again approved (revised) RDAs between NERC and each of the eight Regional Entities.[6]

[4] Regional activity and actions in regard to standards development and the CMEP, in particular RAI, are discussed later in greater detail under those headings.

[5] *See North American Electric Reliability Corp.*, 119 FERC ¶ 61,060, *order on reh'g,* 120 FERC ¶ 61,260 (2007).

[6] *See North American Electric Reliability Corporation*, 133 FERC ¶ 61,061 (2010), *order on reh'g*, 134 FERC ¶ 61,179, *order on compliance filing*, 137 FERC ¶ 61,028 (2011).

Subsequently, the Commission also approved other changes to specific regional agreements.[7] In brief, the Regional Entities functioned during the assessment period under RDAs with NERC that were comprehensively reviewed and ultimately approved by the Commission to promote effective and efficient administration of BPS reliability.

As a separate but related matter, each of the Regional Entities underwent at least one extensive audit by the Commission staff during the assessment period. Most of these audits evaluated the Regional Entities' budget formulation, administration, and execution, and focused on the costs and resources used to achieve program objectives in fulfilling the duties delegated to them by the ERO under FPA §215.[8] The final audit reports concluded that the Regional Entities had policies, procedures, and controls that facilitated their carrying out, in an effective and efficient manner, their responsibilities under their RDAs and bylaws, as well as their budget obligations. Several other audits more closely examined the structures of the regional organizations, and made recommendations in particular with respect to separation of functions.[9] In all of these proceedings, during the assessment period, the Regional Entities completed or were in the process of completing the corrective actions suggested by the Commission or its staff. The Regional Entities believe that the overall conclusions and recommendations in the Regional Entity audits underscore that they satisfied the statutory and regulatory criteria for maintaining the authority delegated to them by the ERO.[10]

B. Achievements

Closely intertwined in the Regional Entities' satisfaction of the statutory and regulatory certification criteria during the assessment period were their achievements as individual organizations and as a group united by common goals. Their individual achievements are partly set forth in Appendix C, and discussed or referenced throughout this document. Their joint achievements are, by definition, likewise discussed throughout this document. These achievements in particular reflect the work and oversight of the REMG, an organization composed of the executives of the eight Regional Entities to provide strategic guidance in the execution of their RDAs, consistent with maintaining and enhancing reliability across North

[7] *See*, e.g. *North American Electric Reliability Corporation*, Docket Nos. RR13-7-000 (Aug. 19, 2013) (TRE), RR13-5-000 (June 12, 2013) (MRO), RR12-12-000 (Oct. 24, 2012) (RF), RR12-4-000 (June 12, 2012) (FRCC), and RR12-2-000 (March 1, 2012) (WECC) (unpublished delegated letter orders).

[8] *See* delegated letter orders and final audit reports issued in *North American Electric Reliability Corporation*, Docket Nos. FA12-14-000 (May 9, 2013) (MRO), FA12-7-000 (May 9, 2013) (RF), PA12-10-000 (June 28, 2013) (NPCC), FA12-6-000 (June 11, 2013) (SERC), PA11-2-000 (October 5, 2011) (SPP RE), and PA12-9-000 (July 10, 2013) (WECC) (unpublished delegated letter orders).

[9] *See Florida Reliability Coordinating Council, Inc*., 131 FERC ¶ 61,262 (2010); *Western Electricity Coordination Council*, 132 FERC ¶ 61,149 (2010); *Texas Regional Entity*, 130 FERC ¶ 61,025 (2010).

[10] NERC also audited the Regional Entities during the assessment period, in accordance with the Commission's direction in Order No. 672. *See Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204 (2006), at P 773. Specifically, NERC developed a program to audit the Regional Entities' adherence to the NERC ROP, the CMEP, and the requirements of the Regional Delegation Agreements. *See* generally http://www.nerc.com/pa/comp/Audits%20of%20Regional%20Entities%20DL/Forms/AllItems.aspx.

America for the benefit of all BPS users, owners, and operators. The REMG aims to attain that objective by promoting information sharing, transparency, and consistency with and among the Regional Entities while assuring efficient and effective use of resources to execute their delegated functions. In addition, the REMG combines the Regional Entities' efforts with the ERO Executive Management Group (ERO EMG), which was chartered originally in April 2010, and likewise dedicated to provide guidance and direction in the execution of the RDAs.

As particularly relevant to the rest of this self-assessment, in the summer of 2012, the REMG held its first strategic retreat, and decided upon three priorities: (i) to ensure that their work, especially in the audit area, follows professional standards and as a result fosters consistency among the Regional Entities; (ii) to reserve enforcement for serious matters, rather than using enforcement for every corrective action resulting from a violation; and (iii) to scale their work towards risk to reliability and move away from a prescriptive, mechanical approach. Soon after this retreat, as discussed in greater detail below, the Regional Entities took steps to make these priorities a reality. With NERC's participation, they engaged a third-party consulting firm to perform a review of the Regional Entities' auditing practices, to identify areas to improve consistency among the Regional Entities, and to increase the rigor in the conduct of their work. Within a relatively short time, by the end of the assessment period, NERC and the Regional Entities made substantial progress on implementing the consulting firm's major recommendations to develop a standardized audit process checklist, to publish an auditor handbook, and to create an audit training program around these tools. The Regional Entities also worked closely with NERC and the registered entities to pursue the related second and third priorities of reserving enforcement for serious matters and directing their compliance and enforcement efforts to identifying risk to the BPS. In this regard, they continued to examine ways to improve the timeliness and effectiveness of their CMEP processes, including improvements in self-reporting and enhancements to the Find, Fix, Track and Report (FFT) program, and prepared analyses and initiated pilot programs to find better ways to gauge the risk that registered entities posed to reliability, and to scale their monitoring and enforcement efforts accordingly. As a result, the Regional Entities believe that a solid foundation was laid during the assessment period to advance to the next phase of the ERO Enterprise's maturation as captured conceptually in RAI.[11]

C. Improvement Opportunities

Notwithstanding the solid foundation for the continued effective functioning of the ERO Enterprise, the Regional Entities, in tandem with NERC, are committed to exploring ways to improve their operations and their contribution to the reliability of the BPS. In this regard, they have identified certain elements essential to improved operations of the ERO Enterprise on which they plan to focus in the months ahead. Specifically, they plan to pursue: (i) clarifying and refining roles and responsibilities; (ii) coordinating strategic planning and operational decision-making; (iii) continuing to improve consistency; (iv) sharing tools and infrastructure for delegated functions; and (v) coordinating communications.

[11] Toward the end of the assessment period, the reliability community began to use the expression "ERO Enterprise" to represent the combined efforts of NERC and the Regional Entities.

The undertaking to clarify and refine roles and responsibilities is especially important to the Regional Entities as it is critical to the smooth operation of the self-regulated model. At its core, the ERO Enterprise must exercise effective and well-coordinated reliability oversight that mitigates reliability risks to the BPS. Accordingly, NERC and the Regional Entities have identified objectives on which they will concentrate to clarify and refine roles and responsibilities within the ERO Enterprise. For example, NERC will consider including in its review of Regional Entity business plans adequacy of resources and alignment of the plans for achieving delegated function objectives and outcomes described in the three-year plan. For their part, the Regional Entities will work in a coordinated fashion to support NERC in the development of comprehensive functional program designs and controls; adapt existing regional programs for delegated functions to conform to emerging program designs provided by NERC; and ensure Regional Entity staffs meet qualification and training requirements.

In addition, NERC and the Regional Entities will strive to better coordinate their strategic and business planning, e.g., by developing and maintaining a joint three-year strategic plan for the ERO Enterprise describing the goals and deliverables for statutory functions, a plan that should guide the development of each Regional Entity's annual business plans. Along the same lines, NERC and Regional Entities intend to develop and transparently report results based on a common set of performance measures focused on BPS reliability outcomes and effectiveness of the statutory programs. Furthermore, they hope to better coordinate operational decision-making within the ERO Enterprise.

Lastly, at this time, NERC and the Regional Entities plan to focus on better achieving consistency, sharing tools and infrastructure for delegated functions, and coordinating external and cross-ERO Enterprise communications. Specifically, with NERC leading, the ERO Enterprise will explore developing a core set of methods, practices, procedures, and tools to support unified implementation of the major statutory functions of NERC. The Regional Entities and NERC will also examine developing ERO Enterprise IT applications, where appropriate, to support common processes, to enhance the efficiency and effectiveness of Regional Entities' practices, to increase the consistency of the interface with registered entities, and to facilitate NERC's oversight function. Finally, all parties of the ERO Enterprise plan to continue the joint board coordination to ensure oversight and accountability of all elements of the enterprise, and to continue refining and expanding coordinated outreach to government entities in the U.S. and Canada, stakeholders, and media.

The Regional Entities believe that this coordinated effort with NERC to improve the self-regulation model will result in more clarity around the roles and responsibilities between them and among them which in turn will lead to better coordination of goals, more uniform work processes and tools, and performance measures across the enterprise, along with an understanding that all parties comprising the ERO Enterprise must be vested in each other's success. These improvements will also create higher levels of productivity, less duplication, and greater efficiency in the oversight and execution of statutory functions and mitigation of BPS reliability risks. The Regional Entities look forward to working with NERC and the stakeholders in their continual pursuit of opportunities to improve their operations that will promote the reliability of the nation's BPS.

D. Regional Reliability Standards

The 2009 JRESA provided a brief overview of the regional Reliability Standards process and scope, and reviewed what had been achieved to date.[12] The following provides an update on that overview and review and additional information on the Regional Entities' progress in developing regional Reliability Standards.

1. Regional Reliability Standards Processes

FPA §215(d), 16 U.S.C. §824o(d), requires the ERO to develop mandatory and enforceable Reliability Standards that are subject to Commission review and approval. Once approved, the Reliability Standards may be enforced by NERC, subject to Commission oversight, or by the Commission independently. A Regional Entity may also develop a Reliability Standard for Commission approval to be effective in that region only. In Order No. 672, the Commission stated that:

> As a general matter, we will accept the following two types of regional differences, provided they are otherwise just, reasonable, not unduly discriminatory or preferential and in the public interest, as required under the statute: (1) a regional difference that is more stringent than the continent-wide Reliability Standard, including a regional difference that addresses matters that the continent-wide Reliability Standard does not; and (2) a regional Reliability Standard that is necessitated by a physical difference in the Bulk-Power System.[13]

In addition, FPA §215(d)(3), 16 U.S.C. §824o(d)(3), provides that the ERO "shall rebuttably presume that a proposal from a Regional Entity organized on an interconnection-wide basis for a reliability standard or modification to a reliability standard to be applicable on an interconnection-wide basis is just, reasonable, and not unduly discriminatory or preferential, and in the public interest."[14]

In October 2010, as noted earlier, the Commission approved revised RDAs between NERC and each of the eight Regional Entities.[15] As relevant here, Exhibit C to the revised RDAs includes each Regional Entity's current RRSDP.[16] These procedures provide the process that each Regional Entity uses to develop regional Reliability Standards that are proposed to NERC for adoption, and, where applicable, regional variances if the Regional Entity is organized

[15] *See North American Electric Reliability Corporation*, 133 FERC ¶ 61,061 (2010).

[16] *See* http://www.nerc.com/AboutNERC/Pages/Regional-Entity-Delegation-Agreements.aspx.

on an interconnect-wide basis. While the RRSDP's are not identical, each contains important common attributes that advance the development of regional Reliability Standards consistent with the objective of a uniform reliability program.[17] Illustratively, participation in the development of a regional Reliability Standard must be open to all organizations that are directly and materially affected by the Regional Entity's system, with no constraints based on financial capability, technical expertise or membership in the organization. The RRSDP must strive to have an appropriate balance of interests and may not be dominated by any two interest categories and no single interest category can defeat a matter. All entities with a direct and material interest in the BPS in the region may participate by expressing a position and its basis, having that position considered, and having the right to appeal. The RRSDP must also provide for reasonable notice and opportunity for public comment, and provide that all actions material to the development of any standards be transparent.[18] Under these circumstances, it can be fairly stated that during the assessment period, each of the Regional Entities fulfilled the obligation to provide an open, fair, balanced, and inclusive process for the development of regional Reliability Standards as demonstrated by the approval of those processes at the Commission, NERC, and regional levels.

NERC understandably focuses on the development of continent-wide standards as consistent with the goal of a reliable BPS, and, from the inception of the program, the Commission, NERC, and the Regional Entities anticipated that the Regional Entities would develop relatively few regional Reliability Standards to address unique situations with specific or more stringent requirements in a particular interconnection or geographic region which the continent-wide standards may not address. In fact, that has been proven to be the case. Since the Commission issued Order No. 693 in 2007, outside of WECC, the Commission has approved only seven regional Reliability Standards.[19] The regional Reliability Standards in effect as of the end of the assessment period are listed in Table 1.

[17] The Regional Entities regularly review their RRSDPs to ensure they are adequate to develop regional Reliability Standards consistent with Commission's directives and NERC's ROP *Standard Processes Manual* at Appendix 3A. *See,* e.g., *North American Electric Reliability Corporation*, Docket Nos. RR13-5-000 (June 12, 2013) (MRO), RR12-12-000 (Oct. 24, 2012) (RF), RR14-1-000 (Jan. 31, 2014) (SPP RE) , RR12-2-000 (March 1, 2012) (WECC) (unpublished delegated letter orders).

[18] In this regard, NERC maintains on its website a current overview of regional Reliability Standards under development, with detailed information on the status of the proceeding. *See* http://www.nerc.com/pa/Stand/Pages/RegionalReliabilityStandardsUnderDevelopment.aspx.

[19] WECC developed the most regional Reliability Standards because of a mandatory program it had in place prior to the approval of NERC as the ERO and the delegation to WECC. Under this program, called the Reliability Management System (RMS), WECC was required to translate existing reliability criteria into regional mandatory standards. *See,* e.g., *North American Electric Reliability Corporation*, 119 FERC ¶ 61,260 (2007) (describing the RMS and approving WECC-BAL-STD-002-0,WECC-IRO-STD-006-0, WECC-PRC-STD-001-1, WECC-PRC-STD-003-1, WECC-PRC-STD-005-1, WECC-TOP-STD-007-0,WECC-VAR-STD-002a-1,and WECC-VAR-STD-002b-1).

Regional Reliability Standards – Table 1	
Regional Entity	**Regional Reliability Standards (Description)** **FERC Docket Number, Citation**
FRCC	None
MRO	None
NPCC	**PRC-002-NPCC-01** (Disturbance Monitoring Equipment) RD11-8-000, 137 FERC ¶ 61,043 (2011). **PRC-006-NPCC-01** (Automatic Underfrequency Load Shedding) RM12-12-000, Order No. 775, 142 FERC ¶ 61,128 (2013).
RF	**BAL-502-RFC-02** (Planning Resource Adequacy Analysis, Assessment and Documentation) RM10-10-000, Order No. 747, 134 FERC ¶ 61,212 (2011).
SERC	**PRC-006-SERC-01** (Automatic Underfrequency Load Shedding Requirements) RM12-9-000, Order No. 772, 141 FERC ¶ 61,243 (2012).

TRE	**CIP-001-2a** (Regional Variance) (Cyber Security – Sabotage Reporting) RD11-6-000, Delegated Letter Order, August 2, 2011. **IRO-006-TRE-1** (Transmission Loading Relief) RD12-1-000, 139 FERC ¶ 61,169 (2012). **BAL-001-TRE-1** (Real Power Balancing Control) RD13-12-000, 146 FERC ¶ 61,025 (2014).
WECC	**FAC-501-WECC-1** (Transmission Maintenance) **VAR-002-WECC-1** (Automatic Voltage Regulators) **VAR-501-WECC-1** (Power System Stabilizer) **PRC-004-WECC-1** (Protection System and Remedial Action Scheme Misoperation) RM09-9-000, Order No. 751, 135 FERC ¶ 61,061 (2011). **IRO-006-WECC-1** (Qualified Transfer Path Unscheduled Flow Relief) RM09-19-000, Order No. 746, 134 FERC ¶ 61,199 (2011). **BAL-004-WECC-02** (Automatic Time Error Correction) (replacing BAL-004-WECC-1) RD13-11-000k, Delegated Letter Order (Oct. 16. 2013). **TOP-007-WECC-1** (System Operating Limits) RM09-14-000, Order No. 752, 135 FERC ¶ 61,062 (2011). **BAL-002-WECC-2** (Contingence Reserve) (replacing BAL-STD-002-2) RM13-13-000, Order No. 789, 145 FERC ¶ 61,141 (2013).

Indeed, while the Regional Entities believe that they should still have the authority to develop regional Reliability Standards under the conditions laid out by the Commission and

maintain their RRSDP's accordingly, with the exception of WECC, they are no longer actively engaged in developing regional standards.[20] Rather, they prefer to avoid duplicating NERC efforts, and concentrate their relevant resources on working with NERC and stakeholders to develop clear, reasonable, and technically sound continent-wide standards in a timely and efficient manner, and to ensure that regional concerns are addressed in the continent-wide standards. To this end, and as further discussed later under §D.3 below, Prioritization of Standards Work, the Regional Entities are actively encouraging awareness and participation in the NERC standards process by stakeholders in their areas, by educational outreach efforts, and through participation in the NERC Standards Committee and related subcommittees. They also have standards committees or groups that analyze the draft ERO standards to determine their quality and effectiveness, and to ensure the reliability objective is adequate and cost effective.

2. Regional Fill-in-the-Blank Standards and Regional Criteria

The 2009 JRESA agreed with stakeholders' concerns about the effect on reliability of the outstanding and incomplete "fill-in-the-blank" reliability standards projects.[21] During the assessment period, the ERO Enterprise made considerable progress to respond to the Commission's directives on those standards. This was accomplished in large part by greater collaboration and cooperation between NERC and the Regional Entities. Furthermore, the Regional Entities believe now that the appropriate resolution to the issue of fill-in-the-blank standards is the timely development of continent-wide NERC Reliability Standards.[22] Accordingly, as a general matter, the Regional Entities are no longer planning to develop Regional Reliability Standards to address the "fill-in-the blank" standards; however, they may pursue any unaddressed reliability gaps that new continent-wide standards may not cover.

---

[20] Illustratively, during the assessment period, FRCC stayed work on four regional Reliability Standards (PRC-003-FRCC-01, PRC-002-FRCC-01, PRC-006-FRCC-01, and PRC-024-FRCC-01) in large part because of related activities at the national level. MRO developed four regional Reliability Standards, but found them unnecessary before even submitting them to the board. RF worked on a number of regional Reliability Standards (e.g., MOD-024-RFC-01, MOD-025-RFC-01, EOP-007-RFC-01, and PRC-002-RFC-01) that it subsequently, using its RRSDP, converted to Regional Criteria, which are essentially RF board-approved good utility practices. In August 2012, RF also suspended work on drafting efforts for PRC-006-RFC-01 and PRC-012-RFC-01. SPP RE developed one board-approved regional Reliability Standard (PRC-006-SPP-01), but withdrew the FERC filing in August 2013, because a continent-wide standard eliminated the need for it.

In contrast, WECC maintained and continued to develop regional Reliability Standards during the assessment period for two primary reasons: (i) the Western Interconnection has some unique characteristics and concerns; and (ii) several of the current WECC regional Reliability Standards projects are required by the initial FERC orders approving the WECC regional Reliability Standards as part of the transition from the RMS program. *See supra* note 19. *See* generally http://www.wecc.biz/Standards/Development/Pages/default.aspx.

[21] As explained in the 2009 JRESA, at p. 19, when the Commission approved 83 Reliability Standards in Order No. 693, it withheld a decision on certain standards that referred to Regional requirements that were not specifically noted within the standards. These were referred to as "fill-in-the-blank," meaning the entity had to refer to a Regional document for the answer of what level of performance was required.

[22] In this regard, for example, the Commission's approval of Reliability Standard PRC-006-1 addressed an area of significant concern with respect to under-frequency load shedding. *See Automatic Underfrequency Load Shedding and Load Shedding Plans Reliability Standards*, Order No. 763, 139 FERC ¶ 61,098 (2012).

3. Prioritization of Standards Work

While NERC is responsible in the first instance to develop the continent-wide standards, the Regional Entities clearly have a stake in that process, because they are ultimately responsible for enforcing compliance with those standards. Accordingly, during the assessment period, the Regional Entities supported NERC in response to the Commission's concerns to increase the efficiency and effectiveness of the standards development process and to improve the quality of the resulting Reliability Standards. As now discussed, the Regional Entities are encouraged by the advances that NERC made in this regard.

First, the Regional Entities support NERC's objective to transform the current set of Reliability Standards in 2014 through 2015 to high quality, technically sound, results-based, cost-effective standards, which collectively will help ensure the reliable operation of the North American BPS. They especially appreciate NERC's piloting of the Cost Effective Analysis Process (CEAP), which is intended to evaluate the cost effectiveness of standards under development.

Second, the Regional Entities appreciate NERC's development of the *Weekly Standards Bulletin*, which helps the registered entities and other stakeholders to keep apprised of standards development. Along the same lines, the Regional Entities believe that the quarterly *Analyses of NERC Standards Process Results* were also very helpful for a better understanding of, and provides insight to, the development of continent-wide standards.[23]

Third, the Regional Entities are encouraged by the Commission's approval of revisions to the NERC *Standard Processes Manual*, ROP Appendix 3A, finding that those revisions are reasonable and allow for greater flexibility and efficiency in the process.[24] The Commission highlighted that the revisions recognize the need for highly qualified standards drafting teams that include technical writers, legal and compliance resources, and rigorous and highly trained project management.[25] The Regional Entities, which are in daily contact with the stakeholders who must deal with the intricacies of compliance with the standards, agree that well-trained personnel are needed to ensure the quality and effectiveness of the mandatory Reliability Standards, and believe that NERC has made significant strides to achieve that objective.

Fourth, the Regional Entities are encouraged by NERC's response to the Commission's March 2012 invitation to suggest retirement of requirements within standards, and the Commission's approval of NERC's proposal to withdraw 34 requirements within 19 Reliability Standards, and the additional withdrawal of 41 Commission directives that NERC develop

[23] NERC submitted these analyses pursuant to FERC directives, including the order on the three-year assessment. *See Order on the Electric Reliability Organization's Three-Year Performance Assessment*, 132 FERC ¶ 61,217 (2010), at P 85.

[24] *See North American Electric Reliability Corporation*, 143 FERC ¶ 61,273 (2013), at P 18.

[25] *Id.*

modifications to Reliability Standards.[26] These actions signal a cooperative effort that will help alleviate some of the complexity and frustration that has plagued the development of standards for many years and ease compliance burdens on the registered entities. Along the same lines, the Regional Entities commend NERC's creation of the Standards Independent Experts Review project in 2012. During the assessment period, this group assessed the current non-Critical Infrastructure Protection (CIP) Reliability Standards to determine which requirements should be retired and to grade the remaining requirements for content and quality. More important, this group identified gaps where risks to reliability are not adequately addressed in the current set of standards, including outage coordination, governor frequency response, situational awareness models, and clear three-part communications.

Finally, the Regional Entities commend the NERC Board of Trustees (NERC Board) for forming the Reliability Issues Steering Committee (RISC) in August 2012. Through its efforts, RISC is helping to move the ERO Enterprise toward a more efficient standards development program and a sensible prioritization of the work to produce reasonable and effective standards and identify any emerging risks to reliability.

E. Organization Registration and Certification

The 2009 JRESA discussed the subject of compliance registry within the context of the CMEP.[27] While the topic fits there, it also lends itself to a separate discussion, as set out below.

1. Organization Registration

The Regional Entities and NERC are required to identify and register all entities that meet the criteria as laid out in the NERC ROP *Statement of Compliance Registry Criteria*, Appendix 5B.[28] The Regional Entities review and evaluate registration requests and changes and make registration recommendations to NERC when a request or change may affect the NERC Compliance Registry (NCR). NERC is responsible for registering those entities and establishing and maintaining the NCR of the BPS owners, operators, and users that are subject to approved Reliability Standards.[29]

As pointed out in the 2009 JRESA, the registration of BPS users, owners and operators has been a very successful aspect of the Regional Entities' obligation to monitor and enforce the

[27] *See* 2009 JRESA, at pp. 21-23. The 2009 JRESA used the term "Compliance Registry" whereas this section will use the current term "Organization Registration" and also discuss Organization Certification.

[28] *See* http://www.nerc.com/FilingsOrders/us/RuleOfProcedureDL/Appendix_5B_RegistrationCriteria_20140701_updated_20140602.pdf. *See* generally ROP §500, http://www.nerc.com/FilingsOrders/us/RuleOfProcedureDL/NERC_ROP_Effective_20140701_without_Appendices.pdf.

[29] *See* http://www.nerc.com/pa/comp/Pages/Registration-and-Certification.aspx.

Reliability Standards.[30] The Regional Entities believe that continued to be the case during the assessment period, as evidenced by the acceptance by the *vast* majority of the registered entities of their inclusion in the NCR. Indeed, as of December 31, 2013, relatively few registered entities, just 47 out of over 1,850 registered entities in the U.S., appealed their registrations by the Regional Entities to the NERC Board, and only nine of those appeals were filed after January 1, 2009.[31] The NERC Board upheld the Regional Entities' decisions, except in one case, and remanded aspects of another appeal directing the Regional Entity to consider whether two entities should be jointly registered.[32] And in two instances, the NERC Board simply asked the Regional Entity to supply more information on an entity's status.[33] Most important, as of December 31, 2013, only eleven registered entities appealed the NERC Board decisions upholding the Regional Entities' registrations to the Commission.[34]

---

[30] *See* 2009 JRESA, at p. 21.

[31] The number "47" does not refer to the actual number of appeals. Twenty-two of the 47 registrants were involved in just eight appeals of FRCC registrations, five of which concerned the same types of county resource recovery facilities. (No appeal of an FRCC registration has been filed since January 1, 2009.) The other appeals to the NERC Board were filed regarding the registration decisions of MRO (1), RF (8), SERC (6), SPP RE (1), TRE (4), and WECC (5). *See* http://www.nerc.com/pa/comp/Pages/Decisions-on-Appeals.aspx.

[32] In NERC Docket RA080012, on January 16, 2013, the BOT remanded to SERC the issue of whether Louisiana Generating should be registered as a Distribution Provider. In NERC Docket RA080002, on August 19, 2008, the BOT remanded to RF an appeal of Cordova Energy Co, LLC, to consider whether Cordova and Constellation Energy Commodities Group, Inc. should be jointly registered.

[33] The NERC Board directed these requests to SERC regarding the U.S. Army Corps of Engineers-Ft. Worth District (in NERC Docket RA080011) and the North Carolina Electric Membership Corporation (in NERC Docket RA080007).

[34] The Commission denied four, granted six, and denied in part and granted in part one of those appeals.

See the following orders where the Commission denied registrants' appeals: *City of Holland, Michigan Board of Public Works*, 139 FERC ¶ 61,055 (2012), *order on reh'g*, 145 FERC ¶ 61,054 (2013 (denying appeal of RF's decision to register entity as a transmission owner and a transmission operator), *appeal pending sub. nom. City of Holland, Michigan Board of Public Works v. FERC*, No. 13-1306 (D.C. Cir. Dec. 16, 2013); *Cedar Creek Wind Energy, LLC and Milford Wind Corridor Phase I, LLC*, 135 FERC ¶ 61, 241 (2011), *order on reh'g*, 137 FERC ¶ 61,141 (2011), *order on compliance filing*, 139 FERC ¶ 61,214 (2012) (denying appeal of two entities of their registration by WECC as transmission owners and transmission operators); *Southeastern Power Administration*, 125 FERC ¶ 61,294 (2008) (affirming SERC's registration of SEPA as a transmission operator and resource planner).

See the following orders where the Commission granted registrants' appeals: *South Louisiana Electric Cooperative Association*, 144 FERC ¶ 61,050 (2013), *order on reh'g*, 145 FERC ¶ 61,232 (2013) (granting appeal of entity registered by SERC as a distribution provider and load-serving entity for lack of sufficient document); *Direct Energy Services, LLC, Sempra Energy Solutions LLC, and Strategic Energy, L.L.C*, 121 FERC ¶ 61,274 (2007), *order on compliance filing*, 123 FERC ¶ 61,016 (2008) (granting appeals of three entities which objected to their registration as load serving entities and directing NERC to submit a plan to address a possible gap in reliability because of inconsistent registration of certain types of entities); *Mosaic Fertilizer, LLC and City of Tampa, Florida*, 121 FERC ¶ 61,058 (2007) (remanding case to NERC for reconsideration of FRCC's registration or to provide further explanation for underlying decision).

See the following orders where the Commission denied in part and granted in part a registrant's appeal: *U.S. Department of Energy, Portsmouth/Paducah Project Office*, 139 FERC ¶ 61,054, *order on reh'g*, 141 FERC ¶ 61,108 (2012) (granting the appeal of DOE and finding that its Portsmouth facility should not be registered as a

While some individual registration cases were challenging, the organization registration program remained steady during the assessment period. The means by which new registered entities were discovered, for example, were similar to the original means, including self-registrations, compliance audits, public websites, independent system operator (ISO), and regional transmission organization (RTO) memberships (where relevant), information provided by other registered entities, exchange of information between Regional Entities (e.g., through the Regional Registration and Certification Functional Group), Energy Information Administration data, questionnaires, and, of course, word of mouth. The average time to process uncontested entity requests to register or de-register for a function (measured from the time the entity makes the request to the time the request is approved by NERC) likewise stayed the same, or even improved, during that period, taking as little time as three to five business days, or longer up to 90 days if complications arose, such as entity trying to change its registration during an audit. The greatest, albeit not that great, movement within the program was the changes in the number of functions (as opposed to entities) for which entities are registered, as reflected in Table 2.

Trends in the Activation and Deactivation of Functions – Table 2

Regional Entity	Registered Entities		Registered Functions		Trends in the Activation and Deactivation of Functions in the Regions during Assessment Period
	2009	2013	2009	2013	
FRCC	71	69	240	244	FRCC processed approximately 20 function activations, most of which were associated with changes to generating facility functional responsibilities such as a vendor accepting generator owner (GO) and generator operator (GOP) compliance responsibilities and new joint registration organizations (JROs); 14 function deactivations, most of which were associated with the same generation functional responsibility change and with distributor provider (DP) functional responsibilities being accepted by GO and TO; and 10 entity name changes.
MRO	118	134	435	453	MRO, which had registered 435 functions as of 1/1/09, had 453 registered functions at year-end 2013, for an increase of four percent.

load-serving entity on the basis of the evidence submitted) (Commissioner Norris dissenting); *U.S. Department of Energy, Portsmouth/Paducah Project Office*, 124 FERC ¶ 61,072 (2008) (affirming RF's registration of DOE facility as a transmission owner, transmission operator and distribution provider, but remanding to NERC the issue of whether it functions as a load-serving entity).

Trends in the Activation and Deactivation of Functions – Table 2					
Regional Entity	**Registered Entities**		**Registered Functions**		**Trends in the Activation and Deactivation of Functions in the Regions during Assessment Period**
	2009	**2013**	**2009**	**2013**	
NPCC	287	301	576	602	The number of registered entities in NPCC fluctuated slightly during the assessment period. At the end of the period, the number had risen to 301. The ultimate increase in the number of entities was due to the number of new GOs, GOPs, and purchasing-selling entities (PSEs) outpacing the delisting of GOs, GOPs, and PSEs.
RF	358	343	677	686	RF experienced very little change in the registration of new entities, and hence functions, during the assessment period. The majority of registry work involved name or ownership changes. A notable trend during the assessment period was the deactivation of GOs and GOPs that owned or operated blackstart resources. This deactivation may have occurred due to the compliance obligations and costs associated with owning and operating blackstart resources. RF is concerned by this trend, as it appears that the costs of compliance may be creating a perverse incentive for registered entities to dispose of blackstart resources, which are important to bulk electric system (BES) reliability.
SERC	227	244	643	694	SERC continued to see considerable change associated with PSE and GO/GOP functions, mostly due to changes in ownership or corporate structure. SERC also registered several new wind farms and a few new generating facilities. SERC's deactivations typically occurred when there was a change in ownership of an asset. Several BAs were deactivated in December 2013 as a result of integration into the MISO BA. Name changes occurred regularly. SERC anticipates most DPs/load serving entities (LSEs) connected via radial tie lines to request deactivation following the BES definition revisions and FERC's South Louisiana Electric Cooperative Association decision. SERC noted a particular challenge with deactivation–the inability to deactivate a registered entity that has an open enforcement action. There

Trends in the Activation and Deactivation of Functions – Table 2					
Regional Entity	**Registered Entities**		**Registered Functions**		**Trends in the Activation and Deactivation of Functions in the Regions during Assessment Period**
	2009	**2013**	**2009**	**2013**	
					appears to be no mechanism to transfer a function to an acquiring registered entity, even if the new owner has agreed to accept the compliance responsibility and mitigation of the prior issues. During the assessment period, SERC's Compliance Database Management Functional Group began seeking a solution to this limitation.
SPP RE	117	140	379	438	SPP RE registered 117 new functions and deactivated 66 functions during the assessment period. Over half of the activations were GO and GOP, due in large part (60%) to construction of new generation. A large majority of the de-activations were due to sales and mergers, which also led to some name changes.
TRE	216	224	337	440	TRE registered 37 percent of the entities in the ERCOT footprint for at least two functions. Registration deactivations occurred only for the GO, GOP, LSE, PSE, and transmission Oowner (TO) functions, the majority of which occurred during 2011 and 2012, and consisted mostly of the GO, GOP, and PSE functions.
WECC	471	474	1,258	1,250	Since January 1, 2010, WECC processed 239 registration requests, all of which were accepted and approved by NERC. WECC is forecasting that most DPs/LSEs connected via radial tie lines will request deactivation following the BES definition revisions. To help prepare for this anticipated influx, WECC introduced business process management software for the WECC Compliance Registration Process in 2013. Entities now complete a web-based registration form on the WECC.biz site that requires the entity to provide additional information and answer specific questions based on their request. The system delivers the information to a WECC engineer for review while updates are provided automatically to the applicant via template emails. Everything from the original application to the engineer's review notes and correspondence emails

Another important part of the Regional Entities' organization registration functions pertains to the joint registration organization (JRO) and coordinated function registration (CFR), both of which are intended to define the responsibilities and accountability among entities separately registered for the same function. Revisions to NERC ROP §507 and the addition of §508, approved by the Commission on June 10, 2010, helped to clarify the operations of both types of registrations during the assessment period.[35]

Specifically, ROP §507 allows an entity to register as a JRO on behalf of one or more of its members or related entities for one or more functions for which such members or related entities would otherwise be required to register, and, thereby, accept on behalf of such members or related entities all compliance responsibility for that function or those functions including all reporting requirements. Many of the registered entities that use the §507 process are cooperatives, municipalities, and other publicly owned utilities. For example, the Illinois Municipal Electric Agency is a JRO in RF, and accordingly is registered as a DP, LSE, and TO on behalf of certain of its municipal members.[36] As of end of the assessment period, all but two (NPCC and WECC) of the Regional Entities had registered a total of 30 JROs.[37] Otherwise, after the initial implementation, the program was fairly static, with few entities registering as JROs or changing their JRO status. For example, during the assessment period, (i) FRCC processed four JRO changes; (ii) FRCC, SERC, and TRE registered a few JROs; (iii) MRO registered one new JRO; and (iv) SPP RE registered no new JROs.

NERC ROP §508 allows multiple entities to register using a CFR for one or more Reliability Standard(s) or for one or more Requirements or sub-Requirements with particular Reliability Standard(s) applicable to a specific function. The Registration of the CFR is the complete Registration for each entity, and each entity must take full compliance responsibility for those standards or requirements or sub-requirements it has registered for in the CFR. For example, in 2010, TRE registered 13 entities as TOPs through CFR agreements. Each CFR is an agreement between ERCOT ISO and one other transmission entity that allocates responsibility

[36] *See* the compliance audit report at http://www.nerc.com/pa/comp/Audit%20Repots%20DL/2013_public_RFC_MRRE_IMEA.pdf.

[37] *See* the *JRO Member Listing* Excel spreadsheet at http://www.nerc.com/pa/comp/Pages/Registration-and-Certification.aspx.

for TOP requirements between ERCOT ISO and that entity. The CFRs are updated regularly to account for changes in the body of applicable NERC Reliability Standards.[38]

As of end of the assessment period, 184 registered entities took advantage of coordinating their registered functions pursuant to ROP §508.[39] This represented 44 coordination agreements in all Regional Entities but one (FRCC), some of which crossed regional lines. For example, one CFR involved 31 registered entities located in three different Regional Entities (MRO, RF, and SERC). TRE had the largest number of registered entities (73) in the CFR program with 17 CFR arrangements. As was true for the JROs, with the exception of TRE, there was little activity in the CFR program during the assessment period. For example, MRO saw only one JRO convert to a CFR; SPP RE had just one new CFR register; NPCC had two new CFRs register; RF and SERC had a few new CFRs register; and WECC had three new CFR changes. In TRE, in 2010, 60 entities were registered as LSEs in a CFR agreement, and 14 entities were certified and registered as TOPs in a CFR agreement with ERCOT ISO. Since that time, TRE accepted additional CFR registrations.

Notwithstanding the Regional Entities' overall success in registering entities to ensure sufficient coverage of the BPS, the 2009 JRESA listed five areas where improvements could be made to the process of organization registration.[40] As now discussed, in the Regional Entities' opinion, these areas were largely and appropriately resolved during the assessment period by FERC-approved changes to the NERC ROP and by other Commission actions, or were overtaken or resolved by other events or activities.

a. The Scope of the Registration Criteria

FERC-approved changes to NERC ROP Appendix 5B addressed, at least in part, the issue of whether the registration criteria appropriately capture the users, owners, and operators of the BPS to ensure reliability. The current version (effective July 1, 2014) of the *Statement of Compliance Registry Criteria* (contained in ROP Appendix 5B) reflect review by NERC and the Regional Entities, in consultation with the stakeholders. This review aimed to determine if there should be a different threshold for materiality to the reliability of the BES and to determine if the compliance resources could be better prioritized by changes to the registration criteria.[41] Along these same lines, the Regional Entities supported the efforts of the Registration and Certification Functional Group, working with the NERC Board-appointed Compliance and Certification Committee's Organization Registration and Certification Subcommittee, to develop proposed changes to the registry criteria.

---

[38] To assist in this process, each Regional Entity's website includes a link to NERC's website to access its *Requirement Applicability List for Coordinated Functional Registration*. *See* http://www.nerc.com/pa/comp/Pages/Registration-and-Certification.aspx.

[39] *See supra* note 37.

[40] *See* 2009 JRESA, at pp. 21-23.

[41] *See North American Electric Reliability Corporation*, 141 FERC ¶ 61,241 (2012) (approving revisions to NERC ROP).

Also, during the assessment period, the ERO's activities to address the scope of the registration criteria became entwined with the Order No. 773 proceeding, in which the Commission modified the BES definition to remove regional discretion, and established a bright-line threshold that includes all facilities operated at or above 100 kV.[42] Order No. 773 also approved revisions to the NERC ROP to create an exception process to add elements to, or remove elements from, the BES on a case-by-case basis, and established a process pursuant to which an entity may seek a determination by the Commission whether facilities are "used in local distribution" as set forth in the FPA. As relevant here, while recognizing that the registration criteria and the BES definition have different applications (to entities and facilities, respectively), the Regional Entities believe that Order No. 773 addresses many of the concerns that were raised in 2009. The new BES definition and exception process, for example, may resolve the issue of small entities whose facilities are not necessary for the reliable operation of the BES. Currently, the Regional Entities are working with NERC to review and offer corresponding revisions to the *Statement of Compliance Registry Criteria* in NERC ROP Appendix 5B, and develop an application and database for the BES definition exception process (BESnet) to promote efficiency and consistency in the implementation of the new definition.

b. Re-examination of Functional Model Definitions

The 2009 JRESA noted commenters' concerns about the Reliability Functional Model, namely that it is conceptual whereas registered entities have (for historical or business reasons) often aligned their operations differently.[43] To address these concerns, that self-assessment discussed increasing the granularity of registration so it would focus on the requirement level, instead of the standard level, but it also recognized that redefining the terms of various functions may be impractical as it would unlikely resolve the immense diversity of organizational structures in the industry. While NERC and the Regional Entities spent some time at first to examine these ideas, they appropriately put the exercise on hold during the assessment period in light of the significant amount of work required to create and implement the new BES definition and the exception process. Also, the Order No. 773 effort may serve the same purpose and provide an increase in granularity as contemplated by the suggestions made in 2009 to revisit the Functional Model. Finally, NERC and the Regional Entities plan to start in 2014, to review and

On March 20, 2014, the Commission approved NERC's proposed revised definition of "bulk electric system." *See North American Electric Reliability Corporation*, Order Approving Revised Definition, 146 FERC ¶ 61,199 (2014).

[43] *See* http://www.nerc.com/pa/Stand/Functional%20Model%20Archive%201/Functional_Model_V5_Final_2009Dec1.pdf . The Reliability Functional Model is not approved by the Commission, and is not used by every Regional Entity.

clarify relationships between the functional model and the NERC ROP registration and certification directives (including Registry Criteria).

c. Oversight of Multi-Regional Entities

As pointed out in the 2009 JRESA, there are instances where an entity owns or operates BES facilities in two or more regions and thus is subject to multiple compliance programs, and there are businesses that have operations in all eight Regional Entities. To address the challenges raised by these situations, several of the Regional Entities partnered during the assessment period to coordinate more effectively their compliance and enforcement efforts with respect to multi-regional registered entities (MRREs). In particular, they developed a lead region model, in which the Regional Entities decide which one will lead the compliance and enforcement efforts for a given MRRE. For example, RF, MRO, and SERC agreed that RF would be the lead Regional Entity for Mid-continent Independent System Operator (MISO) due to the location of its headquarters and load, and the complex seams issues between the MISO and PJM Interconnection markets, while RF and MRO agreed that MRO would be the lead Regional Entity for American Transmission Company (ATC) due to the majority of ATC's transmission being located within MRO's footprint. In addition, during the assessment period, the Regional Entities worked closely with NERC to improve the coordination of compliance monitoring, mitigation, and enforcement without requiring change to the registration process. To this end, toward the end of the period, the Regional Entities developed *Recommended Guidelines for Multi-Region Entity Coordination*, which the ERO Executive Management Group approved in April 2014 for implementation across the ERO. Efforts are currently underway to develop template agreements between the affected Regional Entities and the notification to registered entities.

d. Transfer of Registered Entities between Regional Entities

Changes to NERC ROP §1208, approved by the Commission during the assessment period, on October 21, 2010, adequately addressed the issue of the appropriate conditions for the transfer of a registered entity from one Regional Entity to another.[44] In the order approving the changes, the Commission agreed with NERC that a registered entity does not have a right to choose the Regional Entity that will be its Compliance Enforcement Authority.[45] The Commission explained:

> In addition, as the Commission stated in Order No. 672, it is important that the footprint of a Regional Entity makes sense from a reliability perspective and does not overlap with another regional footprint. The Commission explained that any change in size, scope or configuration of a Regional Entity would constitute an amendment to the Delegation Agreement, and any such amendment would be

[44] *See North American Electric Reliability Corporation*, 133 FERC ¶ 61,061 (2010) (approving revised Delegation Agreements and changes to ROP, including §1208 governing Regional Entity transfer requests); *see also Nebraska Public Power District, et al*., 136 FERC ¶ 61,047, *order on reh'g*, 137 FERC ¶ 61,144 (2011) (denying NPPD's request to transfer from MRO to SPP RE).

[45] 133 FERC ¶ 61,061, at P 72.

> subject to review by the ERO and approval by the Commission. This process, under which the Commission must approve any change to the boundary of a Regional Entity to which the ERO has agreed, indicates that boundary changes should be carefully considered and should serve to improve the effectiveness or efficiency of the Regional Entities' and NERC's administration of reliability, and should not merely benefit an individual registered entity.[46]

The Regional Entities believe that ROP §1208 will assist them in maintaining a more stable structure for enforcing the reliability standards, and will therefore promote consistency of results.

e. Applicability of Reliability Standards to Federal Entities

The Commission's orders with respect to Southeastern Power Administration, the U.S. Army Corps of Engineers, and the Southwestern Power Administration generally resolved the related issues of: (i) the registration status of U.S. government agencies; (ii) compliance by those agencies with the Reliability Standards; and (iii) the application of penalties to those agencies found in violation of the Reliability Standards.[47] These decisions will greatly assist the Regional Entities in their efforts to ensure that such major users, owners and operators of the BES are held accountable for their actions regarding the reliability of that system.[48]

2. Organization Certification

Organization Certification is the process by which NERC and the Regional Entities ensure that an applicant to be a reliability coordinator (RC), balancing authority (BA), or transmission operator (TOP) has the tools, processes, training, and procedures to demonstrate its ability to meet the Requirements and sub-Requirements of all of the Reliability Standards applicable to the function(s) for which it is applying, thereby demonstrating the ability to become certified and then operational. The specific requirements for this process are found in the NERC ROP Organization Registration and Certification Programs (§500), and *Organization*

---

[46] *Id.*

[47] *See Southeastern Power Administration, 125 FERC ¶ 61,294 (2008)* (affirming SERC's registration of SEPA as a transmission operator and resource planner*); North American Electric Reliability Corporation*, 133 FERC ¶ 61,214 (2010), *order on reh'g*, 137 FERC ¶ 61,044 (2011); *North American Electric Reliability Corporation*, 129 FERC ¶ 61,033 (2009), *order dismissing reh'g*, 130 FERC ¶ 61,002 (2010) (collectively, affirming TRE's and SPP RE's decisions to register the U.S. Army Corps of Engineers and finding that any other federal entity that uses, owns or operates the BPS must comply with mandatory Reliability Standards); *North American Electric Reliability Corporation*, 140 FERC ¶ 61,048, *order on reh'g*, 141 FERC ¶ 61,242 (2012) (finding that SWPA was liable for a $19,500 penalty imposed by SPP RE for violating Reliability Standards), *appeal pending sub nom. Southwestern Power Administration, et al.* v. *FERC*, No. 13-1033 (D.C. Cir. Feb. 15, 2013).

[48] The implication of these decisions on the Regional Entities' workload is apparent from the statistics in NERC's May 8, 2013 PowerPoint presentation titled on *Key Compliance and Enforcement Metrics and Trends*. At that time, there were 419 open federal entity possible violations under review, of which 373 or 89% were "on hold" because the legal issues had not been resolved. Fortunately, the registered entities had mitigated or were in the process of mitigating 86 percent of the possible violations.

Registration and Certification Manual (Appendix 5A), and are also set out in the *ERO Certification and Review Procedure* manual (updated May 12, 2014).[49] Accordingly, the Regional Entities must organize certification teams that are subject to certain training requirements to ensure the accuracy of the certifications.[50] As is true of the registration process generally, the organization certification process ran smoothly during the assessment period. In that time, the Regional Entities certified 53 entities, conducted 68 reviews, and received only three objections to a Regional Entity's certification team's decision.[51]

F. Compliance Monitoring and Enforcement Program

The 2009 JRESA discussed the Regional Entities' implementation of the CMEP, covering ten topics: (i) compliance registry; (ii) consistency and use of discretion in application of penalties; (iii) CMEP consistency; (iv) compliance audit consistency; (v) consistency in interpretation of Reliability Standards; (vi) compliance caseload backlog; (vii) treatment of minor violations; (viii) compliance information management tools; (ix) compliance process transparency (within the ERO and the Regional Entities and between the ERO and its registrants); and (x) the hearings and appeals process.[52] The following updates that discussion, and provides additional information on the Regional Entities' progress to implement and improve the CMEP.[53]

1. Development and Status of the Compliance Monitoring and Enforcement Program

During the assessment period, the Regional Entities made significant progress and improvements in the implementation of the CMEP. This is important because the CMEP represents the Regional Entities' primary responsibility under the FPA and the Commission's regulations. FPA §215(a)(7), 16 U.S.C. §824o(a)(7), defines "regional entity" in the first instance as "an entity having enforcement authority" under the relevant statutory provisions. §39.1 of the Commission's regulations, 18 C.F.R. §39.1, repeats that definition. Accordingly, during the assessment period, the Regional Entities devoted the majority of their resources to oversee compliance with and enforcement of the mandatory Reliability Standards.

[50] *Id.* pp. 5-6

[51] These numbers break down by Regional Entity as follows:

	FRCC	MRO	NPCC	RF	SERC	SPP RE	TRE	WECC
Number of Certifications	0	1	3	5	10	3	18	13
Number of Reviews	4	7	4	11	17	4	4	17
Number of Appeals	0	0	0	0	0	1	0	2

[52] *See* 2009 JRESA, at pp. 21-31.

[53] The update to the section on Compliance Registry, included in the CMEP discussion in the 2009 JRESA, is found in the previous section of this self-assessment.

The Commission explained NERC's and the Regional Entities' roles in regard to the CMEP in its 2007 order accepting the initial RDAs and approving the original formulation of the CMEP.[54] In brief, NERC relies on the Regional Entities to enforce the NERC Reliability Standards with BES owners, operators, and users through approved RDAs. Regional Entities are responsible for monitoring compliance of the registered entities within their regional boundaries, assuring mitigation of all violations of approved Reliability Standards, and assessing penalties and sanctions for failure to comply. For that purpose, the CMEP specifies monitoring processes, including: (i) compliance audits; (ii) self-certification; (iii) spot checking; (iv) investigations; (v) self-reporting; (vi) periodic data submittals; and (vii) complaints.[55] It also includes procedures for enforcement actions, mitigation of violations, and remedial action directives, data retention, and confidentiality matters. In addition, the CMEP obligates each Regional Entity to establish and maintain a hearing body to conduct and render hearings concerning disputes over findings of alleged violations, proposed penalties, and mitigation plans.[56]

The Regional Entities have unwaveringly taken their compliance monitoring and enforcement responsibilities very seriously. In the beginning, they especially relied on their experience in conducting audits, and worked closely with NERC and the Commission's enforcement staff to structure their enforcement activities to ensure that the registered entities complied with the reliability standards. In addition, they increased their staffs to have adequate resources. More resources were necessary in part because the Regional Entities, while recognizing that they had discretion to determine appropriate remedies, conducted their enforcement programs with the understanding that they should investigate every possible violation of a standard or one of its requirements and compile a record sufficient to support any remedy chosen for a violation.[57] This was true regardless of the severity of the violations or the risk they posed to reliability. This was true even if the violations were simply a matter of documentation deficiencies.

No one in the reliability community, including FERC and NERC staff and the personnel at the Regional Entities and the registered entities, anticipated the number of violations that the Regional Entities would ultimately discover. When the 2009 JRESA was submitted to the Commission, the Regional Entities had amassed a significant backlog of over 1,700 violations. Clearly, as NERC and the Regional Entities recognized, this was an unacceptable situation.

---

[54] *See North American Electric Reliability Corporation, et al*., Order Accepting ERO Compliance Filing, Accepting ERO/Regional Entity Delegation Agreements, and Accepting Regional Entity 2007 Business Plans, 119 FERC ¶ 61,060 (2007).

[55] Early in the program, the monitoring processes also included "exception reporting," which was eliminated by a change in the NERC ROP, approved by the Commission in December 2012. *See North American Electric Reliability Corporation*, Order Conditionally Approving Revisions to North American Electric Reliability Corporation Rules of Procedure, 141 FERC ¶ 61,241 (2012).

[56] *See* 119 FERC ¶ 61,060 (2007), at P 26.

[57] *See generally Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Statement of Administrative Policy on Processing Reliability Notices of Penalty and Order Revising Statement in Order No. 672, 123 FERC ¶ 61,046 (2008); Guidance on Filing Reliability Notices of Penalty, 124 FERC ¶ 61,015 (2008).

Within the following year, after many discussions and meetings between and among FERC, NERC, and Regional Entity staffs, and stakeholders, NERC and the Regional Entities were on their way to figuring out how to reduce that backlog, and, more to the point, to address the overarching issue of how much discretion the Regional Entities could exercise in the implementation of the CMEP.

In Fall 2009, several months after NERC had submitted its Three-Year ERO Performance Assessment Report, the Commission took three actions that set the stage for NERC and the Regional Entities to improve their implementation of the CMEP: (i) it provided further guidance on filing proposed penalties, and stated the agency's willingness to consider an abbreviated format for submitting certain types of NOPs;[58] (ii) it issued Order No. 728, which delegated to the FERC Enforcement Director authority to allow routine NOPs to become effective and to stay the effectiveness of NOPs when it was necessary to seek further information;[59] and (iii) it issued an order allowing 564 proposed penalties (labeled the "omnibus filing") to become effective by operation of law.[60]

In 2009 through 2012, the Commission issued additional orders providing direction to the members of the reliability community on what was expected of them and what they could expect from the Commission. These orders covered a variety of issues, including the importance of a mitigation record,[61] the implications of a registered entity's repeat violations and violations by its affiliates,[62] the Regional Entities' responsibility to examine a registered entity's compliance program when determining an appropriate remedy,[63] the need for Regional Entities to consider load loss and harm to customers resulting from violations of Reliability Standards in their penalty assessments for these violations,[64] and the recovery of penalties from third-parties doing business in RTOs and ISOs.[65]

The omnibus filing eventually led to the Regional Entities' compiling processed violations on spreadsheets entitled Administrative Citation NOPs, an approach approved by the Commission in March 2011.[66] The Commission's statements at that time provide the status of NERC's and the Regional Entities' implementation of the CMEP:

> The Commission recognizes that NERC and the Regional Entities expend substantial efforts and resources monitoring compliance with the Reliability Standards and building adequate records to support findings of violations for Commission review. On numerous occasions, the Commission has encouraged NERC and the Regional Entities to develop flexible approaches and more streamlined processes to achieve efficiency in the enforcement process, especially with regard to more minor violations. NERC has adopted an Abbreviated Notice of Penalty format and a Deficiency Notice of Penalty format that have been successful at increasing efficiency. Based upon this filing, we believe that NERC's Administrative Citation Notice format will be a successful tool in improving efficiency of NERC's enforcement process, thereby reducing the time and resources expended by the Regional Entities, NERC, and Commission staff while still achieving transparency and consistency in penalty determinations for violations that are appropriate for this format. We also commend NERC for promptly following through with its intent to institute the Administrative Citation process.
>
> We encourage NERC's continued use of the Administrative Citation Notices of Penalty format. We also encourage, particularly in the early stages of this process, the ongoing consultation between our staff and NERC prior to filing to determine what violations are appropriate for inclusion in an Administrative Citation Notice of Penalty and the appropriate amount of detail and description necessary to ensure that the Administrative Citation process continues to be a success.[67]

Six months later, in September 2011, Administrative Citation NOPs transitioned into Spreadsheet NOPs (SNOPs). Candidates for inclusion in an SNOP are those violations that posed minimal or moderate risk to the reliability of the BPS. In all cases, the SNOP sets forth whether the violations have been mitigated, certified by the respective registered entities as mitigated, and verified by the Regional Entity as having been mitigated. During the assessment period, the Regional Entities processed and submitted through NERC 5,128 confirmed violations in NOPs to the Commission, using the Administrative Citation NOP format for 296 and the

SNOP format for 1,428 of those violations. For the 27 months from September 30, 2011 to December 31, 2013, the use of SNOPs alone represented 58% of the total number of NOPs submitted to the Commission.[68]

The next phase in the evolution of the ERO Enterprise's implementation of the CMEP is reflected in the FFT program, which started as the centerpiece of NERC's Compliance Enforcement Initiative (CEI). Details of this program during the assessment period are found primarily in two Commission orders—one issued in March 2012 and one issued in June 2013—and the NERC filings addressed by those orders.[69] Candidates for FFT treatment are possible violations that pose minimal or moderate risk to reliability and have been fixed. A certification of completion of the mitigation activities is submitted, at least within 90 days from the date the FFT is filed or posted, by the respective registered entity for every FFT submission.[70]

Again, the Commission's statements in these FFT orders are evidence of the progress made by NERC and the Regional Entities in the implementation of the CMEP. In the March 2012 order, the Commission explained,

> While the FFT initiative represents a significant change in the paradigm for monitoring and enforcing compliance with Reliability Standards, we agree with NERC that this change is warranted at this time. After several years of experience with the current program, we agree that NERC and the Regional Entities should have the flexibility to more efficiently process and track lesser risk violations in order to focus their resources on issues that pose the greatest risk to reliability.[[71]]

In its June 2013 order, the Commission found, "[b]ased on the information provided in NERC's filing… the FFT program is improving the ability of NERC and its Regional Entities to more efficiently process lesser-risk possible violations, enabling them to reduce the backlog of pending enforcement cases and focus on issues of greater importance to bulk-power system reliability."[72] Notably, in that order, the Commission explained that its staff had reviewed a

[69] *See North American Electric Reliability Corporation*, Order Accepting with Conditions the Electric Reliability Organization's Petition Requesting Approval of New Enforcement Mechanisms and Requiring Compliance Filing, 138 FERC ¶ 61,193 (2012); *North American Electric Reliability Corporation*, Order on Compliance Filing, 143 FERC ¶ 61,253 (2013).

[70] Originally, as approved by the Commission, the FFT program only pertained to possible violations with minimum risk; however, in the June 2013 order, the Commission approved NERC's proposal to expand coverage to possible violations that pose moderate risk to reliability, subject to NERC's submitting a report by June 20, 2014, justifying a continuation of the expansion of the program. The Commission likewise approved NERC's proposal to allow FFT treatment even before mitigation is completed provided it is completed within 90 days of the time when the FFT is filed or posted. *See* 143 FERC ¶ 61,253, at PP 32-34, 36-37.

[71] 138 FERC ¶ 61,193, at P 2 (footnote omitted).

[72] 143 FERC ¶ 61,253, at P 27.

sample of 100 FFT issues out of approximately 820 FFT issues filed with the Commission between September 2011 and September 2012, and determined that the Regional Entities properly treated those possible violations under the FFT program.[73]

As recognized by the Commission, the Regional Entities generally believe that the FFT program significantly improved the processing of violations of the reliability standards during the assessment period, and enabled them to focus resources and attention on more serious and complex matters.[74] During the assessment period, they processed total of 1,762 possible violations using the FFT procedures, which, in 2012 and 2013, respectively, represented 48% and 43% the total number of violations and possible violations processed by the Regional Entities. In addition, the FFT program had a positive impact on processing time, which was a major concern identified by the registered entities in 2009. In this regard, between January 1, 2012 and September 30, 2013, the average time for disposing of FFTs was 7.4 months as compared to 10.7 months for SNOPs and 13.1 months for NOPs.[75]

The Commission spoke favorably of the FFT program after its review in 2013, and encouraged NERC to continue to improve the program and report back to the Commission by June 20, 2014. Specifically, the Commission directed NERC to monitor the Regional Entities' eligibility determinations; requested more specificity regarding the FFT program's impact on BPS reliability; encouraged NERC to continue to work with the Regional Entities to improve and better coordinate their risk assessments; and stressed that NERC should continue its outreach to the Regional Entities to encourage the use of self-reports by the registered entities.[76] For their part, to a certain extent in response to the Commission's review, the Regional Entities elicited from focus groups other specific issues that they believed needed to be addressed in general or in certain Regional Entities as NERC and they continued to refine the program. These included overall processing time, the full mitigation plan requirement, insufficient information on content and process, no centralized information collection (particularly for MRREs), and inadequate communication during the process. The Regional Entities are committed to continue working closely with NERC and registered entities to address these issues and to bring about continuous improvement in the FFT program and related efforts.[77]

---

[73] *Id.* P 31. Between December 6, 2013 and December 16, 2013, in Docket No. RC11-6-000, *et al*., all eight Regional Entities responded to the Commission's annual FFT survey to collect data on the effectiveness and efficiency of the FFT program. Each response included data, correspondence, and other supporting information used by the Regional Entity staffs to evaluate and conclude that the previously submitted possible violations identified by FERC staff qualified for FFT treatment. The Commission's response to these filings was still pending at the end of the assessment period.

[74] *See* Attachment A to NERC's Report in Docket No. RC11-6-004, for information from each Regional Entity on the impact of the FFT program on its region. *See* also 143 FERC ¶ 61,253, at PP 8-9 (describing the information gleaned from Attachment A).

[75] *See* the PowerPoint presentation titled *Key Compliance and Enforcement Metrics and Trends,* Compliance Committee Meeting, November 6, 2013, at slide. 5.

[76] *See* 143 FERC ¶ 61,253, at PP 28-30.

[77] Indicative of the progress made to date is reflected in the Key Compliance Monitoring Index (KCMI) compiled by NERC, which reported that as of the end of 2012, 5,115 confirmed violations were processed for the period beginning June 18, 2007. Of these violations, 85 percent had minimal impact to reliability, 13 percent had moderate

The ERO Enterprise's next advancement in CMEP implementation is RAI. Started in late 2012, RAI is intended to transform the current compliance and enforcement program into one that is forward-looking, focuses on high reliability risk areas, simplifies compliance for registered entities, and creates alternative paths outside of enforcement to resolve minor matters. Accordingly, RAI has three main goals:

(1) Develop enforcement incentives to recognize positive behavior that contribute to higher accountability and improved performance and discourage poor performance;

(2) Design and scope compliance programs that recognize risk to reliability, including consideration of an entity's management controls and corrective action programs used to meet the reliability standards; and

(3) Reduce unnecessary compliance and enforcement activities while gaining efficiencies.

As much if not more than any CMEP project undertaken since 2007, RAI is a collaborative and coordinated effort of the ERO, the Regional Entities, and the registered entities, without regard to ownership, but rather with an objective of working on a common set of deliverables.

A statement made at the July 9, 2013 FERC Reliability Technical Conference accurately portrays the situation in which the Regional Entities find themselves daily in their efforts to enforce the reliability standards, and serves as a backdrop to RAI:

> Simply put, we know the current zero tolerance approach is not sustainable for the long term….[O]ur current processes tend to be backward-looking, and we need to move to a space where we're more forward-looking to really assess an entity's ability to stay in compliance and meet or exceed the reliability standards.[78]

As further discussed at the conference, RAI would not allow "small stuff" to be "swept under the rug." The "small stuff" matters. The expectation is that the registered entities would have management practices in place to resolve the "small stuff" before it becomes a reliability risk in the form of a material violation of a Reliability Standard. To this end, the Regional Entities would look to how well a registered entity meets the reliability objectives of the standards, and whether any identified violations rise to the level that needs enforcement. It would allow Regional Entities to, among other things, better tailor the scope of audits and other

---

impact, and 2 percent had serious impact. Furthermore, the five-year assessment of the KCMI indicated that the risk to BPS reliability based on the number of violations of NERC Reliability Standards trended lower from 2008 to 2012. *See* NERC's *State of Reliability 2013* report (May 2013), http://www.nerc.com/pa/RAPA/PA/Performance%20Analysis%20DL/2013_SOR_May%2015.pdf, at p. 6.

[78] Testimony of Mark Rossi, Senior Vice President and Chief Operating Officer, NERC, Transcript of Reliability Conference (July 9, 2013), Docket Nos. AD13-6-000, *et al.*, at p. 86.

compliance monitoring activities based on an entity's risk (e.g., size, complexity of operations, and effectiveness of internal controls).[79] It would also provide for the determination of the nature of enforcement actions to be based on risk and the presence of internal controls. For example, a single missing record (out of hundreds) for maintaining and testing protection systems that is proactively identified and recorded by the registered entity as part of its normal management practices might not rise to an enforcement matter. While the matter would be part of the entity's compliance record, it would likely not require an enforcement filing. Traditional methods of enforcement and application of penalties, however, would still be used in connection with matters that pose a serious or substantial risk to the BPS. For those matters, the full NOP or SNOP would remain available.[80]

Starting in March 2013, several Regional Entities and registered entities became engaged in pilot programs as the initial steps towards full RAI implementation. In this regard, the Regional Entities appreciate that the Commission has previously recognized the value of pilot projects, pointing out that "[n]o matter how good the data suggesting that a regulatory change should be made, there is no substitute for reviewing the actual results of a regulatory action."[81] With this in mind, each pilot project endeavored to further define the risk-based approach and develop effective tools, training, procedures, and policies to allow the ERO Enterprise to deploy these concepts in a consistent manner across all Regional Entities. The ERO Enterprise intends to keep the Commission apprised of the progress of the pilot projects, and will make appropriate revisions and submit any necessary filings with the Commission to establish a common framework throughout the ERO Enterprise.

In sum, in the ERO Enterprise's opinion, there are significant benefits to be gained through RAI, including better alignment to a culture of reliability. RAI would give credit to entities that demonstrate strong management practices and a culture of complying with the reliability standards. Similarly, the program would focus compliance monitoring on areas that pose the greatest risk to reliability, thereby enabling and encouraging an entity to address areas of higher risk by strengthening management practices around those risks. This in turn should result in a more effective program addressing risks to reliability consistent with internal control approaches used in other areas of the corporation.[82]

[81] Order No. 637, FERC Stats. & Regs. ¶ 31,091 (2000), at p. 31,279. The U.S. Court of Appeals for the D.C. Circuit agrees: "For at least 30 years this court has given special deference to agency development of such experiments, precisely because of the advantages of data developed in the real world." *Interstate Natural Gas Association of America v. Federal Energy Regulatory Commission*, 285 F.3d 18, 24 (D.C. Cir. 2001).

[82] *See* generally http://www.nerc.com/pa/comp/Pages/Reliability-Assurance-Initiative.aspx. In this regard, the Regional Entities appreciate the Commission's recognition of the RAI's potential benefit. Toward the end of the assessment period, the Commission noted that "…the [RAI] process when fully developed may afford a consistent, informed approach that provides incentives for entities to develop robust internal control programs." *Version 5 Critical Infrastructure Protection Reliability Standards*, Order No. 791, 145 FERC ¶ 61,160 (2013), at P 73 (footnote omitted).

Along with developing the RAI toward the end of the assessment period, NERC and the Regional Entities focused on three other major areas: (i) the development of a single ERO-wide audit process checklist and associated auditor handbook to ensure the use of more consistent processes and procedures by the staff in the field; (ii) the implementation of the FFT enhancements approved by the Commission in its June 20, 2013 order in Docket No. RC11-06-004; and (iii) the improvement in the self-reporting processes, including reducing the burden and cost of self-reporting. The Regional Entities, as part of the ERO Enterprise, made the following progress in each of these areas:

a. Development of Single ERO-Wide Audit Process Checklist and Associated Auditor Handbook

As the Regional Entities recognized in 2009, work was needed to ensure the consistency of compliance audits.[83] Accordingly, as discussed below, they worked on numerous projects within their own regions and across regions to improve their major tool to ensure compliance with the mandatory Reliability Standards. As relevant here, in September 2012, the Regional Entities engaged an outside firm to assess the current state of regional compliance audit procedures and underlying processes, and make recommendations that could lead to more consistent audit practices across the Regional Entities and better position them to adapt to future regulatory changes and demands. This engagement dovetailed with the development of the white papers and other conceptual documents underlying RAI, and naturally became part of the larger effort to revisit the CMEP paradigm. The outside firm produced its assessment (referred to as the Third-Party Assessment) in February 2013, and recommended that the Regional Entities:

(1) Develop a single set of standardized audit methodology documents to be used across the ERO, after aligning their existing audit methodologies;

(2) Deploy a pilot program to assess and implement the standardized audit checklist; and

(3) Roll out a robust training program to provide the audit community with sufficient growth opportunities and ultimately guide auditors in the interpretation and optimal application of the audit guidance and checklist.

Subsequently, with NERC's support and cooperation, during the assessment period, the Regional Entities produced a standard *Compliance Auditor Checklist* and completed the first version of a common *Compliance Auditor Handbook*, as found in the *ERO Enterprise Compliance Auditor Manual*.[84] Also, certain Regional Entity staffs participated in pilot or

[84] *See* http://www.nerc.com/pa/comp/ERO%20Enterprise%20Compliance%20Auditor%20Manual%20DL/ERO_Enterprise_Compliance_Auditor_Manual_version_1.pdf.

comparable programs to see how the audit process checklist worked in the field, and collaborated with their colleagues in other Regional Entities to fashion appropriate training materials. The Regional Entities firmly believe that the use of the audit process checklist and handbook will create a standardized process that will improve efficiencies and drive consistency while ensuring that audits conform to professional auditing standards, particularly the Generally Accepted Government Accounting Standards (GAGAS).

b. Implementation of FFT Enhancements

As noted earlier, in the June 2013 FFT order, the Commission approved, with conditions, four enhancements to the FFT program.[85] The Commission permitted an expansion of the program by allowing FFT treatment for a "limited pool" of possible violations involving moderate (in addition to minimal) risk, subject to NERC's filing a report by June 20, 2014, justifying the continuation of the expanded FFT program; allowed the inclusion of possible violations as FFTs even if the mitigation was not yet completed, provided the mitigation was completed within 90 days from the date the FFT is filed or posted; permitted the Regional Entities to publicly post FFTs on a common website on the last business day of each month instead of NERC submitting a monthly informational filing to the Commission; and agreed with NERC's proposal to review a representative sample of FFTs during the 60-day window following the Regional Entities' monthly posting of FFTs on NERC's website instead of reviewing each FFT before public posting. In July 2013, immediately after the issuance of the June 2013 order, the Regional Entities began implementing the approved FFT enhancement applicable to them. Specifically, they included FFTs where mitigating activities had not yet been completed, submitted monthly FFT compilations to NERC for posting on its website, and evaluated possible violations involving moderate risk for processing as FFTs.[86]

c. Improvement in the Self-Reporting Process

As NERC President and CEO Gerry Cauley pointed out at the July 9, 2013 FERC Technical Conference, two-thirds of all violations at that time were self-reported.[87] Nevertheless, at that conference and in other forums such as the FERC FFT proceedings and NERC and regional meetings with the registered entities, the need to improve the self-report process was often stressed. Accordingly, the Regional Entities took steps to meet that need. To start with, as mentioned earlier, they identified areas for potential improvements. These included a lack of sufficient information on content in self-reports both in the details of the violation and the risk assessment information. In addition, there was a perception in certain cases of a lack of centralized information collection (particularly for MRREs), and the registered entity complaints on the combination of long overall processing time and a lack of communication throughout the process.

---

[85] *See* 143 FERC ¶ 61,253 (2013). The Commission rejected one of NERC's proposals, to eliminate senior officer certification. *Id*. P 17.

[86] *See* http://www.nerc.com/pa/comp/CE/Pages/Enforcement-and-Mitigation.aspx for the FFT postings.

[87] *See* Transcript of Reliability Conference (July 9, 2013), Docket Nos. AD13-6-000, *et al*., at p. 135. Self-reports in this context also includes self-certifications.

Next, the Regional Entities worked together, with NERC, and with a focus group of registered entities to start putting in place enhancements to the self-report process. These included:

(1) Additional guidance on processing and the content of self-reports;

(2) Points of contact at the Regional Entity for additional guidance;

(3) An improved intake form that has the capability of augmenting information and cross-referencing information already provided, and a centralized process for MRREs; and

(4) Aggregation of minimal risk issues by selected registered entities in selected Regional Entities to allow training on risk assessment and mitigation development.

Significantly, by the end of the self-assessment period, with input from the industry focus group, NERC and the Regional Entities completed a draft of the *ERO Self-Report User Guide*, which was posted for broader stakeholder comment in January 2014. As explained in the posting, this user guide should provide registered entities with valuable information and insight on what to do to facilitate disposition of possible noncompliance by the ERO Enterprise.[88] Subsequently, in April 2014, NERC posted a revised *ERO Self-Report User Guide* with the express purpose of enhancing the Registered Entities' understanding of the information necessary for NERC and the Regional Entities to provide efficient and timely resolution of instances of potential noncompliance.[89]

2. Updates to the 2009 Joint Regional Entity Self-Assessment

As described above, the 2009 JRESA addressed nine separate CMEP topics, in addition to the compliance registry. Four involved achieving consistency within the program (consistency and use of discretion in application of penalties, CMEP consistency, consistency in interpretation of reliability standards, and compliance audit consistency), four dealt with enforcement issues (caseload backlog, treatment of minor violations, information management tools, and process transparency), and one reviewed the hearing and appeals process. Because the previous discussion on the progress made by NERC and the Regional Entities on streamlining and improving the CMEP addresses or otherwise touches on most of these topics, the following will not repeat relevant parts of that discussion here. Rather, it will provide updates to specific topics and issues that were raised by the Commission, NERC, the Regional Entities themselves, or stakeholders, in 2009. The discussion is organized under the topics of: (i) Consistency; (ii) Compliance Monitoring; (iii) Enforcement; and (iv) Hearings and Appeals.

[88] *See* http://www.nerc.com/pa/comp/Pages/Reliability-Assurance-Initiative.aspx.

[89] *See* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/ERO%20Self-Report%20User%20Guide%20(April%202014).pdf.

a. Consistency

In the 2009 JRESA, the Regional Entities identified consistency as an overarching issue in their discussion of the CMEP. That discussion, of course, reflects their recognition that the Commission has repeatedly tasked NERC to ensure consistency of compliance across the Regional Entities, and the NERC ROP explicitly provide that NERC must have a program to monitor the compliance enforcement efforts of each Regional Entity to achieve that objective. Accordingly, in 2009, the Regional Entities examined the issue from several different perspectives. Taken as a whole, these examinations break down into an understanding of the concept of consistency as a general matter and the efforts of the Regional Entities to achieve consistency within their own regions and across regions. To reiterate, what is now described is in addition or complementary to the ERO Enterprise's efforts to develop the RAI.

Consistency as a General Matter

The Regional Entities are committed to working within their own areas, across regions, and with NERC to meet the Commission's expectation that their compliance monitoring and enforcement endeavors adhere to the same principles, course, and form. That said, they also are aware, and urge the Commission and NERC to recognize, that consistency does not necessarily mean exactness in results. Indeed, the adoption of a risk-based approach to the CMEP, as introduced in NERC's 2011 through 2013 annual CMEP Implementation Plan,[90] will naturally result in different treatment of different entities and different outcomes of compliance and enforcement activities. Specifically, for example, penalty consistency does not mean the same penalty for specific alleged violations across all Regional Entities, because the risk posed by a specific alleged violation varies depending on the characteristics of the Regional Entity's footprint, the registered entity and its geographical location and interconnection, as well as other pertinent facts and circumstances. Instead, in the Regional Entities' opinion, penalty consistency must focus on the need for a uniform methodology to ensure that the penalty for each violation (i) is consistent with the risk posed by that violation, and (ii) encourages the appropriate behavior to improve the reliability of the BES.

Consistency of Remedies <u>Within</u> the Regions

While sensitive to consistency in their work generally, the Regional Entities expended considerable resources and paid special attention during the assessment period to ensure that their determinations on appropriate remedies for violations of the mandatory reliability standards were consistent within their own regions. For that purpose, they all used internal case management systems, which were similar in that they involved methodical comparisons of the violations to actual penalties assessed for violations of the same or similar standards or requirements within the Regional Entity; directed their staffs to coordinate and otherwise participate in regular meetings of the regional stakeholder compliance committees; required review or "sign off" by senior regional managers; and stressed internal training and regular

[90] *See*, e.g., *ERO Compliance Monitoring and Enforcement Program 2013 Implementation Plan* (revised December 27, 2012) at http://www.nerc.com/pa/comp/Resources/Pages/default.aspx?View={cb5b1d3f-f5b7-421d-8266-0bcf6a06fc08}&SortField=Date&SortDir=A.

communications with and outreach to their registered entities. They also developed other specific means for achieving the objective of consistent remedial determinations, such as compiling and posting frequently asked questions (FAQs), using surveys, involving technical experts to address risk and harm, assigning a single point of contact for each registered entity, and separating their compliance and enforcement staffs.

Consistency of Remedies and Other Matters Across the Regions

The Regional Entities made substantial progress during the assessment period to improve CMEP consistency by increasing their interaction with each other. Notable accomplishments in this regard were made by the REMG, which proactively and persistently stressed the importance of information sharing, transparency, and consistency within and among Regional Entities, and working collaboratively with NERC. In addition, as mentioned earlier, several of the Regional Entities partnered to coordinate more effectively their compliance and enforcement efforts with respect to MRRE. In this regard, they developed a lead region model, in which the Regional Entities decide which one will lead the compliance and enforcement efforts for a given MRRE.[91] Further, the Regional Entity staffs regularly met with each other to promote consistency with CMEP processes and provide subject matter experts, as needed, to the same end, and conducted compliance workshops to which the registered entities from other regions were welcomed. They also collaborated on improving data management tools and the various forms used by the Regional Entities and the registered entities, including the self-report and the self-certification forms and, as discussed in greater detail below, the reliability standards audit worksheets (RSAWs).

Finally, and as apparent from the previous discussion of the developments in the CMEP during the assessment period, the Regional Entity staffs actively participated in NERC-led committees, task forces, and working groups. For example, the Regional Entities actively participated during the assessment period is the Enforcement Sanctions and Mitigation Working Group (ESMWG). This group reviews one or two Regional Entity enforcement processes during an in-person meeting, and then shares its review to help identify best practices and highlight areas where consistency could be improved. NERC Enforcement staff also participates in these meetings and is present for discussions regarding variations in approach to enforcement and mitigation responsibilities. Additionally, the ESMWG conducts periodic "risk assessment" exercises whereby each Regional Entity is asked to review particular fact patterns and descriptions of mitigating activities and assign the appropriate level of risk. Regional Entities are further asked to highlight any assumptions that are made or to identify additional information that would assist in the assignment of the risk posed by the particular facts and circumstances. Not only do these exercises provide value in driving consistency in assessment of risk, they highlight areas of improvement in the drafting of descriptions of violations, mitigating activities, and risk assessments. By becoming involved in in-depth analyses and discussions of potential and actual risk, the Regional Entities aim to continuously improve the final enforcement product.

[91] For example, RF, MRO, and SERC agreed that RF would be the lead Regional Entity for MISO", while RF and MRO agreed that MRO would be the lead Regional Entity for ATC".

b. Compliance Monitoring

During the assessment period, the Regional Entities steadfastly used their major tool to monitor compliance with the mandatory Reliability Standards—compliance audits of the registered entities. They also used other compliance monitoring tools, including: (i) spot checks; (ii) self-reports; (iii) self-certifications; and (v) periodic data submittals. The Regional Entities' extensive compliance monitoring efforts, specifically with respect to compliance audits, spot checks, and self-reports, can be seen in Table 3.[92]

The 2009 JRESA primarily focused on compliance audits, and the following discussion will be tailored accordingly. Importantly, during the assessment period, the Regional Entities completed the first three-year cycle of such audits for registered entities (registered in 2007 or 2008) performing the RC, BA, and TOP functions on schedule in 2010, and the six-year cycle for those registered entities not performing one of the three certified functions on schedule in 2013. Some Regional Entities also completed a portion of the second 3-year audits during the assessment period.

[92] The CMEP also once included Exception Reporting, which was removed by the revisions to the NERC ROP, approved by the Commission on December 20, 2012. *See* 141 FERC ¶ 61,241 (2102). The Regional Entities review self-certifications for all registered entities at least once annually. Some Regional Entities also require monthly self-certifications for certain Reliability Standards and Requirements. Periodic data submittals happen continuously, with certain information due to the Regional Entities on a monthly basis, other data on a quarterly basis.

The 2009 JRESA touched mainly on three topics related to Compliance Audits—the effectiveness of the RSAWs, the adequacy of audit training, and the status of NERC and FERC observers in regional audits. These will be taken up in turn.

Reliability Standards Audit Worksheets

As a general matter, the Regional Entities believe that RSAWs are helpful in their conduct of compliance audits. For example, they provide a means for recording the conduct of the audit, including detailed auditor notes and findings, and can be linked to the registered entity's evidence that can then be more easily reviewed. Registered entities appear to appreciate them, and use them extensively to prepare for an audit. Nevertheless, all of the Regional Entities believe that the RSAWs could be improved, and are pleased that their staffs are involved in the task force for that purpose. They are concerned, among other things, that the RSAWs attempt to meet multiple diverse needs, with the result being that no need is met fully or effectively; lack sufficient detail or granularity to be effective in guiding the conduct of the audit; constitute nothing more at times than a restatement of the requirement and provide little meaningful guidance to the auditor or the audited entity; and are generally cumbersome to use. As a consequence, some of the Regional Entities have developed alternate or supplemental tools to augment the RSAWs, e.g., with detailed data requests and inventory workbooks. Of course, in the Regional Entities' opinion, the audit process checklist and auditor handbook, described earlier, will help alleviate many of the Regional Entities' current concerns.

Adequacy of Audit Training

Without question, the Regional Entities are mindful of the importance of adequate audit training, both of their own staffs and for their registered entities. Accordingly, during the assessment period, they routinely encouraged, if not required, their staffs to attend or otherwise participate in relevant training sponsored by NERC (e.g., semi-annual ERO auditor workshops, GAGAS performance audit training, fundamentals of audits training, audit team leader training, compliance investigations training, *Crucial Conversations* training, and gathering quality evidence online training) or provided by third-party vendors; conducted their own in-house training; and regularly held compliance workshops for their registered entities.[93] In addition, they stressed the importance of their staffs continuing their education in specialized areas, such as cybersecurity, and maintaining or adding to their professional accreditations. As a result, the Regional Entities are confident that during the assessment period they assembled highly trained and professional audit staffs, which some of them supplemented with outside consultants with corresponding qualifications and credentials and with industry subject matter experts, to carry out their compliance monitoring obligations.[94]

[93] A good overview of NERC's training can be found in its filing submitted in compliance with the Commission's initial order on the FFT program in Docket No. RC11-6-003, on October 12, 2012, and accepted by Delegated Letter Order, on February 25, 2013.

[94] The Regional Entities' Cyber Infrastructure Protection auditor qualifications are discussed in greater detail below under §F.3, Additional Statutory Functions.

The Regional Entities will steadfastly continue these efforts, which complement and otherwise support the development of RAI. In this regard, the Third-Party Assessment suggested ways for improving auditor training, which are currently under active consideration by the ERO Enterprise. These suggestions include:

(1) Understanding and inventorying audit training over the past 2 to 3 years;

(2) Identifying initial pockets of excellence that could be leveraged;

(3) Preparing an initial listing and profile of known trainings and certifications that should be embedded within an on-going training program;

(4) Reconfirming and defining key trainings that include content related to auditing and understanding the technical aspects of the NERC requirements;

(5) Determining which professional certifications are best suited for audit professionals;

(6) Developing a program that includes all desired training and certifications;

(7) Assigning a target audience, delivery method, importance, approximate course length and frequency for each item in the training program;

(8) Establishing a method to track employee completion which will report data on progress per employee, office and region;

(9) Developing a process for proactive monitoring and continued improvements in the current training program;

(10) Creating individual annual training requirements for each employee based on gaps in their current skill sets and their expressed interests; and

(11) Tracking training and certification completion status and periodically reporting progress.

Status of NERC and FERC Observers in Regional Audits

The final compliance audit topic addressed in the 2009 JRESA concerned the uncertainty of the scope of participation by NERC and FERC observers in regional audits, even though as a general matter the Regional Entities found benefit in the observers' feedback. The Regional Entities believe that this uncertainty was largely resolved during the assessment period by Commission-approved changes to the NERC ROP Appendix 4C, §3.1.5.3, which clearly sets forth the role of audit observers, stating that "[c]ompliance Audit observers and attendees are not

Compliance Audit team members and do not participate in conducting the Compliance Audit or in making Compliance Audit findings and determinations."[95]

c. Enforcement

The 2009 JRESA touched on four specific enforcement-related topics in addition to issues of consistency—caseload backlog, treatment of minor violations, process transparency, and information management tools. As these topics overlap with each other and previously discussed topics, the following will combine the updates. As an initial matter, the Regional Entities want to stress that they continue to view communication and transparency in the enforcement process to be imperative to ensure a fair and effective implementation of the CMEP. They also believe that RAI is a positive step in that direction, and are committed to working with NERC and other members of the reliability community to make RAI a reality to advance BES reliability. In particular, RAI will support the goal of approaching the enforcement of the reliability standards on the basis of risk, as the initiative calls for evaluating registered entities' internal controls and processes, an evaluation that will enable the Regional Entities to create risk profiles. Once known, those risk profiles will assist the Regional Entities in both their compliance monitoring and enforcement activities, and eventually help reduce the time to final resolution of compliance issues.

The Regional Entities experienced a significant increase in the number of new violations discovered during the assessment period, in large part because of the introduction of the CIP mandatory Reliability Standards in 2010. Indeed, with the exception of the last year, NERC reported that the number of violations consistently trended upward during the assessment period, generally for all Regional Entities. This trend can be seen by Regional Entity on Table 4. NERC also reported that the CIP Reliability Standards were consistently the most frequently violated since 2010.[96]

New Violations during Assessment Period – Table 4						
	2009	**2010**	**2011**	**2012**	**2013**	**Total**
FRCC[97]	184	103	135	68	61	**551**
MRO	60	103	196	166	139	**664**
NPCC	43	99	130	213	66	**551**
RF	123	469	565	505	240	**1,902**
SERC	187	312	309	300	285	**1,393**
SPP RE	132	254	291	173	191	**1,041**
TRE	14	51	430	197	169	**861**

[95] *See* 141 FERC ¶ 61,241 (2012).

[96] *See* the PowerPoint presentation titled *Key Compliance and Enforcement Metrics and Trends* (February 2014), http://www.nerc.com/gov/bot/BOTCC/Compliance%20Committee%202013/Presentations%20--%20February%205,%202014.pdf, at slide 15.

[97] There is a slight difference between the FRCC number of violations in Table 4 and those found in NERC's assessment of the Regional Entities. FRCC's numbers here reflect the year in which the violations were discovered whereas the other numbers reflect the year the violations were reported to NERC.

New Violations during Assessment Period – Table 4						
	2009	**2010**	**2011**	**2012**	**2013**	**Total**
WECC	571	550	807	818	437	**3,183**
TOTALS	**1,314**	**1,941**	**2,863**	**2,440**	**1,588**	**10,146**

Notwithstanding the generally steady increase in new violations during the assessment period, the Regional Entities were able to meet their objectives, stated in the 2009 JRESA, to clear out what was described there as a backlog of violations, improve the time of processing violations (especially minor violations), and, generally speaking, establish stable workloads of enforcement cases. In particular, the Regional Entities' significant reduction in their pre-2012 caseload by the end of the assessment period can be seen on Table 5.[98]

[98] As NERC reported in its 2014 business plan and budget proposal:

> As of June 30, 2013, approximately 85% of the active non-CIP violations and 72% of the active CIP violations were discovered since January 1, 2012 (i.e., were discovered in the preceding 18 months). At June 30, 2013, there were no active non-CIP violations that were discovered prior to January 1, 2010 and only 12 active non-CIP violations that were discovered in 2010. There were only 16 active violations that were discovered in 2009 and 91 active CIP violations that were discovered in 2010. Further, for the 12 months ended June 30, 2013, the number of violations dismissed or filed with the Commission exceeded the number of new violations opened by 680 violations.

Request for Acceptance of 2013 Business Plans and Budgets of NERC and Regional Entities and for Approval of Proposed Assessments to Fund Budgets, Docket No. RR13-9-000 (submitted on August 23, 2013), at p. 104.

Reduction in Pre-2012 Violations Caseload – Table 5			
	Total violations open at the end of 2011	**Total violations open at the end of 2011 still open at end of 2013**	**Percentage of Reduction**
FRCC	95	0	100%
MRO	151	14	93%
NPCC	221	0	100%
RF	429	21[99]	95%
SERC	575	25	96%
SPP RE	233	6	97.4%
TRE	283	0[100]	100%
WECC	65	0	100%

The Regional Entities accomplished these objectives in the first instance by gaining more experience, expanding their enforcement staffs, increasing their outreach to registered entities, and focusing on improved efficiency. They also accomplished this by working with Commission staff, NERC, and the stakeholders in the development of the CEI, in particular the Administrative Citation NOPs, the SNOPs, and the FFTs.[101] As mentioned above, in 2012 and 2013, respectively, the use of SNOPs represented 48% and 43% of the total number of violations and possible violations submitted to the Commission. For the same years, the use of FFTs represented 38% and 43% of the total number of violations and possible violations processed by the Regional Entities.[102] Moreover, for violations and possible violations discovered after January 1, 2012 and filed by September 30, 2013, the average processing time for SNOPs and FFTs was 10.7 months and 7.4 months, respectively.[103] As the Commission can appreciate from the management of its own enforcement cases, as reported in its Enforcement staffs' annual reports, this represents a very respectable and acceptable time to process violations of the law.

[99] This number excludes Federal entity violations which are on hold due to legal issues.

[100] This number excludes one case involving two violations that is on appeal.

[101] The Regional Entities also credit the registered entities in the improvement in the processing of violations, namely that as they also gained experience through compliance and enforcement activities, they obtained a better understanding of how to comply with the standards and thereby were able to facilitate both activities.

[102] *See* the PowerPoint presentation titled *Key Compliance and Enforcement Metrics and Trends* (February 2014), http://www.nerc.com/gov/bot/BOTCC/Compliance%20Committee%202013/Presentations%20--%20February%205,%202014.pdf, at slide 10. For the period July 1, 2012 to June 28, 2013, this breaks down by region as follows:

	WECC	TRE	SPP RE	SERC	RF	NPCC	MRO	FRCC
FFT	25%	54%	44%	43%	41%	60%	57%	45%
SNOP	37%	23%	28%	38%	28%	39%	39%	40%
NOP	38%	23%	28%	19%	32%	1%	4%	15%

[103] *See* the PowerPoint presentation titled *Key Compliance and Enforcement Metrics and Trends* (November 2013), http://www.nerc.com/gov/bot/BOTCC/Compliance%20Committee%202013/CC_Presentations_Nov_2013_Complete.pdf, at slide 5.

At the same time as they were working to reduce their pre-2012 caseload and otherwise improve their processing of violations of the mandatory Reliability Standards, the Regional Entities endeavored to strictly oversee the completion of plans to mitigate those violations, because, axiomatically, timely mitigation is imperative for BPS reliability. Toward the end of the assessment period, they were able to improve the average times of two major milestones to less than a year, or significantly less than a year—the time from discovery of the violation to the registered entity's submittal of mitigation activities and the time from the discovery of a violation to the registered entity's completion of mitigation activities. This can be seen by Regional Entity for September 2012 through September 2013 in Table 6.

Average Times for Submittal and Completion of Mitigation Plans – Table 6		
	Average time from discovery of a violation to the registered entity's submittal of mitigating activities	**Average time from discovery of a violation to the registered entity's completion of mitigating activities**
FRCC	5.6 months	10.2 months
MRO	5 months	9 months
NPCC	3 months	3.4 months
RF	5.6 months	6.4 months
SERC	11 months	9 months
SPP RE	6.4 months	10.2 months
TRE	8 months	6 months
WECC	4.6 months	5.6 months

The Regional Entities achieved another 2009 enforcement goal during the assessment period by compiling and sharing with each other and the reliability community "lessons learned" from their enforcement proceedings. Accordingly, they were able to improve their own operations and help the registered entities to understand better how to comply with the mandatory Reliability Standards. They did this by: (i) creating webpages;[104] (ii) producing training videos; (iii) issuing newsletters with information on frequently violated standards and violation processing metrics;[105] (iv) publishing cases and dismissal notes;[106] (v) developing and sharing compliance guidance statements;[107] (vi) compiling other relevant written materials such as FAQs;[108] (vii) holding frequent compliance calls with registered entities; (viii) conducting

[104] *See*, e.g., http://www.texasre.org/StakeholderOutreach/LessonsLearned/Pages/Default.aspx; and http://www.serc1.org/Documents/Compliance/Statistics%20and%20Lessons%20Learned/2012/SERC%20Lessons%20Learned%20July%202012.pdf.

[107] *See*, e.g., https://www.npcc.org/Compliance/Compliance%20Guidance%20Statements/Forms/Public%20List.aspx.

[108] *See*, e.g., https://www.frcc.com/FAQ/default.aspx.

numerous workshops, seminars, conferences, webinars, and open forums;[109] (ix) including detailed discussions in their compliance committee meetings; and (x) participating in trade and other industry conferences and conventions. Indeed, in the last three years of the assessment period (2011 through 2013), the Regional Entities' workshops and equivalent training programs attracted more than 30,000 attendees.[110]

Critical in the Regional Entities' enforcement activities is their use of information management tools. During the assessment period, they all changed or significantly improved or enhanced those tools. They did not, however, use the same tools (and there was no single, integrated compliance information system approach in place for them and NERC). Rather, they used one of two different integrated systems to manage compliance information received from registered entities. Five of the Regional Entities (RF, MRO, SPP RE, TRE, and WECC) used the web-based Compliance Data Management System (webCDMS), and three of the Regional Entities (SERC, NPCC, and FRCC) used the Compliance Issue Tracking System (CITS).[111] NERC used the Compliance Reporting and Tracking System (CRATS) to aggregate regional compliance data from webCDMS and CITS. While each system has its advantages, NERC and the Regional Entities plan to look to the feasibility of a common platform in the near future.

d. Hearings and Appeals

From the inception of the CMEP, the Regional Entities recognized the importance of providing sufficient process to registered entities which allegedly violated the mandatory Reliability Standards. Indeed, the Commission stressed more than once that the Regional Entities must have procedures in place to enable a registered entity to be heard in a trial-type hearing, and that NERC must have procedures in place to allow a registered entity to appeal a regional decision to the NERC Board and ultimately to the Commission.[112] Accordingly, the ERO Enterprise spent considerable time during the assessment period in developing and refining the *Hearing Procedures* laid out in Attachment 2 to NERC ROP Appendix 4C, and each Regional Entity issued its own CMEP hearing procedures, either incorporating or adopting by reference the procedures in Attachment 2. Many of the Regional Entities also provided training on the hearing procedures, including conducting a mock hearing, for their staffs, hearing bodies, or stakeholders.

---

[109] *See*, e.g., http://www.wecc.biz/Training/Pages/default.aspx.

[110] This broke down by Regional Entity as follows: FRCC (2,176), MRO (1,219), NPCC (1,650), RF (1,260), SERC (4,019), SPP RE (2,451), TRE (2,924), and WECC (14,658). WECC had almost half of the attendees because it held routine open WebEx calls with pre-set agendas with the time dedicated for questions and answers.

[111] The Regional Entities also used a variety of other programs, such as SharePoint document management system and MK Insight materials repository system.

[112] *See*, e.g., *North American Electric Reliability Corporation, et al*., Order Accepting ERO Compliance Filing, Accepting ERO/Regional Entity Delegation Agreements, and Accepting Regional Entity 2007 Business Plans, 119 FERC ¶ 61,060 (2007), at PP 134-165*; North American Electric Reliability Corporation, et al.*, Order Addressing Revised Delegation Agreements, 122 FERC ¶ 61,245, at PP 74-138, *order on compliance filing*, 125 FERC ¶ 61,330 (2008), at PP 58-60.

Toward the end of the assessment period, with active participation by the Regional Entities, NERC proposed changes to *Hearing Procedures*, which the Commission approved on December 20, 2012.[113] Among other things, the Commission agreed with NERC's proposal to allow third-party interventions under a strict standard, namely that the intervener must have a direct and substantial interest in the outcome of the alleged violation, proposed penalty or sanction, mitigation plan, or remedial action directive.[114] The Regional Entities agree that the codification of this standard will facilitate the resolution of enforcement proceedings, especially in those regions with RTOs or ISOs, where a third-party may be allocated all or a portion of a penalty and where the Commission's objective of getting to the "root cause" of the violation is critical to such allocation.[115]

Even though all of the Regional Entities established hearing procedures and organized their resources to accommodate hearings, just three of them conducted a total of only five hearings during the assessment period.[116] RF conducted one regular hearing and one fast-tracked hearing, both of which were ultimately resolved by settlement. SPP RE conducted two regular hearings, one of which is pending resolution in the U.S. Court of Appeals for the D.C. Circuit,[117] and one for which a settlement was pending before the NERC Board of Trustees Compliance Committee as of December 31, 2013. TRE conducted one hearing, at the end of which its board of directors issued a confidential decision, in January 2013, and submitted the matter to the NERC Board where it was pending as of December 31, 2013. At this time, in light of the relatively little activity under the current ROP, the Regional Entities believe that they should

[113] *See North American Electric Reliability Corporation*, Order Conditionally Approving Revisions to North American Electric Reliability Corporation Rules of Procedure, 141 FERC ¶ 61,241 (2012), at PP 108-110.

[114] *Id*. P 110. *See also Monongahela Power Co., et al*., 135 FERC ¶ 61,226 (2011) (authorizing FirstEnergy to intervene in an RF hearing).

[115] *See generally Reliability Standard Compliance and Enforcement in Regions with Regional Transmission Organizations or Independent System Operators,* Order Providing Guidance on Recovery of Reliability Penalty Costs by Regional Transmission Organizations and Independent System Operators, 122 FERC ¶ 61,247 (2008); *see also PJM Interconnection, L.L.C.,* Order Accepting Tariff Revisions and Requiring Compliance Filing, 124 FERC ¶ 61,260 (2008) and *Midwest Independent Transmission Operator, Inc.,* Order Conditionally Accepting Proposed Tariff Revisions, 128 FERC ¶ 61,229 (2009).

[116] The Regional Entities also received very few complaints and conducted very few investigations (as that term is defined in the CMEP) during the assessment period as follows:

	FRCC	MRO	NPCC	RF	SERC	SPP RE	TRE	WECC
Complaints	2	1	6	4	4	1	3	0
Investigations	0	3	3	3	3	3	3*	1

*One of TRE's investigations involved a 2011 winter event that led to a FERC/NERC staff report, *Report on Outages and Curtailments During the Southwest Cold Weather Event on February 1-5, 2011*. *See* http://www.ferc.gov/legal/staff-reports/08-16-11-report.pdf.

[117] *See Southwestern Power Administration, et al. v. FERC*, No. 13-1033 (D.C. Cir. Feb. 15, 2013).

obtain more experience with hearings and appeals before any significant changes are made to Attachment 2.[118]

3. Additional Statutory Functions

The 2009 JRESA identified four other functions which are primarily the ERO's responsibility but which require the active involvement, cooperation, and assistance of the Regional Entities—Reliability Assessment, Event Analysis, Situation Awareness, and Critical Infrastructure Protection.[119] In regard to Reliability Assessment, Event Analysis, and Situation Awareness, NERC and some industry members expressed concerns about the Regional Entities' performance. In regard to Critical Infrastructure Protection, the Regional Entities noted a concern they had. As now demonstrated, during the assessment period, the Regional Entities successfully took steps to address and otherwise allay the concerns of NERC and the industry members, and had its own concern satisfactorily addressed as well.[120]

a. Reliability Assessment

FPA §215(g), 16 U.S.C. §824o(g), provides that "[t[he ERO shall conduct periodic assessments of the reliability and adequacy of the bulk-power system in North America." Section 39.11 of the Commission's regulations, 18 C.F.R. §39.11 (2013), additionally directs the ERO to conduct such assessments and provide reports to the Commission and other designated entities. Accordingly, NERC prepares the annual *Long-Term Reliability Assessment*, *Summer Assessment*, *Winter Assessment*, and special assessments as needed. To this end, as can be gleaned from the NERC's *Reliability Assessment Guidebook* (version 3.1), NERC relies heavily on the Regional Entities to prepare these reports.[121] Indeed, as anticipated in the 2009 JRESA, the finalization of this guidebook during the assessment period adequately responded to the issues raised during the preparation of the Regional Entities' first performance assessment.[122] Nonetheless, the Regional Entities are committed to continue working with NERC to improve data collection and validation, and to foster greater alignment across the regions in the conduct of high quality, timely, and independent assessments that support the ERO Enterprise's valuation of reliability.

---

[118] Notably, the Commission approved a major change to the TRE hearing procedures in August 2013, allowing TRE to change its hearing process, which previously provided for the Texas Public Utility Commission to serve as the hearing body, to be the same as used by the other seven Regional Entities. *See North American Electric Reliability Corporation*, Docket No. RR13-7-000 (August 19, 2013) (unpublished delegated letter order).

[119] *See* 2009 JRESA, at pp. 32-33.

[120] Additionally, as budget matters were discussed at various places in the 2009 JRESA, this section concludes with a brief overview of Regional business plans and budget activities during the assessment period.

[121] *See* http://www.nerc.com/pa/RAPA/rg/ReliabilityGuidelines/Reliability_Assess_Guidebook_3_1Final.pdf.

[122] Concerns at that time included data checking and validation, process and procedures, stakeholder/member involvement, and overall quality and timeliness.

b. Event Analysis

In the 2009 JRESA, the Regional Entities agreed with industry members that work needed to be done on the process of timely conducting, and disseminating information gathered from, event analyses performed by NERC and the Regional Entities.[123] Without question, the ERO Enterprise made tremendous strides during assessment period to address these concerns and otherwise improve the very critical reliability function of analyzing events and distributing lessons learned to the entire reliability community. For their part, the Regional Entities significantly contributed to this effort by helping to organize and actively participating in the voluntary ERO event analysis program.

By way of background, following the creation of the NERC Event Analysis Working Group (EAWG) and two industry trials in 2010, NERC approved an industry-wide event analysis program in February 2012, and revised it in 2013.[124] This voluntary program recognizes the need to establish an appropriate level of review for the events which occur on the BPS based on their varying levels of significance, while still providing otherwise unrealized lessons to be learned from both major and minor occurrences. To complete this effort, the registered entity, the Regional Entity, and NERC staff collaborate to prepare an event analysis report, identify root cause and contributing causes, perform a formal "cause-coding" analysis, and publish lessons learned gathered from the disturbance. The process also encourages registered entities to establish a liaison between their internal event analysis and compliance functions for development of a registered entity compliance self-assessment report separate from the event analysis report. During the assessment period, this integration of industry engagement and the collaborative review of disturbances greatly improved the effectiveness, consistency, and timeliness of event analyses performed by NERC and the Regional Entities.

The following shows the progress made by the voluntary ERO event analysis program, developed by NERC, the Regional Entities, and stakeholders. Between October 2010 and December 31, 2013, registered entities submitted 469 event reports through the program, two-thirds of which were classified as Category 1.[125] Generally, the registered entities were very

---

[123] The *Report on Outages and Curtailments During the Southwest Cold Weather Event of February 1-5, 2011, Causes and Recommendations* (August 2011) (2011 Southwest Cold Weather Event) neatly summarizes the event analysis process:

> Registered entities are required to report the occurrence of defined bulk power system disturbances and unusual occurrences to the appropriate Regional Entity and to NERC. The Regional Entity and/or NERC in turn undertakes various levels of analysis to determine the causes of the events, assure tracking of corrective actions to prevent recurrence, gather information needed to assess compliance, and provide lessons learned to the industry. The event analysis process also provides input for training and education, reliability trend analysis efforts and Reliability Standards development, all of which support continued reliability improvement.

http://www.ferc.gov/legal/staff-reports/08-16-11-report.pdf, at p. 23.

[124] *See* http://www.nerc.com/pa/rrm/ea/EA%20Program%20Document%20Library/Final_ERO_EA_Process_V2.1.pdf. The EAWG eventually transitioned to the NERC Event Analysis Subcommittee.

[125] A Category 1 event includes, among other things, an unexpected outage, contrary to design, of three or more BPS elements caused by a common disturbance. *See* generally *Electric Reliability Organization Event Analysis Process*,

supportive of the process and worked with the Regional Entities' staffs to improve the quality of the reports, even providing subject matter experts to participate in calls to ensure that the reports were completely understood to more effectively assign categories and cause codes. The Regional Entities' staffs, in turn, were fully committed to the success of the lessons learned aspect of the program, and attempted to keep the registered entities up to date on the program and to help develop meaningful lessons learned. As is well known, during the assessment period, the two most notable event analyses were performed by NERC and FERC staffs with respect to the 2011 Southwest Cold Weather Event and the 2011 Arizona-Southern California Outages.[126] In both matters, the reports provided valuable information and recommendations that were closely examined by the other Regional Entities for application in their areas.[127]

c. Situation Awareness

The 2009 JRESA touched briefly on situation awareness, and took note that NERC and the Regional Entities were actively participating with FERC to enhance situation awareness by having RCs provide near-real-time operating information for their respective footprints to the Commission, NERC and the Regional Entities in order to permit the Commission to "measure the health" of the Interconnections and to monitor parameters which might warn of a developing crisis. The Regional Entities cautioned in 2009 that the communication protocols should be followed in order to prevent this effort from exposing system operators to distracting inquiries during emergency situations. Since then, as now explained, the efforts underway in 2009 were largely successful and the Regional Entities' concerns were satisfactorily addressed.

During the assessment period, FERC, NERC, and Regional Entity staffs worked together to develop a near-real time situation awareness visualization tool called SAFNR (**S**ituation **A**wareness for **F**ERC, **N**ERC, and the **R**egional Entities). SAFNR version 1 was implemented in June 2009. SAFNR version 2, which provides enhanced situation awareness with increased

---

Appendix E: Categorization of Events (February 2012) at http://www.nerc.com/pa/rrm/ea/EA%20Program%20Document%20Library/ERO_Event_Analysis_Process_Document_Version_1_Feb_2012.pdf. There was only one Category 5 event during the assessment period—Hurricane Sandy in 2012.

The events covered by the reports break down by Regional Entity as follows:

FRCC	MRO	NPCC	RF	SERC	SPP RE	TRE	WECC
25	41	69	47	42	13	69	163

[126] *See* n. 125 and *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendation*s (April 2012) (2011 Arizona-Southern California Outages) http://www.ferc.gov/legal/staff-reports/04-27-2012-ferc-nerc-report.pdf. *See also Arizona Public Service Company*, Order Approving Stipulation and Consent Agreement, 148 FERC ¶ 61,009 (2014) (approving first settlement in 2011 Southwest Blackout case between FERC's Office of Enforcement, NERC, and Arizona Public Service Company).

[127] For example, in light of the recommendations in the Arizona-Southern California Outages report, SPP RE staff conducted a survey of entities regarding operational planning and real-time situational awareness, and worked with the SPP RTO and the SPP Event Analysis Working Group to craft training materials. In addition, the SPP RTO implemented a daily benchmark process of the "next day" models to validate load forecasting and generation dispatch assumptions as well as voltage performance. Also in consideration of the recommendations in that report, WECC launched an initiative to improve modeling of remedial action schemes and relays.

trending capability, was completed in late 2012. As contemplated in the 2009 JRESA, SAFNR calls for U.S. RCs to provide system conditions via the internet to FERC, NERC, and the Regional Entities thereby allowing them to monitor continuously operating conditions and emerging reliability events on the BPS. In addition to the near-real time monitoring capabilities of SAFNR, the RCs send situation awareness reports every morning to the Commission, NERC, and the Regional Entities. These reports include an overview of weather conditions, transmission line and generation outages, and operating reserves. Furthermore, the Regional Entities participate in weekly situation awareness and event analysis conference calls with NERC. From the Regional Entities' perspective, the combination of SAFNR, the daily situation awareness reports, and the weekly calls with the ERO, give them a good overview of what is happening on the BES. And, of course, they are in regular communication with the registered entities within their footprints, in particular the RCs, and provide those entities with the means to contact them or receive pertinent information from them at all times with respect to any incidents or events on the grid.[128]

d. Critical Infrastructure Protection

The 2009 JRESA posited only one issue with respect to CIP, namely that the Commission should approve a pending proposal to amend the NERC ROP to provide that any Technical Feasibility Exception (TFE) requests (from the coverage of the CIP Reliability Standards) be submitted in the first instance to the Regional Entities, rather than to NERC.[129] Early in the assessment period, the Commission approved the proposed amendment, thus mooting the issue raised in 2009.[130] More recently, in September 2013, the Commission approved what NERC described as the first comprehensive review of the TFE process since it was originally developed and approved.[131] The Commission explained that NERC and the Regional Entities had processed by that time over 3,800 TFE requests in the past three years, including over 1,300 TFE requests in 2011, experience that supported NERC's proposal to streamline the process for submitting, reviewing, and approving or disapproving TFE requests, and for modifying approved TFEs.[132] The Regional Entities are pleased that the Commission

[128] For example, WECC established a web portal to allow BAs and TOPs access to actual RC real-time state estimator, contingency analysis, and other situational awareness-enhancing tools. NPCC introduced the *Emergency Preparedness Conference Call Procedures* to enable the RCs in its footprint, and, as circumstances may require, their counterparts in neighboring Regional Entities, to rapidly communicate the status of current operating conditions, facilitate the procurement of assistance during emergency conditions, and identify potential physical or cyber threats to the system.

[129] TFE requests primarily arise with respect to long-life equipment in place that is not readily compatible with a modern environment where cyber security issues are a concern. *See Mandatory Reliability Standards for Critical Infrastructure Protection*, Order No. 706, 122 FERC ¶ 61,040 (2008), at P 180.

[130] *See North American Electric Reliability Corporation*, Order Approving Technical Feasibility Exception Procedures and Ordering Compliance Filing, 130 FERC ¶ 61,050 (2010).

[131] *See North American Electric Reliability Corporation,* Order Approving Revisions to Electric Reliability Organization's Rules of Procedure and Directing Compliance Filing, 144 FERC ¶ 61,180 (2013), *order on compliance*, Docket No. RR13-3-001 (January 30, 2014) (unpublished letter order).

[132] *Id.* P 12.

approved NERC's proposed amendments, which will help reduce TFE processing times while maintaining the integrity of the CIP mandatory Reliability Standards.

In addition, during the assessment period, the Regional Entities significantly expanded the number and the expertise of their staffs, in particular their auditors, to verify compliance with the CIP mandatory Reliability Standards. They uniformly hired personnel with relevant credentials and experience. For example, SPP RE's audit team (as of mid-2013) had over 94 years of information technology, cybersecurity, and IT audit experience, including 52 years of experience in the electricity sector, and FRCC required (as of mid-2013), as a condition of employment, five years of experience in cybersecurity practices, information technology, auditing practices, implementation of NERC Reliability Standards, or other equivalent experience. Moreover, by the end of the assessment period, many of the Regional Entities' employees held active certifications recognized by the U.S. Department of Defense Directive 8570 (e.g., Certified Information Systems Auditor (CISA), Certified Information Systems Security Specialists (CISSP), Certified Ethical Hacker (CEH), and Network +). They also sought out personnel who understood energy management systems (EMS) and supervisory control and data acquisition (SCADA) systems and several of them augmented their staffs' expertise with contractors who held similar credentials and experience.

Needless to say, the Regional Entities recognize the incredibly important role that cybersecurity plays in the fulfillment of their statutory responsibilities.[133] Accordingly, during the assessment period, they uniformly expended considerable resources and effort to organize their CIP programs and to enforce the mandatory CIP Reliability Standards. Several also initiated on-site visits at their registered entities to assess their physical security, to discuss with those entities the intricacies of complying with the CIP Reliability Standards, and to explore best industry practices with respect to cybersecurity. In addition, the Regional Entities improved their own technology to be able to handle the transport and storage of the especially sensitive information that they collect in CIP compliance audits and investigations.

Finally, during the assessment period, Regional Entities participated in two NERC Grid Security Exercises (GridEx), which use best practices from the Department of Homeland Security, the Federal Emergency Management Agency, and the National Institute of Standards and Technology. Six Regional Entities (MRO, NPCC, RF, SERC, TRE, and WECC) joined 70 industry and government organizations in the 2011 GridEx, on November 16, 2011 through November 17, 2011, and six Regional Entities (FRCC, MRO, NPCC, RF, SERC, and TRE) joined more than 200 industry and government organizations, either as full participants or as observers, in the 2013 GridEx on November 13, 2013 through November 14, 2013. The 2011 GridEx was designed to validate the readiness of the Electricity Sub-sector to respond to a cybersecurity incident, strengthen registered entities' crisis response functions, and provide input for internal security program improvements. Overall, the exercise was widely regarded across industry and government as a critical imperative in preparing the BPS for a disruptive cyber event.[134] The 2013 GridEx gave participants the opportunity to check the readiness of their crisis

[133] *See* 16 U.S.C. §§824o(a)(3) and (4).

[134] *See 2011 NERC Grid Security Exercise After Action Report* (March 2012) at http://www.nerc.com/pa/CI/CIPOutreach/Documents/NERC%20GridEx%20AAR%2016Mar2012%20Final.pdf.

action plans through a simulated security exercise to self-assess response and recovery capabilities, and to adjust actions and plans as needed, while communicating with industry and government information sharing organizations.[135]

4. Budget

The 2009 JRESA mentioned various budget matters but did not include a separate section on the topic. The significant progress made in this area during the assessment period by the Regional Entities under NERC leadership calls for at least a brief discussion here. Also, as related generally in the Introduction and specifically by each Regional Entity in Appendix C, the Regional Entities are required by FPA §215 to establish rules that "allocate equitably reasonable dues, fees, and other charges among end users for all activities," an obligation that obviously necessitates that they function under a business plan and a budget. The Regional Entities first approached these budget responsibilities during the assessment period by developing, in collaboration with NERC, and proposing annual business plans and budgets, in accordance with Commission orders, ERO rules, and NERC business planning and budgeting policies and instructions. For this purpose, they used NERC forms for business plan and budget submittal and adhered to NERC's schedule for preparation of the business plan and budget and related financial statements. They likewise followed NERC's prescribed system of accounts (except to the extent that NERC permitted a departure from the prescribed system of accounts).

The Regional Entities made significant progress in the development and submission of their annual business plans and budgets partly as a result of their active participation in the Regional Entity Budget Group (REBG), which transitioned during the assessment period to the ERO Finance Group (EROFG). This group reviewed templates, budget processes, schedules and deadlines, account classifications, financial reporting, and accounting changes. Members of the group were able to share information concerning benefits, salaries, policies, and procedures that are used in the day-to-day accounting activities in the regions. The Regional Entities also took advantage of the opportunity to preview their preliminary annual budgets for Commission staff, and receive feedback generally and with respect to staffing needs and extraordinary items. They further worked with NERC to develop long term resource and financial planning, and to formulate a set of "common assumptions," which helped to clarify expectations. As a consequence of the concerted efforts made by NERC, the Regional Entities, and the EROFG, the regional budget process significantly improved during the assessment period, progressing from a level of some uncertainty to a level of considerable predictability regarding needed resources and anticipated expenses.[136]

---

[135] *See Grid Security Exercise (GridExII) After-Action Report* (March 2014) available at: http://www.nerc.com/pa/CI/CIPOutreach/GridEX/GridEx%20II%20After%20Action%20Report.pdf. The Regional Entities were also represented at the "tabletop" of executives from government, industry, and NERC, which took place after the 2013 exercise.

[136] An excellent overview of the progress made by the ERO Enterprise during the last year of the assessment period in preparing the Regional Entities' 2014 business plans and budgets can be found in NERC's *Request for Acceptance of 2014 Business Plans and Budgets of NERC and Regional Entities and for Approval of Proposed Assessments to Fund Budgets*, Docket No. RR13-9-000 (submitted on August 23, 2013), at pp. 24-30. *See also*

CONCLUSION

The ERO Enterprise significantly matured during the assessment period, building on the foundation of the first three years of the program in which the ERO and the Regional Entities had to set up and organize their operations to implement a sweeping new set of Federal laws, regulations, policies and practices under the oversight of the Commission. Those first three years were truly a time of learning and adjusting to the new paradigm. The next five years, the current assessment period, were a time to learn from experience and explore ways to improve, refine, and stabilize the program. The Regional Entities successfully contributed to those objectives in several ways. They worked more closely and productively with the ERO and with each other. They reached out to and trained their registered entities and other stakeholders. They actively participated in FERC proceedings to keep the Commission informed and to help craft orders and policies that appropriately advance reliability. They continuously examined ways to be more efficient and effective in exercising their compliance enforcement authority and to better gauge the risk that noncompliance posed to reliability. Finally, at all times, they met their statutory obligations to be impartial, develop reasonable and technically sound standards, enforce those standards with due process, operate within sound business plans and budgets, coordinate their efforts in North America, where applicable, and function under RDAs that promote effective and efficient administration of BPS reliability.

North American Electric Reliability Corporation, Order on 2014 Business Plan and Budget of the North American Electric Reliability Corporation and Ordering Compliance Filing, 145 FERC ¶ 61,097 (2013).

Appendix A
Description of Regional Entities

A Regional Entity is an organization that has been delegated certain statutory functions of the Electric Reliability Organization (ERO). The ERO and each Regional Entity consummate the delegation through the execution of a Delegation Agreement, which must be approved by the Federal Energy Regulatory Commission (Commission or FERC) in the U.S. By entering into such an agreement, the Regional Entity becomes subject to the jurisdiction of the FERC and the rules of procedure of the ERO.

In July 2006, when the Commission certified the North American Electric Reliability Corporation (NERC) as the ERO, it also accepted NERC's proposal to delegate certain ERO functions to designated Regional Entities, as well as NERC's proposed *pro forma* Delegation Agreement.[137] In April 2007, NERC entered into separate Delegation Agreements with eight Regional Entities, through which NERC delegated certain ERO functions. Specifically, NERC delegated authority to the Regional Entities to audit, investigate, and otherwise ensure that users, owners, and operators of the BPS comply with NERC's mandatory Reliability Standards, subject to ERO oversight.[138] Further, the Delegation Agreements addressed: (i) Regional Reliability Standards development; (ii) registration of entities that must comply with Reliability Standards; and (iii) other services supporting NERC's functions, including reliability assessments, event analysis, and training and education. In October 2010, the Commission approved a revised *pro forma* Delegation Agreement, and revised Delegation Agreements between NERC and each of the eight Regional Entities.[139] Subsequently, the Commission also approved other changes to specific Delegation Agreements.[140]

As shown in Figure 1, the existing eight Regional Entities provide full geographic coverage for the jurisdictional scope of NERC as the international ERO.

Figure 1 — Map of Regional Entities within NERC

Each of the Regional Entities is briefly described below.

Florida Reliability Coordinating Council, Inc. (FRCC) was formed in 1996. Its sole purpose is to ensure and enhance the reliability and adequacy of the BPS in Florida. Since becoming a Regional Entity, FRCC has made significant changes in its governance and organizational structure. FRCC amended its bylaws to create two membership divisions — Regional Entity Division (statutory functions) and Member Services Division (non-statutory functions), added a new General Sector to its membership sectors, added new employees strictly dedicated to the compliance and standards functions, and made changes in its organizational reporting structure. All staff members are independent of registered entities, and the organization is governed by a balanced stakeholder board. FRCC has also implemented internal controls in its accounting procedures to ensure there is no cross subsidization of funds between statutory and non-statutory activities.

Midwest Reliability Organization (MRO) was formed from the former Mid-Continent Area Power Pool (MAPP) Regional council and a portion of Mid-America Interpool Network (MAIN) as a new corporation for the purpose of becoming a Regional Entity under the Energy Policy Act of 2005 and the Bilateral Principles. The region spans eight states and two Canadian provinces. MRO's bylaws provide for members from the following industry sectors: municipal utilities, cooperatives, investor-owned utilities, federal power marketing agency, Canadian Crown Corporations, and independent power producers. MRO's bylaws also allow for adjunct members that are not eligible to belong to an industry sector and have a material interest in reliability issues in the MRO region. Membership is at no cost. MRO is independent of all BPS owners, operators, and users, and has no shared employees with any third party. MRO performs only responsibilities delegated from the ERO and similar functions in the Canadian provinces of Saskatchewan and Manitoba. MRO's board of directors (MRO Board) represents a hybrid

governance structure with both independent and stakeholder directors. The stakeholder directors represent the industry sectors noted above; two independent directors are elected by the entire membership. MRO's hybrid board is structured so that no two sectors can control a vote. The MRO Board has adopted procedures to ensure that it carries out its responsibilities in a non-discriminatory manner, free of conflicts.

Northeast Power Coordinating Council, Inc. (NPCC) was established as the voluntary, international regional reliability organization for Northeastern North America in January 1966. NPCC is a not-for-profit corporation with a Regional Entity division that performs the statutory functions delegated by NERC and a Criteria Services division that establishes, monitors, and enforces compliance with regionally-specific criteria. The NPCC geographic region includes the State of New York and the six New England states as well as the Canadian provinces of Ontario, Québec and the Maritime provinces of New Brunswick and Nova Scotia. Overall, NPCC covers an area of nearly 1.2 million square miles, populated by more than 55 million people. In total, from a NEL perspective, NPCC is approximately 45% U.S. and 55% Canadian. With regard to Canada, approximately 70% of Canadian NEL is within the NPCC region. NPCC's board of directors consists of seven stakeholder voting sectors that each consist of a maximum of two directors per sector, an independent sector consisting of two independent directors, an independent board chair with voting rights to preclude board deadlocks, and the President and CEO. Within NPCC, no two sectors can control and no one sector can block action.

ReliabilityFirst Corporation (RF) was formed from parts of the former East Central Area Reliability Council (ECAR), MAIN, and the Mid-Atlantic Area Council (MAAC) Regional reliability councils on January 1, 2006. The organization was specifically designed to address changes required by the Energy Policy Act of 2005 and to support the ERO in a self-regulating model by which the industry participants establish their own standards and independent Regional Entities determine compliance to those standards. The organization was modified from top to bottom compared to the legacy reliability councils it replaced, and exists solely to serve as a FERC-approved Regional Entity performing only those functions delegated to it by NERC as the ERO. All ReliabilityFirst staff are independent of registered entities, the organization is governed by a hybrid board of directors, which includes both independent and balanced industry sector directors, and the organization is funded (through the ERO) by all load-serving entities in the footprint as opposed to members (membership is free.)

SERC Reliability Corporation (SERC) was incorporated in April 2005, replacing the Regional reliability council previously in existence since 1969. The new organization was redesigned to meet FPA §215 and FERC criteria for delegating statutory authorities and responsibilities. SERC's scope includes only statutory functions delegated by NERC. The organization does not perform any registered entity functions and has no business affiliations with any registered entities. SERC adopted new bylaws, approved by FERC in April 2007, that provide for a balanced stakeholder board with seven sectors. All SERC staff are independent of registered entities. The organization is funded through the ERO. Membership is free and open to all owners, operators, and users in the SERC region.

Southwest Power Pool Regional Entity (SPP RE) has made fundamental governance and organizational changes necessary to carry out its delegated responsibilities. In response to

the Energy Policy Act of 2005, Southwest Power Pool, Inc. (SPP), created a new department to perform all compliance activities over SPP registered entities. SPP RE began engaging NERC to lead SPP audits in 2007. In April 2007, FERC approved changes to the SPP bylaws creating three independent trustees to manage all SPP RE delegated activities. These trustees, initially elected in June 2007, are required to be independent of SPP members and customers, and registered entities in the region. In March 2009, SPP RE hired a general manager, reporting directly to the three independent trustees, to oversee the execution of the Regional Entity strategic direction and direct the day-to-day operations, including all compliance and enforcement activities. The general manager oversees only delegated statutory functions. All reporting relationships between SPP RE employees and SPP employees have been terminated.

Texas Reliability Entity, Inc. (Texas RE or TRE) is a non-profit Texas corporation that was formed to serve as the Regional Entity for the Electric Reliability Council of Texas, Inc. (ERCOT) region, and to preserve and enhance reliability in the region. Effective July 1, 2010, Texas RE took over the duties of the previous Regional Entity, the Texas Regional Entity, an independent division of ERCOT. Texas RE also performs non-statutory activities as the Reliability Monitor for the ERCOT region pursuant to its July 1, 2010, agreement with the Public Utility Commission of Texas (PUCT) and ERCOT (the ISO in the region). As Reliability Monitor, Texas RE monitors and reports to the PUCT regarding market participants' compliance with electric reliability-related ERCOT Protocols, Operating Guides, and Texas rules (ERCOT Regional Rules). The ERCOT region is the geographic area located within the state of Texas that operates under the jurisdiction of the PUCT and is not synchronously interconnected with any electric utilities operating outside of Texas. The ERCOT region includes approximately 85 percent of Texas load and 75 percent of the Texas land area.

Western Electricity Coordinating Council (WECC) is the successor to the Western Systems Coordinating Council (WSCC), which was formed in 1967. WECC, established in April 2002, continues to be responsible for promoting and coordinating electric system reliability among industry stakeholders as had been done by WSCC since its formation. On July 20, 2006, pursuant to FPA §215, NERC was certified as the ERO in the U.S. Included in this certification was a provision for the ERO to delegate authority for the creation and enforcement reliability to Regional Entities such as WECC. WECC is geographically the largest and most diverse of the eight Regional Entities that have Delegation Agreements with NERC. WECC's service territory extends from Canada to Mexico. It includes the provinces of Alberta and British Columbia, the northern portion of Baja California, Mexico, and all or portions of the 14 Western states between. Due to the size and diverse characteristics of the region, WECC and its members face unique challenges in coordinating the day-to-day interconnected system operation and the long-range planning needed to provide reliable electric service across nearly 1.8 million square miles. Membership in WECC is open to all entities with an interest in the operation of the BPS in the Western Interconnection. All meetings are open and anyone may participate in WECC's standards development process.

On June 27, 2013, the WECC board of directors (WECC Board) approved the bifurcation of the company into a Regional Entity (WECC) and a Reliability Coordination Company (Peak Reliability). This decision—which is the culmination of a year of work by various WECC board committees, staff, WECC members, and WECC stakeholders—signals a major landmark in the

history of the organization. Under this new structure the reliability coordinator and interchange authority functions in the Western Interconnection became a separate company from WECC. When established, Peak Reliability will provide core and other associated reliability coordination services within the Western Interconnection. As anticipated, the Commission approved the relevant documents by the end of December 2013; however, as there were outstanding compliance filings, the bifurcation was not finalized during the assessment period. Nevertheless, WECC and Peak Reliability began operating as separate entities in many respects by that time.

Appendix B
Regional Entity Responses to Specific Concerns Raised in the Commission's September 16, 2010 Order on the Three-Year ERO Performance Assessment

In the order on the Electric Reliability Organization's Three-Year Performance Assessment (2010 Order), the Commission discussed several specific concerns regarding Regional Entity activities including: (i) compliance monitoring and enforcement issues concerning all Regional Entities; (ii) NERC's evaluation of each Regional Entity compliance program; (iii) SPP independence; and (iv) WECC's voting structure.[141] The first topic has been addressed throughout the 2014 JRESA. The other three region-specific topics are addressed below (italicized paragraphs come from the 2010 Order).

NERC's Evaluation of Each Regional Entity

222. *With respect to **FRCC**, NERC states that FRCC needs to improve its timeliness in: (1) reporting alleged violations to NERC; (2) issuing notices of alleged violation; (3) confirming violations and issuing notices of confirmed violation or entering into settlement agreements; and (4) obtaining Board of Trustees Compliance Committee approval of confirmed violations. NERC relates that FRCC recently has increased its compliance program staffing and, as of the Performance Assessment filing date, had the second lowest number of registered functions per full-time equivalent (FTE) committed to compliance of any Regional Entity.*

The FRCC improved its timeliness in all aspects of the compliance and enforcement processes during the assessment period. Notices of alleged violations, notices of confirmed violations and settlements were handled by the FRCC Compliance Enforcement staff. In January 2010, FRCC created a new position of manager of compliance enforcement, promoted a senior auditor to that position, and added two new enforcement positions, an enforcement specialist and a compliance legal assistant. The enforcement specialist position was filled in January 2010, and the legal assistant was filled in May 2010. Subsequently, the FRCC added two more enforcement positions, both CIP enforcement specialists. With the increased enforcement staff, the FRCC worked steadily to improve all of its processes. Additionally, FRCC developed internal processes and goals to support and facilitate the processing of alleged violations, as follows:

- Created enforcement processing checklists;
- Developed violation and mitigation plan responsibility flowcharts;
- Developed enforcement procedures;
- Created annual success plan goals for enforcement team members;
- Implemented departmental caseload goal;
- Developed internal enforcement processing metrics;
- Collaborated with other Regional Entities in a Consortium Users Group (CUG) to improve data base management tool;
- Automated database reporting tools which improved efficiency;

[141] *North American Electric Reliability Corporation, et al*., 132 FERC ¶ 61,217 (2010) at PP 198-244.

- Implemented a secure vault system for registered entity CIP data, which eliminated onsite reviews; and
- Compiled with NERC requests to complete processing of all violations through 2011 to NERC goals.

223. *NERC views **MRO** as an effective Regional Entity. NERC indicates that MRO should improve by providing accurate statements of fact for each violation and assess penalties according to the facts of each situation. NERC has concerns about several of MRO's compliance processes, which NERC has not yet reviewed or approved. NERC states that although these methods may be effective, they are not consistent with NERC practices and could lead to inconsistency with other regions.*

NERC's 2009 assessment alluded to two situations which occurred in that year. The first involved the issuance by FERC of a formal notice extending the time for consideration of a NOP (NP09-21-000), in which FERC requested additional information and clarification of certain facts. While MRO was the first of the Regional Entities to receive such a formal notice, similar notices were subsequently issued to all of the Regional Entities. In some instances, the Commission issued multiple requests to the same region. In only one instance, during the assessment period, did the Commission undertake its own review of a regional enforcement determination (WECC decision in Turlock, FERC Docket No. NP10-18-000), which was ultimately affirmed. MRO has not received any other formal requests from FERC for additional information and clarification.

Also in 2009, the NERC BOTCC remanded an enforcement action because MRO characterized a self-certification as a self-report in its determination. This was a simple administrative error, which MRO appreciates being found by NERC. Subsequently, MRO worked with NERC staff to develop a process whereby NERC staff works with Regional Entity staff to ensure agreement with or clarification of discrepancies prior to presenting enforcement actions to the BOTCC for approval. At the time, the MRO self-certification process was a manual process, which then required MRO compliance staff to enter the information into the data management system (CDMS). In this instance, MRO compliance staff entered the self-certification into the CDMS application as a self-report without indicating that the possible violation was actually identified through the self-certification process. This was the only instance where such an error occurred and it did not change the enforcement determination.

Finally, MRO believes that NERC's concerns about several of MRO's compliance processes, which NERC stated may be effective, were due to NERC's misunderstanding MRO's practices at the time. Shortly before the submission of the 2009 JRESA, MRO adopted its three-step process for activities within the CMEP: (i) Compliance Monitoring, (ii) Risk Assessment and Mitigation, and (iii) Enforcement, each performed by its own personnel within MRO. Compliance Monitoring staff conducts audits and spot checks of compliance with Reliability Standards by registered entities. Risk Assessment and Mitigation undertakes an independent review of the facts and circumstances surrounding each violation discovered by Compliance Monitoring, and determines whether sufficient evidence supports each possible violation. Risk Assessment and Mitigation works with the registered entity to develop an effective mitigation plan in the event that a violation is confirmed. Confirmed violations move to the Enforcement

department staff, who review recommendations made by Risk Assessment and Mitigation staff, verify all relevant facts, and evaluate appropriate enforcement actions. The factual review conducted by Risk Assessment and Mitigation and Enforcement staff is intended to ensure a consistent, accurate application of the NERC Reliability Standards. The three-step process also provides for segregation of duties, establishing independence among those making the findings, those assessing risk, and those determining and negotiating penalties and sanctions. MRO believes that this process provides a high level of assurance that determinations are accurate, fair and non-discriminatory.

224. *NERC views **NPCC** as effective in that it is processing and completing identified violations in a timely manner. However, NERC is concerned that NPCC's low level of alleged violations per registered reliability function may indicate that NPCC is not identifying all violations that are occurring. NERC points out that, among the Regional Entities, NPCC had the second highest number of FTEs committed to the compliance program and the highest ratio of registered functions per compliance FTE as of the Performance Assessment filing date. NERC states that it will continue to work with NPCC to improve its process for compliance violation investigations.*

NPCC continues to have a low level of alleged violations per registered reliability function; however, the ratio is in line with several of the other Regional Entities. NPCC credits in part its low level of alleged violations per registered reliability function to its thorough outreach and communication both on an individual basis and through workshops and other forums with the registered entities within its region. Such outreach assists the registered entities in their compliance activities and enhances reliability. In addition, by the end of the assessment period, while NPCC had the lowest number of full-time equivalents (FTEs) committed to the compliance program and the highest ratio of registered functions per compliance FTE, it supplemented its compliance program with independent contractors that perform many of the compliance duties. In this manner, NPCC has been able to build a very cost effective compliance program. NPCC welcomes ERO-wide collaboration on improvements to the process for compliance violation investigations and other process related issues, and is actively involved in RAI-related projects, including running pilots on analyzing registered entities' internal controls, the auditor check list and workbook, and the transition from CIP version 3 to version 5 Reliability Standards.

225. *NERC and its outside auditing firm independently audited **RF's** compliance program and found no material deficiencies. NERC observes that RF was the first Regional Entity to receive approval from the NERC Board of Trustees Compliance Committee for a notice of penalty that imposed a non-zero dollar penalty. NERC notes that RF does need to find ways to increase its efficiency with respect to conducting enforcement activities.*

Since 2009, ReliabilityFirst has taken several steps to increase its efficiency with respect to conducting enforcement activities.

First, ReliabilityFirst has internal violation processing goals that are tied to its overall corporate goals. Second, enforcement staff members hold regular meetings to discuss their plans to meet these violation processing goals. At these meetings, enforcement staff members provide

projected timeframes for the resolution of their matters, and are held accountable to those timeframes. Third, ReliabilityFirst has held formal and informal meetings to better focus enforcement staff on how to tailor their fact gathering efforts and resolving documents to only relevant information. As a result, enforcement staff became more efficient at resolving violations in a shorter amount of time. Fourth, ReliabilityFirst has focused its efforts on those violations that pose the greatest risk to reliability, and expedited its processing of lesser risk violations via the FFT process. To date, ReliabilityFirst has processed approximately 330 FFTs. (Even prior to the FFT process, ReliabilityFirst followed an internal "fast track" process, where it expedited the processing of minimal risk violations in a separate internal process from its other violations.)

ReliabilityFirst's efforts to increase its efficiency in the enforcement process were successful, and to date, ReliabilityFirst has processed over 1,400 alleged violations through NERC and the Commission. The volume of compliance work at ReliabilityFirst has increased significantly since the 2009 self-assessment,[142] but ReliabilityFirst has nevertheless become more efficient at processing violations. As a result, ReliabilityFirst has not only kept up with its caseload, but has simultaneously refined its approach to better focus its efforts on high risk violations and ensuring that major reliability enhancements result from their corresponding enforcement actions. ReliabilityFirst staff's focus on high risk violations is fundamental to regulatory effectiveness as it is critical to prevent staff at the Regional Entities from spending unnecessary amounts of time on minimal risk issues, so they can focus on the high risk issues that are critical to reliability.

226. *NERC views **SERC** as an effective Regional Entity. NERC audited SERC's compliance program and did not find any material deficiencies, but urges SERC to improve on its timeliness in issuing notices of alleged violation. NERC notes that SERC continues to use industry volunteer subject matter experts in addition to its own staff on compliance audits.*

SERC made significant progress during the assessment period to address the concerns raised in 2009. For example, in order to improve violation processing cycle time, SERC staff developed a comprehensive plan that included increasing productivity, improving process and tools, and reviewing staffing levels. This plan was unanimously approved by the SERC Board Executive Committee.[143] Furthermore, SERC implemented process improvements in order to

[142] In 2009, ReliabilityFirst received 169 new violations, and in 2010, this number jumped to 453 violations. In 2011, ReliabilityFirst received 514 violations, in 2012, ReliabilityFirst received 549 violations, and as of August 9, 2013, ReliabilityFirst received 520 violations.

[143] In 2011, SERC removed some collateral duties from Enforcement staff to ensure a focus on violation processing and reduced the ancillary meetings attended by Enforcement staff by 50%. In 2011, SERC developed a corporate metric focused on improving violation processing time, increasing the average number of determinations completed per FTE from 1.4 determinations per month to 4 determinations per month. In 2012, SERC developed a corporate metric focused on improving violation processing to continue its work towards achieving a 12-month violation processing cycle time for Planning and Operations issues. In 2013, SERC developed a corporate metric focused on improving CIP violation processing to continue its work towards achieving a 12-month violation processing cycle time while maintaining a 12-month or less violation processing cycle time for Planning and Operations issues. In addition, SERC provides an ongoing interface and training for Enforcement, legal, and audit staff to allow for discussion of lessons learned and feedback to improve violation assessments and risk statements.

streamline the enforcement process and ensure that SERC has the necessary information to conduct a thorough and timely assessment. These improvements included automation of notification and letters, increased use of requests for information, seminars and outreach, simplified review steps for violation processing, continued use of streamlined enforcement processing (FFT and SNOP), and expanded capabilities for access to CIP evidence and data.

In addition to the increased focus on productivity and process improvements, SERC also has worked to implement organizational efficiencies. To this end, SERC restructured Enforcement staff after a review of other regional structures. Enforcement now reports directly to the vice president and chief program officer, which removes a redundant reporting structure and serves to elevate Enforcement in the organization, given its priority at SERC. SERC has also reviewed its staffing levels and has increased the number of Enforcement staff focused on CIP issues based on the increase in CIP possible violations reported to the region.

As a final matter, with respect to SERC's use of volunteer industry subject matter experts, during the assessment period, the Commission reviewed SERC's use of volunteer industry subject matter experts (ISMEs) on compliance audits as part of its audit of SERC (FERC Docket No. FA12-6-000). FERC found that SERC's use of ISMEs was consistent with the NERC ROP, but did recommend that SERC: (i) revise its process, procedures, and controls regarding ISME participation in compliance activities and ensure SERC has an adequate and detailed set of policies governing ISMEs' participation in compliance activities; and (ii) ensure greater awareness of SERC's ongoing training and education programs and use the feedback from ISME participation in compliance activities to better focus these outreach programs. SERC has committed to implement the recommendations contained in the FERC audit report.

227. *As of the filing date of the Performance Assessment, NERC views* ***SPP Regional Entity*** *as less effective in administering its compliance program than some other Regional Entities. NERC commends SPP Regional Entity for its ability to accurately identify high risk violations, but is concerned about SPP Regional Entity's ability to process alleged violations to completion in a timely manner and its situational awareness capabilities. NERC notes that SPP Regional Entity has been unaware of events that occurred within its footprint, while NERC and the Commission were aware of those events. NERC states that among the Regional Entities, SPP Regional Entity stands eighth in FTEs committed to the compliance program and second in the number of registered functions per compliance FTE.*

SPP RE has significantly reduced the amount of time it takes to process alleged violations to completion. Prior to January 1, 2009, SPP RE's average time to process alleged violations to completion was 24 months, compared to 9.2 months (as of June 30, 2013). The reduction is due to a number of factors, including developing internal Enforcement procedures, streamlining internal Enforcement processing procedures, and increasing the Enforcement staff.[144] SPP RE staff members have also taken several steps to increase their awareness of system events within the region. These steps include SPP RE staff's registering to receive NERC Reliability Coordinator Information System information and *NERC Alerts*, and their receiving and reviewing the *SPP RTO Daily Operations Report*, the *NERC Situational Awareness Morning*

[144] Since January 1, 2009, SPP RE has increased its Enforcement staff from one FTE to ten FTEs and one part-time employee, and has steadily decreased the number of registered functions per compliance FTE to 11.62 (2013 figure).

Report, and the NERC BPS *System Awareness Daily Report*. In addition, SPP RE participates on weekly situational awareness calls with NERC staff, and has increased its outreach through workshops, webinars, newsletters, and personal communication to encourage reporting of events.

228. *NERC rates **TRE** as an effective Regional Entity, commending TRE for focusing on identifying higher risk violations and noting that TRE excels in processing alleged violations through completion. NERC does have questions about a contrast between TRE's high percentage of "failure to perform" violations and low number of violations TRE has recommended for a non-zero dollar penalty. NERC states that it will continue to explore these concerns with TRE.*

In 2007 and 2008, Texas RE recommended zero-dollar penalties in most cases because the Reliability Standards were new and registered entities were still learning how to comply with them. In 2009, in an effort to deter noncompliance, Texas RE began recommending more non-zero dollar penalties for "failure to perform" violations. However, in 2010 Texas RE implemented the Administrative Citation NOP process and by 2012 Texas RE adopted the FFT program. Using the Administrative Citation process and FFT processes, Texas RE stopped recommending monetary penalties for issues involving "failure to perform" if the issues presented low risk to reliability and had been mitigated.

231. *NERC states that **WECC** is "one of the less effective Regional Entities" to date, but notes that WECC made significant progress in the spring of 2009, particularly with respect to processing a backlog of violations. NERC points out that although, as of the Performance Assessment filing date, WECC had the highest level of FTEs committed to the compliance program among the Regional Entities, WECC had the fourth highest ratio of registered functions to compliance FTEs. NERC notes that, due to the violations processing backlog, WECC cancelled all compliance audits scheduled for the fourth quarter of 2008 without coordinating with NERC. According to NERC, WECC also took several other unilateral actions, including issuing compliance bulletins containing Reliability Standards interpretations and/or guidance. NERC indicates that it will continue to work with WECC to resolve these issues. NERC also suggests that WECC create stronger separation between its compliance encouragement efforts and its enforcement activities, examine its staffing levels and compliance processes and stay focused on processing violations to completion. (Footnote omitted.)*

WECC has thoughtfully and thoroughly addressed each of the areas of concern identified in the Three-Year ERO Performance Assessment and the 2010 Order. First, WECC cleared all of its pre-2012 violations caseload by December 31, 2013. As reported to the NERC Board in September 2013, WECC has a caseload index of 8.3 months, ranking third among the Regional Entities.[145] Second, WECC completed all audits contemplated in its annual Implementation Plans. Specifically, during the assessment period, WECC conducted 598 audits and 62 spot checks. The number of audits increased from 90 in 2009 to 165 in 2013, an increase of 83

[145] The caseload index refers to a NERC metric that computes the number of months that it takes to clear the violations that are either in the Regional Entity's inventory, NERC's inventory, or the ERO's inventory based upon the respective average monthly processing rate over the preceding 12-month period. This metric is used to evaluate the efficiency of processing violations over time.

percent. Third, WECC developed and maintains a highly qualified Compliance staff, which increased from 31 to 57 during the assessment period. To further improve its compliance capabilities, in 2013, WECC launched an audit tracking system to assure timely audit completion and document integrity. WECC's internal metric for providing final audit reports to registered entities is 60 days after the close of the audit, a goal which was met 97 percent of the time. Fourth, WECC enhanced, streamlined and documented all of its Enforcement processes, an effort aided by using dedicated subject matter experts and tools such as FFT and expedited settlement agreements. As a result, by the end of the assessment period, WECC was able to process violations from intake through filing with NERC in less than five months, on average. Fifth, WECC successfully implemented new IT solutions and systems, and provided extensive training to registered entities on the new systems. Sixth, WECC expanded and enhanced its compliance encouragement and outreach efforts while ensuring "adequate separation between compliance encouragement efforts and its enforcement activities." This was accomplished in part by personnel changes and strengthening the role of the director of stakeholder outreach. Finally, WECC worked collaboratively with the other Regional Entities and NERC to bring forward the Omnibus proposal; proposed Rules of Procedure changes to streamline TFE processing; developed new registration system tools; and actively participated in several ongoing NERC IT projects, lending expertise and practical experience.

SPP Independence

In the 2010 Order, the Commission laid out its initial concerns about the possible conflicts of interest between SPP RE and SPP RTO, and emphasized the heavy burden on SPP RE to demonstrate a strong separation of functions between the two organizations.[146] As a consequence, the Commission had required NERC to provide an appropriate discussion of SPP RE's bylaws in its first performance assessment. In response to NERC's submission, the Commission generally found that SPP RE had achieved sufficient separation from SPP RTO, citing in particular SPP RE's efforts to ensure that its standards development process was not unduly influenced by the RTO.[147] While the Commission's analysis in the 2010 Order does not necessarily require a further response at this time, SPP RE would like to point out that the Commission's second audit of SPP RE, which was finalized in 2011, reinforced the adequacy of Regional Entity's separation from the RTO.[148] Among other things, the second audit report described how SPP RE's general manager is the primary contact between NERC and SPP RE, with responsibility for administering SPP RE's programs under the Delegation Agreement. The report also described how SPP RE is governed by three independent trustees who operate separately from the SPP RTO board of directors, and that SPP RE trustees have autonomy over decisions in fund allocation and approval of SPP RE's budget, as well as oversight of SPP RE decisions on regional Reliability Standards, compliance enforcement actions, and penalties. In addition, as the report set out, SPP RE's organizational structure makes it independent from the

[146] *See* 132 FERC ¶ 61,217 (2010), at P 232.

RTO in its performance of CMEP functions while linking with shared resources to use their expertise when performing delegated functions outside of the CMEP. Finally, the report detailed how SPP RE has reduced its reliance on shared staff and increased the number of FTEs since January 1, 2009.[149]

WECC Voting Structure

In the 2010 Order, the Commission took note of some initial concerns that NERC had regarding the effectiveness of WECC's stakeholder voting structure, but that those concerns had been largely allayed by changes to WECC's bylaws and its process for developing and approving regional Reliability Standards.[150] WECC continues to improve its regional Reliability Standards development process. For example, on March 1, 2012, the Commission approved WECC's revised RRSDP, which call for voting by eligible members of the WECC Ballot Body rather than by a lead Standing Committee of WECC. In addition, WECC has developed a web-based system for balloting, and make all the proceedings of the standards drafting teams available using WECC's website. Available information includes notification of meetings, team meeting agenda and minutes, draft and final documents and supporting documents. Finally, WECC strives for continuous improvement and is always open to feedback from the various committees, standards drafting teams, and stakeholders at large.

Appendix C
Regional Entities' Satisfaction of Statutory and Regulatory Criteria

During the 2009 through 2014 assessment period, all eight Regional Entities continued to satisfy the three sets of criteria set out in FPA §215(e)(4), 16 U.S.C. §824o(e)(4), as reiterated in §39.8 of the Commission's regulations, 18 C.F.R. §39.8 (2013), to maintain the authority delegated to them by the ERO, as approved by the Commission, to propose and enforce mandatory Reliability Standards. The three sets of criteria are:

1. The Regional Entity is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board.

2. The Regional Entity meets the requirements otherwise applicable to the ERO in FPA §215(c)(1) and (2), 16 U.S.C. §824o(c)(1)(2), namely that it (a) has the ability to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk-power system; and (b) has established rules that (i) assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure, (ii) allocate equitably reasonable dues, fees, and other charges among end users for all activities, (iii) provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties, (iv) provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties, and (v) provide for taking appropriate steps to gain recognition in Canada and Mexico,

3. The Regional Entity operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability.

Specifically, the eight Regional Entities continued to satisfy the statutory and regulatory criteria for their delegated authority as follows:

Florida Reliability Coordinating Council, Inc. (FRCC)

1. **FRCC "is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board."** The FRCC board of directors (FRCC Board) is a balanced stakeholder board. The FRCC Board has a minimum of sixteen (16) members, who are allocated among the region's six sectors, and the chief executive officer (CEO). The sector representation is as follows: (i) three directors from the Suppliers Sector; (ii) two directors from the Non-Investor Owned Utility Wholesale Sector; (iii) two directors from the Load Serving Entity Sector (one Municipal and one Cooperative); (iv) three directors from the Generating Load Serving Entity Sector; (v) three directors from the Investor Owned Utility Sector; and (vi) two directors from the General Sector. FRCC's CEO is an ex-officio non-voting director. Directors are elected by their sector and serve two-year terms.

2. **FRCC meets the requirements of Federal Power Act Section 215 (c)(1)(2), because**:
   a. **FRCC is able to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk power system**. The FRCC has a RRSDP that is based on the set of common attributes that provide for an open, balanced, fair, transparent and inclusive process. During the assessment period, FRCC placed two standards development projects on hold awaiting the completion of NERC standards development projects, and terminated one project as NERC's continent-wide standard was determined to be sufficient for FRCC reliability needs. Finally, the FRCC Registered Ballot Body and FRCC Board approved one project, which was nevertheless held in abeyance while the adequacy of the NERC continent-wide standard was evaluated, and will be withdrawn if the NERC Reliability Standard is determined to be sufficient for FRCC's needs. FRCC prefers the development of continent-wide standards, but will follow its RRSDP should a need arise for a more stringent standard or a standard to cover an area that NERC standards do not.

      Compliance monitoring and enforcement of Reliability Standards is carried out by FRCC compliance staff which grew during the assessment period. FRCC enforcement staff began reporting directly to the vice president and executive director of standards and compliance in 2012, while the monitoring staff continued to report to the director of compliance. FRCC implemented this separation to provide more independence in enforcement decisions.

      FRCC took additional steps to enforce reliability standards and provide an adequate level of reliability for the BPS. For example, its Compliance staff developed approximately 30 detailed internal procedures for all aspects of the compliance process, which were regularly reviewed and updated. These procedures helped promote consistent and effective application of its internal procedures and ensured that it met the obligations in the NERC ROP. In addition, FRCC upgraded its compliance portal application in 2012, to provide needed enhancements to protect security of the application and data held within the application along with providing some desired improvements in the use of many of its components.

      FRCC improved its enforcement caseload processing during the assessment period, and also experienced a reduction of new violations in the last two years of that period. FRCC attributes the reduction in new violations in part to increased understanding of the registered entities in what the requirements mean and what their compliance expectations are. In addition to this reduction, FRCC worked hard to streamline its enforcement activities to utilize the available processes and were able to reduce its caseload index to approximately 6.5.

   b. **FRCC has established rules that:**
      i. **Assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure.** During the assessment period, FRCC implemented an annual employee recital and disclosures, which

includes a copy of the *FRCC Conflict of Interest Policy* and a process where each employee signs a *Conflict of Interest Questionnaire*, a *Disclosure Statement of Stock Ownership of FRCC Member Companies* and a *Non-Disclosure Acknowledgement*. As previously described, the governance of the FRCC is performed by a balanced stakeholder board, which assures fair stakeholder representation while also practicing balanced decision making where no one sector can block or no two sectors can pass any decision.

ii. **Allocate equitably reasonable dues, fees, and other charges among end users for all activities.** The funding for the FRCC Regional Entity division is allocated among the FRCC load serving entities (LSEs) through a formula which is based on NEL. Each entity reports, on an annual basis, the NEL for the previous year. After the FRCC reviews this information, it is provided to NERC as part of the business plan and budget development process. The FRCC develops an annual budget each year, which is based on common assumptions that have been developed collaboratively by NERC and the eight Regional Entities, and which provides for the resources to carry out all of its delegated functions. The budget and accompanying LSE assessments are approved by the FRCC Board, the NERC Board, and the Commission.

iii. **Provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties**. The FRCC has adopted the NERC CMEP, Appendix 4C to the NERC ROP. This is the primary document that the FRCC uses to provide fair and impartial procedures for enforcement. With respect to the calculation of penalties, the FRCC consistently uses the penalty calculator tool provided by NERC in order to provide a consistent application of the penalty and sanctions guidelines. In addition, the FRCC Board and their alternates are required to sign a *Code of Conduct* that obligates each of them to act in the best interest of FRCC and refrain from involvement in any situation where there is an actual or potential conflict of interest. In addition, since the FRCC Board is a balanced stakeholder board, FRCC does not allow members of the board to participate directly in settlement discussions with FRCC on behalf of their registered entities to avoid any conflict of interest or undue influence situation.

iv. **Provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties**. FRCC has a RRSDP that is based on the required set of common attributes that provide for an open, balanced, fair, transparent and inclusive process. The process has the following characteristics:

- Due Process – Any entity that is directly and materially affected by the reliability of the FRCC BPS has a right to participate in this process.

- Openness – Participation is open to any entity that is directly and materially affected by the reliability of the FRCC BPS. Participation is not conditional upon membership in the FRCC. All FRCC RRSDP meetings will be open and noticed on the FRCC website.

- Balance – The FRCC RRSDP process shall have a balance of interests and shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter.

The FRCC also provides reasonable notice and opportunity for public comment in its compliance monitoring and enforcement activities as required by the CMEP and the NERC ROP.

v. **Provide for taking appropriate steps to gain recognition in Canada and Mexico**. This criterion is not applicable to the FRCC region.

3. **FRCC operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability**. On June 12, 2012, the Commission approved the amended and restated FRCC Delegation Agreement which incorporated benefits of NERC's and FRCC's mutual experience and lessons learned while operating under the predecessor agreement. The revised Delegation Agreement provides for more efficient and effective execution of responsibilities that promote the reliability of the BES. These responsibilities include: (i) development and proposal of Reliability Standards; (ii) enforcement of compliance with Reliability Standards; (iii) certification of BPS entities; (iv) registration of owners, operators, and users of the BPS; (v) reliability assessment and performance analysis; (vi) event analysis and reliability improvement; (vii) training and education; and (viii) situation awareness and infrastructure security.

Midwest Reliability Organization (MRO)

(1) **MRO "is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board.**" During most of the assessment period, MRO was governed by a balanced stakeholder board. On June 25, 2012, the Commission approved MRO's proposal to change from a balanced stakeholder board to a combination independent and balanced stakeholder board. MRO's two independent board members were elected for terms beginning January 2013; they bring cyber and data security expertise to the MRO Board's set of executive and technical skills and expertise.

(2) **MRO meets the requirements of Section 215 (c)(1)(2) of the Federal Power Act, because**:

a. MRO is able to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk power system. MRO supports the development of continent-wide standards to maintain the reliable operations of the BES as opposed to regional Reliability Standards, particularly in the Eastern Interconnection, and decided during the assessment period to forego the development of regional

standards. Nevertheless, MRO has a RRSDP manual, which is found in Exhibit C to its Delegation Agreement with NERC, and a stakeholder Standards Committee comprised of subject matter experts in the event there was a need for a regional Reliability Standard in the future.

MRO also has the requisite staff both in terms of number of people and expertise, and adequate processes and procedures, to enforce the operating and CIP Reliability Standards. Notably, during the assessment period, MRO split the CMEP function into three distinct steps with their own assigned personnel— (i) Compliance Monitoring, (ii) Risk Assessment and Mitigation, and (iii) Enforcement. Compliance monitoring staff conducts audits and spot checks of compliance with reliability standards by registered entities. Risk Assessment and Mitigation undertakes an independent review of the facts and circumstances that surround each violation discovered by Compliance Monitoring, and determines whether sufficient evidence supports each possible violation. Risk Assessment and Mitigation also works with the registered entity to develop an effective and comprehensive mitigation plan in the event that a violation is confirmed. Confirmed violations move to the Enforcement department staff, who review recommendations made by Risk Assessment and Mitigation staff, verify all relevant facts, and evaluate appropriate enforcement actions.

The factual review conducted by Risk Assessment and Mitigation and Enforcement staff is intended to ensure a consistent, accurate application of the NERC reliability standards. The three-step process also provides for segregation of duties, establishing independence among those making the findings, those assessing risk, and those determining and negotiating penalties and sanctions. As a result of this approach, registered entities in the MRO region accept responsibility in 90% of all violations and settlements are reserved only for the more complicated compliance matters (thus, expediting less serious violations and lowering administrative costs).

b. MRO has established rules that:

i. **Assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure.** In particular, MRO assures the independence of the users and owners and operators of the BPS by establishing processes and procedures for the conduct of its work. For example, by having a three-step process to implement the CMEP, MRO assures that its internal work is subjected to review and validation. MRO also has specific policies that prevent stakeholder conflicts of interest and prevent stakeholders from participating in its CMEP work. In addition, all MRO members elect the two independent directors; the remaining directors are elected by his or her sector.

ii. Allocate equitably reasonable dues, fees, and other charges among end users for all activities. MRO's funding requirements are equitably allocated in a manner similar to the one used by the other Regional Entities. Each year,

MRO develops an annual business plan and budget that describes in detail the resources MRO needs to carry out its delegated functions. The annual business plan and budget is reviewed and approved by the MRO Board and then submitted to NERC and ultimately filed with the Commission for approval. Assessments are made to MRO's LSEs through a formula which is based on NEL. MRO does not charge additional fees to be a member or to participate in its training. The annual business plan and budget as well as annual audits by independent auditors and periodic audits by FERC help ensure that MRO's expenses and assessments to end users are reasonable.

iii. **Provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties**. To ensure fair and impartial procedures, as described above, MRO has implemented a three-step approach to fulfill its delegated responsibilities under the CMEP. MRO Compliance Monitoring staff conducts compliance monitoring activities, including audits, self-certifications, and spot checks. Risk and Mitigation staff is responsible for scoping MRO's compliance monitoring work under RAI. Risk and Mitigation staff also works with the entity to develop a thorough, comprehensive, and effective mitigation plan, not only to resolve the concern but to prevent recurrence of the noncompliance. MRO Enforcement staff completes the process by reviewing any recommendations from MRO Risk Assessment and Mitigation staff, verifying that all relevant facts have been gathered, and evaluating the possible violation for the appropriate enforcement action.

There are many factors which may affect a penalty determination. MRO does not utilize the penalty calculator/SIV tool for most minimal risk concerns, as those violations are currently resolved through the FFT process and under RAI, they will be primarily resolved as compliance exceptions outside the enforcement process. The penalty calculator/SIV tool is used as a resource for violations that pose greater risk. As a result of the extensive risk assessment conducted by MRO Risk Assessment and Mitigation staff, Enforcement is able to make fair, accurate and reasonable enforcement decisions scaled on the risk posed by an individual violation – the greater the risk, the greater the penalty and scrutiny of review and approval.

In addition MRO has policies and procedures to avoid conflicts of interest in its CMEP work. Those policies and procedures provide:

(1) No MRO director or member of MRO committees may participate in any way in compliance violation investigations, compliance audits, reports, sanction determinations, or other matters within the CMEP.

(2) An MRO director or member of an MRO committee may engage in actions on behalf of his or her employer regarding a compliance monitoring and enforcement matter undertaken by MRO; however,

that director or member of an MRO committee must recuse himself or herself from any board or committee decisions, meetings, and actions related to that compliance monitoring and enforcement matter. Potential concerns about the participation of a MRO director or member of an MRO committee are brought to the attention of the president and CEO who will seek an appropriate resolution of the matter with the advice and counsel of the independent directors.

iv. **Provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties**. MRO does not have any regional Reliability Standards and does not anticipate developing any regional Reliability Standards because of its strong support for continent wide, or at least interconnection wide, standards. Nevertheless, MRO has a RRSDP manual which has been approved by NERC and FERC. This RRSDP manual is based on the set of common attributes that provide for an open, balanced, fair, transparent and inclusive process, and includes specific provisions relating to the process for the opportunity to comment and be heard.

v. **Provide for taking appropriate steps to gain recognition in Canada**. MRO operates under provincial Manitoba regulations which were adopted in 2012. Prior to the adoption of regulations, MRO had a memorandum of understanding with Manitoba Hydro.

During the assessment period, MRO also had a memorandum of understanding with Saskatchewan Power Corporation and NERC governing MRO's work in Saskatchewan, Canada.

(3) **MRO operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability**. MRO has adopted principles associated with the theory of a "Highly Reliable" organization in its approach to its delegated responsibilities, an approach that has positioned MRO and its registered entities to move to the risk based approach contemplated by RAI. These principles recognize risk, and emphasize self-monitoring with strong corrective action programs. The approach has fostered greater engagement with registered entities to solve technical problems and resulted in a corporate theme—clarity, assurance, and results (CAR). Clarity sets clear expectations for registered entities on the technical requirements of the standards. Assurance measures performance against these key requisites. Results can be seen in improved reliability. For example, MRO leveraged the technical expertise of subject matter experts on stakeholder-led committees to develop application guides for NERC standards that provide clear expectations of compliance. While these application guides are not authoritative, they provide much needed direction on compliance requirements. As a result, MRO has seen a measurable drop in the frequency and severity levels of violations in higher risk standards, beginning with the most violated Reliability Standard several years ago, PRC-005.

Additionally, during the assessment period, an MRO stakeholder-led committee developed an internal controls and procedures framework for use by registered entities to strengthen their internal compliance programs. These types of guidelines provide the necessary clarity to industry to assure that key reliability requirements are met. This has now become part of a pilot project under RAI.

Registered entities, too, need to provide assurance to MRO staff that they understand the requirements and have established sustainable management practices to detect, correct, report, and prevent problems. For example, MRO staff sampled self-reported violations from 2013. In 90% of these violations, the registered entity's assessment of risk matched MRO's staff assessment of risk. When registered entities and MRO staff view risk the same way and accept responsibility, they have greater day-to-day, sustainable assurance.

Northeast Power Coordinating Council, Inc. (NPCC)

1. **NPCC "is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board."** On October 17, 2011, the Commission approved NPCC's proposal to change its board to a hybrid (combination independent and balanced stakeholder) board. That change became effective on January 1, 2012. NPCC's board of directors consists of seven stakeholder voting sectors that each consist of a maximum of two directors per sector, an independent sector consisting of two independent directors, an independent board chair with voting rights to preclude board deadlocks, and the president and CEO. Within NPCC, no two sectors can control and no one sector can block action.

2. **NPCC meets the requirements of Section 215(c)(1)(2) of the Federal Power Act, because:**
    a. **NPCC is able to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk power system.** NPCC has developed a RRSDP that provides the design-basis approach to a consensus building process by which NPCC may develop regional Reliability Standards and regional variances to be proposed to the ERO for adoption, under delegated authority by the FERC and the Canadian provincial regulatory and/or governmental authorities. This procedure contains common attributes that provide for an adequate level of reliability to provide for an open, balanced, fair, transparent, and inclusive standards development process. NPCC's RRSDP sets forth the structure for developing reliability standards that provide for an adequate level of reliability.

    Illustratively, during the assessment period, NPCC developed a disturbance monitoring regional Reliability Standard, PRC-002-NPCC-01, to ensure that adequate disturbance data is available to facilitate BES event analyses. The Reliability Standard addresses a specific recommendation from the *August 14, 2003 Blackout Final NERC Report - Conclusions and Recommendations* (July 13, 2004) regarding the use of time-synchronized data recorders.[151] Substantively, the Reliability Standard outlines the basic requirements for the type, location and capability of

[151] *See* http://www.nerc.com/pa/rrm/ea/Pages/Blackout-August-2003.aspx.

equipment to be placed on the power system to enable the analysis of grid disturbances effectively and efficiently. The Reliability Standard is intended to fill the reliability gap related to disturbance monitoring and reporting by establishing enforceable disturbance monitoring and reporting requirements for the NPCC region.

Compliance and enforcement activities are carried out by the NPCC compliance staff and are independent of all users, owners and operators of the international BPS and from the hearing officer. Compliance and enforcement activities are governed in the U.S. by the Delegation Agreement between NERC and NPCC, delegating portions of NERC's authority as the ERO to NPCC. In addition, pursuant to an agreement between NPCC and WECC that was approved by the Commission, NPCC assumed responsibility for the CMEP with respect to the WECC RC function and the WECC IA function from January 1, 2012 through the end of the assessment period.

Examples of NPCC's efforts to monitor compliance with, and enforcement of, the reliability standards include its use of extensive pre-audit data collection and pre-audit conference calls with the registered entities. NPCC staff thoroughly reviews the first round of data submittals, and via questions, routinely collects a second round of data from the registered entity before the audit is performed. From these pre-audit activities, NPCC is able to conduct a more targeted audit. This results in an efficient and effective audit for both NPCC and the registered entity. This efficiency also permits the auditors to drill down into other areas and to make recommendations to the registered entity for enhanced reliability performance. In addition, during the assessment period, developed an enforcement dashboard, highlighting the regional caseload index and the status of mitigation plans associated with high risk violations among other compliance parameters. The enforcement dashboard is an informational tool to both management and to the industry.

NPCC amended its hearing procedures to provide for a hearing body comprised of an independent hearing officer and two independent directors. As a result of the amendments, the hearing body will always be comprised of independent members and will not have stakeholder members to assure enforcement of reliability standards provides for an adequate level of reliability.

b. NPCC has established rules that:

i. **Assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure**. The rules and procedures contained in the Delegation Agreement, ROP, amended and restated NPCC bylaws, and other NPCC committee governance documents assure the independence of the users and owners and operators of the BPS while assuring fair stakeholder representation and balanced decision-making at the same time. Fair stakeholder representation and participation is assured by NPCC's committees, subcommittees, task forces and other groups as the board of directors may deem appropriate. Industry technical experts from

within the membership also provide valuable input to the board through various working groups and task forces as well as the committees.

ii. **Allocate equitably reasonable dues, fees, and other charges among end users for all activities.** The allocation of dues, fees, and other charges by NPCC is governed by Article XIII of its bylaws. Funding of Regional Entity division activities are undertaken pursuant to FPA §215 in accordance with the funding provisions and procedures of that law and related FERC regulations and orders. The NPCC board of directors approves the annual Business plan and Budget in time for submission to the ERO and to FERC for approval. NPCC funds reliability activities in Canadian provinces pursuant to the mechanisms established by the applicable Canadian provincial regulatory authority. Budgets for the costs of reliability activities are allocated equitably based on the NEL and other relevant factors consistent with applicable law, the Delegation Agreement, and any agreements with Canadian provincial authorities. NPCC members are not assessed an annual membership fee. For NPCC's Criteria Services division, which establish and monitor regional-specific non-statutory criteria, full members that perform the balancing authority function are assessed and pay based upon a NEL. Special assessments for Criteria Services may be separately budgeted to full members that perform the balancing authority function or upon Full Members with full members' consent.

iii. **Provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties**. The NERC ROP is the primary document that NPCC uses to provide fair and impartial procedures for enforcement. Additionally, NPCC has in place *Conflict of Interest Guidelines* that require each NPCC director, officer, and employee to avoid and refrain from involvement in situation where there is an actual conflict of interest, disclose any actual or potential conflicts of interest that may arise, recuse himself or herself from participation in any action involving an actual or potential conflict of interest, and refrain from voting on any actions where there is an actual or potential conflict of interest. In addition, NPCC's *Code of Conduct*, which applies to its officers, board of directors, employees, and all participants of NPCC committees, task forces, and working groups, requires each individual to recognize conflicts of interest that may arise and to take steps to disclose such conflicts of interest and to refrain from voting and/or influencing others with respect to such conflicts of interest. With respect to penalties, NPCC consistently uses the penalty calculator tool for consistency in penalty calculation determinations

iv. **Provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties**. NPCC follows a RRSDP that provides that participation in the development of a regional Reliability Standard shall be open to all organizations that are directly and materially

affected by the NPCC BPS reliability, that there shall be no undue financial barriers to participation, that participation shall not be conditioned upon membership in NPCC or unreasonably restricted on the basis of technical qualifications or other such requirements. Meetings of drafting teams are open to the NPCC members and others.

Compliance and enforcement activities are carried out by the NPCC compliance staff and are independent of all users, owners and operators of the international BPS and from the hearing officer. Compliance and enforcement activities are governed in the U.S. by the Delegation Agreement between NERC and NPCC, delegating portions of NERC's authority as the ERO to NPCC. NPCC's hearing procedures provide for a hearing body comprised of an independent hearing officer and two independent directors.

v. **Provide for taking appropriate steps to gain recognition in Canada and Mexico**. NPCC has MOUs in place with the Northeastern Canadian provinces (New Brunswick, Nova Scotia, Ontario, and Quebec). At the end of the assessment period, NPCC was in the process of updating and revising MOUs to respond to recent Canadian legislative and regulatory changes and initiatives.

3. **NPCC operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability**. Effective January 1, 2012, NPCC executed an amended and restated Delegation Agreement, which delegated to NPCC certain activities pursuant to FPA §215. These delegated activities include certification of BPS Entities, registration of owners, operators, and users of the BPS as responsible for compliance with requirements of Reliability Standards, developing assessments of the reliability of the BPS, developing and maintaining, and collecting data in support of the development and maintenance of, reliability performance metrics and assessments of risks to the reliable operation of the BPS, conducting and coordinating event analysis, providing training and education to registered entities, and gathering and assessing situation awareness information. NERC has also delegated NPCC the authority to propose Reliability Standards, regional variances, or modifications thereof to NERC and to develop regional Reliability Standards. In summary, the Delegation Agreement promotes the effective and efficient administration of the BPS by clearly identifying the delegation of authority provided to NPCC.

ReliabilityFirst Corporation (RF)

1. **RF "is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board**." RF is governed by a combination independent and balanced stakeholder board, which consists of 14 directors: (i) three are independent directors; (ii) three are at-large directors elected by all the industry sectors voting together as a single class; and (iii) eight are elected by their industry sectors (suppliers elect two directors, transmission companies elect two directors, RTOs elect one

director, small LSEs elect one director, medium LSEs elect one director, and large LSEs elect one director).

2. **RF met the requirements of Section 215 (c)(1) (2) of the Federal Power Act, because**:
   a. **RF is able to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk power system**. Although RF no longer develops regional Reliability Standards in order to avoid duplication with the NERC continent-wide Reliability Standards, RF has adopted a RRSDP, and has otherwise proved its ability to develop regional Reliability Standards, as illustrated by its development of RF's BAL-502-RFC-02 (Planning Resource Adequacy Analysis, Assessment and Documentation), which was approved by the Commission on March 17, 2011.

      RF has sufficient staff with the requisite expertise to conduct compliance audits, investigations, spot checks, and other compliance reviews, and to enforce Reliability Standards as demonstrated in part by its performing over 290 audits and over 200 spot checks during the assessment period, and ensuring the mitigation of over 1,400 alleged violations of those standards. These enforcement activities have resulted in tangible improvements to the reliability of the BPS. To enhance its risk-determination process in enforcement, RF developed a "Risk-Harm" process which, among other things, provided for technical experts to answer a series of questions about the risk and harm posed by each violation using a common scale to ascertain a quantified risk assessment for each violation. Additionally, for serious violations of the NERC Reliability Standards, RF works with registered entities to implement substantial "above and beyond" activities to enhance reliability on their system and on the BPS.

   b. **RF has established rules that**:
      i. **Assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure.** As described earlier, RF is governed by a combination independent and balanced stakeholder board. Pursuant to RF's bylaws, no two industry sectors can control any RF decision and no single industry sector can veto any RF decision. This hybrid board structure assures RF's independence, while still assuring fair stakeholder representation and balanced decision-making. To further assure RF's independence of the users, owners and operators of the BPS, RF has the following protections in place:

         - First, RF adopted the NERC CMEP, Appendix 4C to the NERC ROP, which provides fair and impartial procedures for the monitoring and enforcement of Reliability Standards.

         - Second, all RF employees and contractors sign and must adhere to non-disclosure and confidentiality agreements and conflict of

interest forms, and RF employees, contractors, and directors are governed by the RF *Conflict of Interest Policy*, the RF *Code of Business Conduct and Ethics*, and §1500 of the NERC ROP.

- Third, to ensure the independence of its staff and eliminate any potential conflicts of interest, RF does not allow stakeholder participation in its compliance or enforcement activities (i.e., a registered entity staff member may not be on an RF audit or compliance investigation team).

- Fourth, RF does not allow its industry sector directors to participate in settlement discussions with RF on behalf of their registered entity.

ii. **Allocate equitably reasonable dues, fees, and other charges among end users for all activities**. The funding for RF's activities is equitably allocated among its end users and recovered through a formula based on NEL. Each year, RF develops an annual business plan and budget, which describes the adequate resources needed for RF to carry out its delegated functions. The annual business plan and budget and the assessments to the end users must be approved by the Commission. The annual business plan and budget process, the Commission's approval of the assessments, and periodic financial audits by the Commission all ensure that RF's expenses and assessments to end users are reasonable.

iii. **Provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties.** RF has adopted the NERC CMEP, Appendix 4C to the NERC ROP, which provides fair and impartial procedures for the enforcement of Reliability Standards within RFC's geographic boundaries. Additionally, RF maintains the RF *Conflict of Interest Policy* and the RF *Code of Business Conduct and Ethics* to ensure the integrity and independence of its compliance and enforcement staff. To assess fair, impartial, and consistent penalties, RF follows the *Sanction Guidelines*, as set out in ROP Appendix 4B.

iv. **Provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties.** Although RF no longer develops regional Reliability Standards, RF's RRSDP provides for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in the development of Reliability Standards.

The RRSDP includes public notice and a comment period for any proposed standard, due consideration of those public comments, and a ballot of interested stakeholders. Participation in the standards development process is open to all entities that are directly and materially affected by reliability in the

RF region, and there are no undue financial barriers to participation. The standards development process is balanced: it may not be dominated by any two interest categories, and no single interest category shall be able to defeat a matter.

RF provides for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in its CMEP activities. A registered entity has the right to receive notice when it is placed on the NCR, and may appeal their registration to NERC and to the Commission.

The CMEP requires RF to provide notice to a registered entity when it determines that the registered entity has violated a Reliability Standard, and the registered entity has an opportunity to respond. If a registered entity wishes to contest an alleged violation of a Reliability Standard or a penalty, it may request and receive a hearing, and may appeal the hearing decision to NERC. A registered entity also has the right to request a hearing to contest a twice-rejected mitigation plan or a remedial action directive.

At the conclusion of an enforcement matter, NERC publicly files a NOP with the Commission, which promotes openness and the opportunity for public comment. The ERO balances the interest in openness with the concern for the security of critical infrastructure information, and as such, all sensitive critical infrastructure information is redacted from all public NOP filings.

v. **Provide for taking appropriate steps to gain recognition in Canada and Mexico.** This criterion is not applicable to RF, as its geographic boundaries do not include any portion of Canada or Mexico.

3. **RF operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability**. Effective January 1, 2011, RF executed an amended and restated regional Delegation Agreement with NERC, which delegated to RF certain activities pursuant to FPA §215. These delegated activities include: (i) certification of BPS entities; (ii) registration of owners, operators, and users of the BPS responsible for compliance with the requirements of Reliability Standards; (iii) reliability assessment and performance analysis; (iv) event analysis and reliability improvement; (v) training and education; (vi) situational awareness and infrastructure security; (vii) the development and proposal of Reliability Standards to NERC; (viii) monitoring of compliance with Reliability Standards; and (ix) enforcement of compliance with Reliability Standards. These delegated activities are necessary for the effective administration of BPS reliability. RF only performs those activities delegated to it under the Delegation Agreement. This ensures that RF is not distracted by any other activities, and in turn promotes the efficiency and effectiveness of the corporation's efforts to improve reliability.

SERC Reliability Corporation (SERC)

1. **SERC "is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board**." SERC is governed by a balanced stakeholder board. Stakeholders are classified by the SERC Board Executive Committee in one of seven sectors (investor-owned utility sector, federal/state sector, cooperative sector, municipal sector, marketer sector, merchant electricity generator sector, and ISO-RTO sector). SERC's bylaws establish voting rules that ensure that no two sectors are able to approve a decision and that no one sector can veto a decision.

2. **SERC met the requirements of Section 215 (c)(1)(2) of the Federal Power Act, because**:
   a. **SERC is able to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk power system**.

      Standards: The SERC RRSDP defines the process for the development, revision, reaffirmation, and withdrawal of regional Reliability Standards. The SERC RRSDP requires any proposed regional Reliability Standard to be more stringent than a continent-wide Reliability Standard, whether the regional Reliability Standard addresses matters that the continent-wide Reliability Standard does not or the regional Reliability Standard is necessitated by a physical difference in the BPS within the SERC region. SERC regional Reliability Standards are required to provide for as much uniformity as possible with continent-wide reliability standards. Proposed SERC regional reliability standards are subject to approval by NERC and FERC prior to becoming mandatory and enforceable within the SERC region.

      SERC has one FERC-approved regional Reliability Standard, PRC-006-SERC-01, which addresses automatic underfrequency load shedding requirements. SERC currently is not developing any additional Regional Reliability Standards because the continent-wide NERC Reliability Standards are presently adequate for the SERC region. SERC also participates in the NERC Standards Committee, hosts biannual meetings of the SERC Standards Committee, and hosts specific commenting sessions for NERC Standards Projects as NERC requests comments, all of which involve the discussion of proposed changes to NERC Reliability Standards.

      Compliance: SERC's authority to monitor reliability standards is based on the authority granted in its Delegation Agreement with NERC. SERC has the expertise on staff to conduct compliance audits, investigations, spot checks and other compliance reviews for the Operating, Planning, and CIP Reliability Standards. SERC develops and posts an annual CMEP implementation plan that is complementary to the NERC CMEP, but also addresses reliability issues specific to the SERC region. SERC builds upon the NERC actively monitored list and incorporates additional Standards or Requirements that relate to the SERC region's BES. SERC utilizes off-site and on-site audits, spot checks, and other compliance monitoring methods to assess registered entity compliance with NERC Reliability Standards. Compliance prepares detailed reports on each audit and makes

recommendations to Enforcement about possible violations of NERC Reliability Standards.

Enforcement: Over the past five years, SERC has demonstrated its ability to enforce Reliability Standards by processing approximately 800 alleged violations originating from audits, spot checks, self-certifications, complaints, self-reports, and compliance investigations following the requirements of the CMEP and NERC ROP. Enforcement staff conducts a thorough assessment of all possible violations to determine whether there is a sufficient basis to allege a violation. If a sufficient basis exists, Enforcement staff determines the complete scope of the violation and the actual and potential risk to the reliability of the BPS. Enforcement staff reviews the registered entity's mitigating activities to ensure that the entity corrects the noncompliance and prevents recurrence. Enforcement staff also participates in settlement negotiations with the registered entity. If a registered entity challenges the findings of the violation and/or penalty, Enforcement staff would prosecute the case before the Board Compliance Committee, which acts as SERC's hearing body. SERC's processing of possible violations has improved because of increased resources and improved tools such as FFT and the SNOP filing mechanisms.

b. SERC has established rules that:

i. **Assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure**. SERC's bylaws allow each SERC member company to appoint a director to SERC's board. The SERC Board Executive Committee is made up of 12 sector representatives from among the directors. All directors, alternate directors, and board committee representatives are required to comply with SERC's standards of conduct policy that prohibits participation in decisions that could pose a conflict of interest.

SERC's bylaws establish voting rules that ensure that no two sectors are able to approve a decision and that no one sector can veto a decision. These voting rules assure SERC's independence of the users, owners, and operators of the BPS. In addition, SERC has adopted the NERC CMEP, Appendix 4C to the NERC ROP, which provides fair and impartial procedures for the monitoring and enforcement of Reliability Standards. In addition, SERC employees and contractors sign non-disclosure and confidentiality agreements and conflict of interest forms.

ii. **Allocate equitably reasonable dues, fees, and other charges among end users for all activities**. SERC develops a budget annually that will accomplish all delegated duties. The budget is reviewed and approved by SERC's board before going to NERC and FERC. The budget is paid by all registered entities based on their proportionate share, based on the NEL. Pursuant to §202 of the NERC ROP, NEL is the net generation of an electric

system plus energy received from others less energy delivered to others through interchange. It includes system losses but excludes energy required for the storage of energy at energy storage facilities. Each entity reports the energy generated on an annual basis for the previous year. After verification by SERC, this data is provided to NERC. NERC produces an allocation of the budgets to each appropriate region.

iii. **Provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties**. SERC has adopted without exception the NERC CMEP, Appendix 4C to the NERC ROP, and the associated *Sanction Guidelines*, ROP Appendix 4B, which provide fair and impartial procedures for the enforcement of Reliability Standards within the SERC region. SERC maintains a *Conflict of Interest Policy* to ensure the integrity and independence of its compliance and enforcement staff. To ensure consistency and remain fair, unbiased and balanced in assessing penalties, SERC follows the *Sanction Guideline*s of NERC, utilizes the NERC penalty tool to develop a proposed penalty, and compares the proposed penalty with similarly situated violations that have been filed with and approved by FERC. All proposed penalties are reviewed and approved by a technical peer group, legal counsel, the director of enforcement, and the SERC CEO or vice president.

iv. **Provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and other exercising its duties**. The SERC RRSDP requires SERC to provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in development reliability standards.

SERC provides for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in its CMEP activities. A registered entity has the right to receive notice when it is placed on the NCR, and may appeal its registration to NERC and to the Commission.

The CMEP requires SERC to provide notice to a registered entity when it determines that the Registered Entity has violated a Reliability Standard, and the registered entity has an opportunity to respond. If a registered entity wishes to contest an alleged violation of a Reliability Standard or a penalty, it may request and receive a hearing, and may appeal the hearing decision to NERC. A registered entity also has the right to request a hearing to contest a twice-rejected mitigation plan or a remedial action directive.

At the conclusion of an enforcement matter, NERC publicly files a NOP with the Commission, which promotes openness and the opportunity for public comment. The ERO balances the interest in openness with the concern for the

security of critical infrastructure information, and as such, all sensitive critical infrastructure information is redacted from all public NOP filings.

v. **Provide for taking appropriate steps to gain recognition in Canada and Mexico**. The SERC region does not extend into any part of Canada or Mexico. Thus SERC has no need to establish rules that provide for taking appropriate steps to gain recognition in Canada or Mexico.

3. **SERC operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability**. On January 1, 2011, SERC executed an amended and restated regional Delegation Agreement with NERC, which delegated to SERC certain activities pursuant to FPA §215. FERC approved this Delegation Agreement on June 12, 2012. These delegated activities include: (i) certification of BPS entities; (ii) registration of owners, operators, and users of the BPS responsible for compliance with the requirements of Reliability Standards; (iii) reliability assessment and performance analysis; (iv) event analysis and reliability improvement; (v) training and education; (vi) situational awareness and infrastructure security; (vii) the development and proposal of Reliability Standards to NERC; (viii) monitoring of compliance with Reliability Standards; and (ix) enforcement of compliance with Reliability Standards. These delegated activities are necessary for the effective administration of BPS reliability. SERC only performs those activities delegated to it under the Delegation Agreement.

Southwest Power Pool Regional Entity (SPP RE)

1. **SPP RE "is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board**." SPP RE is governed by three independent Regional Entity trustees. These trustees have autonomy over decisions in fund allocation and SPP RE budget approval, as well as oversight of SPP RE decisions on regional standards, compliance enforcement actions, and penalties. SPP RE's general manager reports directly to the SPP RE trustees. Only the trustees and certain SPP RE staff members have authority to make compliance and enforcement decisions.

2. **SPP RE met the requirements of Section 215 (c)(1)(2) of the Federal Power Act, because:**
   a. **SPP RE is able to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk power system**. SPP RE is not actively developing any reliability standards at this time; however, it does have a RRSDP if the need for such standards were to arise.[152] The RRSDP allows for a fair and open process for adoption, approval, revision, reaffirmation, and deletion of a regional Reliability Standard. Due process is the key to ensuring that the Reliability Standards are developed in an environment that is equitable, accessible and responsive to the requirements of all interested and affected parties. SPP RE supports development of continent-wide

[152] *SPP RE Regional Reliability Standards Development Process Manual* (SPP RRSDP Manual), version 0 became effective October 2, 2007. A petition, in Docket No. RR14-1-000, to update the SPP RRSDP manual was filed by NERC with FERC on December 20, 2013. A 10-day comment period ended on January 10, 2014 with no comments being received.

Reliability Standards at NERC and any regional Reliability Standard developed by SPP RE will go beyond, add detail to, or cover matters not addressed in the NERC Reliability Standards.

Moreover, SPP RE is able to enforce reliability standards by the implementation of the CMEP. Illustratively, during the assessment period, SPP RE experienced a dramatic reduction in the average time to process violations to completion, a dramatic increase of self-reported violations, a dramatic reduction in average time for issuance of final on-site compliance audit reports, and a dramatic reduction in average time for issuance of a notice of possible violation (NPV). Specifically, prior to January 1, 2009, SPP RE's average time to process alleged violations to completion was 24 months, compared to 9.2 months during 2013. In 2009, only 3.1 % of incoming possible violations came from either self-reports or self-certifications, compared to 68.4% in 2013. In 2008, the average time to issue a final on-site compliance audit report to registered entities was 152 days, compared to 54 days during 2013. Prior to January 1, 2009, the average days for SPP RE to issue an NPV was 20.5 days, compared to 3.6 days in 2013.

b. SPP RE has established rules that:

i. **Assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure**. SPP is governed by an independent board of directors and has an extensive organizational group structure comprised of stakeholders that represent the membership's diversity. SPP's bylaws provide for fair stakeholder representation and balanced decision-making. SPP RE does not have a separate committee structure or bylaws; however, it is an independent unit of SPP. and reports to its Regional Entity Trustees (SPP RE Trustees). In addition, SPP RE's employees are subject to standards of conduct, its employees and contractors are screened for conflicts of interest, and its compliance monitoring teams must agree to maintain strictly the confidentiality of their auditing efforts.

ii. **Allocate equitably reasonable dues, fees, and other charges among end users for all activities**. SPP RE follows the common assumptions developed by NERC and the Regional Entities to guide its budget projections. As such, SPP RE allocates projected statutory costs to end users via an annual assessment fee based on the SPP RE's registered entity's NEL. At the end of each budget cycle, a reserve balance is determined by taking the difference between the monies collected from end users through the assessment fee and the statutory costs incurred. This reserve balance is then used to offset the next year's funding requirement in addition to any penalty monies received during a twelve-month period. The annual assessment fee is adjusted at the beginning of each budget year (January 1).

iii. **Provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties**. The following, generally

describes the steps the SPP RE enforcement attorneys follow for penalty determinations, which are outlined in SPP RE's internal processes and procedures:

Step 1: Utilizing the NERC penalty determination framework tool (Penalty Tool), the enforcement attorney determines a suggested penalty amount for the violation. Note: Although not procedurally codified, once the SPP RE enforcement attorney member has calculated a preliminary penalty via the Penalty Tool, the enforcement attorney compares the proposed penalty (when possible) with similarly situated previous violations that have been filed and subsequently approved by FERC. Furthermore, enforcement attorneys implement guidance from *Sanction Guidelines*, ROP Appendix 4B, the NERC CMEP, ROP Appendix 4C, and FERC orders as to how the enforcement attorneys should assess factors such as load loss and repeat/similar/affiliate violation history.

Step 2: The enforcement attorney submits its proposed penalty amount, the Penalty Tool, notice(s) of alleged violation and proposed penalty or sanction and/or settlement documents, and any other information relevant to the proposed penalty to the sanctions review team (SRT), which consists of the SPP RE general manager, the manager of enforcement, and the director of compliance.

Step 3: The SRT reviews the information presented by the enforcement attorney and collectively either approves the proposed penalty amount or determines the appropriate penalty amount for the violation or violations. **Note:** Penalties in excess of $250,000 are required by procedure to receive additional approval of the SPP RE Trustees.

iv. **Provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties**. The SPP RE RRSDP includes steps for a fair and open standards process that is open to all regional stakeholders. Any entity within the SPP RE or SPP RTO region has a right to participate by: (a) expressing a position and its basis; (b) having that position considered; (c) voting through a segment-weighted balanced process; and (d) having the right to appeal.

v. **Provide for taking appropriate steps to gain recognition in Canada and Mexico.** This criterion does not apply to SPP RE.

3. **SPP RE operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability**. The Delegation Agreement between SPP RE and NERC grants SPP RE the authority to carry out certain statutory activities, including: (i) certification of BPS entities; (ii) registration of owners, operators, and user of the BPS as responsible for compliance with requirements of Reliability Standards; (iii) reliability assessment and performance analysis; (iv) event analysis and reliability improvement; (v)

training and education; and (vi) situational awareness and infrastructure security. This delegation of authority has promoted the effective and efficient administration of the BPS. Through its delegated authority from NERC, SPP RE has successfully implemented the NERC CMEP, and is working with NERC and the other Regional Entities to improve both the effectiveness and efficiency of the program. As evidence of the success of the early program, SPP RE's region successfully navigated nine consecutive quarters without a reportable transmission vegetation contact.

SPP RE has also, in combination with the other Regional Entities and NERC, greatly enhanced the functionality of the electronic tool (webCDMS), used by registered entities to report compliance issues. Enhancements to webCDMS have allowed both the Regional Entities and registered entities to realize efficiency gains through the automation of processes such as: (i) self-reports, (ii) self-certifications, (iii) submission of mitigation plans, (iv) exchange of mitigation information, (v) mis-operations reporting, (vi) analysis of prior violations, and (vii) violation processing in general. Furthermore, the SPP RE compliance audit teams utilize a risk-based assessment to determine the scope of the compliance audit, and adjust the scope of compliance audits based on violation history and the particular risk presented by certain registered functions. To further improve the effectiveness and efficiency of the program going forward, SPP RE is working with NERC and the other Regional Entities to shift the focus of the ERO Enterprise to those areas of the BPS that present the greatest risk to reliability. To that extent, SPP RE is an active participant in the RAI process.

In addition, since January 1, 2009, SPP RE has steadily increased its outreach efforts. SPP RE has held annual workshops since 2009 and attendance has increased each year. SPP RE staff has made incremental improvements to the workshops, such as inviting more guest speakers from outside the SPP RE footprint including FERC Commissioners, NERC Board members, and Department of Homeland Security staff, adding break-out sessions to give registered entities a smaller setting to ask questions and voice concerns, and refining both advance and on-site preparations to ensure the workshops run smoothly and on-time. In 2011, workshop attendees began providing feedback via evaluation forms following the workshops; feedback has generally been very favorable. In 2011, SPP RE began publishing monthly newsletters and implemented an e-news format that is easily readable on handheld devices. In 2012, SPP RE created a video training webpage and began filming and publically posting training videos in-house and at workshops. The feedback from the training videos has been generally positive and benefits not only registered entities in the SPP RE footprint, but registered entities across all Regional Entities.

Texas Reliability Entity, Inc. (TRE or Texas RE)

1. **TRE "is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board**." Texas RE currently has a combination independent and balanced stakeholder board. From 2007 to 2010, the Regional Entity for the ERCOT region was Texas Regional Entity, Inc., an independent division of the Electric Reliability Council of Texas, Inc. (ERCOT, the ISO for the region). During that time, Texas RE shared the same board of directors as ERCOT ISO.

To ensure that the Regional Entity would remain independent from all registered entities, including ERCOT, a new Texas non-profit corporation called Texas Reliability Entity, Inc. (Texas RE), was formed to take over the functions as Regional Entity effective July 1, 2010. As part of this process, Texas RE separated its board of directors from ERCOT ISO. Texas RE is now governed by a combination independent and balanced stakeholder board consisting of nine members: (i) four independent directors; (ii) two industry-affiliated directors; (iii) the Texas RE CEO; and (iv) two ex-officio non-voting directors (the Public Utility Commission of Texas Chairman or delegate, and the Public Counsel from the Office of Public Utility Counsel). The independent directors are elected by Texas RE membership to serve staggered three-year terms. The two-industry-affiliated directors may not be from the same market sector and may not concurrently serve on the ERCOT ISO board of directors.

2. **TRE met the requirements of Section 215 (c)(1) (2) of the Federal Power Act, because**:
   a. **TRE is able to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk power system.** Texas RE follows the requirements as defined by the NERC ROP, including the CMEP, and by the Delegation Agreement with NERC, including TRE's current RRSDP, and has used these documents to develop standards and to audit and enforce compliance with the standards.

      Standards Development: Texas RE participates in the NERC Standards Committee and develops, comments and votes on Reliability Standards. Texas RE also hosts quarterly meetings of the Reliability Standards Committee (RSC) and twice-monthly meetings of the NERC Standards Review Subcommittee (NSRS). Changes and proposed changes to NERC Reliability Standards are discussed in these forums. Texas RE created one major regional Reliability Standard (BAL-001-TRE) and several minor regional Reliability Standards (CIP-001 regional variance and IRO-0006-TRE) designed to improve reliability. The major regional Reliability Standard, BAL-001-TRE, was designed to maintain Interconnection steady-state frequency within defined limits in the ERCOT region. It requires individual generation facilities to operate with properly configured governors in service to meet frequency response performance requirements.

      Compliance: Between January 1, 2009 and December 31, 2013, Texas RE successfully completed more than 260 audits of registered entities for compliance with Reliability Standards. Texas RE uses the complete list of NERC-approved actively monitored Reliability Standards and Requirements as the minimum audit scope. Audit staff also investigates possible violations of the Reliability Standards arising from BPS disturbances, outages, self-reports, and complaints. Texas RE requires all Compliance employees, not just the auditors, to complete NERC scheduled basic training classes for auditors so that all employees have an understanding of the significance of the auditing process. In addition, Texas RE has developed a robust CIP compliance and audit program. All current CIP auditors have earned Department of Defense 8570 recognized certifications (e.g., CISSP, CEH, CISA, and Network+).

Enforcement: In addition to the auditing program, Texas RE has implemented a separate Enforcement program with a dedicated staff. The Enforcement group processes alleged violations originating from audits, spot checks, self-certifications, complaints, and self-reports. This includes managing settlement negotiations, supporting legal staff in contested case hearings, and reviewing and approving mitigation plans. Texas RE has been successful in streamlining the Enforcement process since 2009 by implementing a new webCDMS data management system and implementing new processes such as the FFT program.

b. TRE has established rules that:

i. **Assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure.** Texas RE has adopted bylaws to assure its independence from industry while assuring fair stakeholder representation in selection of its directors and balanced decision-making in its committees. Its bylaws first provide that Texas RE membership is voluntary and open to any entity that is a user, owner or operator of the ERCOT region BPS that registers as a member with Texas RE and complies with Texas RE bylaws. In addition to the structure of the board described earlier, independent directors and members of their immediate families or households may not: (1) have current or recent status (within the past two years) as a director, officer or employee of an ERCOT region NERC registered entity or ERCOT region electric Market Participant, or (2) have direct business relationships, other than as customers, with any NERC registered entity or ERCOT region electric Market Participant. The industry-affiliated directors are selected annually by the Texas RE Member Representatives Committee and each must come from a different Texas RE membership sector: System Coordination and Planning, Transmission and Distribution, Cooperative, Municipal Utility, Generation, or Load-Serving and Marketing. The Texas RE bylaws prohibit an entity from belonging to any two membership sectors, and require the board of directors and any of its committees to operate using balanced decision-making.

ii. **Allocate equitably reasonable dues, fees, and other charges among end users for all activities.** Texas RE bylaws and its Delegation Agreement with NERC provide that it will allocate equitably reasonable dues, fees, and other charges among end users for its statutory activities. Each year Texas RE produces a draft budget using templates provided by NERC, and posts the draft on its website for public comment. The budget includes the costs necessary to perform Texas RE's statutory functions under the Delegation Agreement with NERC and any expected income, such as membership fees. The budget is reviewed for reasonableness by the Texas RE Member Representatives Committee and approved by the Texas RE board of directors, NERC and FERC. Pursuant to Exhibit E to

its Delegation Agreement, assessments to fund Texas RE delegated functions and related activities are allocated to all load-serving entities in the region on the basis of NEL. Penalty monies received by Texas RE are applied as a general offset to its budget requirements for the subsequent fiscal year.

iii. **Provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties.** Texas RE has adopted and implemented the CMEP in accordance with its Delegation Agreement with NERC. Texas RE is committed to five guiding principles: (1) independence; (2) ethics and integrity; (3) inclusiveness; (4) fairness and openness; and (5) organizational effectiveness and efficiency. Texas RE strives to be fair, unbiased and balanced in its enforcement actions and imposition of penalties, and its internal procedures incorporate these concepts. After a possible violation is found by the Compliance group, the violation is reviewed and verified by a member of the Enforcement group. Penalties are calculated using the NERC *Sanction Guidelines* and are reviewed in relation to similar penalties assessed in this and other regions. In addition, all penalties are reviewed by the director of enforcement prior to issuance.

Texas RE also has implemented policies and procedures to ensure its employees act with independence, ethics, integrity, fairness, and openness. All Texas RE employees and contractors must annually sign an ethics agreement which requires them to conduct Texas RE business with total objectivity and to avoid situations in which his or her personal or financial interests conflict or appear to conflict with the interests of Texas RE. A conflict of interest arises when: (1) the personal, financial, or other interest of a Texas RE employee is significantly affected or may reasonably appear to be affected by the employee's actions or decisions in the employee's capacity at Texas RE; or (2) the action of any employee is in any way detrimental to the best interests of Texas RE. Financial interest includes any ownership, investment, or compensation interest by the employee or a member of the employee's household, and specifically includes any direct or indirect remuneration, as well as gifts or favors which are not insubstantial. An employee must immediately inform the Texas RE legal department if a conflict of interest or even the appearance of a conflict of interest might exist, to allow Texas RE management to evaluate the situation. After full disclosure by the employee, Texas RE management may agree to conditions that appropriately limit any potential influence from a conflict of interest.

Texas RE also follows the CMEP requirement to provide biographies of all potential audit team members to registered entities prior to a Compliance engagement and provide opportunity for entities to object to use of any employee where a potential conflict of interest exists. At the

end of each audit, registered entities are also provided a questionnaire which allows them to directly report to NERC any concerns they have with fairness, openness, or objectivity with respect to how Texas RE conducted the audit. In addition, Texas RE has implemented a Compliance hotline to allow anyone to report (anonymously if desired) any noncompliance by a registered entity and any ethics complaints they have concerning Texas RE.

iv. **Provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties**. As part of its Delegation Agreement, Texas RE has adopted and follows a RRSDP designed to provide for reasonable notice and opportunity for public comment, due process, and balancing of interests. The RRSDP requires that proposed Reliability Standards must be drafted by a standards drafting team and be posted publicly, and it requires a public comment period prior to any vote on the standard by Texas RE membership.

Texas RE also conducts its general operations in a manner that is transparent to the public. As required by its bylaws, it posts public notices of its board and committee meetings on its public website and posts meeting materials, including draft budgets, for public review prior to the meetings. The Texas RE public website includes training materials, useful compliance information, and the contact information for key Texas RE personnel.

Texas RE also provides due process to registered entities seeking to contest a violation, penalty or sanction. Texas RE adheres to the NERC ROP and CMEP, which require Regional Entities to provide registered entities reasonable notice of possible violations, the ability to contest a violation or penalty or sanction, and the ability to appeal such matters to the NERC Compliance Committee and FERC. In August 2013, FERC approved Texas RE's request to begin using the same hearing procedures as are used by the other seven Regional Entities.

v. **Provide for taking appropriate steps to gain recognition in Canada and Mexico.** This criterion is not applicable to Texas RE.

3. **TRE operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability**. Under its Delegation Agreement with NERC, Texas RE has promoted effective and efficient administration of the BES in the ERCOT region. Texas RE has worked with industry to create a major regional Reliability Standard (BAL-001-TRE) and several minor regional Reliability Standards (CIP-001 regional variance and IRO-006-TRE) designed to improve reliability in the ERCOT region. The major regional Reliability Standard requires individual generation facilities to operate with properly configured governors in service to meet frequency

response performance requirements. Texas RE also has successfully implemented the CMEP in the region, performing more than 260 audits since January 2009 and developing a robust CIP audit program. Since 2009, Texas RE has streamlined its Enforcement processing by implementing the webCDMS data management system in 2011 and implementing the FFT program to more quickly process lower risk violations. From 2010 to 2012, Texas RE also worked in cooperation with NERC, the other regions and industry to develop an events analysis program in which registered entities report their performance during system events and develop lessons learned to be shared with the industry. Early in the program, when Texas faced rotating outages during the 2011 Southwest Cold Weather Event, Texas RE used the framework the events analysis program provided to quickly collect and analyze information from the event and to disseminate it to FERC, NERC, and the industry.

Western Electricity Coordinating Council (WECC)

1. **WECC "is governed by an independent board, a balanced stakeholder board or a combination independent and balanced stakeholder board**." Since its creation, WECC has been governed by a hybrid board of directors including both non-affiliated directors and a balanced group of stakeholder directors as envisioned by the FPA §215(e)(4), 16 U.S.C. §824o(e)(4). However, on June 27, 2013, the WECC Board approved the bifurcation of the company into a Regional Entity (WECC) and a Reliability Coordination Company, Peak Reliability. This decision—the culmination of a year of work by various WECC board committees, staff, WECC members, and WECC stakeholders—signals a major landmark in the history of the organization. Under this new structure the RC and IA functions in the Western Interconnection will become a separate company from WECC. When established, Peak Reliability will provide core and other associated reliability coordination services within the Western Interconnection. As anticipated, the Commission approved the relevant documents by the end of December 2013;[153] however, as there were outstanding compliance filings, the bifurcation was not finalized during the assessment period.[154] Nevertheless, WECC and Peak Reliability began operating as separate entities in many respects by that time.

2. **WECC met the requirements of Section 215 (c)(1) (2) of the Federal Power Act, because**:
    a. **WECC is able to develop and enforce reliability standards that provide for an adequate level of reliability of the bulk power system**. WECC's authority to enforce Reliability Standards is based on the authority granted in its Delegation Agreement with NERC. FERC's approval of the Delegation Agreement conferred authority to WECC to manage and enforce compliance with FERC-approved Reliability Standards and to apply penalties up to the extent of FERC's civil penalty

[153] *See Western Electricity Coordinating Council*, Order on Petition for Declaratory Order, 143 FERC ¶ 61,239, *order on reh'g*, 145 FERC ¶ 61,202 (2013), *appeal pending sub nom. Edison Electric Institute v. FERC*, No. 14-1012 (D.C. Cir. Jan. 27, 2014).

[154] The Commission accepted the compliance filings on February 12, 2014. *See North American Electric Reliability Corporation; Western Electricity Coordinating Council*, 146 FERC ¶ 61,092 (2014), *order on reh'g*, 147 FERC ¶ 61,063 (2014), *appeal pending sub nom. Edison Electric Institute v. FERC*, No. 14-1071 (D.C. Cir. May 9, 2014).

authority. Additionally, WECC develops Regional Criteria and practices to improve the functioning and efficiency of the Western Interconnection. This combination provides a forum for addressing system-wide issues and an oversight role to promote reliable operation of the Western Interconnection.

WECC also demonstrated its ability to enforce reliability standards during the assessment period, by successfully clearing its backlog of Enforcement work; completing all audits contemplated in its annual Implementation Plans; developing and maintained highly qualified Compliance staff; enhancing, streamlining and documenting all the Enforcement processes; successfully implementing new IT solutions and systems; and expanding and enhancing its compliance encouragement and outreach efforts. Furthermore, WECC worked collaboratively with the other Regional Entities and NERC to bring forward the Omnibus proposal; proposed NERC ROP changes to streamline TFE processing; developed new registration system tools; and, actively participated in several ongoing NERC IT projects, lending expertise and practical experience.

b. WECC has established rules that:

i. **Assure its independence of the users and owners and operators of the bulk-power system, while assuring fair stakeholder representation in the selection of its directors and balanced decision-making in any ERO committee or subordinate organization structure**. WECC currently has a hybrid board comprised of member class directors and non-affiliated (independent) directors, who are subject to standards of conduct set out in WECC's bylaws. This ensures that member/stakeholder views are well-represented and that board decisions are ultimately made fairly and in the best interests of WECC as a whole. Effective January 1, 2014, WECC transitioned to an all independent director board. Accordingly, directors are directly elected by the WECC membership and members are represented on a newly created Member Advisory Committee that has direct access to the WECC Board to provide advice and recommendations regarding WECC policy and proposed board decisions. In addition, WECC staff members, and representatives from WECC member entities, routinely participate in ERO and ERO Enterprise committees and work groups.

ii. **Allocate equitably reasonable dues, fees, and other charges among end users for all activities**. The allocation of dues, fees and other charges is governed by §12.1 of the WECC bylaws, Funding of Reliability Activities. WECC funds all activities undertaken pursuant to FPA §215 in accordance with the funding provisions and procedures of that law and related FERC regulations and orders. The WECC Board approves the annual business plan and budget in time for submission to the ERO and to FERC for approval. WECC funds reliability activities undertaken pursuant to any agreements with appropriate Canadian or Mexican authorities in accordance with the provisions of those agreements. In adopting budgets for the costs of reliability activities, the WECC Board seeks an equitable allocation based upon the NEL

and other relevant factors consistent with applicable law, the Delegation Agreement and any international reliability agreements. To the extent that WECC elects to fund any activities not eligible for funding pursuant to §§12.1.1 and 12.1.2, it does so through the use of service fees, charges or dues applicable to the persons or entities that voluntarily participate in such activities.

iii. **Provide fair and impartial procedures for enforcement of reliability standards through the imposition of penalties.** WECC's Delegation Agreement with NERC is based on the NERC *pro forma* Delegation Agreement and has been reviewed and approved by FERC. As required, WECC developed an annual CMEP Implementation Plan, which identifies the NERC Reliability Standards on the actively monitored list as well as the compliance monitoring methods that will be used to enforce those standards. The plan was submitted to NERC for approval. Additionally, WECC has developed and documented all formal processes and procedures relating to enforcement activities, including penalties. In this regard, WECC uses the NERC *Sanction Guidelines* as a framework for assessing fair and reasonable penalties, and considers all facts associated with the registered entity and the alleged violation. Individuals responsible for assessing, recommending, or negotiating penalties are not otherwise involved in compliance monitoring or discovery of violations. In other words, WECC specifically segregates the duties associated with violation discovery or review and violation disposition and penalty assessment. Furthermore, WECC has a layered review approach to penalties, including non-monetary ones. Specifically, the manager of enforcement policy reviews all penalties and communicates with the director of enforcement, who then reviews and, as appropriate, approves them. WECC management reviews these processes and procedures bi-annually. Finally, WECC's enforcement staff receives regular training on all aspects of their duties to ensure consistency of application. This training is delivered in weekly staff meetings as well as at formal training sessions held at least annually.

iv. **Provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties.** WECC uses the FERC-approved WECC RRSDP to develop regional Reliability Standards along with regional criteria and regional business practices. These procedures assure that the documents will be developed in a fair and open manner with contribution and review by subject matter experts and that all affected parties will have the chance to comment and vote on the documents. Illustratively, proposed standards are drafted by a standards drafting team, publicly posted, and subject to a mandatory public comment period prior to any vote.

In regard to the exercise of its other duties, WECC posts on its website notices of, and agendas and materials for, board and committee meetings. WECC

also adheres to the NERC ROP and the CMEP processes, which provide due process protections to registered entities with respect to compliance obligations and enforcement of standards violations. Accordingly, registered entities are provided reasonable notice of possible violations, and the right to contest a violation, penalty or sanction, and to appeal the Regional Entity's decisions to the NERC Board of Trustees Compliance Committee, and the Commission.

v. **Provide for taking appropriate steps to gain recognition in Canada and Mexico**. WECC has negotiated various agreements with the applicable governmental authorities for British Columbia, Canada, Alberta, Canada, and Baja, Mexico, the three international areas included in the Western Grid, as detailed below:

British Columbia:

Under the Administration Agreement (dated October 8, 2009) between the British Columbia Utilities Commission (BCUC) and the WECC, WECC acts as the administrator for the BCUC in carrying out certain activities relating to the Mandatory Reliability Standards program in British Columbia. Working under this agreement, WECC monitors compliance to the standards adopted in BC. WECC receives and reviews self-reports, self-certifications, and periodic data submittals; conducts audits; and reviews mitigation plans and other such activities. At the BCUC's request, WECC has set up a separate webCDMS portal, an electronic system to collect compliance data, dedicated to BCUC and its entities.

Alberta:

WECC acts as the Compliance Monitor for the Alberta Market Surveillance Administrator (Alberta MSA), under the Services Agreement (dated April 30, 2010) between the Alberta MSA and WECC, in carrying out certain activities related to Alberta Reliability Standards, specific to the Alberta Electric System Operator (AESO), in Alberta, Canada. WECC operates under the Services Agreement with the MSA, and as contemplated in the membership and operating agreement (MOA) (dated September 23, 2008) with the AESO.

Mexico:

Under the MOA (dated December 31, 2010) between Comisión Federal de Electricidad (CFE) and WECC, WECC acts as CFE's compliance monitor for certain activities in Baja California, Mexico, monitoring compliance with its mandatory Reliability Standards. The agreement between CFE and WECC requires that WECC not disclose any confidential data to anyone other than CFE. Any request from NERC or FERC to WECC for data relating to WECC activities in Mexico is directed to CFE. The CFE/WECC annual Implementation Plan, based on WECC's

recommendations and after consultation with the Area de Control Baja California (ACBC), CFE's compliance program administrator, includes a list of actively monitored standards, a description of the monitoring methods WECC uses for designated entities, and the compliance audit timeline. As with British Columbia, the Alberta MSA, and the AESO, WECC set up a separate webCDMS portal for use by CFE.

In summary, WECC does not have enforcement or registration authority for any of the international jurisdictions within the Western Interconnection. WECC provides monitoring, reviews mitigation plans and completed mitigation plans, and assessment recommendations with respect to alleged violations.

3. WECC operates under a delegation agreement that promotes effective and efficient administration of bulk-power system reliability. WECC assures the reliability and efficient administration of the Western Interconnection through a variety of activities authorized under its Delegation Agreement. To start with, during the assessment period, WECC continued to develop regional Reliability Standards, in large part due to its unique situation among the Regional Entities. Indeed, WECC has developed the most regional Reliability Standards because of a mandatory program it had in place prior to the approval of NERC as the ERO and the delegation to WECC. Under this program (called the Reliability Management System (RMS)), WECC is required to translate existing reliability criteria into regional mandatory standards. As a consequence, whereas all of the other Regional Entities have a total of seven regional Reliability Standards, WECC alone has a total of eight.[155]

WECC likewise promoted effective and efficient administration of the BPS in the Western Interconnection during the assessment period through its implementation of NERC's CMEP approved by the Commission. Illustratively, WECC successfully cleared its backlog of Enforcement work; completed all audits contemplated in its annual Implementation Plans; developed and maintained a highly qualified Compliance staff; enhanced, streamlined and documented all the Enforcement processes; successfully implemented new IT solutions and systems; and expanded and enhanced its compliance encouragement and outreach efforts. Furthermore, WECC worked collaboratively with the other Regional Entities and NERC to bring forward the Omnibus proposal; proposed ROP changes to streamline TFE processing; developed new registration system tools; and, actively participated in several ongoing NERC IT projects, lending expertise and practical experience.

As a separate matter with respect to the administration of the Western Interconnection, during the assessment period, WECC managed a comprehensive planning database, provided guidance on the analysis and modeling of the transmission system, and developed scenario

[155] These eight regional Reliability Standards are: (i) FAC-501-WECC-1 (Transmission Maintenance); (ii) VAR-002-WECC-1 (Automatic Voltage Regulators); (iii) VAR-501-WECC-1 (Power System Stabilizer); (iv) PRC-004-WECC-1 (Protection System and Remedial Action Scheme Misoperation); (v) IRO-006-WECC-1 (Qualified Transfer Path Unscheduled Flow Relief); (vi) BAL-004-WECC-01 (Automatic Time Error Correction); (vii) TOP-007-WECC-1 (System Operating Limits); and (viii) BAL-002-WECC-2 (Contingence Reserve) (replacing BAL-STD-002-2).

studies of system performance to establish operating policies and limits, and regional transmission planning. In addition, WECC performed annual assessments of 10-year loads and resources in the Western Interconnection and created a 10-year coordinated plan of system growth. WECC also provided information to NERC for their annual summer and winter assessments of the reliability of the BPS. Beginning in 2012, WECC produced an annual *State of the Interconnection* report to provide WECC's members and stakeholders with an independent assessment of data collected annually in the Western Interconnection. The goal was to develop reasonable measurements that would identify reliability trends in the Interconnection.

B. Regional Entity Performance in Business Planning and Budgeting, Accounting, and True-Up Reporting 147

This **Attachment 3** is NERC's assessment of the Regional Entities' performance of their delegated functions during the five-year assessment period 2009 through 2013. Following are brief descriptions of the geographic footprints of the eight Regional Entities.

Florida Reliability Coordinating Council, Inc. (FRCC) is the Federal Energy Regulatory (FERC or Commission)-approved Regional Entity for the territory covering peninsular Florida in the Eastern Interconnection.

Midwest Reliability Organization (MRO) is the FERC-approved Regional Entity for the north central region of North America within the Eastern Interconnection. MRO's footprint spans the states of North Dakota, Minnesota, and Nebraska, the majority of the territory in the states of South Dakota, Iowa, and Wisconsin, portions of Michigan and Montana, and the Canadian provinces of Saskatchewan and Manitoba.

Northeast Power Coordinating Council, Inc. (NPCC) is the FERC-approved Regional Entity for the northeastern North American region in the Eastern Interconnection. NPCC's footprint includes the states of Connecticut, Maine, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont, as well as the Canadian provinces of New Brunswick, Nova Scotia, Ontario, and Quebec.

ReliabilityFirst Corporation (ReliabilityFirst) is the FERC-approved Regional Entity for portions of the mid-Atlantic and east central areas of the United States within the Eastern Interconnection. ReliabilityFirst's footprint includes all or portions of the states of New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, Ohio, Michigan, Kentucky, Tennessee, Indiana, Illinois, Wisconsin, and the District of Columbia.

SERC Reliability Corporation (SERC) is the FERC-approved Regional Entity for the southeastern United States region within the Eastern Interconnection. SERC's footprint includes the states of Alabama, Georgia, Mississippi, Missouri, North Carolina, South Carolina, and Tennessee, and portions of the states of Arkansas, Florida, Illinois, Iowa, Kentucky, Louisiana, Oklahoma, Texas, and Virginia.

Southwest Power Pool Regional Entity (SPP RE) is the FERC-approved Regional Entity for the central southern United States within the Eastern Interconnection. SPP RE's footprint includes all or parts of the states of Arkansas, Kansas, Louisiana, Mississippi, Missouri, New Mexico, Oklahoma, and Texas. SPP RE is an independent and functionally separate division of Southwest Power Pool, Inc., one of nine independent system operators (ISOs)/RTOs in North America.

Texas Reliability Entity, Inc. (Texas RE) is the FERC-approved Regional Entity for the Electric Reliability Council of Texas (ERCOT) region in the Texas Interconnection. At the time of the three-year performance assessment, Texas Regional Entity, an independent division of ERCOT, performed compliance monitoring and enforcement activities for the ERCOT region. Texas RE was formed on January 1, 2010 to become the successor Regional Entity for the ERCOT region. Effective July 1, 2010, NERC delegated to Texas RE the authority and responsibility for

the continuation of all compliance monitoring and enforcement activities that it had previously delegated to Texas Regional Entity.

Western Electricity Coordinating Council (WECC) is the FERC-approved Regional Entity for the portions of the Western United States and Canada in the Western Interconnection. WECC's footprint extends from the provinces of Alberta and British Columbia in Canada to the northern portion of Baja California, Mexico. WECC's service territory includes all or portions of 14 states in the western United States. Geographically, WECC's territory is the largest of all the Regional Entities.

I. RELIABILITY STANDARDS DEVELOPMENT

Section 215(d) of the Federal Power Act (FPA), 16 U.S.C. §824o(d), requires NERC to develop mandatory and enforceable Reliability Standards that are subject to Commission review and approval. A Regional Entity may also develop a Reliability Standard for approval by NERC and by the Commission, to be effective in that Regional Entity only. The FPA and Commission regulations provide that the ERO shall rebuttably presume that a proposal from a Regional Entity organized on an interconnection-wide basis for a Reliability Standard or modification to a Reliability Standard to be applicable on an interconnection-wide basis is just, reasonable, and not unduly discriminatory or preferential, and in the public interest.[1] This presumption is also embodied in the Regional Delegation Agreements (RDAs), which delegate to each Regional Entity authority to propose regional Reliability Standards to NERC for approval.

In Order No. 672, the Commission stated that:

> As a general matter, we will accept the following two types of regional differences, provided they are otherwise just, reasonable, not unduly discriminatory or preferential and in the public interest, as required under the statute: (1) a regional difference that is more stringent than the continent-wide Reliability Standard, including a regional difference that addresses matters that the continent-wide Reliability Standard does not; and (2) a regional Reliability Standard that is necessitated by a physical difference in the Bulk-Power System.[[2]]

These parameters are embodied in the NERC Rules of Procedure (NERC ROP). Section 312.1 of the NERC ROP specifies that Regional Entities may propose regional Reliability Standards that set more stringent reliability requirements than the NERC Reliability Standard or cover matters not covered by an existing NERC Reliability Standard. Section 313.1 of the NERC ROP specifies that Regional Entities may develop Regional Criteria that are necessary to implement, augment, or comply with NERC Reliability Standards, but which are not Reliability Standards; or which address issues not within the scope of Reliability Standards.

---

[1] FPA §215(d)(3), 16 U.S.C. §824o(d)(3), 18 C.F.R. §39.5(b).

[2] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, at P 291, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

Regional Reliability Standards must be approved by NERC and are then submitted by NERC to the Commission; they become enforceable as NERC Reliability Standards under §215 of the FPA in the U.S. once they are approved by the Commission. Therefore, regional Reliability Standards must meet the requirements set out by the Commission for approval of such standards, including having violation risk factors (VRFs) and violation severity levels (VSLs) that meet the criteria the Commission has set out in its various orders.

To evaluate each Regional Entity's performance during the assessment period, NERC focused on two parameters. First, NERC reviewed whether each Regional Entity has in place a regional Reliability Standards Development Procedure (RSDP) that meets applicable requirements. This portion of the evaluation was straightforward because, as described in §I.A below, each Regional Entity is required to have in place, as part of its RDA, a NERC-approved and Commission-approved RSDP that satisfies a pre-established set of attributes. During the assessment period, some of the Regional Entities developed revisions to their RSDPs, which were approved by NERC and by the Commission. Second, NERC reviewed each Regional Entity's activity, if any, in developing proposed regional Reliability Standards during the assessment period. As described in §I.B below, with the exception of WECC, the Regional Entities have, in general, suspended regional Reliability Standards development activities in favor of devoting resources and stakeholder participation to the development of, and reliance on, NERC's continent-wide Reliability Standards. However, during the assessment period, NPCC, ReliabilityFirst, SERC and Texas RE, in addition to WECC, had regional Reliability Standards approved by the Commission. The Regional Entities will continue to develop regional Reliability Standards only to the extent that NERC Reliability Standards do not address a perceived gap in reliability specific to a particular region.

A. Regional Entity Standards Development Processes

Exhibit C to each RDA contains (i) the list of NERC's common attributes of an appropriate RSDP, and (ii) each Regional Entity's current RSDP. In reviewing and approving a Regional Entity's RSDP for inclusion in Exhibit C to the RDA, NERC reviews the RSDP against the common attributes to determine whether the RSDP meets the common attributes. During the assessment period, some of the Regional Entities' RSDPs were revised and approved by NERC and then by the Commission.[3]

The RSDPs include the process that each Regional Entity uses to develop regional Reliability Standards that are proposed to NERC for adoption, and, where applicable, regional variances if the Regional Entity is organized on an interconnection-wide basis. While the RSDPs are not identical, each one must, as noted, satisfy the common attributes that advance the development of regional Reliability Standards consistent with the objective of a uniform reliability program. Among other things, participation in the development of a regional Reliability Standard must be open to all organizations that are directly and materially affected by the bulk power system (BPS) located in the Regional Entity's footprint, with no constraints based on financial capability, technical expertise or membership in the organization. The RSDP must provide for an appropriate

[3] NERC maintains on its website each Regional Entities' RSDP which lists the date of the current version. *See* http://www.nerc.com/pa/Stand/Pages/RegionalStandardsDevelopment.aspx.

balance of interests and the process must be structured so that it may not be dominated by any two interest categories and no single interest category can defeat a matter. All entities with a direct and material interest in the BPS in the Regional Entity may participate in the development of regional Reliability Standards by expressing a position and support for that position. Participating entities then will have that position considered and have the right to appeal the final outcome. The RSDP must also allow for reasonable notice and opportunity for public comment, and include language that states that all actions material to the development of any regional Reliability Standards be transparent.[4]

Based on its review and approval of the Regional Entities' RSDPs for inclusion in the RDAs and the subsequent approval by the Commission, NERC believes that during the assessment period, all of the Regional Entities met the requirements applicable to the ERO in the development of regional Reliability Standards.[5] Specifically, the Regional Entities: (i) demonstrated the ability to develop Reliability Standards that provide for an adequate level of reliability of the BPS; (ii) established rules that assure the independence of the users and owners and operators of the BPS, (iii) took action to ensure balanced decision-making in applicable committees or subordinate organization structures; and (iv) developed rules that provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing Reliability Standards. During the assessment period, each Regional Entity fulfilled the obligation to provide an open, fair, balanced, and inclusive process for the development of regional Reliability Standards, as demonstrated by the approval of those processes by NERC and the Commission.

B. Review of Each Regional Entity's Standards Development Activities During the Assessment Period

NERC focuses on the development of its continent-wide Reliability Standards as consistent with the goal of a reliable BPS. The Regional Entities have developed relatively few regional Reliability Standards to address unique situations with specific or more stringent requirements in a particular interconnection or geographic region which the NERC continent-wide standards may not address. Since the Commission issued Order No. 693 in 2007, approving the initial set of NERC continent-wide Operations and Planning Reliability Standards, the Commission has approved a total of only seven regional Reliability Standards submitted by Regional Entities other than WECC.

The Regional Entities are concentrating their standards development resources on working with NERC and stakeholders to develop clear, reasonable, and technically sound continent-wide Reliability Standards in a timely and efficient manner, and to ensure that regional concerns are addressed in the continent-wide Reliability Standards. This approach also avoids duplicating NERC's efforts at the regional level. Barring the existence of a perceived region-specific gap in reliability not addressed by NERC Reliability Standards, the Regional Entities will refrain from developing further regional Reliability Standards.

---

[4] NERC maintains on its website a current overview of regional Reliability Standards under development, with detailed information on the status of the proceeding.
See http://www.nerc.com/pa/Stand/Pages/RegionalReliabilityStandardsUnderDevelopment.aspx.

[5] FPA §215(c)(1) and (2); 16 U.S.C. §824o(c)(1)(2).

To this end, the Regional Entities are actively encouraging awareness and participation by stakeholders in their respective areas in the NERC standards development process, by engaging in educational outreach efforts, and through participation in the NERC Standards Committee (NERC SC) and related subcommittees. The Regional Entities also have standards committees or similar groups at the regional level that analyze the draft ERO standards to determine their quality and effectiveness and evaluate whether the reliability objective is adequate and cost effective, and to provide input on these topics in the NERC standards development process.

The following subsections provide a review of the activities of each Regional Entity in the development of regional Reliability Standards during the assessment period.

1. Florida Reliability Coordinating Council, Inc.

The most recent version of the FRCC RSDP was approved by the Commission on June 12, 2012 and is included as Appendix C to the FRCC RDA. FRCC currently has no FERC-approved regional Reliability Standards or regional variances. During the assessment period, FRCC placed two regional Reliability Standards development projects on hold awaiting the completion of NERC standards development projects, and terminated one project because NERC's continent-wide Reliability Standard was determined to be sufficient for FRCC's reliability needs. Additionally, FRCC's registered ballot body and board of directors approved one project, which was held in abeyance while the adequacy of the NERC continent-wide Reliability Standard was evaluated, and will be withdrawn if it is determined to be sufficient for FRCC's needs. FRCC prefers the development of continent-wide Reliability Standards, but will follow its regional RSDP should a need arise for a more stringent standard or a standard to cover an area that NERC Reliability Standards do not.

2. Midwest Reliability Organization

MRO supports the development of continent-wide Reliability Standards to maintain the reliable operations of the BPS, as opposed to regional Reliability Standards, particularly in the Eastern Interconnection. Therefore, MRO decided during the assessment period to forego the development of regional Reliability Standards. Nevertheless, MRO has a regional RSDP in effect. The most recent revised version of the MRO RSDP was approved by the Commission on June 12, 2013[6] and is included as Appendix C to the MRO RDA. The principal purposes of these amendments to the MRO RSDP include: (i) to provide greater alignment of MRO's standards develop procedures with the NERC *Standard Processes Manual*; (ii) to incorporate a requirement for a review of the MRO RSDP every five years; and (iii) to provide various clarifications to the process development steps in the MRO RSDP. MRO also has a stakeholder-based Standards Committee comprised of subject matter experts (SMEs) in the event there is a need for a regional Reliability Standard in the future.

[6] *North American Electric Reliability Corporation*, Docket Nos. RR13-5-000 (June 12, 2013) (unpublished letter order).

3. Northeast Power Coordinating Council, Inc.

NPCC has developed a revised RSDP that provides a results-based, consensus building approach by which NPCC may develop regional Reliability Standards and Regional Variances proposals to the ERO for adoption, under delegated authority by the Commission and the Canadian Provincial regulatory and/or governmental authorities.

During the assessment period, NPCC developed a disturbance monitoring regional Reliability Standard, PRC-002-NPCC-01, to ensure that adequate disturbance data are available to facilitate event analyses. This NPCC regional Reliability Standard addresses a specific recommendation from the August 14, 2003 Blackout final NERC report regarding the use of time-synchronized data recorders.[7] Substantively, this NPCC regional Reliability Standard outlines the basic requirements for the type, location and capability of equipment to be placed on the BPS to enable analysis of grid disturbances to be conducted effectively and efficiently. This regional Reliability Standard is intended to establish enforceable and uniform requirements for disturbance monitoring throughout the NPCC region. On October 20, 2011, the Commission issued an order approving regional Reliability Standard PRC-002-NPCC-01, the related VRFs and VSLs, implementation plan, and two associated regional definitions in the *Glossary of Terms Used in NERC Reliability Standards* (NERC Glossary).

NPCC also developed regional Reliability Standard PRC-006-NPCC-1, Automatic Underfrequency Load Shedding, during the assessment period. The purpose of PRC-006-NPCC-1 is to provide a regional Reliability Standard that ensures the development of an effective regional automatic underfrequency load shedding (UFLS) program in order to preserve the security and integrity of the BPS during declining system frequency events, in coordination with the NERC UFLS Reliability Standard characteristics. Further, this NPCC regional Reliability Standard creates a region-wide and fully coordinating single set of UFLS requirements that will serve as a last resort to preserve the BPS during a major system failure that may cause a system frequency collapse. On February 21, 2013, the Commission issued Order No. 775 approving regional Reliability Standard PRC-006-NPCC-1, the related VRFs and VSLs, implementation plan, and the effective dates proposed by NERC.[8]

4. ReliabilityFirst Corporation

ReliabilityFirst has an approved RSDP in place as Exhibit C to its RDA. ReliabilityFirst no longer develops regional Reliability Standards, in order to avoid duplication with the NERC continent-wide Reliability Standards. However, ReliabilityFirst has proved its ability to develop regional Reliability Standards, as shown by its development of regional Reliability Standard BAL-502-RFC-02, Planning Resource Adequacy Analysis, Assessment and Documentation, during the assessment period. The purpose of this standard and associated definitions is to establish common criteria based on the principle of "one day in ten years" loss of load expectation for the analysis,

[7] *See Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations* available at: http://www.nerc.com/pa/rrm/ea/Pages/Blackout-August-2003.aspx.

[8] *Regional Reliability Standard PRC-006-NPCC-1 – Automatic Underfrequency Load Shedding*, Order No. 775, 142 FERC ¶ 61,128 (2013).

assessment, and documentation of resource adequacy for load in the ReliabilityFirst footprint and to establish requirements for planning coordinators in the ReliabilityFirst region regarding resource adequacy assessment, a subject matter not addressed in NERC's continent-wide Reliability Standards. The Commission approved regional Reliability Standard BAL-502-RFC-02 and related filings in an order issued on March 17, 2011, directing that the regional Reliability Standard and associated VSLs, VRFs, and definitions become effective on the date of that order.[9]

5. SERC Reliability Corporation

The SERC RSDP, included in Exhibit C to the SERC RDA, defines the process for the development, revision, reaffirmation, and withdrawal of SERC regional Reliability Standards. The SERC RSDP requires any proposed SERC regional Reliability Standard to be more stringent than a continent-wide Reliability Standard, whether the regional Reliability Standard addresses matters that the continent-wide Reliability Standard does not or the regional Reliability Standard is necessitated by a physical difference in the BPS within the SERC region. SERC regional Reliability Standards are required to provide for as much uniformity as possible with continent-wide Reliability Standards.

SERC has one Commission-approved regional Reliability Standard, PRC-006-SERC-01, Automatic Underfrequency Load Shedding Requirements. The purpose of this standard and the associated VSLs and VRFs is to establish consistent and coordinated requirements for the design, implementation, and analysis of automatic UFLS schemes among all applicable entities within the SERC region so that distribution providers and transmission owners may effectively mitigate the consequences of an underfrequency event. The standard effectively mitigates the consequences of an underfrequency event while accommodating differences in system transmission and distribution topology among SERC planning coordinators. The Commission approved regional Reliability Standard PRC-006-SERC-01 in Order No. 772 issued on December 20, 2012.[10]
