NPCC REGIONAL STANDARDS COMMITTEE

AGENDA FOR MEETING #14-5
December 4th, 2014, 8:00 a.m. – 5:00 p.m. AST
Halifax Marriott Harbourfront Hotel
1919 Upper Water Street
Halifax, Nova Scotia B3J 3J5 Canada
Attire: Business Casual

Dial-In: 415-655-0003 (USA) / 416-915-6530 (Canada) **Guest Code: 28796919**

For Reference: Glossary of Terms Used in NERC Reliability Standards, dated October 1, 2014
NPCC Glossary of Terms, dated January 18, 2012

Introductions and Chair's Remarks

NPCC Antitrust Compliance Guidelines

Agenda Items:

1.0 Review of Agenda

2.0 RSC Meeting Minutes

2.1 Approval of Minutes: September 17-18, 2014 RSC Meeting #14-4*

3.0 Drafting Team Members and Executive Tracking Summary

3.1 NPCC Members on NERC Drafting Teams*
3.2 Executive Tracking Summary*
3.3 NERC Project Tracking Spreadsheet (*link*)

4.0 Open Action Items*

4.1 Open Action Items List

5.0 Items Requiring RSC Discussion / Approval

5.1 NERC Weekly Standards Bulletin
5.2 NERC RAPA Meeting
5.3 NPCC RCC Meeting Minutes
5.4 NERC Bulk Electric System Update
5.5 Canadian Provincial Summaries

6.0 NERC Reliability Standards
http://www.nerc.com/pa/Stand/Pages/Standards-Under-Development.aspx

6.1 Currently Posted Projects

Project	Comment Period	Ballot Period	Standards Developer	12/4/14 Call-In

	End Date	End Date		
Project 2014-01 Standards Applicability for Dispersed Generation Resources	12/10/14	12/19/14	Katherine Street	
Project 2014-02 - Critical Infrastructure Protection Standards Version 5 Revisions	1/8/15	1/8/15	Ryan Stewart	
Comments: (I) – Informal; (F) – Formal **Ballots:** (I) – Initial; (A) – Additional; (F) – Final				

6.1.1 NERC Projects Comment Period Guidelines

6.2 Ballot History (Since last RSC Meeting)*

6.3 Comment Form History (Since last RSC Meeting)*

7.0 NERC Drafting Team Nominations

http://www.nerc.com/pa/Stand/Pages/Drafting-Team-Vacancies.aspx

7.1 Currently Posted Drafting Team Vacancies

7.1.1 None at this time

7.2 Closed Drafting Team Nominations (Since last RSC Meeting)

7.2.1 None at this time

7.3 Solicitation For Informal Development Teams

7.3.1 None at this time

8.0 NPCC Regional Reliability Standards*

https://www.npcc.org/Standards/default.aspx

8.1 Current Activities: Regional Standards Process Manual

8.2 Current Activities: Regional Standard BAL-002-NPCC-01: Regional Reserve Sharing

9.0 NPCC Non-Standards*

https://www.npcc.org/Standards/SitePages/NonStandardsList.aspx

9.1 Directories:

9.1.1 Directory #1 Design and Operation of the Bulk Power System

9.1.2 Directory#3 Maintenance Criteria BPS – (Retirement Approved on 10/15/2014 effective April 1st, 2015).

9.2 Directory Clarifications

9.2.1 TFSP Clarification for the IESO- Market Assessment and Compliance Division (MACD).

9.3 Criteria (A) / Guides (B) / Procedures (C) Documents

9.4 Directory Manual (Revisions Approved by the RSC on 10/03/2014)

10.0 RSC Member Items of Interest

10.1 RSC Roster*

11.0 Standards Activity Post NERC BOT Approval*

(Since last RSC Meeting)

11.1 NERC Filings to FERC

http://www.nerc.com/FilingsOrders/Pages/default.aspx

11.2 FERC Orders / Rules
http://www.nerc.com/FilingsOrders/Pages/default.aspx
11.3 Federal Register

11.4 FERC Sunshine Act Meeting Notice
11.5 FERC Open Meeting Summaries

12.0 NERC Meetings

12.1 Standards Committee (SC)
http://www.nerc.com/comm/SC/Pages/default.aspx

January 15th - Meeting	January 29th - Call	February 12th - Call
March 12th & 13th - Meeting	April 9th - Call	May 14th - Call
June 10th & 11th - Meeting	July 16th - Call	August 20th - Call
September 23rd & 24th Meeting	October 22nd - Call	November 19th - Call
December 9th & 10th - Meeting		

12.2 Standards Committee Process Subcommittee (SCPS)
http://www.nerc.com/comm/SC/Pages/Standards%20Committee%20Process%20Subcommittee%20SCPS/Standards-Committee-Process-Subcommittee-SCPS.aspx

February 6th & 7th	March 12th & 13th	April 23rd Call
June 10th & 11th	July 29th	October 1st
October 28th	December 9th	

12.3 Standards Committee Project Management and Oversight Subcommittee (PMOS)
http://www.nerc.com/comm/SC/Pages/ProjectManagementandOversightSubcommittee(PMOS).aspx

February 21st - Call	February 28th - Meeting	April 17th - Meeting
June 10th	September 30th	October 16th - Call
November 6th - Call		

12.4 Member Representatives Committee (MRC) Meeting
http://www.nerc.com/gov/bot/MRC/Pages/AgendaHighlightsandMinutes2013.aspx

January 8th	February 5th	April 9th
May 6th	July 16th	August 13th
October 15th	November 12th & 13th	

12.5 Board of Trustees (BOT) Meeting
http://www.nerc.com/gov/bot/Pages/Agenda-Highlights-and-Minutes-.aspx

February 6th	April 23rd	May 7th
August 14th	October 29th	November 13th

12.6 Reliability Issues Steering Committee (RISC)
http://www.nerc.com/comm/RISC/Pages/AgendasHighlightsandMinutes.aspx

February 13th - Call	March 19th - Meeting	April 9th - Call
May 7th - Meeting	June 17th - Meeting	June 10th - Call
August 14 - Meeting	September 12th - Meeting	October 7th – Call
November 13th - Meeting	December 2nd - Meeting	

13.0 NERC Compliance Tools (Since last RSC Meeting)

13.1 Compliance Analysis Reports (CARs)
http://www.nerc.com/pa/comp/Pages/Compliance-Analysis-Reports.aspx

13.1.1 There have not been any CARs posted since the last RSC meeting

13.2 Reliability Standard Audit Worksheets (RSAWs)
http://www.nerc.com/pa/comp/Pages/Reliability-Standard-Audit-Worksheets-(RSAWs).aspx

13.2.1 There are five RSAWs have been posted for comment since the last RSC meeting.

13.3 Compliance Application Notices (CANs)
http://www.nerc.com/pa/comp/Resources/Pages/Compliance-Application-Notices.aspx

13.3.1 There have not been any new CANs posted since the last RSC meeting

14.0 NERC Items of Interest (Since last RSC Meeting)

14.1 Lessons Learned
http://www.nerc.com/pa/rrm/ea/Pages/Lessons-Learned.aspx

14.1.1 Three new Lessons Learned have been issued since the last RSC meeting.

14.2 Alerts
http://www.nerc.com/pa/rrm/bpsa/Pages/Alerts.aspx

14.2.1 There has been no new NERC Alert released since the last RSC meeting.

14.3 Five Year ERO Performance Assessment

15.0 Other Items of Interest

15.1 2015 Regional Entity Business Plans and Budgets

15.2 Quality Review of NERC Standards

16.0 Future RSC Meetings and Conference Calls

16.1 RSC 2014/2015 Meeting Dates

Feb. 19th – 20th, NextEra Energy Offices
April 10th & 11th, NPCC Offices

June 18th & 19th, Saratoga, NY
September 17th & 18th, Montreal, Quebec
December 4th, Halifax, Nova Scotia
February 18-19, 2015, NextEra Energy Offices

16.2 RSC 2014 Conference Call Schedule (calls can be scheduled as needed)
all Calls are planned to start at 10:00 a.m. (call: 415-655-0003 (USA) / 416-915-6530 (Canada), Guest Code 29173141)

July 3	July 18	August 1
August 15	August 29	September 12
September 26	October 10	October 24
November 7	November 21	December 19

Respectfully Submitted,

Guy V. Zito, Chair RSC
Assistant Vice President-Standards
Northeast Power Coordinating Council, Inc.

Northeast Power Coordinating Council, Inc. (NPCC)

Antitrust Compliance Guidelines

It is NPCC's Policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. The antitrust laws make it important that meeting participants avoid discussion of topics that could result in charges of anti-competitive behavior, including: restraint of trade and conspiracies to monopolize, unfair or deceptive business acts or practices, price discrimination, division of markets, allocation of production, imposition of boycotts, exclusive dealing arrangements, and any other activity that unreasonably restrains competition.

It is the responsibility of every NPCC participant and employee who may in any way affect NPCC's compliance with the antitrust laws to carry out this commitment.

Participants in NPCC activities (including those participating in its committees, task forces and subgroups) should refrain from discussing the following throughout any meeting or during any breaks (including NPCC meetings, conference calls and informal discussions):

- Industry-related topics considered sensitive or market intelligence in nature that are outside of their committee's scope or assignment, or the published agenda for the meeting;
- Their company's prices for products or services, or prices charged by their competitors;
- Costs, discounts, terms of sale, profit margins or anything else that might affect prices;
- The resale prices their customers should charge for products they sell them;
- Allocating markets, customers, territories or products with their competitors;
- Limiting production;
- Whether or not to deal with any company; and
- Any competitively sensitive information concerning their company or a competitor.

Any decisions or actions by NPCC as a result of such meetings will only be taken in the interest of promoting and maintaining the reliability and adequacy of the bulk power system.

Any NPCC meeting participants or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NPCC's antitrust compliance policy is implicated in any situation should call NPCC's Assistant Secretary, Andrew Fawbush at 904-598-6133.

MEETING MINUTES

Attendees:

	Name	Organization	Sector (s)	Day(s)	Comment
1.	Kal Ayoub	FERC	Guest	1 & 2	
2.	Guy Zito	Northeast Power Coordinating Council		1 & 2	
3.	Lee Pedowicz	Northeast Power Coordinating Council		1 & 2	
4.	Gerry Dunbar	Northeast Power Coordinating Council		1 & 2	Via Phone
5.	RuiDa Shu	Northeast Power Coordinating Council		1 & 2	
6.	Herb Schrayshuen	Power Advisors, LLC – Proxy for NextEra Energy, LLC	4	1 & 2	Via Phone
7.	Jim Grant Proxy for Greg Campoli	New York Independent System Operator	2	1 & 2	Via Phone
8.	Chris de Graffenried	Consolidated Edison Co. of New York, Inc.	2	1 & 2	
9.	Michael Jones	National Grid	3	1 & 2	Via Phone
10.	Vijay Puran	NYS Department of Public Service	6	1	Via Phone
11.	Kathleen Goodman	ISO-NE	2	1 & 2	
12.	Helen Lainis	IESO	2	1	

* Item in Meeting Materials

13.	Alan MacNaughton	New Brunswick Power Corporation	1	1 & 2	
14.	Don Weaver	New Brunswick Power Corporation	Guest	1 & 2	
15.	Bruce Metruck Sector 4 Proxy for Wayne Sipperly	New York Power Authority	4/5	1 & 2	
16.	Greg Goodrich	New York Power Authority	Guest	1	Via Phone
17.	Si-Truc Phan Sector 1 Proxy for Sylvain Clermont	Hydro-Québec TransÉnergie	1/2	1 & 2	
18.	Brian Robinson	Utility Services	5	1	
19.	Brian Shanahan	National Grid	1	1 & 2	
20.	Chantal Mazza	Hydro-Québec TransÉnergie	Guest	1 & 2	
21.	Muhammed Ali	Hydro One Networks	Guest	1 & 2	
22.	Ayesha Sabouba	Hydro One Networks	1	2	Via Phone
23.	Ben Wu	Orange and Rockland Utilities	1	1 & 2	
24.	Tom Neglia	Orange and Rockland Utilities	Guest	1 & 2	Via Phone
25.	Mike Garton	Dominion Resources Services	4	1 & 2	
26.	Connie Lowe	Dominion Resources Services	Guest	1 & 2	
27.	Don Nelson	Massachusetts Department of Public Utilities	Guest	1	Via Phone
28.	Ron Falsetti	AESI	Guest	1 & 2	Via Phone
29.	Dave Kiguel	David Kiguel Consulting	Guest	1 & 2	

Introductions and Chair's Remarks

Guy Zito called the meeting to order at 9:59AM on Wednesday September 17, 2014.

NPCC Antitrust Compliance Guidelines

The NPCC Antitrust Compliance Guidelines were read by Lee Pedowicz.

Agenda Items:

1.0 <u>Review of Agenda</u>

The RSC Draft Meeting Agenda was reviewed by Guy Zito.

* Item in Meeting Materials

2.0 RSC Meeting Minutes

2.1 Approval of Minutes: June 18-19, 2014 RSC Meeting #14-3*

The RSC Meeting Minutes for June 18-19, 2014 RSC Meeting #14-3 was reviewed.

Mike Garton made a motion for approval.

Kathleen Goodman seconded the motion.

The Meeting Minutes were approved as read.

3.0 Drafting Team Members and Executive Tracking Summary

3.1 NPCC Members on NERC Drafting Teams*

The spreadsheet of NPCC Members on NERC Drafting Teams March, 2014 was reviewed. It was noted that the spreadsheet was unchanged since the last RSC meeting.

3.2 Executive Tracking Summary*

Additional information was provided for RSC members to look at. The Executive tracking summary has been actively updated for over seven years.

3.3 NERC Project Tracking Spreadsheet (*link*)

This is NERC's version of the Executive Tracking Summary.

4.0 Open Action Items*

4.1 Open Action Items List

Item	Description	Owner	Due	Status
4.1.1	Coordination with the Compliance Committee to develop Joint Activity Action List	Greg Campoli/Guy Zito	RSC Meeting	Update: RSC decided that it was not necessary to have a joint meeting with CC at the December, 2014 meeting in Halifax.
4.1.2	New York Adoption of More Stringent/Specific NPCC Criteria – determine more stringent criteria and submit filing	Gerry Dunbar	October, 2014	Update: NPCC Executive Staff is providing additional comments. NPCC expects the document to be filed with the NYSPSC by late September pending final NPCC legal review. RSC Members will

* Item in Meeting Materials

				be notified when the document is filed.
4.1.3	NPCC outreach program development – discussion item: members provide input and opportunities for development of an outreach program	RSC	RSC Meeting	Update: Ongoing, two outreaches have been done with NYPA.
4.1.4	Project 2010-17, BES - Follow up with Drafting Team to identify established set of criteria for when an entity can request an exclusion and what should be provided	Guy Zito		Update: Because this has been addressed, this will be removed from the Open Action Item List.
4.1.5	Revise the Directory Development Manual to address cost effectiveness	G. Dunbar		Update: Revisions to the Directory Manual posted to the NPCC Open Process from May, 2014 to July, 2014. Draft RSC responses to Open Process comments and final approval of Directory Manual revisions pending final RSC review and approval.
4.1.6	Project 2007-06 - System Protection Coordination – share concerns raised at the RSC meeting with the	Guy Zito		Update: This will be removed from the Open Action Item List as suggested by

* Item in Meeting Materials

	Standard Drafting Team *[At the February RSC meeting there were concerns regarding: coordination between entities; tracking and notification of 10% or greater change in fault current at an interconnecting bus; need for a common tool to facilitate data exchange.]*			Guy Zito, agreed to by Si-Truc Phan who had been following it.
4.1.7	Follow up with NERC on current RSAW development process	Guy Zito		Update: After discussion the RSC members decided to not immediately address this, but wait for new items to be published.
4.1.8	Update NPCC Members on NERC Drafting Teams based on feedback received at the April, 2014 RSC meeting			Update: This item will be removed from the Open Action Item list because the task is completed
4.1.9	Update executive tracking summary. • Project 2007-02 Operating Personnel Communications Protocols: COM-002-4 Final Ballot Project 2010-05.1 was updated under the Reliability Standards tab but was missing from summary of changes. The summary of changes should be corrected.			Update: This item will be removed from the Open Action Item List. RuiDa Shu is keeping it current.
4.1.10	Update the RSCMembers email list to include both Primary and Alternate RSC members			Update: This item was done, and will be removed.

* Item in Meeting Materials

4.1.11	Project 2010-02, the use of the term "Facilities" rather than entities defined by the functional model was not supported by the RSC. Provide alternate language for consideration	Helen Lainis		Update: This item will be removed from the Open Action Item List since Project 2010-02 is approved, as suggested by Guy Zito and approved by Helen Lainis.

5.0 Items Requiring RSC Discussion / Approval

5.1 NERC Weekly Standards Bulletin

This is additional information for the RSC and is available on the NERC website.

5.2 NERC RAPA Meeting

Guy Zito suggested that for future RSC meetings only provide a link to these materials instead of downloading them into the meeting package.

5.3 NPCC RCC Meeting Minutes

Guy Zito suggested that for future RSC meetings only provide a link to these materials instead of downloading them into the meeting package.

5.4 NERC Bulk Electric System Update

Guy Zito suggested that for future RSC meetings only provide a link to these materials instead of downloading them into the meeting package.

5.5 Enhancing and Expanding RSC Standards Activities

Comments should be reviewed more closely. Guy Zito asked the RSC members to consider and provide suggestions/comments if necessary.

5.6 Impact of New SPS Definition – Gerry Dunbar

Currently NERC has posted a project for comment and ballot (Project 2010-05.2 – Special Protection Systems) that would establish a new NERC Glossary definition for a RAS (Remedial Action Scheme) and retire the term SPS, in addition to replacing references to SPS with RAS in all ERO standards.

NPCC and its Task Forces will be required to evaluate the revised definition to ensure that its criteria remain not inconsistent with the new definition.

While the RSC is responsible for coordinating the NPCC Directory project and monitoring the impact of revised ERO standards on its criteria, ultimately any changes to the NPCC criteria or other documents fall under the jurisdiction of the NPCC Task Force responsible for the document and the RCC.

* Item in Meeting Materials

The RSC will continue to monitor the progress of this project in order to ensure that its criteria remain not inconsistent with the ERO standards.

6.0 NERC Reliability Standards

http://www.nerc.com/pa/Stand/Pages/Standards-Under-Development.aspx

6.1 Currently Posted Projects

Project	Comment Period End Date	Ballot Period End Date	Standards Developer	9/17/14 Call-In

Project 2014-01 Applicability for Dispersed Generation Resources Standards	10/16/14 (F)	10/16/14 (A)	Ryan Stewart	2:15PM
Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions	10/17/14 (F)	10/17/14 (A)	Ryan Stewart	2:30PM
Project 2009-03 Emergency Operations	10/20/14 (F)	10/20/14 (A)	Laura Anderson	2:45PM
Project 2007-11 Disturbance Monitoring	10/21/14 (F)	10/21/14 (A)	Stephen Crutchfield	3:00PM
Project 2014-01 Applicability for Dispersed Generation Resources Standards	10/22/14 (F)	10/22/14 (A)	Ryan Stewart	3:15PM
Comments: (I) – Informal; (F) – Formal **Ballots:** (I) – Initial; (A) – Additional; (F) – Final				

* Item in Meeting Materials

1. Project 2014-02 CIP version 5: The communication systems deadline is in December, 2015. Two elements did not pass. The SDT has made adjustments to the standards' language to satisfy concerns from entities. One area of concern is the effort from the low risk entities. The sense is generally a positive response from the entities with minor changes to the standards. There is a concern with the industry in terms of underestimating the amount of time/effort required for the new standards. The goal is to have the TFIST group come up with the consensus votes during the meeting tomorrow September 18th, 2014 and turn it in by next Tuesday September 23rd, 2014 to RSC. The internal control program is completely separate from the RSAWs. CIP-003 low impact assets and CIP-010 are the two areas of concern and an update from TFIST is needed in terms of consensus for those two standards. These two issues will be the main focus for RSC, and the CIP-003 low impact assets will be the biggest challenge. Greg Goodrich is recommending we abstain on the recommendation for CIP-003. All other standards were approved.
2. Project 2014-03: Standard developer Wendy Muller called in.
   TOP-001-3:
   R1 should revert back to the original language. Use maintain instead of ensure. Operations planning is not real-time operations. It was suggested to keep real-time operations. R2 has the same issue as R1.
   R3 has the same issues with the time horizons.
   R4--all time horizons should be reviewed especially where operating instruction is used to review the time horizons to be done. Check the wording for this.
   R5 is acceptable as is.
   R6 is acceptable as is.
   R7 capitalize Emergency procedures since Emergency is a defined term. Comparable should be added in front of Emergency procedures.
   R8 is acceptable as is.
   R9--need to remove interconnect NERC registered to be consistent with TOP-002-4 requirement R3.
   R10--repeat the comments submitted for the previous posting.
   R11 make a comment on the word "ensure". Reference PRC-001-1.1 against R11.
   R12 is acceptable as is.
   R13 remove the word "ensure".
   R14 is acceptable as is.
   R15-- "System" should be capitalized.
   R16--remove telecommunication and replace it with telemetering equipment. There is inconsistency between R9 and R16.
   R17--remove telecommunication and replace it with telemetering equipment. There is inconsistency between R9 and R16.
   R18--remove the word "always".
   R19--remove the word "Balancing Authority Area", and replace it with Transmission Operator area.
   R20--remove the Transmission Operator Area and replace it with "Balancing Authority Area".
   RSC will be voting "No" for this standard.
   TOP-002-4: RSC will be voting "Yes".

* Item in Meeting Materials

TOP-003-3: RSC will be voting "Yes".
IRO-001-4: Voting status is divided among the members.
IRO-002-4: Telecommunication should be removed from R3 and replaced with telemetering equipment. The goal is to make it consistent. R4--remove the comma between facilities and identify. RSC will be voting "No".
IRO-008-2: Remove "Wide" from R6 on Reliability Coordinator Wide Area so it is consistent. There are no positive votes, all votes were abstain or negative.
IRO-010-2: Dominion is voting "No" because of the sub-100KV requirement. Voting status is divided among the members.
IRO-014-3: Use the old wording instead of adjacent Reliability Coordinator Areas, RSC will be voting "No".
IRO-017-1: RSC will be voting "Yes".
RSC voted "Yes" to the Implementation plan.

3. Project 2010-14.1: Some language was removed from the standard because it clouded the issue. The SDT tried to make it stand-alone versus the EOP standards. BAL-002 and EOP standards are conflicting with each other. Additional language was added, such as contingency reserves that can be used, but you are required to restore the contingency reserve within 90 minutes. Darrel Richardson called in.
4. Project 2010-13.3: Re-evaluation of the relays every three years. Three years allows the entities to plan out their relay maintenance. There was a 17 percent approval and 83 percent disapproval. Scott Barfield-McGinnis called in.
5. Project 2008-02: Very minimal changes, modified R9 and R10 for the new requirement. Identified the deficiency in the UFLS program. Lacey Ourso called in.
6. Project 2013-03 GMD: The main objectives are historical measurements, reports, and an understanding of HQ's findings. There are three types of GIC (Geomagnetic Induced Current): Electrojet, Simulation and Hypothesis. Study is based on the blackout of March, 1989. Volts/km is an issue. E-field is another issue. Transformer thermal assessment is proving to be a challenge. GMDTF has provided a training model. Mark Olson called in.
7. Project 2014-01: A NERC Webinar outreach will be in a few weeks. Ryan Stewart called in.
8. Project 2014-02: CIP version 5 has a webinar on Friday September 19th, 2014. Ryan Stewart called in.
9. Project 2009-03: The manual load shedding plan has been minimized. Major change was taking out the "approval" language to "review". Review, identify and notify the BA for any emergency operations. The goal is to make sure the RC, BA and TOP do not have overlapping responsibilities. Contingency reserves should be part of operating reserves. Laura Anderson called in.
10. Project 2007-11: Standard is posted for another comment and ballot. The standard has been revised to address common concerns of the industry. The standard is trying to capture the data, not focus on the equipment to capture the data. The standard is there because data capture is not consistent across the continent. Dynamic disturbance recording data has been revised, the fault recording section of the standard (record length) has been reduced. Best business practice is to have these data available for your power system for real time operations and analysis afterwards. Lee Pedowicz discussed the standard.

* Item in Meeting Materials

11. Project 2014-01: Ryan Stewart called into the meeting, provided a brief update on PRC-004-2.1a(X) and PRC-004-4. The goal is to complete this project (including regulatory approval) prior to BES Phase 2 implementation 7/1/2016.

6.1.1 NERC Projects Comment Period Guidelines

Lee Pedowicz gets comments from TFSP and TFIST only.

Lee Pedowicz proposed to provide comments (generated by the Standards Staff) before sending it to the appropriate Task Force.

Chris de Graffenried suggested to have a weekly conference call with the Task Force to discuss comments on posted standards.

Lee Pedowicz suggested to meet with the NPCC Staff who is in charge of the Task Forces and explain to them the work necessary for the comments, Guy Zito approved.

6.2 Ballot History (Since last RSC Meeting)*

Guy Zito reviewed the Ballot History in the meeting.

6.3 Comment Form History (Since last RSC Meeting)*

Guy Zito reviewed the Comment Form History document in the meeting.

7.0 NERC Drafting Team Nominations

http://www.nerc.com/pa/Stand/Pages/Drafting-Team-Vacancies.aspx

7.1 Currently Posted Drafting Team Vacancies

7.1.1 None at this time

7.2 Closed Drafting Team Nominations (Since last RSC Meeting)

7.2.1 None at this time

7.3 Solicitation For Informal Development Teams

7.3.1 None at this time

8.0 NPCC Regional Reliability Standards*

https://www.npcc.org/Standards/default.aspx

8.1 Current Activities: Regional Standards Process Manual

8.2 Current Activities: Regional Standard BAL-002-NPCC-01: Regional Reserve Sharing

9.0 NPCC Non-Standards*

https://www.npcc.org/Standards/SitePages/NonStandardsList.aspx

9.1 Directories:

9.1.1 Directory #1 Design and Operation of the Bulk Power System

Directory #1 has been posted to the Open Process for two 45 day comment periods with the most recent posting concluding on July 7th, 2014.

CO7/CP11 was currently reconvened to address comments, develop draft responses and revise the draft of Directory #1as necessary.

9.1.2 Directory #3 Maintenance Criteria BPS

The TFSP has completed a technical comparison of the criteria within Directory #3 with the FERC approved PRC-005-2 Protection System Maintenance standard and has recommended that the criteria in Directory #3 can be retired.

* Item in Meeting Materials

The TFSP recommendation was posted to the NPCC Open Process and all comments on the TFSP proposal have been addressed.
The RCC approved the TFSP recommendation at its September, 2014 meeting and pending a final ballot of the NPCC Full Members Directory#3 will be retired effective April 1st, 2015.

9.2 Directory Interpretations

TFSP is considering 4 separate clarification requests from the IESO on Directory #3. Clarification Requests now subject to an Open Process posting and RCC approval, in accordance with 2013 RSC approved revisions to the Directory Manual. TFSP expects to post responses to criteria clarification requests in late October.

9.3 Criteria (A) / Guides (B) / Procedures (C) Documents

9.3.1 TFCO Retirement of 'C' Documents: C05, C07, C17, C21, C36, C42 and C44

9.4 Directory Manual Revisions (Posting concluded 8-8-2014)

9.4.1 Comment Review and Proposed Responses for RSC Approval

9.4.2 Approval of Directory Manual Revisions

Bruce Metruck made a motion to approve the Directory Manual.
Brian Robinson seconded the motion.
Bruce Metruck withdrew his motion because many members of RSC did not review the manual.
The goal is to have the RSC Members review it on their own first and then have the conference call on September 26th, 2014 (conference call moved to Oct. 3, 2014) so it can be approved.
Gerry Dunbar circulated agenda items to RSC Members in advance of a scheduled October 3rd Conference Call to finalize draft Open Process comment responses and obtain RSC approval of the Directory Manual revisions.

10.0 RSC Member Items of Interest

10.1 RSC Roster*

11.0 Standards Activity Post NERC BOT Approval*

(Since last RSC Meeting)

11.1 NERC Filings to FERC
http://www.nerc.com/FilingsOrders/Pages/default.aspx
Guy Zito provided regulatory updates to the RSC members.

11.2 FERC Orders / Rules
http://www.nerc.com/FilingsOrders/Pages/default.aspx

11.3 Federal Register
https://www.federalregister.gov/

11.3.1 June 25th, 2014 Geomagnetic Disturbance Operations

11.3.2 June 26th, 2014 Modeling, Data and Analysis Reliability Standards

11.3.3 June 26th, 2014 Reliability Standards Approvals

11.3.4 July 7th, 2014 Generator Relay Loadability and Revised Transmission Relay Loadability Reliability Standards

* Item in Meeting Materials

11.3.5 July 7th, 2014 Physical Security Reliability Standards
11.3.6 July 31st, 2014 Protection System Maintenance Reliability Standards

11.4 FERC Sunshine Act Meeting Notice

11.5 FERC June Open Meeting Summaries

12.0 NERC Meetings

12.1 Standards Committee (SC)
http://www.nerc.com/comm/SC/Pages/default.aspx

January 15th - Meeting	January 29th - Call	February 12th - Call
March 12th & 13th - Meeting	April 9th - Call	May 14th - Call
June 10th & 11th - Meeting	July 16th - Call	August 20th - Call
September 23rd & 24th Meeting	October 22nd - Call	November 19th - Call
December 9th & 10th - Meeting		

12.2 Standards Committee Process Subcommittee (SCPS)
http://www.nerc.com/comm/SC/Pages/Standards%20Committee%20Process%20Subcommittee%20SCPS/Standards-Committee-Process-Subcommittee-SCPS.aspx

NERC has decided to redo the cost effectiveness document. It is a quality control review as part of the quality review process.

February 6th & 7th	March 12th & 13th	April 23rd Call
June 10th & 11th	September 23rd & 24th	

12.3 Standards Committee Project Management and Oversight Subcommittee (PMOS)
http://www.nerc.com/comm/SC/Pages/ProjectManagementandOversightSubcommittee(PMOS).aspx

February 21st - Call	February 28th - Meeting	April 17th - Meeting

12.4 Member Representatives Committee (MRC) Meeting
http://www.nerc.com/gov/bot/MRC/Pages/AgendaHighlightsandMinutes2013.aspx

February 5th	May 6th & 7th	August 13th & 14th
November 12th & 13th		

12.5 Board of Trustees (BOT) Meeting
http://www.nerc.com/gov/bot/Pages/Agenda-Highlights-and-Minutes-.aspx

The NPCC Regional Standard Processes Manual (RSPM) was approved at the BOT meeting.

* Item in Meeting Materials

February 6th	May 6th & 7th	August 13th & 14th
November 12& 13		

12.6 Reliability Issues Steering Committee (RISC)
http://www.nerc.com/comm/RISC/Pages/AgendasHighlightsandMinutes.aspx

Fourteen risk profiles were presented at the meeting.

February 13th - Call	March 19th - Meeting	April 9th - Call
May 7th - Meeting	June 17th - Meeting	June 10th - Call
August 14 - Meeting	September 12th - Meeting	October 7th – Call
November 13th - Meeting	December 2nd - Meeting	

13.0 NERC Compliance Tools (Since last RSC Meeting)

Chris de Graffenried suggested to keep this section, but only review when necessary or upon request.

13.1 Compliance Analysis Reports (CARs)
http://www.nerc.com/pa/comp/Pages/Compliance-Analysis-Reports.aspx

13.1.1 There have not been any CARs posted since the last RSC meeting

13.2 Reliability Standard Audit Worksheets (RSAWs)
http://www.nerc.com/pa/comp/Pages/Reliability-Standard-Audit-Worksheets-(RSAWs).aspx

13.2.1 There are seven individual RSAWs and one group RSAWs have been posted for comment since the last RSC meeting:

After discussion around the table regarding a question raised by Lee Pedowicz with regard to whether it's necessary to keep the RSAWs on our Agenda, the final decision is to leave the RSAWs on the Agenda and keep and maintain it. However, the RSC does not need to go over these as a group. The RSC determined that Compliance Committee is the appropriate group to be reviewing the RSAWs.

- Project 2013-03 Geomagnetic Disturbance (GMD) TPL-007-1 issued on 6/27/14 and issued on 9/11/14
- Project 2009-03 Emergency Operations EOP-011-1 issued on 7/18/14
- Project 2014-01 Applicability for Dispersed Generation Resources Standards issued on 7/25/14
- Project 2014-03 Revisions to TOP and IRO Standards issued on 8/26/14
- Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings and Lens Characteristic Tool issued on 9/10/14
- Project 2008-02 Underfrequency Load Shedding (UFLS) PRC-006-2 issued on 9/10/14
- Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves BAL-002-2 issued on 9/11/14

13.3 Compliance Application Notices (CANs)
http://www.nerc.com/pa/comp/Resources/Pages/Compliance-Application-Notices.aspx

13.3.1 There have not been any new CANs posted since the last RSC meeting

* Item in Meeting Materials

14.0 NERC Items of Interest (Since last RSC Meeting)

14.1 Lessons Learned
http://www.nerc.com/pa/rrm/ea/Pages/Lessons-Learned.aspx

14.1.1 Six Lessons Learned have been issued since the last RSC meeting:

- LL20140601 - Relay and Protection System - Generation Relaying - Underfrequency Protection Coordination

  Issued 6/19/2014

  Primary Interest Groups: Generator Owners (GOs)

- LL20140602 - Relay and Protection System - Generation Relaying - Overexcitation

  Issued 6/19/2014

  Primary Interest Groups: Generator Owners (GOs)

- LL20140603 - Bulk-Power System Operations - Verify That Actions Called for in Operating Guides Can Be Implemented Within Required Time Frames

  Issued 6/19/2014

  Primary Interest Groups: Reliability Coordinator (RC), Balancing Authority (BA), Transmission Operator (TOP), Transmission Owner (TO)

- LL20140604 - Communications - Loss of SCADA Due to Memory Resources Being Fully Utilized

  Issued 6/19/2014

  Primary Interest Groups: Transmission Owners (TOs), Transmission Operators (TOPs)

- LL20140801 - Bulk-Power System Operations - Load-Shedding Plans for Localized Events

  Issued 8/5/2014

  Primary Interest Groups: Transmission Operator (TOP), Transmission Owner (TO), Balancing Authority (BA), Load Serving Entity (LSE), Generator Operator (GOP)

- LL20140802 - Communications - Loss of EMS Monitoring and Control Functionality for More Than 30 Minutes

  Issued 8/5/2014

  Primary Interest Groups: Reliability Coordinator (RC), Transmission Operator (TOP), Transmission Owner (TO), Generator Operator (GOP)

14.2 Alerts
http://www.nerc.com/pa/rrm/bpsa/Pages/Alerts.aspx

14.2.1 There has been no new NERC Alert released since the last RSC meeting.

14.3 Five Year ERO Performance Assessment

15.0 Other Items of Interest

15.1 NERC Fall Standards and Compliance Workshop – September 23-25, 2014, Atlanta, GA

15.2 2015 Regional Entity Business Plans and Budgets

15.3 Quality Review of NERC Standards

October 15th, and 16th, Risk Base Registration Workshop for TOs and TOPs.

16.0 Future RSC Meetings and Conference Calls

16.1 RSC 2014/2015 Meeting Dates

RSC members agreed on the dates for the next meeting at NextEra Energy Office in Juno Beach, Florida Wednesday-Thursday, February 18th-19th, 2015.

Guy proposed the following dates for 2015 RSC meetings:

April 15th and 16th at Dominion's Offices in Richmond VA.

June 23rd and 24th in Saratoga Spring NY.

October 7th and 8th in Montreal Canada.

December 3rd and 4th in Albany NY.

Set up a conference call schedule with Lee Pedowicz based on this tentative face-to-face meeting schedule.

Feb. 19th – 20th, 2014 NextEra Energy Offices
April 10th & 11th, 2014 NPCC Offices
June 18th & 19th, 2014 Saratoga, NY
September 17th & 18th, 2014Montreal, Quebec
December 4th & 5th, 2014 Halifax, Nova Scotia
February 18-19, 2015, NextEra Energy Offices

16.2 RSC 2014 Conference Call Schedule (calls can be scheduled as needed)
all Calls are planned to start at 10:00 a.m. (call: 415-655-0003 (USA) / 416-915-6530 (Canada), Guest Code 29173141)

July 3	July 18	August 1
August 15	August 29	September 12
September 26	October 10	October 24
November 7	November 21	December 19

* Item in Meeting Materials

The meeting adjourned at 10:46AM on Thursday, September 18, 2014.

Respectfully Submitted,

Guy V. Zito, Chair RSC
Assistant Vice President-Standards
Northeast Power Coordinating Council, Inc.

* Item in Meeting Materials

Northeast Power Coordinating Council, Inc. (NPCC)
Antitrust Compliance Guidelines

It is NPCC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. The antitrust laws make it important that meeting participants avoid discussion of topics that could result in charges of anti-competitive behavior, including: restraint of trade and conspiracies to monopolize, unfair or deceptive business acts or practices, price discrimination, division of markets, allocation of production, imposition of boycotts, exclusive dealing arrangements, and any other activity that unreasonably restrains competition.

It is the responsibility of every NPCC participant and employee who may in any way affect NPCC's compliance with the antitrust laws to carry out this commitment.

Participants in NPCC activities (including those participating in its committees, task forces and subgroups) should refrain from discussing the following throughout any meeting or during any breaks (including NPCC meetings, conference calls and informal discussions):

- Industry-related topics considered sensitive or market intelligence in nature that are outside of their committee's scope or assignment, or the published agenda for the meeting;
- Their company's prices for products or services, or prices charged by their competitors;
- Costs, discounts, terms of sale, profit margins or anything else that might affect prices;
- The resale prices their customers should charge for products they sell them;
- Allocating markets, customers, territories or products with their competitors;
- Limiting production;
- Whether or not to deal with any company; and
- Any competitively sensitive information concerning their company or a competitor.

Any decisions or actions by NPCC as a result of such meetings will only be taken in the interest of promoting and maintaining the reliability and adequacy of the bulk power system.
Any NPCC meeting participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NPCC's antitrust compliance policy is implicated in any situation should call NPCC's Secretary, Andrianne S. Payson at 212-335-4765.

Source = NERC Standard Drafting Team Rosters - March 2014

Change Control: Changes Since March 2014:

Projects Removed:

1. Project 2010-13.2, Phase 2 of Relay Loadability: Generation

Projects Added:

1. Project 2014-04, Physical Security

NPCC Representative Changes:

1. Project 2010-17, Removed Jennifer Dering as the NPCC Representative as she is no longer at NYPA
2. Project 2012-13, Added Kevin Donnelly, Con Edison, as the NPCC Representative
3. Project 2014-03, Added Kyle Russell, IESO, as the NPCC Representative
4. Project 2014-04, Added Kathy Judge, National Grid, as the NPCC Representative

BAL-001-1	Real Power Balancing Control Performance	x	3/28/2014	New RSAW Posted
BAL-00202	Contingency Reserve for Recovery from Balancing Contingency Event	x	8/19/2014	Draft RSAW Posted
BAL-003-0.1b	Frequency Response and Bias	x	3/20/2014	
BAL-005-0.2b	Automatic Generation Control	x	5/20/2013	Revised RSAWs Posted
CIP-001-2a	Sabotage Reporting	x	10/13/2012	
CIP-002-5.1	Cyber Security - BES Cyber System Categorization	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-003-6	Cyber Security - Security Management Controls	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-004-6	Cyber Security - Personnel & Training	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-005-5	Cyber Security - Electronic Security Perimeter(s)	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-006-6	Cyber Security - Physical Security of BES Cyber Systems	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-007-6	Cyber Security - System Security Management	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-008-5	Cyber Security - Incident Reporting and Response Planning	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-009-6	Cyber Security - Security Management Controls	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-010-2	Cyber Security - Configuration Change Management and Vulnerability Assessments	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-011-2	Cyber Security - Information Protection	Yes (Thru 10/17/14)	9/17/2014	Draft RSAW Posted
CIP-014-1		Yes (thru 4/24/14)		
COM-002-2a	Communication and Coordination	x	11/14/2012	
COM-002-4	Operating Personnel Communications Protocols	Yes (Thru 1/31/14)		
COM-003-1	Operating Personnel Communications Protocols	Yes (Thru 4/5/13)		
EOP-001-2.1b	Emergency Operations Planning	x	8/9/2013	Revised RSAWs Posted
EOP-002-3.1	Capacity and Energy Emergencies	x	3/20/2014	Revised RSAWs Posted
EOP-003-2	Load Shedding Plans	x	10/13/2012	
EOP-004-2	Event Reporting	N/A	10/15/2013	New RSAW
EOP-005-2	System Restoration from Blackstart Resources	x	7/17/2013	Revised RSAWs Posted
EOP-006-2	System Restoration Coordination	x	7/17/2013	Revised RSAWs Posted
EOP-008-1	Loss of Control Center Functionality	x	6/28/2013	Revised RSAWs Posted
EOP-011-1	Emergency Operations	Yes (Thru 9/25/14)	1-/20/2014	Draft RSAW Posted
FAC-001-2	Facility Interconnection Requirements	Yes (Thru 6/25/2014)		The draft RSAW is posted for feeback through June 25, 2014.
FAC-002-2	Facility Interconnection Studies	Yes (Thru 6/25/2014)		The draft RSAW is posted for feeback through June 25, 2014.
FAC-003-3	Transmission Vegetation Management	N/A	4/24/2014	Revision serves to clarify guidance for Requirement R6 regarding initial inspections for calendar year 2014 by expanding the Note to Auditor section
FAC-008-3	Facility Ratings	x	3/20/2014	Revised RSAWs Posted
FAC-013-2	Assessment of Transfer Capability for the Near-Term Transmission Planning Horizon	x	10/13/2012	
IRO-001-4	Reliability Coordination- Responsibilities	Yes (Thru 11/10/2014)	10/16/2014	Revised RSAWs Posted
IRO-002-2	Reliability Coordination - Facilities	x	3/20/2014	
IRO-002-4	Reliability Coordination - Monitoring and Analysis	Yes (Thru 11/10/2014)	10/16/2014	Revised RSAWs Posted
IRO-003-2	Reliability Coordination - Wide-Area View	x	3/20/2014	
IRO-005-3.1a	Reliability Coordination - Current-Day Operations	x	5/20/2013	Revised RSAWs Posted
IRO-008-2	Reliability Coordinator Operational Analyses and Real-time Assessments	Yes (Thru 11/10/2014)	10/16/2014	Revised RSAWs Posted
IRO-010-2	Reliability Coordinator Data Specification and Collection	Yes (Thru 11/10/2014)	10/16/2014	Revised RSAWs Posted
IRO-014-1	Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	x	10/13/2012	
IRO-014-3	Coordination Among Reliability Coordinators	Yes (Thru 11/10/2014)	10/16/2014	Revised RSAWs Posted
IRO-017-1	Outage Coordination	Yes (Thru 11/10/2014)	10/16/2014	Revised RSAWs Posted
MOD-028-2	Area Interchange Methodology	N/A	10/10/2013	New RSAW

RSAW#	Title	Posted for Comment?	RSAW Issued?	Comments
MOD-031-1	Demand and Energy Data	Yes (Thru 11/22/13)		Draft RSAW posted along with Draft Standard
NUC-001-2		N/A	4/24/2014	Revised RSAW represent the initial release for the errata versions of the Reliability Standard
PER-001-0.2	Operating Personnel Responsibility and Authority	x	5/20/2013	Revised RSAWs Posted
PER-003-1	Operating Personnel Credentials	x	1/23/2013	
PER-005-1	System Personnel Training	N/A	10/15/2013	Revised RSAWs Posted
PRC-001-1	System Protection Coordination	N/A	4/24/2014	Revised RSAW represent the initial release for the errata versions of the Reliability Standard
PRC-002-NPCC-01	Disturbance Monitoring	Yes (Thru 10/21/2014)	9/19/2014	Revised RSAWs Posted
PRC-004-2.1a	Analysis and Mitigation of Transmission and Generation Protection System Misoperations	x	3/28/2014	Revised RSAWs Posted
PRC-004-3	Protection System Misoperation Identification and Correction	Yes (Thru 3/19/14)		Draft RSAW posted along with Draft Standard
PRC-005-1.1b	Transmission and Generation Protection System Maintenance and Testing	x	3/28/2014	Revised RSAWs Posted
PRC-006-2	Automatic Underfrequency Load Shedding	Yes (Thru 10/8/14)	9/10/2014	Revised RSAWs Posted
PRC-010-1	Undervoltage Load Shedding	Yes (Thru 8/7/2014)		
PRC-023-2	Transmission Relay Loadability	N/A	10/10/2013	Revised RSAWs Posted
PRC-025-1	Generator Relay Loadability	Yes (Thru 3/11/13)		
PRC-026-1	Relay Peformance During Stable Power Swings	Yes (Thru 12/2/2014)	11/12/2014	Draft RSAW Posted
TOP-001-1a	Reliability Responsibilities and Authorities	x	5/20/2013	Revised RSAWs Posted
TOP-001-3	Transmission Operations	Yes (Thru 11/10/2014)	10/16/2014	Revised RSAWs Posted
TOP-002-2.1b	Normal Operations Planning	x	3/20/2014	Revised RSAWs Posted

NPCC Regional Reliability Standards Executive Tracking Summary

Revised: 3/24/2014

Further details regarding the individual documents may be found at: http://www.npcc.org/regStandards/UnderDev.aspx

Line No.	Regional Standard ID	Regional Reliability Standard Title	RSAR Posted?	Posted for Comment?	Posted For Ballot?	Industry Approved?	NPCC BOD Approved?	NERC BOT Approved?	Petitioned for FERC Approval?	FERC Approved	Comments	Project Status
1	BPS-501-NPCC-01	Classification of Bulk Power System Elements (Withdrawn by RSC 8/07/09)	Yes (Thru 2/4/08)	NA	NA	NA	NA	NA	NA	NA	Withdrawn by RSC 8/07/09	Withdrawn
2	PRC-002-NPCC-01	Disturbance Monitoring	Yes (Thru 9/10/08)	Yes (Thru 10/24/09)	Yes (Thru 1/6/10)	Yes (1/6/10)	Yes (1/9/10)	Yes (11/4/10)	Yes (5/31/11)	Yes (10/20/11)	10/24/11 - Approved Standard posted publicly	Completed
3	PRC-006-NPCC-01	Automatic Underfrequency Load Shedding Program	Yes (Thru 8/25/08)	Yes (Thru 11/2/11)	Yes (Pre-ballot Thru 11/2/11)	Yes (11/18/11)	Yes (11/30/11)	Yes (2/9/12)	Yes (5/4/12)	Yes (2/21/13)		Completed
4	PRC-002-NPCC-02										- Regional Standard Authorization Request (RSAR) has been submitted and approved - Drafting Team Nomination period ended March 25, 2013 - Draft Team kick-off conference call was Monday April 8, 2013	Under Development
5	PRC-002-NPCC-01, Interpretation R1.1		x	x	x	Yes (TFSP 10/19/12)	N/A	N/A	N/A	N/A	Posted on the NPCC website under "Regional Standards General" on 6/24/13	Completed

NPCC Directory Executive Tracking Summary

Revised: **11/25/2014** Further details regarding the individual documents may be found at:

Line No.	Document	Developed From	Title of Directory	Responsible Task Force	Latest Version	Comments	Status	
1	Directory #1	Criteria A-2	Design and Operation of the Bulk Power System	TFCP	Dec-09	CP11/CO7 Reviewing Phase 2 Draft	CO7/CP11 has completed drafting responses to comments received in the 2nd Open Process Posting and has returned the draft to the TFCO and TFCP.	x
2	Directory #2	Criteria A-3	Emergency Operations	TFCO	Jun-09			
3	Directory #3	Criteria A-4	Maintenance Criteria for Bulk Power System Protection	TFSP	Jun-09	TFSP has completed a Technical Comparision of D#3 with PRC-005-2 and has recommended that D#3 can be retired.	RCC approved the TFSP retirement recommendation and on October 15th, 2014 the NPCC Full Members approved the retirement of D#3 effective April 1st, 2015 to coincide with the enforcement date of PRC-005-2.	
4	Directory #4	Criteria A-5	Bulk Power System Protection Criteria	TFSP	Dec-09	TFSP reviewing D#4 in accordance with NRAP review.	TFSP anticipates posting D#4 to the Open Process by December 2014.	
5	Directory #5	Criteria A-6	Reserve	TFCO	Oct-12			
6	Directory #6		Regional Reserve Sharing		Apr-12			
7	Directory #7	Criteria A-11	Special Protection Systems	TFSP	Jul-13			
8	Directory #8	Criteria A-12	System Restoration	TFCO	Oct-10	TFCO working group CO11 reviewing initial Phase 2 draft of Directory #8.	TFCO anticipates posting D#8 to the Open Process by December 2014.	
9	Directory #9	Criteria A-13	Verification of Generator Gross and Net Real Power Capability	TFCO	Dec-11			
10	Directory #10	Criteria A-14	Verification of Generator Gross and Net Reactive Power Capability	TFCO	Dec-11			
11	Directory #12		Under frequency Load Shedding Program Requirements	TFSS	Jul-13		NPCC anticipates retiring Directory#12 once PRC-006-NPCC-1 is fully implemented.	
12	Directory Manual		Directory Development and Revision Manual	N/A	Dec-13		On October 6th, 2014 the RSC approved revisions to the Directory Manual which incorporated cost considerations into the development of new or revised criteria as mandated by the NPCC BOD.	x

NPCC Directory Criteria Clarifications

Revised: **11/25/2014** Further details regarding the individual documents may be found at: https://www.npcc.org/Standards/Directory%20Interpretations/Forms/Public%20List.aspx

Line No.	Document	Title of Directory	Date Final	Task Force Review	Posted Open Process?	RCC Approval	Comments	Status
1	Directory #8 Interpretation	System Restoration	6/18/2012	TFCO	N/A	N/A	Interpretation on behalf of the NYSRC	Complete
2	Directory#3 Interpretation	Maintenance Criteria for Bulk Power System Protection	8/28/2012	TFSP	N/A	N/A	Interpretation on behalf of Bangor Hydro	Complete
3	Directory #3 Interpretation	Maintenance Criteria for Bulk Power System Protection	12/14/2012	TFSP	N/A	N/A	Interpretation on behalf of Con Ed	Complete
4	Directory #3 Interpretation	Maintenance Criteria for Bulk Power System Protection	2/15/2013	TFSP	N/A	N/A	Response Clarified - Interpretation on behalf of Acumen Engineered Solutions	Complete
5	Directory#3 Interpretation	Maintenance Criteria for Bulk Power System Protection	10/25/2013	TFSP	N/A	N/A	Interpretation on behalf of Hydro One Networks	Complete
6	Directory#3 Interpretation	Maintenance Criteria for Bulk Power System Protection	Pending	TFSP	Yes on October 16th, 2014.			Criteria Clarification Request on behalf of the IESO-Market Assessment and Compliance Division (MACD) posted to Open Process until Nov. 30th, 2014.

x

Quarterly Application to the Nova Scotia Utility and Review Board (NSUARB) for Approval of NPCC Regional Reliability Criteria

Revised: **11/25/2014**

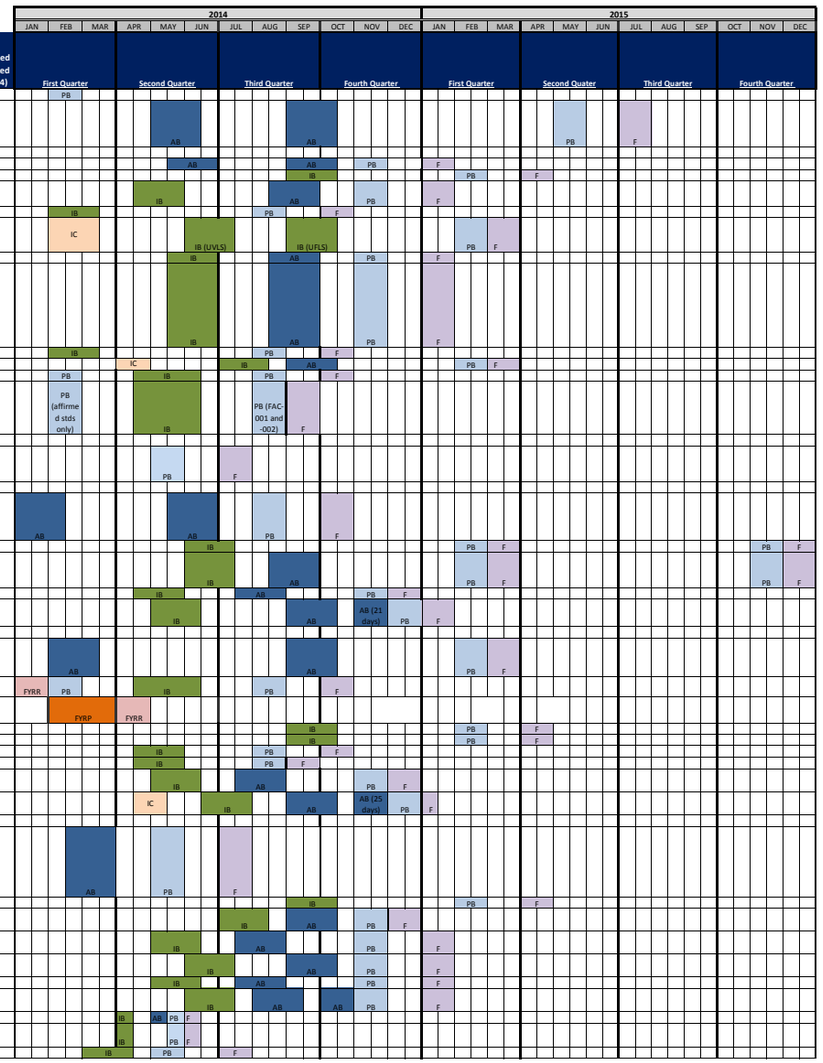
Line No.	Filing Period	Filing Due	Filing Submitted	Comments
1	October 1 to December 31, 2012	3/1/2013	3/1/2013	This filing is NPCC's initial quarterly filing covering the October 1 to December 31, 2012 period and covers the changes to the NPCC Criteria as a result of voting by the Full Members of NPCC.
2	January 1 to March 31, 2013	6/1/2013	N/A	No changes were made during the refeenced period which required filing.
3	April 1 to June 30, 2013	9/1/2013	N/A	No changes were made during the referenced period which required filing.
4	July 1 to September 30, 2013	12/1/2013	11/25/2013	Revisions to D#7 and D#12 approved by the Full Members on 7/9/2013.
5	October 1 to December 31, 2013	3/1/2014	N/A	No changes were made during the referenced period which required filing.
6	January 1 to March 31, 2014	6/1/2014	N/A	No changes were made during the referenced period which required filing.
7	April 1 to June 30, 2014	9/1/2014	N/A	No changes were made during the referenced period which required filing.
8	July 1 to September 30, 2014	12/1/2014	N/A	No changes were made during the referenced period which required filing.
9	October 1 to December 31, 2014	3/1/2015		10/15/14 NPCC Full Members approved retirement of D#3 effective 4/01/15 coinciding with enforcement date of PRC -005-2.

Milestone Keys:

IC- Initial Comment
IB- Initial Ballot
AB - Additional Ballot
PB- Presented to BOT
F-Projected filing with FERC
FYRP- Five-year Review Posting
FYRR - Five-year Review Recommendation to SC

Project Status

No Issues with Project
Project Off Schedule by One Quarter
Project Off Schedule by Two or more Quarters
No Development Work in Progress



Project Tracking Spreadsheet: 2014 Project Work Plan (Status Updated: 11/19/2014)

This worksheet displays estimates of anticipated standards development milestones for projects in 2014, and it is intended to be a project management tool for use in tracking the status of projects under development compared to their anticipated milestones. Detailed information for each project is available from their respective project pages on the NERC website. Projects that remained from 2013's Project Tracking Spreadsheet that were not prioritized in the RSDP, but that are continuing beyond the first quarter of 2014, are also represented here. Projects not anticipated to continue beyond the first quarter of 2014 are not included (information for those projects remains available under the "Standards Under Development" page on the NERC website). Note that projects listed here represent known projects for 2014. As facts and circumstances warrant, it may be necessary to update this tool, and additional projects may be added in response to regulatory directives, input from RISC, or to meet goals of the NERC strategic plan.

Projected Posting Schedule

The above is a link to the schedule of upcoming postings, which is updated weekly. It includes near term posting projections.

Project Number	Activity/Project (Project Names Hyperlinked to Project Page)	Deliverable	Deadline, if any	Priority in 2014-2016 RSDP, if applicable (see Note 1, below)	2013 PB1 Reqs	Number of Directives	# of Guidances (see Note 2)	Directionally consistent with IERP findings	Comments	PMOS Liaison	NERC Contact	Status: Green, Yellow, Red	Milestones: Planned vs. Actual/Projected (See Notes 3 and 4)
2007-06	System Protection Coordination	PRC-001, PRC-027		N/A		1		Yes	A 21-day informal comment period for the preliminary draft 5 of PRC-027-1 concluded on October 21. The SDT will not respond but will consider the comments at its upcoming meetings.	Jennifer Sterling	Al McMeekin	Project extended to address an additional issue by FERC	Plan Actual/Projected
2007-11	Disturbance Monitoring	PRC-002, PRC-018		Medium	2		1	Yes	Passed final ballot.	Jennifer Sterling	Steve Crutchfield		Plan Actual/Projected
2007-17.3	Protection System Maintenance: Sudden Pressure Relays	PRC-005		Medium (prioritized by SC March 2014)	1	1		Yes	Passed final ballot.	Charles Yeung	Jordan Mallory		Plan Actual/Projected
2008-02	Undervoltage Load Shedding and Underfrequency Load Shedding	PRC-010, PRC-022, PRC-006, PRC-004		High	2	1	1	Yes	PRC-010-1 and PRC-006-2 passed final ballot. Next Step is to request authorization to post revised PRC-004 that includes UVLS.	Jennifer Sterling	Katherine Street (UVLS) and Lacey Ourso (UFLS)	Delayed to coordinate with the development of the SPS definition	Plan Actual/Projected
2009-02	Real-time Reliability Monitoring and Analysis Capabilities	New Standards or revisions to TOP and IRO standrds	January 31, 2015 deadline to address concerns in NOPR proposing to remand TOP/IRO standards	High		2		TBD	January 31, 2015 deadline to address concerns in NOPR proposing to remand TOP/IRO standards; the directives associated with this project are being addressed in Project 2014-03; consider consolidating the two projects on this spreadsheet.	Jennifer Sterling	Ed Dobrowolski		Plan Actual/Projected
2009-03	Emergency Operations	EOP-001, EOP-002, EOP-003 being replaced by EOP-011		High	14	3	2	Yes	Passed final ballot.	Gary Kruempel	Laura Anderson	Delayed to coordinate with UVLS balloting	Plan Actual/Projected
2010-02	Connecting new facilities to the grid/Five-year Review of FAC standards	FAC-001, FAC-002		Low		1	1	Yes	Passed final ballot.	Ken Goldsmith	Mallory Huggins		Plan Actual/Projected
2010-04	Demand Data (MOD C)	MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021		N/A	10	10	4	Yes	Passed final ballot.	Scott Miller	Darrel Richardson		Plan Actual/Projected
2010-05.1	Phase 1 of Protection Systems: Misoperations	PRC-003, PRC-004		N/A			2	Yes	Passed final ballot.	Jennifer Sterling	Scott Barfield		Plan Actual/Projected
2010-05.2	Special Protection Systems: Phase 2 of Protection Systems	PRC	Self-imposed deadline for definition of SPS is February 2015 for coordination with other PRC projects.	Medium				Yes	Passed final ballot.	Jennifer Sterling	Al McMeekin		Plan Actual/Projected
2010-13.3	Relay Loadability Stable Power Swings	PRC	December 31, 2014 deadline to address phase 3 directives covered by this project	Medium (prioritized by SC March 2014)		3		n/a	Additional 21-day comment and ballot period will conclude on November 24, 2014.	Charles Long	Scott Barfield		Plan Actual/Projected
2010-14.1	BARC Directives and Issues-Project 2010-14.1 Balancing Authority Reliability-based Controls	BAL-001, BAL-002, BAL-013		N/A	4			Yes	BAL-002-2 did not pass additional ballot. An additional comment period and ballot will be conducted that concludes in January.	Ron Parsons	Darrel Richardson	Project extended to address an additional issue raised by FERC	Plan Actual/Projected
2010-14.2	Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent	BAL-005-0.1b, BAL-006-2		Medium	11	7	6	Yes	An informal comment period concluded on August 14, 2014.	Ken Goldsmith	Sean Cavote		Plan Actual/Projected
2012-09	Implementation of IRO Review Recommendations	IRO-003, IRO-004, IRO-008, IRO-009, IRO-010		Medium	2	2		On hold pending TOP/IRO project	Many FYRT recommendations being addressed in Project 2014-03	Brian Murphy	Soo Jin Kim		Plan Actual/Projected
2012-13	Implementation of NUC Review Recommendations	NUC-001		Low				Yes	Passed final ballot.	PMOS Oversight	Stephen Eldridge		Plan Actual/Projected
2013-03	Geomagnetic Disturbance Mitigation, Stage II	TPL-007	FERC filing deadline of January 21, 2015	High		14		n/a	A 25-day formal comment period and ballot will conclude on November 21, 2014.	Brian Murphy	Mark Olson		Plan Actual/Projected
2013-04	VAR Directives	VAR-002		N/A	3	6	5	Yes	Passed final ballot.	Ron Parsons	Soo Jin Kim		Plan Actual/Projected
2014-01	Standards Applicability for Dispersed Generation Resources	Various	Goal is to complete (including regulatory approval) prior to BES Phase 2 implementation 7/1/2016	Medium (prioritized by SC January 2014)				n/a	PRC-004-2.1a, PRC-004-3, PRC-005-2, PRC-005-3, and VAR-002-3 passed final ballot. PRC-001-1.1(X), PRC-019-2, and PRC-024-	Gary Kruempel	Sean Cavote		Plan Actual/Projected
2014-02	CIP Version 5 Revisions	CIP	FERC filing deadline for certain directives of February 3, 2015.	High (prioritized by SC March 2014)		8		n/a	Standards addressing two time-sensitive directives passed final ballot. Standards incorporating four directives will be posted for an additional comment period	Scott Miller	Marisa Hecht and Ryan Stewart		Plan Actual/Projected
2014-03	TOP/IRO Revisions	TOP/IRO	Deadline of January 31, 2015	High (prioritized by SC March 2014)				TBD	8 of 9 standards passed final ballot. Remaining standard (TOP-001-3) posted for comment and ballot concluding in	Brian Murphy	Ed Dobrowolski		Plan Actual/Projected
2014-04	Physical Security	CIP-014	Deadline of June 5, 2014			7		n/a	Passed final ballot.	Brian Murphy	Steve Crutchfield		Plan Actual/Projected
			Goal is to complete directives and										Plan

RSC Meeting #14-3, Agenda Item 4.0 Open Action Items

Item	Description	Owner	Due	Status
4.1	Coordination with the Compliance Committee to develop Joint Activity Action List	Greg Campoli	RSC Meeting	Ongoing RSC decided that it was not necessary to have a joint meeting with CC at the December, 2014 meeting in Halifax.
4.2	New York Adoption of More Stringent/Specific NPCC Criteria - determine more stringent criteria and submit filing	Gerry Dunbar	April 2014	Update: NPCC Executive Staff is providing additional comments. NPCC expects the document to be filed with the NYSPSC by late September pending final NPCC legal review. RSC Members will be notified when the document is filed.
13-5.6	NPCC outreach program development – discussion item: members provide input and opportunities for development of an outreach program	RSC	RSC Meeting	Update: Ongoing, two outreaches have been done with NYPA.
14-1.2	Revise the Directory Development Manual to address cost effectiveness	G. Dunbar		Update: Revisions to the Directory Manual posted to the NPCC Open Process from May, 2014 to July, 2014. Draft RSC responses to Open Process comments and final approval of Directory Manual revisions pending final RSC review and approval.
14-1.4	Follow up with NERC on current RSAW development process	Guy Zito		Update: After discussion the RSC members decided to not immediately address this, but wait for new items to be published.

DRAFT

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Weekly Standards & Compliance Bulletin

November 24–30, 2014

SPOTLIGHT ON THE RELIABILITY ASSURANCE INITIATIVE

Please note that this will be the final separate "Spotlight on the Reliability Assurance Initiative." Now that all foundational program guides and documents have been posted to the RAI web page and RAI as a separate initiative is being folded into NERC's overall risk-based Compliance Monitoring and Enforcement Program, NERC will announce all future compliance monitoring and enforcement news below, under "General Compliance and Enforcement News."

Coordinated Oversight of MRREs

The ERO Enterprise is beginning the initial implementation of a program for Coordinated Oversight of Multi-Regional Registered Entities (MRREs). An MRRE is a registered entity that has a single NERC Compliance Registry number in more than one Region or affiliated registered entities in multiple Regions with multiple NCR numbers. Under Coordinated Oversight, a Lead Regional Entity is selected from among the Regional Entities that currently have oversight of the MRRE to coordinate the performance of delegated functions.

Coordinated Oversight is intended to streamline risk assessment, compliance monitoring and enforcement, and event analysis activities for the MRRE. Further, Coordinated Oversight may result in reduced administrative burdens for the MRRE and improved consistency.

In the coming weeks, the ERO Enterprise will send notification letters to an initial list of 43 groups of MRREs, totaling over 150 individual registered entities. The MRREs notified in this initial round will have the option to begin participation in the initial implementation of the Coordinated Oversight program. The notification letters will contain a summary of the protocols the Regional Entities will use to assure coordination of delegated activities. Among other things, these activities include receiving self-reports, conducting compliance audits, handling technical feasibility exceptions, conducting enforcement actions, and handling responses to NERC Alerts.

In June 2015, the Coordinated Oversight program will be fully implemented across the ERO Enterprise. At this time, all registered entities may notify their Regional Entities of their interest in Coordinated Oversight and request to participate or request additional information. Also at this time, registered entities that declined to participate during the initial implementation may request to participate.

Additional information about the Coordinated Oversight program for MRREs, including a Frequently Asked Questions document, is available here.

Final 2015 ERO CMEP Implementation Plan Posted

The final 2015 ERO Compliance Monitoring and Enforcement Implementation Plan, which incorporates each Region's Implementation Plan, is now available under "Key Resources" on the RAI web page.

Resources Available for RAI Industry Outreach Workshops

NERC thanks all stakeholders who attended the November 6 and November 20 RAI Industry Outreach Workshops in Phoenix and Atlanta. The slide presentation from the November 20 event, and the slide presentation and streaming webinar from the November 6 event, are available on the RAI Workshops & Webinars page. The streaming webinar from the November 20 event will be posted soon.

NEW Resources Posted

NERC has posted slides and the streaming webinar from the Project 2010-13.3 - Phase 3 of Relay Loadability: Stable Power Swings question and answer session on November 13, 2014.

Spring 2015 Standards and Compliance Workshop

NERC will be introducing a new, semi-combined layout for its ERO Auditor and Standards and Compliance Workshops in 2015. The ERO Auditor Workshop will be held from March 30–April 1, 2015, followed by the Standards and Compliance Workshop from April 1–3, 2015. A joint session with auditors and industry will be held on April 1, allowing the industry better transparency into the auditing process and the application of specific standards. NERC will be eager for industry feedback on the joint session and hopes it enhances the workshop value for both auditors and industry.

As preliminary planning for the Spring 2015 Standards and Compliance Workshop begins, NERC welcomes agenda suggestions. Please email any ideas to NERCStandardsComplianceWorkshop@nerc.net by December 19, 2014.

Please Continue to Register for the New Balloting and Commenting Software System

Since launching the new Standards Balloting System (SBS) on April 1, 2014, NERC has been accepting new registrations for both commenting and participating in ballots in the SBS. Before any projects are posted in the SBS, NERC staff will provide notice with an announcement and an update in the Weekly Standards & Compliance Bulletin. In the meantime, stakeholders should continue to register in the SBS and can expedite the vetting process by sending justifications for segment qualifications to SBSRegistration@nerc.net,using the segment criteria from Appendix 3D. Helpful tools for guidance on registration and participation in the SBS are available on the Balloting and Commenting page.

GENERAL COMPLIANCE AND ENFORCEMENT NEWS

There is no additional compliance and enforcement news from last week.

OTHER NEWS

NEW Canadian Provincial Summaries Available on NERC's Website

Canada's Federal, Provincial, and Territorial Monitoring and Enforcement Sub-group (MESG) has developed provincial summaries of each province's electric reliability standard-making and enforcement functions, with U.S. comparators. The MESG will review the summaries annually and update them as needed. The summaries are available on NERC's Key Players web page.

NEW NERC Releases 2014–2015 Winter Reliability Assessment

The *2014–2015 Winter Reliability Assessment* released on November 21, 2014 provides an independent North American perspective of bulk power system reliability from December 2014 through February 2015. NERC examined key indicators related to electricity demand and generation projections and found that while bulk power system operators have adequate resources and reserve margins to maintain reliability if the 2014–2015 winter is normal, periods of extreme cold could pose a significant challenge to ensuring that fossil-fired power plants have enough fuel to meet anticipated demand. Click here for the full announcement.

STANDARDS SUBJECT TO FUTURE ENFORCEMENT

The following standards are subject to future enforcement. Please refer to the U.S. Enforcement Dates page for more detail:

U.S. Enforcement Date	Standard(s)
January 1, 2015	TPL-001-4 - Transmission System Planning Performance Requirements
April 1, 2015	BAL-003-1 - Frequency Response and Frequency Bias Setting; EOP-010-1 - Geomagnetic Disturbance Operations; PRC-005-2 - Protection System Maintenance
July 1, 2015	MOD-032-1 - Data for Power System Modeling and Analysis; PRC-006-NPCC-1 - Automatic Underfrequency Load Shedding
January 1, 2016	FAC-001-2 - Facility Interconnection Requirements; FAC-002-2 - Facility Interconnection Studies; NUC-001-3 - Nuclear Plant Interface Coordination
April 1, 2016	CIP-002-5.1 - Cyber Security — BES Cyber System Categorization; CIP-003-5 - Cyber Security — Security Management Controls; CIP-004-5.1 - Cyber Security — Personnel & Training; CIP-005-5 - Cyber Security — Electronic Security Perimeter(s); CIP-006-5 - Cyber Security — Physical Security of BES Cyber Systems; CIP-007-5 - Cyber Security — System Security Management; CIP-008-5 - Cyber Security — Incident Reporting and Response Planning; CIP-009-5 - Cyber Security — Recovery Plans for BES Cyber Systems; CIP-10-1 - Cyber Security — Configuration Change Management and Vulnerability Assessments; CIP-011-1 - Cyber Security — Information Protection
July 1, 2016	MOD-025-2 - Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability; PER-005-2 - Operations Personnel Training; PRC-019-1 - Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection; PRC-024-1 - Generator Frequency and Voltage Protective Relay Settings
July 1, 2017	MOD-033-1 - Steady-State and Dynamic System Model Validation

BOARD OF TRUSTEES AND FERC ACTION

NEW FERC Orders Issued

On November 20, 2014, FERC issued three NERC-related orders at its open meeting. First, FERC issued an order approving CIP-014-1–Physical Security. In addition to approving the standard, FERC directed NERC to address the ambiguity of the term "widespread" within six months and to submit an informational filing regarding whether the standard should be applicable to additional control centers within two years. NERC will issue notice in the bulletin when the enforcement date of CIP-014-1 has been calculated.

FERC also issued a Notice of Proposed Rulemaking proposing to approve BAL-001-2–Real Power Balancing Performance, as well as four definitions, associated violation risk factors and violation severity levels, and an implementation plan.

Finally, FERC accepted the second performance assessment of NERC as the Electric Reliability Organization, finding that NERC and the Regional Entities continue to satisfy the statutory and regulatory criteria for certification. In addition, FERC directed NERC to submit an informational filing addressing specific concerns and take actions to further improve its effectiveness as the ERO.

2014 FERC orders are posted here.

UPCOMING EVENTS

For information about other NERC events, such as meetings and conference calls for standard drafting teams, other standing committees, subcommittees, task forces, and working groups, please refer to the NERC calendar.

Workshops and Conferences

- Cause Analysis Training – December 11, 2014, Atlanta, GA (Register)
  - The workshop will include an introduction to cause analysis and the five phases of cause analysis (including some discussion on cause coding and trend analysis). Register early, as the course is limited to 30 attendees.

Webinars

- There are no upcoming webinars.

Standing Committee Meetings and Conference Calls

- Compliance & Certification Committee Meeting – December 3–4 , 2014, Phoenix, AZ (Registration and Details)
- Standards Committee Conference Call – 1:00–5:00 p.m. Eastern, December 9, 2014 (Register) (Details)

ABOUT THE WEEKLY STANDARDS & COMPLIANCE BULLETIN

This weekly bulletin compiles a list of standards and compliance projects with actionable deadlines, as well as upcoming events, recently posted resources, other NERC documents posted for comment, and other relevant news and information. Please email Mallory Huggins with feedback on this bulletin. The current bulletin and old bulletins are available under "Program News" on both the Standards home page and the Compliance & Enforcement home page.

If you would like to receive this bulletin or be added to the distribution list for a particular standards project, please email Arielle Cunningham. For questions or more information about any of the compliance news listed in the bulletin, please contact Brooke Thornton.

Re: Minutes of the June 4, 2014 RCC Meeting

Sir / Madam:

Attached are the minutes of the June 4, 2014 meeting of the NPCC Reliability Coordinating Committee, as approved at the September 10, 2014 meeting.

Sincerely,

Phil Fedora

Philip A. Fedora
Assistant Vice President-Reliability Services

cc: NPCC Staff

NORTHEAST POWER COORDINATING COUNCIL
Reliability Coordinating Committee Minutes
June 4, 2014

Mr. Briggs called the meeting of the Reliability Coordinating Committee (RCC), held at the New York Times Square Residence Inn by the Marriott to order at 10:00 am.

Attendance

Officers of the Reliability Coordinating Committee

Alden Briggs, Chair	New Brunswick Power Corporation
Michael Schiavone, Co-Vice Chair	National Grid USA
Brian Evans-Mongeon, Co-Vice Chair	Utility Services, Inc.

Sector 1 - Transmission Owners

Central Hudson Gas & Electric Corp.	James McCloskey (via phone)
Central Maine Power Company	David Conroy (Alternate)
Consolidated Edison Company of New York, Inc.	Mike Forte
Hydro-One, Inc.	(proxy to Tom Irvine)
Long Island Power Authority	(proxy to Anie Philip – via phone)
National Grid USA	Michael Schiavone
New Brunswick Power Corporation	(proxy to Alden Briggs)
New York Power Authority	(proxy to Randy Crissman)
Northeast Utilities	Brad Bentley
Nova Scotia Power Incorporated	(via written proxy)
Rochester Gas & Electric Corporation	John Allen (Alternate - via phone)
The United Illuminating Company	Jonathan Appelbaum
Vermont Transco	Hantz Presume

Sector 2 – Reliability Coordinators

Hydro-Québec TransÉnergie	Pierre Paquet
Independent Electricity System Operator	(proxy to Mark Wilson)
ISO-New England, Inc.	Don Gates (Alternate – via phone)
New Brunswick Power Corporation	Alden Briggs
New York Independent System Operator	Dana Walters (Alternate)

Sector 3 – Transmission Dependent Utilities, Distribution Companies and Load Serving Entities

Hydro-Québec Distribution	(via written proxy)
New York Power Authority	(proxy to Randy Crissman)
Long Island Power Authority	Anie Philip (Alternate – via phone)
Northeast Utilities	Dwayne Basler

Sector 4 Generation Owners

Dominion Energy Marking, Inc.	Mike Garton (via phone)

Dynegy, Inc.	Jim Watson (via phone)
Entergy Nuclear Northeast	(proxy to Raey Yohannes - via phone)
Long Island Power Authority	(proxy to Anie Philip – via phone)
New York Power Authority	Randy Crissman
NextEra Energy Resources	(via written proxy)
Northeast Utilities	(proxy to Dwayne Basler)
Ontario Power Generation, Inc.	(via written proxy)

Sector 5 – Marketers, Brokers, and Aggregators

Constellation Energy Commodities Group	Glen McCartney (via phone)
HQ Energy Marketing Inc.	(via written proxy)
HQ Energy Services (US) Inc.	(via written proxy)
Long Island Power Authority	(proxy to Anie Philip – via phone)
New York Power Authority	(proxy to Randy Crissman)
PPL EnergyPlus, LLC	Elizabeth Davis (Alternate - via phone)
Utility Services	Brian Evans-Mongeon

Sector 6 – State and Provincial Regulatory and/or Governmental Authorities

New York Power Authority	(proxy to Randy Crissman)
New York State Department of Public Service	Ed Schrom (Alternate)

Sector 7 – Sub-Regional Reliability Councils, Customers, other Regional Entities and Interested Entities

New York State Reliability Council, LLC	Roger Clayton

NPCC Staff

Sal Buffamante	Assistant Vice President Compliance Audits and Investigations
Gerry Dunbar	Manager of Reliability Criteria Requirements
Phil Fedora	Assistant Vice President, Reliability Services
Jessica Hala	Manager of Finance and Accounting
Kristin Halper	Regulatory Attorney
Brian Hogue	Information Systems & Security Management
Damase Herbert	Compliance Attorney
Quoc Le	Manager, System Planning and Protection
Rafael Sahiholamal	Compliance Engineer
John Mosier, Jr.	Assistant Vice President of System Operations

Scott Nied	Manager, Compliance Program Development
Andrey Oks	Manager, Reliability Performance Criteria
Paul Roman	Manager, Operations Planning
Ralph Rufrano	Manager, Event Analysis
Edward Schwerdt	President & Chief Executive Officer

Guests

Noel Augustine	ISO-New England
Paul DiFilippo	Chair, Task Force on System Protection
Marc Dusseault	Chair, Task Force on Coordination of Planning
Gregory Goodrich	Chair, Task Force on Infrastructure Security & Technology
Dean Latulipe (via phone)	Chair, SS-38 Working Group
Richard Mailhot (via phone)	TransÉnergie Hydro-Quebec
Alan McBride	ISO-New England
John Norden	Chair, Task Force on Coordination of Operation
Isen Widjaja (via phone)	Chair, Load Modeling Working Group
Raey Yohannes (via phone)	Entergy Services, Inc.

Quorum Statement

Mr. Fedora indicated that a quorum had been achieved, by member attendance, proxy or alternate designation. He also noted having received the following written proxies:

Sector 1 – Transmission Owners
Paul Casey – Nova Scotia Power, Inc.

Sector 3 – Transmission Dependent Utilities, Distribution Companies and Load-Serving Entities
Stephane Dufresne – Hydro-Quebec Distribution

Sector 4 – Generator Owners
David Ramkalawan – Ontario Power Generation
Allen D. Schriver - NextEra Energy Resources

Sector 5 – Marketers, Brokers, and Aggregators
Yannick Vennes – HQ Energy Marketing Inc.
Louis Guilbault - HQ Energy Services (US) Inc.

Antitrust Guidelines for NPCC Meetings

Mr. Fedora reviewed the NPCC Antitrust Guidelines in the Agenda package, and suggested contacting NPCC Inc.'s Secretary, Andrianne S. Payson, at (212) 424-8218 for further information.

The RCC observed a moment of silence in remembrance of the recent passing of Donal Kidney.

President & CEO Report

Mr. Schwerdt reported on the following items:

Bulk Electric System (BES) Implementation

NERC sent out letters to all registered entity primary compliance contacts on May 1, 2014 announcing that the BES Notification and Exception Tool (BESNet) application would be available for initial registration by registered entity administrators (only) starting on May 12, 2014. Those administrators that have accessed the application thus far are being vetted by the Regional Entities to verify authenticity prior to the submission of any data into the application. To date there have been approximately 400 applications in total across NERC, with 62 vetted in NPCC, with some 16 of those being Transmission Owners.

Registered entity training sessions on the BES Definition and the BESNet application were conducted during the NPCC 2014 Spring Standards and Compliance Workshop.

A BESNet User Account Management training video, a BES Frequently Asked Questions document, and an exceptions process flow diagram, as well as other resources, are available on the NERC website. Additionally, NPCC will be announcing an informational seminar for its registered entities to provide additional training and clarification regarding the BES versus NPCC's A-10 list of Bulk Power System elements.

NERC 2014 State of Reliability Report

NERC released its State of Reliability 2014 report on May 21, 2014. Five of the key findings and recommendations in the report include:

- ✓ Bulk power system reliability performance remained high. In 2013, there were no high-stress days, including weather events.
- ✓ Frequency response remains stable. All interconnections have shown steady frequency response performance, trending above the recommended obligation at all times during the study period.
- ✓ Protection system misoperations continue to cause transmission events. Protection system misoperations (approximately 10% on a North American basis, with approximately 8% misoperations in NPCC) continue to be a significant contributor to transmission outage severity and more impactful than other events

in 2013. The report recommends that NERC complete development of standard PRC-004-3 – Protection System Misoperation Identification and Correction, and develop actions to address the three most common causes of protection system misoperations: incorrect settings; communications failures and failures of the relays themselves.

- ✓ Substation equipment failures impact transmission event severity. In response to last year's State of Reliability recommendations, an AC Substation Equipment Task Force was formed; Mr. Lombardi of NPCC staff ~~is the~~ Chairs that group. The Task Force is gathering equipment failure data to analyze with a report expected by year-end 2014.
- ✓ Use of Energy Emergency Alert Level 3 continued to decline in 2013**.**

Mr. Schwerdt then described the following Panel Sessions scheduled for the June 10, 2014 FERC Reliability Technical Conference:

- ✓ NERC State of Reliability Report;
- ✓ Emerging issues;
  ERO initiatives; and,
- ✓ ERO Performance.

At this point, Mr. Schwerdt introduced Ms. Hala, NPCC's Manager of Finance and Accounting to give a brief overview of the draft NPCC 2015 Business Plan and Budget.

NPCC 2015 Business Plan and Budget

Ms. Hala provided the following NPCC 2015 Budget Overview:

- ✓ For 2015, total expenses are increasing 3.5% over the 2014 Budget;
- ✓ Major drivers include: Reliability Assurance Initiative (RAI), Risk Assessment, Internal Control Evaluation, CIP V5 implementation, and revised BES definition implementation;
- ✓ No additional FTE's are budgeted for 2015; there are currently two open positions: one in the RAPA program area and one in compliance; and,
- ✓ Salaries expense includes a wage package increase of 3%, assuming a vacancy rate of 2%, based on recent trends.

She then provided the following summary of the change from 2014 budget by program area, noting that the funding requirements are very similar to that of 2014.

- ✓ Total Expenses up by 3.5%;
- ✓ Personnel Expenses reflect a wage package increase of 3% and vacancy rate of 2%;
- ✓ Meetings and travel are being held flat;

- ✓ Conference calls are down by $32k (or 42%) based on better negotiated rates with a new vendor;
- ✓ Consultants and Contracts are up by $393k (or 19.8%), driven by projected, temporary increased resource requirements in the compliance and RAPA programs;
- ✓ Office Costs are up $42k (or 8%) primarily due to higher than previous year computer and network maintenance costs; and,
- ✓ Fixed asset additions include the continued development of CDAA and CITS software enhancements as well as a backup system upgrade ($70k) and document management software ($30k).

She reported that the assessment and reprioritization of staffing resources is ongoing and will continue through 2015. In the compliance program area, the full effect of RAI, Risk Assessment, Internal Control Evaluation and CIP v5 implementation is currently unknown; and in RAPA, the full impact of the revised BES definition implementation is also still unknown, but staffing and resources are expected to be adequate as budgeted; including an increase in consulting and contractor expenses in both program areas.

A new Working Capital and Operating Reserves Policy was approved by NPCC's Board in October of 2013. The new policy calls for Change in Operating Reserves requirement from fixed 8.33% (30 days) to a range between 8.33% and 25.00% (90 days) to provide more stability in annual funding assessment. The Working Capital requirement remains unchanged with a targeted level of 8.33% (30 days) of the annual budget.

She concluded her presentation noting that NPCC is currently actively recruiting for its open positions.

Chair Report

Meeting Agenda

Mr. Briggs said he had received no changes to the meeting Agenda as provided in the Agenda package.

The RCC then approved the Agenda.

Common Task Force Statement of Purpose

Mr. Briggs indicated that the Task Force Chairs have agreed to common wording for their respective Task Force's Statement of Purpose; their revised respective Task Force Scopes are presented in the Agenda package under the Consent Agenda.

Consent Agenda

The Reliability Coordinating Committee approved the following Consent Agenda items (all written proxies in favor, with three abstentions: Sector 4, Generator Owners – David Ramkalawan, Ontario Power Generation, Inc., Sector 5, Marketers, Brokers, and

Aggregators - Louis Guilbault, HQ Energy Services (US) Inc., and Yannick Vennes, HQ Energy Marketing Inc.):

February 26, 2014 Meeting Minutes

The Draft-For-Approval Minutes of the February 26, 2014 Reliability Coordinating Committee were approved, with corrections noted.

RCC Membership Changes

The following changes to RCC Membership were approved:

Sector 1 -Transmission Owners

- ✓ Mr. Tom Irvine of Hydro One Networks Inc. succeeds Mr. Paul Tremblay, as the member. Mr. Ajay Garg will remain as the Alternate.
- ✓ Mr. David Conroy of Central Maine Power Company succeeds Mr. Brian Conroy, as the Member.
- ✓ Mr. Brian Conroy of Central Maine Power Company succeeds Mr. David Conroy, as the Alternate.
- ✓ Mr. Hantz Presume of Vermont Transco succeeds Mr. Paul Renaud, as the Member.
- ✓ Mr. Frank Ettori of Vermont Transco succeeds Mr. Hantz Presume, as the Alternate.
- ✓ Mr. Tony O'Hara succeeds Mr. Randy MacDonald as the Member. Mr. Randy MacDonald succeeds Mr. Tony O'Hara as the Alternate, both of New Brunswick Power Corporation.

Sector 2 - Reliability Coordinators

- ✓ Mr. Mark Wilson of Independent Electricity System Operator succeeds Ms. Barbara Constantinescu, as the member. Mr. Michael Falvo will remain as the Alternate.

Sector 3 -TDUs, Distribution. and LSE

- ✓ Mr. Gian DeLuca succeeds Mr. Mike Lupo as the member, both of New York Power Authority.

Sector 4 - Generation Owners

- ✓ Mr. Raey Yohannes of Entergy Nuclear Northeast succeeds Mr. Thomas Czerniewski, as the Member.

Task Force Roster Changes

The following changes to Task Force and Working Group memberships were approved:

Task Force on System Protection

Mr. Éric Loiselle succeeds Mr. Daniel Renaud as an Alternate from TransÉnergie.

Task Force on System Studies

- ✓ Mr. Francesco Elmi of Consolidated Edison of NY to replace Mr. Mohsen Zamzam (retired), as the Member.
- ✓ Mr. Vitaly Spitsa to replace Mr. Elmi as Alternate, both of Consolidated Edison of New York.

Task Force on Infrastructure Security & Technology

- ✓ Mr. William Temple to replace Mr. Michael Puscas as the Member, both of Northeast Utilities.
- ✓ Mr. William Temple to replace Mr. Neal Hickey as Vice-Chair.

SS-38 Load Modeling Working Group

- ✓ Mr. Jose Conto will represent ERCOT as a Member.

CP-8 Working Group on Review of Resource and Transmission Adequacy

- ✓ Mr. Vipul Agrawal will represent Independent Electricity System Operator as Alternate.

2013 New York Interim Area Transmission Review
Approved as provided in the Agenda package.

Task force Scopes
Approved as referenced in the Agenda package.

Protection System Risk Mitigation Plan Extensions
Approved as provided in the Agenda package.

Reliability Coordinating Committee Actions

2013 New England Comprehensive Area Transmission Review
Mr. McBride presented the 2013 New England Comprehensive Area Transmission Review provided in the Agenda package. He stated that the 2013 New England Comprehensive Area Transmission Review (study year 2018) demonstrates that the New England Transmission system is in conformance with the planning criteria and requirements specified in NPCC Directory No. 1 "*Design and Operation of Bulk Power System.*"

Mr. Dusseault reported that the Task Force on Coordination of Planning reviewed the report on April 15, 2014, and recommends RCC for approval. He stated that the Task Force on System Studies has also accepted the 2013 New England Comprehensive Area Transmission Review.

The RCC then approved the 2013 New England Comprehensive Area Transmission Review as provided in the Agenda package (all written proxies in favor, with three abstentions: Sector 4, Generator Owners – David Ramkalawan, Ontario Power Generation, Inc., Sector 5, Marketers, Brokers, and Aggregators - Louis Guilbault, HQ Energy Services (US) Inc., and Yannick Vennes, HQ Energy Marketing Inc.).

NPCC 2014-2015 Winter Probabilistic Multi-Area Reliability Assessment
Mr. Fedora presented the NPCC 2014-2015 Winter Probabilistic Multi-Area Reliability Assessment provided in the Agenda package. He explained that the assessment estimated the use of NPCC Area Operating Procedures designed to mitigate resource shortages for the winter of 2014/15 (November 2014 through March 2015). The use of operating procedures designed to mitigate resource shortages is not expected for Québec, the Maritimes, Ontario, New York, and New England under the assumed Base Case conditions for the expected load level. The expected load level results were based on the probability-weighted average of the seven load levels simulated.

Only the Maritimes Area show a need for use of operating procedures in response to a capacity deficiency this winter under the Base Case, extreme load conditions and under

the Severe Case conditions. The extreme load level represents the second to highest load level, having approximately a 6% chance of being exceeded.

He further explained that these results assumed the corresponding Base Case and Severe Case conditions occurred in every hour of the assessment period.

Regarding the gas-fired generation outage assumptions, Mr. Walters suggested this fact should be emphasized in the report, in order to demonstrate that the assessment considered the duration aspect of a fuel supply disruption that may occur over a period of days. Mr. Fedora agreed to include such a statement in the report.

Mr. Dusseault stated that the Task Force on Coordination of Planning reviewed this report at its May 14, 2014, meeting and recommends RCC approval. The assessment will be released in conjunction the CO-12 Working Group's corresponding winter reliability assessment, to be presented to the RCC for approval at its December 2, 2014 meeting.

The RCC then approved the NPCC 2014-2015 Winter Probabilistic Multi-Area Reliability Assessment as provided in the Agenda package, subject to the discussed clarification that the gas-fired outages were assumed for the entire assessment period (all written proxies in favor, with three abstentions: Sector 4, Generator Owners – David Ramkalawan, Ontario Power Generation, Inc., Sector 5, Marketers, Brokers, and Aggregators – Louis Guilbault, HQ Energy Services (US) Inc., and Yannick Vennes, HQ Energy Marketing Inc.).

July 3, 2013 Quebec Event Analysis

Mr. Paquet provided the RCC with an overview of the events of July 3, 2013; he explained that a fault of an exceptional duration on one of Hydro-Québec's 735 kV lines initiated by a severe forest fire led to internal load and generation losses and resulted in the sequential tripping of several DC interconnections.

He reported that Hydro-Quebec provided its findings and related recommendations were provided to NPCC as part of its Event Analysis Program, as well as TransÉnergie's compliance self-assessment to NERC standards.

A working group was put in place in December 2013 involving NPCC staff to further review the operations and design of the network, and to monitor TransÉnergie's implementation of its Action Plan addressing its findings and related recommendations.

The working group focused on the following five areas:

- ✓ Operational and maintenance procedures;
- ✓ Operational communications and control maintenance related to outage requests;

- ✓ Enhance the understanding of the impact of maintenance activities on system
- ✓ reliability;
- ✓ Supervision, tools, and communications with neighboring systems; and,
- ✓ Other actions, which include the root cause analysis of the SVC and DC ties tripping.

NPCC's Task Force on the Coordination of Operation, Task Force on System Studies, Task Force on Coordination of Planning, and Task Force on System Protection have completed their respective reviews of the event analysis. They are provided in the Agenda package.

The RCC accepted the analysis presented by TransÉnergie regarding the July 3, 2013 event, including the corresponding NPCC Task reviews of the analysis.

Status Reports

Mr. Briggs referred the RCC to the materials provided in the Agenda package; the RCC discussed the following Agenda items:

NPCC Regional Standards Committee (RSC) Report

Mr. Dunbar stated that the RSC continues to be engaged with comment review and ballot recommendations for various NERC standards, as described in the Agenda package. In addition, he highlighted the following activities:

- ✓ The continent wide disturbance monitoring standard development;
- ✓ Cost Evaluation Assessment Procedure; and,
- ✓ Development of a single portal tool – available on the Standards section of the NERC website.

In response to question, he described NERC goal to reach a "steady state" (by 2015) of the consideration of FERC directives and recommendations addressed in their standards development.

NPCC Reliability Directory Status Report

Mr. Dunbar referred the RCC to the materials provided in the Agenda package. He highlighted the status of Directory No. 1 and Directory No. 3. The Task Force on System Protection (TFSP) is currently conducting a technical comparison of the criteria within Directory No. 3 with the recent FERC approved PRC-005-2 Protection System Maintenance standard in order to assess whether all or portions of the criteria in Directory No. 3 can be retired. The TFSP is looking for NPCC comment of this comparison, currently posted through the NPCC Open Process.

NPCC Compliance Committee

Mr. Buffamante provided a brief summary of the materials provided in the Agenda package, and highlighted the activities related to the RAI Pilot Program and internal control assessment.

Mr. Nied explained that NPCC is participating on the Risk Based Registration Advisory Group, which is charged with the ERO-wide development of a risk-based registration criteria. He noted a June 6, 2014 Webinar regarding risk-based registration. He also summarized the topics presented at the 2014 NPCC Spring Standards and Compliance Workshop.

TFCO/TFCP Phase 2 revision of Directory No. 1

Mr. Dunbar reported that the NPCC Open Process review for the draft Directory No. 1 concluded its NPCC Open Process review on January 25, 2014.

The combined CO7/CP11 Working Group reconvened to develop draft responses to all comments, and has revised the draft of Directory No.1 where appropriate. Since additional revisions to the draft have taken place as a result of the comment review it is likely that Directory No. 1 will be reposted to the Open Process for a second posting.

SP-7 Working Group Review of Protection System Misoperations

Mr. DiFilippo reviewed the material provide in the Agenda package. The overall increase in the number of misoperations for the four quarters ending in 2013 as compared to the number of reported misoperations for 2011 and 2012 is attributed to the expanded reporting of non-BPS facilities. He noted a significant increase in the number of reported unknown/unexplainable misoperations and discussed possible causes for the increase.

The SP-7 Working Group continues to investigate the cause of unknown/unexplainable misoperations.

Load Modeling Working Group Update

Mr. Widjaja stated that the SS-38 Load Modeling Working Group is making progress pursuing regarding the following activities:

- ✓ Expanding the effort on the load survey/end-use load model;
- ✓ Conducting initial load model simulations; and,
- ✓ Reviewing actual system events for event recreation.

He explained that the SS38 Load Modeling Working Group plans to use actual system events, where applicable, to benchmark 'bulk power system events against Eastern Interconnection frequency response and recommend any modeling improvements as a result.'

UFLS Adequacy Assessment

Mr. Latulipe summarized the SS-38 Working Group on Inter-Area Dynamic Analysis UFLS Adequacy Assessment Study update provided in the Agenda package. He stated

that preliminary results indicate that each of the five NPCC areas ~~the~~ will meet the NPCC UFLS performance requirements for the study year (2018). He noted that Hydro-Québec is expecting to increase the total amount of load shedding by about 400 MW (~6% increase) for 2018.

He reported that the next step will be to perform sensitivity analyses as described in the Agenda package.

TFIST Cyber Update

Mr. Goodrich summarized the activities related to Project 2014-02 - Critical Infrastructure Protection Revisions, as described in the Agenda package. He reviewed upcoming due dates for CIP posted proposed revisions and a scheduled NERC webinar related to the RAI (June 19, 2014). He stated that TFIST plans to meet June 25-26, 2014 to review the CIP version 5 updates and comments received.
He also mentioned the following key dates:

- ✓ July 7- 16, 2014 CIP version 5 revisions formal ballot period; and,
- ✓ July 14, 2014 – survey responses due regarding BES Cyber assets

He then explained that the Department of Energy has released the Cybersecurity Procurement Language for Energy Delivery. He urged the RCC to review the information and consider appropriate application in their procurement activities going forward. Procurement was a threat reviewed in the 2014 Energy Threat Summit. A copy of the document is provided in the Agenda package.

Additionally, he mentioned that the Electric Sector Coordinating Council has taken over the Electric Sub-Sector Security Clearance process in the US. Mr. Nathan Mitchell, Director of Electric Reliability Standards and Compliance at APPA is coordinating Electric Sub-Sector Security Clearances going forward.

Physical Security Update

Mr. Goodrich summarized the materials presented in the Agenda package related to Physical Security activities.

He stated that the April 2013 PG&E Metcalf Substation attack was a major contributor to media coverage of physical security vulnerabilities in the beginning of 2014. The NERC Alert Advisory on February 28, 2014 - Elevated Risk due to media assertion of electric sector vulnerabilities, generated concerns for the Electric Sub-Sector substation security. On March 7, 2014 FERC Docket No. RD14-6-000 - Reliability Standards for Physical Security Measures was issued.

In response, NERC created the Project 2014-04 – Physical Security Standards Drafting Team. The team developed (in less than three months) CIP-014-1, which received industry

initial ballot Quorum/Approval of 92.53% / 85.61%. The implementation plan, upon approval by FERC, will span at most 120 days.

Additionally the NERC CIPC sponsored an industry Webinar on Physical Security Assessments, Design, and Protection Strategies presented by DOE's Lawrence Livermore National Lab; presentation materials are included in the Agenda package.

Area Compliance with NPCC Document A-10 Implementation Plan

Mr. Conroy reported that the New York ISO conducted BPS testing as part of the 2010 New York Comprehensive Area Transmission Review, and that the Ontario IESO conducted BPS testing in 2013, and as part of its 2012 Comprehensive Area Transmission Review.

He said it is expected that the remaining NPCC areas will have their testing completed by the end of the year.

2014-2015 Task Force Work Plan Progress

The Chairs of the NPCC Task Forces provided a brief summary of their respective 2014-2015 Task Force Work Plan Progress reports provided in the Agenda package.

NPCC Reliability Assessment Program (NRAP) Highlights Report

Mr. Fedora indicated that the '*NPCC Reliability Assessment Program Highlights Report*' has been updated as of May 30, 2014 and is posted on the NPCC website.

NERC Agenda Items

Operating Committee (OC)

Mr. Mosier reviewed the following June 2014 NERC Operating Committee Agenda items:

- ✓ Approval of a new reliability Guideline for communications during a complete loss of communications;
- ✓ The flooding Event in Toronto;
- ✓ New York ISO presentation regarding Electric/Gas Coordination; and,
- ✓ The NERC Physical Security Standard.

Planning Committee (PC)

Mr. Fedora reviewed the following items from the Draft June 2014 NERC Planning Committee Agenda:

- ✓ Essential Reliability Services Task Force White Paper;
- ✓ Integration of Variable Generation Task Force –draft Task 1-6 – the role that probabilistic methods can play in improving analysis;
- ✓ GADS Wind White paper – PC will be requested to review and provide comments;

- ✓ 2014 Long Term Reliability Assessment – review schedule and approval dates;
- ✓ NERC 2014 Probabilistic Assessment Update;
- ✓ Benchmark GMD Event White paper – PC will be requested to review and comment; and,
- ✓ Regional Challenges – Regional Representatives to help the PC identify and prioritize key issues and work products going forward.

Critical Infrastructure Protection Committee (CIPC)

Mr. Hogue reported that there were no voting items on the June 2014 NERC Critical Infrastructure Committee Agenda; the previously identified Cyber Security issues will be discussed.

NPCC Directory Applicability – BES/BPS

Mr. Fedora summarized discussions at the 2014 NPCC Standards and Compliance Workshop and the NPCC Joint Task Force Chairs regarding BES/BPS applicability to the NPCC Directories and Criteria. A NPCC Webinar on the subject is planned for June 25, 2014.

Informational Items

Mr. Briggs referred the RCC to the materials included in the Agenda package. The following Informational Items were discussed at the meeting:

Events Analysis Program – Overview and Status

Mr. Rufrano provided a status and overview of the Events Analysis program provided in the Agenda package.

Operational Highlights

Mr. Mosier briefly described the May 25, 2014 Milestone event; a thorough assessment of the incident is planned through the Event Analysis process.

TFCO Action Plan regarding NPCC "C" Documents

Mr. Mosier reported that the Task Force on Coordination of Operations has reviewed the existing operations-related NPCC "C" Procedure documents; he informed the RCC of several actions taken to either update, remove or consolidate the documents.

Definition of the Bulk Electric System

Mr. Fedora described the recent activities related to the revised definition of the Bulk Electric System (BES) and other supporting materials regarding the NERC Bulk Electric System Definition, Notification, and Exception Process Project Web Page.

The NERC notice for industry virtual question and answer Webinar session for the Bulk Electric System definition and its application has been included in the Agenda package. Mr. Carter Edge, Director of the Office of Coordinated Activities for the Regional Entity

Management Group, and Mr. Bob Cummings, Director of Reliability Initiatives and System Analysis at NERC will be conducting the Webinar to answer questions about the BES core definition, inclusions, exclusions, Self-Determined Notifications, and the exception process.

Other Matters

The RCC meeting was then adjourned.

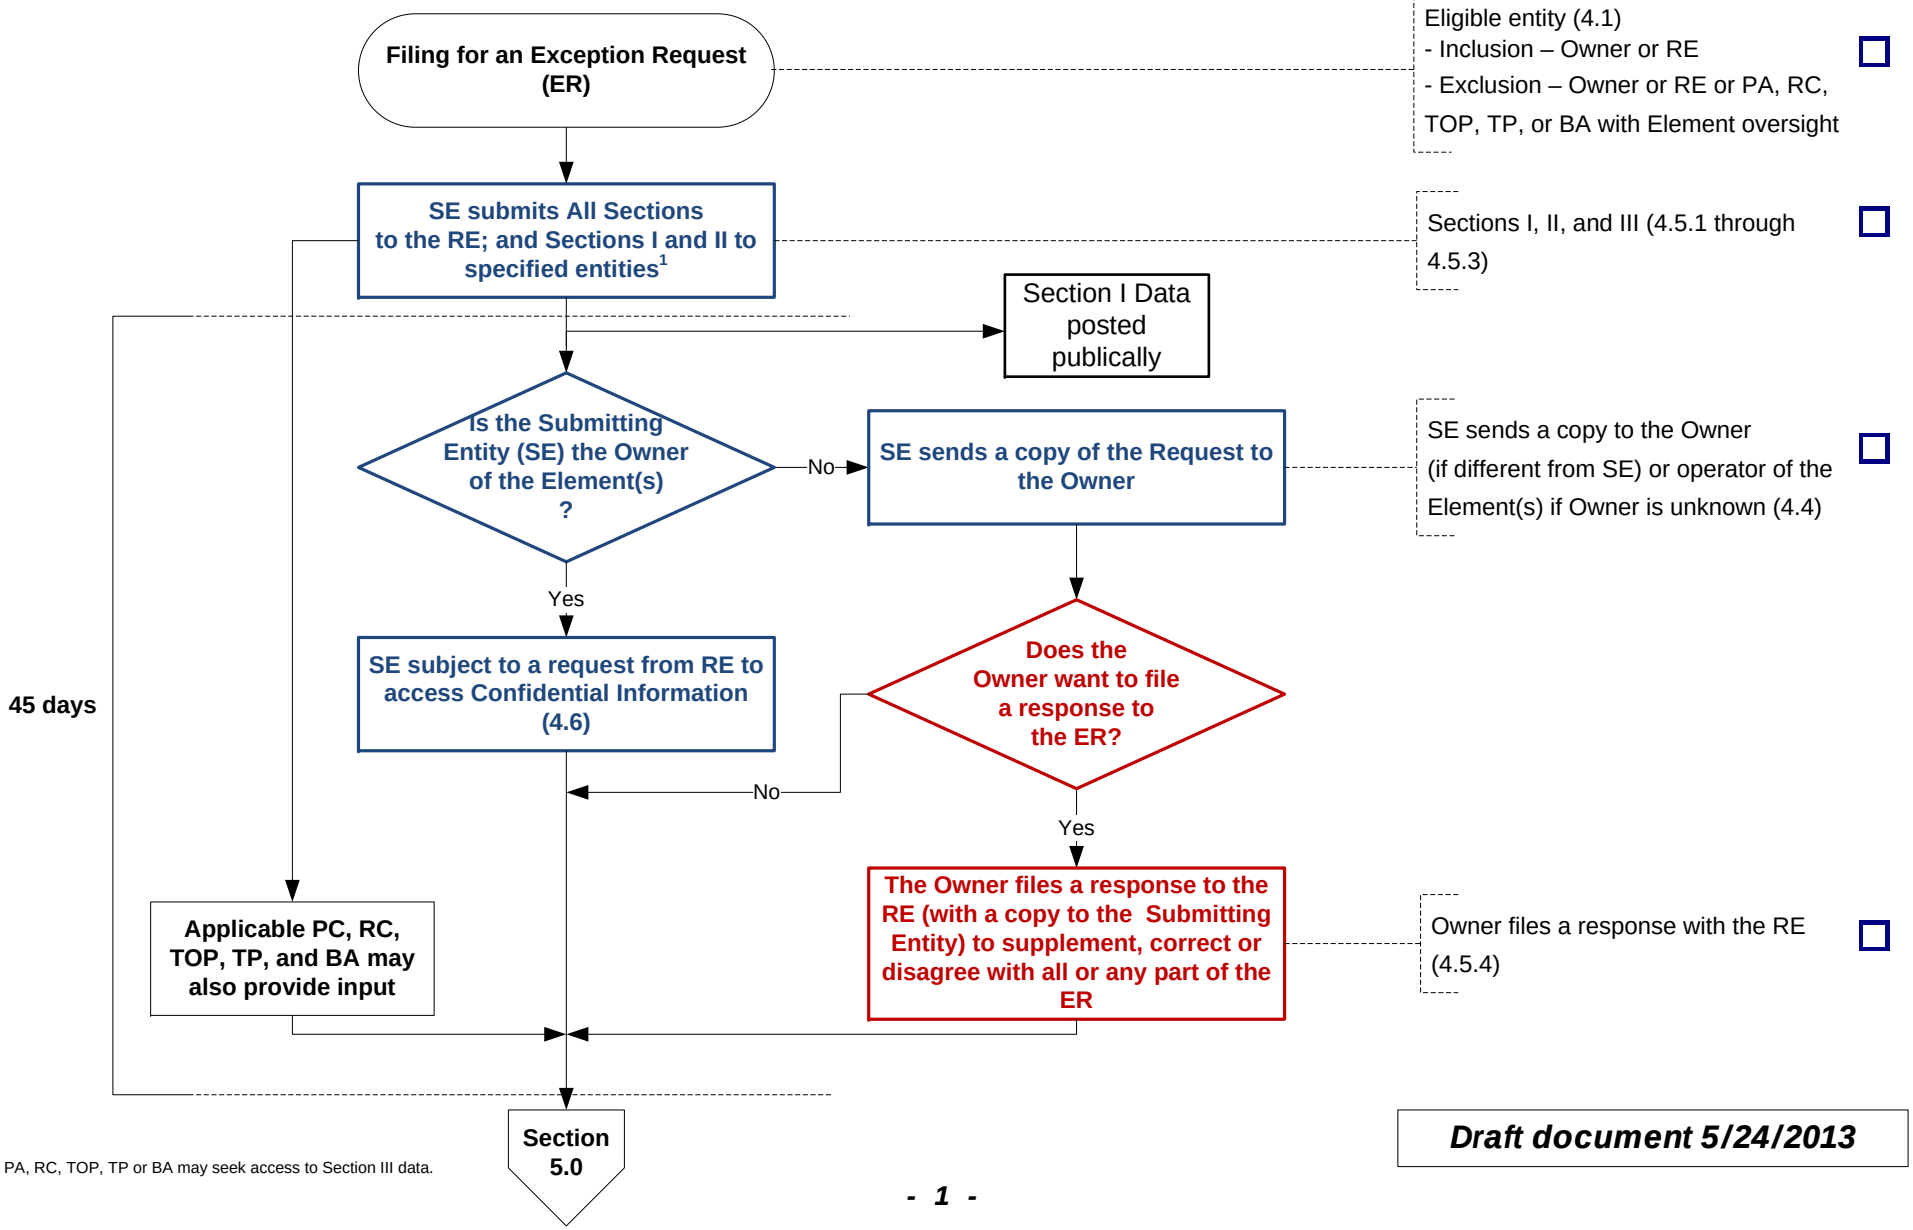
Next RCC Meeting Date	**Location**
September 10, 2014	New York Times Square Residence Inn by the Marriott

Distribution of Approved Minutes

NPCC Full & General Member Representatives and Alternates
Members, NPCC Board of Directors
Members, NPCC Reliability Coordinating Committee
Members, NPCC Public Information Committee
Members, NPCC Compliance Committee
Members, NPCC Regional Standards Committee
Members, NPCC Task Force on Coordination of Operation
Members, NPCC Task Force on Coordination of Planning
Members, NPCC Task Force on Infrastructure Security and Technology
Members, NPCC Task Force on System Protection
Members, NPCC Task Force on System Studies
NPCC Officers
NPCC Staff
Andrew J. Fawbush, Esq.
Andrianne S. Payson, Esq.

And:
Federal Energy Regulatory Commission – Mike Bardee, David O'Connor, Juan Villar
La Régie de L'Énergie – Daniel Soulier
Ontario Energy Board – Peter Fraser
United States Department of Energy – David Meyer
New Brunswick Department of Energy and Mines – David Sallows
Nova Scotia Utility & Review Board – S. Bruce Outhouse, Q.C.

North American Electric Reliability Corp.
Bulk Electric System Exception Process Flow Diagrams
May нф, 2013



Note: Every effort has been made to ensure that the content of these flow diagrams match the Bulk Electric System Exception Process as described in the NERC Rules of Procedure. However, in the case of discrepancies between the NERC Rules of Procedure and these flow diagrams, the NERC Rules of Procedure govern.

BES Element Exception Process

Section 4.0 - Form, content and submission on an exception request

(from the Submitting Entity's perspective)

Timeline	Flowchart	Checklist

Eligible entity (4.1)
- Inclusion – Owner or RE
- Exclusion – Owner or RE or PA, RC, TOP, TP, or BA with Element oversight

☐

Sections I, II, and III (4.5.1 through 4.5.3)

☐

SE sends a copy to the Owner (if different from SE) or operator of the Element(s) if Owner is unknown (4.4)

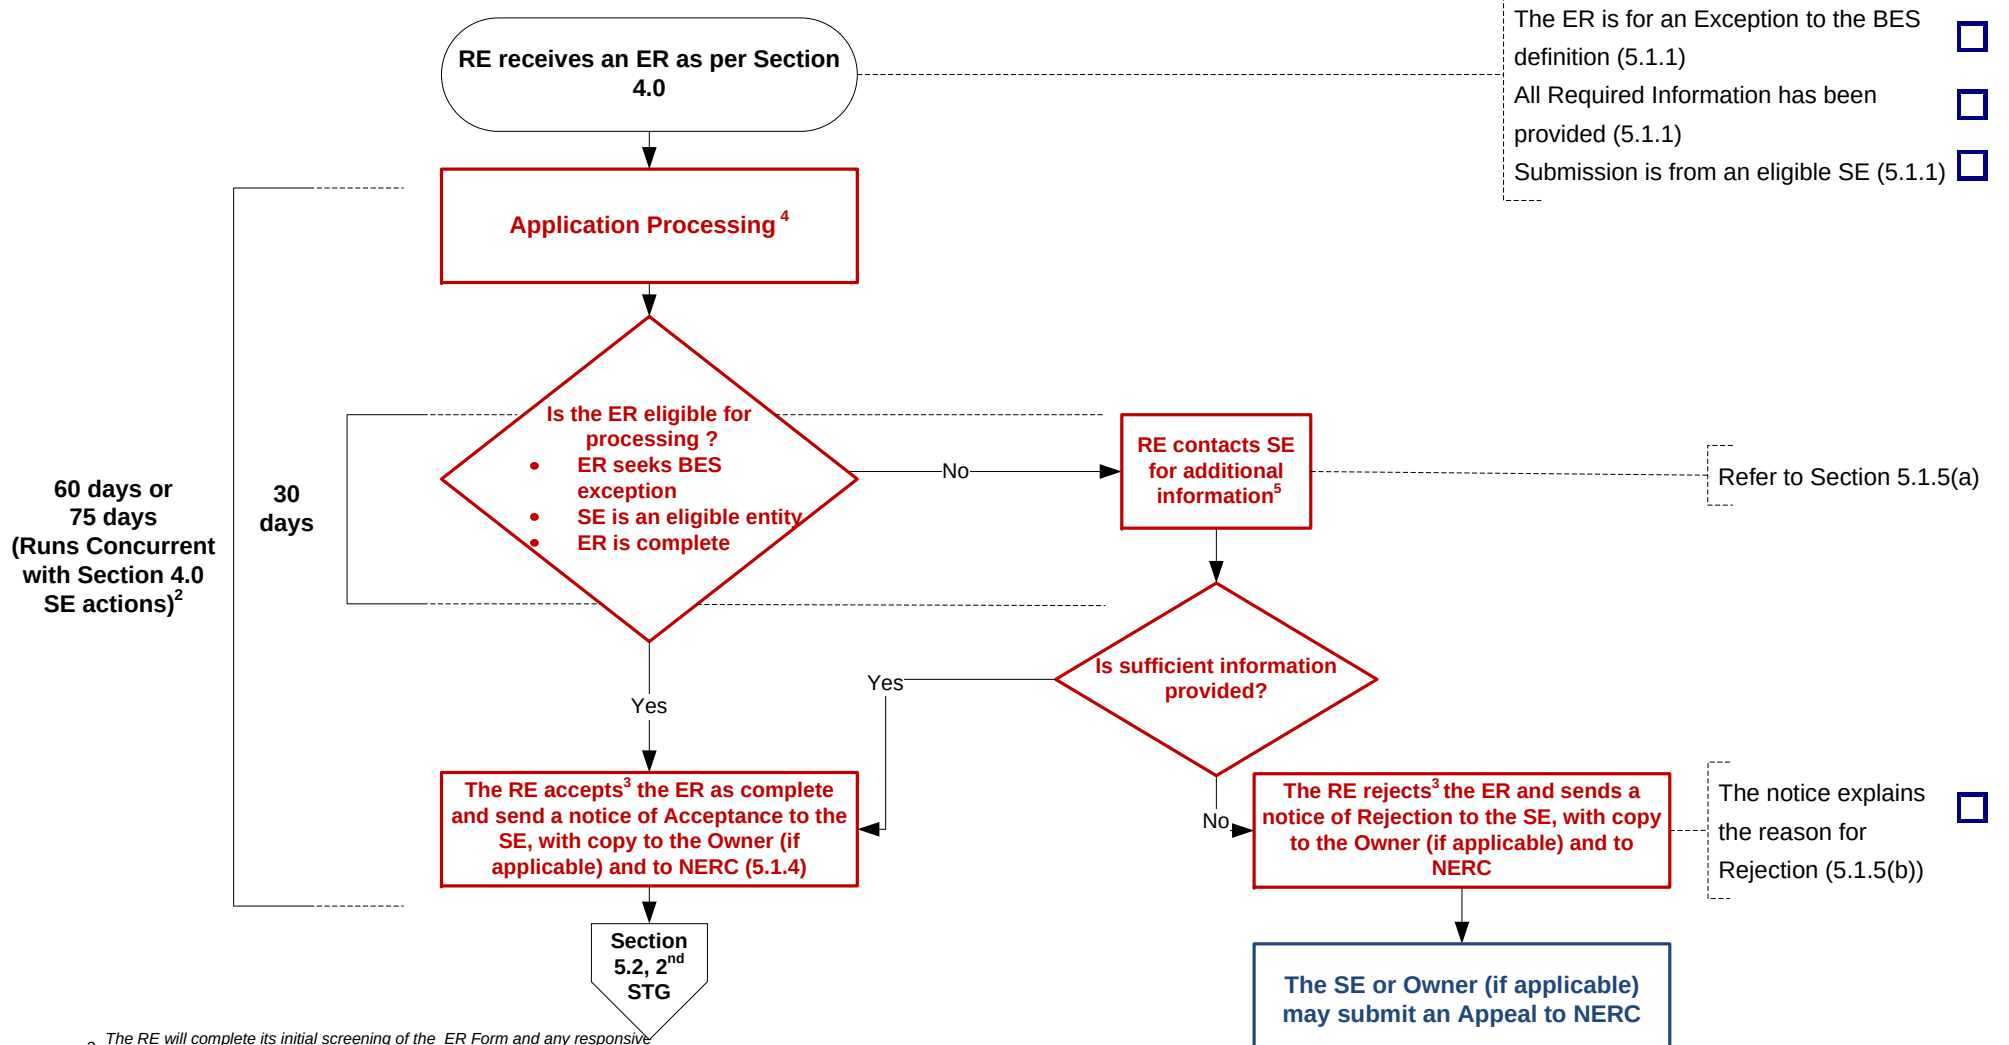
☐

Owner files a response with the RE (4.5.4)

☐

[1] Owner, PA, RC, TOP, TP or BA may seek access to Section III data.

Draft document 5/24/2013



BES Element Exception Process

Section 5.0 – Review, acceptance or rejection, and reccomendation regarding ER

(from the Regional Entity's perspective)

FIRST STAGE – Initial Screening

Timeline	Flowchart	Checklist

Checklist

- Assign a unique identifier to ER (5.1.2)[6]
- The ER is for an Exception to the BES definition (5.1.1)
- All Required Information has been provided (5.1.1)
- Submission is from an eligible SE (5.1.1)
- The notice explains the reason for Rejection (5.1.5(b))

2 *The RE will complete its initial screening of the ER Form and any responsive document filed by an Owner no later than either 60 calendar days after receiving the ER or 30 calendar days after receiving any responsive document from the Owner, whichever is later. Included in this timeframe is 45 days of the Section 4 Process since the action of the SE and RE run concurrently.*

3 *The RE may either accept the ER in its entirety, reject the ER in its entirety, or if the ER is for more than one Element, may accept it with respect to a subset of the Elements and reject it with respect to the remainder based on the similarity of the evidence presented for the Exception Request.*

4 At any stage before the issuance of a final Recommendation, a Submitting Entity may provide supplemental information which may reset the evaluation timeline. (Section 6.0)

5 If additional information is provided, the initial screening time will be extended to 15 days after the receipt of the additional information.

6 When the RE is the SE, after a unique identifier is assigned the process proceeds to section 5.2 second stage.

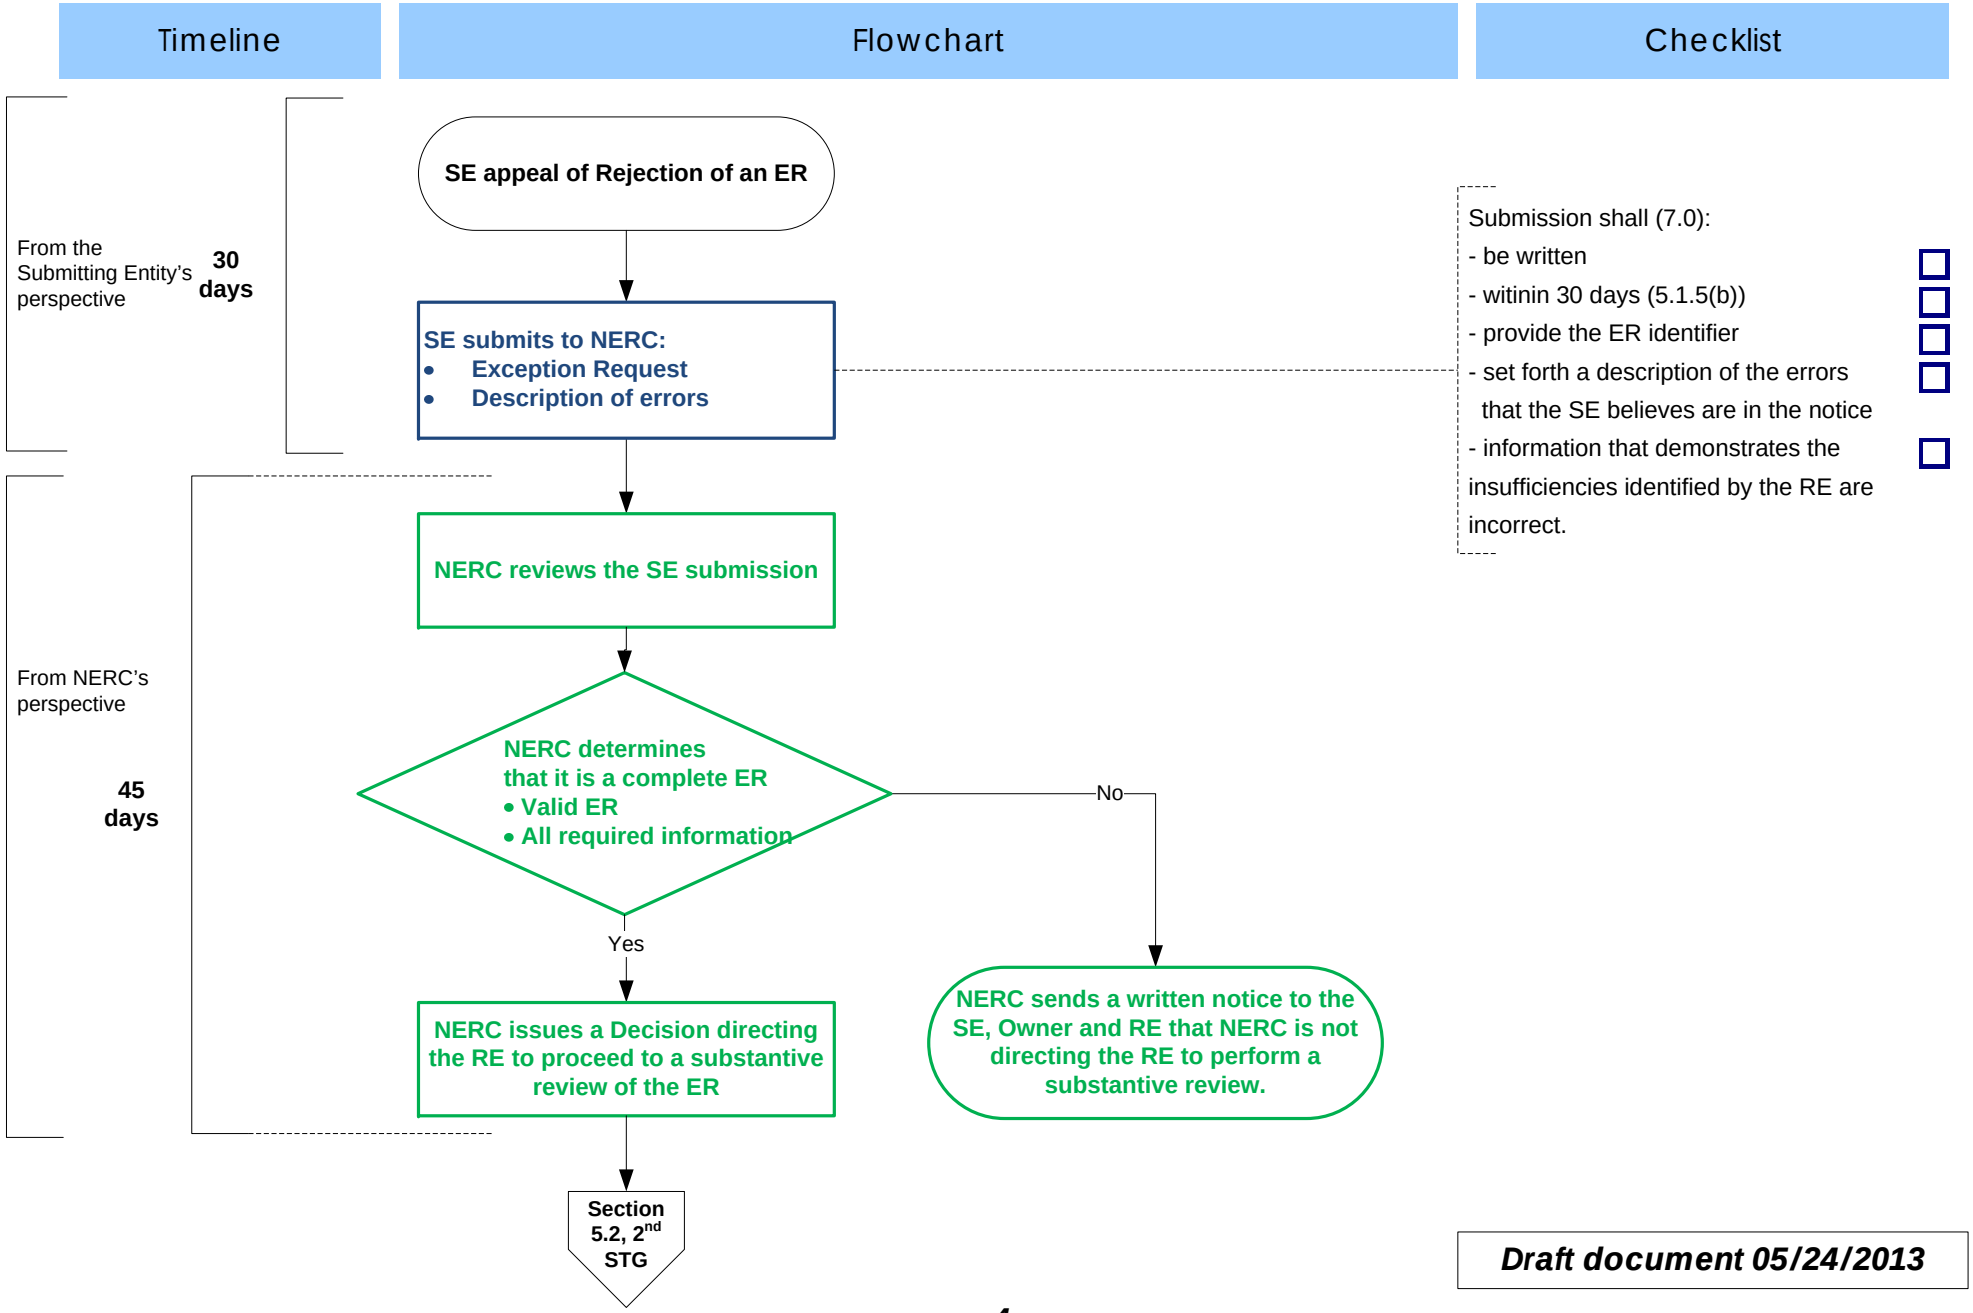
Draft document 05/24/2013

BES Element Exception Process

Section 5.0 – Review, acceptance or rejection, and reccomendation regarding ER

(from the Regional Entity's perspective)

SECOND STAGE – Substantive Review



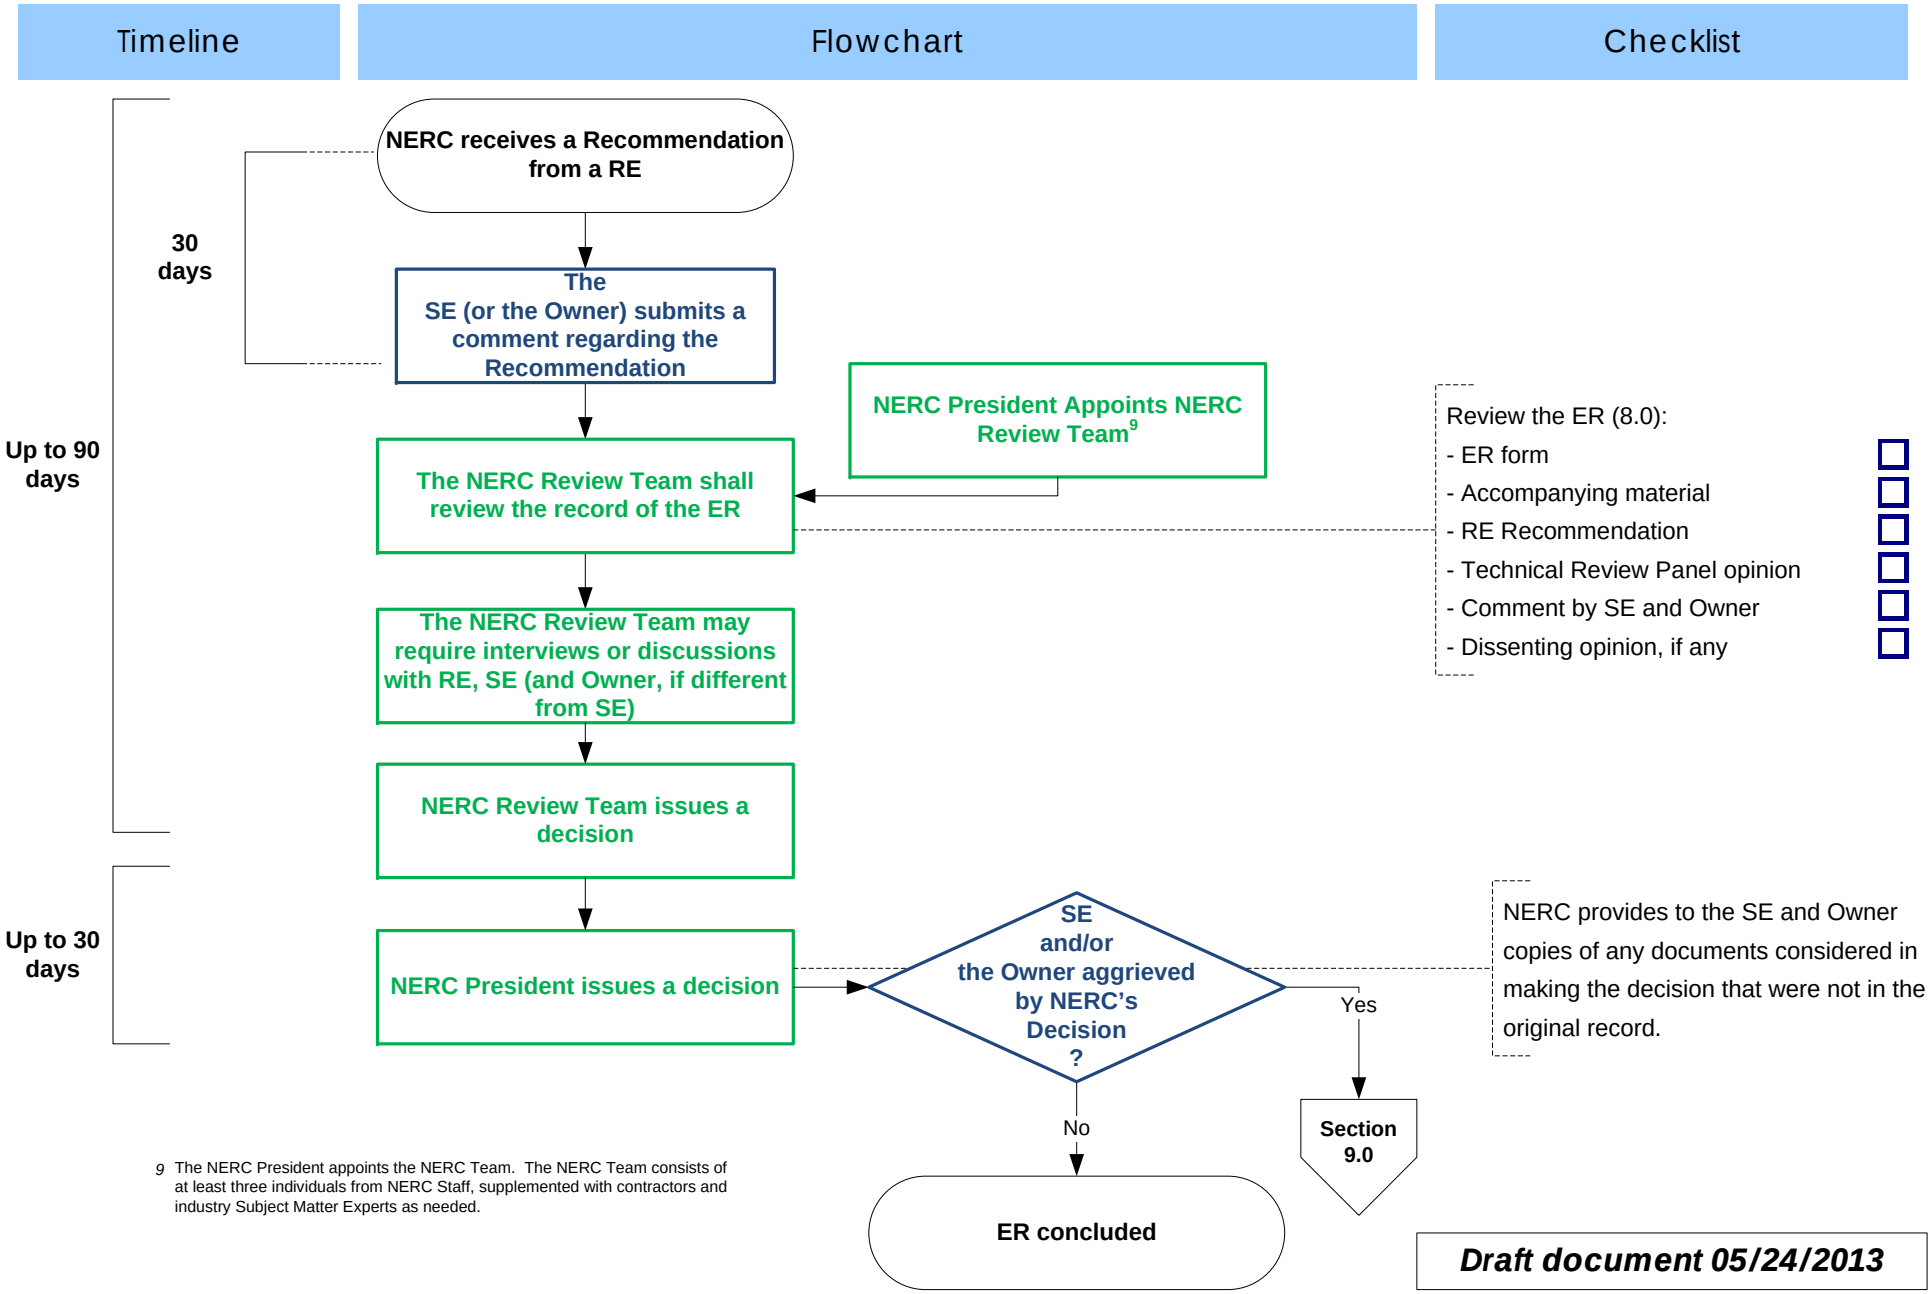
Timeline	Flowchart	Checklist
Up to 6 months	**RE sets milestones and sends copy to Submitting Entity and Owner, if different.**	Set milestones pursuant to Section 5.2.2. ☐
	Is the RE Recommendation to disapprove ER? — Yes → **Review and Opinion from Technical Review Panel[8]**	TRP Opinion pursuant to Sections 5.0(iii), 5.2.4, and 5.3 ☐
	No	The notice is in accordance with Section 5.2.3 ☐
	The RE issues a Recommendation to NERC and SE (and Owner if different from the SE)[7]	The Recommendation (5.2.3): ☐ - includes an evaluation - states the Elements covered - States the basis of the Recommendation - includes information considered by the RE in arriving at its Recommendation
	Section 8.0	

7 At any stage, pursuant to section 6.0, before the issuance of a final Recommendation a Submitting Entity may provide supplemental information which may reset the evaluation timeline.

8 A Technical Review Panel opinion is only required where a Regional Entity intends to issue a disapproval Recommendation to NERC. The Technical Review Panel consists of not less than three (3) individuals appointed by the Regional Entity senior executive (CEO, President, General Manager, etc.).

BES Element Exception Process

Section 7.0 – Appeal of Rejection of an ER Application based on its completeness

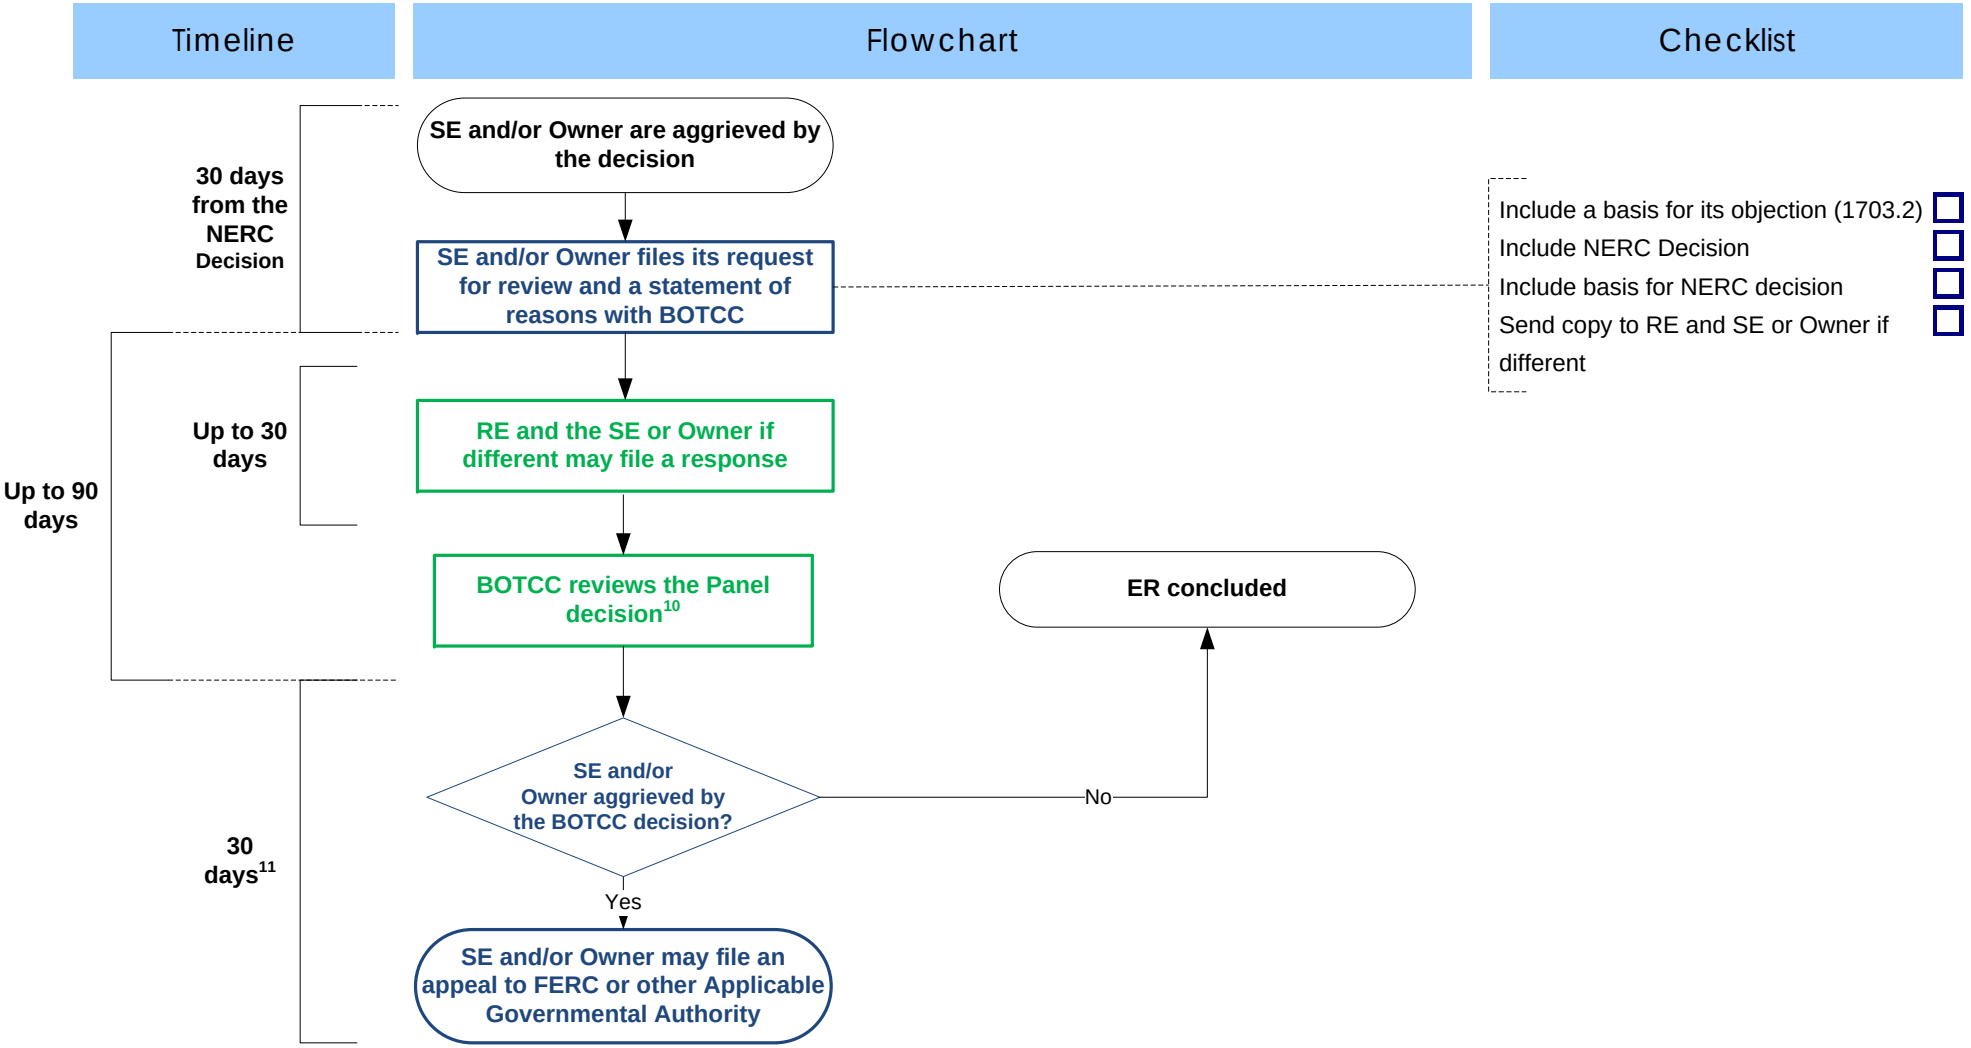


Draft document 05/24/2013

BES Element Exception Process

Section 8.0 – Approval or Disapproval of an ER

(from NERC's perspective)



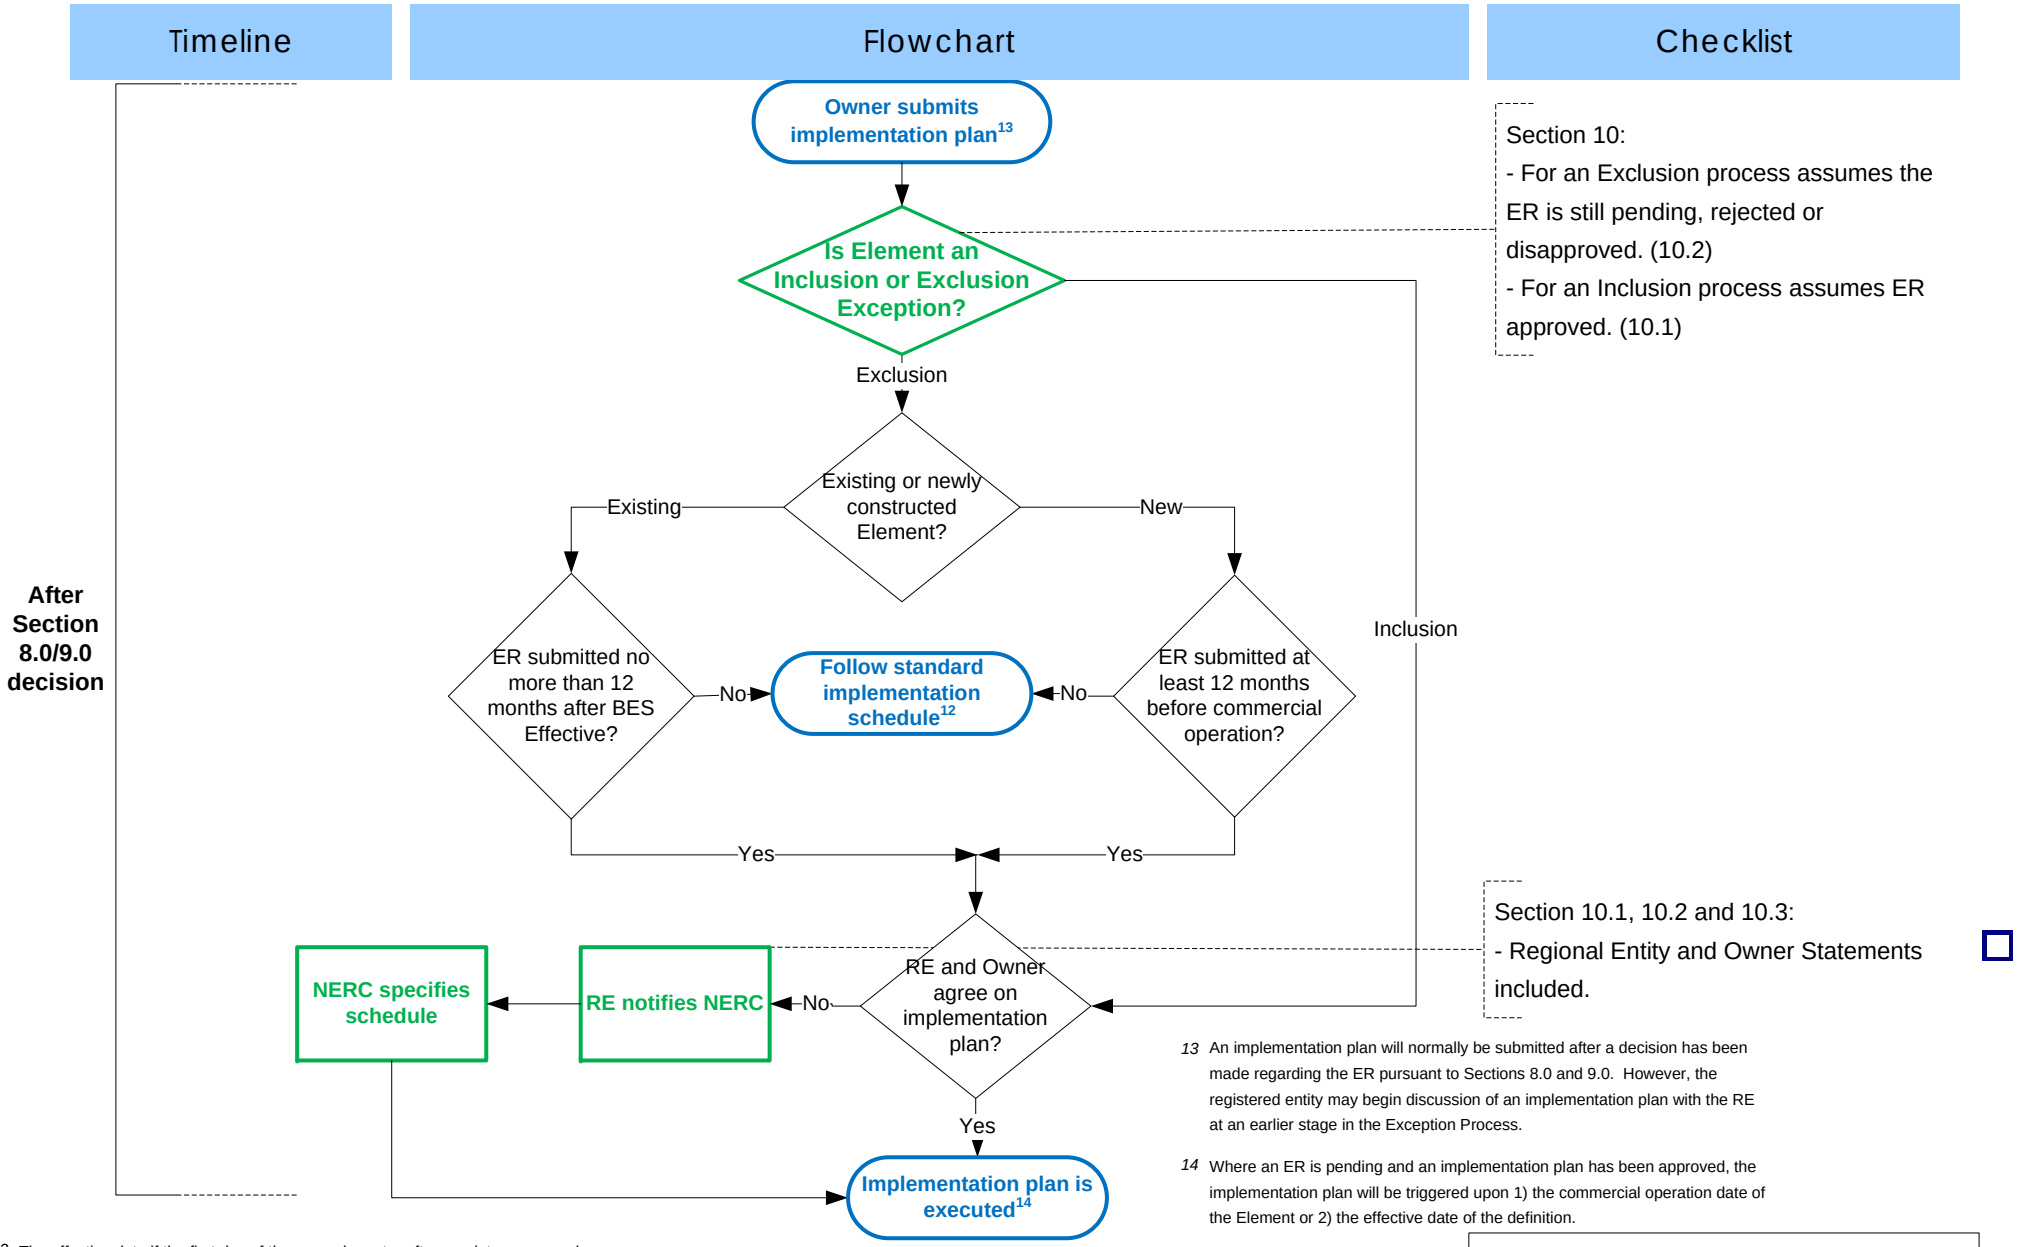
9 The NERC President appoints the NERC Team. The NERC Team consists of at least three individuals from NERC Staff, supplemented with contractors and industry Subject Matter Experts as needed.

Draft document 05/24/2013

BES Element Exception Process

Section 9 – NERC BOT Review of a Decision

(from Submitting Entity and NERC perspective)



10 The Board of Trustees Compliance Committee may extend the deadline date for its decision to a date more than 90 days following submission of the challenge, by issuing a notice to the SE, the Owner (if different) and the RE stating the revised deadline date and the reason for the extension.

11 Within thirty (30) days following the date of the decision of the BOTCC, or within such other time period as is provided for in the legal authority, rules or procedures of the Applicable Governmental Authority.

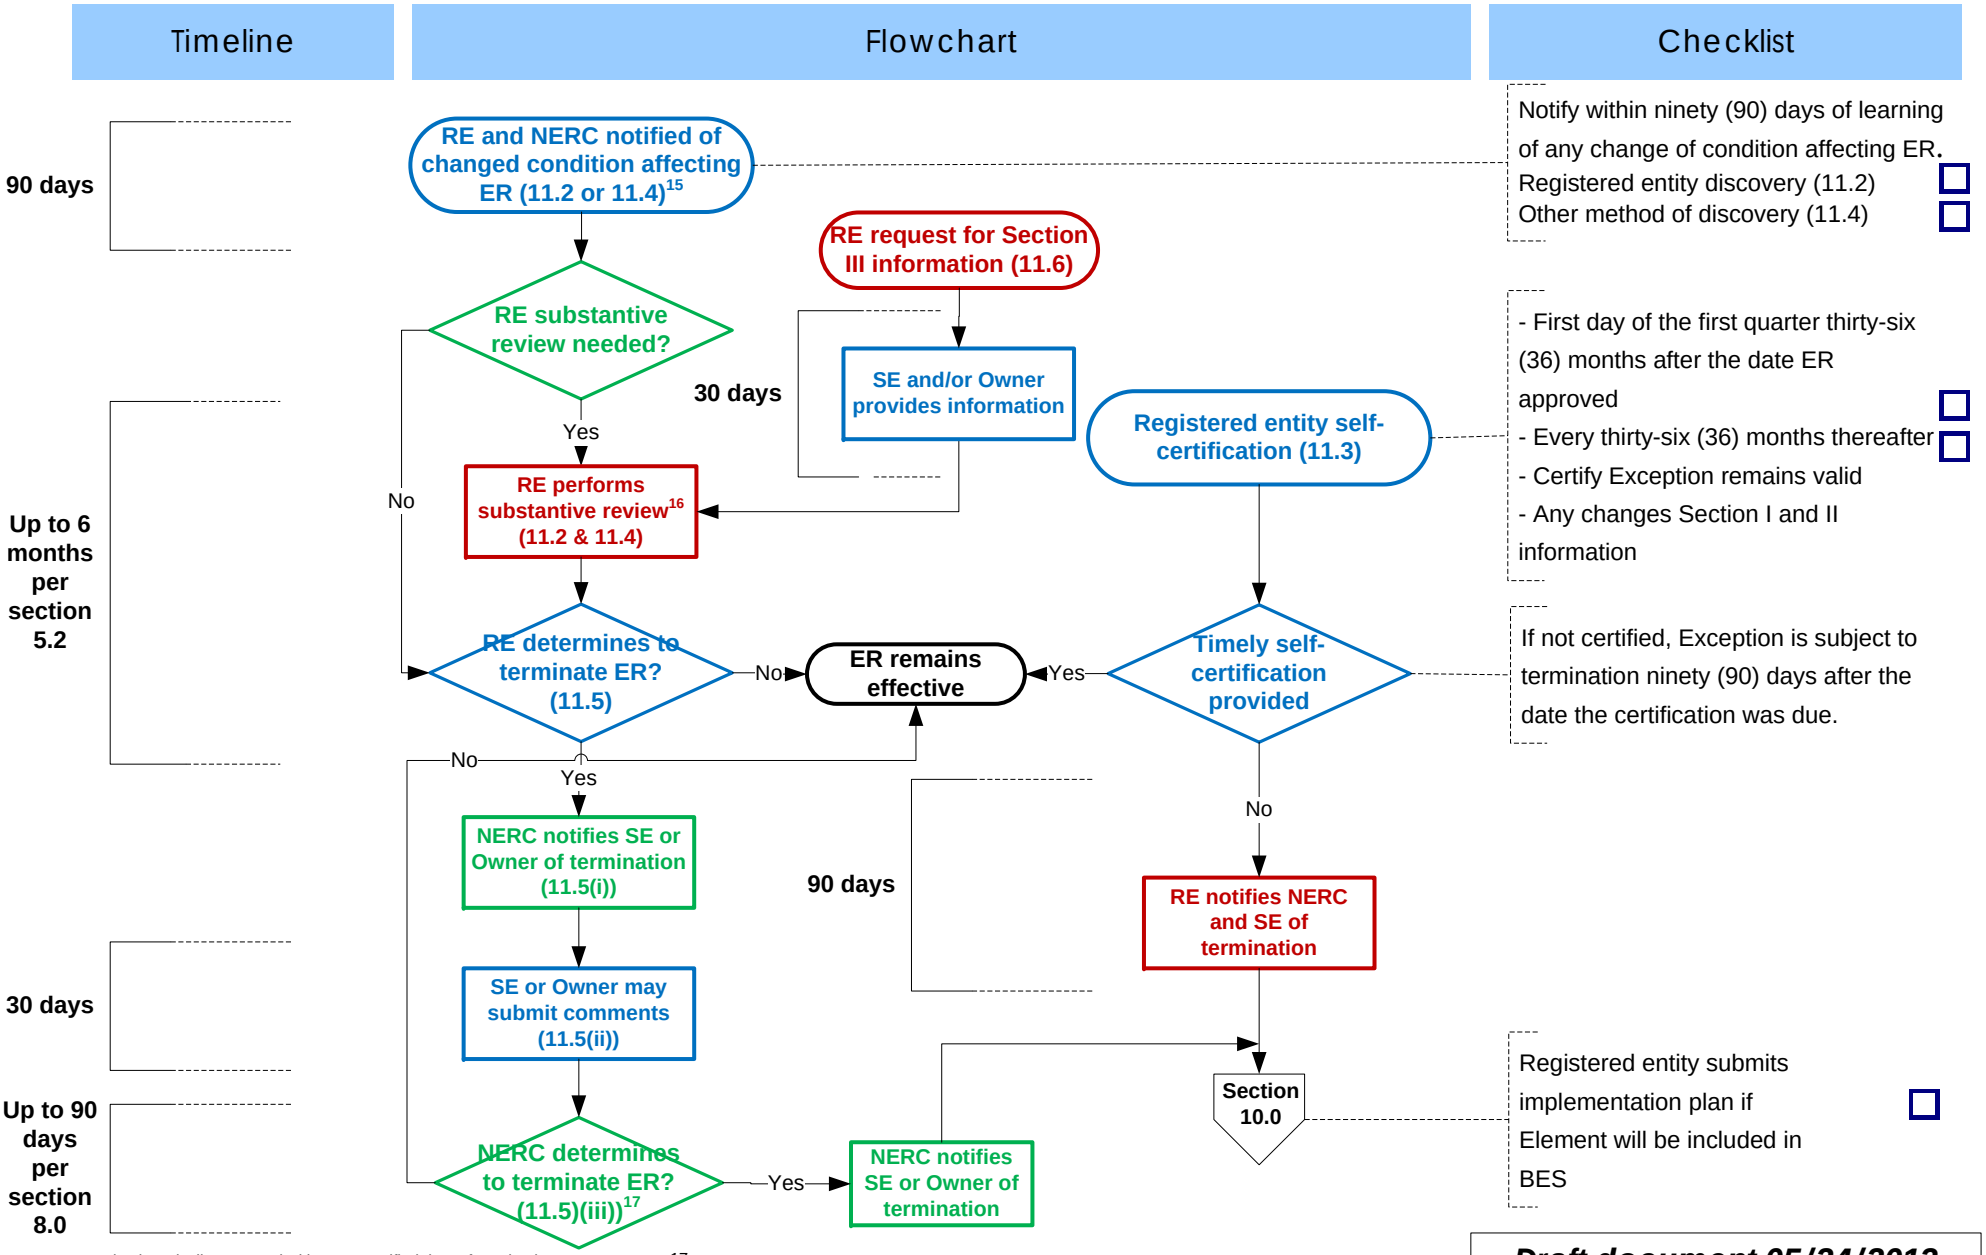
BES Element Exception Process

Section 10.0 – Implementation Period for Exceptions

(from the Regional Entity's and NERC's perspective)

13 An implementation plan will normally be submitted after a decision has been made regarding the ER pursuant to Sections 8.0 and 9.0. However, the registered entity may begin discussion of an implementation plan with the RE at an earlier stage in the Exception Process.

14 Where an ER is pending and an implementation plan has been approved, the implementation plan will be triggered upon 1) the commercial operation date of the Element or 2) the effective date of the definition.



12 The effective date if the first day of the second quarter after regulatory approval (July 1, 2013 for U.S. jurisdictional entities) or if no regulatory approval is required then the first day of the second quarter after NERC Board adoption. The implementation period is 24 months after the applicable effective date.

Draft document 05/24/2013

BES Element Exception Process

Section 11.0 – Termination of an Approved Exception

(from the Regional Entity's and NERC's perspective)

15 An Exception is typically approved without a specified date of termination, see section 11.1.

16 Upon request by the Regional Entity, the Submitting Entity(ies) and/or Owner if different shall provide within thirty (30) days the most recent versions of any Section III Required Information so requested.

17 NERC review is in accordance with Section 8.0.

Table of Contents

Preface iii

1. Version History 1

2. General Questions 2

2.1. When will the revised BES definition be effective? 2

2.2. What are the processes associated with implementing the new BES definition? 2

2.3. How will the ERO implement the BES definition? 2

2.4. What should Entities do to prepare for July 1, 2014? 2

2.5. How do currently registered owners of existing dispersed power producing resources need to report their Facilities on July 1, 2014 when Inclusion I4 takes effect? 3

2.6. Our existing dispersed generation Facility has a generator addition that will bring its aggregate nameplate rating over the 75 MVA threshold of Inclusion I4. How does this affect the Facility's status in the BES and what reporting is expected for the change? 4

2.7. If the ownership of an Element that was granted an Exception (inclusion or exclusion) changes, what is necessary to do to retain the Exception? 5

2.8. Are there any additional Reliability Standard development projects involving dispersed generation Facilities (Inclusion I4)? 5

2.9. What is the "Special Notification Submission Period?" 5

2.10. Does the "Special Notification Submission Period" apply to Notifications of Inclusion as well? 5

2.11. Does the "Special Notification Submission Period" apply to Exception Requests? 6

2.12. Can you provide any guidance about the level of detail needed in one-line diagrams submitted with Self-Determined Notifications or Exception Requests? 6

3. Training and Reference Resources 10

3.1. Will there be any training prior to July 1, 2014? 10

3.2. Will there be any training after July 1, 2014? 10

4. Notification of Self-Determination Process 11

4.1. When can I start entering in my BES Self-Determined Notifications? 11

4.2. Can a Registered Entity discuss matters with the Regional Entity prior to submitting a Self-Determined Notification and/or Exception Request? 11

4.3. What information will I need to supply with a notification of self-determinations? 11

4.4. Am I required to notify the Region of a change of BES status due to the new BES definition? 11

4.5. If nothing has changed in my Element's BES status after applying the new BES definition, do I need to submit a BES Self-Determined Notification? 12

4.6. Do newly identified Elements require the submittal of Self-Determined Inclusion Notifications? 12

4.7. Which Entity should provide Self-Determined Notifications for jointly-owned Elements? 12

4.8. Under legacy Regional BES definitions, certain transmission elements were considered as BES, but will now be excluded under the new BES definition. What should be submitted in the Self-Determination Notifications? 12

5. Exception Request Process 13

5.1. What process will NERC utilize to make evaluate BES Exception Requests? 13

5.2. What supporting information is needed to submit an exception request? 13

5.3. Who evaluates and approves Exception Requests? 13

5.4. What is a technical review panel? Who is on it? How are they chosen? 13

5.5. What is the NERC review panel? Who is on it? 14

5.6. How long will the process take? 14

5.7. How can an Entity appeal a Rejection of an Exception Request? 15

5.8. How can an Entity appeal the NERC decision? 16

5.9. Who can submit BES Exception Requests? 16

5.10. What happens if my system configuration changes after I have an approved Exception Request? 17

5.11. What if I have Elements that cross multiple Regional Entity boundaries? 17

5.12. Do I need to go to my Reliability Coordinator or Balancing Authority before submitting my BES Exception Request? 17

5.13. If an Exception Request is to be submitted for a jointly-owned Element, which Entity should submit the request? 18

5.14. What if I don't submit a BES self-determined BES notification for an exclusion or an inclusion as a result of the new BES Definition? 18

5.15. Should I concurrently file a BES Exception Request with NERC and a petition to exclude local Distribution Elements with FERC? 18

6. BES Notification and Exceptions Tool (BESNet) 20

6.1. What is the BESNet application and for what will it be used? 20

6.2. When will BESNet be available for submitting Exception Requests or Self-Determined Notifications? 20

6.3. Will there be software-related User Guides? 20

6.4. Is the information I enter into the BESNet application safe and secure? 20

6.5. Am I required to register for BESnet access? 21

6.6. Our company is divided into several organizational units that are exclusively registered as different NERC Functional Entities. How should we register for BESnet access? 21

6.7. I am preparing a series of Self-Determined Notifications (SDNs) and Exception Requests (ERs) for a number of Elements on my transmission system. How should the groupings of Elements be organized so as to provide an orderly and efficient approach that will minimize effort, aid review and expedite approval? 21

7. Compliance and Registration Questions 23

7.1. What is the implementation plan for the new BES definition, and when do the related compliance obligations begin? 23

7.2. When will compliance be mandatory with NERC Reliability Standards for existing Elements that are newly identified as BES Elements? 23

7.3. When do compliance obligations begin for newly built Elements that are classified as BES Elements under the new BES definition? 23

7.4. What are the obligations of the owner of a Facility that is designated as a part of the BES? 23

7.5 If I need to register based on the new BES definition, when should I register? 24

7.6. If an Entity does not own or operate BES assets, does that mean they have to follow NERC standards? 24

7.7. Can an Entity's registration requirements change as a result of applying the new BES definition? 24

7.8. If an Element is excluded from the BES through an exception request, what happens to compliance obligations, monitoring and enforcement? 24

7.9. If an Element is excluded from the BES through self-determination, what happens to compliance obligations, monitoring and enforcement? 24

7.10. In FERC Order No. 773-A (P 109), FERC stated, "in the absence of bad faith, if a registered entity applies the bulk electric system definition and determines that an element no longer qualifies as part of the bulk electric system, upon notifying the appropriate Regional Entity that the element is no longer part of the bulk electric system the element should not be treated as part of the bulk electric system unless NERC makes a contrary determination in the exception process." How is NERC implementing this language? 25

7.11. For excluded facilities, do I still have any compliance obligations? 26

7.12. If I am registered for the Distribution Provider function and I do not own or operate any BES Elements, can I request deactivation of my compliance registration? 26

8. NERC Process 28

8.1. Will the BES definition be applied consistently across the Regional Entities? 28

8.2. If my Element is not considered a part of the BES, might I still be required to provide information to NERC about it? 28

9. FERC 29

9.1. Does FERC have a role in designating Facilities as part of the BES? 29

9.2. Should I concurrently file a BES Exception Request with NERC and a petition to exclude local Distribution Elements with FERC? 29

10. Definition Questions 30

10.1. Protection Systems were explicitly included in the Legacy Regional Definition and the new NERC BES Definition is silent on Protection Systems. Do I need to do anything in BESnet for these Protection Systems? 30

Preface

The North American Electric Reliability Corporation's (NERC) mission is to ensure the reliability of the North American bulk power system (BPS). NERC is the electric reliability organization (ERO) certified by the Federal Energy Regulatory Commission (FERC) to establish and enforce Reliability Standards for the BPS. NERC develops and enforces Reliability Standards; assesses adequacy annually via a 10-year forecast and summer and winter forecasts; monitors the BPS; and educates, trains, and certifies industry personnel. ERO activities in Canada related to the reliability of the BPS are recognized and overseen by the appropriate governmental authorities in that country.[1]

NERC assesses and reports on the reliability and adequacy of the North American BPS, which is divided into eight Regional Entity areas, as shown on the map and table below. The users, owners, and operators of the BPS within these areas account for virtually all the electricity supplied in the United States, Canada, and a portion of Baja California Norte, Mexico.

NERC Regional Entities

NERC Regional Entities Map

FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RF	ReliabilityFirst
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electricity Coordinating Council

[1] As of June 18, 2007, FERC granted NERC the legal authority to enforce Reliability Standards with all U.S. users, owners, and operators of the BPS and made compliance with those standards mandatory and enforceable. Equivalent relationships have been sought and for the most part realized in Canada and Mexico. Prior to adoption of §215 in the United States, the provinces of Ontario (in 2002) and New Brunswick (in 2004) adopted all Reliability Standards that were approved by the NERC Board as mandatory and enforceable within their respective jurisdictions through market rules. Reliability legislation is in place or NERC has memoranda of understanding with provincial authorities in Ontario, New Brunswick, Nova Scotia, Québec, Manitoba, Saskatchewan, British Columbia and Alberta, and with the National Energy Board of Canada (NEB). NERC standards are mandatory and enforceable in Ontario and New Brunswick as a matter of provincial law. Manitoba has adopted legislation, and standards are mandatory there. In addition, NERC has been designated as the "electric reliability organization" under Alberta's Transportation Regulation, and certain Reliability Standards have been approved in that jurisdiction; others are pending. NERC standards are now mandatory in British Columbia and Nova Scotia. NERC and the Northeast Power Coordinating Council (NPCC) have been recognized as standards setting bodies by the Régie de l'énergie of Québec, and Québec has the framework in place for Reliability Standards to become mandatory. NEB has made Reliability Standards mandatory for international power lines. In Mexico, the Comisión Federal de Electricidad (CFE) has signed WECC's reliability management system agreement, which only applies to Baja California Norte.

1. Version History

The following is the history of changes to this document.

Version	Date	Change(s) Made	Change Tracking
1.0	May 6, 2014	Original Publishing	
1.1	June 4, 2014	Editorial changes to 7.1 Added FAQs: 2.7, 2.8, 4.7, 5.13, 5.14, 5.15, 6.4, and 7.8.	
1.2	June 26, 2014	Updates to 2.8, 3.1. Added FAQs: 2.9, 2.10, 2.11, 3.2, 4.8, 6.5, 6.6, 6.7, 7.9, 7.10, 7.11, 9.2, and 10.1.	
1.3	July 1, 2014	Updates to 2.5	
1.4	July 23, 2014	Factual corrections to 2.5	
1.5	August 25, 2014	Factual correction to 2.2 Added FAQs: 2.12, 7.12	

2. General Questions

2.1. When will the revised BES definition be effective?

The definition will be effective July 1, 2014.

2.2. What are the processes associated with implementing the new BES definition?

- Notification of Self-Determination: Facility owners notify Regional Entities of Elements excluded from the BES (by application of the BES definition) that were previously included in the BES, as well as Elements that are now included in the BES by application of the BES definition that were previously not included.
- Local distribution exclusions: In accordance with FERC Order No. 773-A, Entities may petition FERC for Facilities to be excluded as local distribution at any time.
- Rules of Procedure Exception process: Entities may request that Facilities either be included in the BES or excluded from the BES after applying the BES definition.

2.3. How will the ERO implement the BES definition?

The ERO has developed a process and single web-based tool for asset owners to provide industry with a uniform method to notify the Regional Entities of changes and to identify BES inclusions or exclusions as directed by the Federal Energy Regulatory Commission's (FERC) Order Nos. 773 and 773-A, as well as the March 20, 2014 Order[2] approving the Revised Definition.

- Provide a uniform process for Self-Determined Notifications of newly identified BES inclusions or exclusions.
- Provide a common tool for Entities to submit Exception Requests.
- Create a consistent method for the Regional Entities and NERC to efficiently process BES Exception Requests.
- Address regulatory requirements in FERC Order Nos. 773 and 773-A, as well as the March 20, 2014 Order approving the Revised Definition.

2.4. What should Entities do to prepare for July 1, 2014?

Step 1: Identify BES Facilities and Elements

NERC suggests that each Entity that owns or operates Facilities and Elements apply the revised BES definition to such Facilities and Elements to determine if they are included in the BES. This analysis should identify Facilities and Elements that:

i. should be included in the BES, or
ii. may be excluded from the BES, based on the revised BES definition.

[2] *Order Approving Revised Definition*, 146 FERC ¶ 61,199 (March 20, 2014) http://www.nerc.com/FilingsOrders/us/FERCOrdersRules/E-7.pdf

After July 1, 2014, Entities are required by the NERC Rules of Procedure[3] to notify their Regional Entity of new Self-Determined Inclusions and Exclusions from application of the bright-line BES definition.

Step 2: Perform a Gap Analysis

Each Entity owning or operating Facilities and Elements that have been newly identified for inclusion in the BES should perform a gap analysis for both:

i. Registration (and Certification, if applicable), and
ii. Compliance with applicable Reliability Standards.

Step 3: Develop BES Implementation Plans

An Entity with newly included Facilities or Elements may need to develop a registration implementation plan (which may include the need for Certification or a revision to an existing Certification), a compliance implementation plan, or both. In either case, the Entity should submit its implementation plan(s) to the applicable Regional Entity for review and concurrence.

Additional information on preparations is contained in the *BES Definition Implementation Guidance Document* and the *BES Definition Reference Document*, which are posted at:

http://www.nerc.com/pa/RAPA/Pages/BES.aspx.

2.5. How do currently registered owners of existing dispersed power producing resources need to report their Facilities on July 1, 2014 when Inclusion I4 takes effect?

Dispersed power producing resources with an aggregate nameplate rating greater than 75 MVA should already be included as BES, based on the former NERC BES Definition. In cases where dispersed power producing resources with an aggregate nameplate rating greater than 75 MVA have not been included as part of the BES, a Self-Determined Notification should be submitted. See the section below for MRO and WECC for a summary of information that should be included with the Notification.

Inclusion I4 within the new BES Definition clarifies which parts of the Facility are considered BES. Based on the approved BES Definition, the individual dispersed generators and equipment that aggregate to ratings of greater than 75 MVA are included in the BES. Inclusion I4 further clarifies that the elements between individual devices or machines and the point where the aggregate nameplate rating is greater than 75 MVA are not BES Elements.

Regional differences in past implementation of the former BES Definition with regard to dispersed power producing resources have led to inconsistencies, which the application of the new BES Definition is intended to address. The following outlines the specific

[3] See Section of 501 of the Rules of Procedure "Scope of the Organization Registration and Organization Certification Programs" located at http://www.nerc.com/pa/RAPA/Pages/BES.aspx.

steps involved in achieving consistent implementation of the new BES Definition across the ERO for dispersed power producing resources.

In FRCC, NPCC, RF, SERC, SPP, and TRE: Registered Entities that own or dispersed power producing resources already considered by their Regional Entity to be part of the BES based on the former definition do not need to submit a Self-Determined Notification (provided that the elements 100 kV and above between the point where the aggregate nameplate rating is greater than 75 MVA and the point of Interconnection to the BES, as well as the individual wind turbines, were also already considered to be part of the BES). There is no obligation to submit a Notification through the BESnet system stating that elements below 100 kV used for common point delivery below a 75 MVA aggregation point are excluded, or that individual turbines are included.

In MRO and WECC: The Regional Entities did not consider the individual devices or machines comprising a dispersed power producing Facility where the aggregate nameplate rating is greater than 75 MVA to be part of the BES. In these cases, the Registered Entity must complete a Self-Determined Notification of inclusion. Registered Entities must submit supporting information with the Self-Determination, which should include one-line diagrams of the facility showing individual machines or devices, the lines used to deliver capacity to common points of connection, and the substation and other Facilities up to the point of transmission interconnection, as well as the point(s) at which output is aggregated and exceeds 75 MVA. The Registered Entity should submit a summary list of the Elements that comprise the facility that are considered part of the BES, including the number, manufacturer (and model), and nameplate MVA rating of the individual machines or devices. Explicitly identifying each of the Elements within the BESnet application is not required. The Regional Entity will review the one-line diagrams and the summary list to validate that the BES Definition was applied correctly. In some instances, additional documents may be requested by the Regional Entity to perform this validation. Registered Entities that submit a valid notification under this approach are permitted up to a two year transition period to bring the newly identified BES Elements into compliance with applicable NERC Reliability Standards.

2.6. Our existing dispersed generation Facility has a generator addition that will bring its aggregate nameplate rating over the 75 MVA threshold of Inclusion I4. How does this affect the Facility's status in the BES and what reporting is expected for the change?

Under the scenario above, this is a change in the Facility's inclusion/exclusion status per the "bright line" in Inclusion I4. The Entity should use the BESNet application to provide a notification of inclusion of this Facility. Supporting details should be provided, including one-line diagrams. The Regional Entity will examine the one-line diagrams for identification of the number, manufacturer (and model), and nameplate MVA rating of the individual machines or devices, the number of collector lines, and the collector substation and other substation Facilities up to the point of transmission interconnection, as well as the point at which output is aggregated and exceeds 75 MVA. In some instances, additional documents may be requested by the Regional Entity.

However, it is not necessary for the owner to provide details in the BESNet application for each individual dispersed machine or device and step-up transformer, nor the individual non-BES collector lines, beyond the one-line diagram, provided the one-line diagram clearly indicates the size of the individual machine or device and their step-up transformers. BESNet should be used for reporting the Facility status change in the aggregate.

2.7. If the ownership of an Element that was granted an Exception (inclusion or exclusion) changes, what is necessary to do to retain the Exception?

The new Element owner must notify the appropriate Regional Entity of the change of ownership. The Regional Entity will then make the reassignment of ownership in the BESNet for the Exception.

The former Element owner also must notify the appropriate Regional Entity of the change in its assets.

2.8. Are there any additional Reliability Standard development projects involving dispersed generation Facilities (Inclusion I4)?

The Project 2014-01 Standard Drafting Team is focusing on identifying Reliability Standard requirements applicable to dispersed power-producing resources. The list developed from the Standards Authorization Request (SAR) may provide a subset of applicable Reliability Standards. Once the Standard Drafting Team concludes its work, NERC will determine next steps, including alignment with the Risk-Based Registration Initiative.

2.9. What is the "Special Notification Submission Period?"

Registered Entities submitting Notifications of Exclusion may perceive a potential compliance benefit in submitting those Notifications as soon as possible, resulting in the possibility of a large number of Notifications being submitted on July 1. In order to reduce the potential for congestion, NERC has established a period beginning July 1, 2014, and ending September 1, 2014, during which all complete and valid notifications of exclusion submitted will be deemed to have been submitted on July 1 for purposes of determining compliance obligations (in so doing, all entities that submit within that period will have the same potential compliance date, reducing any perceived incentive to submit on July 1). Thus entities are encourage to pace their submission of Notifications of Exclusion within this period.

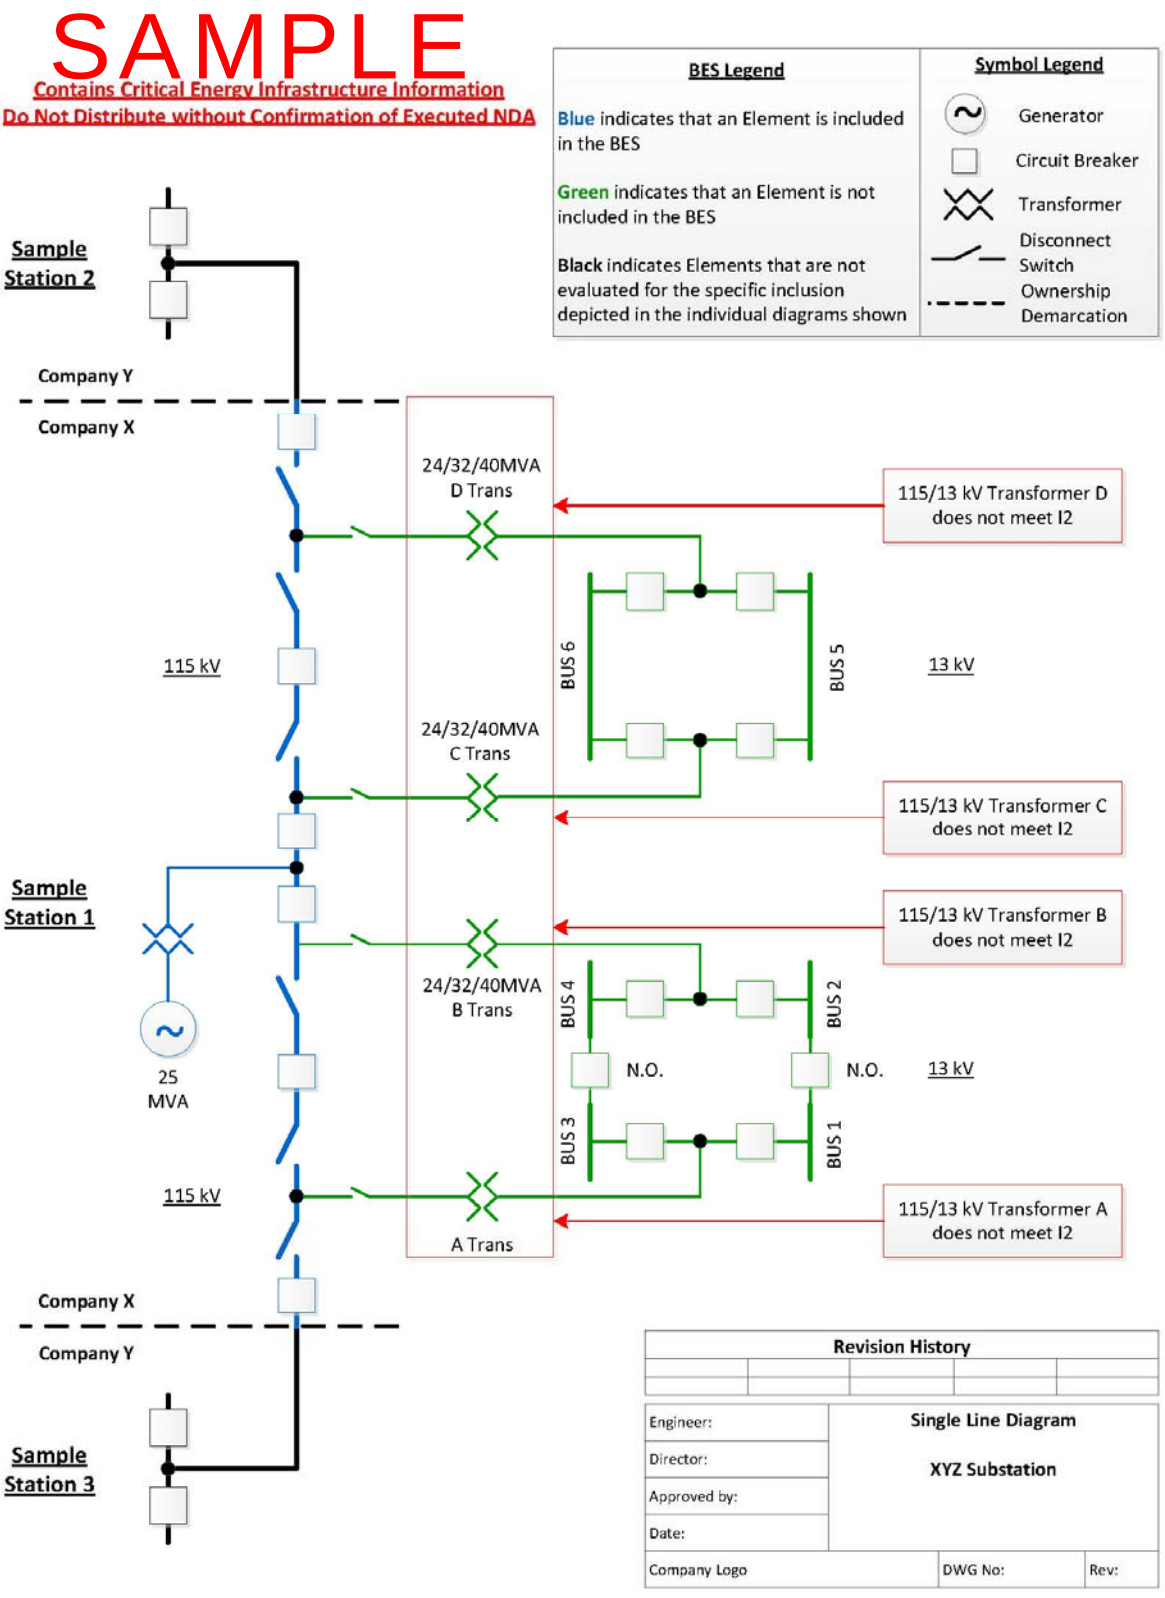
2.10. Does the "Special Notification Submission Period" apply to Notifications of Inclusion as well?

No. Because Notifications of Inclusion are already subject to a transition period, there is no need for the "Special Notification Submission Period" to apply to Notifications of Inclusion.

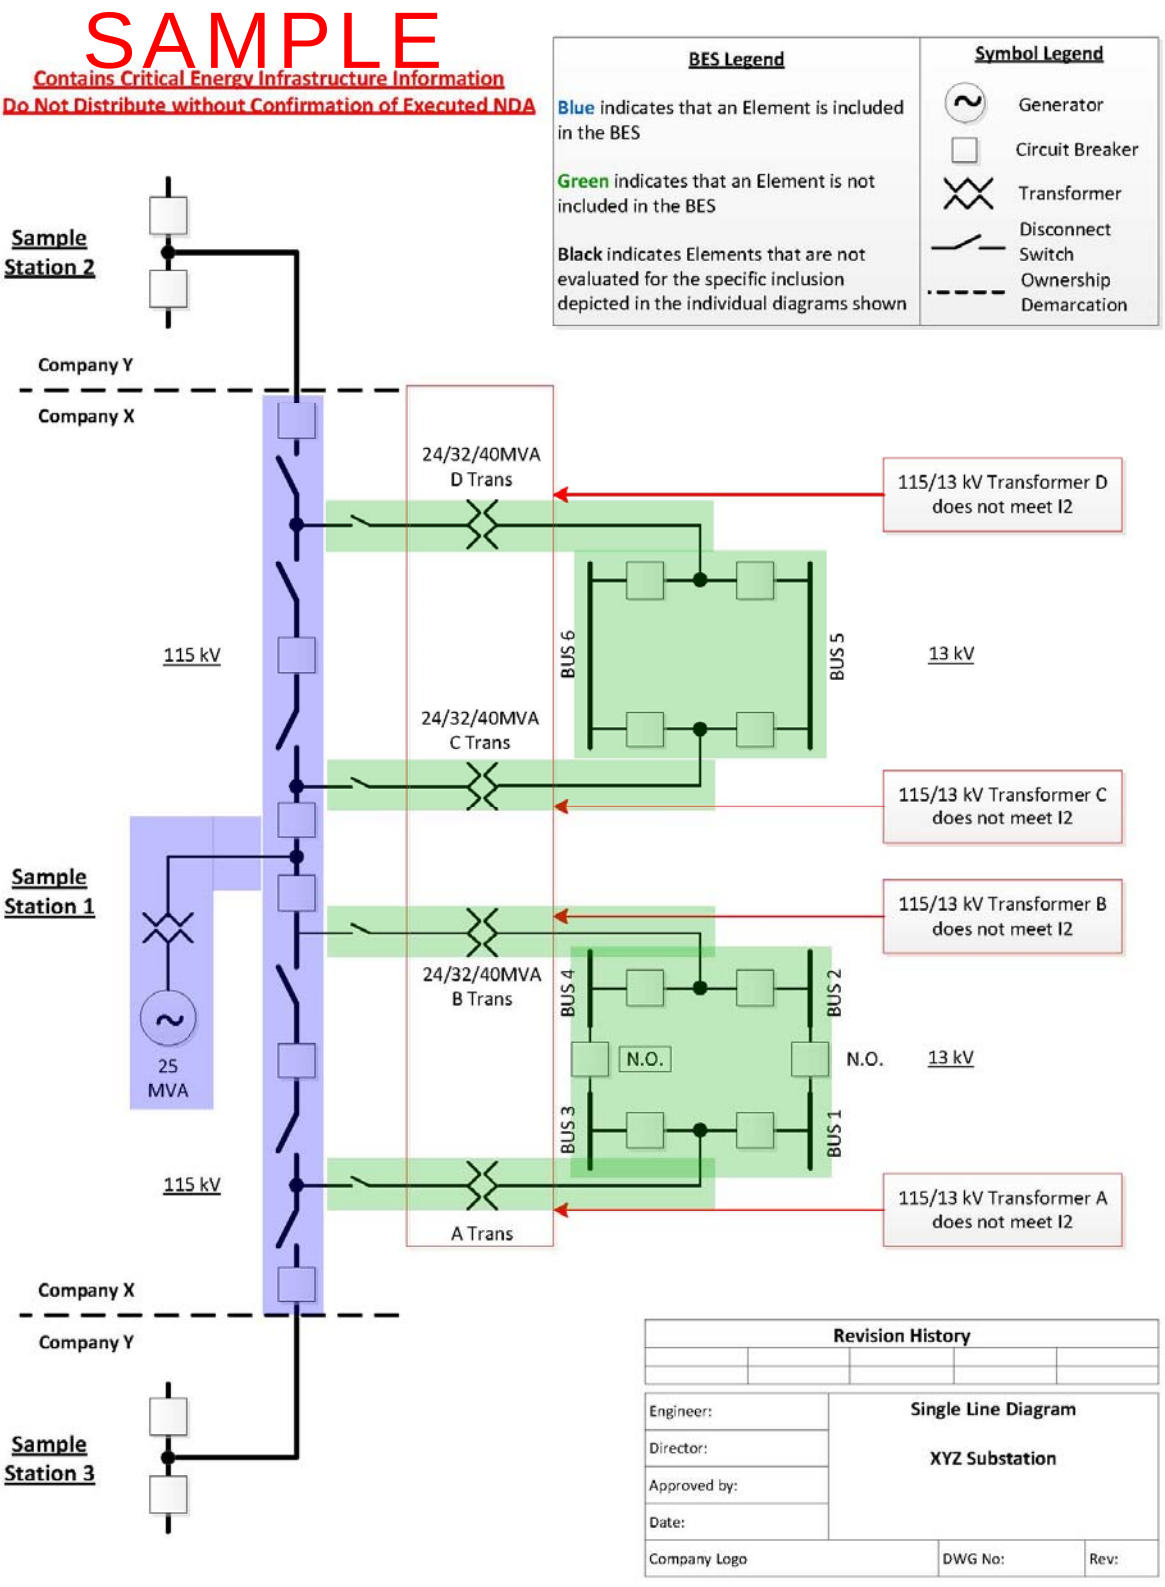
2.11. Does the "Special Notification Submission Period" apply to Exception Requests?

No. There is no direct relationship between Notifications of exclusion and Exception Requests for exclusion. Exception Requests are processed differently than Self-Determined Notifications, and the submission date of an Exception Request does not have a direct relationship with the dates associated with Compliance and Enforcement. Instead, once an Element is excluded from the BES through an approved Exception Request, for all cases in which the excluded Element would have previously been subject to Reliability Standards and Requirements, compliance obligations for those standards will be considered to have ceased upon the affirmative determination of the exception request.

2.12. Can you provide any guidance about the level of detail needed in one-line diagrams submitted with Self-Determined Notifications or Exception Requests?



The level of detail required for one-line diagrams submitted in support of SDN or ER is illustrated in the BES Definition Reference Document Version 2, April 2014. The entity submitting an inclusion or exclusion SDN or ER should submit a one-line diagram possessing the following attributes:



1. One-lines should be complete, officially approved diagrams with company approval blocks. Simplified one-lines may be provided as visual aids but must be accompanied by complete, official company one-lines.
2. If considered CEII, the one-lines must be clearly marked as such.
3. One-lines should clearly indicate change of ownership points and clearly identify the owners on each side of a facility. In the case of joint ownership the joint ownership parties should be indicated on the diagram.
4. The diagrams should clearly indicate the status (BES or non-BES) on the diagram of all facilities; not limited to those expressly identified in the SDN or ER. This can be done by highlighting Elements as Blue (BES) or Green (non-BES) as illustrated in the BES Definition Reference document (Version 2, April 2014).
5. The Elements specifically called out for inclusion or exclusion should be clearly marked (such as with a box, circle, etc…).
6. The applicable provision(s) of the BES core definition, inclusions and exclusions, should be indicated for each element.
7. A sufficient portion of the surrounding system should be provided to enable the Regionals Entity/NERC reviewer to apprehend the context of the Element. The following should be included as relevant to the particular Element:
    a. Portray the complete sub-transmission system less than 100 kV but greater than 50 kV and the sub-transmission system to a bus less than or equal to 50 kV.
    b. Neighboring sub-stations on either end of a transmission line Element.

c. Neighboring substations related to Elements that are part of a local network or radial transmission line.

8. All BES and non-BES generating resources on the diagram should indicate name plate rating, regardless of whether they are the subject of the SDN or ER or not.
9. All breakers/switching devices with indication of whether they are normally opened or normally closed.

Sample diagrams conforming to the above guidance are included on the following pages for reference.

3. Training and Reference Resources

3.1. Will there be any training prior to July 1, 2014?

Yes.

Several webinars and workshops have been scheduled and several training resources are available. Schedules and logistics for the webinars and workshops are posted in the Implementation Schedule. NERC has also posted several training videos on its website. These videos cover both the BES definition and how to apply it, as well as the Bulk Electric System Notification and Exception Tool (BESnet) application.

The following available reference documents may also be of particular interest:

BES Definition Reference Document – Provided to assist Entities with application of the revised BES definition; provides examples of applications of the revised BES definition on specific of BES Elements.

BES Implementation Guidance Document – Provides implementation guidance on the transition to the new BES definition.

All of this information is posted on the NERC Bulk Electric System (BES) Definition, Notification, and Exception Process Project Page, located at:

http://www.nerc.com/pa/RAPA/Pages/BES.aspx .

3.2. Will there be any training after July 1, 2014?

Yes. In addition to the resources above, NERC is planning on hosting two additional webinars describing how to use the BESnet application. These will be announced shortly. NERC may schedule additional webinars as needed.

4. Notification of Self-Determination Process

4.1. When can I start entering in my BES Self-Determined Notifications?

The BESNet application will be available to receive BES Self-Determined Notifications on July 1, 2014.

4.2. Can a Registered Entity discuss matters with the Regional Entity prior to submitting a Self-Determined Notification and/or Exception Request?

Yes. NERC encourages Registered Entities to contact applicable Regional Entities to achieve common understanding of the application of the "bright-line" BES definition and corresponding identification of the BES Elements, and to discuss evidentiary expectations before submitting a Self-Determined Notification or Exception Request.

This will help minimize the potential number and extent of submitted BES Exception Requests. Refer to the *BES Notification Review Guidelines* for additional information.

4.3. What information will I need to supply with a notification of self-determinations?

A "Regional Entity BES Notification Review Checklist" is included in the *BES Notification Review Guidelines*, located at:

http://www.nerc.com/pa/RAPA/Pages/BES.aspx.

The checklist details information the Regional Entities will consider to support notifications of self-determinations. For example:

- Is the Self-Determined Notification exclusion being submitted on the basis of the Element being a Distribution Element? If yes, provide a record of the status of the Entity's petition filed with FERC.
- Was a sufficiently detailed one-line diagram(s) provided with the Self-Determined Notification?
- Were normally open switches marked in the diagrams?
- Was appropriate hourly integrated flow information provided to support E2 and E3 Exclusions?

The Regional Entities may request additional information, as needed, under existing authority.

4.4. Am I required to notify the Region of a change of BES status due to the new BES definition?

Yes. In Order No. 773, at Paragraph 317, FERC also determined that "registered entities are obligated to inform the Regional Entity of any self-determination that an element is no longer part of the BES." Refer to the *BES Notification Review Guidelines* for additional information.

Conversely, if the result of application of the new BES definition is that an element should be added to the BES, Entities should file a Self-Determined Inclusion Notification with their Regional Entity.

4.5. If nothing has changed in my Element's BES status after applying the new BES definition, do I need to submit a BES Self-Determined Notification?

No.

4.6. Do newly identified Elements require the submittal of Self-Determined Inclusion Notifications?

Yes. Self-Determined Notifications for newly included Elements should be submitted through the BESNet application to the Regional Entity during the 24-month implementation period for the BES definition, beginning July 1, 2014.

In addition, newly identified exclusions of Elements that were previously part of the BES under the prior definition require similar Self-Determined Exclusion Notification through the BESNet application to the Regional Entity.

4.7. Which Entity should provide Self-Determined Notifications for jointly-owned Elements?

For jointly-owned facilities, a lead owner, on behalf of the joint owners, should submit any Self-Determined Notifications.

4.8. Under legacy Regional BES definitions, certain transmission elements were considered as BES, but will now be excluded under the new BES definition. What should be submitted in the Self-Determination Notifications?

Elements excluded by application of the new BES Definition must be reported through the self-determined notification process in the BESNet application. This encompasses any such elements included in the BES by legacy Regional BES definitions (for example, line sections tapped directly off a BES line, transformers with the only primary terminal operated at 100 kV, etc…).

The Entity is expected to supply unique circuit identifiers for each of the newly-excluded Elements along with a one-line diagram clearly identifying the Elements being excluded.

5. Exception Request Process

5.1. What process will NERC utilize to make evaluate BES Exception Requests?

Appendix 5C of the NERC Rules of Procedure sets forth the procedure for requesting and receiving an Exception from the application of the BES definition. Appendix 5C is available at:

http://www.nerc.com/pa/RAPA/Pages/BES.aspx.

5.2. What supporting information is needed to submit an exception request?

A "BES Exception Process Review Checklist" is included in the *BES Exception Request Evaluation Guidelines,* located at:

http://www.nerc.com/pa/RAPA/Pages/BES.aspx.

Those considerations provide specificity regarding the data and studies that the Regional Entities and NERC require to evaluate an Exception Request and provide submitting entities with additional information as to the level of analysis expected.

As a general principle, studies should model actual control settings and configurations, model the Year One horizon, address a range of system conditions in terms of load level and generation dispatch, and include an explanation of why the system conditions and contingencies studied are sufficient to address the most limiting system conditions relevant to the requested Exception.

5.3. Who evaluates and approves Exception Requests?

Appendix 5C of the NERC Rules of Procedure governs the process by which an Entity may request and receive an Exception.

The Regional Entities will review exception requests in accordance with the *BES Exception Request Evaluation Guideline*. NERC reviews the Regional Entity recommendations, and then NERC decides all BES Exception Requests, subject to an appeal process.

5.4. What is a technical review panel? Who is on it? How are they chosen?

A Technical Review Panel (TRP) is appointed by the Regional Entity to review the Regional Entity's proposed recommendation and provide an opinion on the Exception Request before a Regional Entity issues a Recommendation to NERC to disapprove an Exception Request in whole or in part.

A copy of the TRP's opinion will be provided to the Submitting Entity, and Owner if different, and the Regional Entity. The Regional Entity will not be bound by the opinion of the TRP, but the opinion will become part of the record associated with the Exception Request that is sent to NERC as part of the Regional Entity's Recommendation.

Each Regional Entity is required to establish provisions for a TRP consisting of not less than three individuals appointed by the Regional Entity senior executive (CEO, President, General Manager, etc.). Panel members could be drawn from the Regional Entity's staff, from other Regional Entities' staffs, consultants, or other subject matter experts. However, all panel members must comply with Subsection 7 of Section 403 of the NERC Rules of Procedure on the use of industry subject matter experts and Regional Entity Members, cannot have participated in the review of the subject Exception Request, and must have the required technical background to evaluate Exception Requests.

It is important to note that the TRP differs from the NERC review panel described under Section 8 of Appendix 5C of the NERC Rules of Procedure.

5.5. What is the NERC review panel? Who is on it?

The NERC review panel is a body established by NERC in accordance with the NERC Rules of Procedure, Appendix 5C, to evaluate Exception Requests and review the Recommendation and accompanying materials (including the Technical Review Panel's opinion, if applicable) provided by the Regional Entity associated with a particular Exception Request.

The NERC president will appoint a team of no less than three persons with the required technical background to evaluate Exception Requests. NERC contemplates that its review teams would be drawn from NERC staff resources, supplemented by contractors as necessary, but situations may arise in which NERC may need to call on consultant subject matter experts to participate as members of NERC review panels, who must comply with the conflict of interest process.

It is important to note that the NERC review panel differs from the TRP described under Section 5 of Appendix 5C of the NERC Rules of Procedure.

5.6. How long will the process take?

In general, assuming a complete application, no appeals, and taking the allotted time for each subtask, the process could take up to 11.5 months, but is anticipated to be shorter for less complicated Exception Requests.

If the Exception Request is appealed to the NERC Board of Trustees Compliance Committee pursuant to Section 1703 of the NERC Rules of Procedure, the process could take an additional 8.5 months, totaling 20 months. This does not include timing related to an appeal to the applicable legal authority or Applicable Governmental Authority.

A Regional Entity, upon consultation with NERC, may extend the time frame of the substantive review process for individual Exception Requests beyond the allotted six months pursuant to Section 5.2.2 or in the case where the Registered Entity supplements its Exception Request pursuant to Section 6.0.

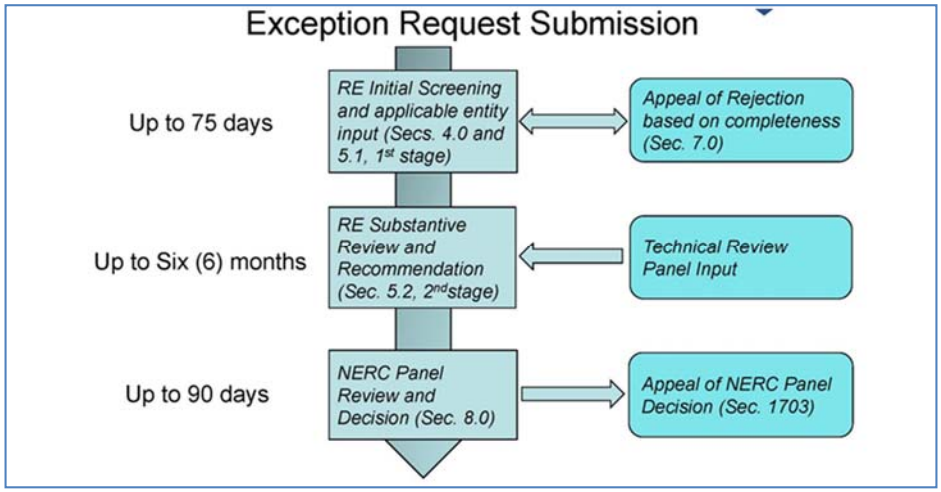

Figure 1: Example of the NERC Exception Process Timeline

5.7. How can an Entity appeal a Rejection of an Exception Request?

Sections 5.1.5b and 7.0 of Appendix 5C of the NERC Rules of Procedure specifically address how a Submitting Entity can appeal a Rejection of an Exception Request by the Regional Entity. Section 5.1.5b states:

> If the Regional Entity rejects the Exception Request in accordance with Section 5.1.5 (a), the Regional Entity's notice shall explain the reason for the Rejection. The Submitting Entity may, within thirty (30) days after receipt of the Rejection, appeal to NERC in accordance with Section 7.0 of this Exception Procedure to reverse the Rejection and to direct the Regional Entity to proceed with a substantive review of the Exception Request.

Also, Section 7.0 states:

> The Submitting Entity may submit to the NERC Director of Compliance Operations, with a copy to the Regional Entity and Owner if different, information that demonstrates that the insufficiencies in an Exception Request Form identified in the notice of Rejection by the Regional Entity pursuant to Section 5.1.5 are incorrect or otherwise do not warrant Rejection of the Exception Request, and that the Exception Request should be accepted and proceed to substantive review. A Submitting Entity's submission to NERC under this Section 7.0 shall be in writing, shall provide the Exception Request which received the Rejection (using the identifier assigned to the Exception Request pursuant to Section 5.1.2), and shall set forth a description of the errors that the Submitting Entity believes are in the notice of Rejection. The Submitting Entity's submission must demonstrate that it is eligible (in accordance with Section 4.1) to submit the Exception Request and that all Required Information for the Exception Request has been provided. NERC will

review the Submitting Entity's submission and the reports submitted by the Regional Entity or Regional Entities pursuant to Section 5.1.5 with respect to the Exception Request, and if NERC determines that the Submitting Entity is eligible (in accordance with Section 4.1) to submit the Exception Request, that all Required Information has been provided, and that the Exception Request should proceed to substantive review, NERC shall, within forty-five (45) days after receiving the submission, issue a decision directing the Regional Entity to proceed to a substantive review of the Exception Request in accordance with Section 5.2. NERC will send a written notice to the Submitting Entity, the Owner if different, and the Regional Entity stating that NERC either directs the Regional Entity to proceed to a substantive review or that NERC does not direct such a review.

5.8. How can an Entity appeal the NERC decision?

Section 9.0 of Appendix 5C to the NERC Rules of Procedure specifically addresses how an Entity can challenge approval or disapproval of Exception Requests. Section 9.0 states:

> A Submitting Entity or Owner aggrieved by NERC's Approval or Disapproval of an Exception Request or termination of an Exception may, within thirty (30) days following the date of NERC's decision, challenge such determination pursuant to Section 1703 of the NERC Rules of Procedure. If neither a Submitting Entity nor Owner challenges, within such period, NERC's determination with respect to any Element to which the Exception Request or the Exception applies, such determination shall become effective with respect to such Element on the thirty-first day following the date of the NERC decision.

5.9. Who can submit BES Exception Requests?

Section 4.1 appendix 5C of the Rules of Procedure states:

> The Owner of an Element may submit an Exception Request for either an Inclusion Exception or an Exclusion Exception regarding that Element.
>
> A Regional Entity, Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Provider, and Balancing Authority that has (or will have upon inclusion in the BES) the Elements covered by an Exception Request within its Scope of Responsibility may submit an Exception Request for the inclusion in the BES of an Element or Elements owned by a Registered Entity, provided that before doing so, (i) the Submitting Entity conferred with the Owner about the reasons for an Exception, and (ii) could not reach agreement regarding the submission

of such an Exception Request. (If the Owner agrees with submitting an Exception Request, the Owner should be the Submitting Entity.)

Only a Regional Entity may submit an Exception Request for the inclusion in the BES of an Element or Elements owned by an Owner that is not a Registered Entity.

Only an Owner or a Regional Entity may submit an Exception Request for the exclusion from the BES of an Element.

5.10. What happens if my system configuration changes after I have an approved Exception Request?

Pursuant to Section 11 of Appendix 5C of the NERC Rules of Procedure, Submitting Entities must notify the appropriate Regional Entity, with a copy to NERC, within ninety days of learning of any change of condition that would affect the basis for NERC approving an Exception Request. If a Regional Entity obtains information that indicates an Exception may no longer be warranted it must also notify NERC. In either instance, NERC will review the notification and determine whether to direct the Regional Entity to perform a substantive review to verify continuing justification for the Exception.

The Submitting Entity and Owner will be notified if the Regional Entity makes a Recommendation to terminate the Exception and will have thirty days from the date of the notice to submit comments or information to NERC to show that the Exception continues to be justified and should remain in effect.

When an Element is included in the BES as a result of the termination of an Exclusion Exception, an implementation plan detailing the schedule for complying with any Reliability Standards applicable to the newly included Element will be developed in accordance with Section 10 as if it were an Inclusion Exception.

There is also a periodic certification process, every thirty-six months, requiring each Registered Entity possessing an Exception to certify that the basis for an Element being included or excluded in the BES through the Exception remains valid. If the certification is not made, the Exception will terminate ninety days after the date the certification was due.

5.11. What if I have Elements that cross multiple Regional Entity boundaries?

Exception Requests for Elements that cross multiple Regional Entity boundaries should identify all Regional Entities involved. The Regional Entities will then determine which Regional Entity will take the lead for coordinating the Exception Request and collecting any additional information from the Entity.

5.12. Do I need to go to my Reliability Coordinator or Balancing Authority before submitting my BES Exception Request?

NERC encourages Entities to coordinate with their Reliability Coordinator and Balancing Authority.

Section 4 of Appendix 5C of the NERC Rules of Procedure requires that the Submitting Entity send copies of Section I and II information to each Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Provider, and Balancing Authority that has, or will have upon inclusion in the BES, the Elements covered by an Exception Request within its Scope of Responsibility. Failure to provide Section I and II information may result in Rejection of the Exception Request as incomplete.

The BES Notifications and Exceptions Tool (BESNet) application handles these notifications.

5.13. If an Exception Request is to be submitted for a jointly-owned Element, which Entity should submit the request?

For jointly-owned facilities, a Lead Submitting Entity, on behalf of the joint owners, should be the Entity submitting any Exception Request.

5.14. What if I don't submit a BES self-determined BES notification for an exclusion or an inclusion as a result of the new BES Definition?

Entities are obligated to notify Regional Entities of changes in its status including BES Elements as required in the NERC Rules of Procedure Section 501.1.3.5. Failure to submit a self-determined BES notification for an Element does not exempt an Entity from compliance obligations (see Paragraph 312 of FERC Order No. 773).

5.15. Should I concurrently file a BES Exception Request with NERC and a petition to exclude local Distribution Elements with FERC?

Order 773-A[4] at Paragraphs 89 and 93 explain that "the two processes are separate, not concurrent and will be used for different determinations" and that FERC "does not direct entities to seek an exception from NERC before seeking a local distribution determination from the Commission."

If concurrent requests are filed with both FERC and NERC, the Exception Request submitted through the NERC BES Notification and Exception Process will be placed "on hold" until FERC has made a determination.

Under the scenario below, three facilities (A, B and C) have not had prior FERC determinations that they are local distribution facilities. Facilities X, Y and Z have had FERC determinations. All six facilities are considered local distribution by the owner.

Paragraph 93 of Order No. 773-A states:

[4] For ease of reference, Order No. 773-A is available at:
http://www.nerc.com/FilingsOrders/us/FERCOrdersRules/Final_Rule_Rehearing_Clar_BES.pdf

> Thus, if an entity believes its facility is a local distribution facility but after applying the bulk electric system definition including inclusions and exclusions the facility is not excluded, the entity may apply to the Commission to determine whether the facility is used for local distribution. Thus, as explained above, the Final Rule contemplates two separate and distinct processes and does not direct entities to seek an exception from NERC before seeking a local distribution determination from the Commission.

For Facilities A, B and C:

- **Step 1**: Apply the BES core definition – are the facilities above 100kV? – Yes.
- **Step 2**: Do any inclusions or exclusions apply? – If Facilities A, B, and C, are eligible for an Exclusion E3, then they are excluded by definition from the BES.
- **Step 3**: A, B, and C are excluded from the definition of BES.
    - **Step 3a**: Enter this information into BESNet as a notification of self-determined exclusion. Will be reviewed for validation by the Regional Entity with oversight by NERC that the definition was properly applied and no mistakes occurred. The entity must notify the Regional Entity/NERC of any changes in accordance with ROP Section 501.1.3.5.
    - **Step 3b**: If the Regional Entity or NERC disagrees with the self-determined exclusion, there are two options. First, the entity may apply to FERC for determination that these are local distribution facilities.
    - **Step 3c**: Second, if FERC disagrees that these are local distribution, the entity may submit an exclusion exception request. If granted, the entity must submit a certification that the exclusion exception remains valid in accordance with ROP Appendix 5C.

For Facilities X, Y and Z:

- **Step 1**: Apply the BES core definition – are the facilities above 100kV? – Yes.
- **Step 2**: Do any inclusions or exclusions apply? – No, however, FERC has made prior determinations that the facilities are local distribution.
- **Step 3**: The entity should discuss with the Regional Entity whether the FERC determinations are consistent with the approved BES definition.
    - **Step 3a**: If the Regional Entity agrees that the facilities can be removed from application of the BES definition, the Entity may enter this into BESNet as a notification of self-determined exclusion. Will be reviewed for validation by the Regional Entity with oversight by NERC that the FERC determinations are consistent with the proper application of the BES definition. The Entity must notify the Regional Entity and NERC of the change of status of these facilities in accordance with ROP Section 501.1.3.5
    - **Step 3b**: If the Regional Entity or NERC disagrees with the self-determined exclusion, discussions should continue between NERC, the Regional Entity and the Entity to resolve the issue.

6. BES Notification and Exceptions Tool (BESNet)

6.1. What is the BESNet application and for what will it be used?

The BES Notifications and Exceptions Tool (BESNet) is an ERO-enterprise tool that provides a workflow-based on-line process that emulates the BES Exceptions Procedure, as outlined in NERC Rules of Procedure Appendix 5, to route, evaluate, and take actions on Exception Requests and Self-Determined Notifications.

Requests for Exceptions and Notifications of Self-Determination to the BES will only be accepted through the BESNet application.

Entities that anticipate submitting a BES Exception Request should contact their applicable Regional Entity, review the relevant training and resource materials, and establish a user account for the BESNet application.

6.2. When will BESNet be available for submitting Exception Requests or Self-Determined Notifications?

The web-based BESNet application will be available July 1, 2014, for entering Exception Requests or Self-Determined Notifications.

6.3. Will there be software-related User Guides?

Users Guides for the BESNet application will be available and posted at:

http://www.nerc.com/pa/RAPA/Pages/BES.aspx.

The *BESNet Users Guides* will be updated periodically based on feedback received by the user group.

6.4. Is the information I enter into the BESNet application safe and secure?

NERC has undertaken a number of steps to secure the BESNet application:

- The BESNet databases are fully encrypted.
- During development, “white-box” and “gray-box” software security assessments were performed, and potential vulnerabilities were identified and addressed.
- Penetration tests of the BESNet infrastructure were performed and passed in 2013 and 2014, and will be periodically repeated.
- BESNet servers are monitored by a third party.
- Internal and external vulnerability scans are routinely performed on the ERO Environment.
- User vetting process is performed during account set-up.
- All application access and communication between servers in the BESNet environment is encrypted via SSL protocols that have been verified to be free of the “Heartbleed” vulnerability.

6.5. Am I required to register for BESnet access?

Entities who intend to submit Self Determined Notifications or Exception Requests must have an ERO Enterprise account with access to the BESnet application in order to do so. Additionally, all entities registered as a Reliability Coordinator, Planning Authority, Transmission Operator, Transmission Planner, or Balancing Authority must have an ERO Enterprise account with access to the BESnet application in order to ensure receipt of notifications of any BES Exception Requests made by other Registered Entities (e.g. Transmission Owners, Generator Owners) for facilities within the recipient's area of responsibility.

6.6. Our company is divided into several organizational units that are exclusively registered as different NERC Functional Entities. How should we register for BESnet access?

We are asking all registered entities to set up an Entity Administrator. The BESnet application grants access to users based on NCR number, so one person's account can have access to multiple NCRs. Depending on how your company is organized, you may have an account with access for all NCRs, an account for each NCR, or any mix of the two. The same is true for regular (non-administrator) user accounts. Storing and processing of actual submissions is handled by NCR, rather than being associated with a specific user.

6.7. I am preparing a series of Self-Determined Notifications (SDNs) and Exception Requests (ERs) for a number of Elements on my transmission system. How should the groupings of Elements be organized so as to provide an orderly and efficient approach that will minimize effort, aid review and expedite approval?

When submitting either an SDN or an ER, multiple Elements (either at the same location or at different locations within the geographic boundaries of a Regional Entity) may be included in one submission with all such Elements or sets of connected Elements separately identified. The Elements within a submission must share a common basis for their BES categorization, and should be similar in form and/or function to aid in efficient processing (for example, all transformers of a certain type, size, or configuration).

Each submission should be as straightforward as possible while including the largest grouping of similar Elements. Considerations to keep in mind include:

a) SDNs must be submitted separately from ERs. Because the method pf processing SDNs, is different than that of ERs, there is no way in the BESNet application to create a single submission that contains both a Notification and an Exception Request.
b) The basis (Core Definition, Not Core Definition, the specific Inclusions, and the specific Exclusions) for an underlying Element or Elements classification within a single submission cannot be mixed. For example, a user cannot submit an SDN

based on both I1 AND I2. While you can include multiple elements in a single submission, their BES classification must share a common basis.

c) Submissions may be grouped on a geographical basis, a regional basis, or any other basis that you desire (for example, Eastern Operating Company, Western Operating Company, etc.)
d) Multiple inter-regional Elements cannot be submitted as part of a single SDN or ER.
e) The BESNet "association" function should be used for interrelated submissions. For example, an entity could place generation related exclusions in one ER, and then use the "Associated Exception Request" function to link to another ER containing related transformer and/or line Elements.
f) Include supporting documentation with your submissions that provide sufficient evidence supporting the basis for BES classification. Include one-line diagrams that provide sufficient detail to support the basis of your submission. Google maps or other aerial photographs are not sufficient.
g) A short summary of the logic being applied, which references the submitted supporting documents and cross references any relevant NERC guidance, will expedite the review process.

7. Compliance and Registration Questions

7.1. What is the implementation plan for the new BES definition, and when do the related compliance obligations begin?

The new BES definition becomes effective July 1, 2014. According to the *Implementation Plan for Project 2010-17: Definition of BES*, the compliance obligations begin:

- Twenty-four months after the applicable effective date of the definition (for newly identified Elements), or
- If a longer time frame is needed for an Entity to be fully compliant with all standards applicable to an Element or group of Elements that are newly identified through application of the BES definition, the appropriate time frame may be determined on a case-by-case basis by mutual agreement between the Regional Entity and the Element owner/operator, and subject to review by the ERO.

7.2. When will compliance be mandatory with NERC Reliability Standards for existing Elements that are newly identified as BES Elements?

For existing Elements that have not been a part of the BES prior to July 1, 2014, but have now been newly identified as part of the BES, Entities will need to be in compliance with the NERC Reliability Standards by July 1, 2016.

7.3. When do compliance obligations begin for newly built Elements that are classified as BES Elements under the new BES definition?

After July 1, 2014, for those newly built Elements that qualify as BES Elements, Entities must be compliant for that Element as of its energization, as per current processes.

Existing Facilities that are now part of the BES and remain a part of the BES must remain compliant at all times.

7.4. What are the obligations of the owner of a Facility that is designated as a part of the BES?

Users, owners, and operators of the BES Facilities must register as transmission owners, generation owners, transmission operators, or generation operators as appropriate, according to the NERC Statement of Compliance Registry Criteria.

Entities owning or operating BES Elements are subject to compliance with the applicable NERC Reliability Standards. It should be noted, however, that several standards refer to Elements that are connected to or impact Reliable Operation of the BES and, therefore, standards may apply in such cases to non-BES Elements.

7.5 If I need to register based on the new BES definition, when should I register?

Entities that have existing Elements that are newly identified as part of the BES by the application of the new BES definition are encouraged to register as soon as practical after July 1, 2014. However, if there are any questions as to whether such Elements should be excluded from the BES through the Exception Request process, Entities should contact the appropriate Regional Entity regarding registration.

7.6. If an Entity does not own or operate BES assets, does that mean they have to follow NERC standards?

Yes, if they meet other criteria in the NERC *Statement of Compliance Registry Criteria* to be a Registered Entity. NERC Reliability Standards are applicable to users of the Bulk Electric System, not just owners and operators. As an example, Distribution Providers, Purchasing-Selling Entities, and Load-Serving Entities are users of the BES, even though they may not own or operate Facilities in the BES.

7.7. Can an Entity's registration requirements change as a result of applying the new BES definition?

NERC's objective in implementing the revised BES definition is to ensure that the proper Entities are registered and responsible for Reliability Standards that are necessary to ensure the reliability of the BPS. In Order No. 773 (at Paragraph 55), FERC stated, "[w]e do not expect there to be significant numbers of entities either needing to register or deregister due to the change in definition." NERC shares FERC's expectation that only a small number of Entities will require changes to their NERC registration as a result of the revised BES definition.

An Entity seeking to modify its current registration, including de-registration or deactivation, must inform its applicable Regional Entity of this change in status. In turn, the Regional Entity will notify NERC of such changes. All changes to registration are processed by the NERC registration and certification department, in accordance with the NERC Rules of Procedure.

7.8. If an Element is excluded from the BES through an exception request, what happens to compliance obligations, monitoring and enforcement?

From the point in time at which the exception request is made to such time as that request is approved, compliance obligations remain in force. Once an Element is excluded from the BES through an approved Exception Request, for all cases in which the excluded Element would have previously been subject to Reliability Standards and Requirements, compliance obligations for those standards will be considered to have ceased upon the affirmative determination of the exception request.

7.9. If an Element is excluded from the BES through self-determination, what happens to compliance obligations, monitoring and enforcement?

The Notification will be reviewed for validation by the Regional Entity, with oversight by NERC, to ensure that the BES Definition was properly applied and no mistakes occurred. The registered entity can facilitate this effort by reviewing these situations with the Regional Entity prior to formally submitting the Notification. This will provide the greatest confidence of appropriate application of the BES Definition to the specific circumstances and facilitate consistent application of the Definition. Once validation is concluded, the registered entity will be advised of the determination. An Element will not be excluded from the BES until the removal is validated.

Until the validation process described for Self-Determined Notifications of Exclusion is completed, the registered entity has the potential to be subject to applicable Reliability Standards. Any instances of non-compliance for potentially excluded Elements will be held in abeyance until such time as the Notification is validated by the Regional Entity, with NERC oversight as described above. If the Self-Determined Notification of Exclusion is accepted as valid, instances of potential non-compliance involving excluded Elements that occurred after the submission of the complete and proper Notification up to the date of its validation will be closed, barring any unique facts and circumstances. A Self-Determined Notification of Exclusion that is incomplete or based on improper application of the BES Definition will result in Elements associated with that Notification remaining subject to compliance monitoring and enforcement until such time all required information is submitted and the BES Definition is correctly applied.

If a Regional Entity believes that a Notification of a Self-Determined Exclusion is based on an incorrect application of the Definition and is unable to come to a common understanding of the Definition with the submitting entity, the Notification will be rejected and the Element at issue will remain part of the BES by application of the Definition. Registered Entities retain the option to pursue exclusion through the exception process.

7.10. In FERC Order No. 773-A (P 109), FERC stated, "in the absence of bad faith, if a registered entity applies the bulk electric system definition and determines that an element no longer qualifies as part of the bulk electric system, upon notifying the appropriate Regional Entity that the element is no longer part of the bulk electric system the element should not be treated as part of the bulk electric system unless NERC makes a contrary determination in the exception process." How is NERC implementing this language?

NERC is implementing its processes with the expectation that entities will submit Self-Determined Notifications in "good faith." Good faith Self-Determinations are those that are made consistent with the BES Definition and reference materials provided by NERC. Taken together, Order Nos. 773 and 773-A, as well as the NERC Rules of Procedure, point to the need for, and appropriateness of, NERC and the Regional Entity review of a Notification to determine if it comports with the Definition and validate the Notification to confirm appropriate application of the Definition.

7.11. For excluded facilities, do I still have any compliance obligations?

Possibly. The BES definition by itself does not establish whether or not an entity has a responsibility to comply with NERC standards. In order to understand compliance obligations, an entity must consider its registration obligations, the applicability of the standards, and the BES categorization of its elements and facilities. The Registration Criteria contained in Appendix 5B of NERC's Rules of Procedure describe what entities must register, and for what functions they must register. These functional registrations generally define what standards may apply to an entity (*e.g.,* BAL-002 Disturbance Control Performance; TPL-001 Transmission System Planning Performance Requirements), although some standards include additional criteria to further refine the applicability of a standard (*e.g.,* BAL-001 Real Power Balancing Control Performance and its limited applicability for Balancing Authorities; PRC-023 Transmission Relay Loadability and its limited applicability based on circuit criteria). Additionally, some standards apply to functions performed regardless of the existence of BES elements and facilities (*e.g.,* IRO-001 Reliability Coordination - Responsibilities and Authorities). Finally, some standards apply to specifically identified equipment that comprises the Bulk Power System, of which the Bulk Electric System is a subset (*e.g.,* PRC-010 Technical Assessment of the Design and Effectiveness of Undervoltage Load Shedding Program). In summary, all three areas – registration, standards applicability, and the BES definition – must be considered together in order to fully understand an entity's compliance obligations.

7.12. If I am registered for the Distribution Provider function and I do not own or operate any BES Elements, can I request deactivation of my compliance registration?

BES protection schemes, including Underfrequency Load Shedding (UFLS), Undervoltage Load Shedding (UVLS), or Special Protection Systems (SPS) and Remedial Action Schemes (RAS), support the reliability of the Bulk Electric System (BES), often serving as the "last-resort" tool for avoiding a total power system blackout. Consequently, NERC and the Regional Entities will not approve the deactivation of the DP function for Registered Entities on the NERC Compliance Registry that have these types of protection devices, solely on the basis that the entity does not own or operate a BES Element by application of the BES Definition. NERC and the Regional Entities will evaluate the relevant facts and circumstances in reaching a decision.

Registered Entities currently performing the DP function may determine to file a Self-Determined Notification of Exclusion of Elements based on the current BES Definition. There is no automatic change in the registration status of an entity for any functional registration categories if a particular Element is excluded from the BES Definition either through the Self-Determined Notification of Exclusion or the BES Exception process. Determinations of registration status are addressed through the registration program. NERC believes that the deactivation of the DP function registration of Registered Entities that have responsibilities relating to BES protection schemes including UFLS, UVLS, and SPS/RAS equipment would present a reliability risk due to the lack of compliance oversight. These types of equipment are essential to the reliable operation

of the BES, even in cases where the equipment is installed below the BES 100 kV bright line. In addition, NERC will closely evaluate requests which involve entities that have transmission Remedial Action Schemes or other types of schemes that have the same or similar BES system protection objectives.

Registered Entities should note that if an Element owned by an entity is excluded from the BES Definition, either through an Exclusion Exception Request or a validated Self-Determined Notification of Exclusion, this exclusion alone does not necessarily provide for deactivation of any functional registration from the NERC Compliance Registry. The Registration Criteria states that a "Distribution Provider is the responsible entity that owns, controls, or operates Facilities that are part of any of the following Protection Systems or programs designed, installed, and operated for the protection of the Bulk Power System." The list includes references to required UFLS programs, UVLS programs, SPS/RAS and transmission Protection Systems. The importance of these programs to system reliability is not diminished by the revised BES Definition.

Under the current registration rules, entities have an opportunity to establish that they are not material to the reliability. Such determinations depend on the specific facts and circumstances. In the future, NERC is moving forward with a new proposal for Distribution Provider registration criteria related to the Risk-Based Registration (RBR) initiative. The proposed criteria will accommodate those DPs who are registered only as a result of the owning of UFLS systems and will include a reduced set of reliability standards for which UFLS-Only DPs will be responsible. RBR also will build on current authority to allow an entity to make a case that it should not remain registered if it is not material to the reliability of the BES. To ensure consistency, a new materiality test is being developed that would be reviewed by a new NERC-led panel comprised of NERC and Regional Entity participants, that the entity is not material to the reliability of the BES and should not remain registered as a DP. The draft design program also includes a process for determining a sub-set of applicable Reliability Standards.

NERC notes that, to the extent that direct application of the BES Definition results in a determination that an Entity's Elements are not BES, an Inclusion Exception process can be initiated by a Responsible Entity to bring such Elements back into the BES. While this would not affect the DP registration status, it may affect other functional registration categories.

8. NERC Process

8.1. Will the BES definition be applied consistently across the Regional Entities?

The BES Drafting Team has prepared a *Bulk Electric System Definition Reference Document* to support consistent application of the BES definition. Those documents are posted at:

http://www.nerc.com/pa/RAPA/Pages/BES.aspx.

NERC and Regional Entity staffs are coordinating the implementation of the new BES definition and have developed several procedures to ensure consistency. A common checklist has been developed for Regional Entities to use when reviewing Self-Determined Notifications of BES changes. Challenges to the notifications are done via the Exception process. Guidelines for BES Exception Evaluation were also developed for use by NERC and the Regional Entities. Finally, NERC must approve all Exception Requests for inclusion or exclusion from the BES.

8.2. If my Element is not considered a part of the BES, might I still be required to provide information to NERC about it?

Yes. Even if an Element is not classified as part of the BES, information about it may be needed to analyze the effects of load, reactive support, and energy injection on the reliability of the overall electric system. One example of data that might be required is modeling data for powerflow and dynamic analysis. Similarly, information on underfrequency load shedding (UFLS) and undervoltage load shedding (UVLS) may be necessary to understand expected system performance. Additional data may be required by NERC or the Regions based on specific configurations or scenarios.

9. FERC

9.1. Does FERC have a role in designating Facilities as part of the BES?

In Order No. 773 (at Paragraph 66), FERC approved NERC's BES Exception Request process to determine the technical issue of whether Facilities are part of the BES; however, FERC determined that the jurisdictional question of whether Facilities are "used in local distribution" will be decided by FERC. Thus, FERC reserved authority to designate sub-100 kV Facilities, or other Facilities, as part of the BES.

FERC also established a process by which an Entity can seek a determination by FERC whether Facilities are "used in local distribution" as set forth in the Federal Power Act. The Commission will make such case-by-case jurisdictional determinations by applying the Seven Factor Test set forth in Order No. 888.

9.2. Should I concurrently file a BES Exception Request with NERC and a petition to exclude local Distribution Elements with FERC?

Order 773-A at Paragraphs 89 and 93 explain that "the two processes are separate, not concurrent and will be used for different determinations" and that FERC "does not direct entities to seek an exception from NERC before seeking a local distribution determination from the Commission."

When and whether to submit such a jurisdictional question to FERC are business and legal decisions for a registered entity, upon which NERC is not opining in this Frequently Asked Question list.

10. Definition Questions

10.1. Protection Systems were explicitly included in the Legacy Regional Definition and the new NERC BES Definition is silent on Protection Systems. Do I need to do anything in BESnet for these Protection Systems?

No. Because Protection Systems are neither included nor excluded per the NERC BES Definition, Entities are not required to provide a Notification of Self-Determination to their Regional Entity or submit Exception Requests for these Protection Systems through the BESNet application. To the extent that a Protection System is needed to comply with a Reliability Standard (i.e., PRC-005), compliance obligations continue, independent of the application of the NERC BES definition.

RELIABILITY | ACCOUNTABILITY

BES Definition at a Glance

- Consistent, uniform way to determine BES assets
- Effective 7/1/2014
- Transition period through 7/2016
- ERO enterprise common process and tool for implementation
- Documents and training readily available
- BES web page – one stop shopping
- Regional and NERC staff resources available to answer detailed questions and implementation

What is the Bulk Electric System?

BES 'Core' Definition

Bulk Electric System (BES): Unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

- Establishes the overall demarcation point between BES and non-BES Elements.

Inclusions

Provide additional clarification for the purposes of identifying specific Elements that are included in the BES.

I1. BES Transformers

I2. Real Power Resources

I3. Blackstart Resources

I4. Dispersed power producing resources meeting certain criteria

I5. Reactive Power Resources

Exclusions

Provide additional clarification for the purposes of identifying specific Elements that may be excluded from the BES.

E1. Radial Systems

E2. Retail Generation

E3. Local Networks

E4. Reactive Power Devices installed solely for retail customers

How to Apply the BES Definition, Inclusions, and Exclusions

Consistent methodology outlined in the BES Definition Reference Document

STEP 1: CORE DEFINITION

STEP 2: INCLUSIONS

STEP 3: EXCLUSIONS

STEP 3: EXCLUSIONS should be applied in the following sequence:

- **E2 Retail Generation** (supersedes **I2 Real Power Resources**)
- **E4 Retail Reactive Power Devices** (supersedes **I5 Reactive Power Resources**)
- **E3 Local Networks** (does not exclude interconnection facilities or generators)
- **E1 Radial Systems** (does not exclude interconnection facilities or generators)

BES Notifications

- Applies to newly self-identified inclusions to and exclusions from the BES
- Assures that entities are appropriately implementing the revised definition
- Compliance obligations cease for facilities excluded from the BES
- 24-month implementation period to bring newly-identified Facilities included in the BES into compliance

Self-Determination Notification Information Requirements

Each notification **should at a minimum include the following:**

- Current one-line diagrams
- For **E2 Retail Generation** Exclusion notifications
  - Net Capacity Transactional Data (12 months of hourly data)
  - Standby, back-up and maintenance power service documentation
- For **E3 Local Network** Exclusion notifications
  - Power Flow Transactional Data (24 months of hourly data)

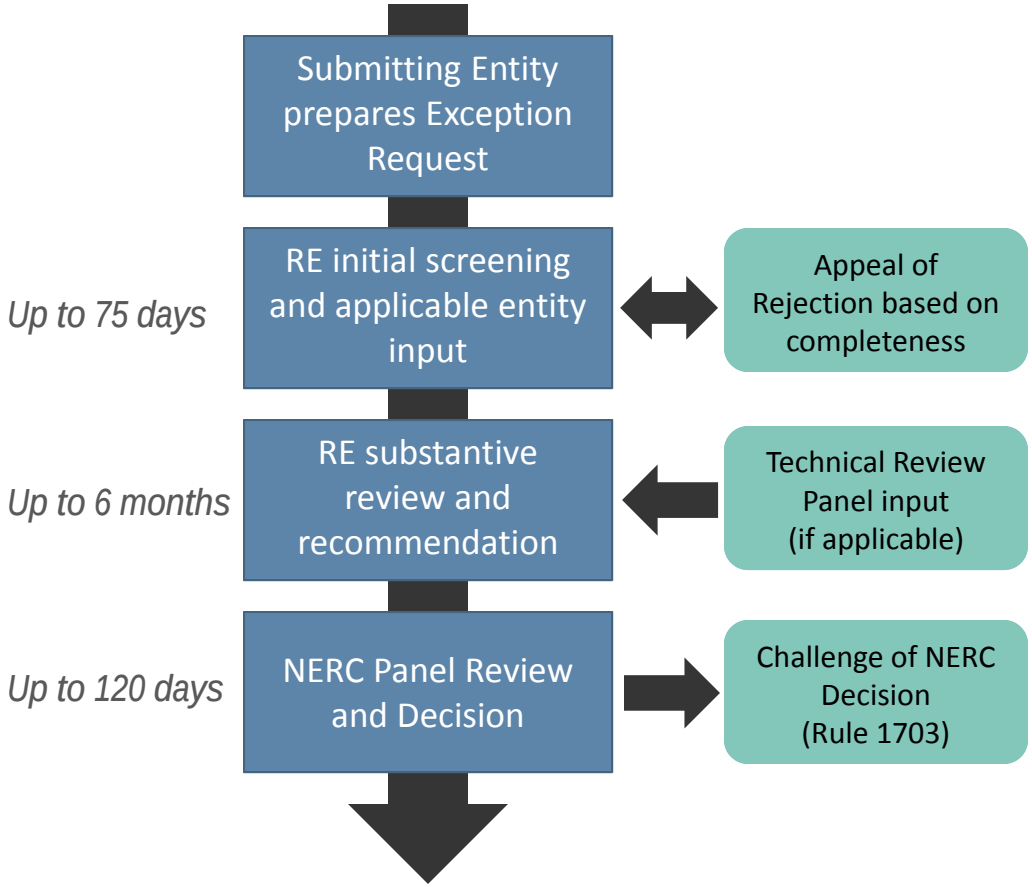
BES Exceptions

Considerations:

- Applicable to all Exception Requests
- Applicable to specific Elements or groups of Elements

Must demonstrate that the requested facilities **are** (for inclusions) or **are not** (for exclusions) necessary for the reliable operation of the interconnected transmission system

Who can Submit an Exception Request?



- Owner of the Element(s)
- Regional Entity
- Entity with Scope of Responsibility for the Element(s) under consideration:
  - Regional Entity
  - Planning Authority
  - Reliability Coordinator
  - Transmission Operator
  - Transmission Planner
  - Balancing Authority

The Exception Request Process

The Main Steps in the Exception Process:

- Exception Request Submittal
- Regional Entity (RE) Initial Review
- Regional Entity Substantive Review and Recommendation
- NERC Review and Final Decision

Bulk Electric System (BES) Definition, Notification, and Exception Process Project Page

This page contains information related to the NERC BES Definition, and the Notification and Exception Processes. The materials linked to this page are the current compilation of materials that support the application of the BES definition, and detailed materials designed to provide entities with the information needed to make uniform determinations of BES elements. This page will be continuously updated as additional materials become available. An overall schedule of training and orientation activities is included for general reference, and separate registration and logistics details will be provided as events approach.

Background

On March 20, 2014, the Commission approved the revised definition of Bulk Electric System, as envisioned in Order Nos. 743, 773 and 773-A. The definition includes bright line core criteria, with various enumerated inclusions and exclusions. As a result of the application of these BES Definition provisions, all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system will be included as BES elements. The Commission also approved the process for review of Elements on a case-by-case basis to allow for exceptions from the definition, where appropriate, as well as a process for entities to self-notify Regions of their respective determinations of BES elements. Entities should apply the definition of Bulk Electric System, including the respective inclusions and exclusions, to their asset inventory effective July 1, 2014.

An ERO enterprise-wide software application, the BES Notification and Exceptions Tool or BESNet, has been developed to support implementation of the definition. BESNet will be live on July 1, 2014 for submittal of self-notifications and exception requests, and entity administrative sign-on processes are targeted to begin mid-May.

Entities should use the BESNet to submit to their respective Regional Entity notifications of changes to Bulk Electric System assets that affect the Registered Entity's responsibilities for compliance with the Reliability Standards. BESNet is the official means of notifications to Regional Entities of newly identified inclusions and exclusions as a result of application of the definition. Entities are encouraged to have preliminary discussions with their Regional Entities prior submitting notifications for the record.

Entities also should use BESNet to request to include or exclude an Element from the Bulk Electric System on a case-by-case basis.

RELIABILITY | ACCOUNTABILITY

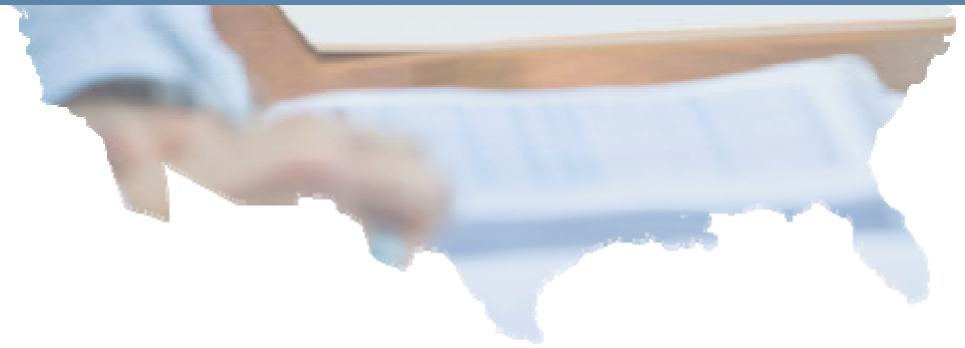
Key Dates

May 12, 2014	BESnet system available for each registered entity's BESnet Administrator to create an ERO Platform account and/or request access to BESnet	*Access requests will be reviewed by Regional BESnet Administrators*
May 30, 2014	BESnet system available for each registered entity's BESnet users to create an ERO Platform account and/or request access to BESnet	*Access requests will be reviewed by Entity BESnet Administrators*
July 1, 2014	BESnet system available users to submit Self-Determined Notifications and Exception Requests	*Notifications and Exceptions will be processed by Regions and NERC*

Training Activities



- **Regional BES Training and Workshops (confirmed)**
  - March 17-18 – SERC Compliance Seminar (completed)
  - March 25 – RF Compliance Seminar (completed)
  - April 21-22 – FRCC BES Workshop (completed)
  - May 21 – TRE Standards and Compliance Workshop
  - May 27-30 – NPCC 2014 Spring Compliance and Standards Workshop
  - May 28 – MRO Reliability Conference
  - June 3-5 – WECC Compliance Users Group
  - June 12 – SPP BES Definition and BESnet Tool Webinar

Training Activities

- **NERC BES Training and Workshops (in planning)**
  - May 9 – Posting of BESnet Video Training Modules
  - May 9 – Posting of BESnet User Guides
  - May 15-30 – Posting of BES Business Process Video Training Modules
  - June 2 – BES Business Process Q&A Webinar
  - June 10 – Standing Committee Q&A Workshop
  - June 16 – BES Business Process Q&A Webinar
  - June 23 – BES Business Process Q&A Webinar
  - June 30 – BES Business Process Q&A Webinar
  - June TBD – NERC BESnet Training Webinar

INCLUSIONS I1

Inclusion I1 - Transformers

The **transformer's** primary and secondary terminals are operated at 100 kV or above, and therefore the transformer is included in the BES by application of Inclusion I1.

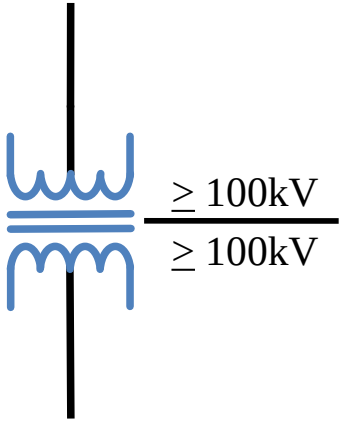

Figure I1-1: Typical Two Winding Transformer (BES)

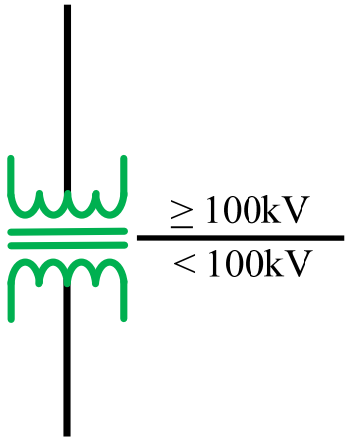
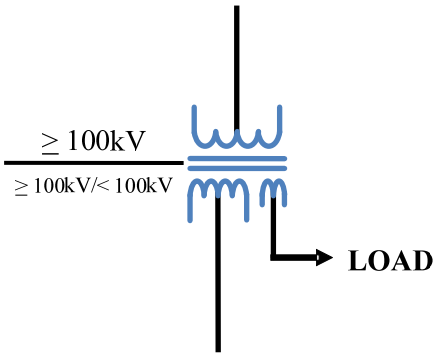
The **transformer's** primary terminal is operated at 100 kV or above, however the secondary terminal is <u>not</u> operated at a voltage of 100 kV or above. Therefore the transformer is <u>not</u> included in the BES by application of Inclusion I1.





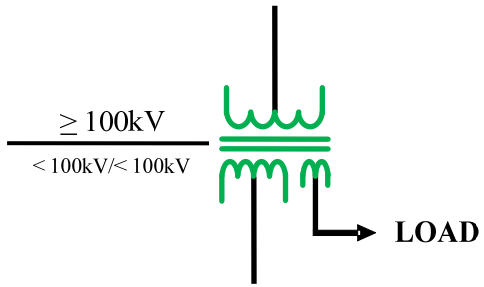


Figure I1-3: Typical Two Winding Transformer (non-BES)

Inclusion I1 - Transformers

The **transformer's** primary terminal and one secondary terminal are operated at 100 kV or above, and therefore the transformer is included in the BES by application of Inclusion I1. Since the transformer is one Element, all windings internal to the transformer (including the tertiary winding) would be included in the BES. The Load and the connection to the tertiary winding, indicated in the diagram, are non-BES as they are connected at a voltage < 100 kV.

Figure I1-2: Typical Three Winding Transformer (BES)

The **transformer's** primary terminal is operated at 100 kV or above, however neither of the secondary terminals are operated at a voltage of 100 kV or above. Therefore the transformer is not included in the BES by application of Inclusion I1. The Load and the connection to the tertiary winding, indicated in the diagram, are non-BES as they are connected at a voltage < 100 kV.

Figure I1-4: Typical Three Winding Transformer (non-BES)

INCLUSIONS I2

Inclusion I2 – Generating Resources

The **generator** has a gross individual nameplate rating > 20 MVA and is connected through the high-side of the step-up transformer at a voltage of 100 kV or above. By application of Inclusion I2 the **generator including the generator terminals through the high-side of the step-up transformer** is included in the BES.

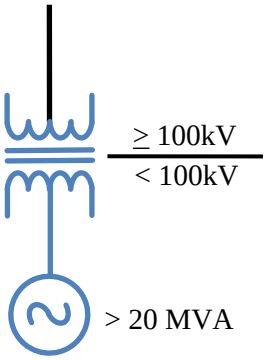

Figure I2-1: Single Generator (BES)

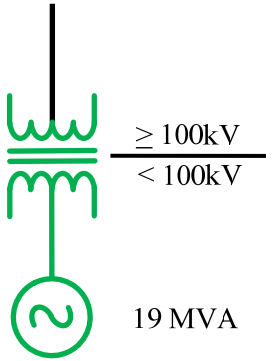
The **generator** has a gross individual nameplate rating ≤ 20 MVA (actual 19 MVA) and is connected through the high-side of the step-up transformer at a voltage of 100 kV or above. By application of Inclusion I2 the **generator including the generator terminals through the high-side of the step-up transformer** is not included in the BES.



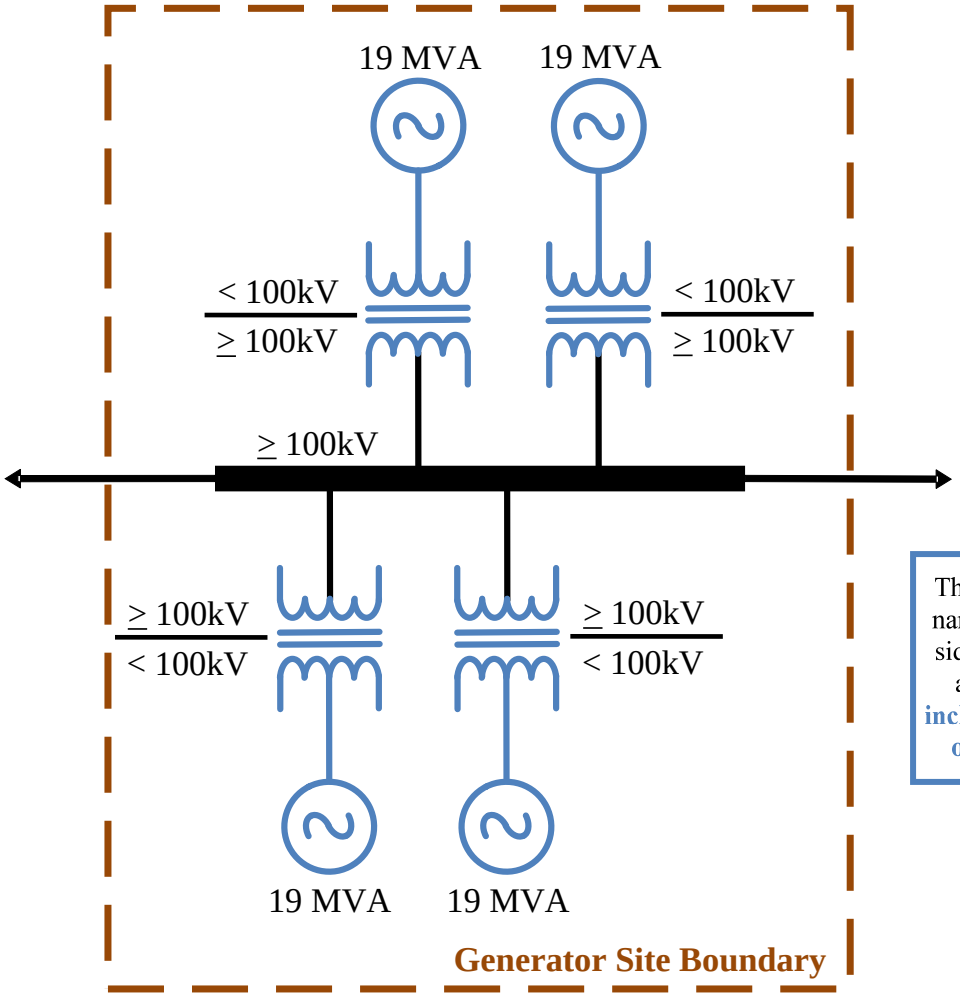


Figure I2-2: Single Generator (non-BES)

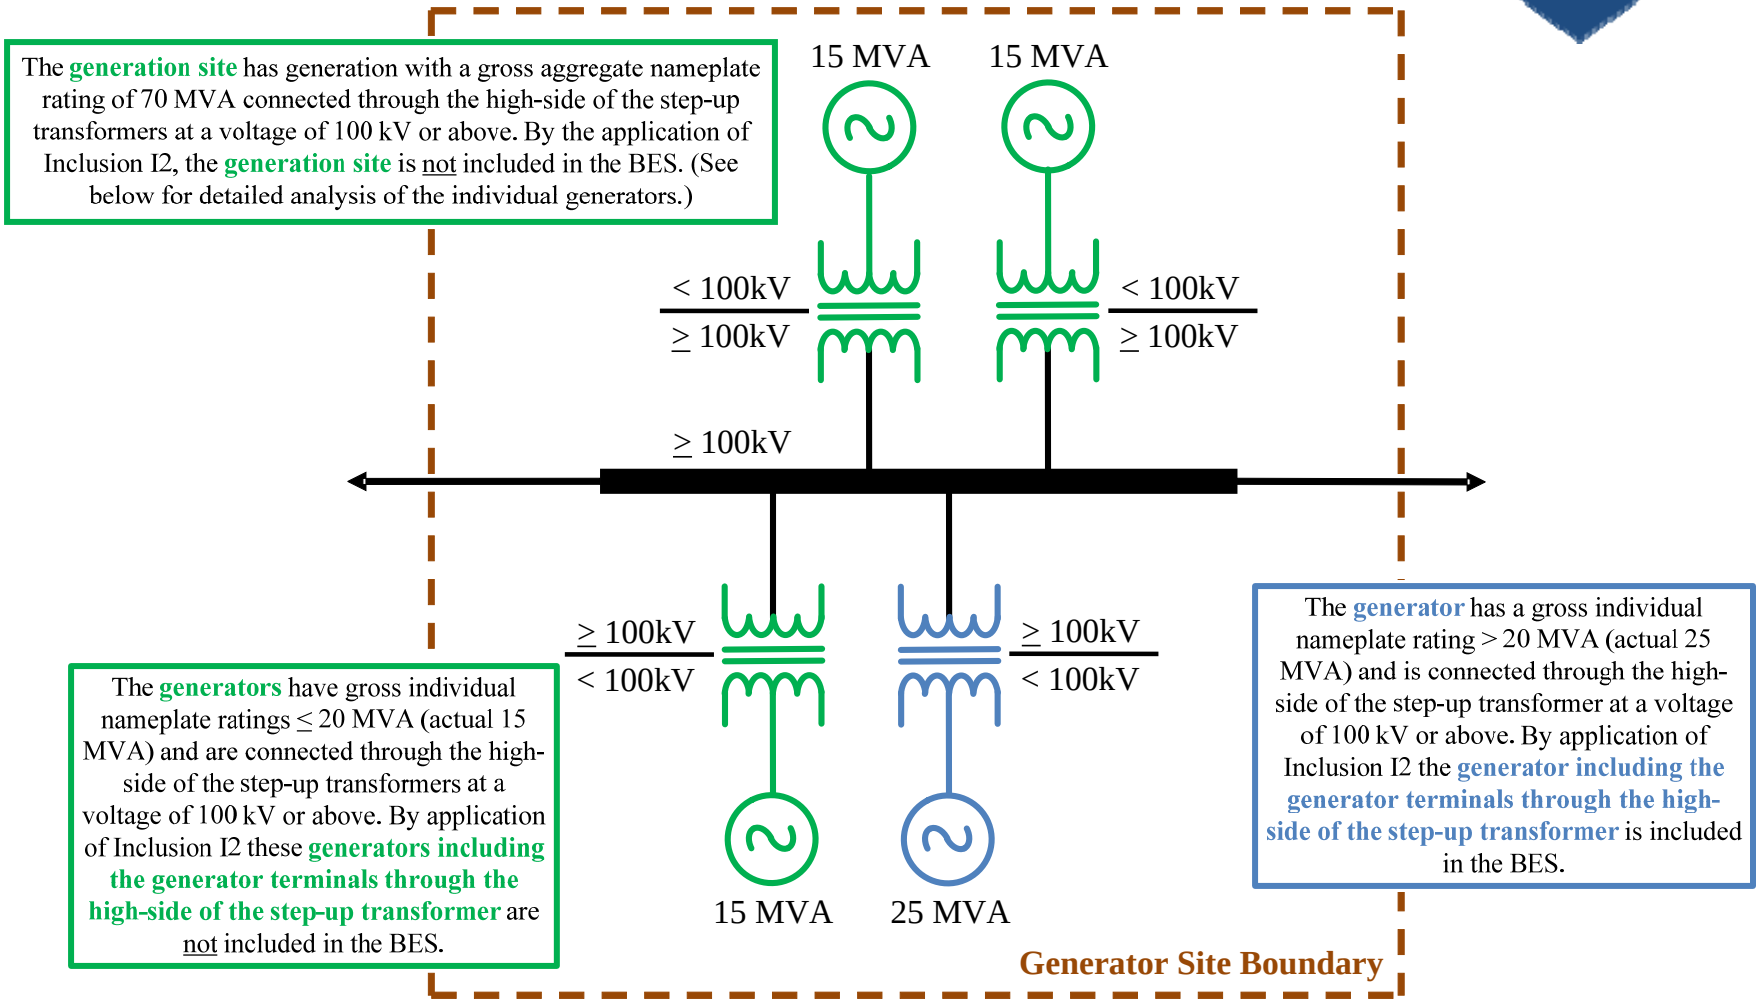
Inclusion I2 – Generating Resources

The generation site has generation with a gross aggregate nameplate rating of 76 MVA connected through the high-side of the step-up transformers at a voltage of 100 kV or above. By application of Inclusion I2, the **generators including the generator terminals through the high-side of the step-up transformers** are included in the BES.

Figure I2-3: Multiple Generators at a Single Site (BES)

Inclusion I2 – Generating Resources



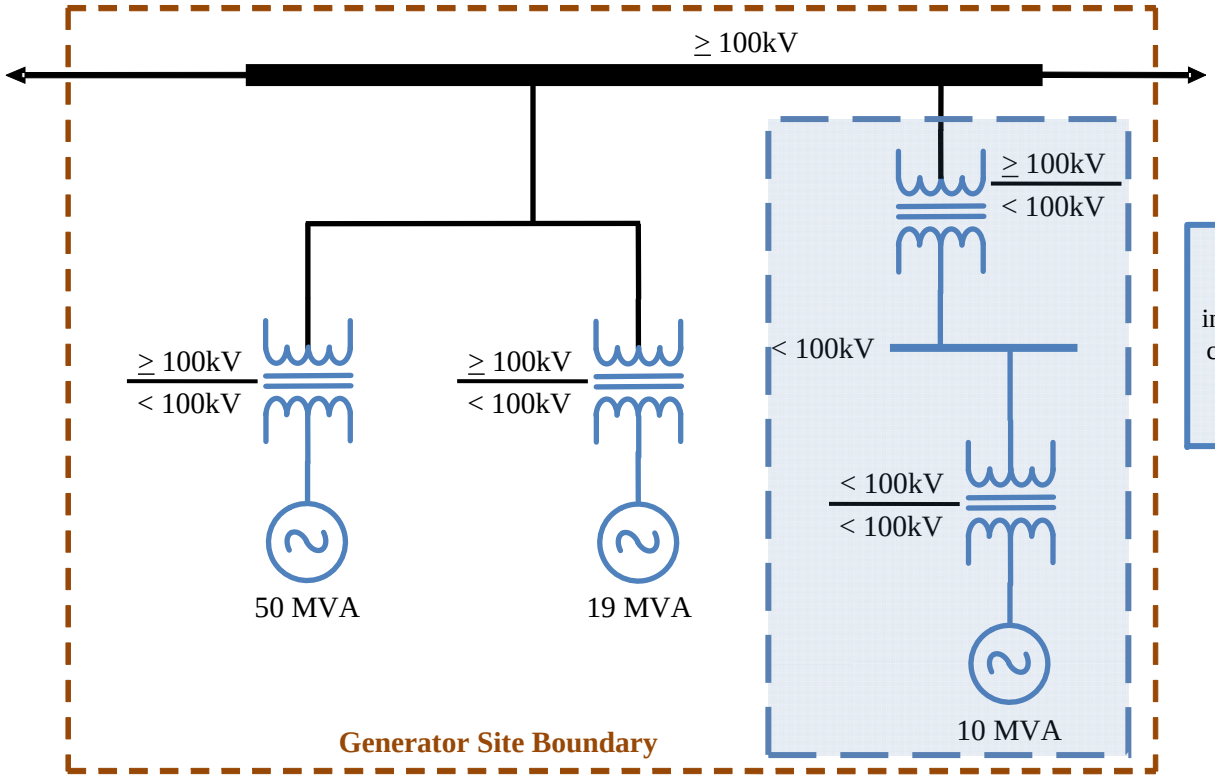


Figure I2-4: Multiple Generators at a Single Site (BES & non-BES)

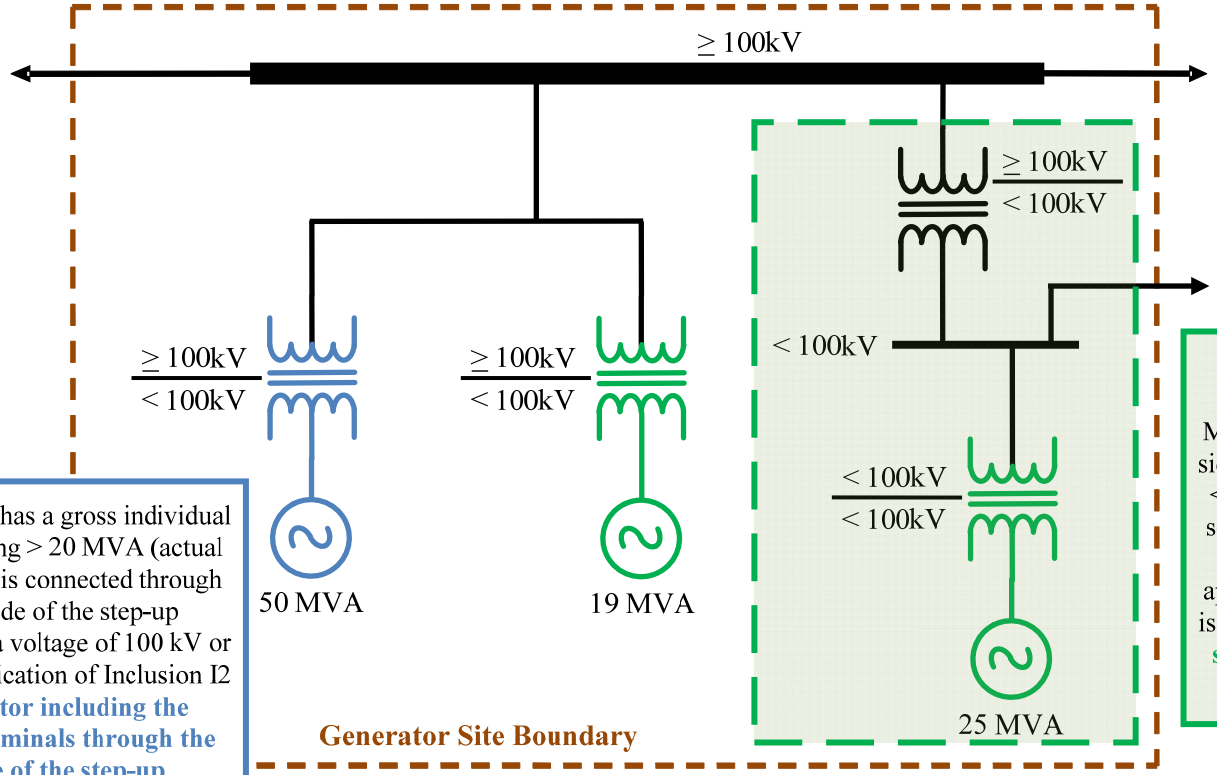
Inclusion I2 – Generating Resources

The **generation site** has generation with a gross aggregate nameplate rating greater than 75 MVA (actual 79 MVA) connected through the high-side of the step-up transformers at a voltage of 100 kV or above. By the application of Inclusion I2, the **generation site** is included in the BES.



The **generator step-up transformers,** associated with the 10 MVA generator, including the interconnecting bus work are considered a BES Element. The generator contributes to the gross aggregate nameplate rating of the site.

Figure I2-5: Multiple Generators at a Single Site (BES)

Inclusion I2 – Generating Resources

The **generation site** has generation with a gross aggregate nameplate rating of less than 75 MVA (actual 69 MVA (50 + 19 MVA)) connected through the high-side of the step-up transformers at a voltage of 100 kV or above. The 25 MVA generator is not included in the gross aggregate calculation, see textbox on right. By the application of Inclusion I2, the **generation site** is not included in the BES.

The **generator** has a gross individual nameplate rating > 20 MVA (actual 50 MVA) and is connected through the high-side of the step-up transformer at a voltage of 100 kV or above. By application of Inclusion I2 this **generator including the generator terminals through the high-side of the step-up transformer** is included in the BES.

The **generator** has a gross individual nameplate rating > 20 MVA (actual 25 MVA) and is connected through the high-side of the step-up transformer at a voltage < 100 kV. The interconnecting bus work serves Load and provides a connection to sub-100 kV Facilities, therefore by application of Inclusion I2, the **generator** is connected **through the high-side of the step-up transformer** at a voltage < 100 kV and is not included in the BES.

Figure I2-6: Multiple Generators at a Single Site (BES & non-BES)

INCLUSIONS I4

Inclusion I4 – Dispersed Power Producing Resources

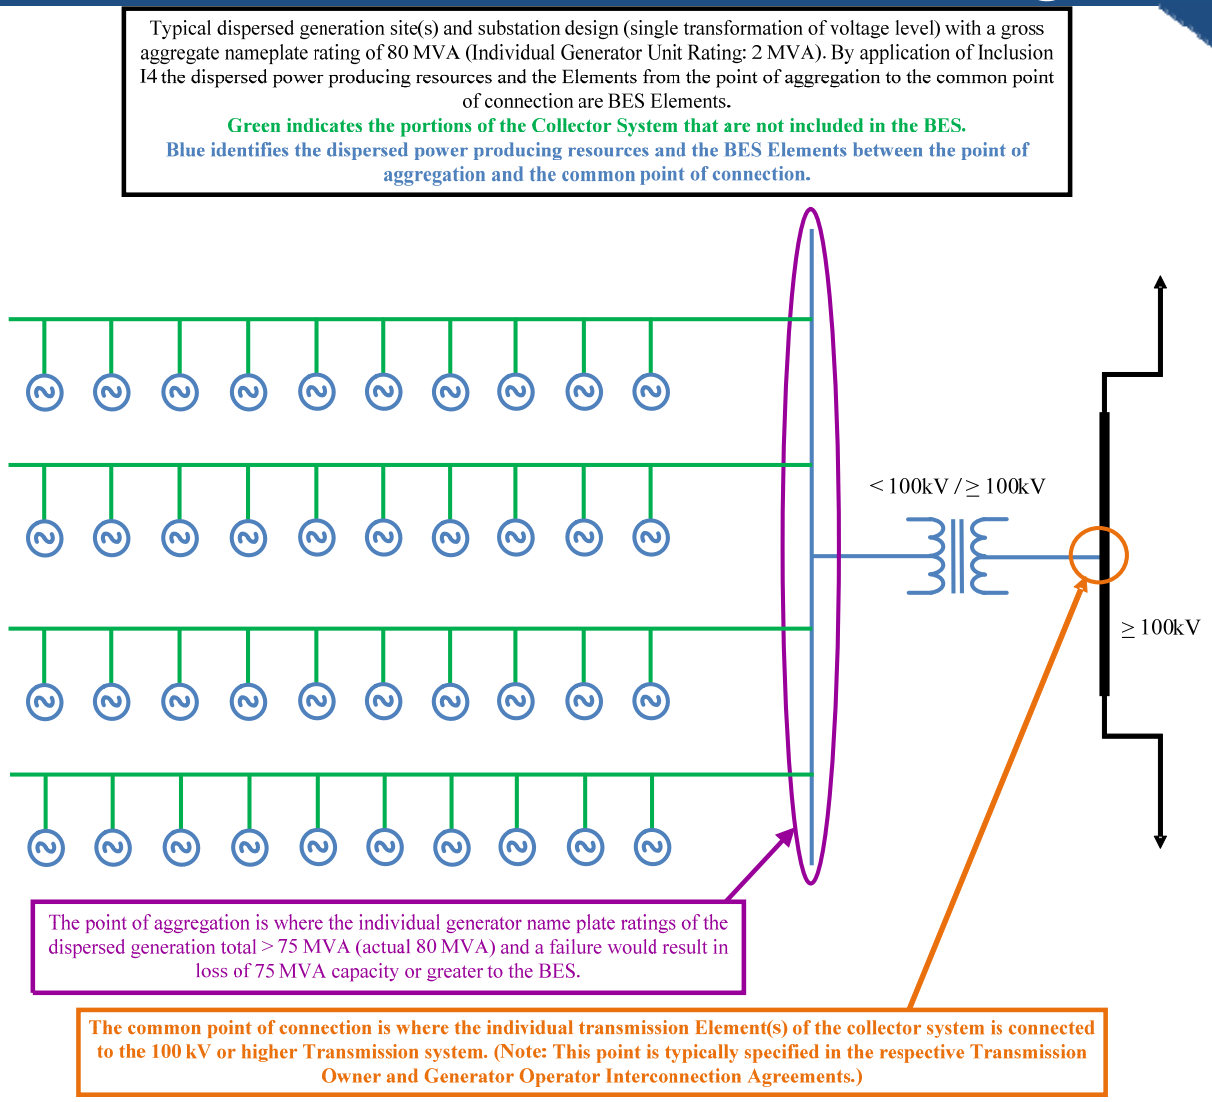


Figure I4-1 Dispersed Generation Site (Single Voltage Transformation) – Wind Farm

Inclusion I4 – Dispersed Power Producing Resources

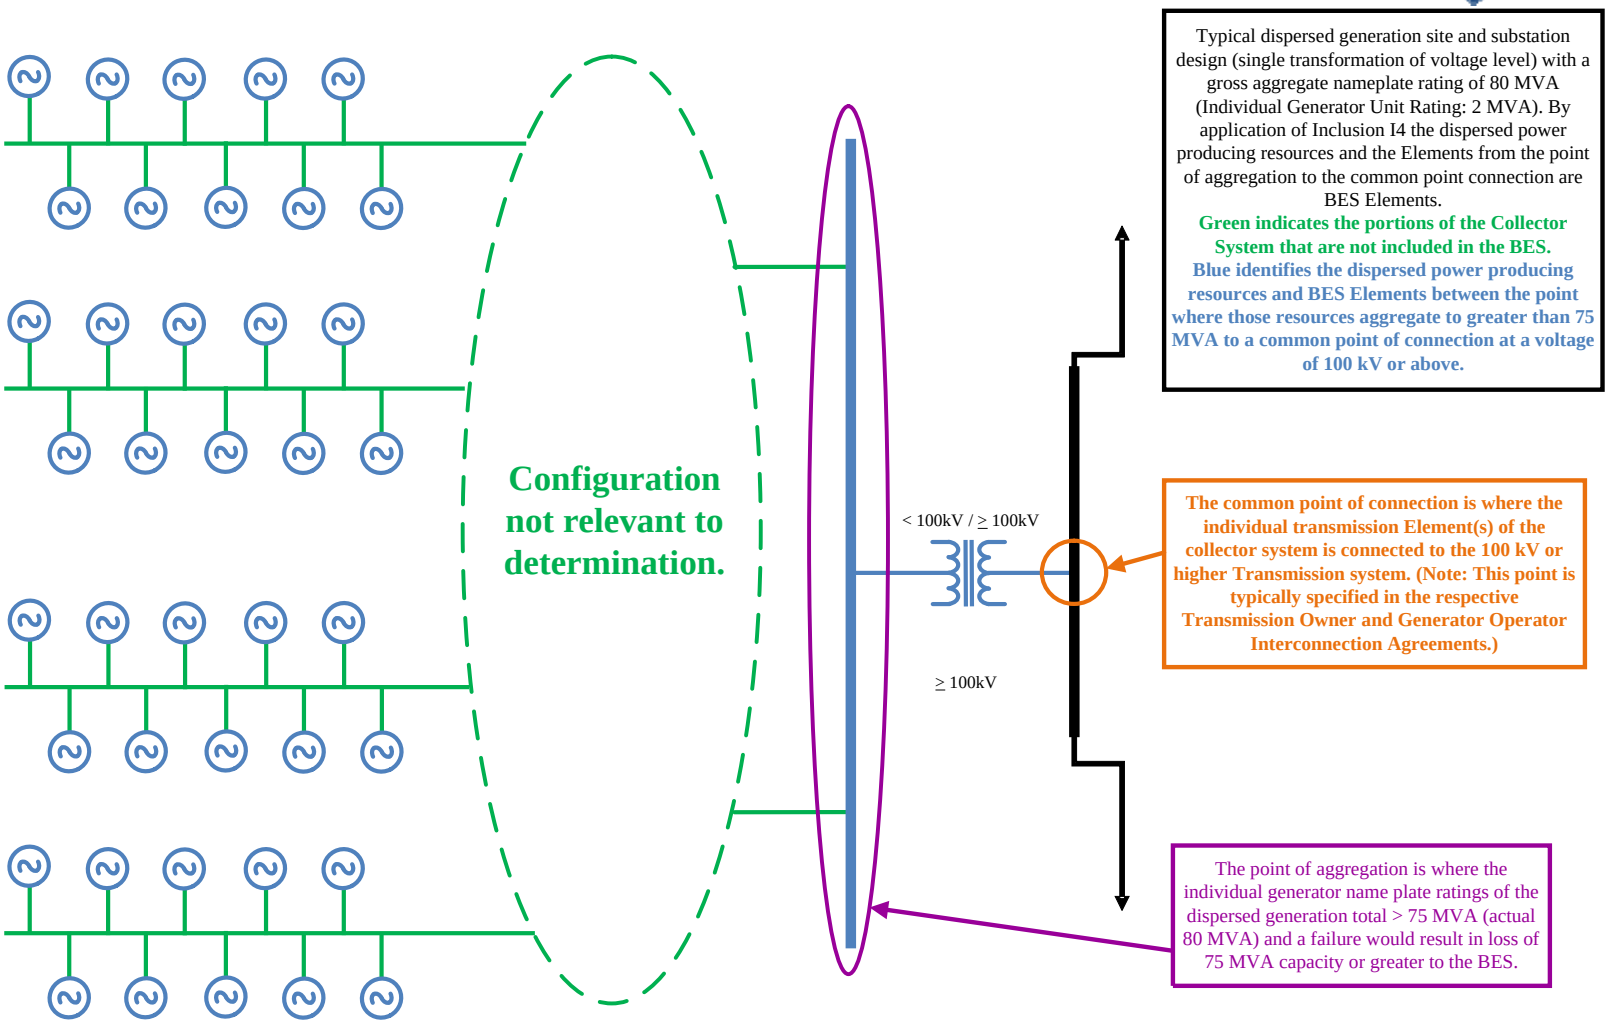

Figure I4-2 Dispersed Generation Site (Unknown Collector System Configuration) – Wind Farm

Inclusion I4 – Dispersed Power Producing Resources

Dispersed generation site and substation design (single transformation of voltage level) with a gross aggregate nameplate rating of 80 MVA (Individual Photovoltaic Bank Rating: 20 MVA). By application of Inclusion I4 the Photovoltaic Cells & Inverters (generators) are included in the BES.

Green indicates the portions of the Collector System that are not included in the BES.

Blue identifies BES dispersed power producing resources (Photovoltaic Cells & Inverters) and the BES Elements between the point of aggregation and the common point of connection.

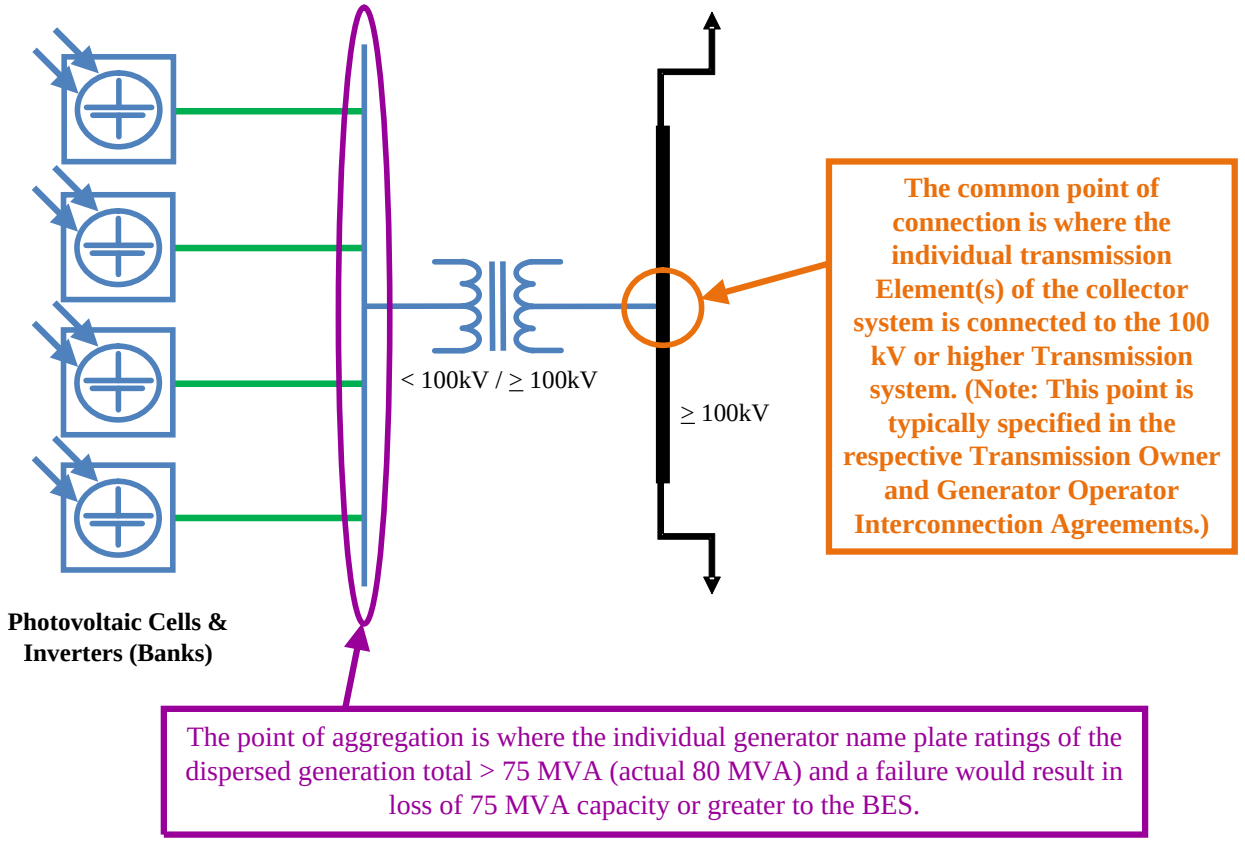

Figure I4-3 Dispersed Generation Site (Single Voltage Transformation) – Solar Array

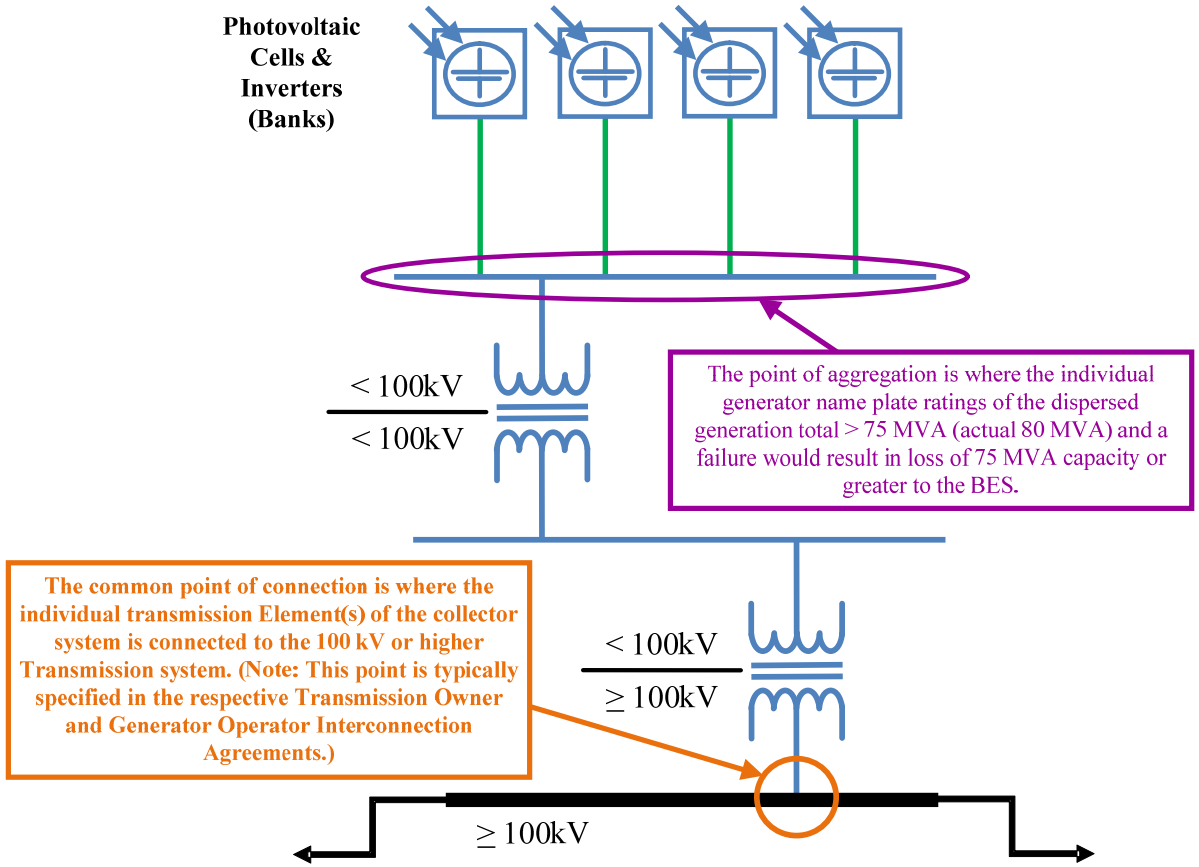
Inclusion I4 – Dispersed Power Producing Resources

Dispersed generation site and substation design (multiple transformations of voltage level) with a gross aggregate nameplate rating of 80 MVA (Individual Photovoltaic Bank Rating: 20 MVA). By application of Inclusion I4 the Photovoltaic Cells & Inverters (generator units) are included in the BES.

Green indicates the portions of the Collector System that are not included in the BES.

Blue identifies BES dispersed power producing resources (Photovoltaic Cells & Inverters) and the BES Elements between the point of aggregation and the common point of connection.



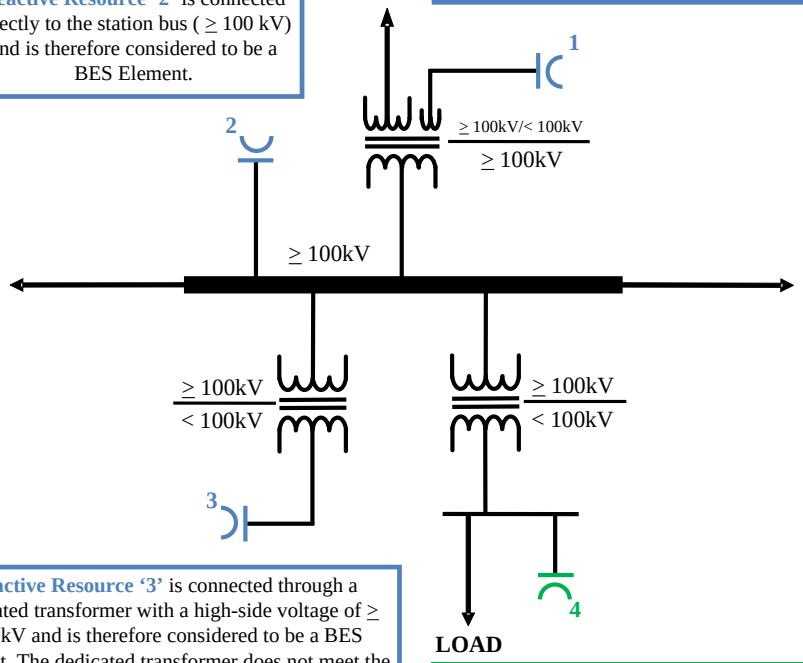


Figure I4-4 Dispersed Generation Site (Multiple Voltage Transformations) – Solar Array

INCLUSIONS I5

Inclusion I5 – Reactive Power Devices

Reactive Resource '1' is connected through the tertiary winding of a transformer that meets the inclusion criteria established by Inclusion I5 (i.e., through a transformer that is designated in Inclusion I1) and is therefore considered to be a BES Element.

Reactive Resource '2' is connected directly to the station bus (≥ 100 kV) and is therefore considered to be a BES Element.

Reactive Resource '3' is connected through a dedicated transformer with a high-side voltage of ≥ 100 kV and is therefore considered to be a BES Element. The dedicated transformer does not meet the inclusion criteria established by Inclusion I1 and is therefore not considered to be a BES Element.

Reactive Resource '4' is connected directly to the station bus (< 100 kV), and is not connected through a dedicated transformer with a high-side voltage of 100 kV or higher or through a transformer that is designated in Inclusion I1, and is therefore not considered to be a BES Element.

Bulk Electric System (BES) Definition, Notification, and Exception Process Project Page

This page contains information related to the NERC BES Definition, and the Notification and Exception Processes. The materials linked to this page are the current compilation of materials that support the application of the BES definition, and detailed materials designed to provide entities with the information needed to make uniform determinations of BES elements. This page will be continuously updated as additional materials become available. An overall schedule of training and orientation activities is included for general reference, and separate registration and logistics details will be provided as events approach.

Background

On March 20, 2014, the Commission approved the revised definition of Bulk Electric System, as envisioned in Order Nos. 743, 773 and 773-A. The definition includes bright line core criteria, with various enumerated inclusions and exclusions. As a result of the application of these BES Definition provisions, all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system will be included as BES elements. The Commission also approved the process for review of Elements on a case-by-case basis to allow for exceptions from the definition, where appropriate, as well as a process for entities to self-notify Regions of their respective determinations of BES elements. Entities should apply the definition of Bulk Electric System, including the respective inclusions and exclusions, to their asset inventory effective July 1, 2014.

An ERO enterprise-wide software application, the BES Notification and Exceptions Tool or BESnet, has been developed to support implementation of the definition. The BESnet application will be live on July 1, 2014 for submittal of self-notifications and exception requests. Entity administrative sign-on processes and account management is ongoing.

Entities should use the BESnet application to submit to their respective Regional Entity notifications of changes to Bulk Electric System assets that affect the Registered Entity's responsibilities for compliance with the Reliability Standards. The BESnet application is the official means of notifications to Regional Entities of newly identified inclusions and exclusions as a result of application of the definition. Entities are encouraged to have preliminary discussions with their Regional Entities prior submitting notifications for the record.

Entities also should use the BESnet application to request to include or exclude an Element from the Bulk Electric System on a case-by-case basis.

Questions?

INCLUSIONS I1

Inclusion I1 - Transformers

The **transformer's** primary and secondary terminals are operated at 100 kV or above, and therefore the transformer is included in the BES by application of Inclusion I1.

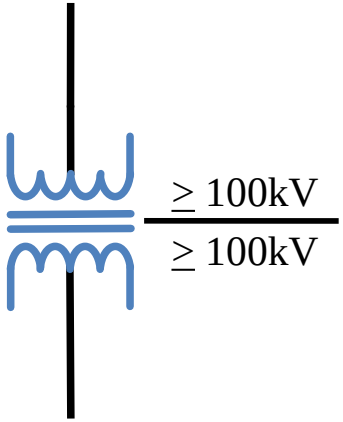

Figure I1-1: Typical Two Winding Transformer (BES)

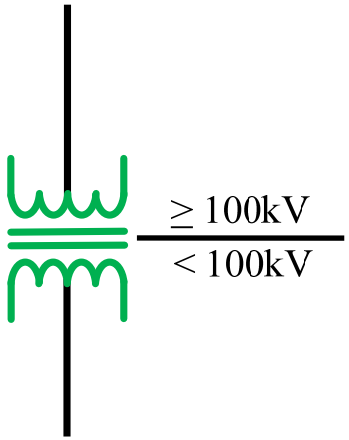
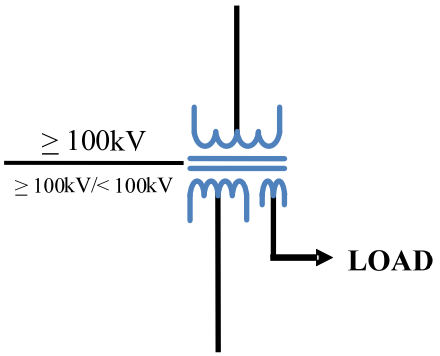
The **transformer's** primary terminal is operated at 100 kV or above, however the secondary terminal is <u>not</u> operated at a voltage of 100 kV or above. Therefore the transformer is <u>not</u> included in the BES by application of Inclusion I1.





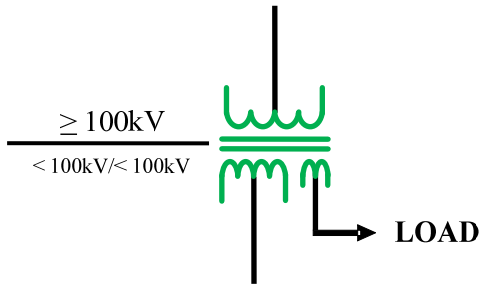


Figure I1-3: Typical Two Winding Transformer (non-BES)

Inclusion I1 - Transformers

The **transformer's** primary terminal and one secondary terminal are operated at 100 kV or above, and therefore the transformer is included in the BES by application of Inclusion I1. Since the transformer is one Element, all windings internal to the transformer (including the tertiary winding) would be included in the BES. The Load and the connection to the tertiary winding, indicated in the diagram, are non-BES as they are connected at a voltage < 100 kV.

Figure I1-2: Typical Three Winding Transformer (BES)

The **transformer's** primary terminal is operated at 100 kV or above, however neither of the secondary terminals are operated at a voltage of 100 kV or above. Therefore the transformer is not included in the BES by application of Inclusion I1. The Load and the connection to the tertiary winding, indicated in the diagram, are non-BES as they are connected at a voltage < 100 kV.

Figure I1-4: Typical Three Winding Transformer (non-BES)

INCLUSIONS I2

Inclusion I2 – Generating Resources

The **generator** has a gross individual nameplate rating > 20 MVA and is connected through the high-side of the step-up transformer at a voltage of 100 kV or above. By application of Inclusion I2 the **generator including the generator terminals through the high-side of the step-up transformer** is included in the BES.

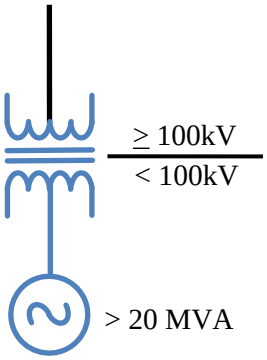

Figure I2-1: Single Generator (BES)

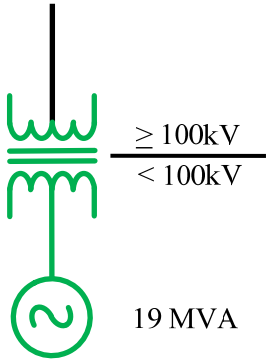
The **generator** has a gross individual nameplate rating ≤ 20 MVA (actual 19 MVA) and is connected through the high-side of the step-up transformer at a voltage of 100 kV or above. By application of Inclusion I2 the **generator including the generator terminals through the high-side of the step-up transformer** is not included in the BES.



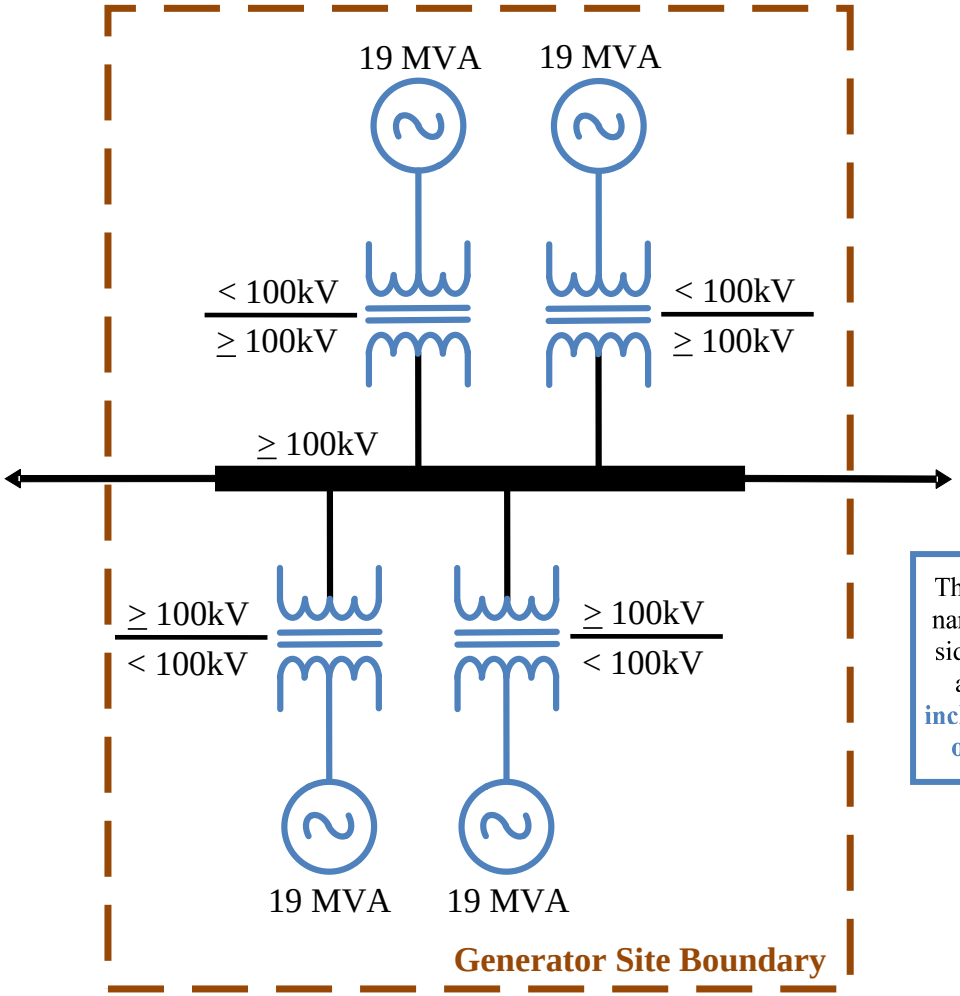


Figure I2-2: Single Generator (non-BES)

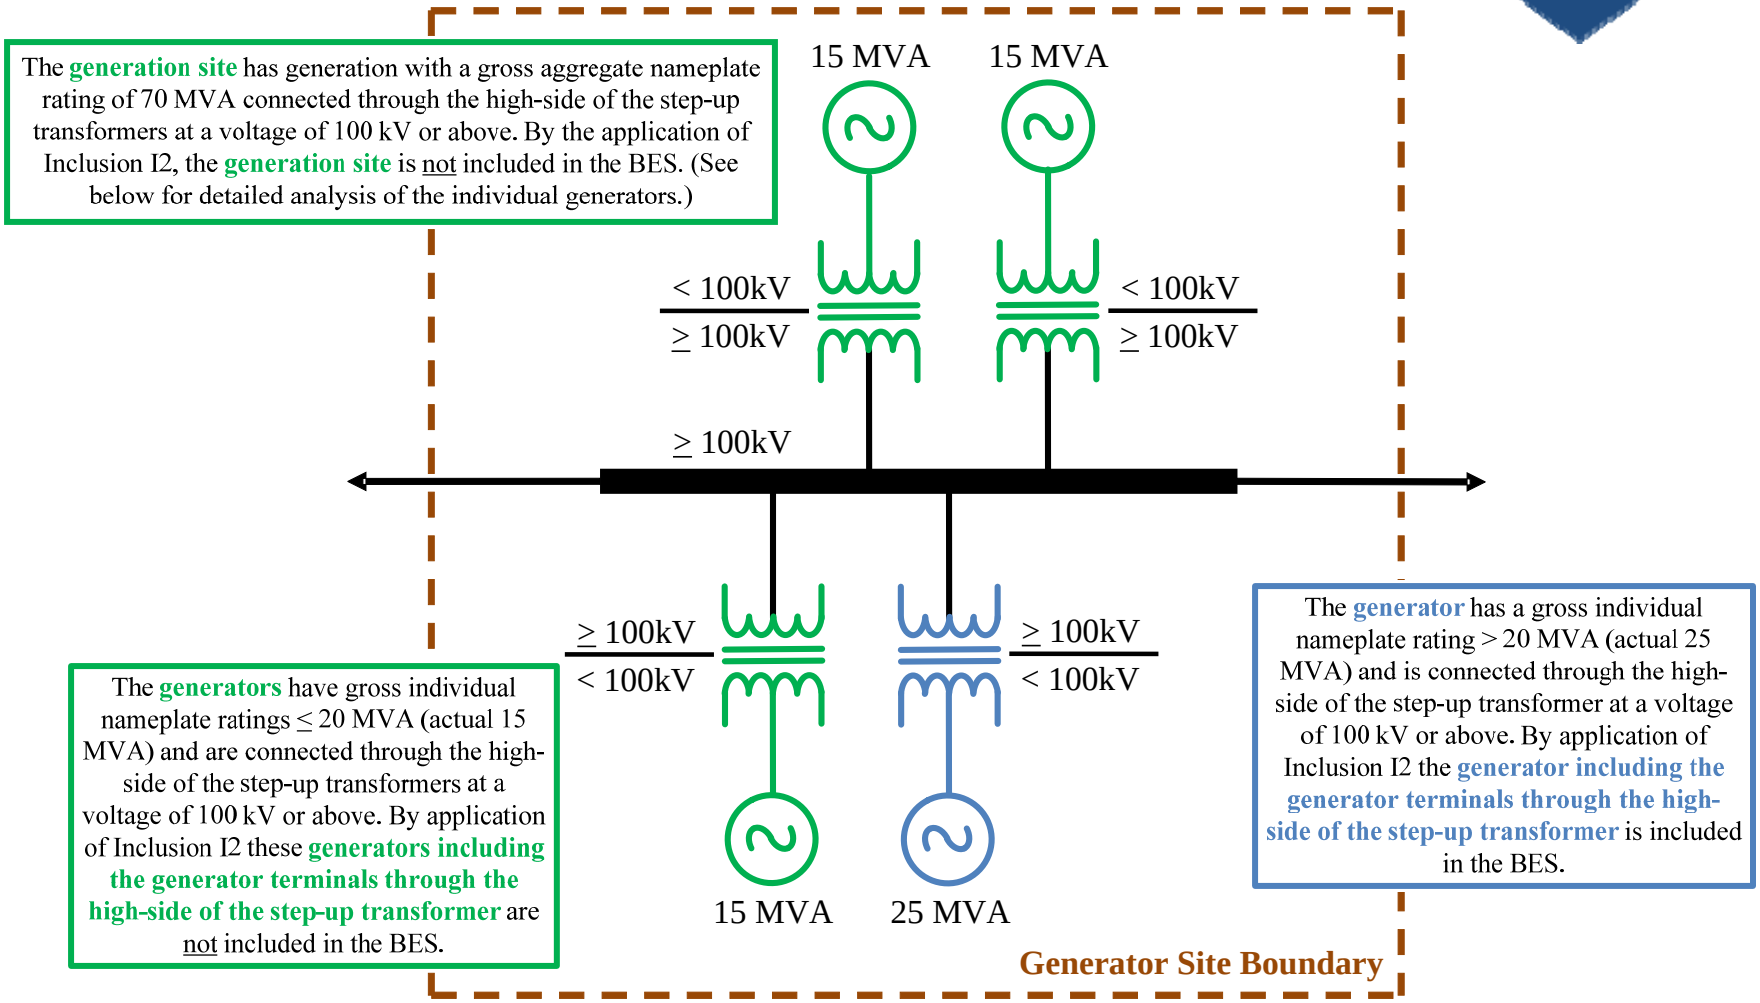
Inclusion I2 – Generating Resources

The generation site has generation with a gross aggregate nameplate rating of 76 MVA connected through the high-side of the step-up transformers at a voltage of 100 kV or above. By application of Inclusion I2, the **generators including the generator terminals through the high-side of the step-up transformers** are included in the BES.

Figure I2-3: Multiple Generators at a Single Site (BES)

Inclusion I2 – Generating Resources



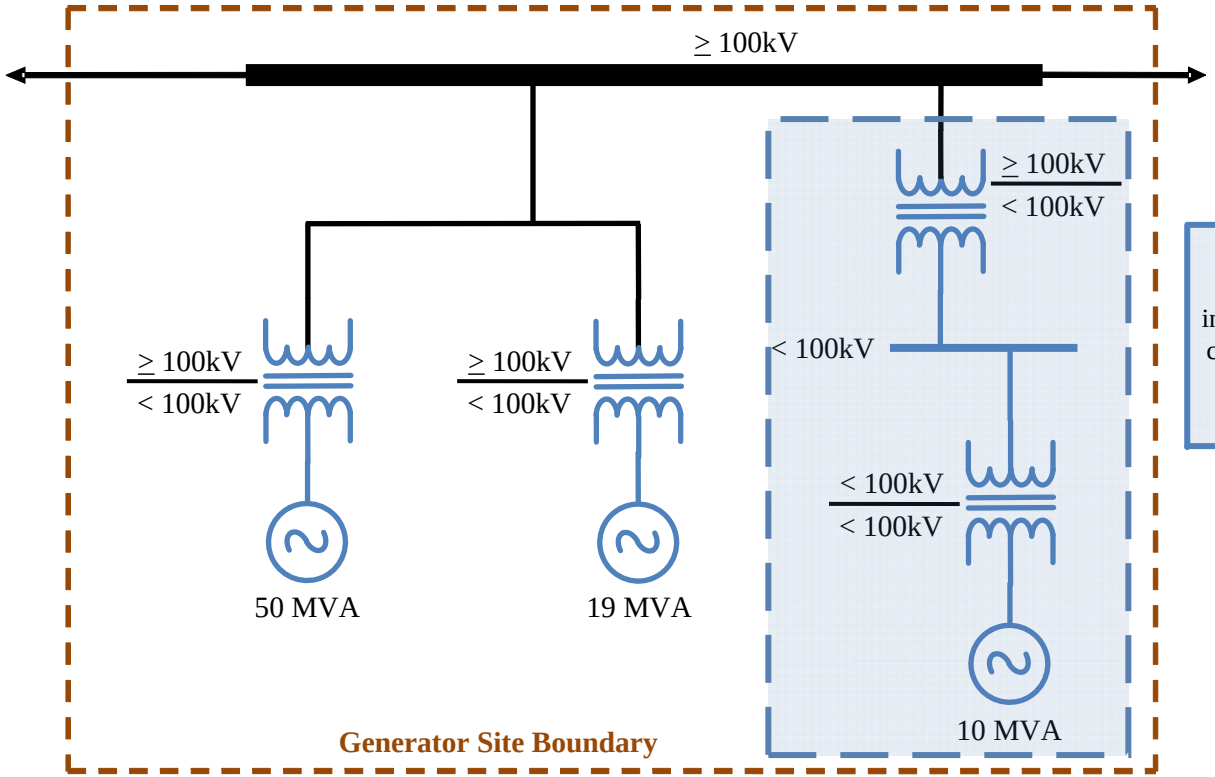


Figure I2-4: Multiple Generators at a Single Site (BES & non-BES)

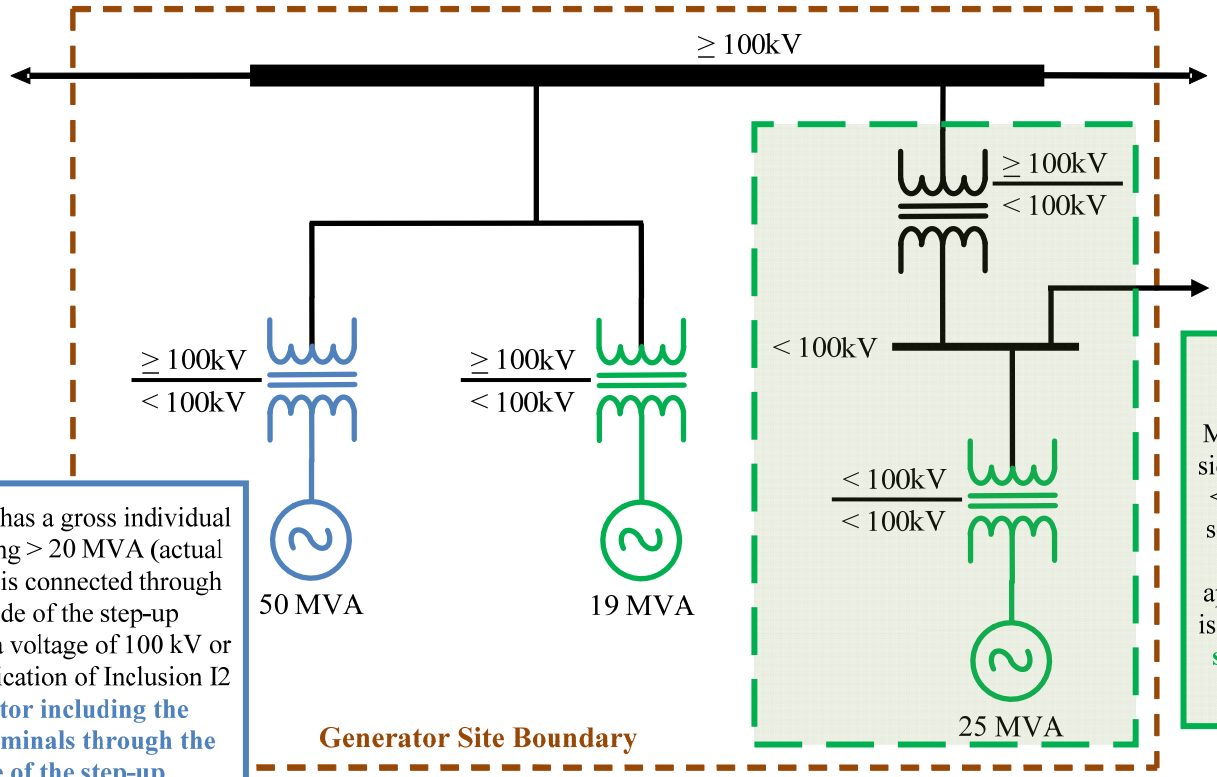
Inclusion I2 – Generating Resources

The **generation site** has generation with a gross aggregate nameplate rating greater than 75 MVA (actual 79 MVA) connected through the high-side of the step-up transformers at a voltage of 100 kV or above. By the application of Inclusion I2, the **generation site** is included in the BES.



The **generator step-up transformers,** associated with the 10 MVA generator, including the interconnecting bus work are considered a BES Element. The generator contributes to the gross aggregate nameplate rating of the site.

Figure I2-5: Multiple Generators at a Single Site (BES)

Inclusion I2 – Generating Resources

The **generation site** has generation with a gross aggregate nameplate rating of less than 75 MVA (actual 69 MVA (50 + 19 MVA)) connected through the high-side of the step-up transformers at a voltage of 100 kV or above. The 25 MVA generator is not included in the gross aggregate calculation, see textbox on right. By the application of Inclusion I2, the **generation site** is not included in the BES.

The **generator** has a gross individual nameplate rating > 20 MVA (actual 50 MVA) and is connected through the high-side of the step-up transformer at a voltage of 100 kV or above. By application of Inclusion I2 this **generator including the generator terminals through the high-side of the step-up transformer** is included in the BES.

The **generator** has a gross individual nameplate rating > 20 MVA (actual 25 MVA) and is connected through the high-side of the step-up transformer at a voltage < 100 kV. The interconnecting bus work serves Load and provides a connection to sub-100 kV Facilities, therefore by application of Inclusion I2, the **generator** is connected **through the high-side of the step-up transformer** at a voltage < 100 kV and is not included in the BES.

Figure I2-6: Multiple Generators at a Single Site (BES & non-BES)

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

INCLUSIONS I4

Inclusion I4 – Dispersed Power Producing Resources

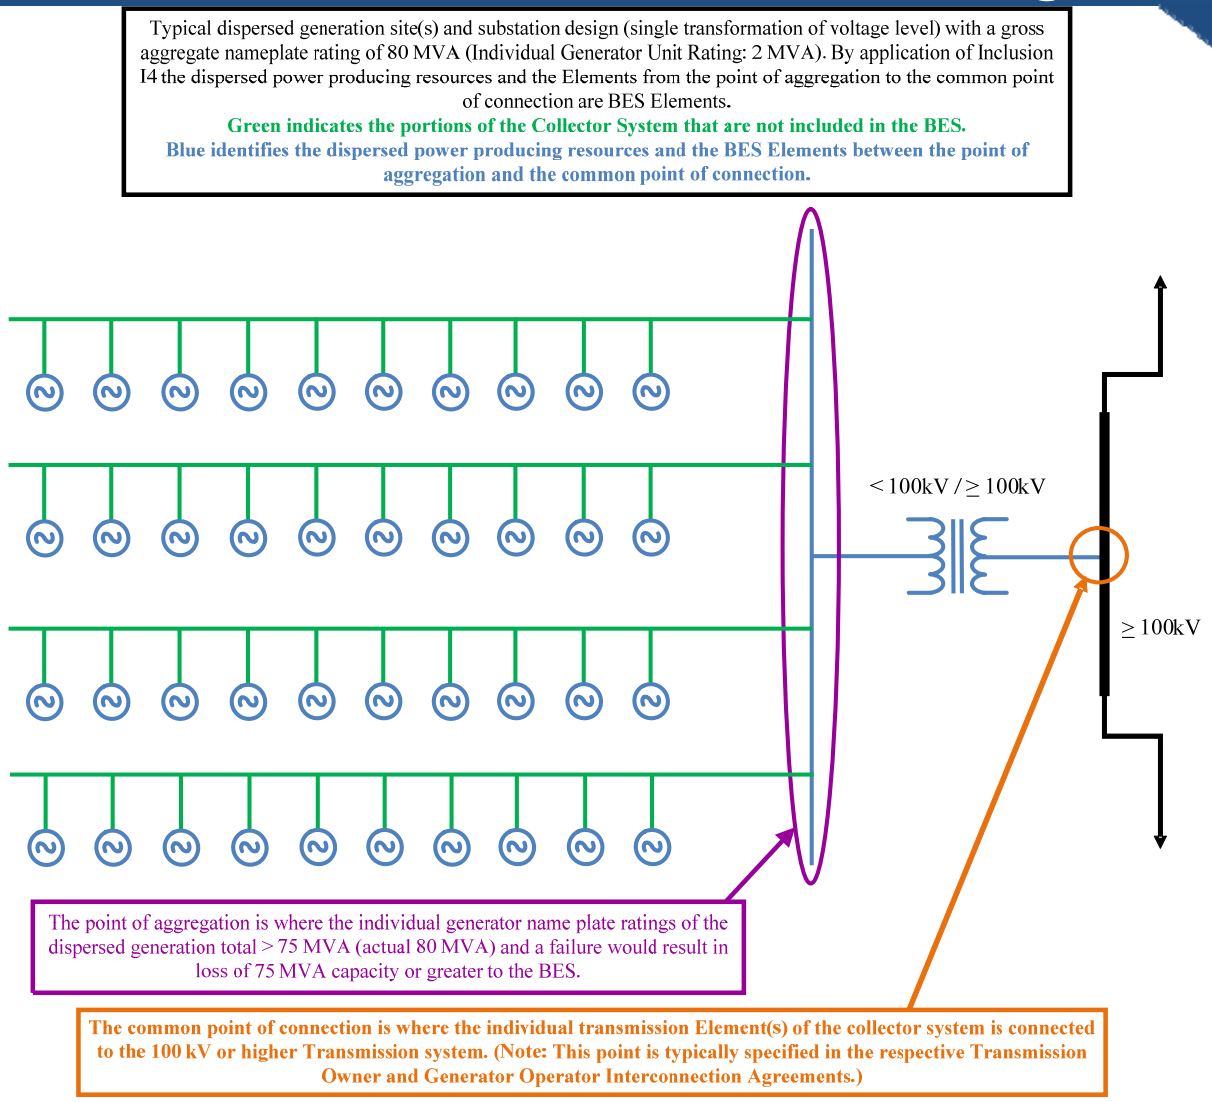

Figure I4-1 Dispersed Generation Site (Single Voltage Transformation) – Wind Farm

Inclusion I4 – Dispersed Power Producing Resources

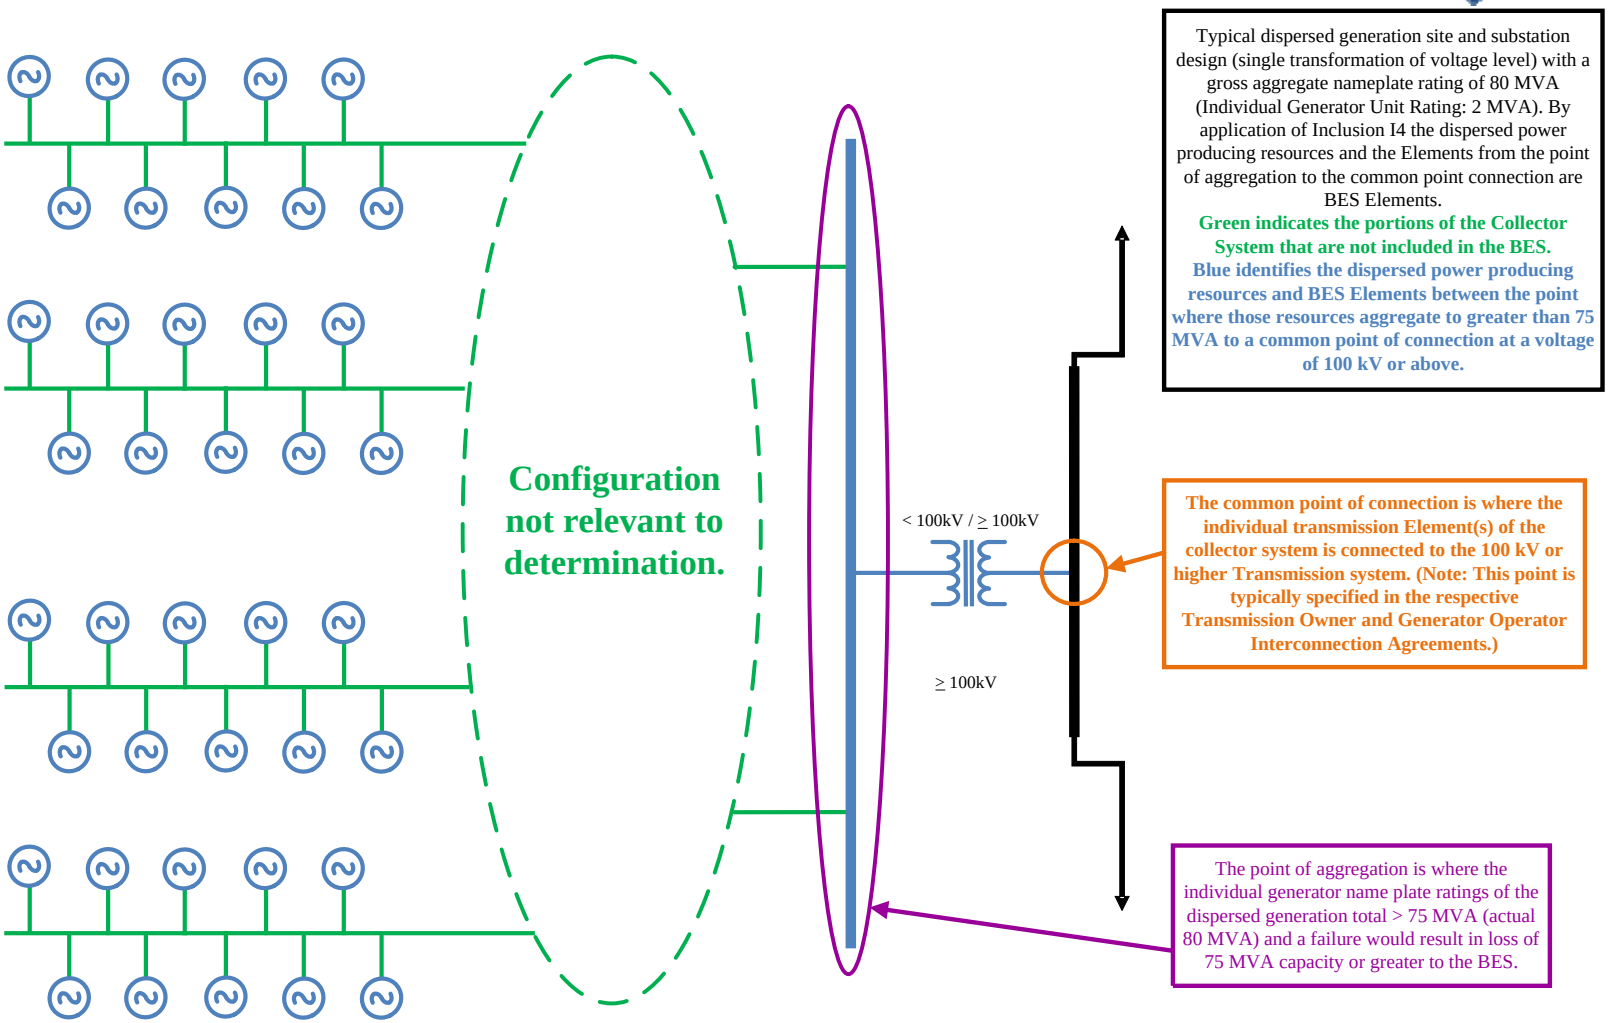

Figure I4-2 Dispersed Generation Site (Unknown Collector System Configuration) – Wind Farm

Inclusion I4 – Dispersed Power Producing Resources

Dispersed generation site and substation design (single transformation of voltage level) with a gross aggregate nameplate rating of 80 MVA (Individual Photovoltaic Bank Rating: 20 MVA). By application of Inclusion I4 the Photovoltaic Cells & Inverters (generators) are included in the BES.

Green indicates the portions of the Collector System that are not included in the BES.

Blue identifies BES dispersed power producing resources (Photovoltaic Cells & Inverters) and the BES Elements between the point of aggregation and the common point of connection.

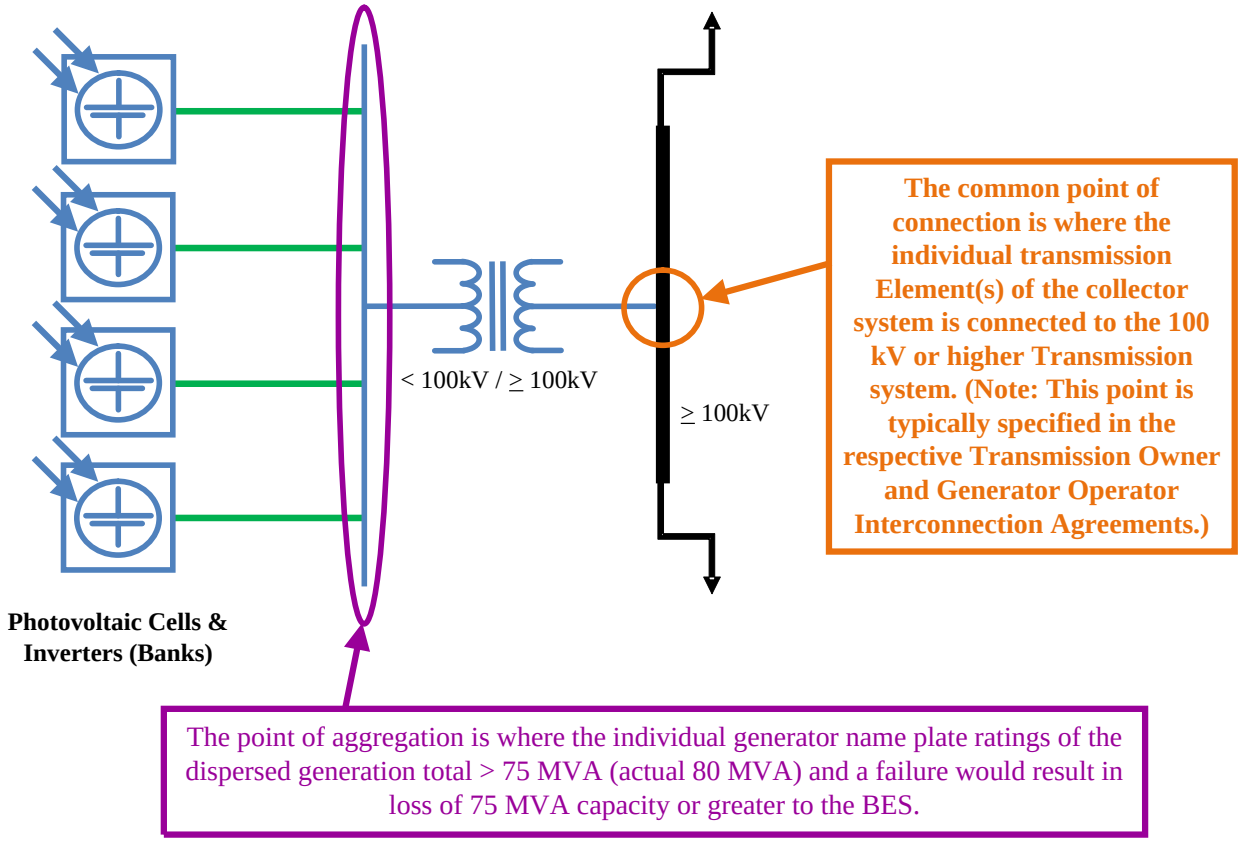

Figure I4-3 Dispersed Generation Site (Single Voltage Transformation) – Solar Array

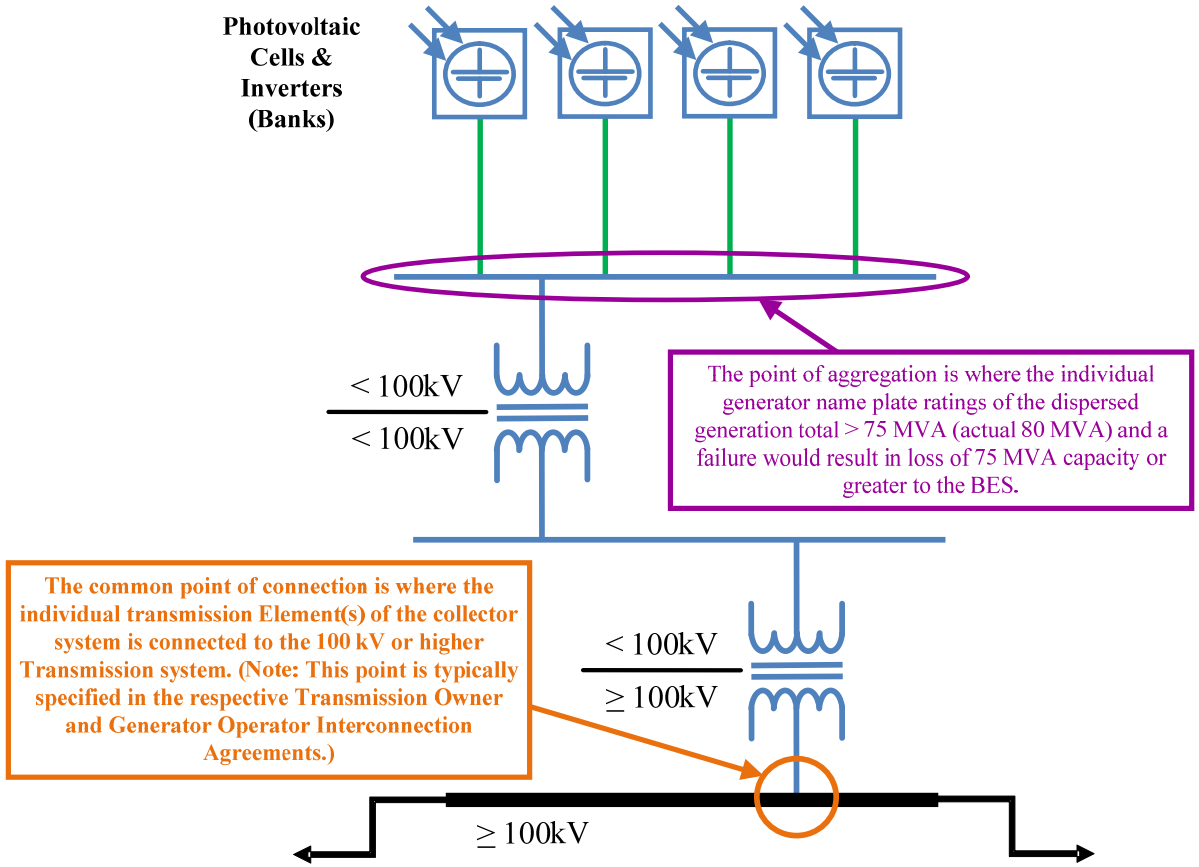
Inclusion I4 – Dispersed Power Producing Resources

Dispersed generation site and substation design (multiple transformations of voltage level) with a gross aggregate nameplate rating of 80 MVA (Individual Photovoltaic Bank Rating: 20 MVA). By application of Inclusion I4 the Photovoltaic Cells & Inverters (generator units) are included in the BES.

Green indicates the portions of the Collector System that are not included in the BES.

Blue identifies BES dispersed power producing resources (Photovoltaic Cells & Inverters) and the BES Elements between the point of aggregation and the common point of connection.



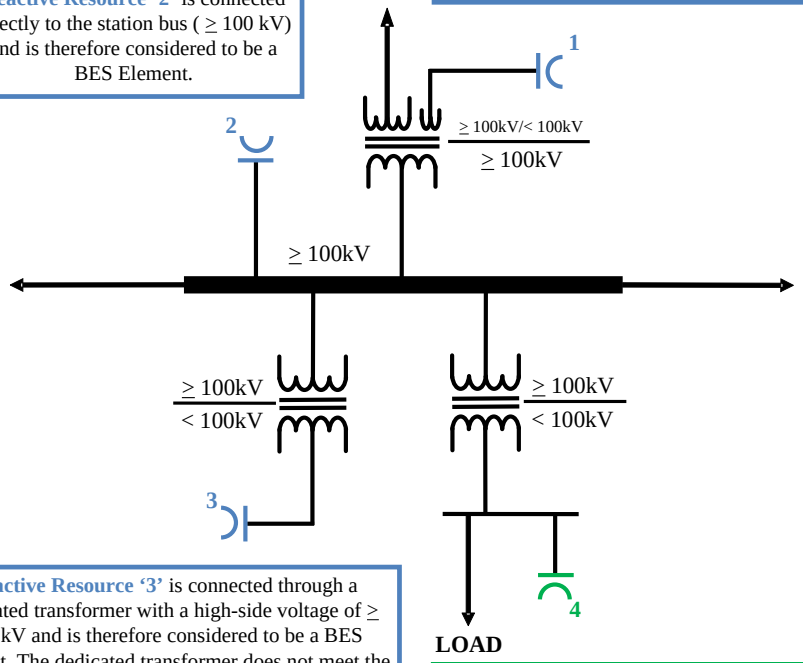


Figure I4-4 Dispersed Generation Site (Multiple Voltage Transformations) – Solar Array

INCLUSIONS I5

Inclusion I5 – Reactive Power Devices

Reactive Resource '1' is connected through the tertiary winding of a transformer that meets the inclusion criteria established by Inclusion I5 (i.e., through a transformer that is designated in Inclusion I1) and is therefore considered to be a BES Element.

Reactive Resource '2' is connected directly to the station bus (≥ 100 kV) and is therefore considered to be a BES Element.

Reactive Resource '3' is connected through a dedicated transformer with a high-side voltage of ≥ 100 kV and is therefore considered to be a BES Element. The dedicated transformer does not meet the inclusion criteria established by Inclusion I1 and is therefore not considered to be a BES Element.

Reactive Resource '4' is connected directly to the station bus (< 100 kV), and is not connected through a dedicated transformer with a high-side voltage of 100 kV or higher or through a transformer that is designated in Inclusion I1, and is therefore not considered to be a BES Element.

RELIABILITY | ACCOUNTABILITY

Actions

- Automation of NERC Rules of Procedure Appendix 5c
  - Registered and Unregistered Entities:
    - Submission, Appeals and Challenges
  - Regional Entities
    - Initial and Substantive Reviews, Recommendations
  - NERC
    - Proposed and Final Decisions, Certification

Actions (cont.)

- Notifications of Self-Determination
  - Submission
  - Regional and NERC review
- Account Management
- Reporting
  - Process Performance
  - Exception Request and Self-Determinations status

Agenda

- Application Overview (:05 - :15)
- Exception Requests (1:20 – 1:00)
  - Creation (:20 – :30)
  - Initial Review and Appeal (:30 – :35)
  - Substantive Review (:35 – :45)
  - Proposed and Final Decisions (:45 – :50)
  - Challenges, Certification and Change (:50 – 1:00)
- Break (1:00 – 1:10)
- Notifications of Self-Determination (1:10 – 1:30)
  - Submission (1:10 – 1:20)
  - Regional Review (1:20 – 1:30)
- Questions and Answers (1:30 – 2:00)

BESnet Release Notes August 8, 2014 and August 13, 2014

Introduction

The list below contains a list of known defects for the August 8, 2014 and August 13 releases of BESnet.

Known Defects

Known Defects			
ID	**Area**	**Description**	**Work-Around**
252	**Create Entity-Submitting Entity Role**	When creating an ER under section 1 there is an option of **YES** or **NO** in regard to if the Submitting entity is the owner of the elements. Once the **NO** option is selected a search option is displayed to select the owner and choose the submitting entity's role. If no owner is selected during the search, or if Submitting Entity Role(s) is chosen before the Owner, the selection will revert back to YES.	Click on the NO option again. All information (e.g. Submitting Entity Role) will be retained and displayed.
351	**ER - details**	When creating a SDN the "primary name" that gets populated in the Section 2 of the Notification gets automatically grabbed from the "From Point Name" field of the Edit Element screen? It would be more appropriate and user friendly to utilize either the "Common Element Name" or the "Circuit ID". This change has not been consistently applied throughout the UI.	No work around needed; will be cleaned up in a future release.
395	**Reports**	The export report Stage column is not showing text in all cases; in some, it is displaying a numerical value.	No work around needed at this time; will be cleaned up in a future release.
401	**Reports**	In several reports, Primary voltage and secondary voltage is showing 'HVDCxxx' where 'xxx' is the actual voltage.	For numerical voltages, ignore or trim the HVDC from the front of the value.
414	**ER Creation**	When the user removes the Associated Entity, the NCR shows up in a pull-down box. This text should be static.	No impact; will be addressed in a future release.

420	**Substantive Review**	The display strips CRLFs from the comments (e.g., if I enter 'Comment 1 <crlf> comment 2, 'it retains that when in a text box, but when displayed as 'label' text, it displays as 'Comment1 comment 2' (all on one line).	No work around needed.
422	**ER**	When adding a SOR, when you click back from the entity selection screen, the system takes you to the dashboard-not to the ER.	Manually go back into the ER
423	**ER**	If the phone number is not filled in correctly, the ER will not save.	Enter phone number correctly in the field provided.
485	**Initial Review-Rejected**	Once an ER is created and it is rejected by the region, the Initial Review documents cannot be read on the Decision tab (i.e. the hyperlink is disabled) for the Submitting Entity or the Owning Entity. The hyperlink is available to the Lead Region.	Initial Review Documents are not available on the Docs tab when the ER is in a **Reject** status. Submit an **Appeal** (this sends the ER to **Reject-under appeal**) and the docs are then available under the Docs tab.

Bug Fixes / Enhancements since the Initial Release into Production

The list below contains the Bug Fixes and Enhancements since the first release of BESnet into Production.

Resolved Issues			
ID	**Area**	**Description**	**Additional Notes**
146	ER - Create	Added a question regarding Black Start service.	
208	**Challenge Response-UI**	When taking an action to approve/disapprove a challenge, the radial button popped up with 'OK' and 'Cancel' instead of the wording in the question. The pop up has been changed to reflect the following: *'Are you sure you approve/disapprove the challenge? 'Ok' and 'Cancel' button*	
267	**TRP - UI**	Changed label "There are no TRP's that can be assigned to this ER' to 'There are no TRP candidates available to be assigned to this exception Request'	

286	**Dashboard-next action**	When the next action = 'Challenge' is reflected; the date shown is the date for re-certification. The date has been corrected to reflect the 'Challenge' date.	
329	**Entity Management**	BESnet was not allowing Canadian zip codes to be reflected in the application. This issue has been corrected and Canadian zip codes are being reflected in the application.	
330	**Entity Management**	Unable to modify entity role (e.g. submitting, BA). This has been corrected.	
332	**User Management-Vetting**	When adding an entity to a user's profile, a success message was returned when the check box to add entity is not checked and the **Save** button is clicked (meaning no entity was selected to be added). A validation rule was added to catch this error.	
356	**ER-Create**	Incorrect text when removing BES Definition Basis. The statement has been updated to reflect the following: 'Remove BES Definition Basis'	
368	**Dashboard**	The status of an ER (approved or disapproved) is being concatenated to the 'Stage' but not to the 'Status'. Overall changes to clarify state, status, and the use of filters were applied.	
376	**Reports**	The 'back' button on reports was not working. This has been corrected.	
377	**SDN**	NEW FUNCTIONALITY: SDNs cannot be submitted (review completed) by the Region or NERC unless all the elements are in the same state (for regions, accepted or rejected; for NERC concurred or conflicted). In cases where they are not in the same state, a validation rule will tell the user they must split them to make each SDN only contain elements in the same state.	
378	**SDN**	NEW FUNCTIONALITY: At the element level there is now a "pass" button next to 'concur' or 'conflict' to indicate when NERC elects not to review an SDN. The status can now be 'concur, conflict or pass'.	

379	**SDN**	NEW FUNCTIONALITY: The SDN will drop into SD in NERC review as soon as the region completes their initial review.	
380	**SDN**	NEW FUNCTIONALITY: The SDN is considered 'Archived' if NERC Concurs (Reject-Concur) with the regional rejection of the SDN. The term "Archived" has been be replaced with "Terminated."	
381	**SDN**	NEW FUNCTIONALITY: If NERC Passes (Reject-Pass) on the SDN (by clicking a new 'Pass' button within the SDN screen for NERC users), the SDN is considered 'Archived.' The term "Archived" has been be replaced with "Terminated."	
382	**SDN**	NEW FUNCTIONALITY: If NERC Conflicts (Reject-Conflicted) with the regional rejection of the SDN, the SDN is considered 'Certified'.	
383	**SDN**	NEW FUNCTIONALITY: If NERC Concurs (Accept-Concur) with the regional acceptance of the SDN, the SDN is considered 'Certified'.	
384	**SDN**	NEW FUNCTIONALITY: If NERC Passes (Accept-Pass) on the SDN (by clicking a new 'Pass' button within the SDN screen for NERC users), the SDN is considered 'Certified'	
385	**SDN**	NEW FUNCTIONALITY: If NERC Conflicts (Accept-Conflicted) with the regional acceptance of the SDN, the SDN is considered 'Archived.' The term "Archived" has been be replaced with "Terminated."	
386	**SDN**	NEW FUNCTIONALITY: The system shall have the following Status: NEW RE Review Complete (accepted/rejected); NERC Review Complete + (accepted/rejected, based on concatenation of both RE and NERC review	Overall changes to clarify state, status, and the use of filters were applied.
387	**SDN**	NEW FUNCTIONALITY: The system shall have the following Stages: Regional Review, NERC review and <Blank>.	Overall changes to clarify state, status, and the use of filters were applied.
397	**SDN**	General clean- up of the UI needed to ensure consistency and accuracy- the SDN screen still shows 'Exception Request' labels. These incorrect references were removed.	

398	**SDN Regional Review**	The language under the Elements tag of a SDN was corrected to align with the buttons (the Region Status in the grid should be 'Accepted' not 'Approved'.	
400	**Dashboard**	The dashboard was changed to include abbreviated types to SDN and ER (SDN-I and SDN-E, ER-I and ER-E).	
402	**Reports**	The 'IsRF' flag in the export report has been changed to "IsRFC," and now accurately reflects the status..	
404	**Reports**	The internal and external IDs were added to the Export reports.	
405	**Reports**	The 'Elements' Report was not displaying the 'Current BESnet Definition Status'; this has now been fixed.	
406	**Reports**	The Excel Export report is only exporting 100 characters for text fields. We have expanded this to allow for more data to be shown.	
407	**Reports**	'Is Rejected' and 'Is Approved' values displaying incorrectly in export report. The report was fixed and data is reflecting as needed.	
408	**Splits**	NEW FUNCTIONALITY: The ability to split an SDN in 'NERC Review' was enabled.	
409	**ER, SDN**	The 'Elements' table in the Documents tab was removed. This table was removed as it caused problems for entities including lots of elements in a single submission.	
410	**Reports**	An Administrative version of the Element Export report was created for the NERC admin role.	
411	**SDN Printed Report**	The primary and secondary voltages reported on the summary were incorrect. This has been corrected to display the correct voltages.	Known defect 401 applies; voltage is displayed as HVDCxxx, where xxx is the correct voltage.
412	**ER/SDN**	The Counter used to create the last five digits of the ER identifier was based on record counts, and incorrectly assigned the same number to multiple requests. This resulted in an error display to the user. The counter has been modified to eliminate this problem.	Note that if an SDN or ER is returned to draft, when it is resubmitted, it will be assigned a NEW ID.

413	**Reports**	An Administrative version of the ER Export report was added for the NERC Admin role.	
429 **Z#619**	**Element Export (Production Issue)**	Data reflected in the Element Report was inaccurate. The report has been corrected to ensure the correct data is being displayed.	
432	**Reports**	The System Administrator was given access to view the Full data reports from the UI.	
433	**UI**	The address on the Help Link in BESnet was changed to reflect: http://www.nerc.com/pa/RAPA/Pages/BESnetHelp.aspx	
486 **Z# 640**	**SDN**	An attempt was made to create a notice of Self Determination for Potomac Electric Company which has a Washington DC address. Drop down menu for states did not contain DC as a selection.	The District of Columbia and Canada were added to the drop down menu for address information.
xxx	**Add Element**	Changes were made to the labels related to ratings. MVA Rating- For Element Types, field and optionality was modified as follows: GEN (Gross Nameplate Rating in MVA, Req'd) CKT (Normal Rating in MVA, Req'd DC Conv (Normal Rating in MVA, Req'd) Shunt (Normal Rating in MVAR, Req'd) Network (NA, Not Req'd)	
yyy	**Add Element**	ID- For Element Type Circuit, ID (Circuit ID) was changed to be a required field.	
SSF	**Terminated filter**	Incorrect assignment/filtering of a Challenged ER was corrected.	
SSF2	**Challenge filters**	The UI was adjusted to make 'Challenge' and filter information clear (i.e., show the decisions made during the challenge phase).

Introduction

NOTE: This pre-implementation manual ONLY addresses Account Management for Registered Entities and Submittal of Self-Determined Notifications. As we near the July 1, 2014, implementation date, additional sections will be made available regarding other parts of the process and application.

Entity Administrator accounts should be the first accounts set up within the BESnet Application. Once the Primary Compliance Contact has established his or her Entity Administrator account, they can then work with the other individuals within their companies to set up additional User and Administrator accounts.

This user manual provides a guided walkthrough to illustrate the BES Notifications and Exceptions Tool (BESNet). The system provides a workflow-based process that emulates the BES Exceptions Procedure, as outlined in NERC RoP Appendix 5, to route, evaluate and take actions on Exception Requests and Self-Determined Notifications.

Users have the ability to login to a secure portal and create both Exception Requests and Self-Determination Notifications. Depending upon the selection, the user is provided with the appropriate Exception or Self-Determination form to which they are able to provide details regarding the Request / Notification. Each form captures the relevant details for the Submitting and Owning Entities, Inclusion and Exclusion rules, Element Descriptions and one or more elements.

Upon completion of the form, the Entity is able to submit the Request / Notification. The system will automatically notify all appropriate parties of the submission. This includes Submitting and Owning Entities, Scope of Responsibility Entities, Regional Entities and NERC. BESNet provides facilities for Regional Entities to acknowledge Notificaton elements and process Exception Requests, request and receive supplemental information, alert and notify participants, issue recommendations, and monitor periodic re-certification of requests. In addition, NERC can create proposed and final decisions, as well as manage appeals to those decisions.

Queries have been created for accessing information about Exception Requests and Notifications enabling the BESNet to produce a list of facilities and Elements for which: 1) exceptions to the definition have been granted and 2) self-determination Notifications have been submitted. NERC will publicly post reports on its website that will provide interested persons, including applicable governmental authorities, information regarding submitted Exception Requests that may be of interest to them.

BESNet Program Cautions

The following cautions should be followed when using the BESNet program.

A. DO NOT use the back button in your browser.

B. Be sure to scroll right and left within your browser (depending on your screen resolution) to ensure that all required information can be entered in the browser.

Version History

The following is the history of changes to this document.

Version	Date	Change(s) Made	Change Tracking
1-0	May 9, 2014	Initial Release – User Account Management Section only	
1-1	June 19, 2014	Incremental Release – Addition of Submittal of Self-Determined Notifications	

User Account Management

Introduction

The BESNet application operates within the framework of the ERO Enterprise Platform, which includes several applications, such as the NERC Standards Balloting System.

Note – If you already have an ERO Platform Account (for the new Standards Balloting System), please proceed to Setting up New Account in the BESNet Application section of this User Guide.

When creating accounts, it is essential to make sure your Entity Administrator account is set up before any other accounts. Your Entity Administrator should be the person who is registered with NERC as your Primary Compliance Contact (PCC). Requesting accounts before the Entity Administrator account is set up will result in having to re-register those accounts later.

Creating a New Account

If you do not have an existing ERO Platform user ID, you will need to create a new account for the BESNet application. The new user must supply user profile information and identify the organization the user represents.

Once an account is created, an administrator will vet the user as a person for role-based, individual access to the system. Once vetted, a user will be notified through email that they can login to the system.

Creating Account Step 1: User Name and Password

Navigate to the following URL:

https://BESNET.EROENTERPRISE.COM

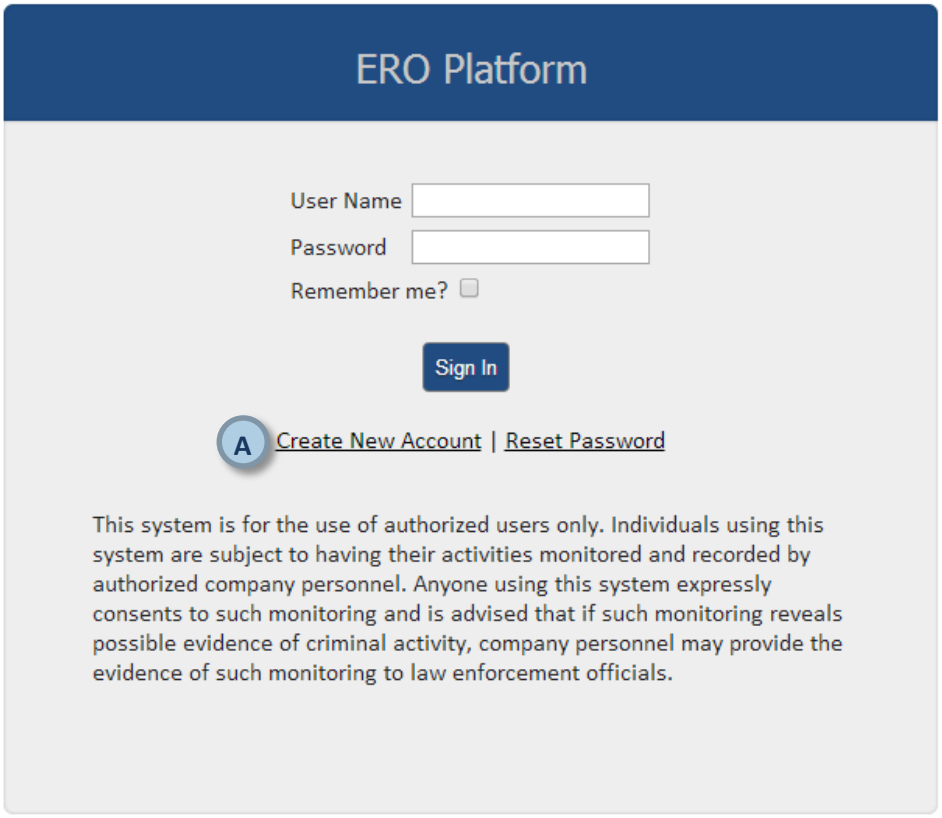

Figure 1: ERO Platform Login Screen

A. Click on **Create New Account** (A). The following screen will appear.

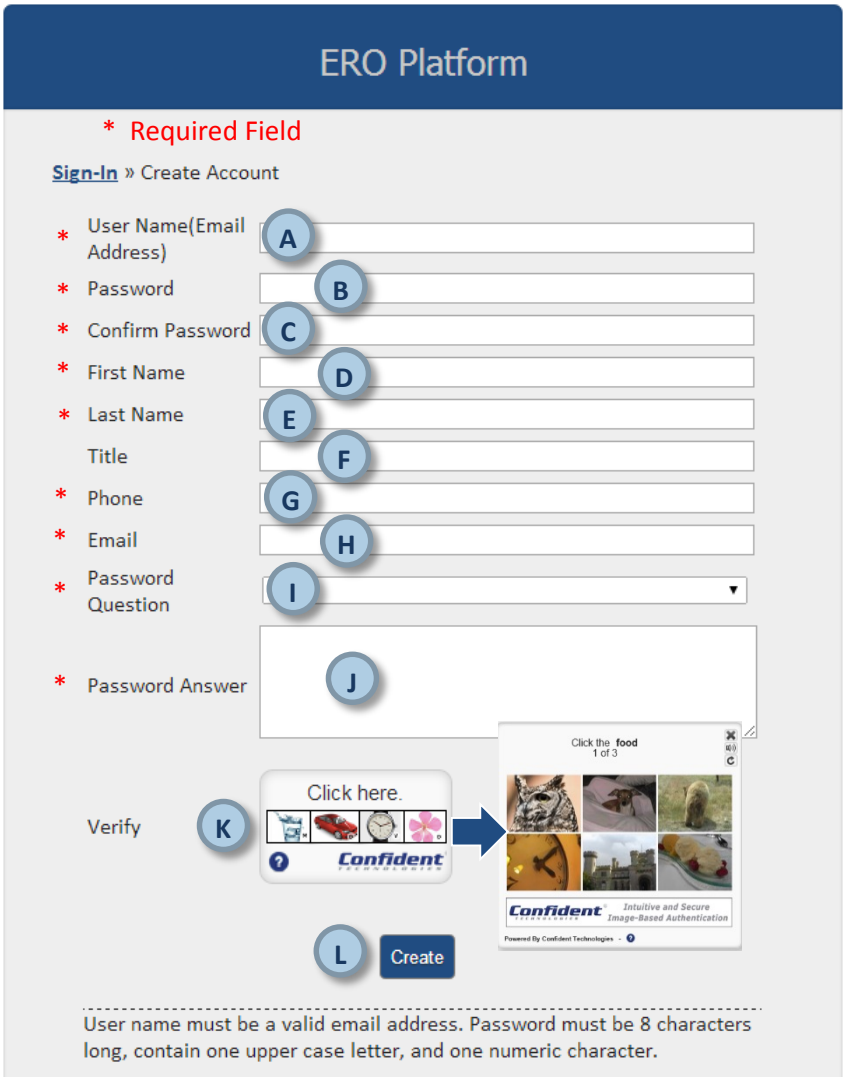

Figure 2: Create Account Screen

To create a new account,

A. Enter a **User Name** (MUST be a business email address - this can be the same email in step H).
B. Enter a **Password**. As the on-screen instructions indicate, this password:
    a. Must be at least eight (8) characters in length.
    b. Must contain at least one uppercase letter.
    c. Must contain at least one numeric character.
C. Re-enter the **Password**.
D. Enter the user's **First Name**.
E. Enter the user's **Last Name**.
F. Enter the user's **Title**.
G. Enter a valid business **Phone Number** where the user may be reached.
H. Enter an **Email Address**. This ***MUST*** be a valid email address, as it will be used to send ***ALL*** notifications of actions and status updates within the system. Both **User Name** and **Email Address** may be the same.

NOTE: Changing this field does not change a user's username.

I. For security purposes, select a **Password Question** from the list of questions.

J. Enter the **Password Answer** to the security question (I).

K. Select the **Verify** icon (K). Several images display. Select the correct image of each description as instructed until all three pictures have been verified.

L. Click the **Create** button (L).

Creating Account Step 2: Verify Account

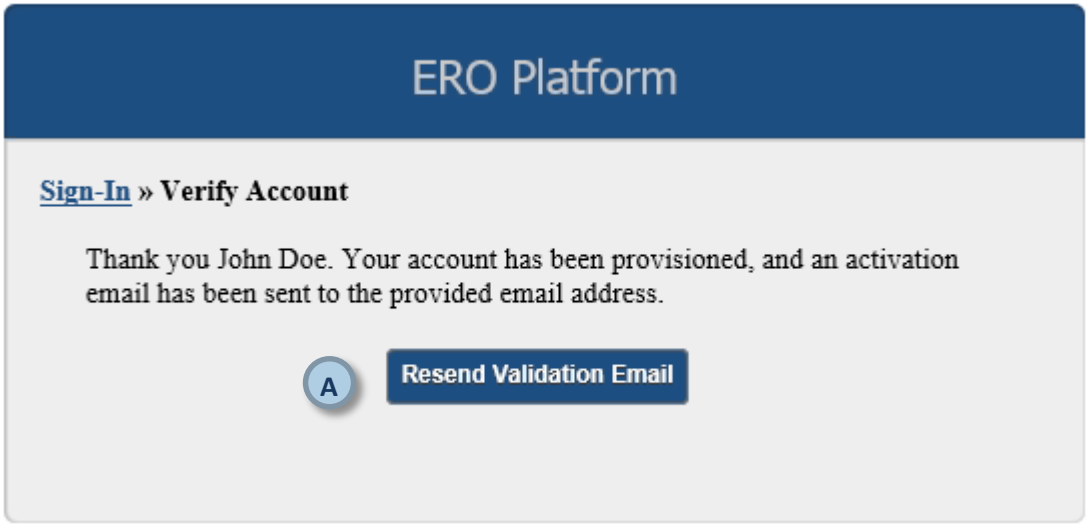

Figure 3: Verify Account Screen

Upon successful verification of the account information provided on the **Create Account** form, a verification email will be sent to the email account used to create your user account.

A. If you have not received the activation email, SELECT the **Resend Validation Email** (A) to have the activation email resent to the email address provided.

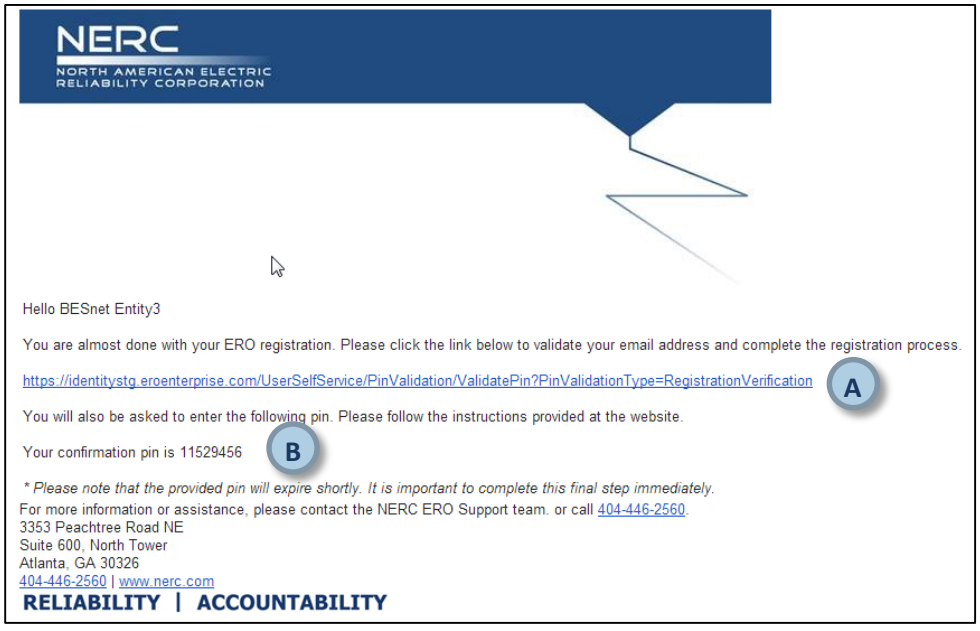

Figure 4: Sample Activation E-Mail

A. Click on the **link** (A) provided in the verification email above. The following screen will appear:

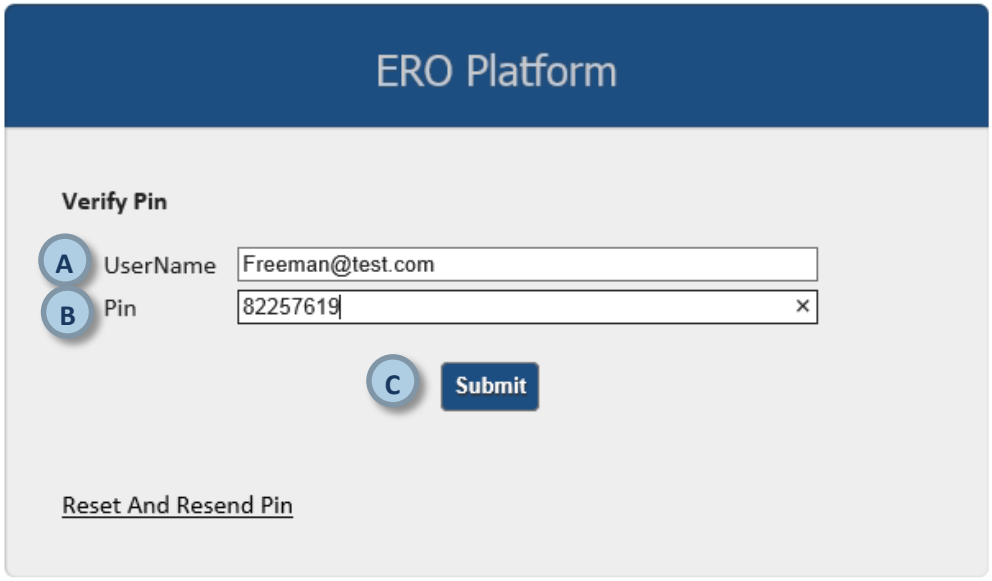

Figure 5: PIN Verification Screen

A. Enter your **User Name** (A).

B. Enter the **PIN** (B) contained in the verification email.

C. Click **Submit** (C).

PIN Expiration Procedure

If the PIN has expired, the following screen will appear:

NOTE: PINs expire 60 minutes after issuance.

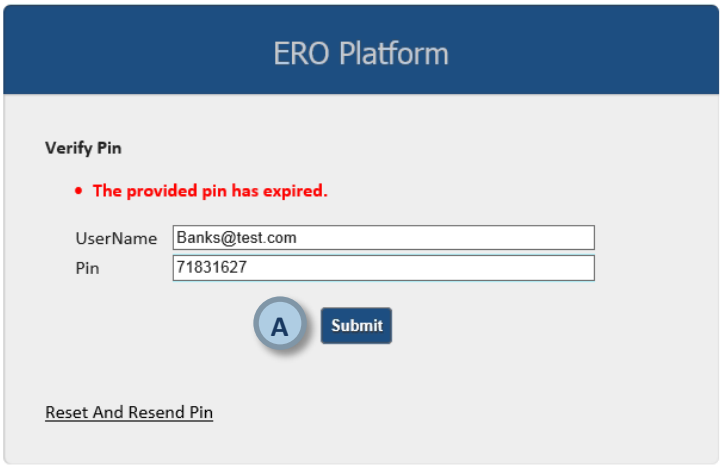

Figure 6: PIN Expiration Screen

A. Click on **Reset and Reset PIN** (A). A new verification email will be sent with a new PIN.

Once you have successfully created a user ID and it has been verified, the **ERO Platform Screen** will appear.

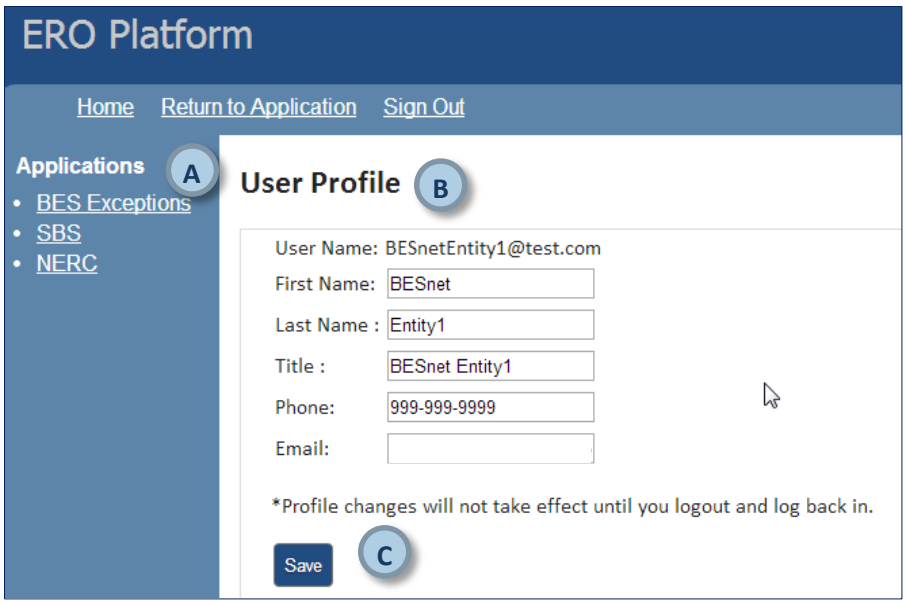

Figure 7: ERO Platform Screen

A. To enter the BESNet application, click on **BES Exceptions** (A).

B. At this screen, you also have the opportunity to modify your User Profile (B).If you have updated your profile, click **Save** (C) to save the changes.

   Note: You will have to logout of the application and log back in for the profile changes to take effect.

Logging Into the BESNet Application

For users who already have an account with BESNet, navigate to the following URL:

https://BESNET.EROENTERPRISE.COM

A. Enter the **User Name** (A).

B. Enter the **Password** (B) entered during the user registration process defined in Section **Creating a New Account.**

C. If desired, check the **Remember me?** (C) Checkbox, which gives permission for the system to remember the credentials entered.

D. Once completed with these fields, complete the login process by pressing the **Sign In** (D) button.

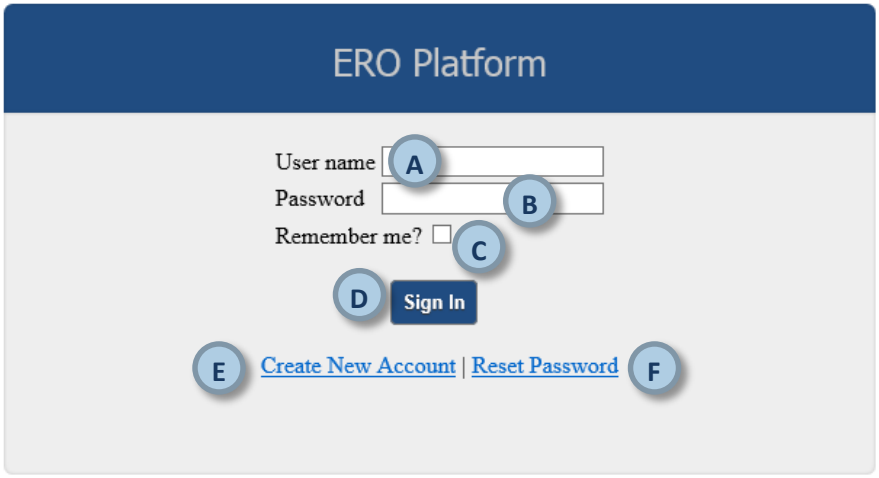

Figure 8: ERO Platform Log-In Screen

For users who do not have an account:

E. Click the **Create New Account** (E) link. See Section **Creating a New Account** for more details.

To reset your password.

F. Click the **Reset Password** (F) link. See Section **Resetting the User Password** for more details.

Selecting the User's Entity to Use

If the user has been vetted as a representative for more than one Entity, the user will first be prompted to select the Entity they wish to represent for the current session. Users who are only vetted for a single Entity will skip this step.

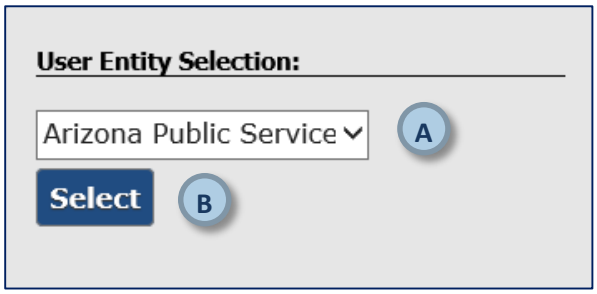

Figure 9: User Entity Selection Screen

To identify the Entity the user will represent during this session:

A. Select the **Entity Name** (A) from the Entity list. Only those for which this user has been vetted will appear.

B. Click the **Select** (B) button.

Setting up Your BESNet Application Account

Once your BESNet User ID has been established, you will need to finish setting up the functions of the new account.

Navigate to the BESNet application: https://BESNET.EROENTERPRISE.COM. You will be shown your user profile.

Select the BES Exceptions tab on the left (A) of the **ERO Enterprise Platform Entry Page**.

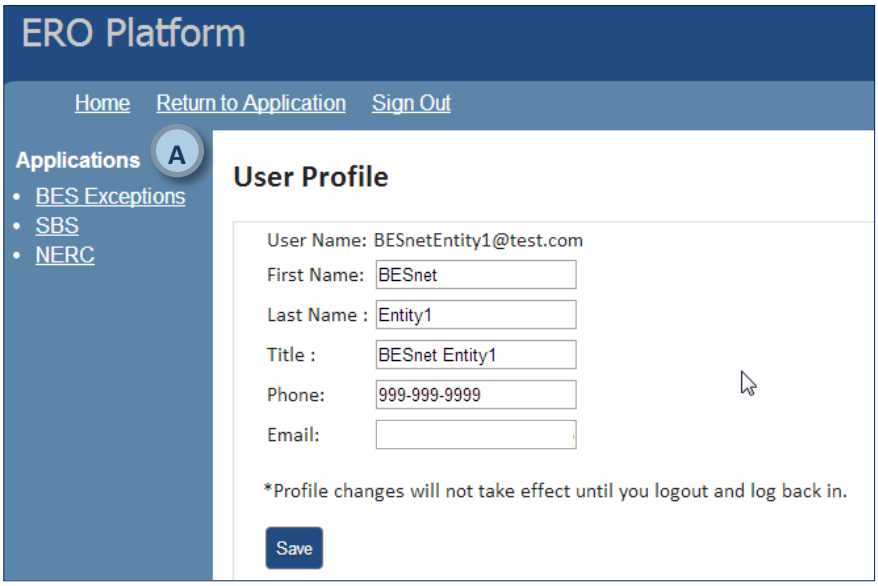

Figure 10: ERO Enterprise Platform Entry Page

Account Setup Step 1: Select Account Type

You must select an **Account Type**. Registered Entities may only select the Registered Entity account type.

A. Select Registered Entity as your **Account Type** (A).

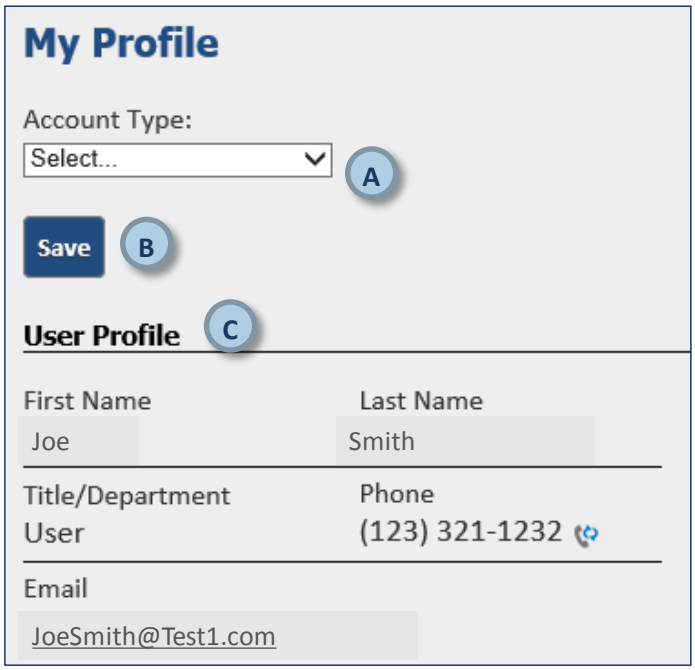

Figure 11: Account Type Selection Screen

Account Type	Description
Registered Entity	Accounts for members of the entities registered with NERC and/or the national Regions. Includes members of submitting, owning, and scope of responsibility entities.

NOTE: Each user account may only be created for a single account type. Account type selection is only available one time following new account creation. ***The account type cannot be changed once it has been selected.***

B. Click the **Save** button (B). This will take you to the **My Profile** screen.

NOTE: The user's profile information entered during the first step of account creation appears in the ***User Profile*** *area (C).*

Account Setup Step 2: Association of Account with Entities

The next step in the registration process is to associate the user's account with one or more Entities on the **My Profile Screen**.

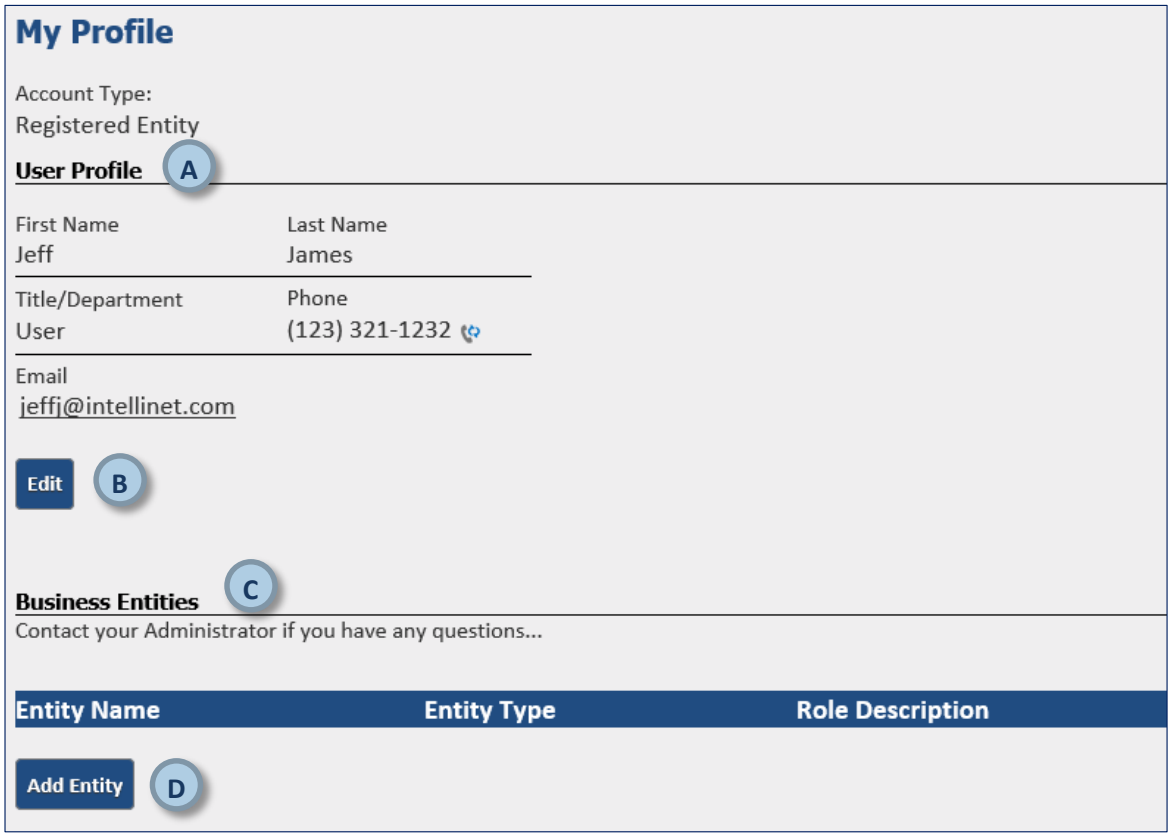

Figure 12: My Profile Screen

The next step in the registration process is to associate the account with one or more Entities.

A. View the User Profile information in the **User Profile** section (A).
B. If desired, edit the **User Profile** information by clicking the **Edit** button (B). See the **Editing Your User Profile** section for further details.
C. View the listing of the **Business Entities** (C) with which the account is currently associated in the **Business Entities** list. When initially registering, this list will be empty.
D. To associate the account with an Entity, click the **Add Entity** button (D). This displays the **Entity Listing Screen** allowing you to select the Entities to be applicable to this user.

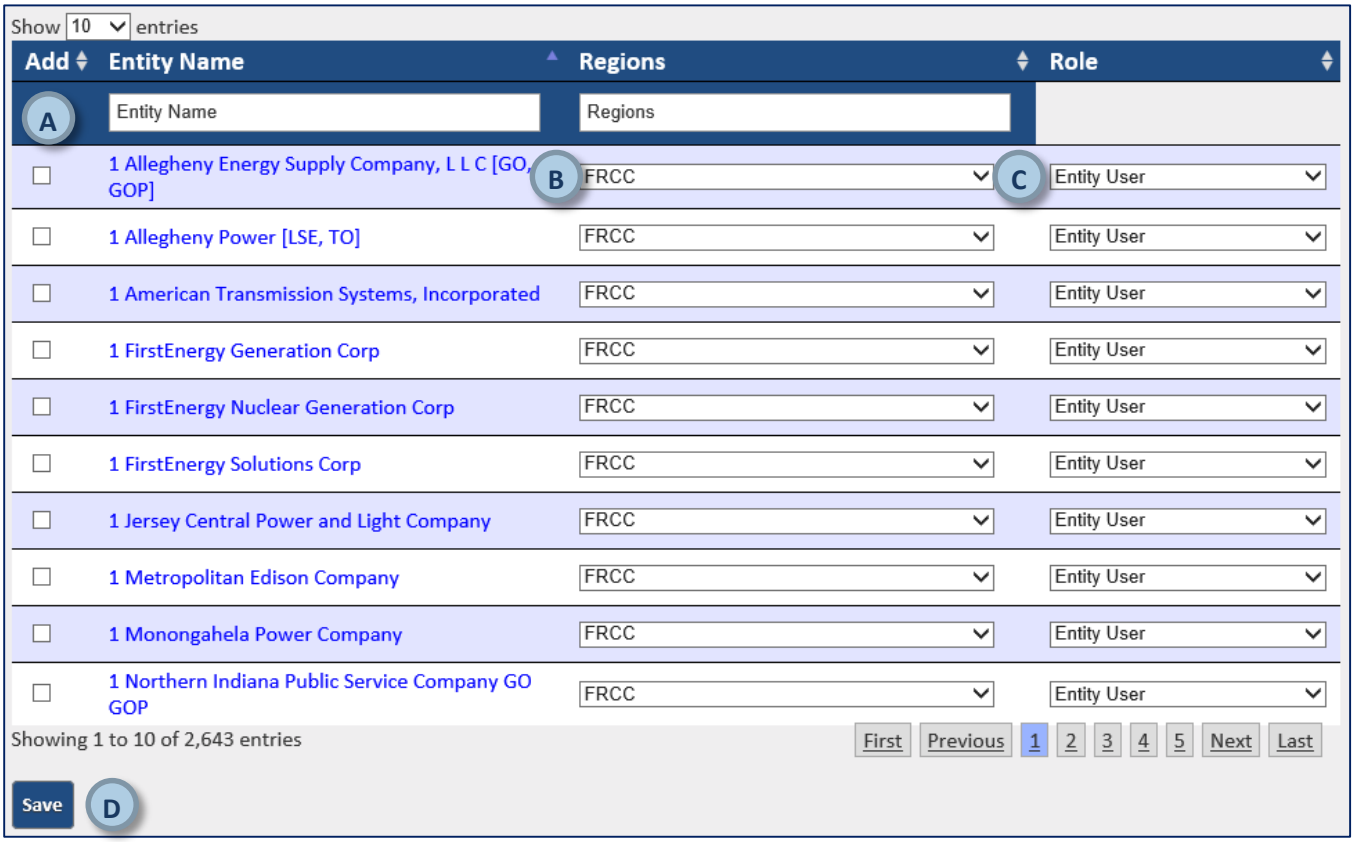

Figure 13: Entity Selection Screen

A. From this list, select the Entity to associate with the account by clicking the checkbox to the left of the Entity record, in the **Add** column (A).

   a. The Entity listing can be filtered by typing in the **Entity Name** filter textbox in the header (directly beneath the **Entity Name** label).

B. Select the **Region** (B) that will be responsible for vetting the user account if an administrator for this Registered Entity does not yet exist in the system. (If there is an Entity Administrator role already associated to the Registered Entity, a vetting request will be sent to that Entity Administrator).

   NOTE: Choosing the Regional Entity in this screen does not associate a Registered Entity to a Region within the system; this is only used for vetting requests for account access.

   NOTE: If you do not see your Entity listed in the list, contact your Regional Entity.

C. Select the **Role** (C) the account will perform for that Entity. Roles are:

   a. Entity User: A general user of the system.

   b. Entity Administrator: A user who has the ability to vet user accounts for that Registered Entity, as well as perform all functions of the Entity User role.

   NOTE: The system does not allow a user to change his or her role for an Entity. Instead, the Entity Administrator must remove the user's association with the Entity, after which the user must submit a new request to be associated to the Entity with the new role.

D. **Repeat steps A through C for each Entity to be associated with the account**. When complete, click the **Save** button (D). This will bring up the **Vetting Request Confirmation Screen**. This confirms your request

to be vetted by the Entity Administrator(s) associated for each selected Entity (See the **Vetting Users** section for further detail) and the following screen will be displayed.

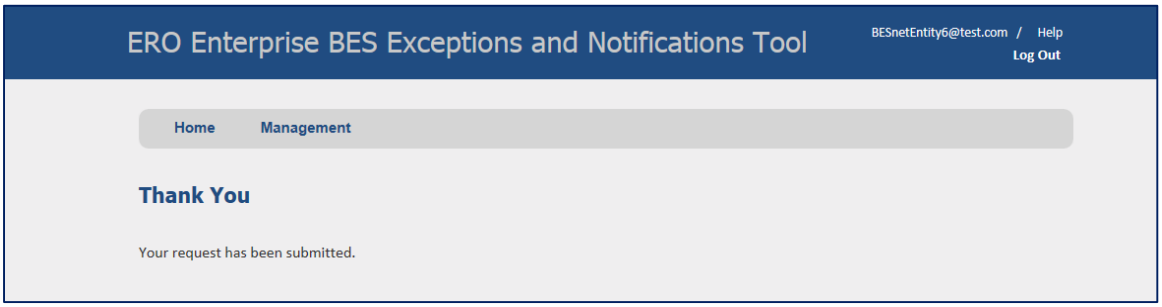

Figure 14: Vetting Request Confirmation Screen

The Entity User will be notified by e-mail when each association request has been vetted (approved or rejected).

If a request for association with an Entity has been rejected, there will be an e-mail notification that you have been rejected.

If the user has not received a vetting response within five business days, contact your Regional Entity or your Entity Administrator.

Once the account user has received notification that the request has been vetted and approved, the user will see the Entities associated with his account in the **My Profile Screen (A)**.

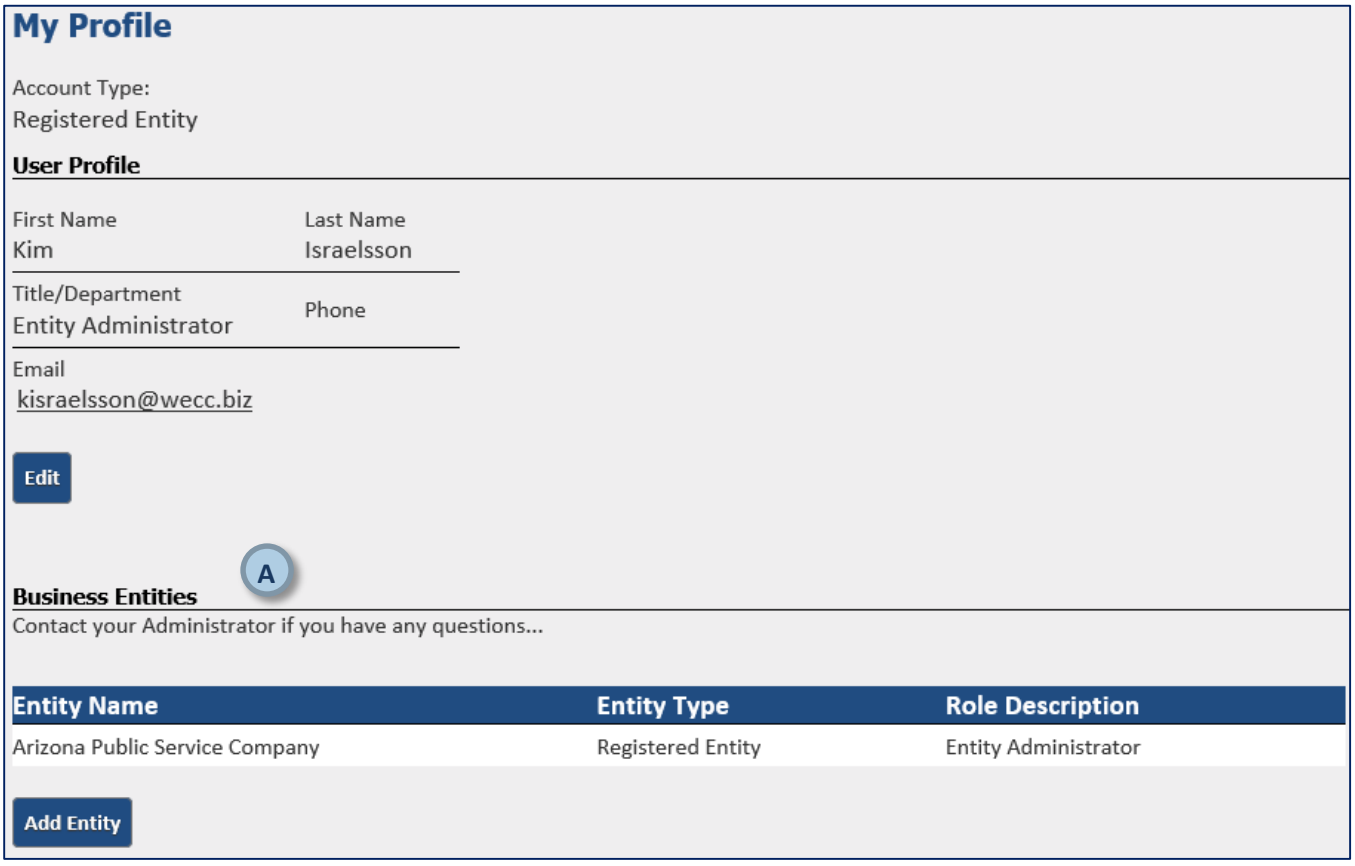

Figure 15: My Profile Screen with Entity Association

The user can then access the information for that Entity in the BESNet application.

Editing Your User Profile

To update your User Profile, enter the desired update(s) in the appropriate field on the **User Profile Screen** and press **Save** (A).

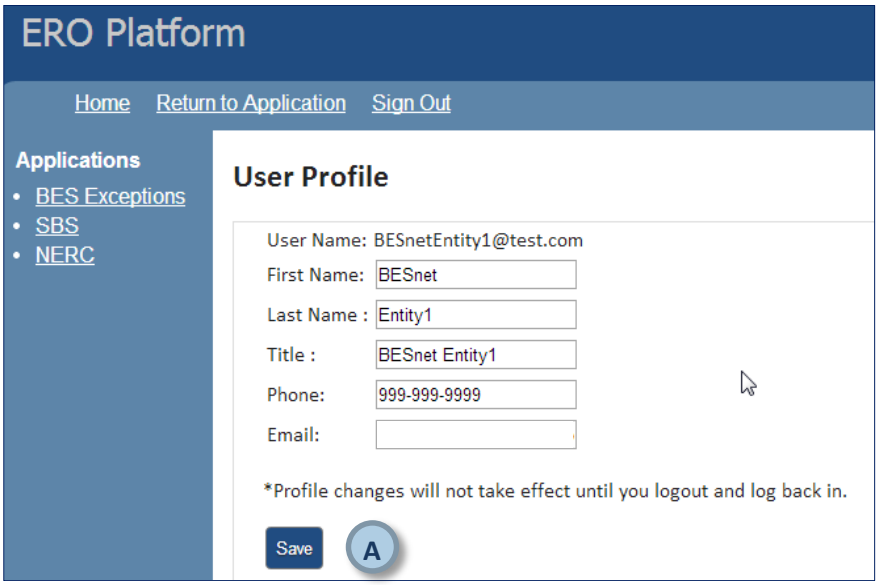

Figure 16: User Profile Screen

If your profile changes have been successful, the **Profile Update Confirmation Screen** will be displayed.

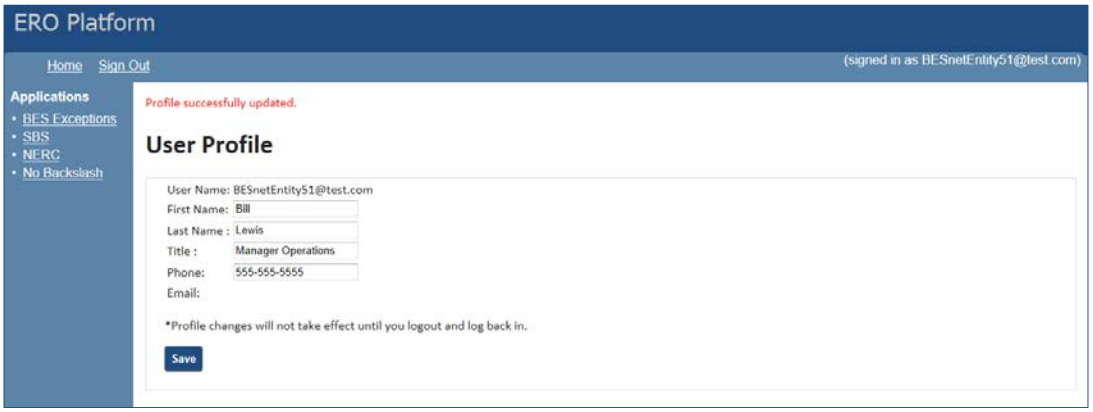

Figure 17: Profile Update Confirmation Screen

Log out and back into the BESNet application.

NOTE: Profile changes will NOT take effect until you log out and log back into the BESNet application.

Password Management

Changing User Password

A. If a User wishes to change his password, he should hover over the **User** tab in the header of the **BESNet Dashboard** and then click on the **My Profile** tab in the dropdown. This will bring you to the **My Profile Screen**.

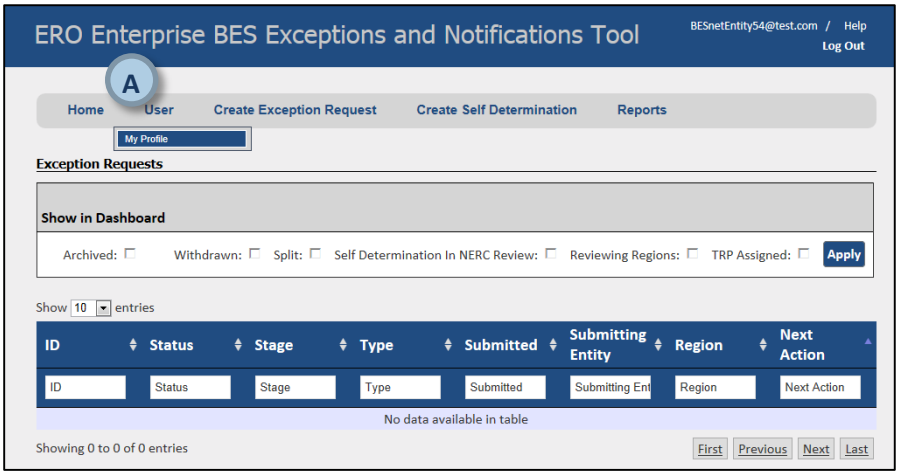

Figure 18: BESNet Home Page

B. Click on the **Edit** button (A) on the **My Profile Screen**. This will bring you to the **User Profile Screen**.

Figure 19: My Profile Screen

C. Click on the **Reset Password** link (A) under **Password** on the **User Profile Screen**.

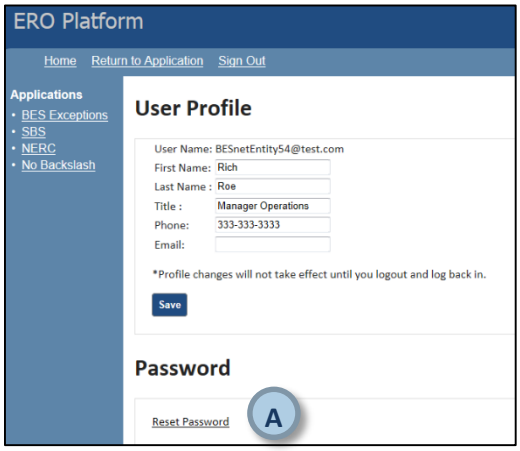

Figure 20: User Profile Screen

D. Continue from **Step B** of the **Forgot/Resetting the User Password** instructions below.

Forgot/Resetting the User Password

If a user has forgotten his password, the password must be reset.

A. To reset a user's password, the user should select **Reset Password** (A) from the **ERO Platform Log-In Screen**. The system then displays the **Password Reset Screen**.

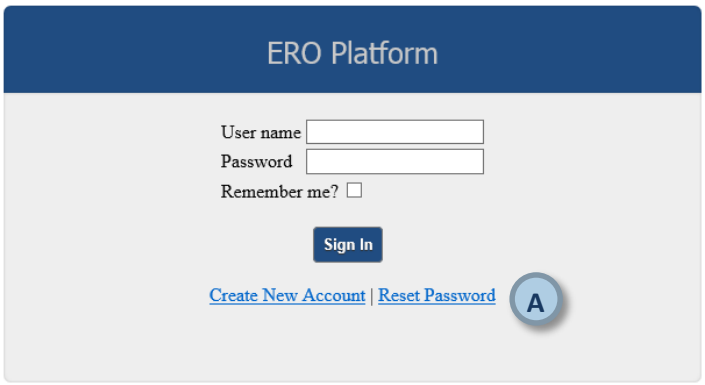

Figure 21: ERO Platform Log-In Screen

B. From the **Password Reset Screen**, the user can
- Enter the **User Name** (A).
- Enter the **Email Address** (B) associated to the Account
- Select the **Verify** icon (C). Several images display. Select the correct image of each description as instructed until all three pictures have been verified.
- Click the **Submit** (D) button.

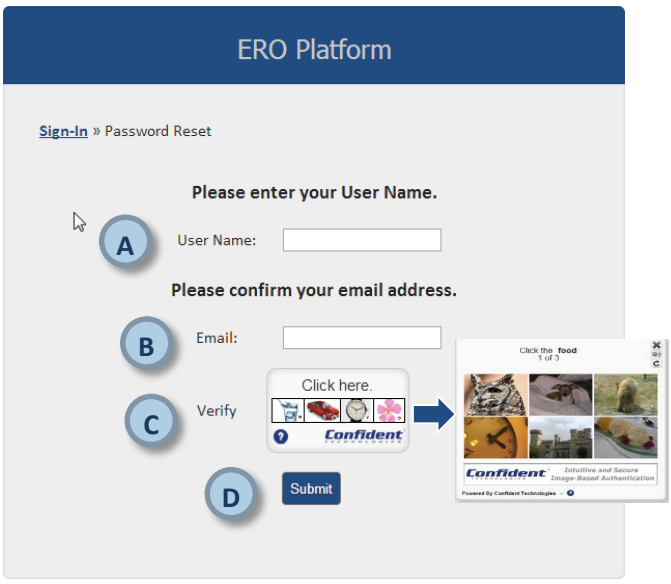

Figure 22: Password Reset Screen

C. The BESNet application will send a **Password Reset Request E-mail** to the user and display the **Password Reset Validation Screen**. If necessary, the user can request that the **Password Reset Request E-mail** be resent pressing the **Resend Validation Email** (A).

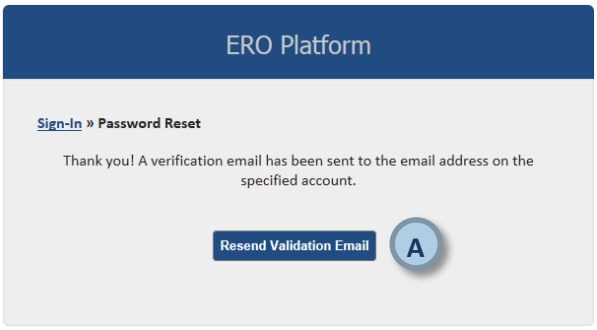

Figure 23: Password Reset Validation Screen

D. The user should then copy the **Confirmation Pin** (A) and click on the **URL** (B) for to change the password

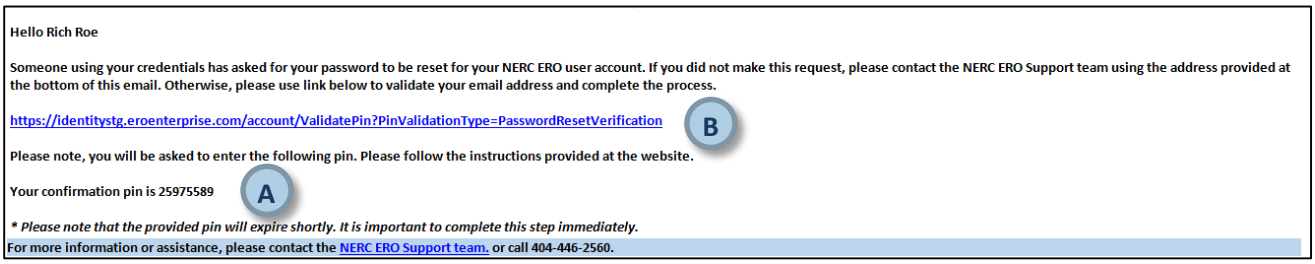

Figure 24: Password Reset Request E-mail

E. The user should then enter his **User Name** (A) and paste the **PIN** (B) on the **Verify Pin Screen** and press **Submit** (C).

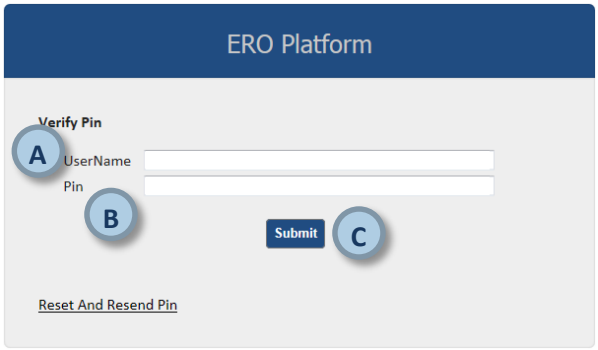

Figure 25: Verify Pin Screen

F. Once the PIN has been entered, the user must enter the **Password Answer** (A) selected during the registration process and click the **Submit Question** (B) button on the **Password Recovery Screen.**

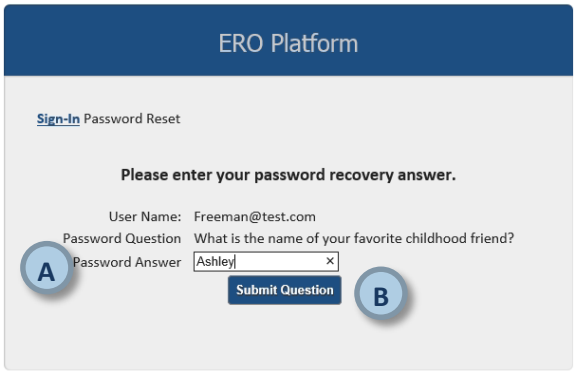

Figure 26: Password Recovery Screen

G. The user should then enter the desired **New Password** (A), Confirm Password (B), and click the **Save Password** (C) button on the **Enter Net Password Screen**.

Figure 27: Enter New Password Screen

H. The BESNet application will send a **Password Change Confirmation E-mail** to the user and display the **User Profile Screen**.

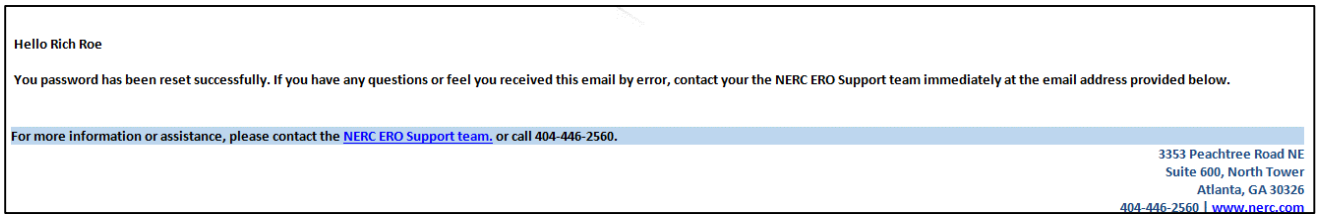

Figure 28: Password Change Confirmation E-mail

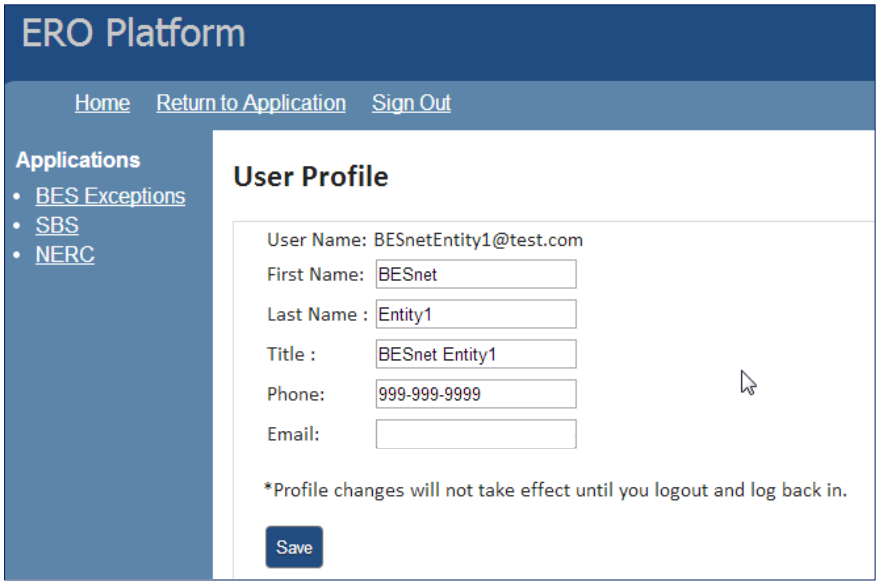

Figure 29: User Profile Screen

Managing Your User Account Properties

A user of the BESNet application can manage their account properties whenever they are logged on to the system. This allows them to edit their user profile or associate themselves with a new Entity. User can access their user account properties in one of two ways:

A. Clicking on the **User Name** in the upper right corner of the BESNet application screen.

Figure 30: BES Application Screen Header

A. Selecting **User > My Profile** from the dashboard menu.

Figure 31: Dashboard Menu Detail

These will display the **User Profile Management** screen.

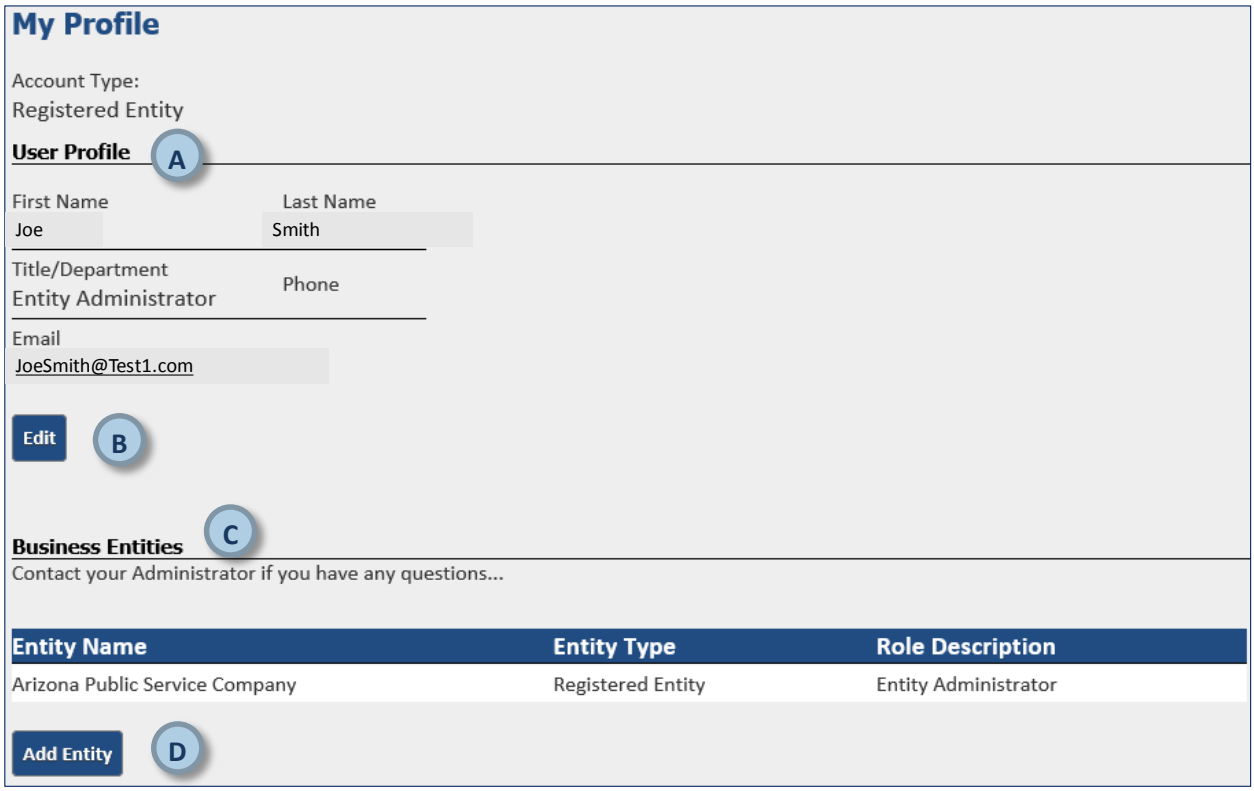

Figure 32: User Profile Management Screen

From here the user can:

A. View the **User Profile** (A) information.

B. Edit the **User Profile** information by clicking the **Edit** button (B).

C. View the listing of **Business Entities** (C) for which the user has access or has requested access.

D. Add an additional Business Entity request, by clicking the **Add Entity** (D) button.

Logging Out

To log out of the system, click the **Log Out** link (A) at the upper right of the BESNET system screen.

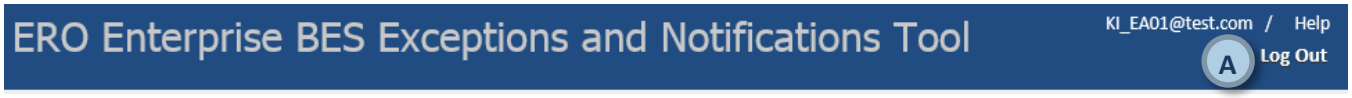

Figure 33: BESNet System Screen Header

Administrator User Account Management

Administrative User Management

The Administrator of a Registered Entity has the ability to vet new user account requests and manage users' roles within the Entity.

The Administrator will be notified by email of new user account requests.

To perform this function, on the **BESNet Dashboard** the Administrator should click **User** > **User Administration** pull-down menu (A).

Figure 34: BESNet Dashboard Header

Vetting New Users

On the **User Management Screen**, the Administrator will see a **Vet Requests** list, containing a listing of all users who have requested accounts associated with the Registered Entity for which the user has Administrative privileges.

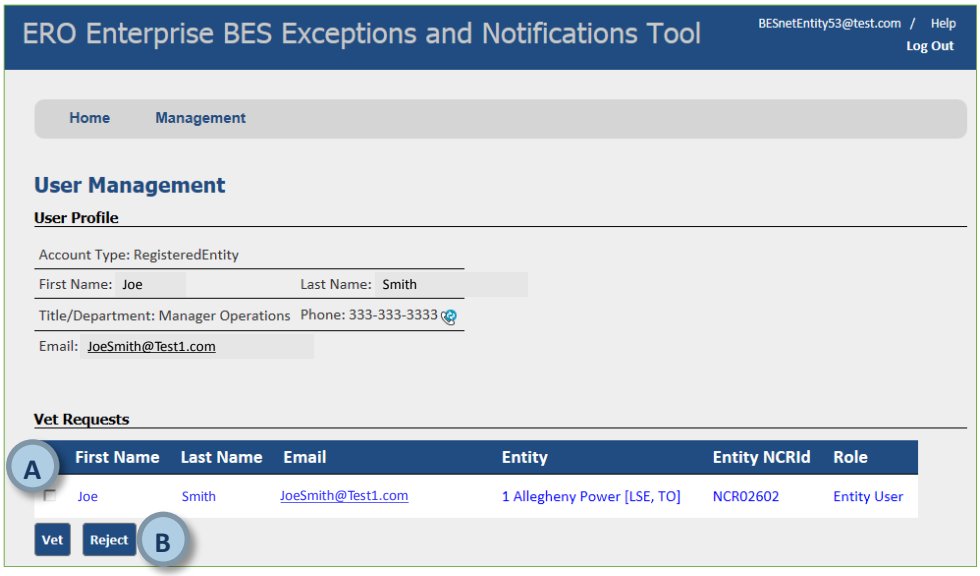

Figure 35: User Management Screen

A. Check the checkbox (A) next to each record to select it as one to approve or reject.

B. To approve the selected request(s), click the **Vet** button (A).

C. To reject the selected request(s), click the **Reject** button (B).

The decision to approve or reject the request will be e-mailed to the user.

User Role Management

The Administrator is responsible for management of the roles of all of the users within his purview.

A. To perform this function, on the **BESNet Dashboard** the Administrator should click **User** > **User Administration** pull-down menu (A). This will bring you to the User Management Screen

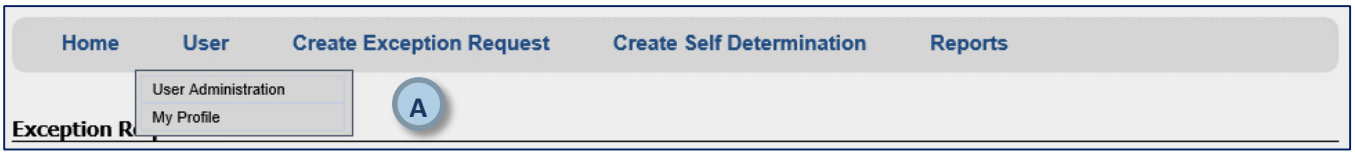

Figure 36: BESNet Dashboard Header

The **User Management** on the lower part of the **User Management Screen** displays a list of all users for which the user has Administrator privileges.

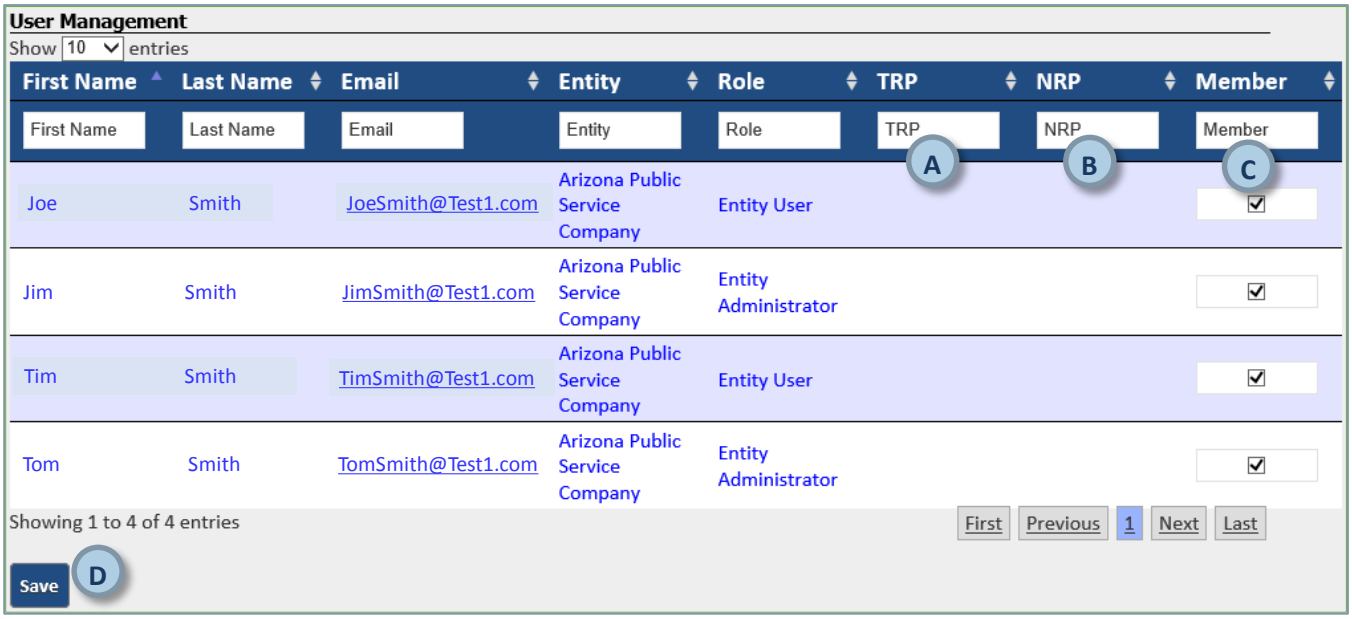

Figure 37: User Management Screen

A. The **Technical Review Panel** (TRP) membership can only be set by a **Regional Administrator**, and therefore cannot be set here.

B. The **NERC Review Panel** (NRP) membership can only be set by a **NERC Administrator**, and therefore cannot be set here.

C. To disassociate a user account from the Entity, uncheck the **Member** checkbox (C) for that account/Entity relationship. By default, all vetted members appear checked in the **Member** checkbox (C).

D. Once all the role changes have been made, click the **Save** button (D).

BESNet Dashboard Overview

The **BESNet Dashboard** is the home screen for the BESNet application. The Dashboard is displayed when a user first logs in and at any point when the **Home** link is pressed.

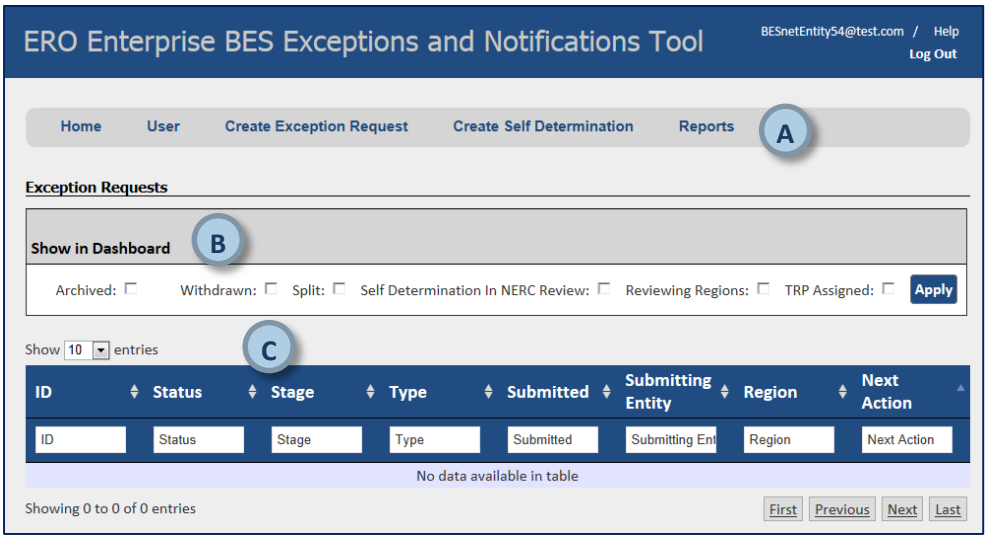

Figure 38: BESNet Dashboard

A. The **Dashboard navigation bar** (A) contains the following options:

   a. **Home:** Returns the user to the Dashboard

   b. **User:** Provides options for user management and account management.

   c. **Create Exception Request:** Starts the process for creating a new Exception Request.

   d. **Create Self-Determination:** Starts the process for creating a new Notification of Self-Determination.

   e. **Reports:** Contains options for reporting.

   NOTE: Some options may not appear, based on a user's role in the system.

B. The **Show in Dashboard** Filter (B). By default, Exception Requests that are archived or withdrawn, or that have been split and are therefore no longer active, do not appear in the Exception Requests listing. This filter allows the user to include any or all of these Exception Requests in the listing by checking the box next to the Exception Request state that should be included. These operate as follows:

   a. **Archived:** When checked, the dashboard will include Exception Requests that have been archived, cancelled, or terminated.

   b. **Withdrawn:** When checked, the dashboard will include Exception Requests that have been withdrawn; that is, those submitted to Initial Review, but then rescinded by the Submitting Entity.

   c. **Split:** When checked, the dashboard will include Exception Requests that have been split into one or more newer Exception Requests, and exist as a historical record.

      *NOTE: For more information about Split Exception Requests, see sections on **Splitting an Exception Request** or **Recertifying an Exception Request**.*

   d. **Self-Determination in NERC Review***: When checked, the dashboard will include any Notifications of Self-Determination that are awaiting NERC's review.*

C. The **Dashboard List** (C) contains a list of all **Exception Requests** and **Notifications of Self-Determination**. Here, the user can:

   a. Change the number of records that appear in the list, by changing the **Show in Entries** value.

   b. Change the display order of the entries in the list, by clicking on the header of each column.

   c. Filter the contents of the list, by entering text into the text boxes underneath each column header.

   d. Open a record, by clicking on the **Status** link.

   e. Navigate through the pages in the list, by clicking the navigation links to the bottom right of the listing.

Notifications of Self-Determination

Creating a Notification of Self-Determination

The BESNet application is the vehicle for officially notifying a Regional Entity of a self-determination of a change of status for an Element when applying the BES Definition.[1]

To start, click the **Create Self-Determination** pull-down (A) on the **Dashboard Menu**, and choose whether the Notification of Self-Determination is **For Inclusion** or **For Exclusion**. This will bring the user to the **Create Notification of Self-Determination Screen**.

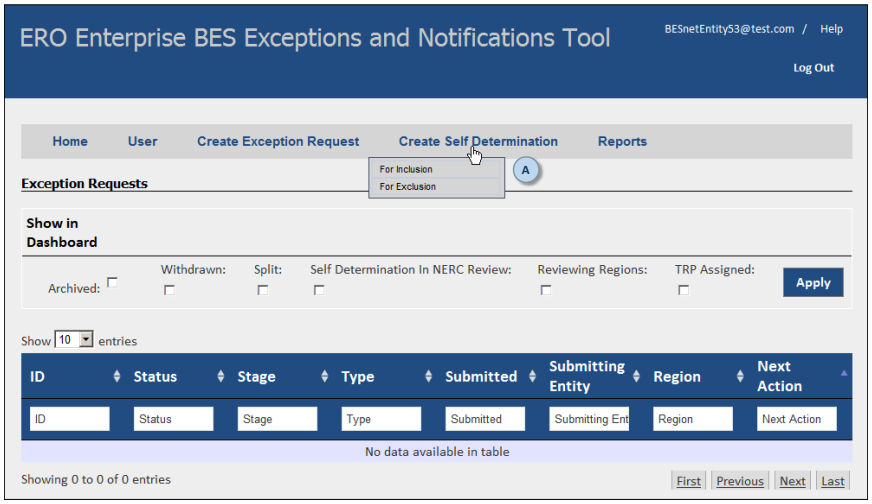

Figure 39: BESNet Dashboard

The **Create Notification of Self-Determination Screen** is broken into three sections for these instructions.

Create Notification of Self-Determination Screen Section 1: General Information

Section 1 contains **General Information (A)** about the Submitting Entity, pre-populated from the user information.

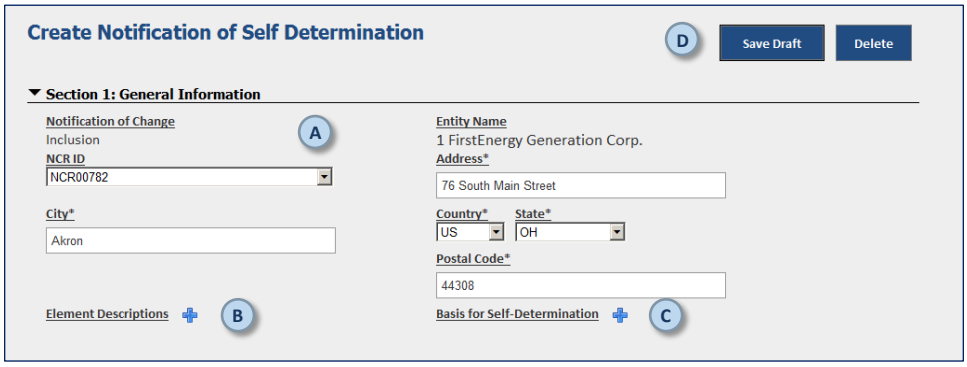

Figure 40: Create Notification of Self-Determination Screen Section 1

Basic information about the Submitting Entity (i.e., the Entity with which the user is operating) can be edited here, including the Address, City, Country, State, and Postal Code.

Section 1 also has two sub-sections about the Notification for:

A. The **Element Description** (B) and the **Basis for Self Determination** (C)

[1] Refer to the *BES Definition Reference Document* and the *BES Notification Review Guidelines* at: http://www.nerc.com/pa/RAPA/Pages/BES.aspx

B. **Save Draft** and **Delete** buttons (D) that can be used at any time.

NOTE: The BESNet application automatically saves a draft of the Notification if the browser is closed or the session is interrupted.

Selecting Element Description

NOTE: A Notification can contain more than one Element, but all Elements in the Notification should be of the same type and should be Included or Excluded for the same reasons.

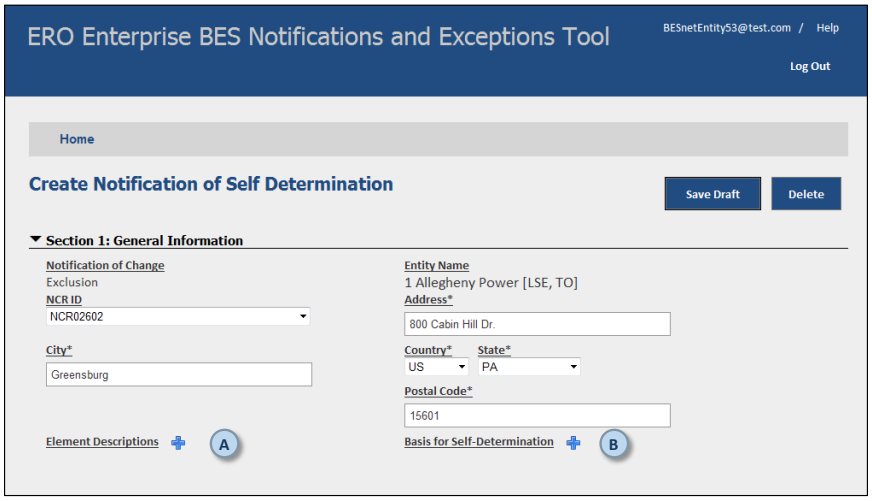

Figure 41: Element Description and Basis for Self-Determination

The user must select the **Element Description**. To do so, click on the blue **Plus Sign** at the **Element Descriptions** (A). This will bring the user to the **Add Element Description Screen**.

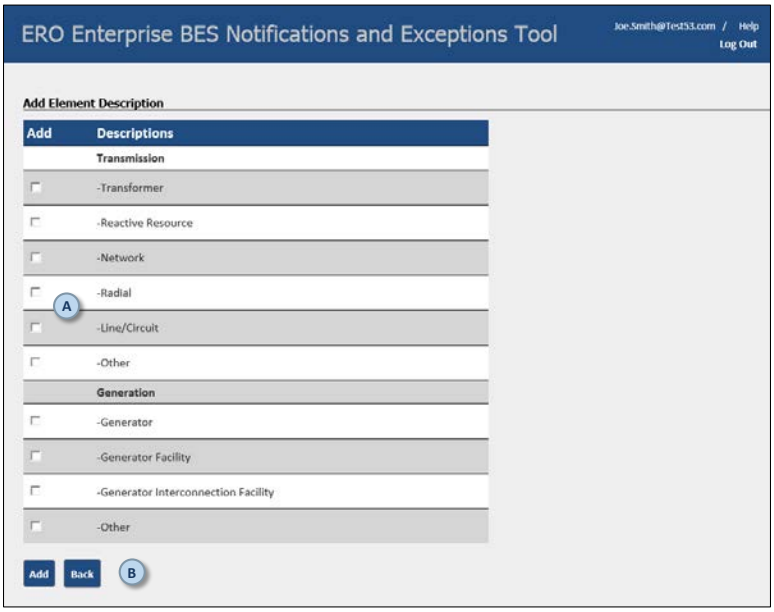

Figure 42: Add Element Description Screen

The user should select the appropriate **Element Description** for which the Notification of Self-Determination is being submitted (A), and click on **Add** (B) to complete the action. This will return the user to the **Create Notification of Self-Determination Screen**.

Selecting Basis for Self-Determination

NOTE: A Notification can contain more than one Element, but all Elements in the Notification should be of the same type and should be Included or Excluded for the same reasons.

The user must select the BES Definition reason for the Element's inclusion or exclusion. To do so, click on the blue **Plus Sign** at the **Basis for Self-Determination** (B). This will bring the user to the **Add BES Definition Screen**.

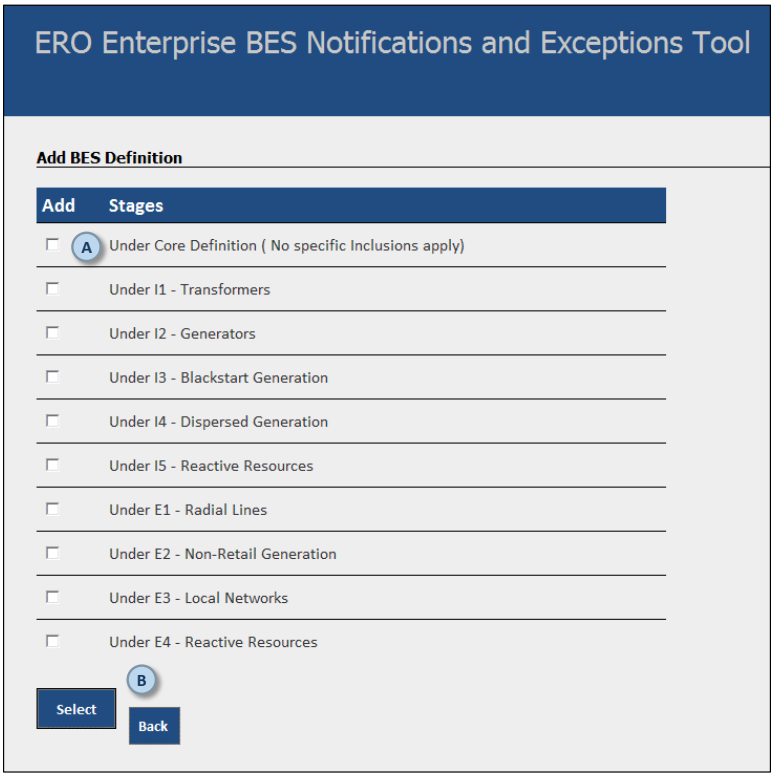

Figure 43: Add BES Definition Screen

The user should select the appropriate BES Definition reason that the Element is being included or excluded and for which the Notification of Self-Determination is being submitted (A), and click on **Add** (B) to complete the action. This will return the user to the **Create Notification of Self-Determination Screen**.

Removing an Element Description or Basis for Self-Determination

Once the Basis for Self-Determination is selected, the **Create Notification of Self-Determination Screen** will show **Red X's** (A) near the **Element Description** and **Basis for Self-Determination** areas on the screen.

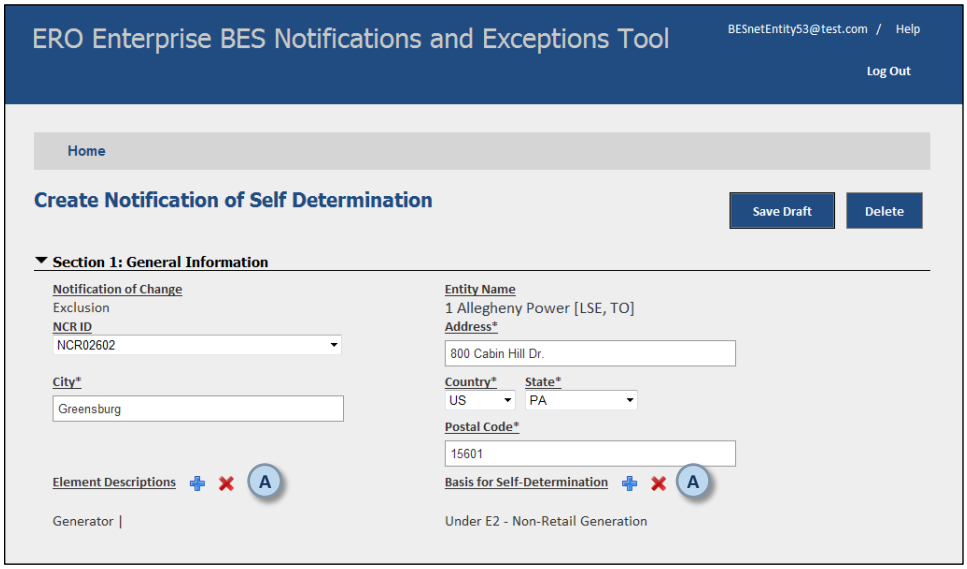

Figure 44: Create Notification of Self-Determination Screen

If either the Element Description or Basis for Self-Determination is incorrect or should be removed, click on the **Red X**. This will bring the user to the appropriate removal screen (Figure 45, **Remove Element Description Screen,** used as an example).

The user should check the box of the **Description** (A) to be removed and then click on the Remove button (B) to complete the action. This will return the user to the **Create Notification of Self-Determination Screen**.

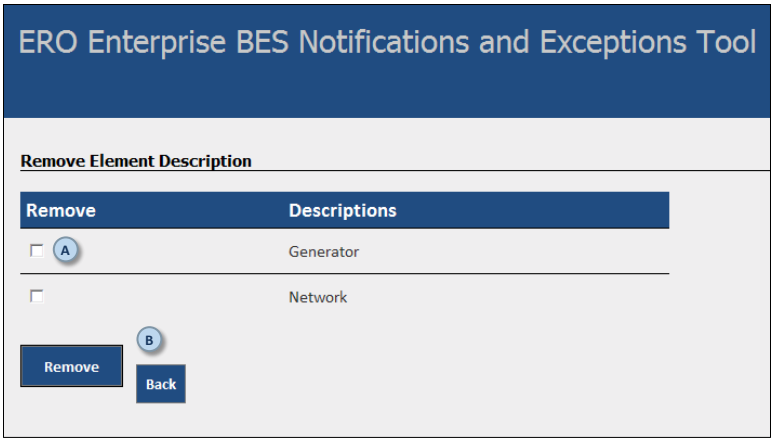

Figure 45: Remove Element Description Screen

Create Notification of Self-Determination Screen Section 2: Detailed Information

The **Detailed Information Section 2** contains information for the **Submitting Entity Contact Information** (A), and the Entity's authorized representative that is certifying the Notification of Self-Determination.

The user must enter:

A. The **Submitting Entity Contact Information** (A)

B. The **Authorized Representative's Name and Title** (B).

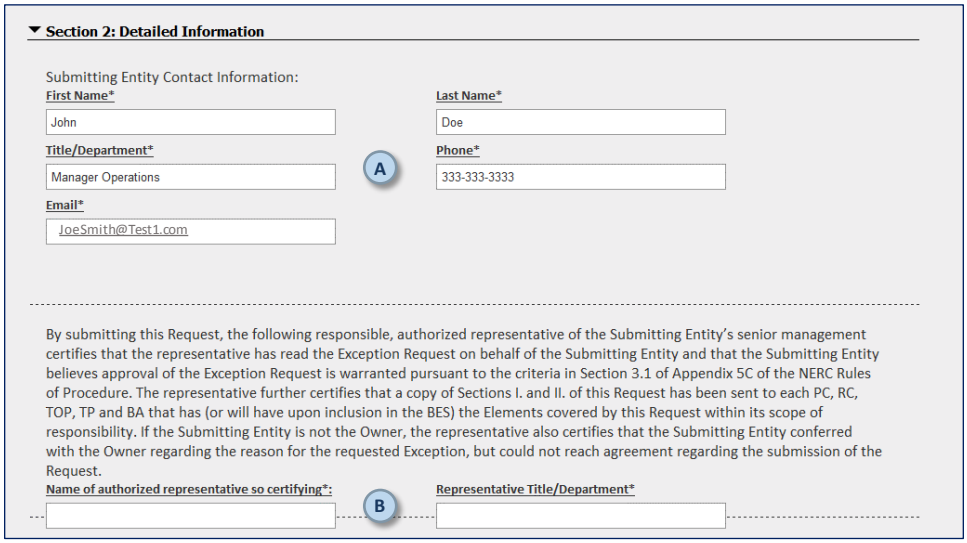

Figure 46: Create Notification of Self-Determination Screen Section 2

Adding an Element to a Notification of Self-Determination

Once the general information is entered in Sections 1 and 2 for the Notification on the **Create Notification of Self-Determination Screen**, the user should click on the **Add** button, which will take you to the **Add Element Screen.**

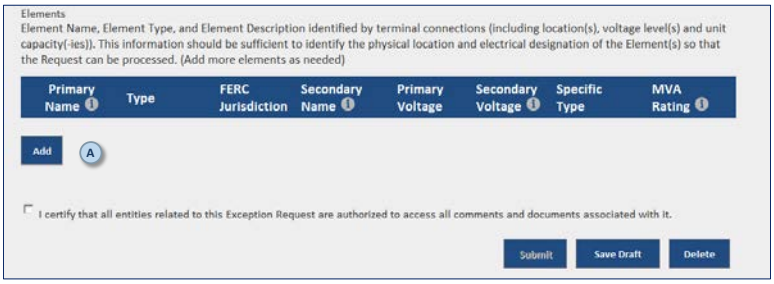

Figure 47: Create Notification of Self-Determination Screen – Add Element Screen

Several functions are performed through the Add Element Screen:

A. The **Element Type** (A) has a pull-down menu (B) allowing selection of the type of Element.

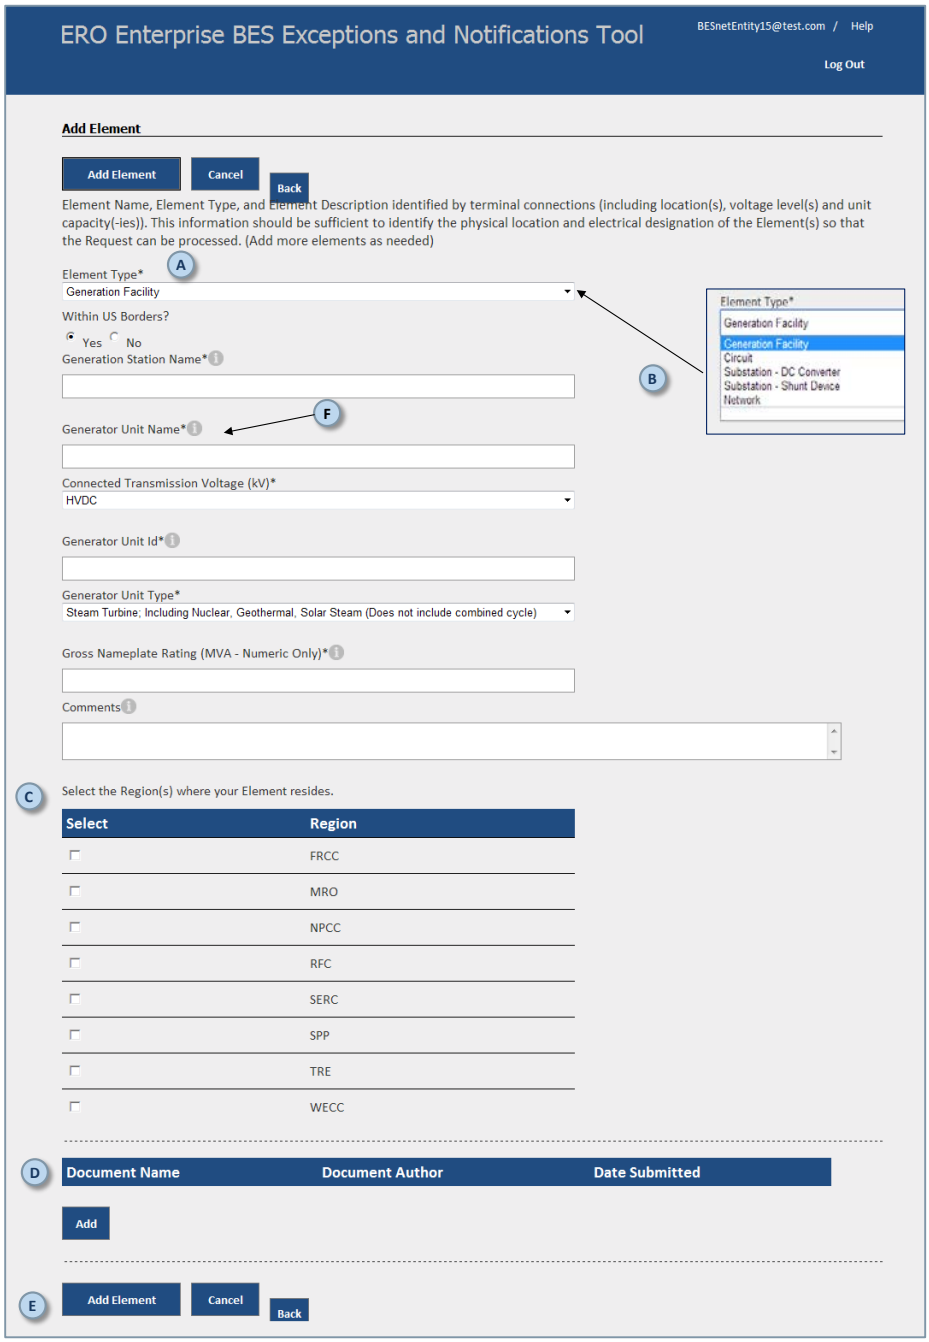

Figure 48: Add Element Screen

B. The user should select the **Element Type** from the pull-down menu (B), which will display data entry screens specific to that **Element Type**. Additional information on the types is in the **Element Type** section of this document.

C. The Region(s) where the Element resides is selected in the **Select the Region** area (C)—multiple Regions can be selected.

D. Attach necessary documentation[2] by clicking on the **Add** button (D). Additional guidance on adding documents is included in the Adding Documents section of this guide.

NOTE: At least one (1) supporting document is required for each Element in a Notification of Self-Determination.

E. Click on the **Add Element** button (E) when finished entering data for the Element to complete its addition to the Notification. That action will return the user to the **Create Notification of Self-Determination Screen**, where all Elements that are part of the Notification are displayed.

F. Informational points are denoted by an "i" (F) throughout the **Add Element Screens**. Hovering over them will reveal additional information about the item.

Element Types

When adding an Element to a Notification of Self-Determination, the fields to be completed vary by Element. Screenshots of each Element's properties are provided below for reference.

Table 1 shows the types of Elements listed in the **Element Type** pull-down menu (A) on the **Add Element Screen**.

Table 1: Element Types

	Within FERC Jurisdiction	Name(s)	Voltage (kV)	ID	Specific Type	MVA Rating	Comments
Generation Facility	Yes or No, Required	Generation Station Name, Required; Unit Name, Required	Connected AC Transmission Voltage, Required, from a list of values	Unit ID, Required	Required, from a list of Generator Unit Types	Gross Nameplate Rating, Required	Optional
Circuit	Yes or No, Required	From Point Name, Required; To Point Name, Required; Common Element Name, Required	From Point kV, Required, from a list of values; To Point kV, Required, from a list of values	Circuit ID, Optional	Required, from a list of Circuit Types	Normal Rating, Optional	Optional
Substation, DC Converter	Yes or No, Required	Converter Name, Required	Connected AC Transmission Voltage, Required, from a list of values	N/A	N/A	Normal Rating, Optional	Optional
Substation, Shunt Device	Yes or No, Required	Network Name, Required; Device Name, Required	Station kV, Required, from a list of values	N/A	Device Type	Normal Rating (MVA or MVAR), Optional	Optional
Network	Yes or No, Required	Network Name, Required	Connected AC Transmission Voltage, Required, from a list of values	N/A	N/A	N/A	Optional

[2] Refer to the *BES Notification Review Guidelines* for additional information on necessary documentation.

Add a Generation Facility

If the user clicks on the **Generation Facility** in the **Element Type** section of the **Add Element Screen**, the following **Generation Facility** Screen appears:

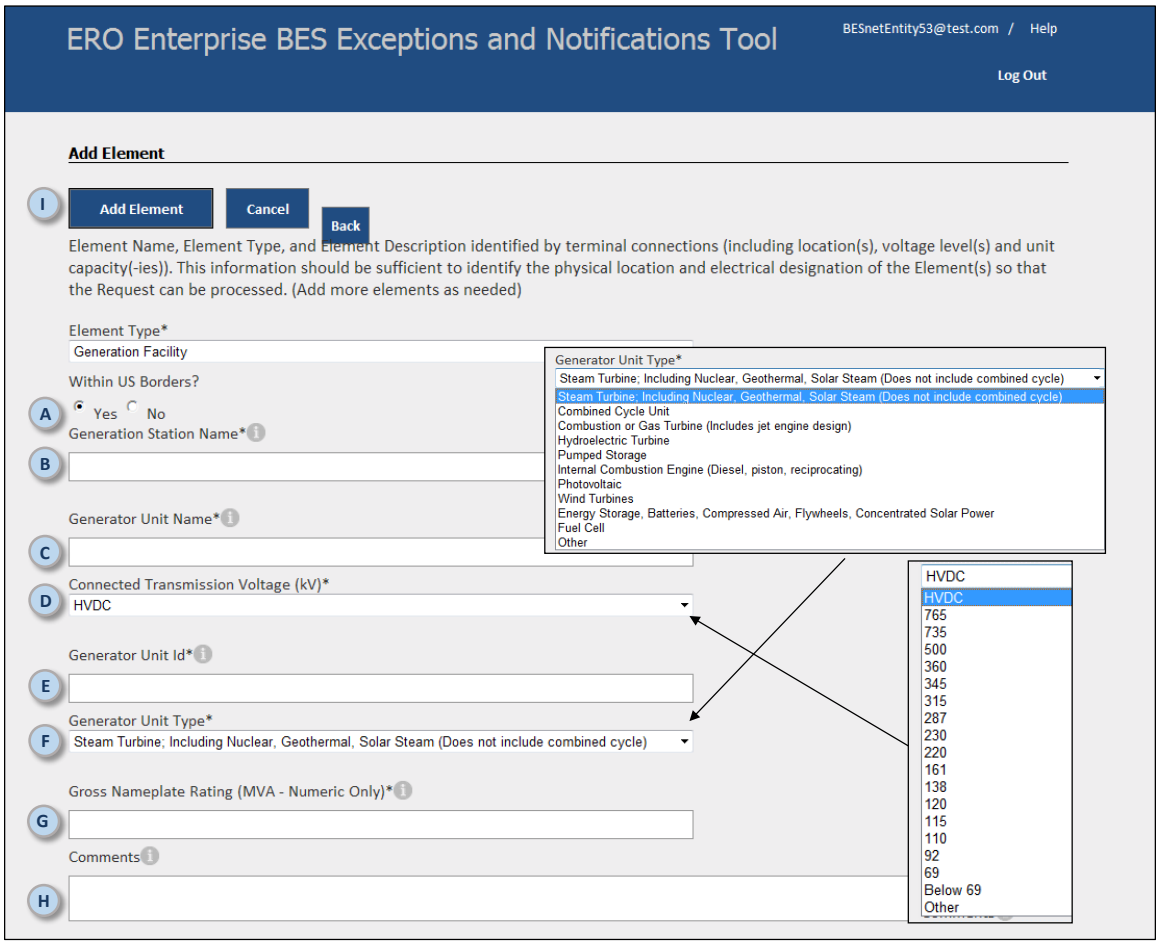

Figure 49: Add Generation Facility Screen

A. Select whether the **Generation Facility** is within the U.S. Borders (A).

B. Provide the **Generation Station Name** (B).

C. Provide the **Generator Unit Name** (C).

D. Select the **Connected Transmission Voltage** (D) from the pull-down list.

E. Provide the **Generator Unit ID** (E).

F. Select the **Generator Unit Type** from the pull-down list.

G. Provide the **Gross Nameplate Rating** in MVA (G). One decimal point is allowed.

H. Provide **Comments** (H) if desired.

I. Click on the **Add Element** button (I) to save the information. This will bring the user to the **Create Notification of Self-Determination Screen**.

Add a Circuit

If the user clicks on the **Generation Facility** in the **Element Type** section of the **Add Element Screen**, the following **Circuit Screen** appears:

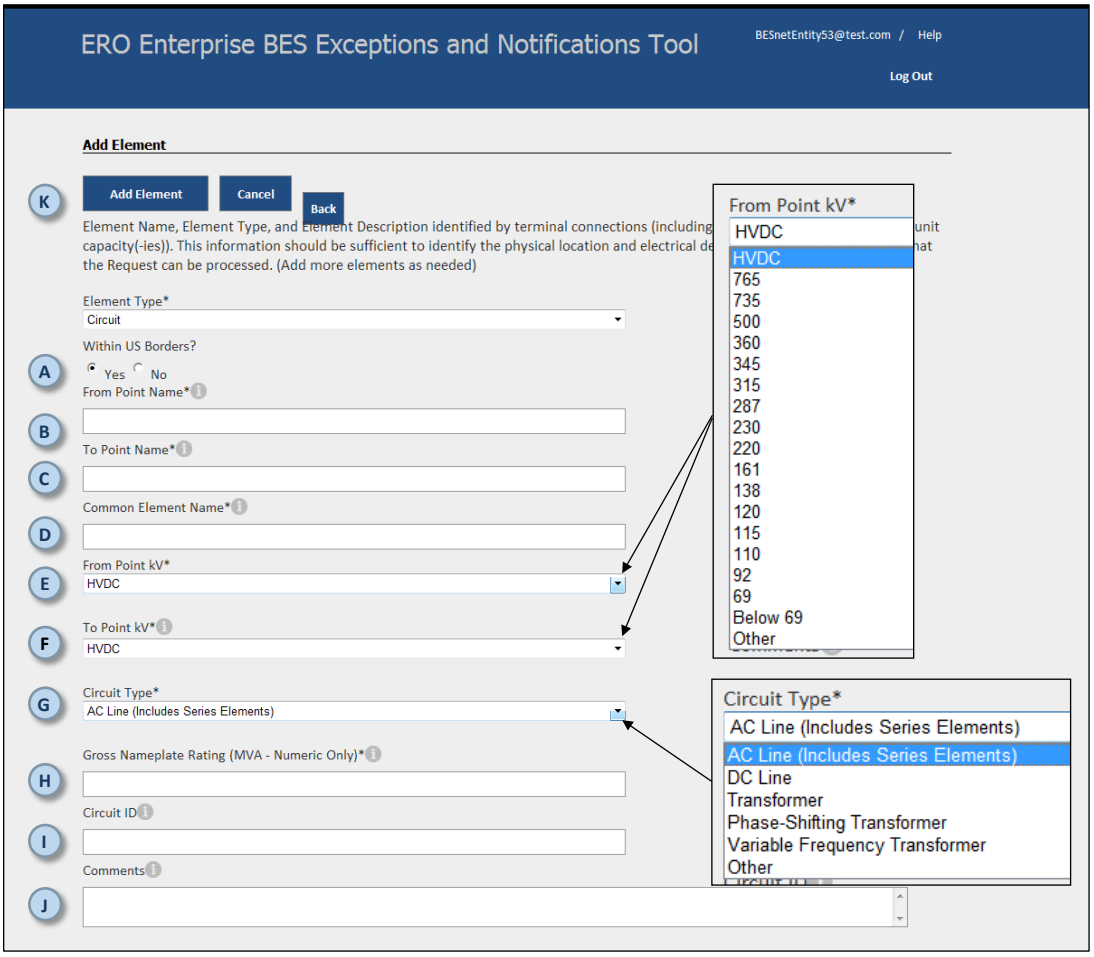

Figure 50: Add Circuit Screen

A. Select whether the **Circuit** is within the U.S. Borders (A).

B. Provide the **From Point Name** (B).

C. Provide the **To Point Name** (C).

D. Provide the **Common Element Name** (D) for the **Circuit**.

E. Select the **From Point kV** (E) from the pull-down list.

F. Select the **To Point kV** (F) from the pull-down list.

G. Select the **Circuit Type** (G) from the pull-down list.

H. Provide the **Gross Nameplate Rating** in MVA of the **Circuit** (H). One decimal point is allowed.

I. Provide the **Circuit ID** (I).

J. Provide **Comments** (J) if desired.

K. Click on the **Add Element** button (I) to save the information. This will bring the user to the **Create Notification of Self-Determination Screen**.

Add a DC Converter

If the user clicks on **Substation – DC Converter** in the **Element Type** section of the **Add Element Screen**, the following **Circuit Screen** appears:

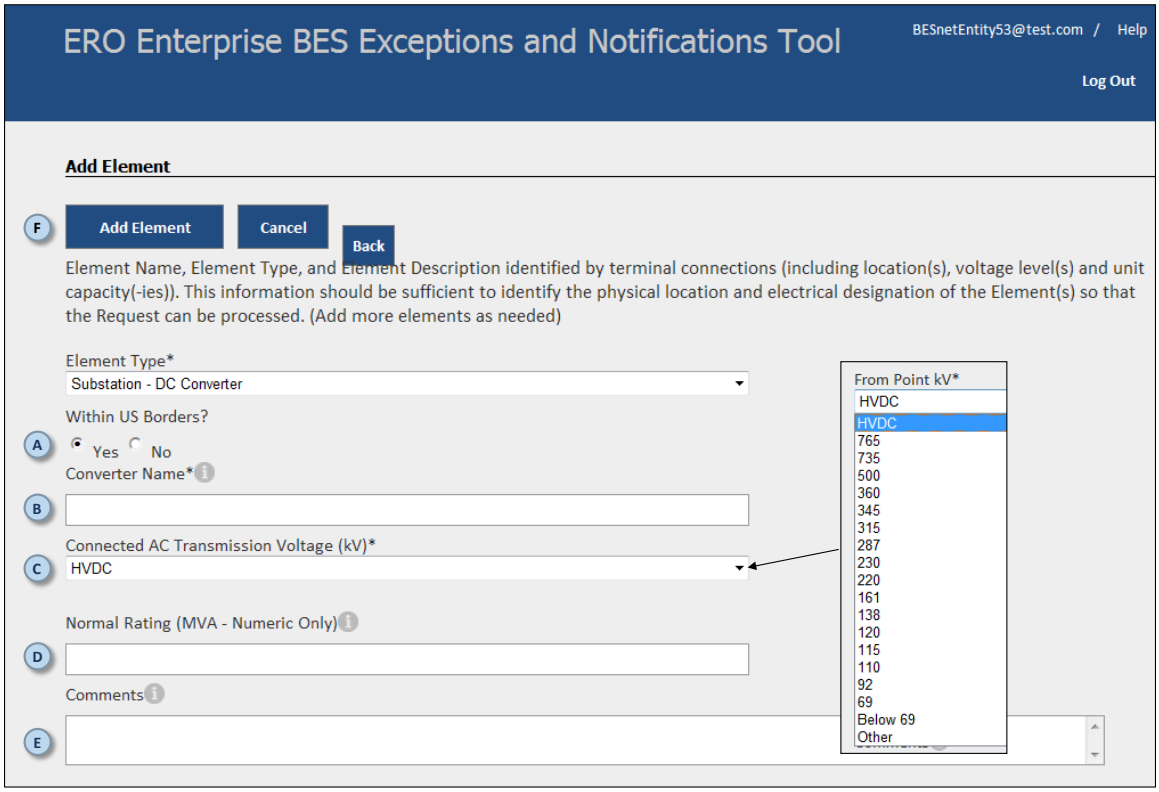

Figure 51: Add DC Converter Screen

A. Select whether the **DC Converter** is within the U.S. Borders (A).

B. Provide the **Converter Name** (B).

C. Select **HVDC** as the **Connected AC Transmission Voltage** (C) from the pull-down list.

D. Provide the **Normal Rating** in MVA for the **DC Converter** (D). One decimal point is allowed.

E. Provide **Comments** (E) if desired.

F. Click on the **Add Element** button (F) to save the information. This will bring the user to the **Create Notification of Self-Determination Screen**.

Add a Substation Shunt Device

If the user clicks on the **Substation – Shunt Device** in the **Element Type** section of the **Add Element Screen**, the following **Shunt Device Screen** appears:

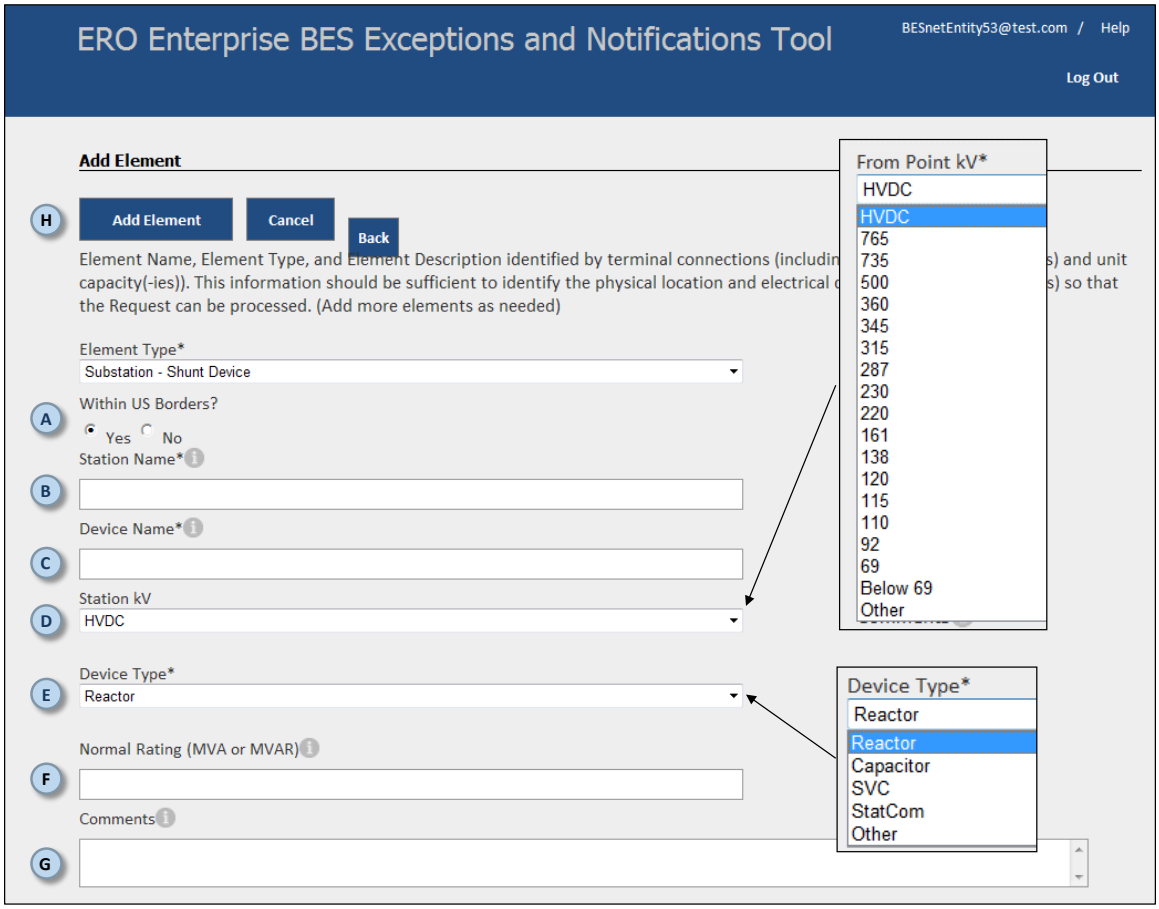

Figure 52: Add Shunt Device Screen

A. Select whether the **Shunt Device** is within the U.S. Borders (A).

B. Provide the **Station Name** (B) where the device is located.

C. Provide the **Device Name** (C).

D. Select the **Station kV** (D) from the pull-down list.

E. Select the **Device Type** (E) from the pull-down list.

F. Provide the **Normal Rating** in MVA for the **Device** (F). One decimal point is allowed.

G. Provide **Comments** (G) if desired.

H. Click on the **Add Element** button (H) to save the information. This will bring the user to the **Create Notification of Self-Determination Screen**.

Add a Network

If the user clicks on the **Network** in the **Element Type** section of the **Add Element Screen**, the following **Network Screen** appears:

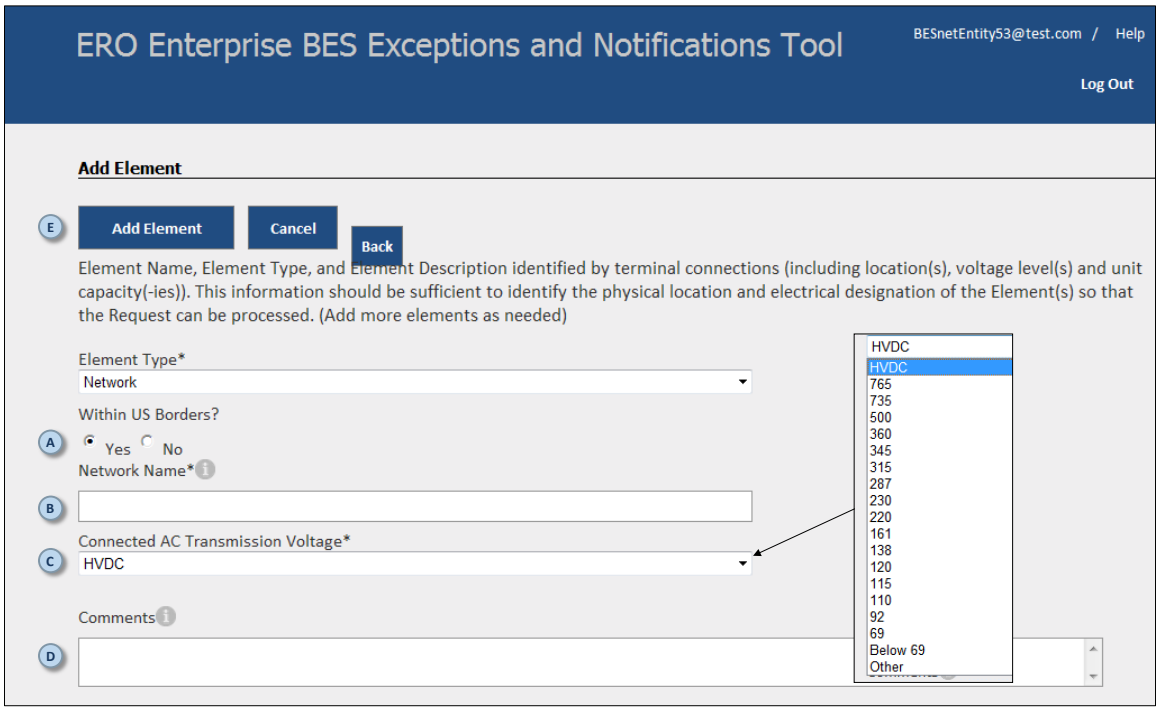

Figure 53: Add Network Screen

A. Select whether the **Network** is within the U.S. Borders (A).

B. Provide the **Network Name** (B).

C. Select the **Connected AC Transmission Voltage** (C) from the pull-down list.

D. Provide **Comments** (D) if desired.

E. Click on the **Add Element** button (E) to save the information. This will bring the user to the **Create Notification of Self Determination Screen**.

Selecting a Region for the Element

The user must select the Region(s) in which the Element of the Self-Determined Notification is located. Multiple Regions can be selected for Circuits.

Figure 54: Select Region(s) Section of Add Element Screen

Add Supporting Documentation for the Element

At least one supporting document[3] must be supplied for each Element in the Notification. To add a document, click the **Add** button in the Document section of the **Add Element Screen** (A). This will take you to the **Add Element Document Screen.**

Figure 55: Document Section of Add Element Screen

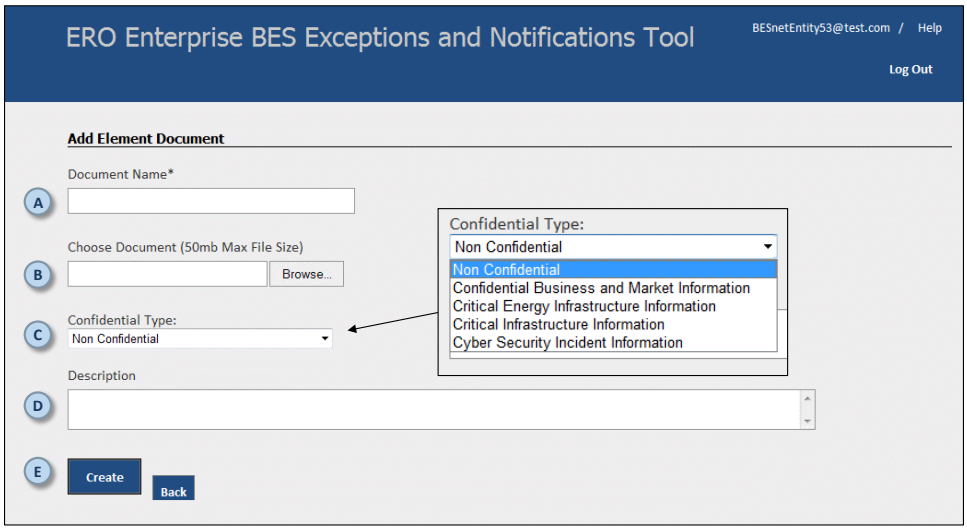

Figure 56: Add Element Document Screen

A. Provide a **Document Name** (A) for the document being attached.

B. Select a document using the **Choose Document** browsing area (B). NOTE: There is a 50 MB file size limit.

C. Select a **Confidential Type** (C) from the pull-down list.

D. Provide a **Description** (D) for the document.

E. When the **Add Element Document** form is completed, click on the **Create** button to attach the document to the Element. This will take the user back to the **Add Element Screen**

Figure 57: Add Element Screen Showing Attached Document

[3] Refer to the *BES Notification Review Guidelines* for additional information on necessary documentation.

When the supporting documentation has been attached to the Notification, the **Add Element Screen** will show that the **Document** (A) is attached to the Element. If additional files need to be attached as supporting documentation, the user should click on the **Add button** (B) and the **Add Document Screen** will appear again.

Certifying the Notification of Self-Determination

Before submitting the Notification of Self-Determination, the Notification must be certified by an authorized representative of the Entity. To do this, the representative's name and title must be entered on the **Create Notification of Self-Determination Screen** at (A).

The user must then select the **Certification** checkbox (B) before submitting the Notification.

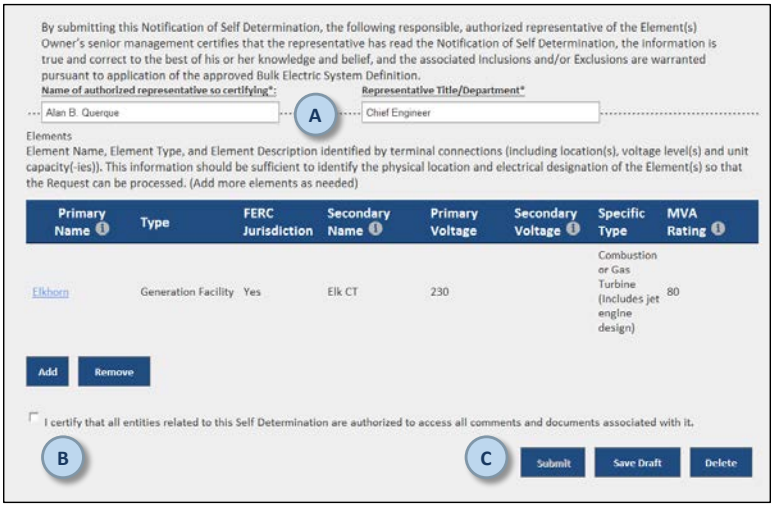

Figure 58: Create Notification of Self Determination Screen

Submitting the Notification of Self-Determination

To Submit the Notification of Self-Determination, the user should click on the **Submit button** (C) on the **Create Notification of Self-Determination Screen.** The user also has the option to **Save Draft** to allow the user to return to complete the draft Notification at a later time, as well as **Delete** to allow the user to completely delete the draft Notification.

The user will be returned to the **BESNet Dashboard** (Figure 59), showing that the submitted Notification is in Regional Review (A below). The **ID** for the Notification will also be complete with year, Region, NCR, and the SD number—SD indicating that the item is a Self-Determined Notification.

Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the bulk power system (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.

FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RF	ReliabilityFirst
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electricity Coordinating Council

Introduction

The following BES implementation guidance is offered to Regional Entities and Responsible Entities[1].

On December 20, 2012, the Federal Energy Regulatory Commission (FERC) issued Order No. 773[2] approving Phase 1 modifications to the currently effective NERC definition for Bulk Electric System (BES), which will become effective on July 1, 2014.[3] On December 13, 2013, NERC filed BES Phase 2 modifications for approval, with a requested effective date of July 1, 2014, to correspond with the Phase 1 effective date.[4] On March 20, FERC approved the Phase 2 modifications with a July 1, 2014 effective date.[5]

This document addresses implementation issues and communicates expectations for users, owners, and operators of the BPS,[6] registered entities, and Regional Entities during the transition period for the FERC-approved BES Definition. Specifically, this document covers the following:

- Application of the BES Definition
- Self-Determined Notifications and the BES Exceptions Request Process
- Registration Changes
- Reliability Standards Applicability
- Local Distribution Determinations

The revised BES Definition was developed through the NERC Standards Development Process for inclusion in the NERC Glossary.[7] The BES Definition removes language allowing for regional discretion and establishes a bright-line threshold that includes all Facilities operated at or above 100 kV. The revised BES Definition also identifies specific categories of facilities and configurations as Inclusions or Exclusions to the BES. Changes in classification of BES Elements due to the revised BES Definition (e.g., newly identified Inclusions or Exclusions) will be processed by NERC and the Regional Entities through the BES Notification and Exceptions Tool (BESnet application), to be made available by NERC by July 1, 2014.[8]

Additional information regarding application of the BES Definition can be found in the BES reference documents and training materials available at the NERC BES Definition web page:

http://www.nerc.com/pa/RAPA/Pages/BES.aspx.

[1] The term Responsible Entities refers to entities that are subject to registration as, or are registered as, users, owners or operators of the Bulk Power System (BPS).

[2] *Revisions to Electric Reliability Organization Definition of BES and Rules of Procedure*, Order No. 773, 141 FERC ¶ 61,236 (2012); *order on reh'g*, Order No. 773-A, 143 FERC ¶ 61,053 (2013); *order denying reh'g*, 144 FERC ¶ 61,174 (2013).

[3] On June 6, 2013, FERC approved an extension of the Phase 1 BES effective date from July 1, 2013 to July 1, 2014.

[4] In Order No. 773, as clarified in Order 773-A, the Commission directed NERC to: (1) modify the Exclusions for radial systems (Exclusion E1) and local networks (Exclusion E3) so that they do not apply to tie-lines, *i.e.* generator interconnection facilities, for BES generators; and (2) modify the local network exclusion to remove the 100 kV minimum operating voltage to allow systems that include one or more looped configurations connected below 100 kV to be eligible for the local network exclusion. NERC addressed the Commission's directives in Phase 2 of the BES Definition. NERC requested expedited action for the Commission to approve the proposed Phase 2 BES Definition by no later than March 31, 2014. If approved by that time, the proposed Phase 2 BES Definition will go into effect on July 1, 2014, the effective date of the Phase 1 BES Definition. The proposed Phase 2 BES Definition will supersede, in its entirety, the Phase 1 version.

[5] *Order Approving Revised Definition*, 146 FERC ¶ 61,199 (2014).

[6] Users, owners and operators of the BPS are users, owners and operators of the BES.

[7] http://www.nerc.com/files/glossary_of_terms.pdf.

[8] The application will provide a common mechanism for each asset owner to provide notice to its Regional Entity of newly identified Exclusions and Inclusions after applying the BES Definition to its asset list.

Chapter 1 – Application of the BES Definition

Under the revised BES Definition, there are four methods for categorizing BES Elements:

1. Application of the BES Definition, allowing for Inclusions and Exclusions of Elements
2. Approval of removal or addition of Elements through the BES Exceptions Process
3. Determination by the Commission of whether an Element is "Local Distribution"
4. Determination by the Commission that an Element is included in the BES after an opportunity for notice and comment

The application of the BES Definition by an entity should generally be done in three steps:

STEP 1 (CORE DEFINITION): The core BES Definition is used to establish the bright line of 100 kV, the overall demarcation point between BES and Non-BES Elements.[9] The core BES Definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher, as included in the BES.

STEP 2 (INCLUSIONS): This step involves applying the specific Inclusions to determine specific Elements that are included in the BES, such as certain Transmission Elements and Real Power and Reactive Power resources.

STEP 3 (EXCLUSIONS): This step evaluates specific situations for potential exclusion from the BES and should be applied in the sequence below:

> Exclusion E2 (Behind-the-Meter Generation) provides for the specific exclusion of certain Real Power resources that reside behind the retail meter (on the customer's side) and supersedes the more general Inclusion I2 (Generating Resources).
>
> Exclusion E4 (Reactive Power Devices) provides for the specific exclusion of Reactive Power devices installed for the sole benefit of a retail customer(s) and supersedes the more general Inclusion I5 (Static or Dynamic Reactive Power Devices).
>
> Exclusion E3 (Local Networks) provides for the exclusion of local networks that meet the specific criteria identified in the exclusion language. Exclusion E3 does not allow for the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 through I5.
>
> Exclusion E1 (Radial Systems) provides for the exclusion of "Transmission Elements" from radial systems that meet the specific criteria identified in the exclusion language. Exclusion E1 does not allow for the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 through I5.

As discussed below, an entity must submit any Self-Determined Notifications or requests for Exception to its Regional Entity and NERC through the BESNet application. Self-Determined Notifications are only required for: (i) Elements that were part of the BES under the original BES Definition and are not part of the BES under the new BES Definition; or (ii) Elements that were not part of the BES under the original BES Definition, but are now part of the BES under the new BES Definition.

[9] An "Element" is defined in the NERC Glossary as "[a]ny electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components."

FERC also approved a four-step BES transition plan for the revised BES Definition.[10] This BES transition plan provides a roadmap for entities to follow in moving from the current BES Definition to the revised BES Definition.

- Step 1: Identify a Comprehensive List of BES Facilities and Elements.
- Step 2: Perform a Gap Analysis.[11]
- Step 3: Develop Implementation Plans (for newly included Elements) to become compliant with Reliability Standards.
- Step 4: Complete Implementation Plans and Certify Completion.

A registered entity should follow the existing NERC Rules of Procedure set forth in Section 500 and Appendices 5A and 5B to submit requests for changes in Registration and Certification. To the extent an entity seeks de-activation or de-registration for a given functional designation due to application of the BES Definition, NERC will determine the appropriate time frame for making such a determination.[12]

[10] BES petition at pp 38-43 available at:
http://www.nerc.com/FilingsOrders/us/NERC%20Filings%20to%20FERC%20DL/Petition_Rev_Def_BES_20120125.pdf.

[11] The Gap Analysis should identify:

(i) any Registration and/or Certification changes that are required due to the newly-identified Elements (e.g., reliability functions for which the entity is not currently registered on the Compliance Registry but should be registered based on the newly-included Elements), and

(ii) changes in compliance obligations for the entity, (i.e., the applicable Requirements of Reliability Standards with which the entity must now become compliant due to the inclusion or exclusion of the new Elements in the BES.)

[12] Order No. 773 at P 55.

Chapter 2 – Self-Determined Notifications and the BES Exceptions Request Process

Self-Determined Notifications

FERC has recognized that applying the new BES Definition may result in the identification of Elements that currently are treated as part of the BES but will no longer be considered part of the BES.[13] FERC further noted that registered entities are obligated to inform their Regional Entities and NERC of any Self-Determination that an Element is no longer part of the BES. For Notifications of Self-Determined Exclusions or Inclusions, the NERC BESNet application provides the functionality for entities to notify the Regional Entities of Self-Determined BES Inclusions and Exclusions.

With respect to a Self-Determined Notification of exclusion, the Regional Entities will validate, with NERC oversight, the submittal to determine complete and proper application of the BES Definition. The Regional Entities may request additional information, as needed, under existing authority, in order to establish a complete and proper Notification. In order to provide consistent application of the BES Definition and associated processes, NERC in its oversight role will review Self-Determined Notifications through sampling or other approaches, and will provide necessary guidance or direction to achieve consistent results. Compliance monitoring and enforcement obligations for Elements that are excluded through a correct application of the BES Definition will be considered to have ended as of the date that a complete Notification was submitted, barring any unique facts and circumstances. Incomplete Notifications of exclusion or incorrect applications of the BES Definition will continue to subject those Elements to compliance monitoring and enforcement until all required information is submitted and the BES Definition is correctly applied.

An entity makes a good faith[14] Notification of a Self-Determined Exclusion of a particular Element by properly applying the BES Definition and relevant Inclusions or Exclusions, then notifying its appropriate Regional Entity. **Good faith Self-Determinations are those that are made consistent with the BES Definition and reference materials provided by NERC.** With NERC oversight, the Regional Entity will validate the Notification to ensure that the BES Definition was properly applied and that no mistakes occurred.[15] Once validation is concluded, the registered entity will be advised of the determination. If additional information is required, the registered entity may be requested to supply it prior to the Regional Entity reaching a conclusion. An Element will not be excluded from the BES until the removal is validated. [16]

[13] *See* Order No. 773 at P 317; *see also* Order No. 773-A at P 110.

[14] Order No. 773-A at P 110 ("… [I]n the absence of bad faith, if a registered entity applies the [BES] Definition and determines that an element no longer qualifies as part of the [BES], upon notifying the appropriate Regional Entity that the element is no longer part of the [BES] the element should not be treated as part of the [BES] unless NERC makes a contrary determination in the exception process**.** If the Regional Entity disagrees with the classification of the element and believes the element is necessary for reliable operation, the Regional Entity should initiate an exception request to include the element in the [BES]. If NERC agrees with the Regional Entity and determines that the element should be included in the [BES], the registered entity should not be subject to retroactive liability for the time period the element was not included in the [BES].").

[15] The validation process is consistent with current practice with respect to Notifications to NERC Rules of Procedure Section 501.1.3.5, as well as Order Nos. 773 and 773-A. In Order No. 773, FERC stated that the Notification was a necessary feature, because NERC and the Regional Entities would need this information for their compliance programs, for audit purposes and to understand the contours of the BES within a particular region. Order No. 773 at P 317 (FERC further noted that, because entities had discretion to declassify certain facilities as part of the BES, NERC, the Regional Entities and FERC needed "notification of such instances to assure that the entities are appropriately implementing the revised definition."). *Id.*

[16] In Order No. 773-A, FERC responded to a circumstance in which a Regional Entity disagrees with the registered entity's determination that an element is not part of the BES and the registered entity acts in good faith, by outlining the appropriate process to use. Order No. 773-A at PP 108-109. FERC agreed that, in the absence of bad faith, and the Regional Entity believes the element is necessary for reliable operation, it should initiate an exception request to include the element in the BES. Order No. 773-A at P 110.

Taken together, Order Nos. 773 and 773-A, as well as the NERC Rules of Procedure, point to the need for NERC and the Regional Entity to review a Notification to determine if it comports with the Definition and validate the Notification to confirm appropriate application of the Definition. The registered entity can facilitate this effort by reviewing these situations with the Regional Entity prior to formally submitting the Notification. This will provide the greatest confidence of appropriate application of the BES Definition and facilitate consistent application of the Definition.

Until the validation process described for Self-Determined Notifications of exclusion is completed, the registered entity has the potential to be subject to applicable Reliability Standards. Any instances of non-compliance for potentially excluded Elements will be held in abeyance until such time as the Notification is validated by the Regional Entity, with NERC oversight as described above. If the Self-Determined Notification of exclusion is accepted as valid, instances of potential non-compliance involving excluded Elements that occurred after the submission of the complete and proper Notification up to the date of its validation will be closed, barring any unique facts and circumstances. A Self-Determined Notification of exclusion that is incomplete or based on improper application of the BES Definition will result in Elements associated with that Notification remaining subject to compliance monitoring and enforcement until such time all required information is submitted and the BES Definition is correctly applied.

If a Regional Entity believes that a Notification of a Self-Determined Exclusion is based on an incorrect application of the Definition and is unable to come to a common understanding of the Definition with the submitting entity, the Notification will be rejected and the Element at issue will remain part of the BES by application of the Definition.[17]

If a Regional Entity and NERC determine that an Element that is excluded as a result of properly applying the BES Definition should be included in the BES for other reasons, the Regional Entity would initiate an Inclusion exception request through the BESNet application and inform the registered entity. Once the process has been completed, the Element then would be included in the BES and the registered entity notified accordingly. The registered entity will not be subject to retroactive liability for the time period the Element was not included in the BES.

As discussed previously, the July 1 implementation date for the new BES Definition is rapidly approaching. As part of the transition across the ERO, NERC recognizes that entities may desire to submit Self-Determined Notifications of exclusion as soon as possible after the effective date. In order to accommodate all entities and manage the flow of processing such materials, NERC is providing an extended initial submittal period as described below.

NERC and the Regional Entities are committed to processing and efficiently managing these submissions in a timely manner for all entities. Accordingly, NERC requests that entities pace their submittals within period beginning July 1 and ending September 1 to ensure a smooth transition. Entities that submit a Notification during the period of July 1, 2014, through September 1, 2014, will be deemed to have submitted such Notification on July 1 for purposes of determining compliance obligations.

In other words, during this initial submittal period of activity, a Notification of Self-Determined exclusion will be treated the same as one received on July 1 when it comes to effective dates for compliance with NERC Reliability Standards. An extended initial submittal period will enable a levelized pace that can be more effectively managed for entities, NERC, and the Regional Entities.

[17] Order No. 773-A at PP 317 ("…[T]he revised definition allows entities the discretion to "declassify" certain facilities as part of the [BES], and NERC, Regional Entities and the Commission need notification of such instances to assure that the entities are appropriately implementing the revised definition.").

BES Exception Request Process

Appendix 5C of the NERC Rules of Procedure sets forth the process to be followed with respect to exception requests for Inclusion and Exclusion of Elements from the BES.[18]

If an Element that is already deemed part of the BES and subject to relevant Reliability Standards is included by application of the revised BES Definition, but an entity believes it has good reason for it not to be included, an entity may submit an Exclusion exception request for the Element through the BESnet application. The Element will remain subject to the relevant Reliability Standards during the pendency of the exception process. All existing BES Elements consistent with the BES Definition continue to remain subject to Reliability Standards—with no gap in coverage or compliance obligations—when the new BES Definition goes into effect on July 1, 2014.

As noted in Order No. 773-A (at P 26), entities with newly included Elements may file exception requests (after a gap analysis is performed). Regional Entities and NERC will make determinations for the exception requests submitted during the 24-month implementation period applicable to newly included Elements. Accordingly, newly included BES Elements will only become subject to relevant Reliability Standards 24 months after the effective date of the revised BES Definition (i.e., July 1, 2016).

If, after validation by the Regional Entity and NERC of a Self-Determined Notification of Exclusion, an Element is excluded from the BES by application of the revised BES Definition, a third-party entity with a reliability oversight obligation may submit an Inclusion exception request to include the Element in the BES as part of the exception process. The Element will not be subject to Reliability Standards during the pendency of the Inclusion exception process.

As noted in the BES transition plan (Steps 3 and 4 above) an entity with newly included Elements may need to develop a Registration implementation plan (which may include the need for Certification or a revision to an existing Certification), a compliance implementation plan, or both. If the Regional Entity and registered entity are unable to agree on the implementation plan, the Regional Entity will notify NERC, and NERC will specify a reasonable implementation schedule.

Finally, to the extent an Element is needed to comply with a Reliability Standard that is based on facility characteristics (e.g., FAC-003 200 kV threshold for individual transmission lines), the Element would not be excluded under the exception process. However, such entities could be considered for a sub-list of Reliability Standards, as appropriate.

Appeal Process

Section 500 and Appendices 5A and 5B of the NERC Rules of Procedure provides for appeals of entity registration and certification decisions.

BESnet Application Access

Requests for Exceptions to the BES will only be accepted through the BESnet Application. Entities that anticipate submitting a BES exception request should contact their applicable Regional Entity contact below, review the relevant training and resource materials, and establish a user account for the BESnet Application.

Reference materials for Regional Entities either are being or have been developed—and will be provided to Responsible Entities for informational purposes—regarding: (1) BES Guideline for Reviewing Self-Determined Notifications; (2) BES Exception Request Evaluation Guideline; (3) BESNet Application User Guide; and (4) Frequently Asked Questions (FAQs). In addition, a BES Definition Reference Document developed through the NERC standards drafting process has been made available to Responsible Entities to demonstrate proper application of the BES Definition.

Chapter 3 – Registration Changes

NERC's objective in implementing the revised BES Definition is to ensure that the proper entities are registered and responsible for Reliability Standards that are necessary to ensure the reliability of the BPS. In Order No. 773 (at P 55), FERC stated, "[w]e do not expect there to be significant numbers of entities either needing to register or deregister due to the change in definition." NERC shares FERC's expectation that only a small number of entities will require changes to their NERC registration as a result of the revised BES Definition.

An entity seeking to modify its current registration, including de-registration or deactivation, must inform its applicable Regional Entity of this change in status. In turn, the Regional Entity will notify NERC of such changes. All changes to registration are processed by the NERC Registration and Certification department, in accordance with the NERC Rules of Procedure.

Guidance on DP-Specific Registration Deactivation Requests

For entities registered for the Distribution Provider (DP) function, and that currently own or operate BES protection schemes, including Underfrequency Load Shedding (UFLS), Undervoltage Load Shedding (UVLS), or Special Protection Systems (SPS) and Remedial Action Schemes (RAS), these devices support the reliability of the Bulk Electric System (BES), often serving as the "last-resort" tool for avoiding a total power system blackout. Consequently, NERC and the Regional Entities will not approve the deactivation of the DP function for Registered Entities on the NERC Compliance Registry that have these types of protection devices, solely on the basis that the entity does not own or operate a BES Element by application of the BES Definition. NERC and the Regional Entities will evaluate the relevant facts and circumstances in reaching a decision.

Registered Entities currently performing the DP function may determine to file a Self-Determined Notification of Exclusion of Elements based on the current BES Definition. There is no automatic change in the registration status of an entity for any functional registration categories if a particular Element is excluded from the BES Definition either through the Self-Determined Notification of Exclusion or the BES Exception process. Determinations of registration status are addressed through the registration program. NERC believes that the deactivation of the DP function registration of Registered Entities that have responsibilities relating to BES protection schemes including UFLS, UVLS, and SPS/RAS equipment would present a reliability risk due to the lack of compliance oversight. These types of equipment are essential to the reliable operation of the BES, even in cases where the equipment is installed below the BES 100 kV bright line. In addition, NERC will closely evaluate requests which involve entities that have transmission Remedial Action Schemes or other types of schemes that have the same or similar BES system protection objectives.

Registered Entities should note that if an Element owned by an entity is excluded from the BES Definition, either through an Exclusion Exception Request or a validated Self-Determined Notification of Exclusion, this exclusion alone does not necessarily provide for deactivation of any functional registration from the NERC Compliance Registry. The Registration Criteria states that a "Distribution Provider is the responsible entity that owns, controls, or operates Facilities that are part of any of the following Protection Systems or programs designed, installed, and operated for the protection of the Bulk Power System." The list includes references to required UFLS programs, UVLS programs, SPS/RAS and transmission Protection Systems. The importance of these programs to system reliability is not diminished by the revised BES Definition.

Under the current registration rules, entities have an opportunity to establish that they are not material to the reliability. Such determinations depend on the specific facts and circumstances. In the future, NERC is moving forward with a new proposal for Distribution Provider registration criteria related to the Risk-Based Registration (RBR) initiative. The proposed criteria will accommodate those DPs who are registered only as a result of the owning of UFLS systems and will include a reduced set of reliability standards for which UFLS-Only DPs will be

responsible. RBR also will build on current authority to allow an entity to make a case that it should not remain registered if it is not material to the reliability of the BES. To ensure consistency, a new materiality test is being developed that would be reviewed by a new NERC-led panel comprised of NERC and Regional Entity participants, that the entity is not material to the reliability of the BES and should not remain registered as a DP. The draft design program also includes a process for determining a sub-set of applicable Reliability Standards.

NERC notes that, to the extent that direct application of the BES Definition results in a determination that an Entity's Elements are not BES, an Inclusion Exception process can be initiated by a Responsible Entity to bring such Elements back into the BES. While this would not affect the DP registration status, it may affect other functional registration categories.

Chapter 4 – Reliability Standards Applicability

On a case-by-case basis, NERC may determine if an entity is eligible for a sub-list of applicable Reliability Standard requirements rather than automatically subjecting the entity to the full scope of standards applicable to a particular function. This occurs through the NERC Organization Registration process, in concert with the respective Regional Entity.[19] To initiate a request for a sub-list of applicable Reliability Standards, an entity must inform its Regional Entity contact. As part of its Risk-Based Registration Initiative that was launched in 2014, NERC will lead a review panel with participation by Regional Entities to evaluate, among other things, subsets of applicable Reliability Standard requirements for certain functional entities.

NERC has previously worked with industry to modify applicability designations for Reliability Standards that affect large groups of entities. For example, to address a reliability gap for generator interconnection facilities, FERC recently approved the NERC GO-TO Project.[20] Specifically, in Order No. 785, FERC approved modifications to the applicability sections for Reliability Standards FAC-001-1, FAC-003-3, PRC-004-2.1a, and PRC-005-1.1b.[21] FERC also noted that a small number of "complex" facilities may be subject to additional Reliability Standards than those approved in the GO-TO Project.[22] NERC will continue to address these "complex" facilities on a case-by-case basis.

Dispersed Generation

Project 2014-01 Standard Drafting Team is focusing on identifying Reliability Standard requirements applicable to dispersed power-producing resources. The list developed from the Standards Authorization Request (SAR) may provide a subset of applicable Reliability Standards. Once the Standard Drafting Team concludes its work, NERC will determine next steps, as part of the Risk-Based Registration Initiative.

[19] NERC has identified a corporate goal for 2014 to examine the registration and certification framework.

[20] *Generator Requirements at the Transmission Interface*, Order No. 785, 144 FERC ¶ 61,221 (2013).

[21] FERC approved NERC's request for an effective date of one year following the first quarter after regulatory approvals for FAC-001-1, and for FAC-003-3 Requirement R3. For the remaining requirements of FAC-003-3, FERC approved an effective date of two years following the first calendar quarter after regulatory approvals. FERC also approved that PRC-004-2.1a and PRC-005-1.1b become effective upon receiving required regulatory approvals. (*See* Order No. 785 at P 9).

[22] Order No. 785 at P 53 ("Consistent with prior decisions in *New Harquahala Generating Co., LLC*, and *Cedar Creek Wind Energy, LLC*, for the anticipated small number of generator owners and operators owning facilities deemed to be "complex" and therefore potentially subject to additional Reliability Standards, NERC should evaluate, in consultation with the Regional Entity, which Reliability Standards should apply to the particular entity based on the specific facts and circumstances.").

Chapter 5 – FERC Local Distribution Determinations

In Order No. 773 (at P 66) FERC approved NERC's BES exception request process to determine the technical issue of whether facilities are part of the BES; however, FERC determined that it (FERC) will decide the jurisdictional question of whether facilities are "used in local distribution." Thus, FERC reserved authority to designate sub-100 kV facilities, or other facilities, as part of the BES.

FERC also established a process by which an entity can seek a determination by FERC as to whether facilities are "used in local distribution" as set forth in the Federal Power Act. FERC will make such case-by-case jurisdictional determinations by starting with the Seven-Factor Test set forth in Order No. 888.

When and whether to submit such a jurisdictional question to FERC are business and legal decisions for a registered entity, upon which NERC is not opining in this guidance document.

Canadian Provincial Summaries of Standard-Making and Enforcement Functions with U.S. Comparators

Last Updated: October 9, 2014

The Federal, Provincial, and Territorial Monitoring and Enforcement Sub-group (MESG) developed the following Canadian provincial summaries and will review them annually and update them as needed. If you have comments on the summaries, please submit them to NERC Director of Canadian Affairs Laura Hussey.

The provincial summary for Manitoba will be posted as soon as it is finalized.

Alberta - US Comparator:
Standard-Making and Enforcement Functions

Fast Facts about Alberta's Electricity System

Total annual consumption: 77,451 GWh
(2013)
Customers: approx. 1,632,000
Installed capacity: 14,500 MW (2013)
Record summer peak: 10,063 MW
Record winter peak: 11,139 MW (2013)
Total length of transmission system: 26,000 km
Interconnections: British Columbia, Saskatchewan (DC), Montana

Current Reliability Standards

Below is a link to current reliability standards in Alberta:
http://www.aeso.ca/rulesprocedures/17006.html

Key Organizations in Alberta's Electricity Sector

Alberta Energy

Alberta Energy is responsible for setting the policy and legislative framework for Alberta's electricity system. Alberta Energy develops solutions and advises on all aspects of energy policy for Alberta, including electricity, natural gas and oil.

Alberta Utilities Commission

The Alberta Utilities Commission ("AUC or Commission") is an independent, quasi-judicial agency of the Province of Alberta. The AUC regulates the utilities sector, and is responsible to ensure that the delivery of Alberta's utility service takes place in a manner that is fair, responsible and in the public interest. The AUC has authority to approve as effective in Alberta, reliability standards filed before it by the AESO, or to reject reliability standards based upon the recommendation of the AESO. The AUC must follow the AESO's recommendation related to Alberta reliability standards unless an interested person satisfies the AUC that the recommendation is either "technically deficient" or "not in the public interest". The AUC is the adjudicative body for compliance enforcement in respect of both ISO rules and Alberta reliability standards.

Alberta Electric System Operator

The Independent System Operator (ISO) in the Province of Alberta is the Alberta Electric System Operator ("AESO") – a statutory corporation pursuant to the *Electric Utilities Act, 2003* ("the Act"). Its statutory mandate requires it to direct the reliable operation of the Alberta interconnected electric system (AIES), plan the transmission system, and operate the wholesale electricity market. The AESO also evaluates Alberta's current and short-term electricity needs, and the adequacy and reliability of the integrated power system to meet those needs. As set out in the Alberta Transmission Regulation, the reliability standards applicable in Alberta are the standards adopted by the AESO following public consultation with those

market participants that it considers likely to be directly affected by the Alberta reliability standards, and AUC approval. The AESO is also mandated by the Act and the Transmission Regulation to 'establish practices and procedures' and 'monitor' the compliance of market participants with ISO rules, with AUC rules, and with Alberta reliability standards.

Market Surveillance Administrator

The Market Surveillance Administrator ("MSA") is a statutory corporation established under the *Electric Utilities Act, 2003* of the Province of Alberta and continued under the *Alberta Utilities Commission Act, 2007*. The mandate of the MSA is to carry out surveillance in respect of the Alberta electricity markets and the Alberta retail gas market to ensure they operate in a fair, efficient, and openly competitive manner. The scope of the MSA's legislative mandate includes the enforcement of ISO rules and reliability standards effective in Alberta. Under rules established by the AUC, the MSA may issue specified penalties for contravention of ISO rules or reliability standards or may request a hearing or other proceeding before the AUC to seek an administrative penalty or other relief. The MSA's mandate of enforcement for both ISO rules and Alberta reliability standards extends to Alberta market participants and the AESO.

Table Definitions

Provincial Organization: the Alberta organization accountable and responsible for performing the function according to provincial legislation for matters concerning Alberta entities.

US Organization: the US organization engaged to perform the function according to an executed Memorandum of Understanding for matters concerning Alberta entities.

US Comparator: the US organization that is responsible for performing the functions according to US law.

Functions		Provincial Organization	Relevant US Organization	US Comparator
Standards Making	Standards Approval	AUC (1)	Not Applicable	FERC
	Standards Development	AESO (1)	NERC (1)	NERC, WECC
	Entity Registration	AESO (2)	Not Applicable	NERC and WECC in their respective roles
Compliance Monitoring	Compliance Monitoring and Violation Detection	AESO/MSA (3)(5)(6)	WECC (3)	NERC and WECC in their respective roles, FERC
Enforcement Processes	Execution of Investigations	AESO/MSA (7)	Not Applicable	NERC and WECC in their respective roles, FERC
	Violation Determination and Sanction Imposition	MSA (8)(9)(10)	Not Applicable	NERC, WECC, FERC
Violation Prevention and Outreach	Violation Prevention, Outreach, including education	AESO/MSA (4)	NERC and WECC	NERC, WECC, FERC
Appeals	First Right of Appeal	AUC (11)	Not Applicable	NERC
	Second Right of Appeal	Review and Variance application to the AUC (12)	Not Applicable	FERC
	Third Right of Appeal	Court of Appeal of Alberta (13)	Not Applicable	US Court of Appeals
Oversight	Approval of Alberta's Rules of Procedure	Not applicable	Not Applicable	FERC
	Approval of Alberta's Compliance Monitoring Plan	AESO (5)/MSA (6)	Not Applicable	NERC and WECC
	Performance Oversight of CMP	AESO (5)/MSA (6)	Not Applicable	NERC BOT CC
	Violation Prevention and Outreach	AESO/MSA	NERC and WECC	NERC and WECC in their respective roles, FERC

Notes:

1. **Standards Approval:** Pursuant to section 20 of the Alberta Transmission Regulation, NERC is recognized as the Electricity Reliability Organization (ERO) in Alberta. NERC reliability standards are assessed by AESO subject matter experts together with the Alberta Reliability Committee (ARC). The ARC advises the AESO on the adoption of NERC standards as Alberta standards. The AESO must consult with market participants who are likely to be directly affected and must file proposed standards with the AUC with its recommendation to approve or reject a standard. In accordance with the Transmission Regulation, the AUC must follow the recommendation of the AESO unless an interested party satisfies the AUC that the recommendation of the AESO is either technically deficient or not in the public interest.

2. **Entity Registration:** Market participants have a duty to comply with Alberta reliability standards that are applicable to them under the Act. The AESO maintains a registry that is used to administer the compliance monitoring program, including scoping and scheduling of monitoring activities. Not being registered does not remove the market participant from complying with the Alberta Reliability Standards. The AESO bases registration on the Alberta Reliability Standards Functional Model and Criteria for Registration which maps Alberta market participant roles to the AESO functional model roles.

3. **Compliance Accountability:** The Alberta Transmission Regulation mandates that the AESO monitor the compliance by market participants with Alberta reliability standards. Further to the MSA's mandate under the Alberta Utilities Commission Act, the MSA oversees compliance of the AESO in respect of Alberta reliability standards applicable to the AESO. The MSA has entered into a services agreement with WECC such that WECC conducts compliance monitoring of the AESO under the auspices of the MSA.

4. **Prevention and Outreach:** The AESO conducts periodic stakeholder meetings for the purpose of updating entities on standards development activities and changes to the compliance monitoring program. In addition, the MSA provides guidance on compliance trends and expectations via its compliance reporting activities.

5. **Monitoring:** Pursuant to the Alberta Transmission Regulation and ISO rules, the AESO has established the Alberta Reliability Standards Compliance Monitoring Program (CMP) and associated processes and procedures for monitoring Alberta market participants. The AESO oversees performance of the CMP.

6. **Monitoring:** The MSA is the compliance monitor with respect to the AESO. In this regard, the MSA has entered into a service agreement with WECC to conduct compliance monitoring of the AESO under the auspices of the MSA including self-certification and compliance audits. Under the service agreement, WECC assists the MSA in the development of an Implementation Plan annually.

The Implementation Plan is applicable solely to the AESO and is subject to MSA approval and oversight.

7. **Investigations:** The AESO and WECC (as applicable) are required to refer suspected contraventions of Alberta reliability standards to the MSA for disposition. The MSA may also investigate and make its own independent conclusions for violation determinations and sanctions for all Alberta entities, including the AESO.

8. **Violation Determination and Sanction Imposition:** MSA makes violation and sanction determinations for all Alberta entities and the AESO. In accordance with AUC rules, the MSA may issue a notice of specified penalty for contravention of an Alberta reliability standard. Alternatively, the MSA may seek an administrative penalty before the AUC or other relief. The maximum administrative penalty amount is $1,000,000 per day on which the contravention occurs or continues.

9. **Violation Determination and Sanction Imposition:** NERC and WECC have no authority to impose sanctions on Alberta entities or the AESO.

10. **Public Disclosure:** In the event that the MSA issues a notice of specified penalty for contravention of a reliability standard, the name of the responsible entity is made public on the MSA website in accordance with AUC rules. A copy of the notice of specified penalty issued to the entity is typically the form of disclosure. In the event of an administrative proceeding before the AUC, the outcome of the proceeding is made public in an AUC decision.

11. **Appeals to MSA Determinations:** If a registered entity or the AESO fails to pay or disputes a specified penalty issued by the MSA, the MSA is required to notify the AUC and request a hearing. The AUC may confirm or rescind the notice of specified penalty or may impose an administrative penalty.

12. **Review of AUC Decisions:** A registered entity or the AESO may seek application to review and vary a decision of the Commission.

13. **Legal Review of AUC Decisions:** A registered entity or the AESO may seek leave to appeal a decision of the AUC with the Court of Appeal of Alberta.

British Columbia – United States Comparator: Standard-Making and Enforcement Functions

Fast Facts about British Columbia's Electricity System

Total annual consumption: approx. 63 Terawatt-hours TWh
Customers: over 2 million
Installed capacity: approx. 13,000 MW
Record summer peak: provincial peak not available
Record winter peak: 10,113 MW Nov. 2006[1]
Total length of transmission system: approx. 20,600 km[2]
Interconnections: British Columbia is part of the Western Interconnection which includes BC, Alberta, all or part of 14 western States and the northern portion of Baja California, Mexico. BC has direct interconnections to Alberta and Washington.

Reliability Standards Currently in Effect

Below is a link to a list of Mandatory Reliability Standards adopted in BC, accessed from both the BCUC and WECC websites:
http://www.wecc.biz/Standards/BCApproved%20Standards/Forms/AllItems.aspx

Key Organizations in British Columbia's Electricity Sector

Ministry of Energy and Mines

The Ministry of Energy and Mines is responsible for British Columbia's electricity sector. The Ministry develops and oversees British Columbia's (BC) policies with regard to electrical power generation and transmission, including replacing and upgrading infrastructure. See the *2007 BC Energy Plan: A Vision for Clean Energy Leadership.* The Ministry also develops and implements policies to ensure reliable electricity supply through mandatory reliability standards and participation with the Western Electricity Coordinating Council. The Ministry administers statutes relating to the energy sector and has policy responsibilities under the *Utilities Commission Act*. The Ministry also oversees the British Columbia Hydro and Power Authority (BC Hydro) through the *British Columbia Hydro and Power Authority Act.*

British Columbia Utilities Commission (BCUC)

The British Columbia Utilities Commission (Commission) is an independent, quasi-judicial, regulatory agency that operates under and administers the *Utilities Commission Act*. The Commission's primary responsibility is the regulation of energy utilities under its jurisdiction to ensure that the rates charged for energy are fair, just and reasonable, and that utilities provide safe, adequate and secure service to their customers. The Commission's mandate in the MRS Program is described in legislation and the *Mandatory Reliability Standards Regulation* (MRS Regulation), *BC Reg. 32/2009, MO39*. Specifically, the Commission adopts or rejects reliability standards in BC and is responsible for the administration of the MRS Program

[1] BC Hydro data only, BC Hydro 2007 annual report
[2] Compiled from BC Hydro and FortisBC annual reports and Rio Tinto Alcan information

in BC. In addition, the Commission also has the authority to impose administrative penalties for contraventions of MRS in accordance with the *Utilities Commission Act* and the *Administrative Penalties Regulation, BC Reg. 316/2012, OIC 731/2012.*

Western Electricity Coordinating Council

The Commission engaged the Western Electricity Coordinating Council (WECC) as the Commission's Administrator for the MRS Program in BC. Through the Administration Agreement the Commission grants WECC authority to act as the Commission's Administrator in the assessment of registration criteria and administration of approved reliability standards in BC. WECC's authority is limited to actions and obligations specified in the Commission's Rules of Procedure for reliability standards in BC, as well as the Registration Manual and Compliance Monitoring Program, or as otherwise ordered by the Commission.

British Columbia Hydro and Power Authority

The British Columbia Hydro and Power Authority (BC Hydro) is a provincially owned crown corporation and the largest electric utility in BC. BC Hydro delivers electricity to its customers through a network of over 75,000 kilometres of transmission and distribution lines and its system connects with other transmission systems in Alberta and Washington State. BC Hydro's responsibilities in the MRS Program are outlined in the Utilities Commission Act and MRS Regulation. Specifically, BC Hydro evaluates MRS for suitability for BC according to certain criteria stated in accordance with the Act and the MRS Regulation. In consultation with stakeholders, BC Hydro assesses reliability standards approved by FERC and reports to the Commission on their suitability for adoption in BC.

Table Definitions:

Provincial Organization: the British Columbia (BC) organization accountable and responsible for performing the function according to provincial legislation for matters concerning entities in BC.

US Organization: the US organization assisting the Commission in administrative matters related to the function described, in accordance with the approved Administrative Agreement (Order G-123-09, Oct. 15, 2009)

US Comparator: the US organization responsible for performing the functions in the United States.

Functions[3]		Provincial Organization	Relevant US Organization Assisting BCUC in Day-to-Day Administration	US Comparator
Standards Making[4]	Standards Approval	BCUC (1)	Not Applicable	FERC
	Standards Development	Not applicable	NERC and WECC	NERC and WECC
	Entity Registration	BCUC (2)	WECC (2)	NERC and WECC in their respective roles
Compliance Monitoring	Compliance Monitoring and Violation Detection	BCUC (3)	WECC (3)	NERC or WECC in their respective roles, FERC
Enforcement Processes	Execution of Investigations (4)	BCUC (5)	WECC (5)	WECC or NERC in their respective roles, FERC
	Violation Determination and Imposes Administrative Penalties	BCUC (6)	WECC recommends NOAVs to BCUC	WECC , NERC, or FERC
Violation Prevention and Outreach	Violation Prevention, Outreach, including Education (7)	BCUC to a limited extent	WECC	WECC, or NERC in their respective roles, FERC
Appeals	First Right of Appeal	BCUC	Not applicable	NERC Board of Trustees Compliance Committee (BOT CC)
	Second Right of Appeal	Supreme Court or Court of Appeal (8)	Not applicable	FERC
	Third Right of Appeal	Not applicable	Not applicable	US Court of Appeals
Oversight	Approval of BC's Rules of Procedure	BCUC	Not applicable	FERC
	Approval of BC's Compliance Monitoring Program and Implementation Plan	BCUC	Not applicable	FERC for approval of the CMEP and NERC for approval of a Regional Entity's Implementation Plan
	Performance Oversight of CMP	BCUC	Not applicable	WECC, or NERC BOT CC in their respective roles

[3] This table is intended to illustrate *who has authority over these various processes* vs. *who has authority for their execution.*
[4] Reliability standards Include FERC approved NERC reliability standards and FERC approved regional reliability standards.

Notes:

1. **Standards Approval:** Pursuant to section 125.2(2) of the *Utilities Commission Act* (Act) the British Columbia Utilities Commission (BCUC in table above) has exclusive jurisdiction to determine whether a "reliability standard" as defined in the Act, is in the public interest and should be adopted in BC. To provide the necessary information required for determinations and in accordance with the Act, British Columbia Hydro and Power Authority (BC Hydro) submits a Mandatory Reliability Standard (MRS) Assessment Report to the Commission assessing the new and revised reliability standards adopted in the US by the Federal Energy Regulatory Commission (FERC) within the annual assessment period (December 1 to November 30). The Assessment Report is developed in consultation with Registered Entities in the BC MRS Program. Further, in consultation with stakeholders regarding the estimated time required for the entities to implement and come into compliance with the reliability standards, BC Hydro suggests BC effective dates for each of the reliability standards assessed. After a public comment process, the Commission adopts reliability standards in the Assessment Report to maintain or achieve consistency with other regions, unless the Commission determines otherwise after a hearing.

2. **Entity Registration:** Entities subject to adopted Mandatory Reliability Standards are required to register with the Commission. The Western Electricity Coordinating Council (WECC) in its role as the Commission's Administrator for the BC Mandatory Reliability Standards Program (BC MRS Program) reviews registration materials provided by all applicable Entities and makes recommendations to the Commission.

3. **Compliance Monitoring:** The Rules of Procedure for reliability standards in British Columbia include the Compliance Monitoring Program and describe the procedures for monitoring and enforcement of adopted reliability standards. The processes include among other things Audits, Self-Certifications, Spot-Checks, Self-Reports, and Periodic Information (Data) Submittals. An annual Implementation Plan, recommended by WECC and approved by the Commission, identifies the Actively Monitored Standards List and schedules for the procedures listed above for the up-coming year. WECC assists the Commission with the compliance monitoring activities for BC entities in accordance to the annual Implementation Plan approved by the Commission.

4. **Execution of Investigations:** The Commission may execute investigations and may direct WECC to execute investigations..

5. **Investigations:** As the Commission's Administrator, WECC may conduct investigations at the direction of the Commission.

6. **Violation Determination and Sanction Imposition:** The Commission makes violation determinations for all BC entities and pursuant to Bill 30 – 2012, the Energy and Mines Statues Amendment Act – 2012, has the authority to impose administrative penalties and set financial limits for confirmed violation of a reliability standard. Penalty maximums are outlined in the Administrative Penalties Regulation. The process for imposing penalties for confirmed violation of reliability standards is under development at this time.

7. **Violation Prevention and Outreach:** The Commission communicates openly with entities and endeavours to foster a culture of compliance with the BC MRS Program. The Commission has offered educational workshops to entities from time to time and relies on WECC for entity outreach on technical matters. In addition to alerts and other publications issued by NERC and/or WECC to help inform entities and prevent violations, the Commission may issue similar notices for this purpose. WECC considers prevention of recurrence when reviewing mitigation plans before recommending them for acceptance by the Commission.

8. **Appeals to Commission Determinations:** There are two (2) avenues of recourse for enforcement decisions made by the Commission: first through the Commission's Application/Request for Reconsideration and, subsequently, through an appeal to the BC Supreme Court or BC Court of Appeal.

9. **Public Disclosure:** Possible and Alleged Violations are confidential unless the Commission determines they are Confirmed Violations and the Commission considers that disclosure would not relate to a cyber-security incident or otherwise jeopardize the security of the Bulk Power System.

New Brunswick - US Comparator: Standard-Making and Enforcement Functions

Fast Facts about New Brunswick's Electricity System

Total annual consumption: 12.885 Terawatt-hours TWh (2012-2013)
Customers: approx. 394,000
Installed capacity: 4,069 MW
Record peak (winter): 3,333 MW (2004)
Total length of transmission system: 6,849 km (4,226 miles)
Interconnections: Quebec, Nova Scotia, Maine, PEI

Reliability Standards Currently in Effect

Below is a link to the reliability standards currently in effect in New Brunswick:
http://www.nbeub.ca/index.php/en/electricity/reliability-compliance/new-brunswick-approved-reliability-standards

Key Organizations in New Brunswick's Electricity Sector

Department of Energy and Mines

The New Brunswick Department of Energy and Mines is responsible for setting the policy and legislative framework for New Brunswick's electricity system. The Department administers the Electricity Act and Reliability Standards Regulation which establishes the authority and requirements for the adoption and enforcement of electric reliability standards in New Brunswick.

New Brunswick Energy and Utilities Board

The New Brunswick Energy and Utilities Board (NBEUB) is an independent, quasi-judicial board that regulates New Brunswick's electricity sector. The NBEUB has the responsibility under the Electricity Act to adopt and enforce reliability standards in New Brunswick. The NBEUB implements the Reliability Standards Regulation which addresses the adoption of standards, determination of the bulk power system, compliance registrations and compliance monitoring and enforcement processes.

New Brunswick Power Corporation

The New Brunswick Power Corporation (NBPC) is a Crown corporation and the province's vertically integrated electric utility. In addition to its responsibility to comply with reliability standards applicable to its functions, NBPC is also responsible under the Electricity Act to make filings to the EUB to update reliability standards, maintain a list of bulk power system elements and to make recommendations on compliance registrations.

Table Definitions:

Provincial Organization: the New Brunswick organization accountable and responsible for performing the function according to provincial legislation.

US Organization: the US organization responsible for performing the function according to an executed agreement for the provision of services.

US Comparator: the US organization responsible for performing the functions in the US according to US law.

Functions[1]		Provincial Organization	Relevant US Organization	US Comparator
Standards Making[2]	Standards Approval	NBEUB (1)	Not Applicable	FERC
	Standards Development	Not Applicable	NERC	NERC NPCC
	Entity Registration	NBEUB (2,3)	NPCC Recommendations to NBEUB (4)	NERC NPCC
Compliance Monitoring	Compliance Monitoring and Violation Detection	NBEUB	NPCC (5)	FERC NERC NPCC
Enforcement Processes	Execution of Investigations	NBEUB	NPCC (6)	FERC NERC NPCC
	Violation Determination and Sanction Imposition	NBEUB	NPCC recommendations to NBEUB (7)	FERC NERC
Violation Prevention and Outreach	Violation Prevention, Outreach, including education	N/A	NERC/ NPCC	FERC NERC NPCC
Appeals	First Right of Appeal	NBEUB Review or Hearing	Not Applicable	NPCC Hearing Body
	Second Right of Appeal	NBEUB Appeal (8)	Not Applicable	NERC Board of Trustees Compliance Committee (BOT CC)
	Third Right of Appeal	A person aggrieved by an order of the NBEUB can make an application for judicial review to The Court of Appeal of New Brunswick.	Not Applicable	FERC
Oversight	Approval of New Brunswick's "rules of procedure"	Lieutenant Governor in Council (9)	Not Applicable	FERC
	Approval of New Brunswick's Compliance Monitoring and Enforcement Implementation Plan	NBEUB	NPCC Recommendations to EUB (10)	NERC NPCC
	Performance Oversight of CMEP	NBEUB	Not Applicable	NERC BOT CC

[1] This table is intended to illustrate *who has authority over these various processes* vs. *who has authority for their execution.*
[2] Reliability standards include FERC approved NERC reliability standards and FERC approved regional reliability standards.

Notes:

1. **Standards Approval:**
   Authority- Pursuant to Section 119 of the *Electricity Act* and the *Reliability Standards Regulation*, the NBEUB may approve NERC reliability standards that have been approved by FERC and filed by NBPC, with or without NB amendments.

   NERC Standards Filing- NBPC files standards with the NBEUB for approval within 60 days of the FERC approval effective date.

   Standard Review- NBPC reviews NERC standards and files with an accompanying NB Appendix to describe the specific application of the standard in NB.

   Public Process- the NBEUB notifies NERC, NPCC and NB Registered Entities when NBPC files an application for approval and the filed materials are publically available on the NBEUB website for a 60 day comment period.

   Approval/Remand – NBEUB approves the application as filed unless there are substantive revisions to the FERC approved version, or if there are substantive comments received during the review period , in which case the NBEUB may hold a hearing and may determine to approve, not approve or remand the proposed reliability standard back to NBPC.

2. **Bulk Power System:** The NB BPS is determined according to the FERC approved definition of the bulk electric system, as it appears in the "NERC Glossary of Terms Used in Reliability Standards". NBPC is required to file updates to the BPS and may submit requests for BPS exceptions to the NBEUB for approval.

3. **Entity Registration:** The NBEUB maintains a NB Compliance Registry identifying those owners, users and operators of the BPS who must comply with approved reliability standards. The NB registry is based on the NERC functional model and registry criteria. NBPC is required to make recommendations to the NBEUB to maintain the compliance registry.

4. **NPCC Recommendations for Entity Registrations:** NPCC provides recommendations to the NBEUB for entity registrations under the provisions of a service agreement the NBEUB has executed with NPCC.

5. **Compliance Monitoring:** The NBEUB implements a compliance monitoring system for reliability standards that is based on the requirements of the NERC compliance program. The NB program is documented as the New Brunswick Compliance Monitoring and Enforcement Program (NB CMEP) – Schedule A to the Reliability Standards Regulation. As a recognized compliance body under the

regulations, NPCC assists the NBEUB with compliance monitoring activities according to a service agreement the NBEUB has executed with NPCC.

6. **Investigations:** The NBEUB is responsible for compliance investigations in New Brunswick. NPCC assists the NBEUB with compliance investigations in NB according to a service agreement the NBEUB has executed with NPCC. The NBEUB may also request NERC to assist with compliance investigations.

7. **Violation Determination and Sanction Imposition:** The NBEUB is responsible for the determination of violations, enforcement action and imposition of fines and penalties. Under a service agreement the NBEUB has executed with NPCC, NPCC makes recommendations on enforcement matters to the NBEUB including recommendations on dismissals, find fix track actions, mitigation plans, settlement agreements and penalties and sanctions. The NBEUB may request that NPCC include a NERC review and comments on NPCC enforcement recommendations to the NBEUB.

8. **Appeals to NBEUB:** A person may appeal to the NBEUB a decision from a review or compliance hearing relating to contested violations, mitigation plans and penalties and sanctions.

9. **NB "rules of procedure":** NB does not adopt a separate rules of procedure document, compliance program requirements (including the NB CMEP), are incorporated into provincial regulations that require LGIC approval to modify.

10. **NB Annual Implementation Plan:** The NB AIP is based on the NERC and NPCC implementation plans and may include NB specific requirements. Under a service agreement the NBEUB has executed with NPCC, NPCC makes recommendations to the NBEUB for a NB AIP.

Nova Scotia-US Comparator:
Standard-Making and Enforcement Functions

Fast Facts about Nova Scotia's Electricity System

Total annual consumption: 10.5 Terawatt-hours TWh (2013)
Customers: approx. 0.5 million
Total Installed capacity: 2,756 MW (as of January 2014)
Record summer peak: 1373 MW (2013-08-28)
Record winter peak: 2122 MW (2014-01-02)
Total length of transmission system: 5,900 km (3,700 miles)
Interconnections: New Brunswick

Key Organizations in Nova Scotia's Electricity Sector

Department of Economic and Rural Development and Tourism

The Minister for this Department is responsible for the Nova Scotia Utility and Review Board (UARB) Act which is the legislation that establishes the governance, structure and mandate of the UARB.

Department of Energy

The Nova Scotia Department of Energy ("Department") is responsible for setting the policy and legislative framework for Nova Scotia's electricity system. The Department develops solutions and advises on all aspects of energy policy for Nova Scotia, including electricity, natural gas and oil.

Nova Scotia Utility and Review Board

The Nova Scotia Utility and Review Board ("NSUARB" or "Board") is an independent, quasi- judicial body which has both regulatory and adjudicative jurisdiction flowing from the Utility and Review Board Act. It reports to the Legislature through the Minister of Economic and Rural Development and Tourism. Pursuant to the Public Utilities Act, the Board exercises general supervision over all electric utilities operating as public utilities within the Province. This jurisdiction includes setting rates, tolls and charges; regulations for provision of service; approval of capital expenditures in excess of $250,000 and any other matter the Board feels is necessary to properly exercise its mandate. The Board has the authority to stay or revoke the operation of a reliability standard in Nova Scotia and refer it back to NERC or the NPCC for further consideration.

Nova Scotia Power

Nova Scotia Power Incorporated (NSPI) is a vertically integrated, privately owned utility serving 95% of customers in Nova Scotia. NSPI owns the majority of transmission and distribution assets in the province as well as a significant portion of the generation. NSPI is a Regulated- Utility under the Public Utilities and subject to supervision by the NSUARB. NSPI is responsible for planning for and maintaining a reliable electricity service to all loads in the province. NSPI is responsible for reviewing and implementing NERC standards under the supervision of the NSUARB.

Nova Scotia Power System Operator

The system operator is financially part of Nova Scotia Power, but operationally and functionally separated from other parts of NSPI and must adhere to a UARB approved Standard of Conduct to ensure its independence from NSPI's other business units.. The system operator bears responsibility for, and

manages the wholesale electricity market and oversees the reliable daily operation of the provincial electricity grid.

Table Definitions

Provincial Organization: Nova Scotia's organization accountable and responsible for performing the function according to provincial legislation.

US Organization: the US organization responsible for performing the function according to an executed agreement for the provision of services.

US Comparator: the US organization responsible for performing the functions in the US according to US law.

Functions[1]		**Provincial Organization**	**Relevant US Organization**	**US Comparator**
Standards Making[2]	Standards Development	Not Applicable	NERC	NERC
	Standards Approval	NSUARB, NSPI (1)	Not Applicable	FERC
	Entity Registration	NSPI-SO (2,3)	NPCC Recommendations to NSPI-SO (4)	NERC
Compliance Monitoring	Compliance Monitoring and Violation Detection	NSUARB	NERC and NPCC (5)	NERC / NPCC and FERC
Enforcement Processes	Execution of Investigations	NSUARB	NERC and NPCC (6)	NERC/ NPCC and FERC
	Violation Determination and Sanction Imposition	NSUARB	Recommendations to NSUARB only (7)	NERC, FERC
Violation Prevention and Outreach	Violation Prevention, Outreach, including education	N/A (10)	NERC/ NPCC	NERC / NPCC and FERC
Appeals	First Right of Appeal	NSUARB Review or Hearing	Not Applicable	NPCC Hearing Body
	Second Right of Appeal	NSUARB Appeal (8)	Not Applicable	NERC BOT CC
	Third Right of Appeal	An order of the NSUARB can be appealed to The Nova Scotia Court of Appeal.	Not Applicable	FERC
Oversight	Approval of Nova Scotia's Compliance Monitoring and Enforcement Implementation Plan	NSUARB	NERC (9)	NERC/NPCC
	Performance Oversight of CMEP	NSUARB	Not Applicable	NERC BOT CC

[1] This table is intended to illustrate *who has authority over these various processes* vs. *who has authority for their execution.*
[2] Reliability standards include FERC approved NERC reliability standards and FERC approved regional reliability standards.

Notes:

1. **Standards Approval:** NERC submits standards to NSUARB and NSPI for approval, each organization may approve, modify, remand or dismiss the standard as not applicable, though final approval authority rests with the NSUARB. The NSUARB has a quarterly review process allowing the submission, by NERC, of standards already approved by FERC.

2. **Bulk Electric System:** The FERC approved definition of the bulk electric system, as modified on May 6th, 2014, has not yet been adopted in Nova Scotia.

3. **Entity Registration:** NPCC as the regional Entity maintains the list of all market participants of the BES who must comply with approved reliability standards. The registry is based on the NERC functional model and registry criteria.

4. **NPCC Recommendations for Entity Registrations:** NPCC provides recommendations and may also identify organizations that may be candidates for registration and assign them to the Compliance Registry.

5. **Compliance Monitoring:** As per MOU with NERC, compliance is mandatory in Nova Scotia. The NSUARB will monitor compliance and accept compliance information and recommendations from NERC.

6. **Investigations:** The NSUARB is responsible for compliance investigations in Nova Scotia. NERC may assist the NSUARB with compliance investigations by providing: Compliance reports and spot checks, Readiness evaluations, disturbance reports, etc.

7. **Violation Determination and Sanction Imposition:** NERC, NPCC and NSUARB may all suggest compliance violation; proceedings shall be conducted under the Board's direction and control. NERC may recommend a particular penalty for any violation, but the NSUARB will be responsible for determining if a violation occurred and what penalties should be imposed.

8. **Appeals to NSUARB:** Any person may appeal to the NSUARB a decision from a review or compliance hearing. Further appeals may proceed to a court of law.

9. **Compliance Monitoring and Enforcement Plan:** Approval for the compliance and monitoring plan is by MOU between NERC and NSUARB on 22nd of Dec, 2006 and later through MOU between NERC, NPCC and NSPI on 20th April 2010. NSPI is subject to NERC's CMEP as implemented by NPCC.

10. **Violation Prevention:** Compliance is mandatory in Nova Scotia.

Ontario-US Comparator:
Standard-Making and Enforcement Functions

Fast Facts about Ontario's Electricity System

Total annual consumption: 140.7 Terawatt-hours TWh (2013)
Customers: approx. 4.9 million
Installed capacity: 34,946 MW (as of December 2013)
Record summer peak: 27,005 MW (August 1, 2006)
Record winter peak: 24,979 MW (December 20, 2004)
Total length of transmission system: 30,000 km (18,600 miles)
Interconnections: Quebec, Manitoba, New York, Michigan, Minnesota

Reliability Standards Currently in Effect in Ontario

http://www.ieso.ca/Pages/Participate/Reliability-Requirements/Reliability-Standards-Compliance.aspx

From the above linked IESO web page, download excel file named, "Milestones in Reliability Standard Development and Lifecycle".

Key Organizations in Ontario's Electricity Sector

Ministry of Energy

The Ontario Ministry of Energy ("Ministry") is responsible for setting the policy and legislative framework for Ontario's electricity system. The Ministry develops solutions and advises on all aspects of energy policy for Ontario, including electricity, natural gas and oil. It also has legislative responsibility for the Ontario Energy Board ("OEB") and Independent Electricity System Operator ("IESO").

Ontario Energy Board

The Ontario Energy Board ("OEB") is an independent, quasi-judicial tribunal that regulates the province's electricity and natural gas sectors in the public interest. Its mandate is prescribed in legislation – primarily the *Ontario Energy Board Act, 1998* and the *Electricity Act, 1998* (the "Act") – and associated regulations. Part of the OEB's mandate is to protect the interests of consumers with respect to prices and the reliability and quality of electricity service. The OEB is the Governmental Authority for Ontario as defined by NERC. The OEB also has the legislative authority to stay or revoke the operation of a reliability standard in Ontario and refer it back to NERC or the NPCC for further consideration.

Independent Electricity System Operator and the Market Assessment and Compliance Division

The Independent Electricity System Operator ("IESO") is a not-for-profit corporate entity established under the Act that manages the wholesale electricity market and oversees the reliable operation of the provincial electricity grid. The IESO evaluates Ontario's current and short-term electricity needs as well as the adequacy and reliability of the integrated power system. The IESO is also responsible for

establishing and enforcing reliability standards and participating in developing standards made by standards authorities[1]. The IESO is subject to the OEB's oversight authority.
The Act also authorizes the IESO to make and enforce rules ("Market Rules") that govern the operation of Ontario's electricity system. The IESO's compliance and enforcement activities have been delegated to an independent business unit called the Market Assessment and Compliance Division ("MACD") through a letter of delegation from the IESO's President and CEO to MACD's Director. As such, MACD makes all determinations and exercises all authorities accorded the IESO in the Market Rules concerning monitoring, investigation and the enforcement of rules and standards concerning the wholesale electricity system and market. MACD establishes and executes processes, procedures and programs for monitoring, investigating and imposing sanctions (including financial penalties) against Ontario market participants and the IESO.

Table Definitions

This table is intended to illustrate who has authority over these various processes vs. who has the authority for their execution.

Provincial Organization: the Ontario organization accountable and responsible for performing the function according to provincial legislation, or through delegation, for matters concerning Ontario entities.

Relevant US Organization: the US organization responsible for performing the function according to an executed Memorandum of Understanding for matters concerning Ontario entities.

US Comparator: the US organization responsible for performing the functions according to US law.

[1] "Standards authority," as defined by the Act, means the North American Electric Reliability Corporation (NERC) and "any other agency or body designated by regulation that approves standards or criteria applicable both in and outside Ontario relating to the reliability of transmission systems." Ontario Regulation 214/08 has designated the Northeast Power Coordinating Council (NPCC) a standards authority in Ontario.

Functions		Provincial Organization	Relevant US Organization	US Comparator
Standards Making[2]	Standards Development	Not Applicable (14)	NERC	NERC, NPCC
	Standards Approval	OEB (1)	Not Applicable	FERC
	Entity Registration	IESO (2)	Not Applicable	NERC, NPCC
Compliance Monitoring	Compliance Monitoring and Violation Detection	MACD (6)	NPCC (7)	NERC, NPCC, FERC
Enforcement Processes	Execution of Investigations	MACD (8)	NERC and NPCC (8)	NERC, NPCC, FERC
	Violation Determination and Sanction Imposition	MACD (9, 11)	NERC and NPCC (10)	NERC, NPCC, FERC
Appeals	First Hearing	Dispute Resolution Panel (13)	NPCC (12)	NPCC Hearing Body
	Right of Appeal	OEB (13)	NERC (12)	NERC Board of Trustees Compliance Committee
	Further Right of Appeal	An order of the OEB can be appealed to Divisional Court on a matter of law or jurisdiction (OEB Act s. 33)	Not applicable (12)	FERC

[2] Reliability standards include FERC-approved NERC reliability standards and FERC-approved regional reliability standards.

Oversight	Approval of Ontario's Rules of Procedure	IESO Board and right of appeal to OEB	Not applicable	FERC
	Approval of Ontario's Compliance Monitoring and Enforcement Implementation Plan (CMEP)	MACD	Not applicable	NERC and NPCC
	Performance Oversight of CMEP	MACD (4)	NERC and NPCC (4)	NERC Board of Trustees Compliance Committee
	Violation Prevention and Outreach (including education)	MACD (5)	NERC and NPCC (5)	NERC, NPCC, FERC

Notes:

1. **Standards Approval:** Generally, unless a NERC reliability standard is otherwise stayed or remanded (by the OEB) back to NERC, the standard will become effective in Ontario when it is declared in force in the United States, unless the standard has been made in response to a regulatory directive that has not been approved by the NERC ballot body.

2. **Entity Registration:** Ontario market participants are subject to compliance with reliability-related market rules which include reliability standards. The IESO has applied a risk-based approach to the applicability criteria it uses to determine which Ontario market participant facilities are subject to reliability standards. These criteria are similar to NERC's Compliance registry criteria and make Purchase Selling Entity standard requirements not applicable in Ontario.

3. **Compliance Accountability:** The IESO is the sole Ontario entity accountable to NERC or NPCC for compliance with NERC reliability standards. This accountability includes violations by Ontario entities of any of these requirements. By extension of licence conditions, the OEB could also find licenced entities non-compliant and invoke penalties including revocation of licence and financial penalties for contravening enforceable provisions. The Board is not accountable to NERC or NPCC.

4. **Peer Review:** MACD, NERC and NPCC can initiate a peer review of each other's compliance program with a mutually-agreed-upon scope of review.

5. **Prevention and Outreach:** Each of NERC, NPCC and MACD can issue alerts and other publications to help Ontario market participants and the IESO prevent violations. In the past, MACD has done so through Interpretation Bulletins and Enforcement Statements. The Reliability Compliance Section (RCS) of the IESO conducts outreach to Ontario entities regarding the requirements of Ontario's Reliability Compliance Program and standards development engagement.

6. **MACD Monitoring:** MACD establishes procedures for monitoring Ontario market participants through the Ontario Reliability Compliance Program (ORCP) and MACD's audit and spot check program. The ORCP is equivalent to the NERC-NPCC CMEP implementation plan for self-certifications and reporting requirements. The RCS conducts these activities on behalf of MACD. MACD conducts additional monitoring of all Ontario market participants through direct access to SCADA systems and other operational information available to the IESO and through referrals from IESO personnel. MACD conducts additional monitoring of the IESO through direct access to SCADA systems and other operational information.

7. **NERC and NPCC Monitoring:** NPCC conducts audits, spot checks and self-certification of the IESO in accordance with the NERC-NPCC Monitoring Program.

8. **Investigations:** In collaboration and coordination with MACD investigations, NPCC and NERC have the right to draw their own conclusions with respect to compliance investigations of Ontario entities. MACD also investigates and makes its own independent conclusions for violation determinations and sanctions for all Ontario entities, including the IESO.

9. **MACD Violation Determination and Sanction Imposition:** MACD makes violation and sanction determinations for all Ontario entities and the IESO. Sanctions include, among other things, orders to: 1) do "such things as may be necessary" to comply with the Market Rules; 2) cease the act, activity or practice constituting the violation; 3) impose record-keeping or reporting requirements on a market participant; 4) issue a non-compliance letter and 5) impose financial penalties. The maximum financial penalty amount is $1,000,000 per occurrence for each breach at issue.

10. **NERC and NPCC Violation Determination and Sanction Imposition:** After determining that a violation has occurred in Ontario, NERC and NPCC may only impose sanctions on the IESO. These sanctions could be in respect of either a violation by an Ontario market participant or by the IESO itself. The possible sanctions imposed may include additional reporting, development of a mitigation plan, additional auditing, and in the case of material threats to reliability, remedial action directives.

11. **Public Disclosure:** When MACD makes a determination of a reliability standard violation or reliability-related market rule violation, the name of the responsible entity is made public on the IESO website. The level of detail disclosed for any violation varies according to what MACD deems necessary. NERC or NPCC do not disclose violations by Canadian entities. MACD sanctions are posted at: http://www.ieso.ca/Pages/Participate/Market-Oversight/Sanctions.aspx

12. **Appeals of NERC and NPCC Determinations:** The IESO is the sole Ontario entity accountable to NERC or NPCC for compliance by market participants and the IESO with NERC standards. If the IESO faces a violation determination or sanction by NERC or NPCC, it has a right to a compliance hearing with NPCC and a subsequent appeal to NERC. The IESO can also appeal any final NERC or NPCC order to the OEB.

13. **Appeals of MACD Determinations:** An enforcement decision made by MACD can be contested through the IESO's Dispute Resolution Panel (DRP) process, which is composed of negotiation, mediation and arbitration stages. The award of a DRP arbitrator can then be appealed to the OEB if it includes a financial penalty above $10,000 or otherwise denies authorization for, or terminates, suspends or restricts, the relevant market participant's right to participate in the Ontario market.

14. The IESO has the authority under s. 32(1) (c) of the *Electricity Act, 1998 to* establish standards and criteria relating to the reliability of electricity service or the IESO-controlled grid, if necessary.

Québec - US Comparator:
Standard-Making and Enforcement Functions

Fast Facts about Québec's Electricity System

Total annual consumption: 168 Terawatt-hours TWh (2012)
Customers: approx. 4,1 million
Installed capacity: 35 829 MW (as of May 2013)
Record summer peak: 22 092 MW (July 2010)
Record winter peak: 39 031MW (January 22, 2014)
Total length of transmission system: 33 640 km (20 900 miles)
Interconnections: Ontario, New Brunswick, Newfoundland & Labrador, New York, New England (Vermont, Massachusetts)

Reliability Standards Currently in Effect

A list of Québec's reliability standards and their status is available at this link:
http://www.regie-energie.qc.ca/en/audiences/NormesFiabiliteTransportElectricite/NormesFiabilite.html

Key Organizations in Québec's Electricity Sector

Ministère des Ressources naturelles

The ministère de l'Énergie et des Ressources naturelles (the "Ministry") is responsible for, among other things, setting the policy and legislative framework for Québec's electricity system. The Ministry develops solutions and advises on all aspects of energy policy for Québec, including electricity, natural gas and oil.

Régie de l'énergie

The Régie de l'énergie (the "Régie") is an independent, economic regulation agency that regulates the province's electricity and natural gas sectors in the public interest. Pursuant to its governing legislation, the *Act respecting the Régie de l'énergie* (the "Act"), it has the authority to establish, monitor and enforce a mandatory regime of reliability standards for electricity transmission in Québec. The mandatory reliability regime is not yet in place, and the framework for the regime is still in development. Once the mandatory regime is in place, the Régie will be responsible for ensuring that electric power transmission in Québec is carried out according to the reliability standards it adopts. The Régie may request the Reliability Coordinator (the "RC") for Québec to modify a standard filed or submit a new one, on the conditions it sets. The Régie adopts reliability standards and sets the dates of their coming into force.

The Régie will make all determinations and exercises all authorities concerning monitoring, investigation and enforcement of reliability standards, including the imposition of sanctions and financial penalties, but will obtain recommendations from NPCC and sometimes NERC, both of whom it has recognized, through an agreement, as experts in the development and monitoring of electric power transmission reliability standards. A second agreement, signed in September 2014, details the mandate granted by the Régie to NPCC and NERC with respect to monitoring and assessing the compliance of registered entities in Québec with the reliability standards adopted by the Régie.

Direction Contrôle des mouvements d'énergie (System Control unit) of Hydro-Québec TransÉnergie ("HQCMÉ")

HQCMÉ was designated by the Régie, pursuant to the Act, as the RC for Québec. Under that function, it oversees the reliable operation of the provincial electricity grid. It files with the Régie reliability standards, either NERC or NPCC standards, as well as any variant or other standard it deems necessary. It also files a register identifying the entities that are subject to the reliability standards adopted by the Régie.

Functions[1]		Provincial Organization	Relevant US Organization	US Comparator
Standards Making[2]	Standards Development	HQCMÉ (RC) (rarely)	NERC	NERC
	Standards Adoption	The Régie (1)	Not Applicable	FERC
Entity Registration		The Régie / RC(2)	Not Applicable	NERC
Compliance Monitoring	Compliance Monitoring and Violation Detection	The Régie (3, 4)	NPCC (5)	NERC, NPCC, FERC
	Execution of Investigations	The Régie (6)	NPCC or NERC (6)	NERC, NPCC, FERC
Enforcement Processes	Violation Determination and Sanction Imposition	The Régie (7, 8, 9)	Not Applicable	NERC, FERC
Appeals	Revision of a decision	The Régie (10)	Not applicable	NPCC Hearing Body
	Further Right of Appeal	Québec Superior Court (11)	Not applicable	NERC Board of Trustees Compliance Committee (BOT CC)
	Further Right of Appeal	Court of Appeal of Québec (12)	Not applicable	FERC
Oversight	Approval of Québec's Rules of Procedure	The Régie (13)	Not applicable	FERC
	Approval of Québec Reliability Standards Compliance Monitoring and Enforcement Program (QCMEP) and of the Implementation Plan	The Régie (14)	Not applicable	NERC, NPCC
	Performance Oversight of QCMEP	The Régie (15)	NERC and NPCC (15)	NERC BOT CC
	Violation Prevention and Outreach (including education)	The Régie (16)	NERC and NPCC (16)	NERC, NPCC, FERC

[1] This table is intended to illustrate who has authority over these various processes vs. who has authority for their execution.

[2] Reliability standards include FERC approved NERC reliability standards and FERC approved regional reliability standards and locally developed reliability standards proposed by the RC.

Table Definitions:

Provincial Organization: the Québec organization accountable and responsible for performing the function according to provincial legislation or through designation for matters concerning Québec registered entities.

Relevant US Organization: the US organization that is responsible for performing the function according to an agreement for matters concerning Québec registered entities.

US Comparator: the US organization that is responsible for performing the functions according to US law.

Notes:

1. **Standards Adoption:**
   Authority – Pursuant to section 85.7 of the Act, the Régie adopts the reliability standards and sets the dates of their coming into force.
   NERC Standards Filing – For information purposes, NERC files Board approved standards in Québec. Generally, when a NERC reliability standard is approved by FERC, the standard will be filed by the RC (HQCMÉ) with the Régie for adoption. The RC can as well file any variant of these standards or other standards it considers necessary.
   Standards Review – The Régie holds public hearing on the standards before their adoption. NERC/NPCC can make observations/recommendations to the Régie pursuant to their signed agreement.
   Public Process – The RC posts the standards on their website for public comments from the registered entities before filing them to the Régie for their adoption.
   Adoption/Remand – The Régie may request that the RC modifies a filed reliability standard or submit a new one, on the conditions it sets. Thus a reliability standard that has been filed with the Régie by the RC will not be remanded to NERC.

2. **Entity Registration:** Section 85.3 of the Act lists the entity characteristics to which the reliability standards applies. Pursuant to the Act (Section 85.13) the RC must file with the Régie, for approval, a register identifying the entities that are subject to the reliability standards adopted by the Régie.

3. **Compliance Accountability:** All Québec registered entities are accountable to the Régie for compliance with the reliability standards it adopts.

4. **Monitoring:** The Régie establishes processes for monitoring Québec registered entities through the *Québec Reliability Standards Compliance Monitoring and Enforcement Program (QCMEP)*. The QCMEP is analogous to the NERC CMEP.

5. **Monitoring:** NPCC monitors compliance to the reliability standards by conducting audits, self-certification, spot checks and other means in accordance with the QCMEP.

6. **Investigations:** The Régie may request or authorize NPCC or NERC to lead a compliance investigation.

7. **Violation Determination and Sanction Imposition:** The Régie makes violation and sanction determinations for all Québec registered entities after reviewing NPCC's findings and recommendations. Sanctions will be fixed according to the *Sanction Guide for the Enforcement of the Reliability Standards in effect in Québec*. The Régie may impose financial penalties or sanctions. The maximum financial penalty amount is $500 000 per occurrence per day.

8. **Enforcement Measure:** The Régie may impose a mitigation plan, a remedial action for non-compliance seriously compromising the reliability of electric power transmission, or conditions for carrying on certain activities.

9. **Public Disclosure:** In the event that a reliability standard violation is determined by the Régie, the name of the responsible entity is made public on the Régie's website. The level of detail disclosed for any violation varies according to what is deemed necessary by the Régie.

10. **Revision of a Decision:** Section 37 of the Act provides the conditions for a revision or revocation of a determination by the Régie.

11. **Further Right of Appeal:** Section 40 of the Act provides that "no appeal lies from a decision of the Régie." The only available recourse is a judicial review to the Superior Court of Québec. However, section 41 of the Act provides for a relatively tight privy clause.

12. **Further Right of Appeal:** A Superior Court decision on judicial review can be appealed to the Quebec Court of Appeal and ultimately, by permission, to the Supreme Court of Canada.

13. **Québec's Rules of Procedure:** Québec's Rules of procedure are integrated into the second agreement and the QCMEP.

14. **QCMEP and Implementation Plan:** Each year, the Régie approves the Implementation Plan to be used by NPCC to monitor and assess Registered Entities' compliance with the reliability standards. The Implementation Plan includes, among other things, the Annual Audit Plan and the Self-Certification program with their schedules.

15. **Performance Oversight:** NPCC provides the Régie and NERC with the *QCMEP Annual Implementation Report* regarding, among other things, the effectiveness of the QCMEP. Upon request from the Régie, NERC will conduct an audit of NPCC.

16. **Prevention and Outreach:** In addition to alerts and other publications issued by NERC and/or NPCC to help Québec registered entities prevent violations, the Régie may also issue similar notices for this purpose in an effort to clarify Québec's mandatory reliability standards regime, the requirements of the QCMEP and reliability standards development.

Saskatchewan - US Comparator: Standard-Making and Enforcement Functions

Table Definitions:

Provincial Organization: the Saskatchewan organization accountable and responsible for performing the function according to provincial legislation or through delegation for matters concerning Saskatchewan entities.

US Organization: the US organization that is responsible for performing the function according to an executed Memorandum of Understanding for matters concerning Saskatchewan entities.

US Comparator: the US organization that is responsible for performing the functions according to US law.

[1] Reliability standards Include FERC approved NERC reliability standards and FERC approved regional reliability standards.

Notes:

1. **Standards Approval:** SaskPower has the legislative authority via *The Power Corporation Act* (Saskatchewan) to set standards and enforce compliance for the bulk electric system in the Province of Saskatchewan. Typically NERC Board of Trustees approved standards shall be viewed as being automatically adopted in Saskatchewan, unless the standard is otherwise ordered, stayed or remanded back to NERC within 120 days of receiving notice.

2. **Entity Registration:** SaskPower is currently registered in the NERC Compliance Registry.

3. **Compliance Monitoring/Enforcement Processes:** The oversight unit within SaskPower will be the monitoring, compliance and enforcement authority for the province, as per SaskPower's legislative authority. The Midwest Reliability Organization currently performs on-site compliance audits for SaskPower.

4. **Prevention and Outreach:** SaskPower receives alerts and other publications issued by NERC and/or MRO that address violation prevention.

5. **Appeals:** If SaskPower disputes an MRO finding of non-compliance regarding a reliability standard, the SaskPower Oversight Unit may choose to hear arguments.

6. **Peer Review:** NERC and MRO can initiate a peer review of each other's compliance program with a mutually agreed scope of review.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Authorization Request Form

When completed, please email this form to:
sarcomm@nerc.com

NERC welcomes suggestions to improve the reliability of the bulk power system through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard			
Title of Proposed Standard:	Application of certain GO/GOP Reliability Standards and Requirements to Dispersed Generation		
Date Submitted:	10/1/2013		
SAR Requester Information			
Name:	Jennifer Sterling-Exelon, Gary Kruempel-MidAmerican, Allen Schriver-NextEra Energy, Inc., Brian Evans-Mongeon-Utility Services Inc.		
Organization:	Exelon, MidAmerican, NextEra Energy, Utility Services Inc.		
Telephone:	(630) 437-2764 – primary contact	E-mail:	jennifer.sterling@exeloncorp.com primary contact
SAR Type (Check as many as applicable)			
☐ New Standard ☒ Revision to existing Standard		☐ Withdrawal of existing Standard ☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
The industry is requesting that the application section of certain GO/GOP Reliability Standards or the requirements of certain GO/GOP Reliability Standards be revised in order to ensure that the Reliability Standards are not imposing requirements on dispersed generation that are unnecessary and/or counterproductive to the reliable operation of the Bulk Electric System (BES). For purposes of this SAR, dispersed generation are those resources that aggregate to a total capacity greater than 75 MVA (gross

SAR Information
nameplate rating), and that are connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage of 100 kV or above. This request is related to the proposed new definition of the Bulk Electric System (BES) from Project 2010-17, that results in the identification of elements of new dispersed generation facilities that if included under certain Reliability Standards may result in a detriment to reliability or be technically unsound and not useful to the support of the reliable operation of the BES .
Purpose or Goal (How does this request propose to address the problem described above?):
The goal of the request is to revise the applicability of GO/GOP Reliability Standards or the Requirement(s) of GO/GOP Reliability Standards to recognize the unique technical and reliability aspects of dispersed generation, given the proposed new definition of the BES.
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
The objective of the revisions to the applicability section and/or Requirements of certain GO/GOP Reliability Standards is to ensure that these revisions are approved by the Board of Trustees and applicable regulatory agencies prior to the effective date for newly identified elements under the proposed BES definition (i.e., June 2016).
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The scope of this SAR involves revisions to the applicability section of the following GO/GOP Reliability Standard applicability sections and/or Reliability Standard Requirements: (a) PRC-005-2 (-3); (b) FAC-008-3; (c) PRC-023-3/PRC-025-1; (d) PRC-004-2a (-3) ; and (e) VAR-002-2 so it is clear what, if any, requirements should apply to dispersed generation. Also, IRO,MOD, PRC or TOP Standards that require outage and protection and control coordination, planning, next day study or real time data or reporting of changes in real and reactive capability should be examined and revised, as needed, to ensure it is clear that these activities and reporting are conducted at the point of aggregation to 75 MVA, and not at an individual turbine, inverter or unit level for dispersed generation. This scope would also include development of a technical guidance paper for standard drafting teams developing new or revised Standards, so that they do not incorrectly apply requirements to dispersed generation unless such an application is technically sound and promotes the reliable operation of the BES. To the extent, there are existing Reliability Standard Drafting Teams that have the expertise and can make the requested changes prior to the compliance date of newly identified assets under the BES definition (i.e., June 2016), those projects may be assigned the required changes as opposed to creating new projects.

SAR Information
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

The following description and technical justification(including an assessment of reliability impacts) is provided for the standard drafting teams to execute the SAR for each applicable Standard.

PRC-005-2

Testing and maintenance of protection and control equipment for dispersed generation should start at the point of aggregation to 75 MVA. Manufacturers of dispersed generation turbines and solar panels recommend against specific testing and maintenance regimes for protection and control equipment at the dispersed generation turbine and panel level. In fact it is counterproductive to implement protection and control at the individual turbine, solar panel, or unit level. Instead this is best done at an aggregated level. Therefore, PRC-005 should indicate that the standard applies at the point of aggregation to at 75 MVA or greater for dispersed generation. This change would clarify that the facility section 4.2.5.3 is the section that would apply to dispersed generating facilities and that the remaining sections would not apply.

FAC-008-3

For dispersed generation, it is unclear if in FAC-008-3 the term “main step up transformer” refers to the padmount transformer at the base of the windmill tower or to the main aggregating transformer that steps up voltage to transmission system voltage. From a technical standpoint, it should be the point of aggregation at 75 MVA or above that is subject to this standard for dispersed generation, such as wind. It is at the point of aggregation at 75 MVA or above that facilities ratings should start, since it is this injection point at which a planner or operator of the system is relying on the amount of megawatts the dispersed generation is providing with consideration of the most limiting element. To require facility ratings at for each dispersed turbine, panel or generating unit is not useful to a planner or operator of the system, and, therefore, FAC-008-3 should be revised to be clear that facility ratings start at the point of aggregation at 75 MVA or above for dispersed generation.

SAR Information

Also consider that the BES definition specifically excludes collector system equipment at less than 75 MVA from being included in the BES. Thus, those portions of the collector systems that handle less than 75 MVA are not BES "Facilities," and, therefore, need not be evaluated per R1 or R2. Given this, there seems to be no technical value to conduct facility ratings for individual dispersed generation turbines, generating units and panels.

PRC-023-3/PRC-025-1

In keeping with the registration criteria for Generator Owners as well as the proposed BES Definition, the 75MVA point of aggregation should be the starting point for application of relay loadability requirements.

PRC-004-2

There is no technical basis to claim that misoperation analysis, corrective action plan implementation and reporting for dispersed generation at the turbine, generating unit or panel level is needed for the reliable operation of the BES. Similar to the statements above, the appropriate point to require misoperation analysis, corrective action plan implementation and reporting is at the point of aggregation at 75 MVA and above.

VAR-002-2

Voltage control for some types of dispersed generating facilities is accomplished by a controller that is able to adjust either generating unit controls or discrete reactive components to provide transmission system voltage adjustment. The VAR-002 standard should be modified to allow this type of control for dispersed generation facilities under the requirements of the standard.

General review of IROs, MODs, PRCs, TOPs

IRO, MOD, PRC or TOP Standards that require outage and protection and control coordination, planning, next day study or real time data or reporting of changes in real and reactive capability should be examined and revised, as needed, to ensure it is clear that these activities are conducted at the point of aggregation at 75 MVA, and not an individual turbine, generating unit or panel level for dispersed generation. Unless this clarity is provided applicability at a finer level of granularity related to dispersed generation may be seen as required and such granularity will result in activities that have no benefit to

SAR Information
reliable operation of the BES. Furthermore applicability at a finer level of granularity will result in uneeded and ineffective collection, analysis, and reporting activities that may result in a detriment to reliability.

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐ Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐ Transmission Owner	Owns and maintains transmission facilities.
☐ Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.

Reliability Functions		
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles		
Applicable Reliability Principles (Check all that apply).		
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.	
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.	
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.	
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.	
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.	
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.	
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.	
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.	
Does the proposed Standard comply with all of the following Market Interface Principles?		Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.		Yes

Reliability and Market Interface Principles	
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.
2. The Standards Committee authorized this posting on September 30, 2014.

Description of Current Draft

PRC-001-1.1(X)[1] is proposed for approval to align the applicability of PRC-001-1.1a with the revised definition of the Bulk Electric System (BES). Specifically, the Project 2014-01 – Standards Applicability for Dispersed Generation Resources standards drafting team (SDT) has coordinated with the other SDTs currently reviewing this standard and has recommended revisions to Requirement R3.1 to account for the unique characteristics of dispersed power producing resources.[2] Given the timing of concurrent standards development of PRC, TOP, and IRO projects, PRC-001-1.1a may be retired pursuant to an Implementation Plan of a successor version of PRC-001. If this occurs, PRC-001-1.1(X) will not go into effect. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the requirements of this standard to dispersed power producing resources.

Anticipated Actions	Anticipated Date
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	December 2014
Final ballot	January 2015
BOT adoption	February 2015

[1] The standard version number currently includes an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to adoption by the NERC Board of Trustees.

[2] The terms "dispersed generation resources" and "dispersed power producing resources" are used interchangeably in Project 2014-01 because the former term was used in the Standards Authorization Request for the project, while the latter term is in line with terminology used in the revised definition of the BES.

When this standard has received ballot approval, the text boxes within the Applicability section of the standard will be moved to the Application Guidelines Section of the standard.

A. Introduction

1. Title: System Protection Coordination

2. Number: PRC-001-1.1(X)

3. Purpose:

To ensure system protection is coordinated among operating entities.

4. Applicability

4.1. Balancing Authorities

4.2. Transmission Operators

4.3. Generator Operators

5. Effective Date:

See the Implementation Plan for this standard.

B. Requirements

R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.

R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:

R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.

R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.

R3.1. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.

- Requirement R3.1 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition.

Rationale for the Applicability Exclusion in Requirement R3.1

Coordination of new or changes to protective systems associated with dispersed power producing resources identified through Inclusion I4 of the BES definition are typically performed on the interconnecting facilities. New or changes to protective systems associated with these facilities should be coordinated with the TOP as these protective systems typically must be closely coordinated with the transmission protective systems to ensure the overall protection systems operates as designed. While the protective systems implemented on the individual generating units of dispersed power producing resources at these dispersed power producing facilities (i.e. individual wind turbines or solar panels/inverters) may in some cases need to be coordinated with other protective systems within the same dispersed power producing facility, new or changes to these protective systems do not need to be coordinated with the transmission protective systems, as this coordination would not provide reliability benefits to the BES.

R3.2. Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

R4. Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

R5. A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:

R5.1. Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems.

R5.2. Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.

R6. Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

C. Measures

M1. Each Generator Operator and Transmission Operator shall have and provide upon request evidence that could include but is not limited to, revised fault analysis study, letters of agreement on settings, notifications of changes, or other equivalent evidence that will be used to confirm that there was coordination of new protective systems or changes as noted in Requirements 3, 3.1, and 3.2.

M2. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, documentation, electronic

logs, computer printouts, or computer demonstration or other equivalent evidence that will be used to confirm that it monitors the Special Protection Systems in its area. (Requirement 6 Part 1)

M3. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, phone records, electronic-notifications or other equivalent evidence that will be used to confirm that it notified affected Transmission Operator and Balancing Authorities of changes in status of one of its Special Protection Systems. (Requirement 6 Part 2)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Generator Operator and Transmission Operator shall have current, in-force documents available as evidence of compliance for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measures 2 and 3.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for Generator Operators:

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: Failed to provide evidence of coordination when installing new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority as specified in R3.1.

3. Levels of Non-Compliance for Transmission Operators:

3.1. Level 1: Not applicable.

3.2. Level 2: Not applicable.

3.3. Level 3: Not applicable.

3.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

3.4.1 Failed to provide evidence of coordination when installing new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities as specified in R3.2.

3.4.2 Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.

4. Levels of Non-Compliance for Balancing Authorities:

4.1. Level 1: Not applicable.

4.2. Level 2: Not applicable.

4.3. Level 3: Not applicable.

4.4. Level 4: Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.

E. Regional Differences

None identified.

Dispersed Generation Resources
PRC-001-1.1(X)

The standard version number currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to adoption by the NERC Board of Trustees.

Standards Involved

Approval:

- PRC-001-1.1(X) – System Protection Coordination

Retirement:

- PRC-001-1.1a – System Protection Coordination

Prerequisite Approvals:

N/A

Background

In light of the adoption of a revised Bulk Electric System (BES) definition by the NERC Board of Trustees, changes to the applicability of certain Reliability Standards, including PRC-001, are necessary to align the standards with the implementation of the revised BES definition. The standard drafting team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Generation Resources has modified the applicability section and requirements of certain standards applicable to Generator Owners and Generator Operators to recognize the unique technical and reliability aspects of dispersed power producing resources in order to ensure the applicability of the standards is consistent with the reliable operation of the BES.[1]

General Considerations

PRC-001-1.1(X) is proposed for approval to align the applicability of PRC-001-1.1a with the revised definition of the BES. Specifically, the SDT has coordinated with the other SDTs currently reviewing this standard and has recommended revisions to Requirement R3.1 to account for the unique characteristics of dispersed power producing resources. Given the timing of concurrent standards development of PRC, TRP, and IRO projects, PRC-001-1.1a may be retired pursuant to an Implementation Plan of a successor version of PRC-001. If this occurs, PRC-001-1.1(X) will not go into effect.

Effective Date

PRC-001-1.1(X) shall become effective immediately after the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable

[1] The terms "dispersed generation resources" and "dispersed power producing resources" are used interchangeably in Project 2014-01 because the former term was used in the Standards Authorization Request for the project, while the latter term is in line with terminology used in the revised definition of the BES.

governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards:

The existing standard, PRC-001-1.1a, shall be retired at midnight of the day immediately prior to the Effective Date of PRC-001-1.1(X).

Applicability:

This standard applies to the following functional entities:

- Transmission Operator
- Generator Operator
- Balancing Authority

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.
2. The Standards Committee authorized this posting on September 30, 2014.

Description of Current Draft

PRC-001-1.1(X)[1] is proposed for approval to align the applicability of PRC-001-1.1a with the revised definition of the Bulk Electric System (BES). Specifically, the Project 2014-01 – Standards Applicability for Dispersed Generation Resources standards drafting team (SDT) has coordinated with the other SDTs currently reviewing this standard and has recommended revisions to Requirement R3.1 to account for the unique characteristics of dispersed power producing resources.[2] Given the timing of concurrent standards development of PRC, TOP, and IRO projects, PRC-001-1.1a may be retired pursuant to an Implementation Plan of a successor version of PRC-001. If this occurs, PRC-001-1.1(X) will not go into effect. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the requirements of this standard to dispersed power producing resources.

Anticipated Actions	Anticipated Date
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	December 2014
Final ballot	January 2015
BOT adoption	February 2015

[1] The standard version number currently includes an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to adoption by the NERC Board of Trustees.

[2] The terms "dispersed generation resources" and "dispersed power producing resources" are used interchangeably in Project 2014-01 because the former term was used in the Standards Authorization Request for the project, while the latter term is in line with terminology used in the revised definition of the BES.

When this standard has received ballot approval, the text boxes within the Applicability section of the standard will be moved to the Application Guidelines Section of the standard.

A. Introduction

1. **Title:** **System Protection Coordination**

2. **Number:** PRC-001-1.1(X)

3. **Purpose:**

   To ensure system protection is coordinated among operating entities.

4. **Applicability**

   4.1. Balancing Authorities

   4.2. Transmission Operators

   4.3. Generator Operators

5. **Effective Date:** ~~January 1, 2007~~

   See the Implementation Plan for this standard.

B. Requirements

R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.

R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:

R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.

R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.

R3.1. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.

- Requirement R3.1 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition.

Rationale for the Applicability Exclusion in Requirement R3.1

Coordination of new or changes to protective systems associated with dispersed power producing resources identified through Inclusion I4 of the BES definition are typically performed on the interconnecting facilities. New or changes to protective systems associated with these facilities should be coordinated with the TOP as these protective systems typically must be closely coordinated with the transmission protective systems to ensure the overall protection systems operates as designed. While the protective systems implemented on the individual generating units of dispersed power producing resources at these dispersed power producing facilities (i.e. individual wind turbines or solar panels/inverters) may in some cases need to be coordinated with other protective systems within the same dispersed power producing facility, new or changes to these protective systems do not need to be coordinated with the transmission protective systems, as this coordination would not provide reliability benefits to the BES.

R3.2. Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

R4. Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

R5. A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:

R5.1. Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems.

R5.2. Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.

R6. Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

C. Measures

M1. Each Generator Operator and Transmission Operator shall have and provide upon request evidence that could include but is not limited to, revised fault analysis study, letters of agreement on settings, notifications of changes, or other equivalent evidence that will be used to confirm that there was coordination of new protective systems or changes as noted in Requirements 3, 3.1, and 3.2.

M2. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, documentation, electronic

logs, computer printouts, or computer demonstration or other equivalent evidence that will be used to confirm that it monitors the Special Protection Systems in its area. (Requirement 6 Part 1)

M3. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, phone records, electronic-notifications or other equivalent evidence that will be used to confirm that it notified affected Transmission Operator and Balancing Authorities of changes in status of one of its Special Protection Systems. (Requirement 6 Part 2)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Generator Operator and Transmission Operator shall have current, in-force documents available as evidence of compliance for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measures 2 and 3.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for Generator Operators:

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: Failed to provide evidence of coordination when installing new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority as specified in R3.1.

3. Levels of Non-Compliance for Transmission Operators:

3.1. Level 1: Not applicable.

3.2. Level 2: Not applicable.

3.3. Level 3: Not applicable.

3.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

3.4.1 Failed to provide evidence of coordination when installing new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities as specified in R3.2.

3.4.2 Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.

4. Levels of Non-Compliance for Balancing Authorities:

4.1. Level 1: Not applicable.

4.2. Level 2: Not applicable.

4.3. Level 3: Not applicable.

4.4. Level 4: Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.

E. Regional Differences

None identified.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.
2. The Standards Committee authorized this posting on September 30, 2014.

Description of Current Draft

PRC-019-2 is proposed for approval to align the applicability section of PRC-019-1 with the revised definition of the Bulk Electric System (BES). Specifically, the Project 2014-01 – Standards Applicability for Dispersed Generation Resources standards drafting team has recommended revisions to the Facilities section to clarify that facilities that solely regulate voltage at the individual generating unit are subject to the requirements. Given the timing of concurrent standards development of PRC projects, PRC-019-1 may be retired pursuant to an Implementation Plan of a successor version of PRC-019. If this occurs, PRC-019-2 will not go into effect. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the requirements of this standard to dispersed power producing resources.[1]

Anticipated Actions	Anticipated Date
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	December 2014
Final ballot	January 2015
BOT adoption	February 2015

[1] The terms “dispersed generation resources” and “dispersed power producing resources” are used interchangeably in Project 2014-01 because the former term was used in the Standards Authorization Request for the project, while the latter term is in line with terminology used in the revised definition of the BES.

When this standard has received ballot approval, the text boxes within the Applicability section of the standard will be moved to the Application Guidelines Section of the standard.

A. Introduction

1. **Title:** Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection

2. **Number:** PRC-019-2

3. **Purpose:** To verify coordination of generating unit Facility or synchronous condenser voltage regulating controls, limit functions, equipment capabilities and Protection System settings.

4. **Applicability:**

   4.1. Functional Entities

   4.1.1 Generator Owner

   4.1.2 Transmission Owner that owns synchronous condenser(s)

   4.2. Facilities

   For the purpose of this standard, the term, "applicable Facility" shall mean any one of the following:

   4.2.1 Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

   4.2.2 Individual synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

   4.2.3 Generating plant/ Facility consisting of one or more units that are connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

   4.2.3.1 This includes individual dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition where voltage regulating control for the facility is performed solely at the individual resources.

Rationale for Facilities section 4.2.3.1

For those dispersed power producing facilities that only perform voltage regulating control at the individual unit level, the SDT believes that coordination should take place at the individual power producing resource level. These facilities need to consider the Protection Systems at the individual units and their compatibility with the reactive and voltage limitations of the units. Where voltage regulating control is done at an aggregate level, applicability is already included under Facilities section 4.2.3.

4.2.4 Any generator, regardless of size, that is a blackstart unit material to and designated as part of a Transmission Operator's restoration plan.

5. Effective Date:

See the Implementation Plan for this standard.

B. Requirements

R1. At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall coordinate the voltage regulating system controls, (including in-service[2] limiters and protection functions) with the applicable equipment capabilities and settings of the applicable Protection System devices and functions. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. Assuming the normal automatic voltage regulator control loop and steady-state system operating conditions, verify the following coordination items for each applicable Facility:

1.1.1. The in-service limiters are set to operate before the Protection System of the applicable Facility in order to avoid disconnecting the generator unnecessarily.

1.1.2. The applicable in-service Protection System devices are set to operate to isolate or de-energize equipment in order to limit the extent of damage when operating conditions exceed equipment capabilities or stability limits.

R2. Within 90 calendar days following the identification or implementation of systems, equipment or setting changes that will affect the coordination described in Requirement R1, each Generator Owner and Transmission Owner with applicable Facilities shall perform the coordination as described in Requirement R1. These possible systems, equipment or settings changes include, but are not limited to the following *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*:

- Voltage regulating settings or equipment changes;
- Protection System settings or component changes;
- Generating or synchronous condenser equipment capability changes; or
- Generator or synchronous condenser step-up transformer changes.

C. Measures

M1. Each Generator Owner and Transmission Owner with applicable Facilities will have evidence (such as examples provided in PRC-019 Section G) that it coordinated the voltage regulating system controls, including in-service[3] limiters and protection functions, with the applicable equipment capabilities and settings of the applicable

[2] Limiters or protection functions that are installed and activated on the generator or synchronous condenser.

[3] Limiters or protection functions that are installed and activated on the generator or synchronous condenser.

Protection System devices and functions as specified in Requirement R1. This evidence should include dated documentation that demonstrates the coordination was performed.

M2. Each Generator Owner and Transmission Owner with applicable Facilities will have evidence of the coordination required by the events listed in Requirement R2. This evidence should include dated documentation that demonstrates the specified intervals in Requirement R2 have been met.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention

The following evidence retention periods identify a period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention specified below is shorter than the time since the last compliance audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Owner shall retain evidence of compliance with Requirements R1 and R2, Measures M1 and M2 for six years.

If a Generator Owner or Transmission Owner is found non-compliant, the entity shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last periodic audit report and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 5 calendar years but less than or equal to 5 calendar years plus 4 months after the previous coordination.	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 5 calendar years plus 4 months but less than or equal to 5 calendar years plus 8 months after the previous coordination.	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 5 calendar years plus 8 months but less than or equal to 5 calendar years plus 12 months after the previous coordination.	The Generator Owner or Transmission Owner failed to coordinate equipment capabilities, limiters, and protection specified in Requirement R1 within 5 calendar years plus 12 months after the previous coordination.
R2	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 90 calendar days but less than or equal to 100 calendar days following the identification or implementation of a change in equipment or settings that affected the coordination.	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 100 calendar days but less than or equal to 110 calendar days following the identification or implementation of a change in equipment or settings that affected the coordination.	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 110 calendar days but less than or equal to 120 calendar days following the identification or implementation of a change in equipment or settings that affected the coordination.	The Generator Owner or Transmission Owner failed to coordinate equipment capabilities, limiters, and protection specified in Requirement R1 within 120 calendar days following the identification or implementation of a change in equipment or settings that affected the coordination.

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking
1	February 7, 2013	Adopted by NERC Board of Trustees	New
1	March 20, 2014	FERC Order issued approving PRC-019-1. (Order becomes effective on 7/1/16.)	

G. Reference

Examples of Coordination

The evidence of coordination associated with Requirement R1 may be in the form of:

- P-Q Diagram (Example in Attachment 1), or
- R-X Diagram (Example in Attachment 2), or
- Inverse Time Diagram (Example in Attachment 3) or,
- Equivalent tables or other evidence

This evidence should include the equipment capabilities and the operating region for the limiters and protection functions

Equipment limits, types of limiters and protection functions which could be coordinated include (but are not limited to):

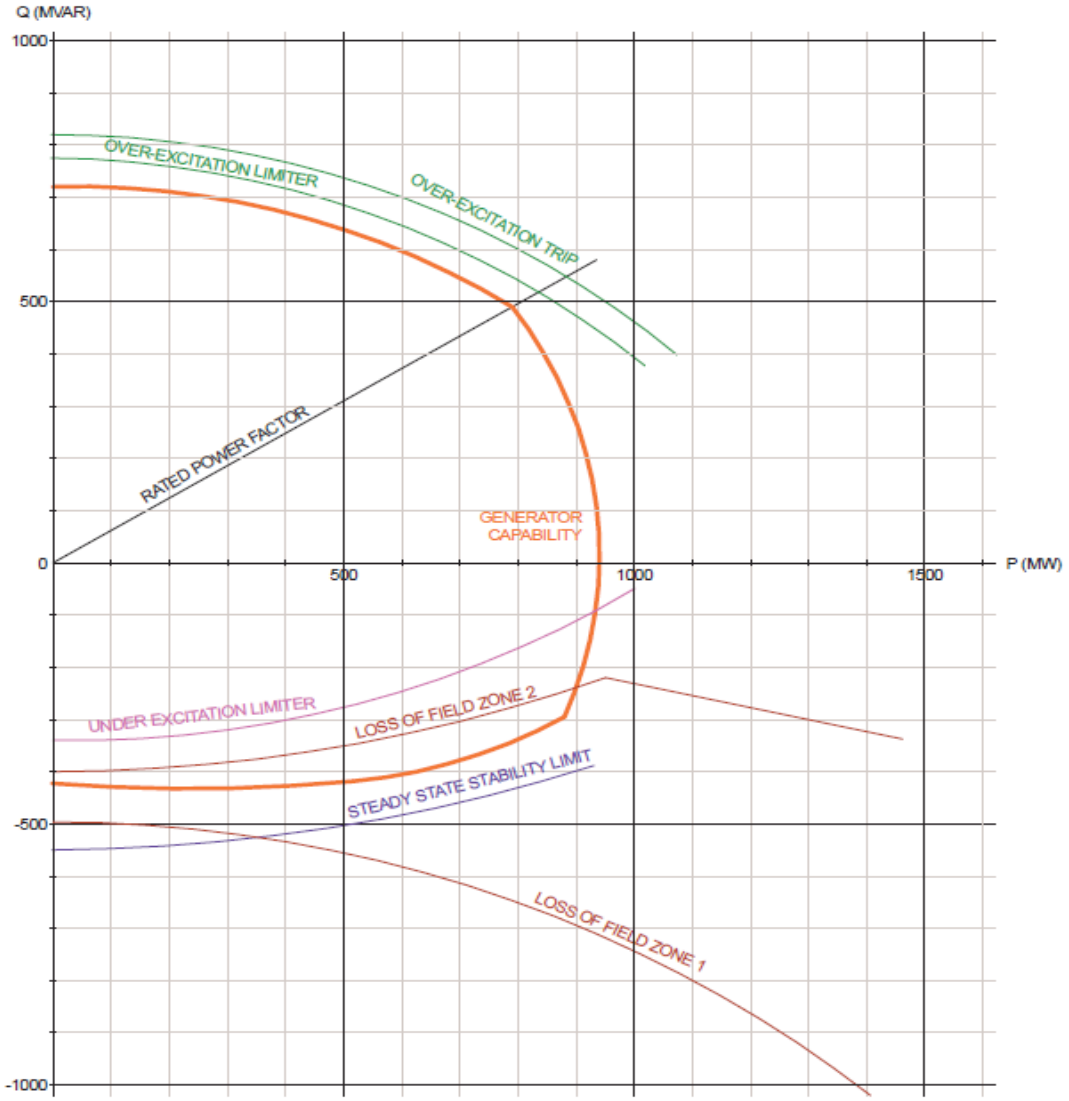
- Field over-excitation limiter and associated protection functions.
- Inverter over current limit and associated protection functions.
- Field under-excitation limiter and associated protection functions.
- Generator or synchronous condenser reactive capabilities.
- Volts per hertz limiter and associated protection functions.
- Stator over-voltage protection system settings.
- Generator and transformer volts per hertz capability.
- Time vs. field current or time vs. stator current.

NOTE: This listing is for reference only. This standard does not require the installation or activation of any of the above limiter or protection functions.

For this example, the Steady State Stability Limit (SSSL) is the limit to synchronous stability in the under-excited region with fixed field current.

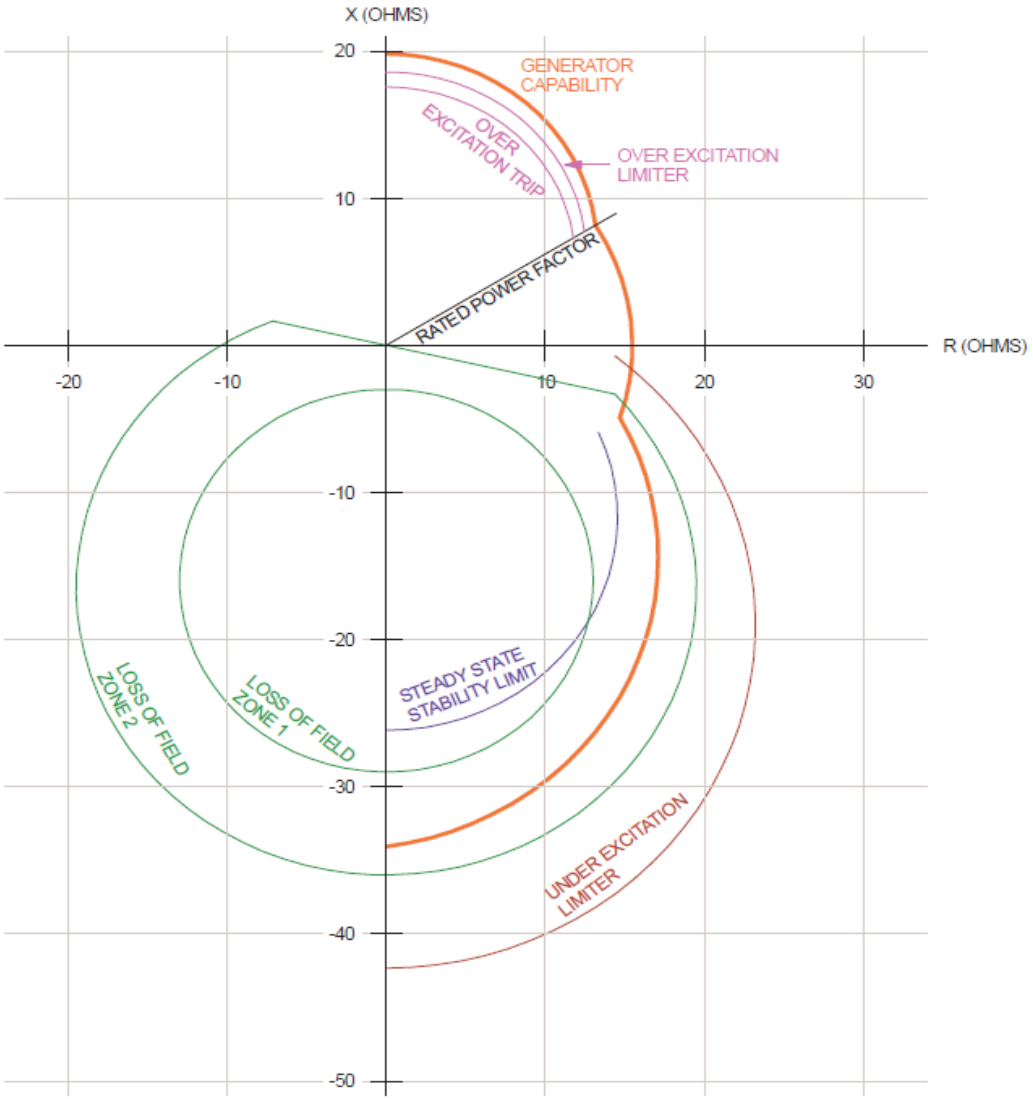
On a P-Q diagram using X_d as the direct axis saturated synchronous reactance of the generator, X_s as the equivalent reactance between the generator terminals and the "infinite bus" including the reactance of the generator step-up transformer and V_g as the generator terminal voltage (all values in per-unit), the SSSL can be calculated as an arc with the center on the Q axis with the magnitude of the center and radius described by the following equations

$$C = V^2_g/2*(1/X_s-1/X_d)$$



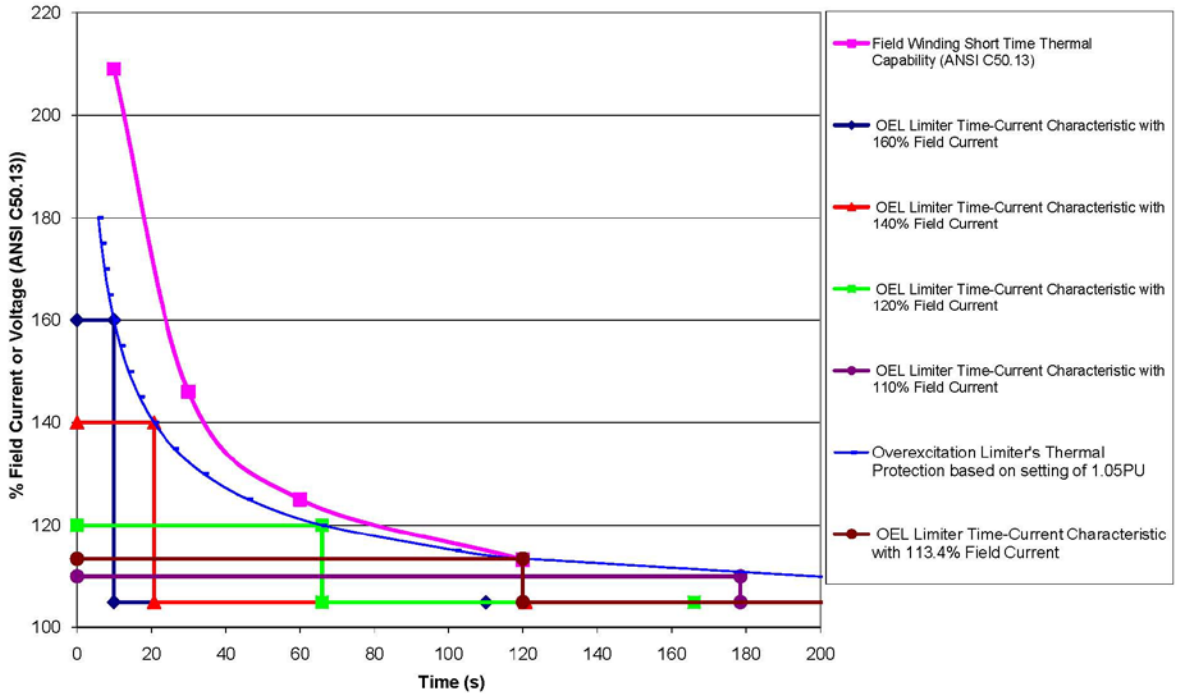
$$R = V^2_g/2*(1/X_s+1/X_d)$$

On an R-X diagram using X_d as the direct axis saturated synchronous reactance of the generator, and X_s as the equivalent reactance between the generator terminals and the "infinite bus" including the reactance of the generator step-up transformer the SSSL is an arc with the center on the X axis with the center and radius described by the following equations:



$$C = (X_d-X_s)/2$$

$$R = (X_d+X_s)/2$$



Section G Attachment 1 – Example of Capabilities, Limiters and Protection on a P-Q Diagram at nominal voltage and frequency

Section G Attachment 2 – Example of Capabilities, Limiters, and Protection on an R-X Diagram at nominal voltage and frequency

Section G Attachment 3 - Example of Capabilities, Limiters, and Protection on an Inverse Time Characteristic Plot

Dispersed Generation Resources
PRC-019-2

Standards Involved

Approval:

- PRC-019-2 – Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection

Retirement:

- PRC-019-1 – Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection

Prerequisite Approvals:

N/A

Background

In light of the adoption of a revised Bulk Electric System (BES) definition by the NERC Board of Trustees, changes to the applicability sections of certain Reliability Standards, including PRC-019, are necessary to align the standards with the implementation of the revised BES definition. The standard drafting team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Generation Resources has modified the applicability section and requirements of certain standards applicable to Generator Owners and Generator Operators to recognize the unique technical and reliability aspects of dispersed power producing resources in order to ensure the applicability of the standards is consistent with the reliable operation of the BES.[1]

General Considerations

PRC-019-2 is proposed for approval to align the applicability section of PRC-019-1 with the revised definition of the BES. Specifically, the SDT has recommended revisions to the Facilities section to clarify that facilities that solely regulate voltage at the individual generating unit are subject to the requirements. Given the timing of concurrent standards development of PRC projects, PRC-019-1 may already be retired pursuant to an Implementation Plan of a successor version of PRC-. If this occurs, PRC-019-2 will not go into effect.

[1] The terms “dispersed generation resources” and “dispersed power producing resources” are used interchangeably in Project 2014-01 because the former term was used in the Standards Authorization Request for the project, while the latter term is in line with terminology used in the revised definition of the BES.

Effective Date

PRC-019-2 shall become effective immediately after the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards:

The existing standard, PRC-019-1, shall be retired at midnight of the day immediately prior to the Effective Date of PRC-019-2

Applicability:

This standard applies to the following functional entities:

- Transmission Owner that owns synchronous condenser(s)
- Generator Owner

Implementation Plan

All aspects of the Implementation Plan for PRC-019-1 will remain applicable to PRC-019-2 and are incorporated here by reference.

The Implementation Plan for the revised definition of "Bulk Electric System" is available here.

The Implementation Plan for PRC-019-1 is available here.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.
2. The Standards Committee authorized this posting on September 30, 2014.

Description of Current Draft

PRC-019-2 is proposed for approval to align the applicability section of PRC-019-1 with the revised definition of the Bulk Electric System (BES). Specifically, the Project 2014-01 – Standards Applicability for Dispersed Generation Resources standards drafting team has recommended revisions to the Facilities section to clarify that facilities that solely regulate voltage at the individual generating unit are subject to the requirements. Given the timing of concurrent standards development of PRC projects, PRC-019-1 may be retired pursuant to an Implementation Plan of a successor version of PRC-019. If this occurs, PRC-019-2 will not go into effect. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the requirements of this standard to dispersed power producing resources.[1]

Anticipated Actions	Anticipated Date
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	December 2014
Final ballot	January 2015
BOT adoption	February 2015

[1] The terms “dispersed generation resources” and “dispersed power producing resources” are used interchangeably in Project 2014-01 because the former term was used in the Standards Authorization Request for the project, while the latter term is in line with terminology used in the revised definition of the BES.

When this standard has received ballot approval, the text boxes within the Applicability section of the standard will be moved to the Application Guidelines Section of the standard.

A. Introduction

1. **Title:** Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection

2. **Number:** PRC-019-21

3. **Purpose:** To verify coordination of generating unit Facility or synchronous condenser voltage regulating controls, limit functions, equipment capabilities and Protection System settings.

4. **Applicability:**

   4.1. Functional Entities

   4.1.1 Generator Owner

   4.1.2 Transmission Owner that owns synchronous condenser(s)

   4.2. Facilities

   For the purpose of this standard, the term, "applicable Facility" shall mean any one of the following:

   4.2.1 Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

   4.2.2 Individual synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

   4.2.3 Generating plant/ Facility consisting of one or more units that are connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

   4.2.3.1 This includes individual dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition where voltage regulating control for the facility is performed solely at the individual resources.

Rationale for Facilities section 4.2.3.1

For those dispersed power producing facilities that only perform voltage regulating control at the individual unit level, the SDT believes that coordination should take place at the individual power producing resource level. These facilities need to consider the Protection Systems at the individual units and their compatibility with the reactive and voltage limitations of the units. Where voltage regulating control is done at an aggregate level, applicability is already included under Facilities section 4.2.3.

4.2.4 Any generator, regardless of size, that is a blackstart unit material to and designated as part of a Transmission Operator's restoration plan.

5. Effective Date:

See the Implementation Plan for this standard.

~~**5.1.** In those jurisdictions where regulatory approval is required:~~

~~**5.1.1** By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.~~

~~**5.1.2** By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.~~

~~**5.1.3** By the first day of the first calendar quarter, four calendar years following applicable regulatory, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, approval each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.~~

~~**5.1.4** By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.~~

~~**5.2.** In those jurisdictions where regulatory approval is not required:~~

~~**5.2.1** By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.~~

~~**5.2.2** By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.~~

~~**5.2.3** By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator~~

~~Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.~~

~~5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.~~

B. Requirements

R1. At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall coordinate the voltage regulating system controls, (including in-service[2] limiters and protection functions) with the applicable equipment capabilities and settings of the applicable Protection System devices and functions. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. Assuming the normal automatic voltage regulator control loop and steady-state system operating conditions, verify the following coordination items for each applicable Facility:

1.1.1. The in-service limiters are set to operate before the Protection System of the applicable Facility in order to avoid disconnecting the generator unnecessarily.

1.1.2. The applicable in-service Protection System devices are set to operate to isolate or de-energize equipment in order to limit the extent of damage when operating conditions exceed equipment capabilities or stability limits.

R2. Within 90 calendar days following the identification or implementation of systems, equipment or setting changes that will affect the coordination described in Requirement R1, each Generator Owner and Transmission Owner with applicable Facilities shall perform the coordination as described in Requirement R1. These possible systems, equipment or settings changes include, but are not limited to the following *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*:

- Voltage regulating settings or equipment changes;
- Protection System settings or component changes;
- Generating or synchronous condenser equipment capability changes; or
- Generator or synchronous condenser step-up transformer changes.

C. Measures

[2] Limiters or protection functions that are installed and activated on the generator or synchronous condenser.

M1. Each Generator Owner and Transmission Owner with applicable Facilities will have evidence (such as examples provided in PRC-019 Section G) that it coordinated the voltage regulating system controls, including in-service[3] limiters and protection functions, with the applicable equipment capabilities and settings of the applicable Protection System devices and functions as specified in Requirement R1. This evidence should include dated documentation that demonstrates the coordination was performed.

M2. Each Generator Owner and Transmission Owner with applicable Facilities will have evidence of the coordination required by the events listed in Requirement R2. This evidence should include dated documentation that demonstrates the specified intervals in Requirement R2 have been met.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention

The following evidence retention periods identify a period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention specified below is shorter than the time since the last compliance audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Owner shall retain evidence of compliance with Requirements R1 and R2, Measures M1 and M2 for six years.

If a Generator Owner or Transmission Owner is found non-compliant, the entity shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last periodic audit report and all requested and submitted subsequent audit records.

[3] Limiters or protection functions that are installed and activated on the generator or synchronous condenser.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 5 calendar years but less than or equal to 5 calendar years plus 4 months after the previous coordination.	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 5 calendar years plus 4 months but less than or equal to 5 calendar years plus 8 months after the previous coordination.	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 5 calendar years plus 8 months but less than or equal to 5 calendar years plus 12 months after the previous coordination.	The Generator Owner or Transmission Owner failed to coordinate equipment capabilities, limiters, and protection specified in Requirement R1 within 5 calendar years plus 12 months after the previous coordination.
R2	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 90 calendar days but less than or equal to 100 calendar days following the identification or implementation of a change in equipment	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 100 calendar days but less than or equal to 110 calendar days following the identification or implementation of a change in equipment	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 110 calendar days but less than or equal to 120 calendar days following the identification or implementation of a change in equipment	The Generator Owner or Transmission Owner failed to coordinate equipment capabilities, limiters, and protection specified in Requirement R1 within 120 calendar days following the identification or implementation of a change in equipment or settings that

	or settings that affected the coordination.	or settings that affected the coordination.	or settings that affected the coordination.	affected the coordination.

G. Reference

Examples of Coordination

The evidence of coordination associated with Requirement R1 may be in the form of:

- P-Q Diagram (Example in Attachment 1), or
- R-X Diagram (Example in Attachment 2), or

- Inverse Time Diagram (Example in Attachment 3) or,
- Equivalent tables or other evidence

This evidence should include the equipment capabilities and the operating region for the limiters and protection functions

Equipment limits, types of limiters and protection functions which could be coordinated include (but are not limited to):

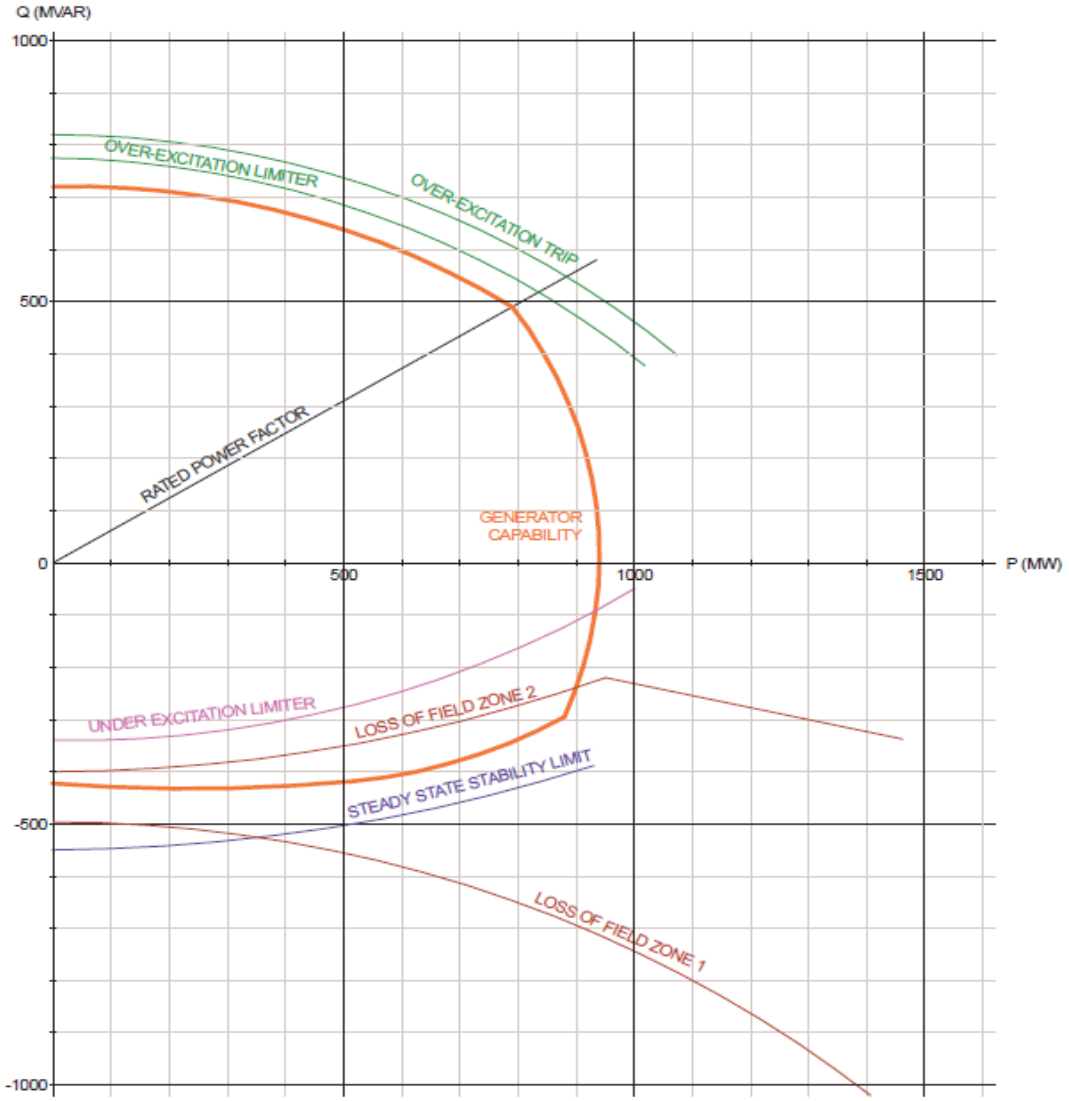
- Field over-excitation limiter and associated protection functions.
- Inverter over current limit and associated protection functions.
- Field under-excitation limiter and associated protection functions.
- Generator or synchronous condenser reactive capabilities.
- Volts per hertz limiter and associated protection functions.
- Stator over-voltage protection system settings.
- Generator and transformer volts per hertz capability.
- Time vs. field current or time vs. stator current.

NOTE: This listing is for reference only. This standard does not require the installation or activation of any of the above limiter or protection functions.

For this example, the Steady State Stability Limit (SSSL) is the limit to synchronous stability in the under-excited region with fixed field current.

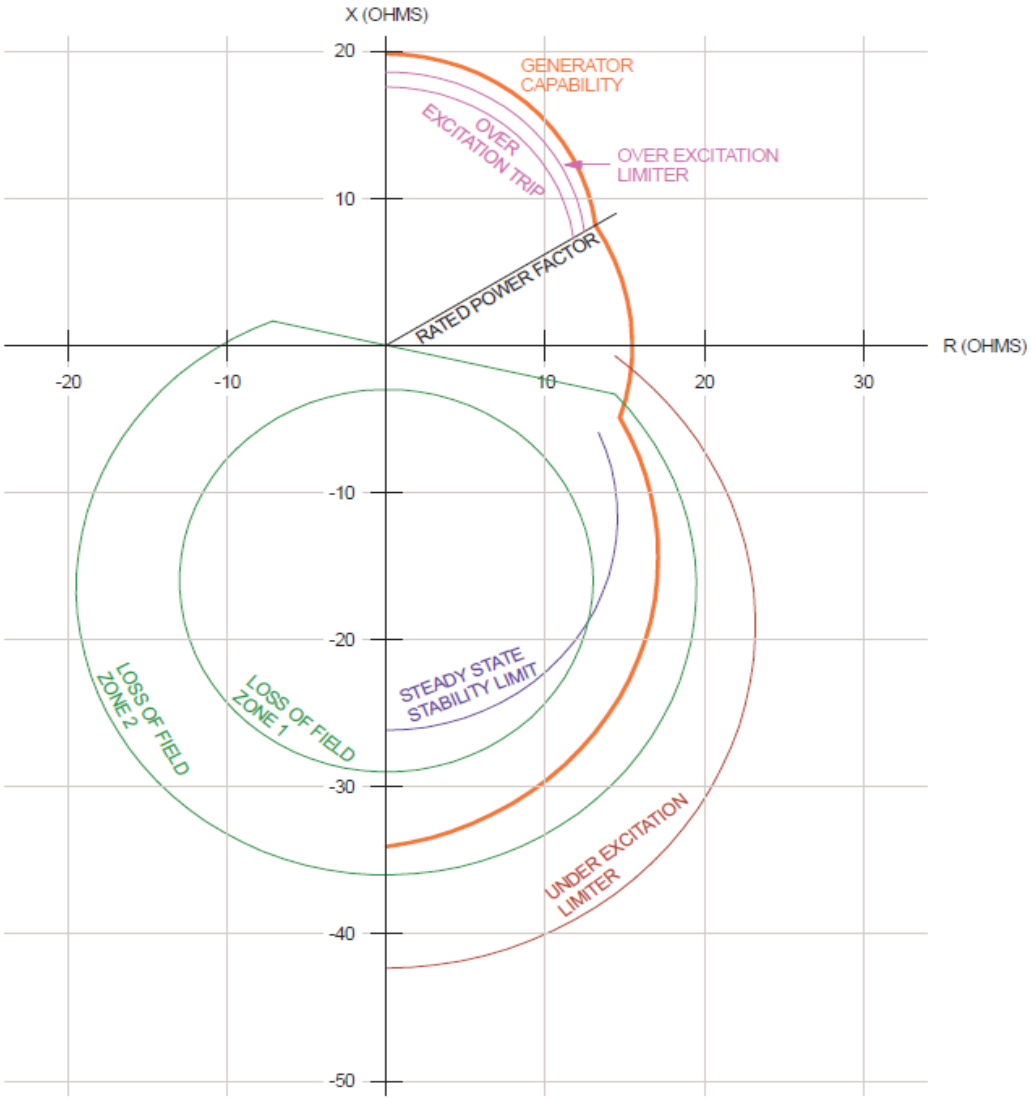
On a P-Q diagram using X_d as the direct axis saturated synchronous reactance of the generator, X_s as the equivalent reactance between the generator terminals and the "infinite bus" including the reactance of the generator step-up transformer and V_g as the generator terminal voltage (all values in per-unit), the SSSL can be calculated as an arc with the center on the Q axis with the magnitude of the center and radius described by the following equations

$$C = V^2_g/2*(1/X_s-1/X_d)$$



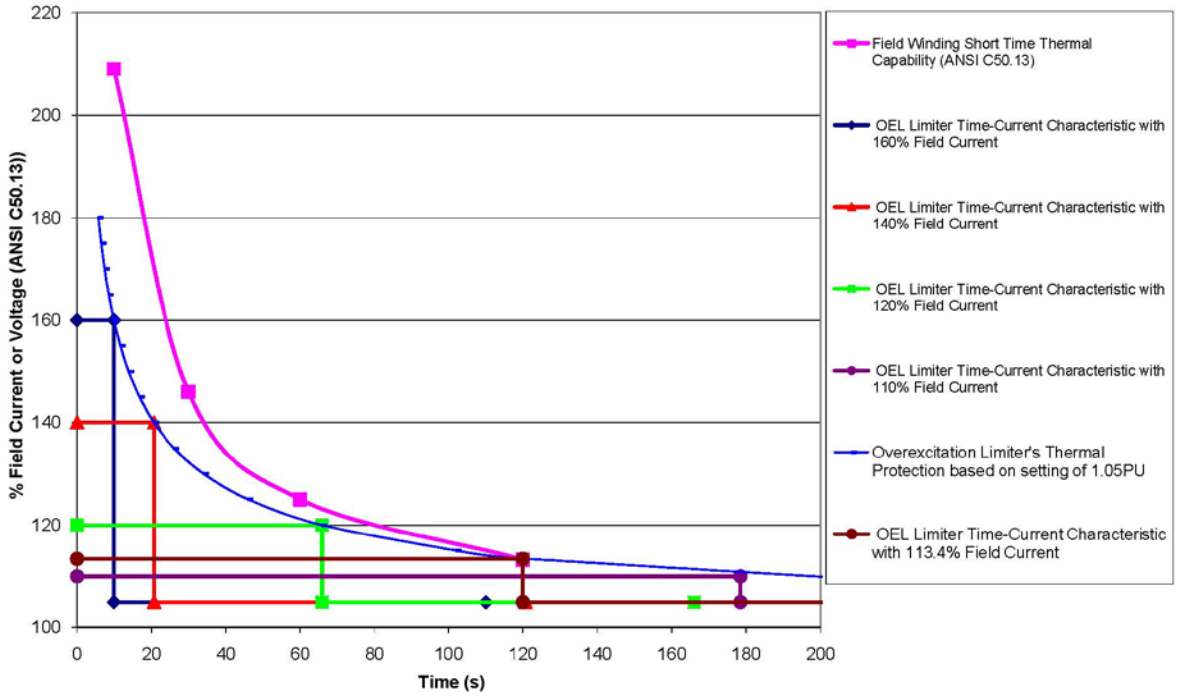
$$R = V^2_g/2*(1/X_s+1/X_d)$$

On an R-X diagram using X_d as the direct axis saturated synchronous reactance of the generator, and X_s as the equivalent reactance between the generator terminals and the "infinite bus" including the reactance of the generator step-up transformer the SSSL is an arc with the center on the X axis with the center and radius described by the following equations:



$$C = (X_d - X_s)/2$$

$$R = (X_d + X_s)/2$$



Section G Attachment 1 – Example of Capabilities, Limiters and Protection on a P-Q Diagram at nominal voltage and frequency

Section G Attachment 2 – Example of Capabilities, Limiters, and Protection on an R-X Diagram at nominal voltage and frequency

Section G Attachment 3 - Example of Capabilities, Limiters, and Protection on an Inverse Time Characteristic Plot

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.
2. The Standards Committee authorized this posting on September 30, 2014.

Description of Current Draft

PRC-024-1(X)[1] is proposed for approval to align the applicability section of PRC-024-1 with the revised definition of the Bulk Electric System (BES). Specifically, the Project 2014-01 –Standards Applicability for Dispersed Generation Resources standards drafting team recommended changes to the requirements addressing the scope of applicability and also recommended changes to the Reliability Standard Audit Worksheet to address documentation options. Given the timing of concurrent standards development of PRC projects, PRC-024-1 may be retired pursuant to an Implementation Plan of a successor version of PRC-024. If this occurs, PRC-024-1(X) will not go into effect. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the requirements of this standard to dispersed power producing resources.[2]

Anticipated Actions	Anticipated Date
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	December 2014
Final ballot	January 2015
BOT adoption	February 2015

[1] The standard version number currently includes an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to adoption by the NERC Board of Trustees.

[2] The terms “dispersed generation resources” and “dispersed power producing resources” are used interchangeably in Project 2014-01 because the former term was used in the Standards Authorization Request for the project, while the latter term is in line with terminology used in the revised definition of the BES.

When this standard has received ballot approval, the text boxes within the Applicability section of the standard will be moved to the Application Guidelines Section of the standard.

A. Introduction

1. **Title:** Generator Frequency and Voltage Protective Relay Settings

2. **Number: PRC-024-1(X)**

3. **Purpose:** Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.

4. **Applicability:**

   4.1. Generator Owner

5. **Effective Date:**

   See the Implementation Plan for this standard.

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[3] activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator frequency protective relaying does not trip the applicable generating unit(s) within the "no trip zone" of PRC-024 Attachment 1, subject to the following exceptions:[4] *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

[3] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

[4] For frequency protective relays associated with dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition, this requirement applies to frequency protective relays applied on the individual power producing resources, as well as frequency protective relays applied on equipment from the individual power producing resource up to the point of interconnection.

Rationale for Footnotes 2 and 4

The SDT has determined it is appropriate to require that protective relay settings applied on both the individual generating units and aggregating equipment (including any non-Bulk Electric System collection system equipment) are set within the "no-trip zone" referenced in the requirements to maintain reliability of the BES. If any of the protective relay settings applied on these elements of the facility were to be excluded from this standard, the potential would exist for portions of or the entire generating capacity of the dispersed power producing facility to be lost during a voltage or frequency excursion.

R2. Each Generator Owner that has generator voltage protective relaying[3] activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator voltage protective relaying does not trip the applicable generating unit(s) as a result of a voltage excursion (at the point of interconnection[5]) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2.[6] If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner's study. Requirement R2 is subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

[5] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

[6] For voltage protective relays associated with dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition, this requirement applies to voltage protective relays applied on the individual power producing resources, as well as voltage protective relays applied on equipment from the individual power producing resource up to the point of interconnection.

R3. Each Generator Owner shall document each known regulatory or equipment limitation[7] that prevents an applicable generating unit with generator frequency or voltage protective relays from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. The Generator Owner shall communicate the documented regulatory or equipment limitation, or the removal of a previously documented regulatory or equipment limitation, to its Planning Coordinator and Transmission Planner within 30 calendar days of any of the following:

- Identification of a regulatory or equipment limitation.
- Repair of the equipment causing the limitation that removes the limitation.
- Replacement of the equipment causing the limitation with equipment that removes the limitation.
- Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.

R4. Each Generator Owner shall provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated unit within 60 calendar days of receipt of a written request for the data and within 60 calendar days of any change to those previously requested trip settings unless directed by the requesting Planning Coordinator or Transmission Planner that the reporting of relay setting changes is not required. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets or other documentation.

M2. Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots, dynamic simulation studies or other documentation.

M3. Each Generator Owner shall have evidence that it has documented and communicated any known regulatory or equipment limitations (excluding limitations noted in footnote 3) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advice.

[7] Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect.

M4. Each Generator Owner shall have evidence that it communicated applicable generator protective relay trip settings in accordance with Requirement R4, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R4; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Voltage Ride-Through Curve Clarifications

Curve Details:

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage first exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. When evaluating Volts/Hertz protection, you may adjust the magnitude of the high voltage curve in proportion to deviations of frequency below 60 Hz.
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

Evaluating Protective Relay Settings:

1. Use either the following assumptions or loading conditions that are believed to be the most probable for the unit under study to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
    a. All of the units connected to the same transformer are online and operating.
    b. All of the units are at full nameplate real-power output.
    c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals.
    d. The automatic voltage regulator is in automatic voltage control mode.
2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.
3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Dispersed Generation Resources
PRC-024-1(X)

The standard version numbers currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to adoption by the NERC Board of Trustees.

Standards Involved

Approval:

- PRC-024-1(X) – Generator Frequency and Voltage Protective Relay Settings

Retirement:

- PRC-024-1 – Generator Frequency and Voltage Protective Relay Settings

Prerequisite Approvals:

N/A

Background

In light of the adoption of a revised Bulk Electric System (BES) definition by the NERC Board of Trustees, changes to the applicability of certain Reliability Standards, including PRC-024, are necessary to align the standards with the revised BES definition. The Standard Drafting Team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Generation Resources has modified the applicability section or requirements of certain standards applicable to Generator Owners and Generator Operators to recognize the unique technical and reliability aspects of dispersed generation in order to ensure the applicability of the standards is consistent with the reliable operation of the BES.

General Considerations

PRC-024-1(X) is proposed for approval to align the applicability of PRC-024-1 with the revised definition of the BES. Specifically, the SDT recommended changes to the requirements addressing the scope of applicability and also recommended changes to the Reliability Standard Audit Worksheet to address documentation options. Given the timing of concurrent standards development of PRC projects, PRC-024-1 may be retired pursuant to an Implementation Plan of a successor version of PRC-024. If this occurs, PRC-024-1(X) will not go into effect.

Effective Date

PRC-024-1(X) shall become effective immediately after the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first

calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards:
The existing standard, PRC-024-1, shall be retired at midnight of the day immediately prior to the Effective Date of PRC-024-1(X).

Applicability:
This standard applies to the following functional entities:

- Generator Owner

Implementation Plan
All aspects of the Implementation Plan for PRC-024-1 will remain applicable to PRC-024-(X) and are incorporated here by reference.

Cross References
The Implementation Plan for the revised definition of "Bulk Electric System" is available here.

The Implementation Plan for PRC-024-1 is available here.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.
2. The Standards Committee authorized this posting on September 30, 2014.

Description of Current Draft

PRC-024-1(X)[1] is proposed for approval to align the applicability section of PRC-024-1 with the revised definition of the Bulk Electric System (BES). Specifically, the Project 2014-01 –Standards Applicability for Dispersed Generation Resources standards drafting team recommended changes to the requirements addressing the scope of applicability and also recommended changes to the Reliability Standard Audit Worksheet to address documentation options. Given the timing of concurrent standards development of PRC projects, PRC-024-1 may be retired pursuant to an Implementation Plan of a successor version of PRC-024. If this occurs, PRC-024-1(X) will not go into effect. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the requirements of this standard to dispersed power producing resources.[2]

Anticipated Actions	Anticipated Date
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	December 2014
Final ballot	January 2015
BOT adoption	February 2015

[1] The standard version number currently includes an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to adoption by the NERC Board of Trustees.

[2] The terms “dispersed generation resources” and “dispersed power producing resources” are used interchangeably in Project 2014-01 because the former term was used in the Standards Authorization Request for the project, while the latter term is in line with terminology used in the revised definition of the BES.

When this standard has received ballot approval, the text boxes within the Applicability section of the standard will be moved to the Application Guidelines Section of the standard.

A. Introduction

1. **Title:** Generator Frequency and Voltage Protective Relay Settings

2. **Number:** **PRC-024-1(X)**

3. **Purpose:** Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.

4. **Applicability:**

   4.1. Generator Owner

5. **Effective Date:**

   See the Implementation Plan for this standard.

~~In those jurisdictions where regulatory approval is required:~~

~~By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.~~

~~By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.~~

~~By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.~~

~~By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.~~

~~In those jurisdictions where regulatory approval is not required:~~

~~By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.~~

~~By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.~~

~~By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.~~

~~By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.~~

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[3] activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator frequency protective relaying does not trip the applicable generating unit(s) within the "no trip zone" of PRC-024 Attachment 1, subject to the following exceptions:[4] *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

Rationale for Footnotes 2 and 4

The SDT has determined it is appropriate to require that protective relay settings applied on both the individual generating units and aggregating equipment (including any non-Bulk Electric System collection system equipment) are set within the "no-trip zone" referenced in the requirements to maintain reliability of the BES. If any of the protective relay settings applied on these elements of the facility were to be excluded from this standard, the potential would exist for portions of or the entire generating capacity of the dispersed power producing facility to be lost during a voltage or frequency excursion.

R2. Each Generator Owner that has generator voltage protective relaying[3] activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator voltage protective relaying does not trip the applicable generating unit(s) as a result of a voltage excursion (at the point of interconnection[5]) caused by an event on the

[3] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

[4] For frequency protective relays associated with dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition, this requirement applies to frequency protective relays applied on the individual power producing resources, as well as frequency protective relays applied on equipment from the individual power producing resource up to the point of interconnection.

[5] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2.[6] If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner's study. Requirement R2 is subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

R3. Each Generator Owner shall document each known regulatory or equipment limitation[7] that prevents an applicable generating unit with generator frequency or voltage protective relays from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. The Generator Owner shall communicate the documented regulatory or equipment limitation, or the removal of a previously documented regulatory or equipment limitation, to its Planning Coordinator and Transmission Planner within 30 calendar days of any of the following:

- Identification of a regulatory or equipment limitation.
- Repair of the equipment causing the limitation that removes the limitation.
- Replacement of the equipment causing the limitation with equipment that removes the limitation.
- Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.

[6] For voltage protective relays associated with dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition, this requirement applies to voltage protective relays applied on the individual power producing resources, as well as voltage protective relays applied on equipment from the individual power producing resource up to the point of interconnection.

[7] Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect.

R4. Each Generator Owner shall provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated unit within 60 calendar days of receipt of a written request for the data and within 60 calendar days of any change to those previously requested trip settings unless directed by the requesting Planning Coordinator or Transmission Planner that the reporting of relay setting changes is not required. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets or other documentation.

M2. Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots, dynamic simulation studies or other documentation.

M3. Each Generator Owner shall have evidence that it has documented and communicated any known regulatory or equipment limitations (excluding limitations noted in footnote 3) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advice.

M4. Each Generator Owner shall have evidence that it communicated applicable generator protective relay trip settings in accordance with Requirement R4, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R4; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Implementation Plan

Project 2014-02 CIP Version 5 Revisions

November 25, 2014

This Implementation Plan for the Reliability Standards developed as part of Project 2014-02 CIP Version 5 Revisions replaces the Implementation Plan for the versions of those CIP Reliability Standards adopted by the NERC Board of Trustees on November 13, 2014.

Requested Approvals

- CIP-003-7 — Cyber Security — Security Management Controls
- CIP-004-7 — Cyber Security — Personnel & Training
- CIP-006-6 — Cyber Security — Physical Security of BES Cyber Systems*
- CIP-007-7 — Cyber Security — Systems Security Management
- CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems*
- CIP-010-3 — Cyber Security — Configuration Change Management and Vulnerability Assessments
- CIP-011-3 — Cyber Security — Information Protection

Requested Withdrawals

- CIP-003-6 — Cyber Security — Security Management Controls

---

* The NERC Board of Trustees adopted Reliability Standards CIP-006-6 and CIP-009-6, and an associated implementation plan, on November 13, 2014. While these Reliability Standards are not being presented again for ballot or Board adoption, they are included herein for ease of reference and to provide a single implementation plan that contains all of the Reliability Standards adopted as part of Project 2014-02 CIP Version 5 Revisions.

- CIP-004-6 — Cyber Security — Personnel & Training
- CIP-007-6 — Cyber Security — Systems Security Management
- CIP-010-2 — Cyber Security — Configuration Change Management and Vulnerability Assessments
- CIP-011-2 — Cyber Security — Information Protection

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following defined terms in the NERC Glossary:

BES Cyber Asset (BCA)	A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.
Protected Cyber Asset (PCA)	One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP.

The standards drafting team proposes the following new defined terms for incorporation into the NERC Glossary:

Removable Media	Storage media that (i) are not Cyber Assets, (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less to a BES Cyber Asset, a network within an ESP, or a Protected Cyber Asset. Examples include, but are not limited to, floppy disks, compact

	disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.
Transient Cyber Asset	A Cyber Asset that is (i) capable of transmitting or transferring executable code, (ii) is not included in a BES Cyber System, (iii) is not a Protected Cyber Asset (PCA), and (iv) is directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless, including near field or Bluetooth communication) for 30 consecutive calendar days or less to a BES Cyber Asset, a network within an ESP, or a PCA. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.
Low Impact BES Cyber System Electronic Access Point (LEAP)	A Cyber Asset interface that controls Low Impact External Routable Connectivity. The Cyber Asset containing the LEAP may reside at a location external to the asset or assets containing low impact BES Cyber Systems.
Low Impact External Routable Connectivity (LERC)	Direct user-initiated interactive access or a direct device-to-device connection to a low impact BES Cyber System(s) from a Cyber Asset outside the asset containing those low impact BES Cyber System(s) via a bi-directional routable protocol connection. Point-to-point communications between intelligent electronic devices that use routable communication protocols for time-sensitive protection or control functions between Transmission station or substation assets containing low impact BES Cyber Systems are excluded from this definition (examples of this communication include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).

Effective Dates

The effective dates for each of the proposed Reliability Standards and NERC Glossary terms are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

1. CIP-003-7 — Cyber Security — Security Management Controls

Reliability Standard CIP-003-7 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-003-7, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-7, Requirement R1, Part 1.2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-7.

Compliance Date for CIP-003-7, Requirement R2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-7, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-7.

Compliance Date for CIP-003-7, Attachment 1, Section 1

Registered Entities shall not be required to comply with Reliability Standard CIP-003-7, Attachment 1, Section 1 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-7.

Compliance Date for CIP-003-7, Attachment 1, Section 2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-7, Attachment 1, Section 2 until the later of September 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-7.

Compliance Date for CIP-003-7, Attachment 1, Section 3

Registered Entities shall not be required to comply with Reliability Standard CIP-003-7, Attachment 1, Section 3 until the later of September 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-7.

Compliance Date for CIP-003-7, Attachment 1, Section 4

Registered Entities shall not be required to comply with Reliability Standard CIP-003-7, Attachment 1, Section 4 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-7.

2. CIP-004-7 — Cyber Security — Personnel & Training

   Reliability Standard CIP-004-7 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

3. CIP-006-6 — Cyber Security — Physical Security of BES Cyber Systems[1]

   Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

[1] The NERC Board adopted this standard and its implementation plan in November 2014. Therefore, it is not being presented again for ballot or for Board adoption but is included in this implementation plan for ease of reference.

Compliance Date for CIP-006-6, Requirement R1, Part 1.10

For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

4. CIP-007-7 — Cyber Security — Systems Security Management

Reliability Standard CIP-007-7 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-007-7, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with Reliability Standard CIP-007-7, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with high and medium impact BES Cyber Systems until nine calendar months after the effective date of Reliability Standard CIP-007-7.

5. CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems[2]

Reliability Standard CIP-009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the

[2] As noted above, the NERC Board adopted this standard and its implementation plan in November 2014. Therefore, it is not being presented again for ballot or for Board adoption but is included in this implementation plan for ease of reference.

first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. CIP-010-3 — Cyber Security — Configuration Change Management and Vulnerability Assessments

   Reliability Standard CIP-010-3 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-010-3, Requirement R4

   Registered Entities shall not be required to comply with Reliability Standard CIP-010-3, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-3.

7. CIP-011-3 — Cyber Security — Information Protection

   Reliability Standard CIP-011-3 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

8. New and Modified NERC Glossary Terms

The new and modified NERC Glossary Terms BES Cyber Asset, Protected Cyber Asset, Removable Media, and Transient Cyber Asset shall become effective on the compliance date for Reliability Standard CIP-010-3, Requirement R4, as applicable in the relevant jurisdiction.

The new and modified NERC Glossary Terms Low Impact BES Cyber System Electronic Access Point and Low Impact External Routable Connectivity shall become effective on the compliance date for Reliability Standard CIP-003-7, Requirement R2, as applicable in the relevant jurisdiction.

9. Standards for Retirement

CIP-003-5 shall retire at midnight of the day immediately prior to the effective date of CIP-003-7 in the particular jurisdiction in which the new standard is becoming effective.

CIP-004-5.1 shall retire at midnight of the day immediately prior to the effective date of CIP-004-7 in the particular jurisdiction in which the new standard is becoming effective.

CIP-006-5 shall retire at midnight of the day immediately prior to the effective date of CIP-006-6 in the particular jurisdiction in which the new standard is becoming effective.[3]

CIP-007-5 shall retire at midnight of the day immediately prior to the effective date of CIP-007-7 in the particular jurisdiction in which the new standard is becoming effective.

CIP-009-5 shall retire at midnight of the day immediately prior to the effective date of CIP-009-6 in the particular jurisdiction in which the new standard is becoming effective.[4]

CIP-010-1 shall retire at midnight of the day immediately prior to the effective date of CIP-010-3 in the particular jurisdiction in which the new standard is becoming effective.

CIP-011-1 shall retire at midnight of the day immediately prior to the effective date of CIP-011-3 in the particular jurisdiction in which the new standard is becoming effective.

Certain Compliance Dates in the Implementation Plan for Version 5 CIP Cyber Security Standards Remain the Same

The following sections of the Implementation Plan for Version 5 CIP Cyber Security Standards[5] (Version 5 Plan) remain the same:

[3] As noted above, the NERC Board adopted this standard and its implementation plan in November 2014. Therefore, it is not being presented again for ballot or for Board adoption but is included in this implementation plan for ease of reference.
[4] As noted above, the NERC Board adopted this standard and its implementation plan in November 2014. Therefore, it is not being presented again for ballot or for Board adoption but is included in this implementation plan for ease of reference.

- *Initial Performance of Certain Periodic Requirements*
  - For those requirements with recurring periodic obligations, refer to the Version 5 Plan for compliance dates. These compliance dates are not extended by the effective date of CIP Version 5 Revisions.
- *Previous Identity Verification*
  - The same concept in this section applies for CIP Version 5 Revisions. A documented identity verification performed pursuant to a previous version of the CIP Cyber Security Standards does not need to be repeated under CIP-004-7, Requirement R3, Part 3.1.
- *Planned or Unplanned Changes Resulting in a Higher Categorization*
  - The same concept applies for CIP Version 5 Revisions.

Unplanned Changes Resulting in Low Impact Categorization

For *unplanned* changes resulting in a low impact categorization where previously the asset containing BES Cyber Systems had no categorization, the Responsible Entity shall comply with all Requirements applicable to low impact BES Cyber Systems within 12 calendar months following the identification and categorization of the affected BES Cyber System.

[5] Implementation Plan for Version 5 CIP Cyber Security Standards, October 26, 2012, available online at http://www.nerc.com/pa/Stand/CIP00251RD/Implementation_Plan_clean_4_(2012-1024-1352).pdf

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2014-02 CIP Version 5 Revisions

~~September 3, 2014~~November 25, 2014

This Implementation Plan for the Reliability Standards developed as part of Project 2014-02 CIP Version 5 Revisions replaces the Implementation Plan for the versions of those CIP Reliability Standards adopted by the NERC Board of Trustees on November 13, 2014.

Requested Approvals

- CIP-003-~~6~~ 7 — Cyber Security — Security Management Controls
- CIP-004-~~6~~ 7 — Cyber Security — Personnel ~~and~~ & Training
- CIP-006-6 — Cyber Security — Physical Security of BES Cyber Systems[*]~~-~~
- CIP-007-~~6~~ 7 — Cyber Security — Systems Security Management
- CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems~~-~~[*]
- CIP-010-~~2~~ 3 — Cyber Security — Configuration Change Management and Vulnerability Assessments
- CIP-011-~~2~~ 3 — Cyber Security — Information Protection

Requested ~~Retirements~~Withdrawals

- CIP-003-~~5~~ 6 — Cyber Security — Security Management Controls

[*] The NERC Board of Trustees adopted Reliability Standards CIP-006-6 and CIP-009-6, and an associated implementation plan, on November 13, 2014. While these Reliability Standards are not being presented again for ballot or Board adoption, they are included herein for ease of reference and to provide a single implementation plan that contains all of the Reliability Standards adopted as part of Project 2014-02 CIP Version 5 Revisions.

- CIP-004-~~5~~ 6 — Cyber Security — Personnel ~~and~~ & Training
- ~~CIP-006-5 — Cyber Security — Physical Security~~
- CIP-007-~~5~~ 6 — Cyber Security — Systems Security Management
- ~~CIP-009-5 — Cyber Security — Recovery Plans for BES Cyber Systems~~
- CIP-010-~~1~~ 2 — Cyber Security — Configuration Change Management and Vulnerability Assessments
- CIP-011-~~1~~ 2 — Cyber Security — Information Protection

Prerequisite Approvals

None

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following defined terms in the NERC Glossary:

BES Cyber Asset (BCA)	A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.
Protected Cyber Asset (PCA)	One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP.

The standards drafting team proposes the following new defined terms for incorporation into the NERC Glossary:

Removable Media	Storage ~~Media~~media~~,~~ that (i) are not Cyber Assets, (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less~~, capable of transmitting~~

	~~executable code to:~~ to ~~(1)~~ a BES Cyber Asset, ~~(2)~~ a network within an ESP, or ~~(3)~~ a Protected Cyber Asset ~~that can be used to store, copy, move, or access data~~. ~~Removable Media are not Cyber Assets.~~ Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.
Transient Cyber Asset	A Cyber Asset~~,~~ that is (i) capable of transmitting or transferring executable code, (ii) is not included in a BES Cyber System, (iii) is not a Protected Cyber Asset (PCA), and (iv) is ~~(e.g., using Ethernet, serial, Universal Serial Bus, and wireless including near field and Bluetooth communication)~~ directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless, including near field or Bluetooth communication) for 30 consecutive calendar days or less to~~, capable of transmitting executable code to: (1)~~ a BES Cyber Asset, ~~(2)~~ a network within an ESP, or ~~(3)~~ a ~~Protected Cyber Asset~~PCA. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.
Low Impact BES Cyber System Electronic Access Point (LEAP)	A Cyber Asset interface that ~~allows~~ controls Low Impact External Routable Connectivity. The Cyber Asset containing the LEAP may reside at a location external to the asset or assets containing low impact BES Cyber Systems. ~~The Low Impact BES Cyber System Electronic Access Point is not an Electronic Access Control or Monitoring System.~~
Low Impact External Routable Connectivity (LERC)	Direct user-initiated interactive access or a direct device-to-device connection to a~~Bi-directional routable communications between~~ low impact BES Cyber System(s) ~~and~~ from a Cyber Asset~~s~~ outside the asset containing those low impact BES Cyber System(s) via a bi-directional routable protocol connection. ~~Communication protocols created for Intelligent Electronic Device (IED) to IED communication for protection and/or control functions from~~ Point-to-point communications between intelligent electronic devices that use routable communication protocols for time-sensitive protection or control functions between Transmission station or substation assets containing low impact BES Cyber Systems are excluded from this definition (examples of this communication include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).

Effective Dates

The effective dates for each of the proposed Reliability Standards and NERC Glossary terms are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular ~~element~~section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof) ~~of a proposed Reliability Standard~~, the additional time for compliance with that ~~element~~section is specified below. The compliance date for those particular ~~element~~sections represents the date that entities must begin to comply with that particular ~~element~~section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

1. CIP-003-~~6~~ 7 — Cyber Security — Security Management Controls

   Reliability Standard CIP-003-~~6~~ 7 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-003-~~6~~7, Requirement R1, Part 1.2

   Registered Entities shall not be required to comply with Reliability Standard CIP-003-~~6~~7, Requirement R1, Part 1.2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-~~6~~7.

   Compliance Date for CIP-003-~~6~~7, Requirement R2

   Registered Entities shall not be required to comply with Reliability Standard CIP-003-~~6~~7, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-~~6~~7.

   Compliance Date for CIP-003-~~6~~7, Attachment 1, ~~element~~Section 1

   Registered Entities shall not be required to comply with Reliability Standard CIP-003-~~6~~7, Attachment 1, ~~element~~Section 1 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-~~6~~7.

Compliance Date for CIP-003-~~6~~7, Attachment 1, ~~element~~Section 2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-~~6~~7, Attachment 1, ~~element~~Section 2 until the later of ~~April~~ September 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-~~6~~7.

Compliance Date for CIP-003-~~6~~7, Attachment 1, ~~element~~Section 3

Registered Entities shall not be required to comply with Reliability Standard CIP-003-~~6~~7, Attachment 1, ~~element~~Section 3 until the later of September 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-~~6~~7.

Compliance Date for CIP-003-~~6~~7, Attachment 1, ~~element~~Section 4

Registered Entities shall not be required to comply with Reliability Standard CIP-003-~~6~~7, Attachment 1, ~~element~~Section 4 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-~~6~~7.

2. CIP-004-~~6~~ 7 — Cyber Security — Personnel ~~and~~ & Training

Reliability Standard CIP-004-~~6~~ 7 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

3. CIP-006-6 — Cyber Security — Physical Security of BES Cyber Systems[1]

Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-006-6, Requirement R1, Part 1.10

For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

4. CIP-007-~~6~~ 7 — Cyber Security — Systems Security Management

Reliability Standard CIP-007-~~6~~ 7 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-007-~~6~~7, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with ~~the elements of~~ Reliability Standard CIP-007-~~6~~7, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a

[1] The NERC Board adopted this standard and its implementation plan in November 2014. Therefore, it is not being presented again for ballot or for Board adoption but is included in this implementation plan for ease of reference.

PSP and inside an ESP and associated with ~~High~~ high and ~~Medium~~ medium ~~Impact~~ impact BES Cyber Systems until nine calendar months after the effective date of Reliability Standard CIP-007-~~6~~7.

5. CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems[2]

   Reliability Standard CIP-009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. CIP-010-~~2~~ 3 — Cyber Security — Configuration Change Management and Vulnerability Assessments

   Reliability Standard CIP-010-~~2~~ 3 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-010-~~2~~3, Requirement R4

   Registered Entities shall not be required to comply with Reliability Standard CIP-010-~~2~~3, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-~~2~~3.

7. CIP-011-~~2~~ 3 — Cyber Security — Information Protection

   Reliability Standard CIP-011-~~2~~ 3 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable

[2] As noted above, the NERC Board adopted this standard and its implementation plan in November 2014. Therefore, it is not being presented again for ballot or for Board adoption but is included in this implementation plan for ease of reference.

governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

8. New and Modified NERC Glossary Terms

The new and modified NERC Glossary Terms BES Cyber Asset, Protected Cyber Asset, Removable Media, and Transient Cyber Asset shall become effective on the ~~same~~ compliance date ~~as when~~for Reliability Standard CIP-010-~~2~~3, Requirement R4, as applicable in the relevant jurisdiction~~is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the same compliance date as when Reliability Standard CIP-010-2, Requirement R4 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction~~.

The new and modified NERC Glossary Terms Low Impact BES Cyber System Electronic Access Point and Low Impact External Routable Connectivity shall become effective on the ~~same~~ compliance date ~~as when~~for Reliability Standard CIP-003-~~6~~7, Requirement R2, as applicable in the relevant jurisdiction~~is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the same compliance date as when Reliability Standard CIP-003-6, Requirement R2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction~~.

9. Standards for Retirement

CIP-003-5 shall retire at midnight of the day immediately prior to the effective date of CIP-003-7 in the particular jurisdiction in which the new standard is becoming effective.

CIP-004-5.1 shall retire at midnight of the day immediately prior to the effective date of CIP-004-7 in the particular jurisdiction in which the new standard is becoming effective.

CIP-006-5 shall retire at midnight of the day immediately prior to the effective date of CIP-006-6 in the particular jurisdiction in which the new standard is becoming effective.[3]

CIP-007-5 shall retire at midnight of the day immediately prior to the effective date of CIP-007-7 in the particular jurisdiction in which the new standard is becoming effective.

CIP-009-5 shall retire at midnight of the day immediately prior to the effective date of CIP-009-6 in the particular jurisdiction in which the new standard is becoming effective.[4]

CIP-010-1 shall retire at midnight of the day immediately prior to the effective date of CIP-010-3 in the particular jurisdiction in which the new standard is becoming effective.

CIP-011-1 shall retire at midnight of the day immediately prior to the effective date of CIP-011-3 in the particular jurisdiction in which the new standard is becoming effective.
~~Midnight of the day immediately prior to the Effective Date in the particular jurisdiction in which the new standard or definition is becoming effective.~~

Certain Compliance Dates in the Implementation Plan for Version 5 CIP Cyber Security Standards Remain the Same

The following sections of the Implementation Plan for Version 5 CIP Cyber Security Standards[5] (Version 5 Plan) remain the same:

[3] As noted above, the NERC Board adopted this standard and its implementation plan in November 2014. Therefore, it is not being presented again for ballot or for Board adoption but is included in this implementation plan for ease of reference.

- *Initial Performance of Certain Periodic Requirements*
  - For those requirements with recurring periodic obligations, refer to the Version 5 Plan for compliance dates. These compliance dates are not extended by the effective date of CIP Version 5 Revisions.
- *Previous Identity Verification*
  - The same concept in this section applies for CIP Version 5 Revisions. A documented identity verification performed pursuant to a previous version of the CIP Cyber Security Standards does not need to be repeated under CIP-004-~~6~~7, Requirement R3, Part 3.1.
- *Planned or Unplanned Changes Resulting in a Higher Categorization*
  - The same concept applies for CIP Version 5 Revisions.

Unplanned Changes Resulting in Low Impact Categorization

For *unplanned* changes resulting in a low impact categorization where previously the asset containing BES Cyber Systems had no categorization, the Responsible Entity shall comply with all Requirements applicable to low impact BES Cyber Systems within 12 calendar months following the identification and categorization of the affected BES Cyber System.

[4] As noted above, the NERC Board adopted this standard and its implementation plan in November 2014. Therefore, it is not being presented again for ballot or for Board adoption but is included in this implementation plan for ease of reference.

[5] Implementation Plan for Version 5 CIP Cyber Security Standards, October 26, 2012, available online at http://www.nerc.com/pa/Stand/CIP00251RD/Implementation_Plan_clean_4_(2012-1024-1352).pdf

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for an additional comment period and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period and Ballot	November 2014
Final Ballot is Conducted	January 2015
Board of Trustees (Board) Adoption	February 2015
Filing to Applicable Regulatory Authorities	February 2015

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-7

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-7:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

See Implementation Plan for CIP-003-7.

6. Background:

Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term *policy* refers to one or a collection of written documents that are used to communicate the Responsible Entities' management goals, objectives and expectations for how the Responsible Entity will protect its BES Cyber Systems. The use of *policies* also establishes an overall governance foundation for creating a culture of security and compliance with laws, regulations, and standards.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Reliability Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high, medium, and low impact BES Cyber Systems. For example, a single cyber security awareness program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an “or,” and numbered items are items that are linked with an “and.”

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within Regional Reliability Standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the requirements of the cyber security Reliability Standards. The purpose of policies is to provide a management and governance foundation for all requirements that apply to a Responsible Entity's BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the requirements.

Annual review and approval of the cyber security policies ensures that the policies are kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1 For its high impact and medium impact BES Cyber Systems, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of BES Cyber Systems (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for BES Cyber Systems (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2 For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls for Low Impact External Routable Connectivity (LERC) and Dial-up Connectivity; and

1.2.4. Cyber Security Incident response

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

In response to FERC Order No. 791, Requirement R2 requires entities to develop and implement cyber security plans to meet specific security control objectives for assets containing low impact BES Cyber Systems. The cyber security plan(s) covers four subject matter areas: (1) cyber security awareness; (2) physical security controls; (3) electronic access controls; and (4) Cyber Security Incident response. This plan(s), along with the cyber security policies required under Requirement R1, Part 1.2, provides a framework for operational, procedural, and technical safeguards for low impact BES Cyber Systems.

Considering the varied types of low impact BES Cyber Systems across the BES, Attachment 1 provides Responsible Entities flexibility on how to apply the security controls to meet the security objectives. Additionally, because many Responsible Entities have multiple-impact rated BES Cyber Systems, nothing in the requirement prohibits entities from using their high and medium impact BES Cyber System policies, procedures, and processes to implement security controls required for low impact BES Cyber Systems, as detailed in Requirement R2, Attachment 1.

Responsible Entities will use their list of assets containing low impact BES Cyber System(s) (developed pursuant to CIP-002) to substantiate the sites or locations associated with low impact BES Cyber Systems. However, there is no requirement or compliance expectation for Responsible Entities to maintain a list(s) of individual low impact BES Cyber Systems and their associated cyber assets or to maintain a list of authorized users.

R2. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall implement one or more documented cyber security plan(s) for its low impact BES Cyber Systems that include the sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per section are located in Attachment 2.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the CIP Senior Manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior

Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

CIP-003-7 - Attachment 1

Required Sections for Cyber Security Plan(s) for Assets Containing Low Impact BES Cyber Systems

Responsible Entities shall include each of the sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple-impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. Cyber Security Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, cyber security practices (which may include associated physical security practices).

Section 2. Physical Security Controls: Each Responsible Entity shall control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact BES Cyber Systems within the asset and (2) the Low Impact BES Cyber System Electronic Access Points (LEAPs), if any.

Section 3. Electronic Access Controls: Each Responsible Entity shall:

3.1 For LERC, if any, implement a LEAP to permit only necessary inbound and outbound bi-directional routable protocol access; and

3.2 Implement authentication for all Dial-up Connectivity, if any, that provides access to low impact BES Cyber Systems, per Cyber Asset capability.

Section 4. Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;

4.4 Incident handling for Cyber Security Incidents;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security

Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident; and

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

CIP-003-7 - Attachment 2

Examples of Evidence for Cyber Security Plan(s) for Assets Containing Low Impact BES Cyber Systems

Section 1 - Cyber Security Awareness: An example of evidence for Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation through one or more of the following methods:

- Direct communications (for example, e-mails, memos, or computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

Section 2 - Physical Security Controls: Examples of evidence for Section 2 may include, but are not limited to:

- Documentation of the selected access control(s) (e.g., card key, locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls that control physical access to both:
    a. The asset, if any, or the locations of the low impact BES Cyber Systems within the asset; and
    b. The Cyber Asset, if any, containing the LEAP.

Section 3 - Electronic Access Controls: Examples of evidence for Section 3 may include, but are not limited to:

- Documentation showing that inbound and outbound connections for any LEAP are confined to only those the Responsible Entity deems necessary (e.g., by restricting IP addresses, ports, or services); and documentation of authentication for Dial-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, or access control on the BES Cyber System).

Section 4 - Cyber Security Incident Response: An example of evidence for Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process documents of one or more Cyber Security Incident response plan(s) developed either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and for notifying the Electricity Sector Information Sharing and Analysis Center (ES-ISAC);

2. to identify and document the roles and responsibilities for Cyber Security Incident response by groups of individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to update, as needed, Cyber Security Incident response plan(s) within 180 calendar days after completion of a test or actual Reportable Cyber Security Incident.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section “4. Applicability” of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section “4.1. Functional Entities” is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section “4.2. Facilities” defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term “Facilities” already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

In developing policies in compliance with Requirement R1, the number of policies and their content should be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering the required topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-7, Requirement R1.

If a Responsible Entity has any high or medium impact BES Cyber Systems, the one or more cyber security policies must cover the nine subject matter areas required by CIP-003-7, Requirement R1, Part 1.1. If a Responsible Entity has identified from CIP-002 any assets containing low impact BES Cyber Systems, the one or more cyber security policies must cover the four subject matter areas required by Requirement R1, Part 1.2.

Responsible Entities that have multiple-impact rated BES Cyber Systems are not required to create separate cyber security policies for high, medium, or low impact BES Cyber Systems. The Responsible Entities have the flexibility to develop policies that cover all three impact ratings.

Implementation of the cyber security policy is not specifically included in CIP-003-7, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through

successful implementation of CIP-003 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements in NERC cyber security Reliability Standards, but to develop a holistic cyber security policy appropriate for its organization. Elements of a policy that extend beyond the scope of NERC's cyber security Reliability Standards will not be considered candidates for potential violations although they will help demonstrate the organization's internal culture of compliance and posture towards cyber security.

For Part 1.1, the Responsible Entity should consider the following for each of the required topics in its one or more cyber security policies for medium and high impact BES Cyber Systems, if any:

1.1.1 Personnel and training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control

- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components
- Availability of system backups

1.1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

Requirements relating to exceptions to a Responsible Entity's security policies were removed because it is a general management issue that is not within the scope of a reliability requirement. It is an internal policy requirement and not a reliability requirement. However, Responsible Entities are encouraged to continue this practice as a component of their cyber security policies.

In this and all subsequent required approvals in the NERC CIP Reliability Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

Using the list of assets containing low impact BES Cyber Systems from CIP-002, the intent of the requirement is for each Responsible Entity to create, document, and implement one or more cyber security plan(s) that addresses objective criteria for the protection of low impact BES Cyber Systems. The protections required by Requirement R2 reflect the level of risk that misuse

or the unavailability of low impact BES Cyber Systems poses to the BES. The intent is that the required protections are part of a program that covers the low impact BES Cyber Systems collectively either at an asset or site level (assets containing low impact BES Cyber Systems), but not at an individual device or system level.

There are four subject matter areas, as identified in Attachment 1, that must be covered by the cyber security plan: (1) cyber security awareness, (2) physical security controls, (3) electronic access controls for LERC and Dial-up Connectivity, and (4) Cyber Security Incident response.

Requirement R2, Attachment 1

As noted, Attachment 1 contains the sections that must be in the cyber security plan(s). The intent is to allow entities that have a combination of high, medium, and low impact BES Cyber Systems the flexibility to choose, if desired, to cover their low impact BES Cyber Systems (or any subset) under their programs used for the high or medium impact BES Cyber Systems rather than maintain two separate programs. Guidance for each of the four subject matter areas of Attachment 1 is provided below.

Requirement R2, Attachment 1, Section 1 – Cyber Security Awareness

The intent of the cyber security awareness program is for entities to reinforce good cyber security practices with their personnel at least once every 15 calendar months. The entity has the discretion to determine the topics to be addressed and the manner in which it will communicate these topics. As evidence of compliance, the Responsible Entity should be able to produce the awareness material that was delivered according to the delivery method(s) (e.g., posters, emails, or topics at staff meetings, etc.). The Responsible Entity is not required to maintain lists of recipients and track the reception of the awareness material by personnel.

Although the focus of the awareness is cyber security, it does not mean that only technology-related topics can be included in the program. Appropriate physical security topics (e.g., tailgating awareness and protection of badges for physical security, or “If you see something, say something” campaigns, etc.) are valid for cyber security awareness. The intent is to cover topics concerning any aspect of the protection of BES Cyber Systems.

Requirement R2, Attachment 1, Section 2 – Physical Security Controls

The Responsible Entity must document and implement methods to control physical access to (1) low impact BES Cyber Systems at assets containing low impact BES Cyber System(s) and (2) LEAPs, if any. If the LEAP is located within the BES asset and inherits the same controls outlined in Section 2, this can be noted by the Responsible Entity in either its policies or cyber security plan(s) to avoid duplicate documentation of the same controls.

The Responsible Entity has the flexibility in the selection of the methods used to meet the objective to control physical access to the asset(s) containing low impact BES Cyber Systems or the low impact BES Cyber System itself or LEAPs, if any. The Responsible Entity may use one or a combination of access controls, monitoring controls, or other operational, procedural, or technical physical security controls. Entities may use perimeter controls (e.g., fences with locked gates, guards, or site access policies, etc.) or more granular areas of physical access control in areas where low impact BES Cyber Systems are located, such as control rooms or

control houses. User authorization programs and lists of authorized users for physical access are not required although would help meet the security objective.

The objective is to control the physical access based on need as determined by the Responsible Entity. The need can be documented at the policy level for access to the site or systems. The requirement does not obligate an entity to specify a need for each access or authorization of a user for access.

Monitoring as a physical security control can be used as a complement or an alternative to access control. Examples of monitoring controls include, but are not limited to: (1) alarm systems to detect motion or entry into a controlled area, or (2) human observation of a controlled area. Monitoring does not necessarily require logging and maintaining logs but could include monitoring that physical access has occurred or been attempted (e.g., door alarm, or human observation, etc.). The monitoring does not need to be per low impact BES Cyber System but should be at the appropriate level to meet the security objective.

Requirement R2, Attachment 1, Section 3 – Electronic Access Controls

Section 3 requires the establishment of boundary protections for low impact BES Cyber Systems when the low impact BES Cyber Systems have bi-directional routable protocol communication or Dial-up Connectivity to devices external to the asset containing the low impact BES Cyber Systems. The establishment of boundary protections is intended to control communication either into the asset containing low impact BES Cyber System(s) or to the low impact BES Cyber System itself to reduce the risks associated with uncontrolled communication using routable protocols or Dial-up Connectivity. The term “electronic access control” is used in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing. The Responsible Entity is not required to establish LERC communication or a LEAP if there is no bi-directional routable protocol communication or Dial-up Connectivity present. In the case where there is no external bi-directional routable protocol communication or Dial-up Connectivity, the Responsible Entity can document the absence of the communication within its low impact cyber security plan.

The defined terms LERC and LEAP are used to avoid confusion with the similar terms used for high and medium impact BES Cyber Systems (e.g., External Routable Connectivity (ERC) or Electronic Access Point (EAP)). To future-proof the standards, and in order to avoid future technology issues, the definitions specifically exclude “point-to-point communications between intelligent electronic devices that use routable communication protocols for time-sensitive protection or control functions between Transmission station or substation assets containing low impact BES Cyber Systems,” such as IEC 61850 messaging. This does not exclude Control Center communication but rather excludes the communication between the intelligent electronic devices themselves. A Responsible Entity using this technology is not expected to implement a LEAP even though there technically is LERC. This exception was included so as not to inhibit the functionality of the time-sensitive requirements related to this technology nor to preclude the use of such time-sensitive reliability enhancing functions if they use a routable protocol in the future.

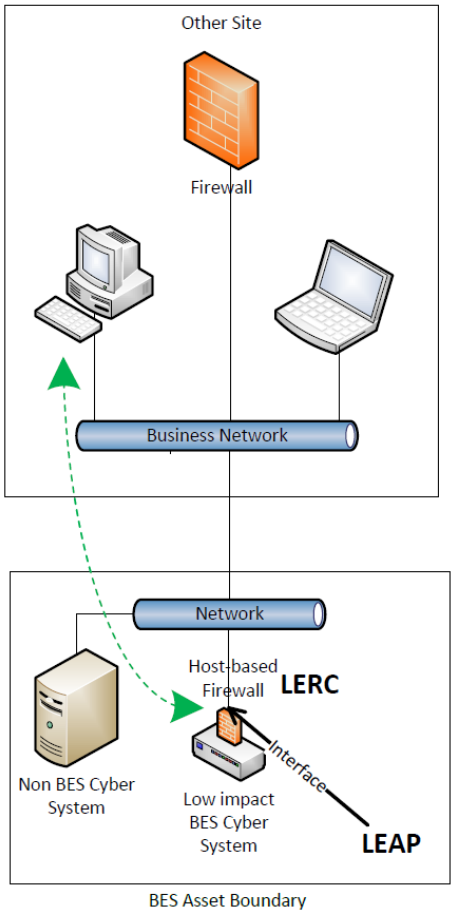
When determining whether there is LERC to the low impact BES Cyber System, the definition uses the phrases “direct user-initiated interactive access or a direct device-to-device connection to a low impact BES Cyber System(s) from a Cyber Asset outside the asset containing those low impact BES Cyber System(s) via a bi-directional routable protocol connection.” The intent of “direct” in the definition is to indicate LERC exists if a person is sitting at another device outside of the asset containing the low impact BES Cyber System, and the person can connect to logon, configure, read, or interact, etc. with the low impact BES Cyber System using a bi-directional routable protocol within a single end-to-end protocol session. The reverse case would also be LERC, in which the individual sits at the low impact BES Cyber System and connects to a device outside the asset containing low impact BES Cyber Systems using a single end-to-end bi-directional routable protocol session. Additionally, for “device-to-device connection,” LERC exists if the Responsible Entity has devices outside of the asset containing the low impact BES Cyber System sending or receiving bi-directional routable communication from or to the low impact BES Cyber System.

When identifying a LEAP, Responsible Entities are provided flexibility in the selection of the interface on a Cyber Asset that controls the LERC. Examples include, but are not limited to, the internal (facing the low impact BES Cyber Systems) interface on an external or host-based firewall, the internal interface on a router that has implemented an access control list (ACL), or other security device. The entity also has flexibility with respect to the location of the LEAP. LEAPs are not required to reside at the asset containing the low impact BES Cyber Systems. Furthermore, the entity is not required to establish a unique physical LEAP per asset containing low impact BES Cyber Systems. Responsible Entities can have a single Cyber Asset containing multiple LEAPs that controls the LERC for more than one asset containing low impact BES Cyber Systems. Locating the Cyber Asset with multiple LEAPs at an external location with multiple assets containing low impact BES Cyber Systems “behind” it, however, should not allow uncontrolled access from one asset to all other assets sharing the LEAP.

A Cyber Asset that contains interface(s) that only perform the function of a LEAP does not meet the definition of Electronic Access Control or Monitoring System (EACMS) associated with medium or high impact BES Cyber Systems and is not subject to the requirements applicable to an EACMS. However, a Cyber Asset may contain some interfaces that function as a LEAP and other interfaces that function as an EAP for high or medium impact BES Cyber Systems. In this case, the Cyber Asset would also be subject to the requirements applicable to the EACMS associated with the medium or high impact BES Cyber Systems.

Examples of sufficient access controls may include:

- Any LERC for the asset passes through a LEAP with explicit inbound and outbound access permissions defined, or equivalent method by which both inbound and outbound connections are confined to only those that the Responsible Entity deems necessary (e.g., IP addresses, ports, or services).
- As shown in Reference Model 1 below, the low impact BES Cyber System has a host-based firewall that is controlling the inbound and outbound access. In this model, it is also possible that the host-based firewall could be on a non-BES Cyber Asset. The intent is that the host-based firewall controls the inbound and

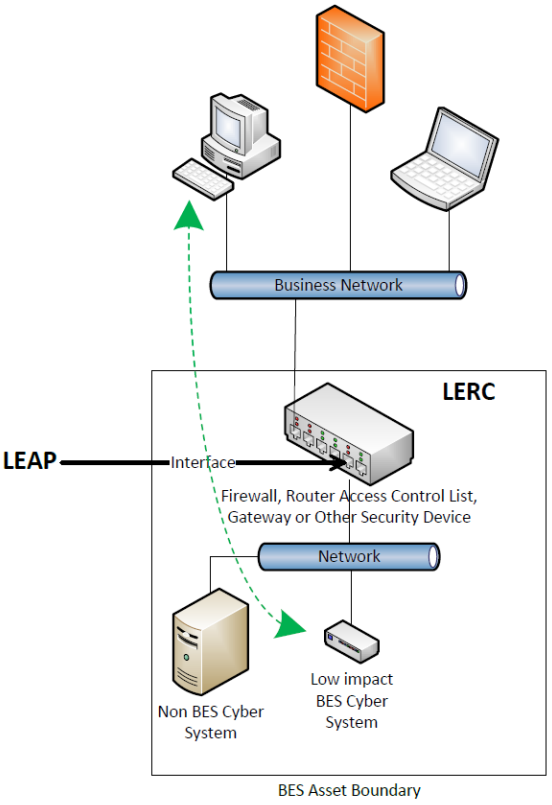


outbound access between the low impact BES Cyber System and the Cyber Asset in the business network.

- As shown in Reference Model 5 below, a non-BES Cyber Asset has been placed between the low impact BES Cyber System on the substation network and the Cyber Asset in the business network. The expectation is that the non-BES Cyber Asset has provided a "protocol break" so that access to the low impact BES Cyber System is only from the non-BES Cyber Asset that is located within the asset containing the low impact BES Cyber System.
- Dial-up Connectivity to a low impact BES Cyber System is set to dial out only (no auto-answer) to a preprogrammed number to deliver data. Incoming Dial-up Connectivity is to a dialback modem, a modem that must be remotely controlled by the control center or control room, has some form of access control, or the low impact BES Cyber System has access control.

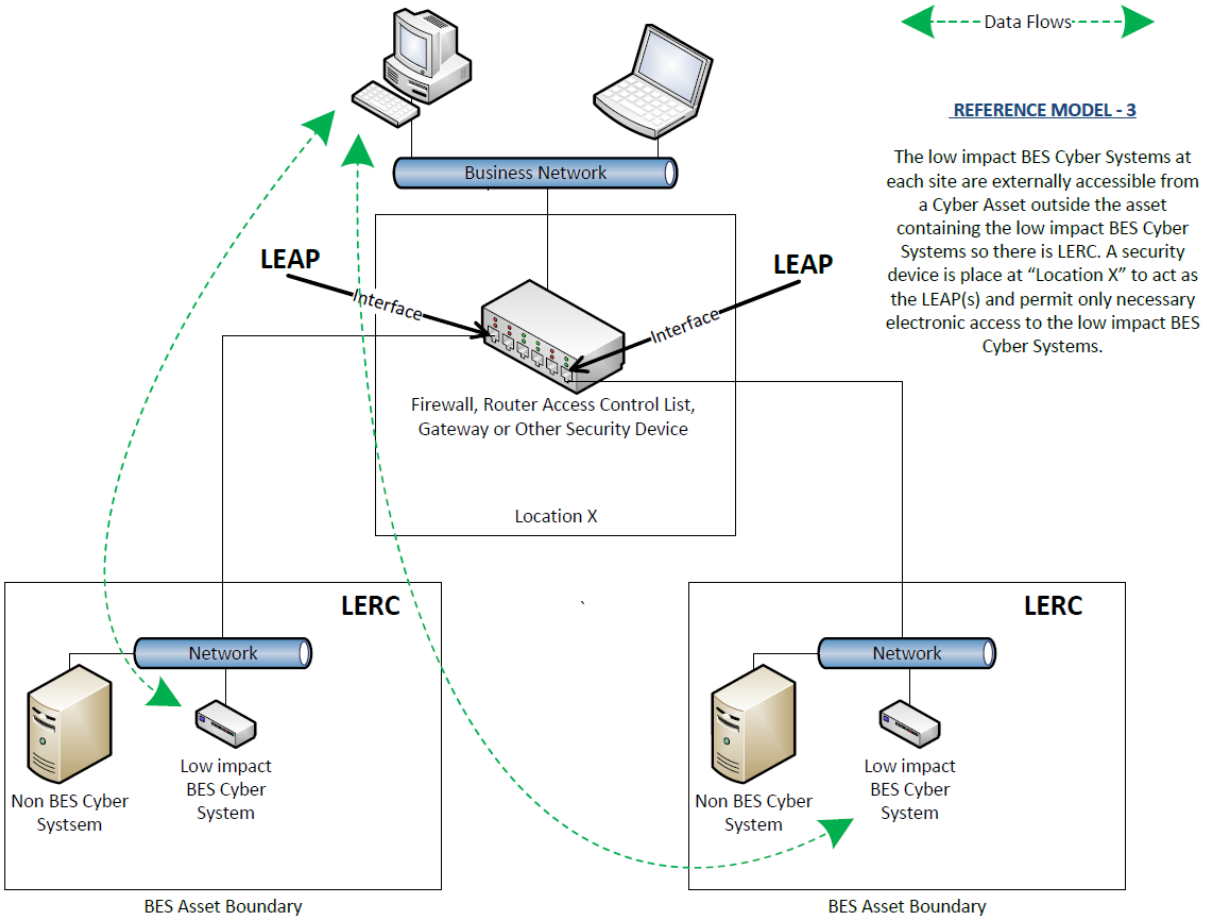
Some examples of situations that would lack sufficient access controls to meet the intent of this requirement include:

- An asset has Dial-up Connectivity and a low impact BES Cyber System is reachable via an auto-answer modem that connects any caller to the Cyber Asset that has a default password. There is no practical access control in this instance.
- An asset has LERC due to a BES Cyber System within it having a 3G/4G wireless card on a public carrier that allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan.
- In Reference Model 5, using just dual-homing or multiple-network interface cards in the non-BES Cyber Asset within the DMZ to provide separation between the low impact BES Cyber System and the business network would not meet the intent of "controlling" inbound and outbound electronic access assuming there was no other host-based firewall or other security device on that non-BES Cyber Asset.

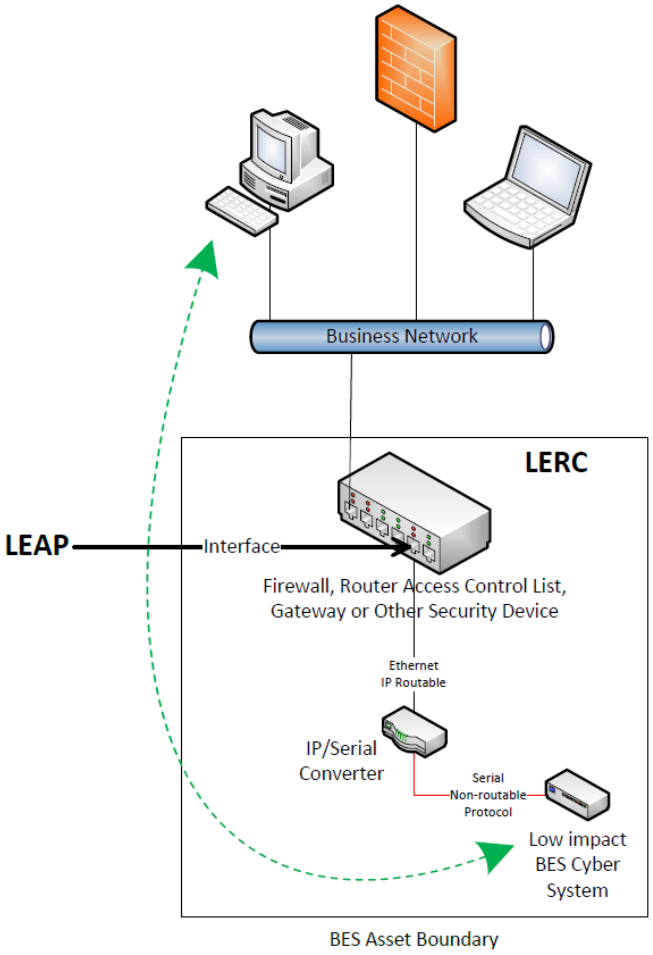


The following diagrams provide reference examples to depict the rationale for identifying whether there is LERC and for implementing a LEAP. While these diagrams identify several possible configurations, Responsible Entities may have additional configurations not identified below.

REFERENCE MODEL - 1



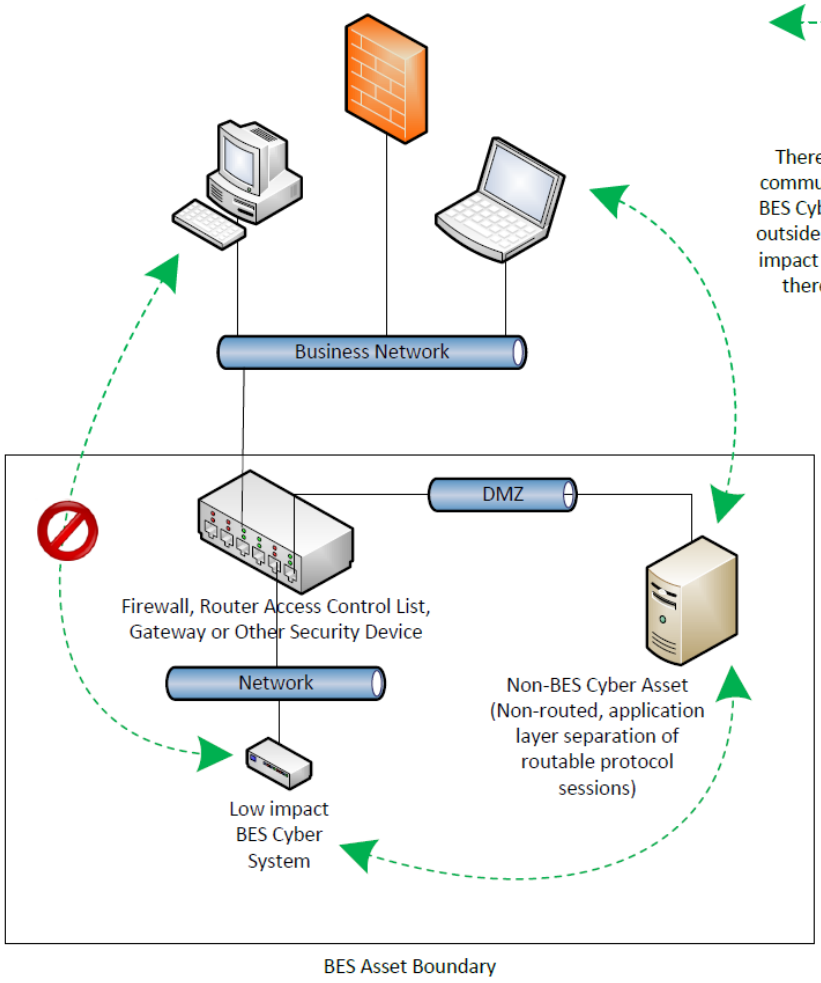
The low impact BES Cyber System is externally accessible from a Cyber Asset outside the asset containing the low impact BES Cyber System so there is LERC. A host-based firewall is configured on the low impact BES Cyber System to act as the LEAP and permit only necessary electronic access to the low impact BES Cyber System.



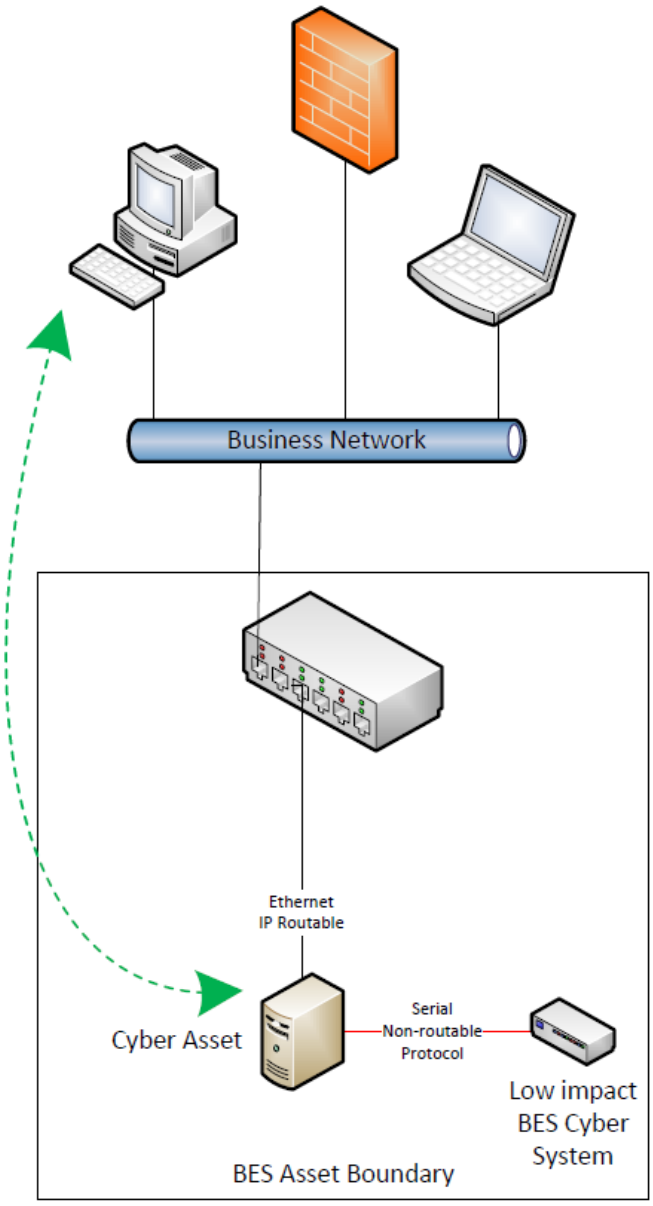
Data Flows

REFERENCE MODEL - 2

The low impact BES Cyber System is externally accessible from a Cyber Asset outside the asset containing the low impact BES Cyber System so there is LERC. A security device is placed between the business network and the low impact BES Cyber System to act as the LEAP and permit only necessary electronic access to the low impact BES Cyber System.



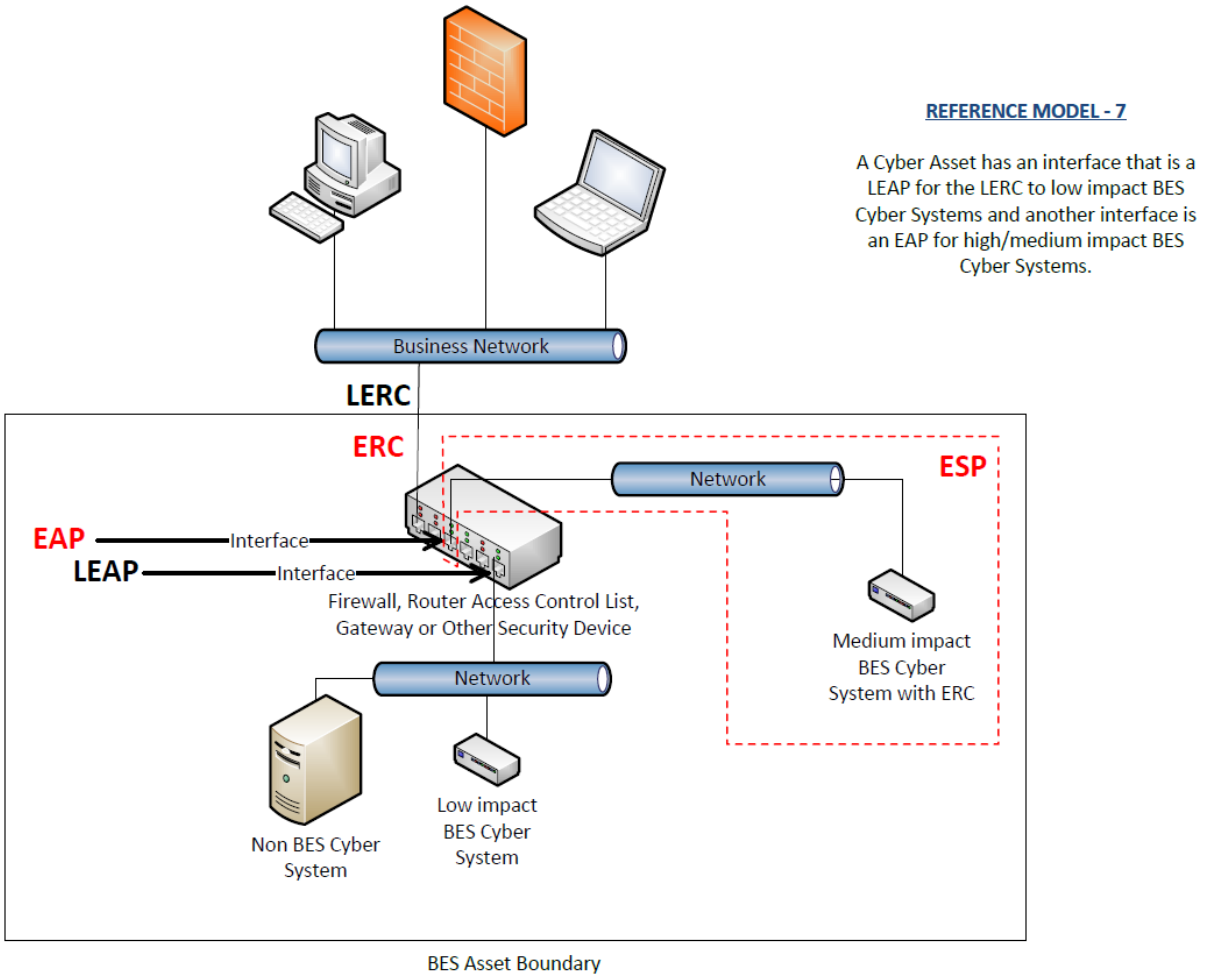
Data Flows
REFERENCE MODEL - 3
The low impact BES Cyber Systems at each site are externally accessible from a Cyber Asset outside the asset containing the low impact BES Cyber Systems so there is LERC. A security device is place at "Location X" to act as the LEAP(s) and permit only necessary electronic access to the low impact BES Cyber Systems.
Business Network
LEAP
Interface
LEAP
Interface
Firewall, Router Access Control List, Gateway or Other Security Device
Location X
LERC
Network
Non BES Cyber Systsem
Low impact BES Cyber System
BES Asset Boundary
LERC
Network
Non BES Cyber System
Low impact BES Cyber System
BES Asset Boundary



Data Flows

REFERENCE MODEL - 4

The low impact BES Cyber System is externally accessible from a Cyber Asset outside the asset containing the low impact BES Cyber System. There is LERC because the IP/Serial converter is extending the communication between the business network Cyber Asset and the low impact BES Cyber System is directly addressable from outside the asset. A security device is placed between the business network and the low impact BES Cyber System to permit only necessary electronic access to the low impact BES Cyber System.



Data Flows
REFERENCE MODEL - 5
There is no bi-directional routable communications between low impact BES Cyber System(s) and Cyber Assets outside the asset containing those low impact BES Cyber System(s) therefore there is no LERC in this example.
Business Network
DMZ
Firewall, Router Access Control List, Gateway or Other Security Device
Network
Non-BES Cyber Asset (Non-routed, application layer separation of routable protocol sessions)
Low impact BES Cyber System
BES Asset Boundary

REFERENCE MODEL - 6

In this example, a Cyber Asset stops the direct access to the low impact BES Cyber System. There is a layer 7 application layer break or the Cyber Asset requires authentication and then establishes a new connection to the low impact BES Cyber System. There is no LERC in this example.

Requirement R2, Attachment 1, Section 4 – Cyber Security Incident Response

The entity should have one or more documented Cyber Security Incident response plan(s) that include each of the topics listed in Section 4. If, in the normal course of business, suspicious activities are noted at an asset containing low impact BES Cyber Systems, the intent is for the entity to implement a Cyber Security Incident response plan that will guide the entity in responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident.

Entities are provided the flexibility to develop their Attachment 1, Section 4 Cyber Security Incident response plan(s) by asset or group of assets. The plans do not need to be on a per asset site or per low impact BES Cyber System basis. Entities can choose to use a single enterprise-wide plan to fulfill the obligations for low impact BES Cyber Systems.

The plan(s) must be tested once every 36 months. This is not an exercise per low impact BES Cyber Asset or per type of BES Cyber Asset but rather is an exercise of each incident response plan the entity created to meet this requirement. An actual Reportable Cyber Security Incident counts as an exercise as do other forms of tabletop exercises or drills. NERC-led exercises such as GridEx participation would also count as an exercise provided the entity's response plan is followed. The intent of the requirement is for entities to keep the Cyber Security Incident response plan(s) current, which includes updating the plan(s), if needed, within 180 days following a test or an actual incident.

For low impact BES Cyber Systems, the only portion of the definition of Cyber Security Incident that would apply is, "A malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of a BES Cyber System." The other portion of that definition is not to be used to require ESPs and PSPs for low impact BES Cyber Systems.

Requirement R3:

The intent of CIP-003-7, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Reliability Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that the CIP Senior Manager will play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-7, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the intent is to afford the Responsible Entity significant flexibility to adapt this requirement to its existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records shows a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up-to-date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or the individual is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for an additional comment period and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period and Ballot	~~September~~ November 2014
Final Ballot is Conducted	~~October/November 2014~~January 2015
Board of Trustees (Board) Adoption	~~November 2014~~February 2015
Filing to Applicable Regulatory Authorities	~~December 2014~~February 2015

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
~~6~~	~~June 2014~~	~~Responding to FERC Order No. 791.~~	~~Revised~~
6	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-~~6~~7

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-~~6~~7:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

~~Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.~~

~~Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R1, Part 1.2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.~~

~~Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.~~

~~Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 1 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.~~

~~Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 2 until the later of April 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.~~

~~Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 3 until the later of September 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.~~

~~Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 4 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.~~ See Implementation Plan for CIP-003-7.

6. Background:

Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require ~~a minimum level of~~ organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term *policy* refers to one or a collection of written documents that are used to communicate the Responsible Entities' management goals, objectives and expectations for how the Responsible Entity will protect its BES Cyber Systems. The use of *policies* also establishes an overall governance foundation for creating a culture of security and compliance with laws, regulations, and standards.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Reliability Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high, ~~and~~ medium, and low impact BES Cyber Systems. For example, a single ~~training~~ cyber security awareness program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save

the ~~Bulk Electric System~~BES. A review of UFLS tolerances defined within ~~regional~~ Regional ~~reliability~~ Reliability ~~standards~~ Standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the ~~standard's~~ requirements of the cyber security Reliability Standards. The purpose of policies is to provide a management and governance foundation for all requirements that apply to ~~its~~ a Responsible Entity's BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the ~~standard's~~ requirements.

Annual review and approval of the cyber security ~~policy~~ policies ensures that the ~~policy~~ policies ~~is~~ are kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1 For its high impact and medium impact BES Cyber Systems, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of BES Cyber Systems (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for BES Cyber Systems (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2 For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls for Low Impact External Routable Connectivity (LERC) and Dial-up Connectivity; and

1.2.4. Cyber Security Incident ~~Response~~response

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

In response to FERC Order No. 791, Requirement R2 requires entities to develop and implement cyber security plans to meet specific security control objectives ~~The requirement to implement a cyber security plan~~ for assets containing low impact BES Cyber Systems. ~~provides a minimum set of cyber security controls for assets containing low impact BES Cyber Systems. Individually, these low impact BES Cyber Systems pose a relatively lower risk to the BES than other BES Cyber Systems, but in aggregate or through communication dependencies, they have the potential to create an adverse reliability impact if compromised. To that end,~~ The ~~Requirement R2 requires Responsible Entities to implement documented~~ cyber security plan(s) ~~covering~~ covers four subject matter areas: ~~–~~ (1) cyber security awareness~~,~~; (2) physical ~~access~~ security controls~~,~~; (3) electronic access controls~~,~~; and (4) ~~cyber~~ Cyber ~~security~~ Security ~~incident~~ Incident response. ~~In response to directives in FERC Order No. 791, Requirement R2 provides for the specific elements that must be included in the cyber security plan(s). Attachment 1 provides these elements. These~~ This plan(s), along with the cyber security policies required under Requirement R1, Part 1.2, provides a framework for ~~sufficient~~ operational, procedural, and technical safeguards for ~~assets containing~~ low impact BES Cyber Systems.

Considering the varied types of low impact BES Cyber Systems across the ~~Bulk Power System~~BES, Attachment 1 provides Responsible Entities flexibility on how to apply the ~~required~~ security controls to meet the security objectives. Additionally, ~~the SDT recognizes that~~because many Responsible Entities have ~~multiple~~ multiple-impact rated BES Cyber Systems, nothing in the requirement prohibits entities from using their ~~and has provided the ability to use~~ high and medium impact BES Cyber System policies, procedures, and processes to implement security controls required for low impact BES Cyber Systems, as detailed in Requirement R2, ~~the objective criteria within~~ Attachment 1.

Responsible Entities will ~~utilize~~ use their list of assets ~~that~~ containing low impact BES Cyber System(s) (~~that is created~~ developed pursuant to ~~as a result of applying~~ CIP-002) to substantiate the sites or locations associated with low impact BES Cyber Systems. However, there ~~continues to be~~ is no requirement or compliance expectation for Responsible Entities to maintain a list(s) of individual low impact BES Cyber Systems and their associated cyber assets or to maintain a list of authorized users.

R2. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall implement one or more documented cyber security

plan(s) for its low impact BES Cyber Systems that include the ~~elements~~ sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the ~~elements~~ sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per ~~element~~ section are located in Attachment 2.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the CIP ~~senior~~ Senior ~~manager~~ Manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior

Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-~~6~~7)

Required ~~Elements~~ Sections for Cyber Security Plan(s) for Assets Containing Low Impact BES Cyber Systems

Responsible Entities shall include each of the ~~elements~~ sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with ~~multiple~~ multiple-impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the ~~elements~~ sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. Cyber S~~s~~ecurity ~~awareness~~Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, ~~its~~ cyber security practices (which may include associated physical security practices)~~, using one or a combination of the following methods:~~

- ~~Direct communications (for example, e-mails, memos, computer-based training);~~
- ~~Indirect communications (for example, posters, intranet, or brochures); or~~
- ~~Management support and reinforcement (for example, presentations or meetings).~~

Section 2. Physical ~~access s~~Security ~~controls~~Controls: Each Responsible Entity shall ~~implement controls to restrict~~control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact BES Cyber Systems within the asset~~,~~ and (2) the Low Impact BES Cyber System Electronic Access Points (LEAPs), if any.~~, based on need as determined by the Responsible Entity, through one or more of the following:~~

- ~~Access controls;~~
- ~~Monitoring controls; or~~

~~Other operational, procedural, or technical physical security controls.~~

Section 3. Electronic ~~access~~ Access C~~c~~ontrols: Each Responsible Entity shall ~~implement controls to restrict electronic access for Low Impact External Routable Connectivity and Dial-up Connectivity, which shall include the following, or other electronic access controls that provide an equal or greater level of protection~~:

3.1 For ~~any Low Impact External Routable Connectivity~~LERC, if any, ~~establish~~ implement a ~~Low Impact BES Cyber System Electronic Access Point~~ LEAP ~~that~~ to permit~~s~~ only necessary inbound and outbound bi-directional routable protocol access ~~and denies all other access~~; and

~~**3.2** Authentication~~ Implement authentication ~~of~~ for all Dial-up Connectivity, if any, that provides access to low impact BES Cyber Systems, per Cyber Asset capability.

~~**3.2**~~

3.2

Section 4. Cyber Security Incident ~~response~~Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents~~.~~;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law~~.~~;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals~~.~~;

4.4 Incident handling for Cyber Security Incidents~~.~~;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident~~.~~; and

~~Record retention related to Reportable Cyber Security Incidents.~~

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

CIP-003-~~6~~ 7 - Attachment 2

Examples of Evidence for Cyber Security Plan(s) for Assets Containing Low Impact BES Cyber Systems

~~Element~~ Section 1 - Cyber ~~security~~ Security ~~awareness~~Awareness: An example of evidence for ~~element~~ Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation ~~has been provided~~ through one or more of the following methods: ~~dated copies of the information used to reinforce security awareness via direct communications, indirect communications or management support and reinforcement.~~

- Direct communications (for example, e-mails, memos, or computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

~~Element~~ Section 2 - Physical ~~s~~Security ~~c~~Controls: Examples of evidence~~s~~ for ~~element~~ Section 2 may include, but are not limited to:

- Documentation of the selected ~~one or more~~ access control(s) (e.g., card key, ~~special~~ locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls ~~to restrict~~ that control physical access to both:
    a. The asset, if any, or the locations of the low impact BES Cyber Systems within the asset; and
    ~~b.~~ The Cyber Asset, if any, containing the ~~Low Impact BES Cyber System Electronic Access Point~~LEAP.
    ~~c.~~b. ~~Documentation showing that the physical access restrictions cited above are based on need, which may include, but is not limited to, a policy describing the high level operational or business need(s) for physical access.~~

~~Element~~ Section 3 - Electronic ~~a~~Access ~~c~~Controls: Examples of evidence for ~~element~~ Section 3 may include, but are not limited to:

- Documentation showing that inbound and outbound connections ~~(e.g. IP addresses, ports, services)~~ for any ~~Low Impact BES Cyber System Electronic Access Point~~LEAP are confined to only those the Responsible Entity deems necessary (e.g., by restricting IP addresses, ports, or services); and documentation of authentication for Dial-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, or access control on the BES Cyber System).~~; or~~
- ~~Documentation of other electronic access controls that provide an equal or greater level of protection.~~

~~Element~~ Section 4 - Cyber Security Incident ~~r~~Response: An example of evidence for ~~element~~ Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process documents of one or more Cyber Security Incident response plan(s) developed~~;~~ either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security ~~incident~~ Incident and for notifying the Electricity Sector Information Sharing and Analysis Center (ES-ISAC);
2. ~~the~~ to ~~identification~~ identify and document~~ation of~~ the roles and responsibilities for Cyber Security Incident response by groups of individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and

~~5. to retain records related to Reportable Cyber Security Incidents (e.g., security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes).~~

~~6.~~5. to update, as needed, ~~Also include dated revised~~ Cyber Security Incident response plan(s) ~~that identify that the plan(s) were updated~~ within 180 calendar days after ~~a~~ completion of a test or actual Reportable Cyber Security Incident.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

In developing policies in compliance with Requirement R1, ~~The~~ the number of policies and their ~~specific language~~content ~~are~~ should be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. ~~If a Responsible Entity has any high or medium impact BES Cyber Systems, the cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-6, Requirement R1.1. If a Responsible Entity has any assets from CIP-002 containing low impact BES Cyber Systems, the cyber security policy must cover in sufficient detail the four topical areas required by Requirement R1.2.~~ The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering ~~these~~ the required topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-~~6~~7, Requirement R1.

If a Responsible Entity has any high or medium impact BES Cyber Systems, the one or more cyber security policies must cover the nine subject matter areas required by CIP-003-7, Requirement R1, Part 1.1. If a Responsible Entity has identified from CIP-002 any assets containing low impact BES Cyber Systems, the one or more cyber security policies must cover the four subject matter areas required by Requirement R1, Part 1.2.

~~For~~ Responsible Entities that have ~~multiple~~ multiple-impact rated BES Cyber Systems~~, they~~ are not required to create separate cyber security policies for high~~, or~~ medium~~, and~~ or low impact BES Cyber Systems. The Responsible Entities have the flexibility to develop policies that cover all three impact ratings.

Implementation of the cyber security policy is not specifically included in CIP-003-~~6~~7, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-~~004~~ 003 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements in NERC cyber security Reliability Standards~~from CIP-004 through CIP-011~~, but ~~rather to put together~~to develop a holistic cyber security policy appropriate ~~to~~ for its organization. ~~The assessment through the Compliance Monitoring and Enforcement Program of~~ Elements of a policy ~~items~~ that extend beyond the scope of ~~CIP-004 through CIP-011~~NERC's cyber security Reliability Standards ~~should~~ will not be considered candidates for potential violations although they will help demonstrate the organization's internal culture of compliance and posture towards cyber security.

For Part 1.1, ~~T~~the Responsible Entity should consider the following for each of the required topics in its one or more cyber security policies for medium and high impact BES Cyber Systems, if any~~policy~~:

1.1.1 Personnel and training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components
- Availability of system backups

1.1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

~~The Standard Drafting Team (SDT) has removed r~~Requirements relating to exceptions to a Responsible Entity's security policies were removed ~~since~~ because it is a general management issue that is not within the scope of a reliability requirement. ~~The SDT considers i~~It ~~to be~~is an internal policy requirement and not a reliability requirement. However, ~~the SDT encourages~~

Responsible Entities are encouraged to continue this practice as a component of ~~its~~ their cyber security ~~policy~~policies.

In this and all subsequent required approvals in the NERC CIP Reliability Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

Using the list of assets containing low impact BES Cyber Systems from CIP-002, the intent of the requirement is for each Responsible Entity to create, document, and implement one or more cyber security plan(s) that addresses objective criteria for the protection of ~~all~~ low impact BES Cyber Systems. The ~~SDT is~~ protections required by Requirement R2 reflect the level of risk that misuse or the unavailability of low impact BES Cyber Systems poses to the BES~~balancing the fact that low impact BES Cyber Systems are indeed low impact to the BES, but they do meet the definition of having a 15-minute adverse impact so some protections are needed~~.~~ The intent is that ~~such~~ the required protections are part of a program that covers the low impact BES Cyber Systems collectively either at an asset or site level (assets containing low impact BES Cyber Systems), but not at an individual device or system level.

There are four ~~main~~ subject matter areas, as ~~detailed~~ identified in Attachment 1, that must be covered by ~~this~~ the cyber security plan: (1) cyber security awareness, (2) physical security controls, (3) electronic access controls for ~~Low Impact External Routable Connectivity~~LERC and Dial-up Connectivity, and ~~cyber security incident~~(4) Cyber Security Incident response.

Requirement R2, Attachment 1

As noted, Attachment 1 contains the ~~elements~~ sections that must be in the cyber security plan(s). The ~~SDT's~~ intent is to allow entities that have a combination of high, medium, and low impact BES Cyber Systems the flexibility to choose, if desired, to cover their low impact BES Cyber Systems (or any subset) under their programs used for the high or medium impact BES Cyber Systems ~~and not~~ rather than maintain two separate programs. Guidance for each of the ~~4~~ four subject matter areas of Attachment 1 is provided below.

Requirement R2, Attachment 1, Section 1 – Cyber Security Awareness

The intent of the cyber security awareness program is for entities to reinforce good cyber security practices with their personnel at least once every 15 calendar months. ~~It is up to t~~The entity ~~as to~~has the discretion to determine the topics to be addressed and ~~how it~~the manner in which it will communicate ~~schedules~~ these topics. ~~The~~ As evidence of compliance, the Responsible Entity should be able to produce the awareness material that was delivered ~~and~~ according to the delivery method(s) (e.g., posters, emails, or topics at staff meetings, etc.)~~ that were used~~. The ~~SDT does not intend that the~~ Responsible Entity ~~must~~ is not required to maintain lists of recipients and track the reception of the awareness material by personnel.

Although the focus of the awareness is cyber security, it does not mean that only technology-related topics can be ~~used~~ included in the program. Appropriate physical security topics (e.g., tailgating awareness and protection of badges for physical security, or "If you see something,

say something" campaigns, etc.) are valid for cyber security awareness. The intent is to cover topics concerning any aspect of the protection of BES Cyber Systems.

Requirement R2, Attachment 1, Section 2 – Physical Security Controls

The Responsible Entity must document and implement ~~controls~~ methods to ~~restrict~~ control physical access to (1) ~~the~~ low impact BES Cyber Systems at ~~a BES~~ assets containing low impact BES Cyber System(s) and (2) ~~Low Impact BES Cyber System Electronic Access Points~~ LEAPs, if any ~~(see Electronic Access Controls section below)~~. If the LEAP is located within the BES asset and inherits the same controls outlined in ~~element~~ Section 2, this can be noted by the Responsible Entity in either its policies or cyber security plan(s) to avoid duplicate documentation of the same controls. ~~If the LEAP is located at another location, possibly a location without any BES Cyber Systems, then separate documentation and implementation of the physical security controls of the LEAP are required.~~

The Responsible Entity has the flexibility in the ~~controls~~ selection of the methods used to meet the objective to ~~restrict~~ control physical access to the asset(s) containing low impact BES Cyber Systems ~~at a~~or the low impact BES ~~asset~~ Cyber System itself or LEAPs, if any.~~,~~ The Responsible Entity may ~~using~~ use one or a combination of access controls, monitoring controls, or other operational, procedural, or technical physical security controls. Entities may ~~utilize~~ use perimeter controls (e.g., fences with locked gates, guards, or site access policies, etc.) ~~and/~~or more granular areas of physical access control in areas where low impact BES Cyber Systems are located, such as control rooms or control houses. User authorization programs and lists of authorized users for physical access are not required although would help meet the security objective.

The objective is to ~~restrict~~ control the physical access based on need ~~and~~ as determined by the Responsible Entity. ~~t~~The need can be ~~established~~ documented at the policy level ~~based on higher level operational or business needs~~ for access to the site or systems. ~~The SDT intent is that this need at the higher level be documented such that the requirement cannot be interpreted to mean that any and all access must be restricted.~~ The requirement does not ~~imply that a~~ obligate an entity to ~~specific~~ specify a ~~business~~ need ~~must be documented~~ for each access or authorization of a user for access.

Monitoring as a physical security control can be used as a complement or an alternative to access control. Examples of monitoring controls include, but are not limited to: (~~i~~1) alarm systems to detect motion or entry into a controlled area, or (~~ii~~2) human observation of a controlled area. Monitoring does not necessarily ~~imply~~ require logging and maintaining logs~~,~~ but could include monitoring that physical access has occurred or been attempted (e.g., door alarm, or human observation, etc.). The monitoring does not need to be per low impact BES Cyber System but should be at the appropriate level ~~as determined by the entity's controls~~to meet the security objective.

Requirement R2, Attachment 1, Section 3 – Electronic Access Controls

Section 3 requires the establishment of boundary protections for low impact BES Cyber Systems when the low impact BES Cyber Systems have bi-directional routable protocol communication or Dial-up Connectivity to devices external to the asset containing the low impact BES Cyber

Systems. The establishment of boundary protections is intended to control communication either into the asset containing low impact BES Cyber System(s) or to the low impact BES Cyber System itself to reduce the risks associated with uncontrolled communication using routable protocols or Dial-up Connectivity. The term "electronic access control" is used in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing. The Responsible Entity is not required to establish LERC communication or a LEAP if there is no bi-directional routable protocol communication or Dial-up Connectivity present. In the case where there is no external bi-directional routable protocol communication or Dial-up Connectivity, the Responsible Entity can document the absence of the communication within its low impact cyber security plan.

The defined terms LERC and LEAP are used to avoid confusion with the similar terms used for high and medium impact BES Cyber Systems (e.g., External Routable Connectivity (ERC) or Electronic Access Point (EAP)). To future-proof the standards, and in order to avoid future technology issues, the definitions specifically exclude "point-to-point communications between intelligent electronic devices that use routable communication protocols for time-sensitive protection or control functions between Transmission station or substation assets containing low impact BES Cyber Systems," such as IEC 61850 messaging. This does not exclude Control Center communication but rather excludes the communication between the intelligent electronic devices themselves. A Responsible Entity using this technology is not expected to implement a LEAP even though there technically is LERC. This exception was included so as not to inhibit the functionality of the time-sensitive requirements related to this technology nor to preclude the use of such time-sensitive reliability enhancing functions if they use a routable protocol in the future.~~Where Low Impact External Routable Connectivity (LERC) or Dial-up Connectivity exists, the Responsible Entity must document and implement controls that include the LERC and Dial-up Connectivity to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected. Two glossary terms are included in order to help clarify and simplify the language in Attachment 1. The SDT's intent in creating these terms is to avoid confusion with the similar concepts and requirements (ESP, EAP, ERC, EACMS) needed for high and medium impact BES Cyber Systems by utilizing separate terms that apply only to assets containing low impact BES Cyber Systems.~~

~~**Low Impact External Routable Connectivity (LERC) –** includes any bi-directional routable protocol based connectivity between low impact BES Cyber Systems within a BES asset and Cyber Assets outside the BES asset containing the low impact BES Cyber Systems. The SDT, in order to avoid future technology issues, is specifically excluding from the definition direct Intelligent Electronic Device (IED) to IED communication used for protection and/or control between low impact BES Cyber Systems at different BES assets, such as IEC 61850 messaging. The SDT does not intend for the requirement to have an electronic access point even though there is LERC or to preclude the use of such time-sensitive (for example 4 ms or less) reliability enhancing functions if they use a routable protocol in the future.~~

~~**Low Impact BES Cyber System Electronic Access Point (LEAP) –**~~ When determining whether there is LERC to the low impact BES Cyber System, the definition uses the phrases "direct user-initiated interactive access or a direct device-to-device connection to a low impact BES Cyber System(s) from a Cyber Asset outside the asset containing those low impact BES Cyber

System(s) via a bi-directional routable protocol connection." The intent of "direct" in the definition is to indicate LERC exists if a person is sitting at another device outside of the asset containing the low impact BES Cyber System, and the person can connect to logon, configure, read, or interact, etc. with the low impact BES Cyber System using a bi-directional routable protocol within a single end-to-end protocol session. The reverse case would also be LERC, in which the individual sits at the low impact BES Cyber System and connects to a device outside the asset containing low impact BES Cyber Systems using a single end-to-end bi-directional routable protocol session. Additionally, for "device-to-device connection," LERC exists if the Responsible Entity has devices outside of the asset containing the low impact BES Cyber System sending or receiving bi-directional routable communication from or to the low impact BES Cyber System.

When identifying a LEAP, Responsible Entities are provided flexibility in the selection of~~is~~ the interface on a Cyber Asset that ~~allows and~~ controls the LERC. Examples include, but are not limited to, the internal (facing the low impact BES Cyber Systems) interface on an external or host-based~~a~~ firewall, the internal interface on a router that has implemented an access control list (ACL), or ~~an internal interface on a unidirectional gateway that physically enforces outbound-only data flows~~other security device. ~~LEAP are not to be considered EACMS or meet EACMS specific requirements (as utilized for the Electronic Security Perimeter protecting high and medium impact BES Cyber Systems). However they are required, as per element 2 of the cyber security plan elements, to have physical security controls.~~ The entity also has flexibility with respect to the location of the LEAP. LEAPs are not required ~~is not prescriptive and does not have~~ to reside at the ~~BES~~ asset containing the low impact BES Cyber Systems. Furthermore, the entity is not required to establish~~. This flexibility is included so that the standard does not~~ nor ~~require~~ a unique physical LEAP per ~~BES asset. Responsible Entities can have a single LEAP that controls the LERC from more than one BES~~ asset containing low impact BES Cyber Systems. Responsible Entities can have a single Cyber Asset containing multiple LEAPs that controls the LERC for more than one asset containing low impact BES Cyber Systems. ~~However the LERC between assets "behind" the LEAP and another asset containing a low impact BES Cyber System must also pass through the single LEAP.~~ Locating the ~~LEAP~~ Cyber Asset with multiple LEAPs at an external location with multiple ~~BES~~ assets containing low impact BES Cyber Systems "behind" it, however, should not allow ~~unfettered~~ uncontrolled access from one ~~BES~~ asset to all other ~~BES~~ assets sharing the LEAP. ~~It is also not the intent of the SDT where low impact BES Cyber Systems do not have any LERC that additional connectivity be established nor that a LEAP be established.~~

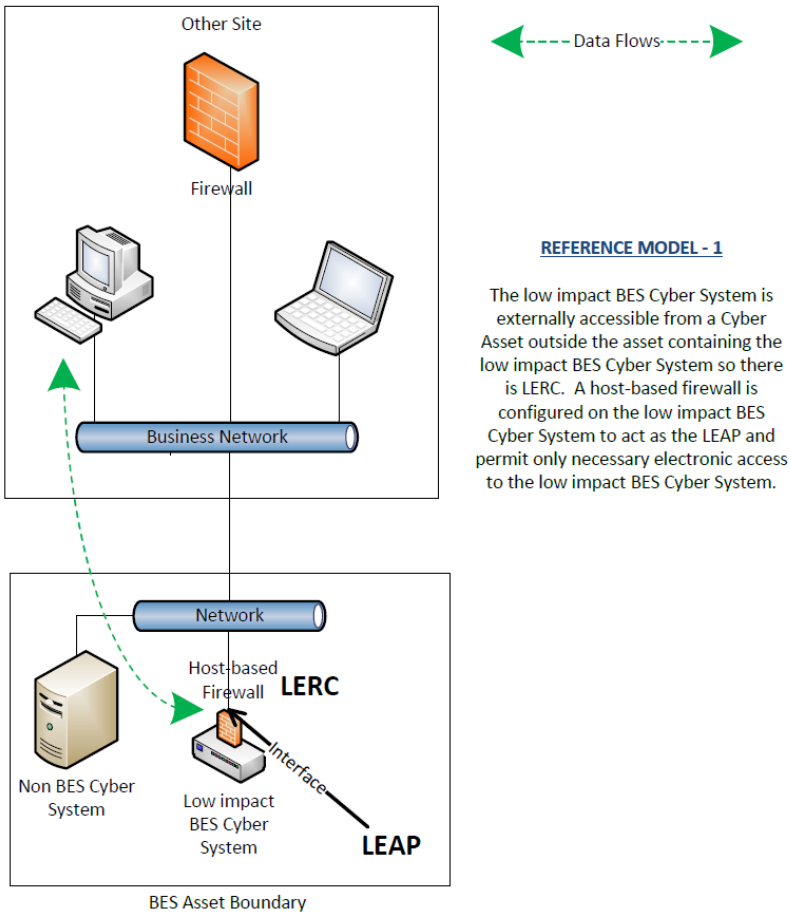
A Cyber Asset that contains interface(s) that only perform the function of a LEAP does not meet the definition of Electronic Access Control or Monitoring System (EACMS) associated with medium or high impact BES Cyber Systems and is not subject to the requirements applicable to an EACMS. However, a Cyber Asset may contain some interfaces that function as a LEAP and other interfaces that function as an EAP for high or medium impact BES Cyber Systems. In this case, the Cyber Asset would also be subject to the requirements applicable to the EACMS associated with the medium or high impact BES Cyber Systems.

~~The electronic access controls should address the risk of using the asset's LERC or Dial-up Connectivity to gain access to the low impact BES Cyber Systems. For LERC, a LEAP shall be~~

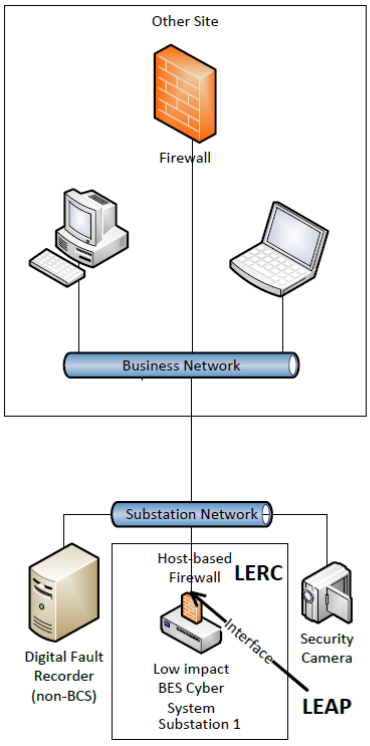
~~implemented that permits only necessary inbound and outbound access and denies all other access.~~

Examples of sufficient access controls may include:

- Any LERC for the asset passes through a LEAP ~~that denies all traffic by default~~ with explicit inbound and outbound access permissions defined, or equivalent method by which both inbound and outbound connections are confined to only those that the Responsible Entity deems necessary (e.g., IP addresses, ports, or services) ~~for scenarios representative of the Responsible Entity's sites having Low Impact BES Cyber Systems~~.
- As shown in Reference Model 1 below, the low impact BES Cyber System has a host-based firewall that is controlling the inbound and outbound access. In this model, it is also possible that the host-based firewall could be on a non-BES Cyber Asset. The intent is that the host-based firewall controls the inbound and outbound access between the low impact BES Cyber System and the Cyber Asset in the business network.
- As shown in Reference Model 5 below, a non-BES Cyber Asset has been placed between the low impact BES Cyber System on the substation network and the Cyber Asset in the business network. The expectation is that the non-BES Cyber Asset has provided a "protocol break" so that access to the low impact BES Cyber System is only from the non-BES Cyber Asset that is located within the asset containing the low impact BES Cyber System.
- Dial-up Connectivity to a low impact BES Cyber System is set to dial out only (no auto-answer) to a preprogrammed number to deliver data. Incoming Dial-up Connectivity is to a dialback modem, a modem that must be remotely controlled by the control center or control room, has some form of access control, or the low impact BES Cyber System has access control.



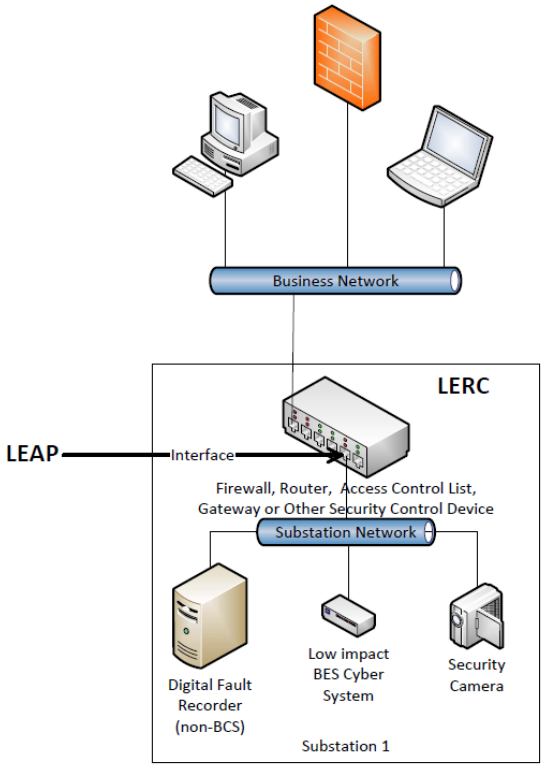
Some examples of situations that would lack sufficient access controls to meet the intent of this requirement include:



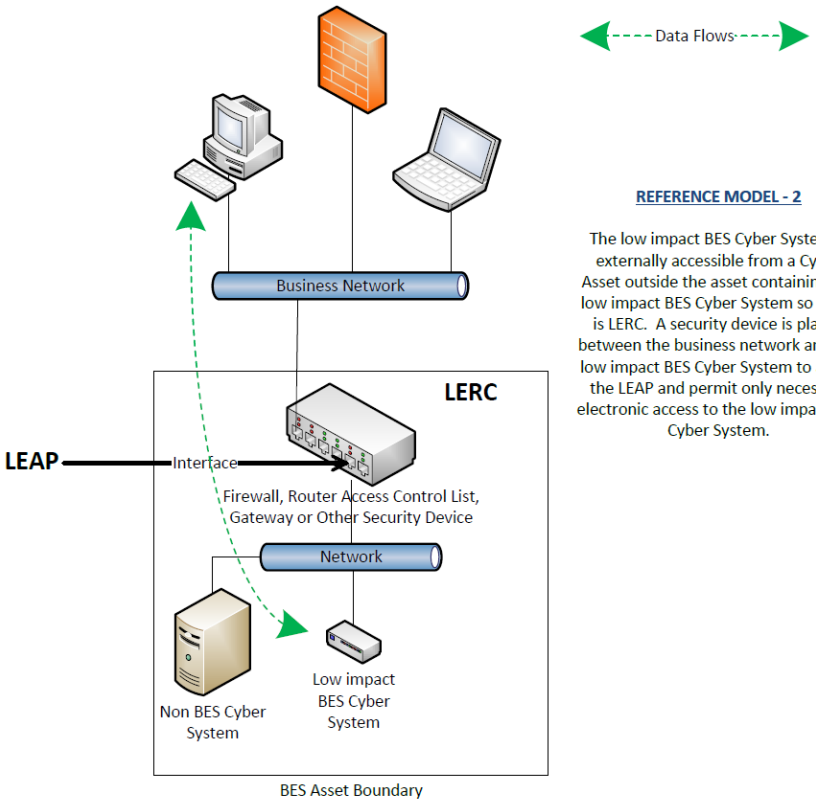
- An asset has Dial-up Connectivity and a low impact BES Cyber System is reachable via an auto-answer modem that connects any caller to the Cyber Asset that has a default password. There is no practical access control in this instance.
- An asset has ~~external routable connectivity~~LERC due to a BES Cyber System within it having a 3G/4G wireless card on a public carrier ~~which~~ that allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan.
- In Reference Model 5, using just dual-homing or multiple-network interface cards in the non-BES Cyber Asset within the DMZ to provide separation between the low impact BES Cyber System and the business network would

not meet the intent of "controlling" inbound and outbound electronic access assuming there was no other host-based firewall or other security device on that non-BES Cyber Asset.

The following diagrams provide reference examples to depict the rationale for identifying whether there is LERC and for implementing a LEAP. While these diagrams identify several possible configurations, Responsible Entities may have additional configurations not identified below.~~The SDT also notes it uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.~~

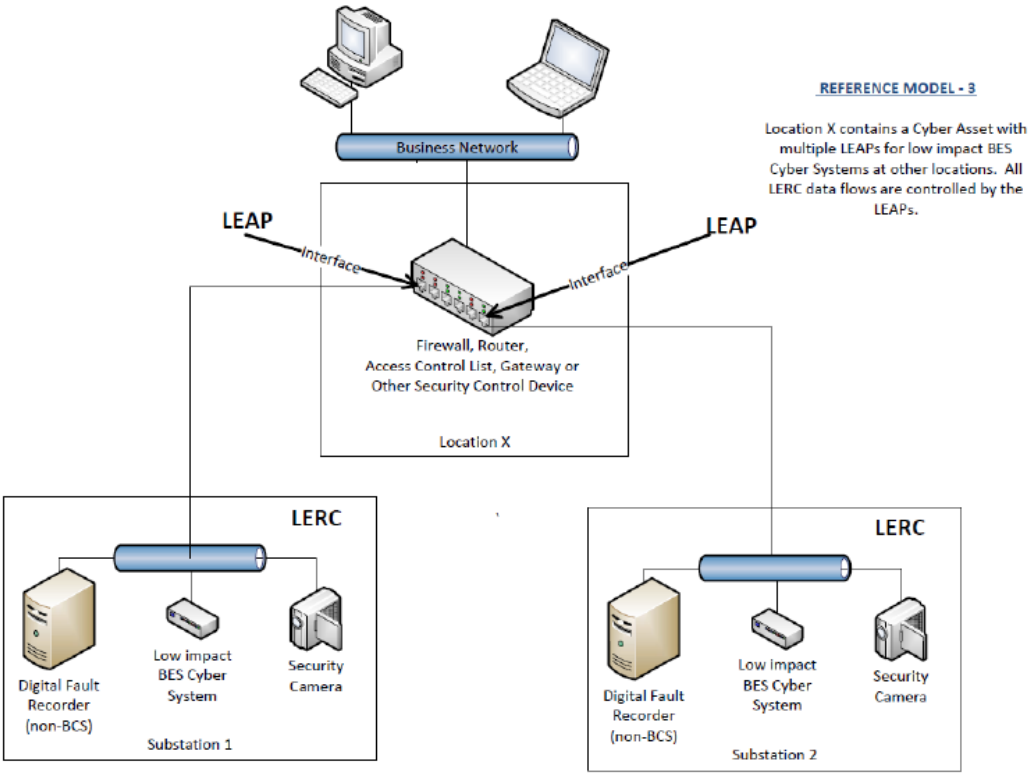


~~The following diagrams explain the SDT's rationale.~~

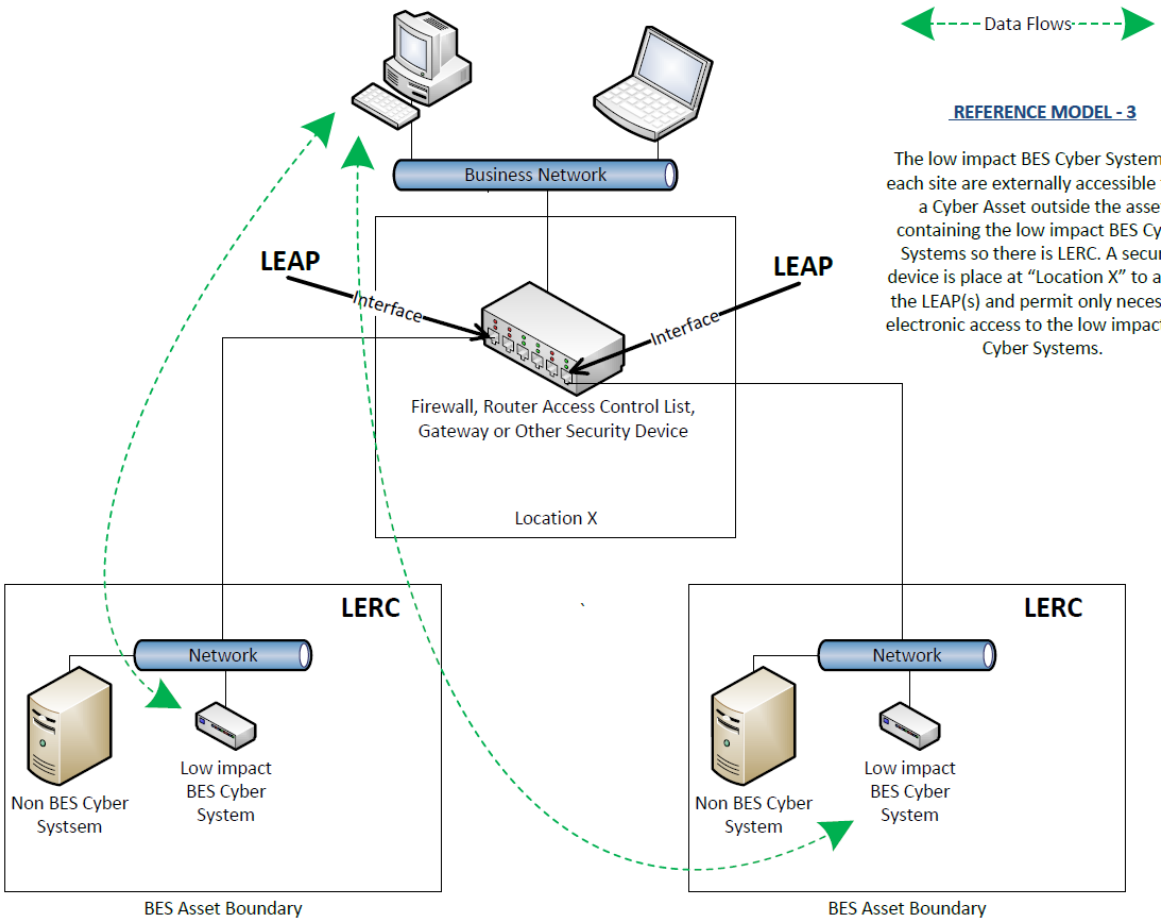


REFERENCE MODEL - 1

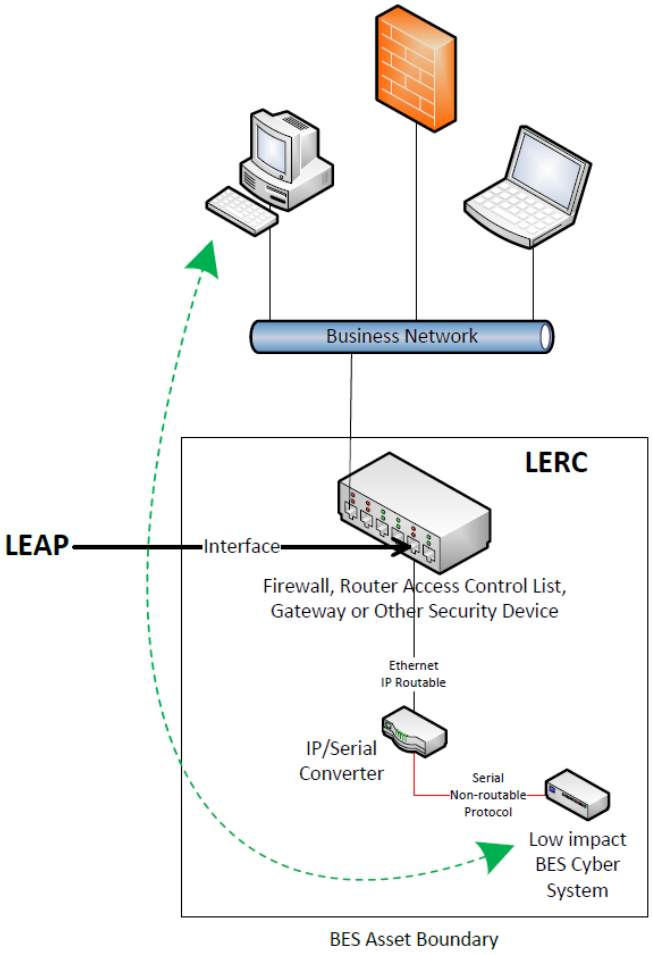
The low impact BES Cyber System is behind a LEAP. In this example, the LEAP is the network interface on the low impact BES Cyber System. The host-based firewall restricts electronic access for Low Impact External Routable Connectivity (LERC).



REFERENCE MODEL - 2



All LERC to the low impact BES Cyber System is controlled by an LEAP.



REFERENCE MODEL - 2

The low impact BES Cyber System is externally accessible from a Cyber Asset outside the asset containing the low impact BES Cyber System so there is LERC. A security device is placed between the business network and the low impact BES Cyber System to act as the LEAP and permit only necessary electronic access to the low impact BES Cyber System.

REFERENCE MODEL - 3
Location X contains a Cyber Asset with multiple LEAPs for low impact BES Cyber Systems at other locations. All LERC data flows are controlled by the LEAPs.
Business Network
LEAP

Data Flows

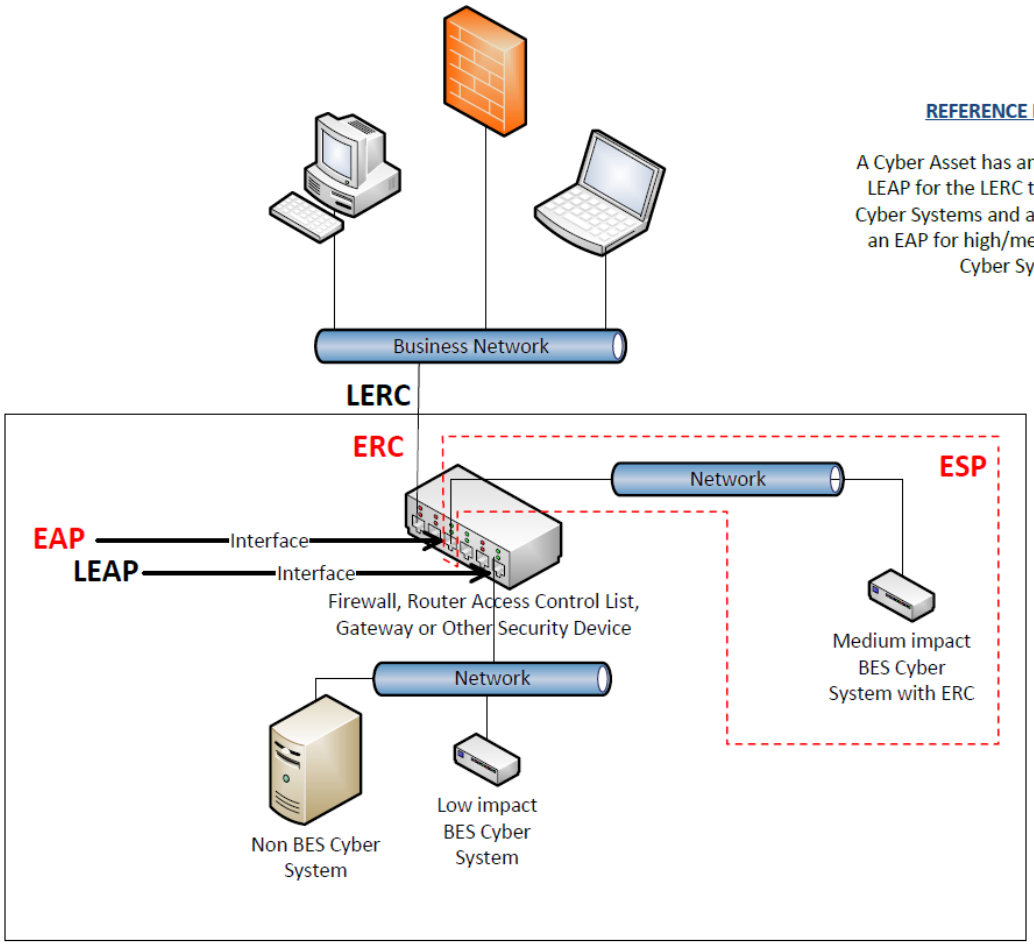
REFERENCE MODEL - 4

The low impact BES Cyber System is externally accessible from a Cyber Asset outside the asset containing the low impact BES Cyber System. There is LERC because the IP/Serial converter is extending the communication between the business network Cyber Asset and the low impact BES Cyber System is directly addressable from outside the asset. A security device is placed between the business network and the low impact BES Cyber System to permit only necessary electronic access to the low impact BES Cyber System.



Data Flows
REFERENCE MODEL - 5
There is no bi-directional routable communications between low impact BES Cyber System(s) and Cyber Assets outside the asset containing those low impact BES Cyber System(s) therefore there is no LERC in this example.
Business Network

Non-BES Cyber Asset (Non-routed, application layer separation of routable protocol sessions)
Low impact BES Cyber System
BES Asset Boundary

Data Flows

REFERENCE MODEL - 6

In this example, a Cyber Asset stops the direct access to the low impact BES Cyber System. There is a layer 7 application layer break or the Cyber Asset requires authentication and then establishes a new connection to the low impact BES Cyber System. There is no LERC in this example.

Requirement R2, Attachment 1, Section 4 – Cyber Security Incident Response

The entity should have one or more documented ~~cyber~~ Cyber ~~security~~ Security ~~incident~~ Incident response plan(s) that include each of the topics listed in Section 4. ~~For assets that do not have LERC, it is not the intent to increase their risk by increasing the level of connectivity in order to have real-time monitoring. The intent is i~~If, in the normal course of business, suspicious activities are noted at an asset containing low impact BES Cyber Systems, the intent is for the entity to implement ~~there is~~ a ~~cyber~~ Cyber ~~security~~ Security ~~incident~~ Incident response plan that will guide the entity ~~through~~ in responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident.

Entities are provided the flexibility to develop their Attachment 1, Section 4 Cyber Security Incident response plan(s) by asset or group of assets. The plans do not need to be on a per asset site or per low impact BES Cyber System basis. Entities can choose to use a single enterprise-wide plan to fulfill the obligations for low impact BES Cyber Systems.

The plan(s) must be tested once every 36 months. This is not an exercise per low impact BES Cyber Asset or per type of BES Cyber Asset but rather is an exercise of each incident response plan the entity created to meet this requirement. An actual Reportable Cyber Security Incident counts as an exercise as ~~well as~~do other forms of tabletop exercises or drills. NERC-led exercises such as GridEx participation would also count as an exercise ~~if~~ provided the entity's response plan is followed. ~~It is the intent of the SDT~~The intent of the requirement is for entities to ~~have~~ keep the ~~cyber~~ Cyber ~~security~~ Security ~~incident~~ Incident response plan(s) ~~kept~~ current, which includes updating the plan(s), if needed, within 180 days following a test or an actual incident.

~~In the event of a Reportable Cyber Security Incident, Attachment 1, element 4.6 specifies entities must retain relevant records for Reportable Cyber Security Incidents. Example evidence may include, but is not limited to, dated documentation, such as security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes. Entities should refer to their handling procedures to determine the types of evidence to retain. The evidence retention period for records related to Reportable Cyber Security Incidents is defined in Section C.1.2 of this Standard, which is the same for all requirements in CIP-003-6.~~

For low impact BES Cyber Systems, the only portion of the definition of Cyber Security Incident that would apply is, "A malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of a BES Cyber System." The other portion of that definition is not to be used to require ESPs and PSPs for low impact BES Cyber Systems.

Requirement R3:

The intent of CIP-003-~~6~~7, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Reliability Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that ~~this~~ the CIP Senior Manager will play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-~~6~~7, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the intent is to afford the Responsible Entity ~~should have~~ significant flexibility to adapt this requirement to ~~their~~ its existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records ~~provides~~ shows a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations ~~up~~ up ~~to~~ to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or the individual is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for an additional comment period and ballot. The draft includes modifications to meet FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	November 2014
Final Ballot is Conducted	January 2015
Board of Trustees (Board) Adoption	February 2015
Filing to Applicable Regulatory Authorities	February 2015

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
5.1	9/30/13	Modified two VSLs in R4	Errata

6	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-7

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-7:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-004-7.

6. Background:

Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the common subject matter of the requirements.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to

provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-7 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-7 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-7 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or

CIP-004-7 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			• indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-7 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-7 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-7 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets, including Transient Cyber Assets, and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-7 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-7 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-7 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-7 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-7 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-7 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-7 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-7. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-7 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-7 Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-7 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-7 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-7 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-7 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-7 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-7 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-7 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)
R2	**Operations Planning**	**Lower**	The Responsible Entity implemented a cyber security training program but failed to include one of the training	The Responsible Entity implemented a cyber security training program but failed to include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity implemented a cyber security training program but failed to include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. (R2) OR

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-7)

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

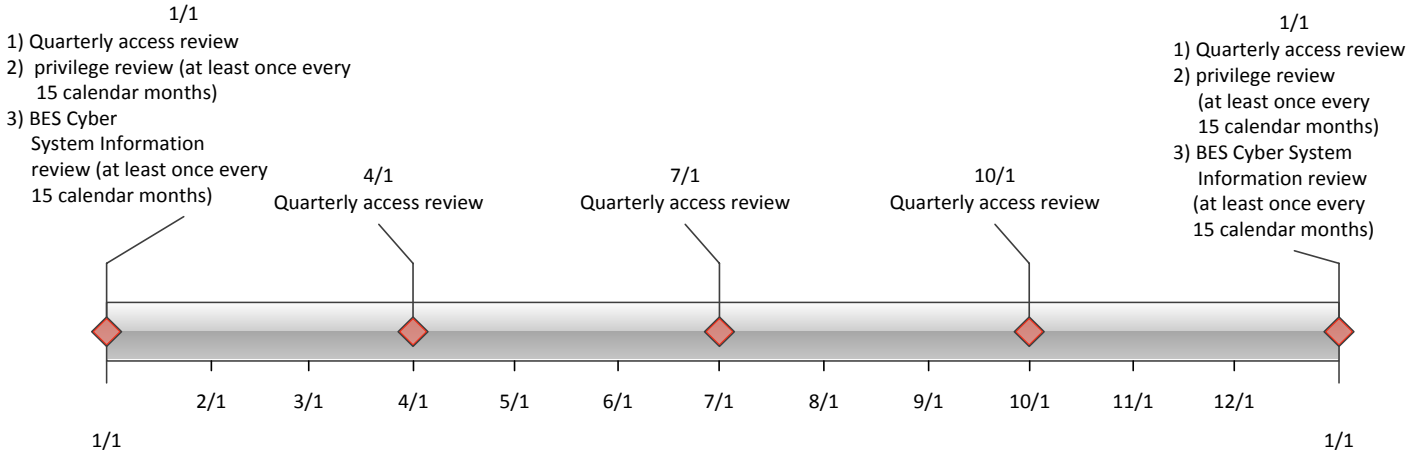
One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. Additionally, training should address the risk posed when connecting and using Transient Cyber Assets and Removable Media with BES Cyber Systems or within an Electronic Security Perimeter. As noted in FERC Order No. 791, Paragraph 135, Transient Cyber Assets and Removable Media have been the source of incidents where malware was introduced into electric generation industrial control systems in real-world situations. Training on their use is a key element in protecting BES Cyber Systems. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the



criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group

assignments cannot be performed. Role-based access permissions eliminate the need to perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for ~~final~~ an additional comment period and ballot. The draft includes modifications to meet FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	November 2014
Final Ballot is Conducted	~~October 2014~~January 2015
Board of Trustees (Board) Adoption	~~November 2014~~February 2015
Filing to Applicable Regulatory Authorities	~~December 2014~~February 2015

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
5.1	9/30/13	Modified two VSLs in R4	Errata

Version	Date	Action	Change Tracking
6	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-~~6~~7

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-~~6~~7:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-004-~~6~~7.

6. Background:

Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the common subject matter of the requirements.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to

provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the ~~Bulk Electric System~~BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~6~~ 7 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or

CIP-004-~~6~~ 7 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			• indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~6~~ 7 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets, including Transient Cyber Assets, and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-~~6~~ 7 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~6~~ 7 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-~~6~~ 7 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-~~6~~ 7 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-~~6~~ 7 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-~~6~~7. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-~~6~~ 7 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-~~6~~ 7 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-~~6~~ 7 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-~~6~~ 7 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-~~6~~ 7 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-~~6~~ 7 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~6~~ 7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-~~6~~ 7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-~~6~~ 7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-~~6~~ 7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-~~6~~ 7 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-~~6~~7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

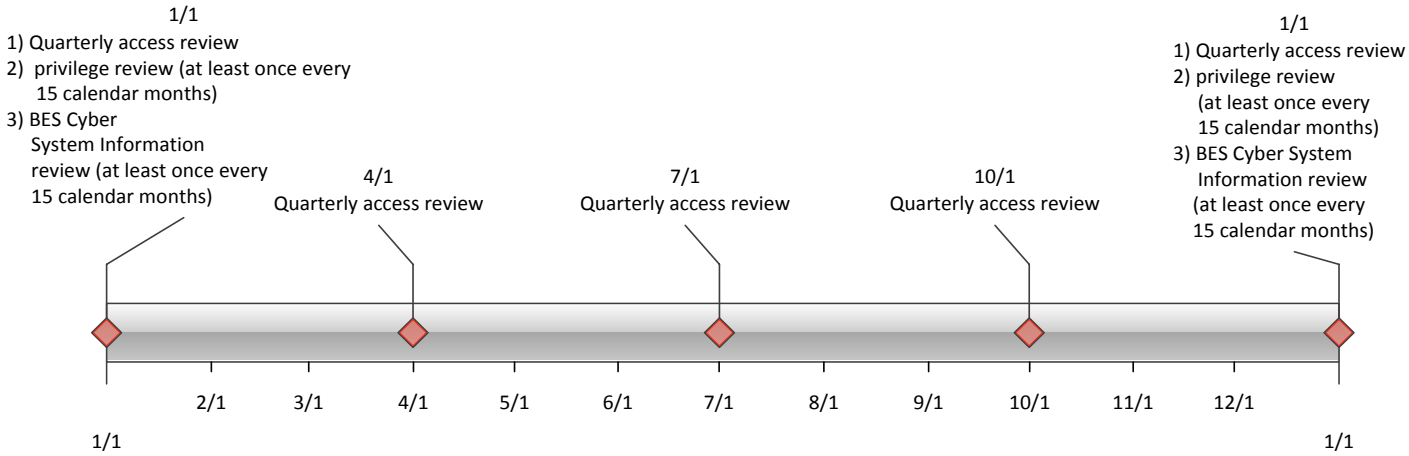
One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. Additionally, training should address the risk posed when connecting and using Transient Cyber Assets and Removable Media with BES Cyber Systems or within an Electronic Security Perimeter. As noted in FERC Order No. 791, Paragraph 135, Transient Cyber Assets and Removable Media have been the source of incidents where malware was introduced into electric generation industrial control systems in real-world situations. Training on their use is a key element in protecting BES Cyber Systems. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the



criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group

assignments cannot be performed. Role-based access permissions eliminate the need to perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for additional comment period and ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	January 2015
Board of Trustees (Board) Adoption	February 2015
Filing to Applicable Regulatory Authorities	February 2015

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-7

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-7:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-007-7.

6. Background:

Standard CIP-007 exists as part of a suite of CIP Standards related to cyber security, which requires the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.

CIP-007-7 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or Removable Media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.

CIP-007-7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).

CIP-007-7 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-7 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

PCA	Where technically feasible, either: • Limit the number of unsuccessful authentication attempts; or • Generate alerts after a threshold of unsuccessful authentication attempts.	Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

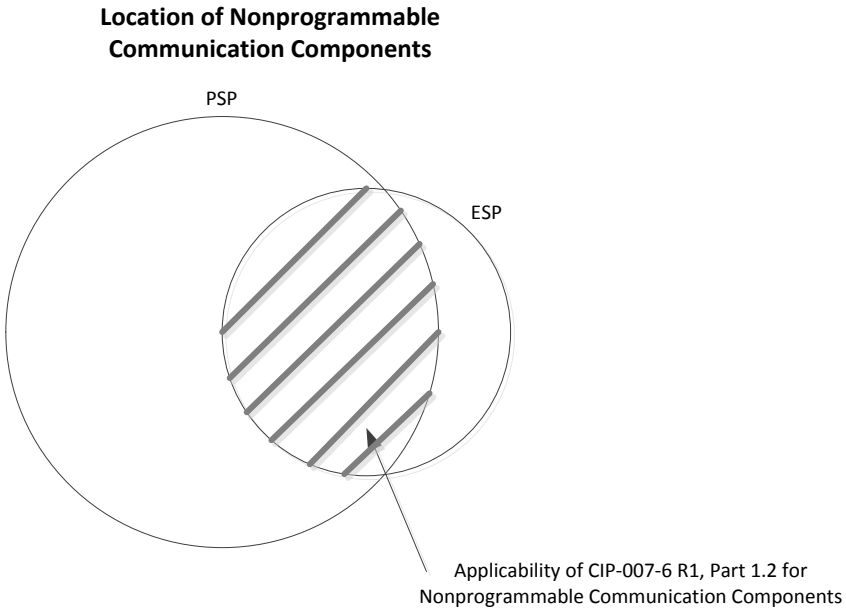
Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.



The protection of these ports can be accomplished in several ways including, but not limited to:

- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense is appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

The Applicable Systems column was updated on CIP-007-7 Requirement 1, Part 1.2 to include "Nonprogrammable communication components located inside both a PSP and an ESP." This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter as can be illustrated in the following diagram:

Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Standalone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they

can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or

those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or

method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

Entities should also have awareness of malware protection requirements for Transient Cyber Assets and Removable Media ("transient devices") in CIP-010-3. The protections required here in CIP-007-7, Requirement R3 complement, but do not meet, the additional obligations for transient devices.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of Removable Media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-

time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc.). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or “special” characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for additional comment period and ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	November 2014
Final Ballot is Conducted	~~October 2014~~January 2015
Board of Trustees (Board) Adoption	~~November 2014~~February 2015
Filing to Applicable Regulatory Authorities	~~December 2014~~February 2015

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-~~6~~7

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting ~~Bulk Electric System (~~BES~~)~~ Cyber Systems against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-~~6~~7:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-007-~~6~~7.

6. Background:

Standard CIP-007 exists as part of a suite of CIP Standards related to cyber security, which requires the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the ~~Bulk Electric System~~BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~ 7 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.

CIP-007-~~6~~ 7 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or ~~removable~~ Removable ~~media~~Media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~ 7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.

CIP-007-~~6~~ 7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-~~6~~ 7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-~~6~~ 7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~ 7 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).

CIP-007-~~6~~ 7 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~ 7 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-~~6~~ 7 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ 7 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~ 7 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Have a method(s) to enforce authentication of interactive user access, where technically feasible.	An example of evidence may include, but is not limited to, documentation describing how access is authenticated.

CIP-007-~~6~~ 7 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Identify and inventory all known enabled default or other generic account types, either by system, by groups of systems, by location, or by system type(s).	An example of evidence may include, but is not limited to, a listing of accounts by account types showing the enabled or generic account types in use for the BES Cyber System.

CIP-007-~~6~~ 7 Table R5 – System Access Control

5.7	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, either: • Limit the number of unsuccessful authentication attempts; or • Generate alerts after a threshold of unsuccessful authentication attempts.	Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

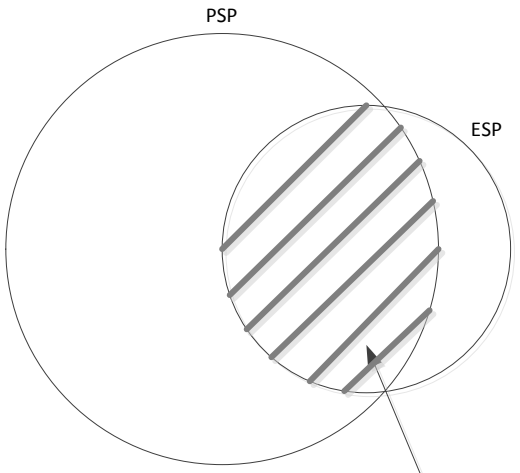
Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

The protection of these ports can be accomplished in several ways including, but not limited to:



- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense is appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

The Applicable Systems column was updated on CIP-007-~~6~~ 7 Requirement 1, Part 1.2 to include "Nonprogrammable communication components located inside both a PSP and an ESP." This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter as can be illustrated in the following diagram:

Location of Nonprogrammable Communication Components

Applicability of CIP-007-6 R1, Part 1.2 for Nonprogrammable Communication Components

Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Standalone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they

can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or

those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or

method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

Entities should also have awareness of malware protection requirements for Transient Cyber Assets and Removable Media ("transient devices") in CIP-010-3. The protections required here in CIP-007-7, Requirement R3 complement, but do not meet, the additional obligations for transient devices.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of ~~removable~~ Removable ~~media~~ Media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-

time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc.). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or "special" characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First Comment and Ballot Period concluded on July 16, 2014
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for an additional comment period and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period and Ballot	November 2014
Final Ballot is Conducted	January 2015
Board of Trustees (Board) Adoption	February 2015
Filing to Applicable Regulatory Authorities	February 2015

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-3

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-010-3:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-010-3.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training

program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R1 – Configuration Change Management

Part	Applicable Systems	Requirements	Measures
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 4. EACMS; 5. PACS; and 6. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: **Section 1.** EACMS; and **Section 2.** PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

Rationale for R4:

Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

Requirement R4 incorporates the concepts from other CIP requirements in CIP-010-3 and CIP-007-7 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets and Removable Media that include the sections in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional examples of evidence per section are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

d. Additional Compliance Information:

CIP-010-3 - Attachment 1

Required Sections for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the sections provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

Section 1. Transient Cyber Asset(s) Managed by the Responsible Entity.

1.1. Transient Cyber Asset Management: Responsible Entities shall manage Transient Cyber Asset(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection to a BES Cyber System, or (3) a combination of both (1) and (2) above.

1.2. Transient Cyber Asset Authorization: For each individual or group of Transient Cyber Asset(s), each Responsible Entity shall authorize:

1.2.1. Users, either individually or by group or role;

1.2.2. Locations, either individually or by group; and

1.2.3. Uses, which shall be limited to what is necessary to perform business functions.

1.3. Software Vulnerability Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Security patching, including manual or managed updates;
- Live operating system and software executable only from read-only media;
- System hardening; or
- Other method(s) to mitigate software vulnerabilities.

1.4. Introduction of Malicious Code Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the introduction of malicious code (per Transient Cyber Asset capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

1.5. Unauthorized Use Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of unauthorized use of Transient Cyber Asset(s):

- Restrict physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication; or
- Other method(s) to mitigate the risk of unauthorized use.

Section 2. Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity.

2.1 Software Vulnerabilities Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Review of installed security patch(es);
- Review of security patching process used by the party;
- Review of other vulnerability mitigation performed by the party; or
- Other method(s) to mitigate software vulnerabilities.

2.2 Introduction of malicious code mitigation: Use one or a combination of the following methods to achieve the objective of mitigating malicious code (per Transient Cyber Asset capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party; or
- Other method(s) to mitigate malicious code.

2.3 For any method used to mitigate software vulnerabilities or malicious code as specified in 2.1 and 2.2, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the Transient Cyber Asset.

Section 3. Removable Media

3.1. Removable Media Authorization: For each individual or group of Removable Media, each Responsible Entity shall authorize:

3.1.1. Users, either individually or by group or role; and

3.1.2. Locations, either individually or by group.

3.2. Malicious Code Mitigation: To achieve the objective of mitigating the threat of introducing malicious code to high impact or medium impact BES Cyber Systems and their associated Protected Cyber Assets, each Responsible Entity shall:

3.2.1. Use method(s) to detect malicious code on Removable Media using a Cyber Asset other than a BES Cyber System or Protected Cyber Assets; and

3.2.2. Mitigate the threat of detected malicious code on Removable Media prior to connecting the Removable Media to a high impact or medium impact BES Cyber System or associated Protected Cyber Assets.

CIP-010-3 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Section 1.1: Examples of evidence for Section 1.1 may include, but are not limited to, the method(s) of management for the Transient Cyber Asset(s). This can be included as part of the Transient Cyber Asset plan(s), part of the documentation related to authorization of Transient Cyber Asset(s) managed by the Responsible Entity or part of a security policy.

Section 1.2: Examples of evidence for Section 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, or forms or spreadsheets that show authorization of Transient Cyber Asset(s) managed by the Responsible Entity. Alternatively, this can be documented in the overarching plan document.

Section 1.3: Examples of evidence for Section 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate software vulnerabilities posed by unpatched software such as security patch management implementation, the use of live operating systems from read-only media, system hardening practices or other method(s) to mitigate the software vulnerability posed by unpatched software. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, or procedures or processes associated with system hardening practices. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.4: Examples of evidence for Section 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.5: Examples of evidence for Section 1.5 may include, but are not limited to, documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; or documentation of other method(s) to mitigate the risk of unauthorized use.

Section 2.1: Examples of evidence for Section 2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memoranda, electronic mail, policies or contracts from parties other than the Responsible Entity that identify the security patching process or vulnerability mitigation performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate software vulnerabilities for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.2: Examples of evidence for Section 2.2 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of live of operating systems or system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.3: Examples of evidence for Section 2.3 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity.

Section 3.1: Examples of evidence for Section 3.1 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users,

either individually or by group or role, and the authorized locations, either individually or by group.

Section 3.2: Examples of evidence for Section 3.2 may include, but are not limited to, documented process(es) of the method(s) used to mitigate malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and that show mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or

other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-7. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-7 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a

major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.

3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected. Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment;
- Packet sniffers;
- Equipment used for BES Cyber System maintenance;

- Equipment used for BES Cyber System configuration; or
- Equipment used to perform vulnerability assessments.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset, BES Cyber Asset, or Protected Cyber Asset.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device

cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R4,Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. Caution: consider whether these user(s) must also have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks, and approved network interfaces (e.g., wireless, including near field communication or Bluetooth, and wired connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Entities should exercise caution when using Transient Cyber Assets and ensure they do not have features enabled (e.g., wireless or Bluetooth features) in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e., high impact, medium impact, and low impact). These impact areas have differing levels of protection under the CIP requirements, and measures should be taken to

prevent the introduction of malicious code from a lower impact area. An entity may want to consider the need to have separate Transient Cyber Assets for each impact level.

Section 1.3: Entities are to document and implement their process(es) to mitigate software vulnerabilities posed by unpatched software through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in software vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how its Transient Cyber Asset(s) will be used. It is possible for an entity to have its Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike CIP-007, Requirement R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.
- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating custom live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.
- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.
- When selecting to use other methods that mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet the software vulnerability mitigation objective.

Section 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility just as with security patching, to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate, from the Transient Cyber Asset to the BES Cyber Asset or BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the introduction of malicious code objective.

Section 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks that unauthorized use of the Transient Cyber Asset may present to the BES Cyber System. The concern addressed by this section is the possibility that the Transient Cyber Asset could be tampered with, or exposed to malware, while not in active use by an authorized person. Physical security of the Transient Cyber Asset is certainly a control that will mitigate this risk, but other tools and techniques are also available. The bulleted list of example protections provides some suggested alternatives.

- For restricted physical access, the intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location or enclosure that uses physical access controls to protect the Transient Cyber Asset.
- Full disk encryption with authentication is an option that can be employed to protect a Transient Cyber Asset from unauthorized use. However, it is important that authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents data from being read from the hard disk until the user has confirmed they have the correct password or other credentials. By performing the authentication prior to the system decrypting and booting, the risk that an unauthorized person may manipulate the Transient Cyber Asset is mitigated.

- Multi-factor authentication is used to ensure the identity of the person accessing the device. Multi-factor authentication also mitigates the risk that an unauthorized person may manipulate the Transient Cyber Asset.
- In addition to authentication and pure physical security methods, other alternatives are available that an entity may choose to employ. Certain theft recovery solutions can be used to locate the Transient Cyber Asset, detect access, remotely wipe, and lockout the system, thereby mitigating the potential threat from unauthorized use if the Transient Cyber Asset was later connected to a BES Cyber Asset. Other low tech solutions may also be effective to mitigate the risk of using a maliciously-manipulated Transient Cyber Asset, such as tamper evident tags or seals, and executing procedural controls to verify the integrity of the tamper evident tag or seal prior to use.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the risk of unauthorized use objective.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

To facilitate these controls, Responsible Entities may choose to execute agreements with other parties to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. [1] Procurement language may unify the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP program attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the other party's support. Entities should consider the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Section 2.1: Entities are to document and implement their process(es) to mitigate software vulnerabilities through the use of one or more of the protective measures listed.

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

- Conduct a review of the Transient Cyber Asset managed by a party other than the Responsible Entity to determine whether the security patch level of the device is adequate to mitigate the risk of software vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the other party's security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of software vulnerabilities to applicable systems.
- Conduct a review of other processes that the other party uses to mitigate the risk of software vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of software vulnerabilities.

Section 2.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity's security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. Authorization includes vendors and the entity's personnel. Caution: consider whether these user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity's plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

As a method to detect malicious code, entities may choose to use Removable Media with on-board malicious code detection tools. For these tools, the Removable Media are still used in conjunction with a Cyber Asset to perform the detection. For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First Comment and Ballot Period concluded on July 16, 2014
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for an additional comment period and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period and Ballot	September November 2014
Final Ballot is Conducted	October/November 2014January 2015
Board of Trustees (Board) Adoption	November 2014February 2015
Filing to Applicable Regulatory Authorities	December 2014February 2015

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
~~2~~	~~June 2014~~	~~Responding to FERC Order No. 791.~~	~~Revised~~
2	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-~~2~~3

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-010-~~2~~3:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

~~Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

~~Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.~~See Implementation Plan for CIP-010-3.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, ~~etc~~etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the ~~Bulk Electric System~~BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~2~~ 3 -Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~2~~ 3 -Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~2~~ 3 -Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-~~2~~ 3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 4. EACMS; 5. PACS; and 6. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-~~2~~ 3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-~~2~~ 3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~2~~ 3 -Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~2~~ 3 -Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~2~~ 3 -Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: **Section 1.** EACMS; and **Section 2.** PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~2~~ 3 -Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~2~~ 3 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~2~~ 3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment~~,~~; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-~~2~~ 3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-~~2~~ 3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

Rationale for R4:

Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with ~~tools~~ Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, ~~the~~ Requirement R4 ~~is a new requirement~~was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

Requirement R4 incorporates the concepts from other CIP requirements in CIP-010-~~1~~ 3 and CIP-007-~~5~~7 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: ~~This is a new requirement.~~ All requirements related to Transient ~~Devices~~ Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets and Removable Media that include the ~~elements~~ sections in Attachment 1~~, except under CIP Exceptional Circumstances~~. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable ~~elements~~ sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional examples of evidence per ~~element~~ section are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

d. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-~~2~~3)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only four of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only three of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only two of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has not documented or implemented any configuration change management process(es). (R1) OR The Responsible Entity has documented and implemented a configuration change management process(es) that includes only one of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity does not have a process(es) that

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-~~2~~3)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						requires authorization and documentation of changes that deviate from the existing baseline configuration. (1.2) OR The Responsible Entity does not have a process(es) to update baseline configurations within 30 calendar days of completing a change(s) that deviates from the existing baseline configuration.(1.3) OR The Responsible Entity does not have a process(es) to determine required security controls in CIP-005 and CIP-007

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-~~2~~3)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						that could be impacted by a change(s) that deviates from the existing baseline configuration. (1.4.1) OR The Responsible Entity has a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline configuration but did not verify and document that the required controls were not adversely affected following the change. (1.4.2 & 1.4.3)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-~~2~~3)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						OR The Responsible Entity does not have a process for testing changes in an environment that models the baseline configuration prior to implementing a change that deviates from baseline configuration. (1.5.1) OR The Responsible Entity does not have a process to document the test results and, if using a test environment, document the differences between the test and production environments. (1.5.2)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-~~2~~3)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	**Operations Planning**	**Medium**	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a process(es) to monitor for, investigate, and document detected unauthorized changes to the baseline at least once every 35 calendar days. (2.1)
R3	**Long-term Planning and Operations Planning**	**Medium**	The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its applicable BES Cyber Systems, but has performed a vulnerability assessment more than 15 months, but less than 18 months,	The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its applicable BES Cyber Systems, but has performed a vulnerability assessment more than 18 months, but less than 21, months	The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its applicable BES Cyber Systems, but has performed a vulnerability assessment more than 21 months, but less than 24 months,	The Responsible Entity has not implemented any vulnerability assessment processes for one of its applicable BES Cyber Systems. (R3) OR The Responsible Entity has implemented one or more documented

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-~~2~~3)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			since the last assessment on one of its applicable BES Cyber Systems. (3.1) OR The Responsible Entity has implemented one or more documented active vulnerability assessment processes for Applicable Systems, but has performed an active vulnerability assessment more than 36 months, but less than 39 months, since the last active assessment on one of its applicable BES Cyber Systems. (3.2)	since the last assessment on one of its applicable BES Cyber Systems. (3.1) OR The Responsible Entity has implemented one or more documented active vulnerability assessment processes for Applicable Systems, but has performed an active vulnerability assessment more than 39 months, but less than 42 months, since the last active assessment on one of its applicable BES Cyber Systems. (3.2)	since the last assessment on one of its applicable BES Cyber Systems. (3.1) OR The Responsible Entity has implemented one or more documented active vulnerability assessment processes for Applicable Systems, but has performed an active vulnerability assessment more than 42 months, but less than 45 months, since the last active assessment on one of its applicable BES Cyber Systems. (3.2)	vulnerability assessment processes for each of its applicable BES Cyber Systems, but has performed a vulnerability assessment more than 24 months since the last assessment on one of its applicable BES Cyber Systems. (3.1) OR The Responsible Entity has implemented one or more documented active vulnerability assessment processes for Applicable Systems, but has performed an active vulnerability assessment more than 45 months since the last active

CIP-010-~~2~~ 3 - Attachment 1

Required ~~Elements~~ Sections for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the ~~elements~~ sections provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

Section 1. Transient Cyber Asset(s) ~~Owned or~~ Managed by the Responsible Entity.

1.1. Transient Cyber Asset ~~management~~Management: Responsible Entities shall manage Transient Cyber Asset(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection to a BES Cyber System, or (3) a combination of both (1) and (2) above.

1.2. Transient Cyber Asset ~~authorization~~Authorization: For each individual or group of Transient Cyber Asset(s), each Responsible Entity shall ~~specify~~authorize:

1.2.1. ~~Authorized users~~Users, either individually or by group or role;

1.2.2. ~~Authorized locations~~Locations, either individually or by group; and

1.2.3. ~~Authorized uses~~Uses, which shall be limited to what is necessary to perform business functions.

1.3. ~~Security~~ Software ~~vulnerability~~ Vulnerability ~~mitigation~~Mitigation: Use one or a combination of the following methods to achieve the objective of ~~To mitigate~~ mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset ~~security vulnerabilities~~ (per Transient Cyber Asset capability)~~, each Responsible Entity shall use one or a combination of the following methods~~:

- Security patching, including manual or managed updates;
- Live operating system and software executable only from read-only media;
- System hardening; or
- Other method(s) to mitigate ~~security~~ software vulnerabilities.

1.4. Introduction of ~~malicious~~ Malicious ~~code~~ Code ~~mitigation~~Mitigation: Use one or a combination of the following methods to achieve the objective of ~~To mitigate~~ mitigating the introduction of malicious code (per Transient Cyber Asset capability)~~, each Responsible Entity shall use one or a combination of the following methods~~:

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or

- ~~Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected; or~~
- Other method(s) to mitigate the introduction of malicious code.

1.5. ~~Risk of unauthorized~~ Unauthorized ~~use~~ Use ~~mitigation~~Mitigation: Use one or a combination of the following methods to achieve the objective of ~~To mitigate~~ mitigating the risk of unauthorized use of Transient Cyber Asset(s)~~, each Responsible Entity shall use one or a combination of the following methods~~:

- ~~Transient Cyber Asset resides within a location with restricted~~ Restrict physical access;
- Full-disk encryption with authentication;
- ~~Multi-factor authentication;~~
- ~~Theft recovery tools;~~ or
- Other method(s) to mitigate the risk of unauthorized use.

Section 2. Transient Cyber Asset(s) ~~Owned or~~ Managed by ~~Vendors or Contractors~~ a Party Other than the Responsible Entity.

2.1 ~~Security~~ Software ~~vulnerability~~ Vulnerabilities ~~mitigation~~Mitigation: Use one or a combination of the following methods to achieve the objective of ~~To mitigate~~ mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset ~~security vulnerabilities~~ (per Transient Cyber Asset capability)~~, each Responsible Entity shall use one or a combination of the following methods~~:

- Review of installed security patch(es);
- Review of security patching process used by the ~~vendor or contractor~~party~~, other than the Responsible Entity, managing the Transient Cyber Asset(s)~~;
- Review of other vulnerability mitigation performed by the ~~vendor or contractor~~party~~, other than the Responsible Entity, managing the Transient Cyber Asset(s)~~; or
- Other method(s) to mitigate ~~security~~ software vulnerabilities.

2.2 Introduction of m~~M~~alicious code mitigation: Use one or a combination of the following methods to achieve the objective of ~~To mitigate~~ mitigating malicious code (per Transient Cyber Asset capability)~~, each Responsible Entity shall use one or a combination of the following methods~~:

- Review of antivirus update level;
- Review of antivirus update process used by the party~~vendor or contractor~~;
- Review of application whitelisting used by the party~~vendor or contractor~~;

- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party~~vendor or contractor~~; or
- Other method(s) to mitigate malicious code.

2.3 For any method used to mitigate ~~security~~ software vulnerabilities or malicious code as specified in 2.1 and 2.2, Responsible Entities shall determine whether any additional mitigation actions are necessary~~,~~ and implement such actions prior to connecting the ~~vendor- or contractor-owned~~ Transient Cyber Asset.

Section 3. Removable Media

3.1. Removable Media ~~authorization~~Authorization: For each individual or group of Removable Media, each Responsible Entity shall ~~specify~~authorize:

3.1.1. ~~Authorized users~~Users, either individually or by group or role; and

3.1.2. ~~Authorized locations~~Locations, either individually or by group.

3.2. Malicious ~~code~~ Code ~~mitigation~~Mitigation: To achieve the objective of mitigating the threat of introducing malicious code to high impact or medium impact BES Cyber Systems and their associated Protected Cyber Assets, each Responsible Entity shall:

3.2.1. Use method(s) to detect malicious code on Removable Media using a Cyber Asset other than a BES Cyber System or Protected Cyber Assets; and

~~**3.1.3.**~~**3.2.2.** Mitigate the threat of detected malicious code on Removable Media prior to connecting the Removable Media to a high impact or medium impact BES Cyber System or associated Protected Cyber Assets~~To mitigate malicious code, each Responsible Entity shall scan Removable Media outside of the BES Cyber System~~.

CIP-010-~~2~~ 3 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

~~Element~~ Section 1.1: Examples of evidence for ~~element~~ Section 1.1 may include, but are not limited to, the method(s) of management for the Transient Cyber Asset(s). This can be included as part of the Transient Cyber Asset plan(s), part of the documentation related to authorization of Transient Cyber Asset(s) ~~Owned or Managed~~ managed by the Responsible Entity or part of a security policy.

~~Element~~ Section 1.2: Examples of evidence for ~~element~~ Section 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, or forms or spreadsheets that show~~s~~ authorization of Transient Cyber Asset(s) ~~Owned or Managed~~ managed by the Responsible Entity. Alternatively, this can be documented in the overarching plan document. ~~The documentation must identify the Transient Cyber Asset, individually or by group of Transient Cyber Asset(s) along with the authorized users, either individually or by group or role, the authorized locations, either individually or by group and the authorized uses associated with what is necessary to perform business functions.~~

~~Element~~ Section 1.3: ~~____~~ Examples of evidence for ~~element~~ Section 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate ~~security~~ software vulnerabilities posed by unpatched software such as security patch management implementation, the use of live operating systems from read-only media, system hardening practices or other method(s) to mitigate the ~~security~~ software vulnerability posed by unpatched software. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, or procedures or processes associated with system hardening practices. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability. ~~If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.~~

~~Element~~ Section 1.4: Examples of evidence for ~~element~~ Section 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the

Transient Cyber Asset does not have the capability. ~~If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.~~

~~Element~~ Section 1.5: Examples of evidence for ~~element~~ Section 1.5 may include, but are not limited to, documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; ~~method(s) of the theft recovery tools;~~ or documentation of other method(s) to mitigate the risk of unauthorized use. ~~If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.~~

~~Element~~ Section 2.1: Examples of evidence for ~~element~~ Section 2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); ~~memorandums~~memoranda, electronic mail, policies or contracts from ~~vendors or contractors~~parties other than the Responsible Entity that identify the security patching process or vulnerability mitigation performed by the ~~vendor or contractor~~party other than the Responsible Entity; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity ~~of~~ that the ~~vendor or contractor~~ practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate ~~security~~ software vulnerabilities for Transient Cyber Asset(s) ~~Owned of Managed~~ managed by ~~Vendors or Contractors~~a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability. ~~If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.~~

~~Element~~ Section 2.2: Examples of evidence for ~~element~~ Section 2.2 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed ~~the~~ antivirus update level; ~~memorandums~~memoranda, electronic mail, system documentation, policies or contracts from ~~vendors or contractors~~the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of live of operating systems or system hardening performed by the ~~vendor or contractor~~party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that

identifies the Responsible Entity's acceptance ~~by the Responsible Entity of~~ that the practices of the party other than the Responsible Entity ~~vendor or contractor practices~~ are acceptable; or documentation of other method(s) to mitigate malicious code for Transient Cyber Asset(s) ~~Owned or Managed~~ managed by ~~Vendors or Contractors~~a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability. ~~If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.~~

~~Element~~ Section 2.3: Examples of evidence for ~~element~~ Section 2.3 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the ~~vendor or contractor owned~~ Transient Cyber Asset managed by a party other than the Responsible Entity.

~~Element~~ Section 3.1: Examples of evidence for ~~element~~ Section 3.1 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users, either individually or by group or role, and the authorized locations, either individually or by group.

~~Element~~ Section 3.2: Examples of evidence for ~~element~~ Section 3.2 may include, but are not limited to, documented process(es) of the method(s) used to mitigate malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and that show mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.~~documentation of the method(s) used to mitigate malicious code such as results of scans of the media, or documented confirmation by the entity that the media was deemed to be free of malicious code. Confirmation can be documented through email or within change management record(s).~~

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or

other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-~~6~~7. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-~~6~~ 7 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a

major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.

3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

~~Most~~ Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks~~. Because of this~~, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas ~~that are needed~~ to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. ~~These assets~~Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected. Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment;
- Packet sniffers;

- Equipment used for BES Cyber System maintenance;
- Equipment used for BES Cyber System configuration; or
- Equipment used to perform vulnerability assessments.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, ~~element~~ Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application~~s~~ of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management. ~~These are broken down as follows:~~

~~Transient Cyber Asset(s) Owned or Managed by the Responsible Entity~~

~~Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors~~

~~Removable Media~~

~~Per Transient Cyber Asset Capability~~

~~As with other CIP standards, the requirements are intended for an entity to perform the security functions that the system is capable of doing. The use of this phrase is to eliminate the need for a technical feasibility exception when it is understood that the device cannot perform a function. Using the example of malicious code, many types of appliances are not capable of implementing antivirus software and therefore the software would not be required since it is not a capability of the device.~~

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the ~~device~~Transient Cyber Asset, BES Cyber Asset, or Protected Cyber Asset.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement ~~4~~ R4, Attachment 1, Section 1 - Transient Cyber Asset(s) ~~Owned or~~ Managed by the Responsible Entity

~~Element~~ Section 1.1: Entities have a high level of control for the assets that they ~~own or~~ manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

~~Element~~ Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct ~~ownership or~~ management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. Caution: consider whether these user(s) must also have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks, and approved network interfaces (e.g., wireless, including near field communication or Bluetooth, and ~~wires~~ wired connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about

authorized and unauthorized activities or uses (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Entities should exercise caution when using Transient Cyber Assets and ensure they do not have features enabled (e.g.~~,~~ wireless or Bluetooth features) in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e.~~,~~ high impact, medium impact, and low impact). These impact areas have differing levels of protection under the CIP ~~Requirements~~requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. An entity may want to consider the need to have separate Transient Cyber Assets for each impact level.

~~Element~~ Section 1.3: Entities are to document and implement their process(es) to mitigate ~~security~~ software vulnerabilities posed by unpatched software through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in ~~security~~ software vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how ~~their~~ its Transient Cyber Asset(s) will be used. It is possible for an entity to have ~~their~~ its Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike~~,~~ CIP-007, Requirement R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.
- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating custom~~er~~ live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.
- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.

- When selecting to use other methods that mitigate ~~security~~ software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet the ~~security~~ software vulnerability mitigation objective.

~~Element~~ Section 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility just as with security patching, to manage ~~their~~ Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, ~~it is possible that~~ entities ~~can~~ may choose ~~for devices that do not regularly connect to receive scheduled updates,~~ to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate, from the Transient Cyber Asset to the BES Cyber Asset ~~of~~ or BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the introduction of malicious code objective.

~~Element~~ Section 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks ~~of~~ that unauthorized use ~~to~~ of the Transient Cyber Asset may present to the BES Cyber System. The concern addressed by this section is the possibility that the Transient Cyber Asset could be tampered with, or exposed to malware, while not in active use by an authorized person. Physical security of the Transient Cyber Asset is certainly a control that will mitigate this risk, but other tools and techniques are also available. The bulleted list of example protections provides some suggested alternatives.

- ~~Transient Cyber Asset resides within a location with r~~For restricted physical access~~.~~, t~~T~~he intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location or enclosure that uses physical access controls to protect ~~manages unauthorized physical access to~~ the ~~device~~Transient Cyber Asset.
- Full disk encryption with authentication is an option that can be ~~used~~ employed to protect a Transient Cyber Asset from unauthorized ~~physical access~~use. However, it is important that authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents ~~anything~~ data from being read from the hard disk until the user has confirmed they have the correct password or other credentials. By performing the authentication prior to the system decrypting and booting, the risk that an unauthorized person may manipulate the Transient Cyber Asset is mitigated.
- Multi-factor authentication is used to ensure the identity of the person accessing the device. Multi-factor authentication also mitigates the risk that an unauthorized person may manipulate the Transient Cyber Asset.
- In addition to authentication and pure physical security methods, other alternatives are available that an entity may choose to employ. Certain ~~T~~theft recovery ~~tools~~ solutions ~~that~~ can be used to locate the Transient Cyber Asset, detect access, remotely wipe, and ~~or~~ lockout the system, thereby mitigating the potential threat from unauthorized use if the Transient Cyber Asset was later connected to a BES Cyber Asset.~~s~~ Other low tech solutions may also be effective to mitigate the risk of using a maliciously-manipulated Transient Cyber Asset, such as tamper evident tags or seals, and executing procedural controls to verify the integrity of the tamper evident tag or seal prior to use~~.if they are stolen or lost~~.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the risk of unauthorized use objective.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) ~~Owned or~~ Managed by ~~Vendors or Contractors~~a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are ~~owned or~~ managed by ~~vendors or contractors~~parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not ~~own or~~ manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

To facilitate these controls, Responsible Entities may choose to execute agreements with other parties ~~vendors and contractors~~ to provide support services to BES Cyber Systems and BES

Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department ~~Of~~ of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. [1] ~~Elements from the p~~Procurement language may unify ~~vendor~~ the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP p~~P~~rogram ~~elements~~ attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the ~~vendor's~~ other party's support. Entities should consider ~~the elements of~~ the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

~~Element~~ Section 2.1: Entities are to document and implement their process(es) to mitigate ~~security~~ software vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the ~~vendor or contractor managed~~ Transient Cyber Asset managed by a party other than the Responsible Entity to determine whether the security patch level of the device is adequate to mitigate the risk of ~~security~~ software vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the ~~vendor or contractor~~other party's security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of ~~security~~ software vulnerabilities to applicable systems.
- Conduct a review of other processes that the ~~vendor or contactor~~other party uses to mitigate the risk of ~~security~~ software vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate ~~security~~ software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of ~~security~~ software vulnerabilities.

~~Element~~ Section 2.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

- Review the antivirus or endpoint security processes of the ~~vendor or contactor~~other party to ensure that their processes are adequate to the Responsible Entity to ~~reduce~~ mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the ~~vendor or contactor~~other party to ~~reduce~~ mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the ~~vendor or contactor~~other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

~~Element~~ Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the ~~vendor or contractor owned~~ Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this ~~element~~ section is to ensure that after conducting the selected review from ~~elements~~ Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible ~~Entities~~ Entity's security posture, the ~~vendor or contactor~~other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

~~Element~~ Section 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. Authorization includes vendors and the entity's personnel. Caution: consider whether ~~These~~ these user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

~~Element~~ Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on ~~scanning~~ the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it~~The scanning~~ is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious

code is a Cyber Security Incident. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity's plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

As a method to detect malicious code, entities may choose to use Removable Media with on-board malicious code detection tools. For these tools, the Removable Media are still used in conjunction with a Cyber Asset to perform the detection. For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for an additional comment period and ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	November 2014
Final Ballot is Conducted	January 2015
Board of Trustees (Board) Adoption	February 2015
Filing to Applicable Regulatory Authorities	February 2015

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
2	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-3

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-3:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-011-3.

6. Background:

Standard CIP-011 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training

program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-3 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-3 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-3 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-3 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-3 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-3 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-3 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-3 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-3)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).
R2	**Operations Planning**	**Lower**	N/A	The Responsible Entity implemented one or more documented processes but did not include processes for reuse as to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.1)	The Responsible Entity implemented one or more documented processes but did not include disposal or media destruction processes to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.2)	The Responsible Entity has not documented or implemented any processes for applicable requirement parts in CIP-011-3 Table R2 – BES Cyber Asset Reuse and Disposal. (R2)

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the

analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset, Transient Cyber Asset, or Removable Media is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the Responsible Entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging.

Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for ~~final~~ an additional comment period and ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	November 2014
Final Ballot is Conducted	~~October 2014~~January 2015
Board of Trustees (Board) Adoption	~~November 2014~~February 2015
Filing to Applicable Regulatory Authorities	~~December 2014~~February 2015

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
2	11/13/14	Adopted by the NERC Board of Trustees.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-~~2~~3

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-~~2~~3:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-011-~~2~~3.

6. Background:

Standard CIP-011 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the ~~Bulk Electric System~~BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-~~2~~ 3 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-~~2~~ 3 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~2~~ 3 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-~~2~~ 3 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-~~2~~ 3 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-~~2~~ 3 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~2~~ 3 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-~~2~~ 3 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~2~~3)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).
R2	**Operations Planning**	**Lower**	N/A	The Responsible Entity implemented one or more documented processes but did not include processes for reuse as to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.1)	The Responsible Entity implemented one or more documented processes but did not include disposal or media destruction processes to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.2)	The Responsible Entity has not documented or implemented any processes for applicable requirement parts in CIP-011-~~2~~ 3 Table R2 – BES Cyber Asset Reuse and Disposal. (R2)

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the

analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset, Transient Cyber Asset, or Removable Media is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the ~~responsible~~ Responsible ~~entity~~ Entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging.

Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Consideration of Issues and Directives

Federal Energy Regulatory Commission Order No. 791
November 25, 2014

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
67 and 76	67. For the reasons discussed below, the Commission concludes that the "identify, assess, and correct" language, as currently proposed by NERC, is unclear with respect to the obligations it imposes on responsible entities, how it would be implemented by responsible entities, and how it would be enforced. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements, while retaining the substantive provisions of those requirements.[1] Alternatively, NERC may propose equally efficient and effective modifications that address the Commission's concerns	The Standard Drafting Team (SDT) removed the "identify, assess, and correct" language from the following 17 Requirements in the CIP standards and their related Violation Severity Levels (VSLs): CIP-003-7, Requirements R2 and R4; CIP-004-7, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-7, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-3, Requirements R1 and R2; and CIP-011-3, Requirement R1.

[1] The 17 requirements are: CIP-003-5, Requirements R2 and R4; CIP-004-5.1, Requirements R2 through R5; CIP-006-5 Requirements R1 and R2; CIP-007-5, Requirements R1 through R5; CIP-009-5, Requirement R2; CIP-010-1, Requirements R1 and R2; and CIP-011-1, Requirement R1.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	regarding the "identify, assess, and correct" language.[2] The Commission directs NERC to submit the modifications to the CIP Reliability Standards within one year from the effective date of this Final Rule. 76. Accordingly, the Commission directs NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this Final Rule. Alternatively, NERC may develop a proposal to enhance the enforcement discretion afforded to itself and the Regional Entities, as discussed above.	
106	Based on the explanations provided by NERC and other commenters, we adopt the NOPR proposal with modifications. As we explain below, while we do not require NERC to develop specific controls for Low Impact	The SDT revised Requirements R1 and R2 of CIP-003-7 to include additional specificity regarding the processes that responsible entities must have for low impact BES Cyber Systems. In addition, the SDT developed objective criteria

[2] *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at P 186, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	facilities, we do require NERC to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for Low Impact assets. While NERC may address this concern by developing specific controls for Low Impact facilities, it has the flexibility to address it through other means, including those discussed below.	surrounding the controls for some entities based on asset-type and routable communications. The SDT determined that the additional specificity and objective criteria address FERC's concerns while maintaining the flexibility in controls necessary for such a diverse array of assets in the low impact category. To better define the protection required for low impact BES Cyber System electronic communication, the terms Low Impact BES Cyber System External Routable Connectivity (LERC) and Low Impact BES Cyber System Electronic Access Point (LEAP) have been added to the NERC Glossary of Terms. These help define the concept of security controls targeted for communication paths at a facility-site level. The SDT confined these revisions in CIP-003-7, Requirements R1 and R2 to the following areas: 1. **Cyber Security Policy:** R1.2 requires a policy addressing the four cyber security subject matter areas specified in the R2 cyber security plan. 2. **Cyber Security Plan(s):** R2 requires the development and implementation of one or more cyber security plan(s) for an entity's low impact BES Cyber System(s).

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		The cyber security plan must cover the 4 areas as specified in Attachment 1 of CIP-003-7: a. **Cyber Security Awareness:** Attachment 1, Section 1 requires responsible entities to implement a security awareness program with timeframes to reinforce cyber security practices. The SDT determined that adding intervals increases the auditability of the requirement part. b. **Physical Security Controls:** Attachment 1, Section 2 and its subparts require physical access controls to low impact BES Cyber Systems as well as Low Impact BES Cyber System Electronic Access Points (LEAP) used for controlling access as specified in Section 3. c. **Electronic Access Controls:** Attachment 1, Section 3 and its subparts address protections around Low Impact BES Cyber System External Routable Connectivity (LERC) and Dial-up Connectivity. d. **Cyber Security Incident Response:** Attachment 1, Section 4 and its subparts outline the criteria required to be in a Cyber Security Incident response plan.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
124	Accordingly, the Commission directs NERC to conduct a survey of Cyber Assets that are included or excluded under the new BES Cyber Asset definition during the CIP version 5 Standards implementation periods. Such data will help provide a better understanding of the BES Cyber Asset definition. Based on the survey data, NERC should explain in an informational filing the following: (1) specific ways in which entities determine which Cyber Assets meet the 15 minute parameter; (2) types or functions of Cyber Assets that are excluded from being designated as BES Cyber Assets and the rationale as to why; (3) common problem areas with entities improperly designating BES Cyber Assets; and (4) feedback from each region participating in the implementation study on lessons learned with the application of the BES Cyber Asset definition. The informational filing should not provide a level of detail that divulges CEII data. This filing should also help other entities implementing CIP version 5 in identifying BES Cyber Assets.	Based on comments and feedback from the draft proposed Section 1600 survey, NERC will no longer be issuing a Section 1600 data request and will be working with the six study participants in developing the information needed for its filing.
132	Based on the explanation provided by NERC and other commenters, we will not direct modifications regarding the 30-day exemption in the definition of BES Cyber Asset. While we are persuaded that it	The threat of connecting transient devices to BES Cyber Systems is addressed in the Reliability Standards through an additional requirement in CIP-010, which requires a Transient Cyber Asset

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	would be unduly burdensome for responsible entities to treat all transient devices as BES Cyber Assets, we remain concerned whether the CIP version 5 Standards provide adequately robust protection from the risks posed by transient devices. Accordingly, as discussed below, we direct NERC to develop either new or modified standards to address the reliability risks posed by connecting transient devices to BES Cyber Assets and Systems.	and Removable Media plan to provide higher assurance against the propagation of malware when connecting transient devices. The terms Transient Cyber Asset and Removable Media have been added to the glossary to define transient devices. In addition, the terms BES Cyber Asset and Protected Cyber Asset have been modified to reference the new Transient Cyber Asset definition. The drafting team determined three distinct scenarios for entities to address in their plan(s) in which transient devices need specific protections: (i) Transient Cyber Assets managed by the Responsible Entity, (ii) Transient Cyber Asset(s) managed by a party other than the Responsible Entity (e.g. vendors or contractors), and (iii) Removable Media. For Transient Cyber Assets managed by the Responsible Entity, the SDT determined that entities manage these devices in two fundamentally different ways. Some entities maintain a preauthorized inventory of transient devices while others have a checklist for transient devices prior to connecting them to a BES Cyber System. The drafting team acknowledges both methods are valid and has drafted requirements that permit either form of management. The controls for this scenario are

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		more specific and recognize the relatively higher frequency in which these devices will be used. In the scenario in which a party other than the Responsible Entity manages the Transient Cyber Assets, the required sections of the plan include those which an entity can verify at the point prior to connecting such as security patch management and malware prevention mechanisms. The security controls entities must apply to Removable Media have considerations for the type of device being protected and include authorization and scanning for malicious code. The Commission provided a list of security controls it expected NERC to consider for addressing transient devices. The consideration of each security section is described as follows: 1. **Device authorization as it relates to users and locations:** CIP-010-3 Requirement R4, Attachment 1 requires entities to authorize Transient Cyber Assets and Removable Media by user(s), location(s) and use prior to connecting them to the BES Cyber System. Transient Cyber Assets managed by another party do not have this authorization because the scenario is often single-use and the entity already conducts an inspection and mitigation of the device prior to connection.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		2. Software authorization: The SDT considered controls relating to software authorization but decided against including specific software as part of the authorization performance because such authorization did not contribute meaningfully to cyber security risk reduction. However, software authorization in the form of application whitelisting is provided as an option to mitigate malicious code. **3. Security patch management:** In CIP-010-3 R4, Attachment 1, both entity and vendor/contractor managed devices must have security patch management or other equivalent forms of mitigation to address security vulnerabilities in software. 4. **Malware prevention:** CIP-010-3 Requirement R4, Attachment 1 requires entities to have malware protection on the Transient Cyber Asset (for both entity- and vendor-managed Transient Cyber Assets) and for Removable Media prior to connection. 5. **Detection controls for unauthorized physical access to a transient device:** The drafting team considered this control and determined this control best applies to entity-managed Transient Cyber Assets with the objective to mitigate the risk of unauthorized use. There are logistical challenges in applying this control to vendor-managed devices, in which the entity likely will

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		have had no control until immediately prior to use. Furthermore, additional guidance is necessary in CIP-011-3 to ensure entities recognize the importance of safeguarding BES Cyber System Information on transient devices. The objective to address the unauthorized release of BES Cyber System Information is sufficiently addressed with the requirements in CIP-011-3 to protect and securely handle BES Cyber System Information. 6. **Processes and procedures for connecting transient devices to systems at different security classification levels (i.e. high, medium, low impact):** The drafting team has considered this control and believes the threat of connecting at multiple impact levels is sufficiently addressed through the proposed Reliability Standards. Rigorous security assessment and controls between classification levels have significant importance to secure authorized information flows. However, connections between impact levels do not carry the same threat for BES Cyber Systems. The flow of BES Cyber System Information is addressed sufficiently through CIP-011-3 requirements. The more concerning threat involves transient devices connecting between BES Cyber Systems and external networks, and this threat is addressed in the proposed CIP-010-3 Requirement R4.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
150	We direct NERC to create a definition of communication networks and to develop new or modified Reliability Standards to address the reliability gap discussed above. The definition of communications networks should define what equipment and components should be protected, in light of the statutory inclusion of communication networks for the reliable operation of the Bulk-Power System. The new or modified Reliability Standards should require appropriate and reasonable controls to protect the nonprogrammable aspects of communication networks. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this final rule. We also direct Commission staff to include this issue in the staff-led technical conference discussed herein.3	The proposed CIP-006-6 Requirement Part 1.10 requires the physical protection of nonprogrammable components of BES Cyber Systems existing outside of the PSP, and the proposed modifications to CIP-007-7 Requirement Part 1.2 include applicability for non-programmable electronic components to prevent unauthorized use of physical ports. These additional requirements address the gap in protection as discussed in the Order by ensuring the physical security for cabling and non-programmable network components not covered by the definition of Cyber Asset. The drafting team reviewed the directives related to submitting a definition for communication network and determined it could address the gap in protection and adequately provide guidance on nonprogrammable electronic components without having a definition. Communication networks can and should be defined broadly. For example, NIST Special Publication 800-53 Revision 4 refers to the CNSSI 4009 definition of Network, which is "Information system(s) implemented with a collection of interconnected components." However, the scope of the requirements modifications as well as the existing requirements has more targeted components than the broad concept of

[3] *See infra* P 223.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		communication networks. Consequently, there is not a need at this time to submit a definition for the NERC Glossary of Terms used in Reliability Standards. The decision to meet the directive without defining the term communication networks does not imply the absence of protection for communication networks components nor do the additional requirements associated with nonprogrammable components denote meaning to the term. Communication networking components associated with BES Cyber Systems and within an Electronic Security Perimeter have the same level of protection applied as the BES Cyber Assets themselves. Additionally, CIP-005-5 communication protections continue to apply at the Electronic Security Perimeter. The drafting team did not find an additional Glossary term useful in the currently applied communication networks protection.
181 and 184	181. The Commission also supports NERC's proposal to develop transition guidance documents and a pilot program to assist responsible entities as they move from compliance with the CIP version 3 Standards to the CIP version 5 Standards.4 The Commission agrees that a pilot program will assist responsible entities by	NERC modified the VRF assignment for CIP-006-6, Requirement R3 from Lower to Medium and filed the revision with FERC on 5/15/2014.

[4] *See* NERC Comments at 39-40.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	offering best practices and lessons learned during this transition. 184. Consistent with our discussion above, the Commission directs NERC to modify the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium, within 90 days of the effective date of this Final Rule.	
192 and 196	192. The Commission adopts the NOPR proposal and directs NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium. This modification is necessary to reflect that access to operationally sensitive computer equipment should be strictly limited to employees or contractors who utilize the equipment in performance of their job responsibilities, and to prevent or mitigate disclosure of sensitive information consistent with Recommendations 40 and 44 of the 2003 Blackout Report. In addition, a Medium VRF assignment ensures consistency with the Commission's VRF guidelines. 196. Consistent with the discussion above, we direct NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium, within 90 days of the effective date of this Final Rule.	NERC modified the VRF assignment for CIP-004-7, Requirement R4 from Lower to Medium and filed the revision with FERC on 5/15/2014.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
205	Consistent with the NOPR proposal, we direct NERC to develop modifications to the VSLs for certain CIP version 5 Standard requirements to: (1) remove the "identify, assess, and correct" language from the text of the VSLs for the affected requirements; (2) address typographical errors; and (3) clarify certain unexplained sections. For the VSLs that include "identify, assess, and correct" language, we direct NERC to ensure that these VSLs are modified to reflect any revisions to the requirement language in response to our directives. We grant NERC the discretion to decide how best to address these modifications be it through an errata filing to this proceeding or separate filing.	In conjunction with the SDT's response to the directive in PP 67 and 76, the SDT removed the "identify, assess, and correct" language from the following 17 Requirements' VSLs: CIP-003-7, Requirements R2 and R4; CIP-004-7, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-7, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-3, Requirements R1 and R2; and CIP-011-3, Requirement R1. NERC filed the following revisions with FERC on 5/15/2014: 1. **VSLs for CIP-003-7, Requirements R1 and R2**. This standard addresses security management controls for cyber security. Requirement R1 governs management approval of policies on topics addressed in other CIP standards for medium and high impact BES Cyber Systems. Requirement R2 governs policies for low impact BES Cyber Systems. NERC staff, in consultation with the SDT, revised the VSLs in CIP-003-5, Requirements R1 and R2 to eliminate redundant language. 2. **VSLs for CIP-004-7, Requirement R4**. This standard includes requirements for personnel

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		and training related to cyber security. Requirement R4 governs implementation of access management programs. NERC staff, in consultation with the SDT, revised the VSLs to a percentage-based gradation. 3. **Severe VSL for CIP-008-5, Requirement R2**. This standard addresses incident reporting and response planning for cyber security. Requirement R2 governs implementation of documented Cyber Security Incident response plans. NERC staff revised the Severe VSL to reduce a gap in months between the High VSL and Severe VSL. 4. **VSLs for CIP-009-6, Requirement R3**. This standard addresses recovery plans for BES Cyber Systems. Requirement R3 governs maintenance of the recovery plans. NERC staff revised the timeframe contained in the VSLs from 90-210 days to 90-120 days.

Consideration of Issues and Directives

Federal Energy Regulatory Commission Order No. 791

~~September 3, 2014~~November 25, 2014

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
67 and 76	67. For the reasons discussed below, the Commission concludes that the "identify, assess, and correct" language, as currently proposed by NERC, is unclear with respect to the obligations it imposes on responsible entities, how it would be implemented by responsible entities, and how it would be enforced. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements, while retaining the substantive provisions of those requirements.[1] Alternatively, NERC may propose equally efficient and effective modifications that address the Commission's concerns	The Standard Drafting Team (SDT) removed the "identify, assess, and correct" language from the following 17 Requirements in the CIP standards and their related Violation Severity Levels (VSLs): CIP-003-~~6~~7, Requirements R2 and R4; CIP-004-~~6~~7, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-~~6~~7, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-~~2~~3, Requirements R1 and R2; and CIP-011-~~2~~3, Requirement R1.

[1] The 17 requirements are: CIP-003-5, Requirements R2 and R4; CIP-004-5.1, Requirements R2 through R5; CIP-006-5 Requirements R1 and R2; CIP-007-5, Requirements R1 through R5; CIP-009-5, Requirement R2; CIP-010-1, Requirements R1 and R2; and CIP-011-1, Requirement R1.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	regarding the "identify, assess, and correct" language.[2] The Commission directs NERC to submit the modifications to the CIP Reliability Standards within one year from the effective date of this Final Rule. 76. Accordingly, the Commission directs NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this Final Rule. Alternatively, NERC may develop a proposal to enhance the enforcement discretion afforded to itself and the Regional Entities, as discussed above.	
106	Based on the explanations provided by NERC and other commenters, we adopt the NOPR proposal with modifications. As we explain below, while we do not require NERC to develop specific controls for Low Impact	The SDT revised Requirements R1 and R2 of CIP-003-~~6~~ 7 to include additional specificity regarding the processes that responsible entities must have for low impact BES Cyber Systems. In addition, the SDT developed objective criteria

[2] *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at P 186, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	facilities, we do require NERC to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for Low Impact assets. While NERC may address this concern by developing specific controls for Low Impact facilities, it has the flexibility to address it through other means, including those discussed below.	surrounding the controls for some entities based on asset-type and routable communications. The SDT determined that the additional specificity and objective criteria address FERC's concerns while maintaining the flexibility in controls necessary for such a diverse array of assets in the low impact category. To better define the protection required for low impact BES Cyber System electronic communication, the terms Low Impact BES Cyber System External Routable Connectivity (LERC) and Low Impact BES Cyber System Electronic Access Point (LEAP) have been added to the NERC Glossary of Terms. These help define the concept of security controls targeted for communication paths at a facility-site level. The SDT confined these revisions in CIP-003-~~6~~7, Requirements R1 and R2 to the following areas: 1. **Cyber Security Policy:** R1.2 requires a policy addressing the four cyber security subject matter areas specified in the R2 cyber security plan. 2. **Cyber Security Plan(s):** R2 requires the development and implementation of one or more cyber security plan(s) for an entity's low impact BES Cyber System(s).

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		The cyber security plan must cover the 4 areas as specified in Attachment 1 of CIP-003-~~6~~7: a. **Cyber Security Awareness:** Attachment 1, ~~element~~Section 1 requires responsible entities to implement a security awareness program with timeframes to reinforce cyber security practices. The SDT determined that adding intervals increases the auditability of the requirement part. b. **Physical Security Controls:** Attachment 1, ~~element~~Section 2 and its subparts require ~~controls to restrict~~ physical access controls to low impact BES Cyber Systems as well as Low Impact BES Cyber System Electronic Access Points (LEAP) used for controlling access as specified in ~~element~~Section 3. c. **Electronic Access Controls:** Attachment 1, ~~element~~Section 3 and its subparts address protections around Low Impact BES Cyber System External Routable Connectivity (LERC) and Dial-up Connectivity. d. **Cyber Security Incident Response:** Attachment 1, ~~element~~Section 4 and its subparts outline the criteria required to be in a Cyber Security Incident response plan.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
124	Accordingly, the Commission directs NERC to conduct a survey of Cyber Assets that are included or excluded under the new BES Cyber Asset definition during the CIP version 5 Standards implementation periods. Such data will help provide a better understanding of the BES Cyber Asset definition. Based on the survey data, NERC should explain in an informational filing the following: (1) specific ways in which entities determine which Cyber Assets meet the 15 minute parameter; (2) types or functions of Cyber Assets that are excluded from being designated as BES Cyber Assets and the rationale as to why; (3) common problem areas with entities improperly designating BES Cyber Assets; and (4) feedback from each region participating in the implementation study on lessons learned with the application of the BES Cyber Asset definition. The informational filing should not provide a level of detail that divulges CEII data. This filing should also help other entities implementing CIP version 5 in identifying BES Cyber Assets.	Based on comments and feedback from the draft proposed Section 1600 survey, NERC will no longer be issuing a Section 1600 data request and will be working with the six study participants in developing the information needed for its filing.
132	Based on the explanation provided by NERC and other commenters, we will not direct modifications regarding the 30-day exemption in the definition of	The threat of connecting transient devices to BES Cyber Systems is addressed in the Reliability Standards through an additional requirement in CIP-010, which requires a Transient Cyber Asset

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	BES Cyber Asset. While we are persuaded that it would be unduly burdensome for responsible entities to treat all transient devices as BES Cyber Assets, we remain concerned whether the CIP version 5 Standards provide adequately robust protection from the risks posed by transient devices. Accordingly, as discussed below, we direct NERC to develop either new or modified standards to address the reliability risks posed by connecting transient devices to BES Cyber Assets and Systems.	and Removable Media plan to provide higher assurance against the propagation of malware when connecting transient devices. The terms Transient Cyber Asset and Removable Media have been added to the glossary to define transient devices. In addition, the terms BES Cyber Asset and Protected Cyber Asset have been modified to reference the new Transient Cyber Asset definition. The drafting team determined three distinct scenarios for entities to address in their plan(s) in which transient devices need specific protections: (i) Transient Cyber Assets ~~owned or~~ managed by the Responsible Entity, (ii) Transient Cyber Asset(s) ~~owned or~~ managed by a party other than the Responsible Entity (e.g. vendors or contractors), and (iii) Removable Media. For Transient Cyber Assets ~~owned or~~ managed by the Responsible Entity, the SDT determined that entities manage these devices in two fundamentally different ways. Some entities maintain a preauthorized inventory of transient devices while others have a checklist for transient devices prior to connecting them to a BES Cyber System. The drafting team acknowledges both methods are valid and has drafted requirements that permit either form of management. The

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		controls for this scenario are more specific and recognize the relatively higher frequency in which these devices will be used. In the scenario in which ~~contractors or vendors~~a party other than the Responsible Entity manages the Transient Cyber Assets, the required ~~element~~sections of the plan include those which an entity can verify at the point prior to connecting such as security patch management and malware prevention mechanisms. The security controls entities must apply to Removable Media have considerations for the type of device being protected and include authorization and scanning for malicious code. The Commission provided a list of security controls it expected NERC to consider for addressing transient devices. The consideration of each security ~~element~~section is described as follows: 1. **Device authorization as it relates to users and locations:** CIP-010-~~2~~ 3 Requirement R4, Attachment 1 requires entities to authorize Transient Cyber Assets and Removable Media by user~~individual~~(s)~~, and~~ location(s) and use prior to connecting them to the BES Cyber System. ~~Vendor or contractor~~Transient Cyber Assets managed by another party~~Transient Cyber Assets~~ do not

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		have this authorization because the scenario is often single-use and the entity already conducts an inspection and mitigation of the device prior to connection. **2. Software authorization:** The SDT considered controls relating to software authorization but decided against including specific software as part of the authorization performance because such authorization did not contribute meaningfully to cyber security risk reduction. However, software authorization in the form of application whitelisting is provided as an option to mitigate malicious code. **3. Security patch management:** In CIP-010-~~2~~ 3 R4, Attachment 1, both entity and vendor/contractor managed devices must have security patch management or other equivalent forms of mitigation to address security vulnerabilities in software. 4. **Malware prevention:** CIP-010-~~2~~ 3 Requirement R4, Attachment 1 requires entities to have malware protection on the Transient Cyber Asset (for both entity- and vendor-managed Transient Cyber Assets) and for Removable Media prior to connection. 5. **Detection controls for unauthorized physical access to a transient device:** The drafting team considered this control and determined this control best applies to entity-managed Transient Cyber Assets with the

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		objective to mitigate the risk of unauthorized use. There are logistical challenges in applying this control to vendor-managed devices, in which the entity likely will have had no control until immediately prior to use. Furthermore, additional guidance is necessary in CIP-011-~~2~~ 3 to ensure entities recognize the importance of safeguarding BES Cyber System Information on transient devices. The objective to address the unauthorized release of BES Cyber System Information is sufficiently addressed with the requirements in CIP-011-~~2~~ 3 to protect and securely handle BES Cyber System Information. 6. **Processes and procedures for connecting transient devices to systems at different security classification levels (i.e. ~~High~~high, ~~Medium~~medium, ~~Low~~ low ~~Impact~~impact):** The drafting team has considered this control and believes the threat of connecting at multiple impact levels is sufficiently addressed through the proposed Reliability Standards. Rigorous security assessment and controls between classification levels have significant importance to secure authorized information flows. However, connections between impact levels do not carry the same threat for BES Cyber Systems. The flow of BES Cyber System Information is addressed sufficiently through CIP-011-~~2~~ 3

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		requirements. The more concerning threat involves transient devices connecting between BES Cyber Systems and external networks, and this threat is addressed in the proposed CIP-010-~~2~~ 3 Requirement R4.
150	We direct NERC to create a definition of communication networks and to develop new or modified Reliability Standards to address the reliability gap discussed above. The definition of communications networks should define what equipment and components should be protected, in light of the statutory inclusion of communication networks for the reliable operation of the Bulk-Power System. The new or modified Reliability Standards should require appropriate and reasonable controls to protect the nonprogrammable aspects of communication networks. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this final rule. We also direct Commission staff to include this issue in the staff-led technical conference discussed herein.3	The proposed CIP-006-6 Requirement Part 1.10 requires the physical protection of nonprogrammable components of BES Cyber Systems existing outside of the PSP, and the proposed modifications to CIP-007-~~6~~ 7 Requirement Part 1.2 include applicability for non-programmable electronic components to prevent unauthorized use of physical ports. These additional requirements address the gap in protection as discussed in the Order by ensuring the physical security for cabling and non-programmable network components not covered by the definition of Cyber Asset. The drafting team reviewed the directives related to submitting a definition for communication network and determined it could address the gap in protection and adequately provide guidance on nonprogrammable electronic components without having a definition. Communication networks can and should be defined broadly. For example, NIST Special Publication 800-53 Revision 4 refers to the CNSSI 4009 definition of Network, which

[3] *See infra* P 223.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		is "Information system(s) implemented with a collection of interconnected components." However, the scope of ~~The~~ the requirements modifications as well as the existing requirements has~~ve~~ more targeted components than the broad concept of communication networks. Consequently, there is not a need at this time to submit a definition for the NERC Glossary of Terms used in Reliability Standards. The decision to meet the directive without defining the term communication networks does not imply the absence of protection for communication networks components nor do the additional requirements associated with nonprogrammable components denote meaning to the term. Communication networking components associated with BES Cyber Systems and within an Electronic Security Perimeter have the same level of protection applied as the BES Cyber Assets themselves. Additionally, CIP-005-5 communication protections continue to apply at the Electronic Security Perimeter. The drafting team did not find an additional Glossary term useful in the currently applied communication networks protection.
181 and 184	181. The Commission also supports NERC's proposal to develop transition guidance documents and a pilot program to assist responsible entities as they move from compliance with the CIP version 3 Standards to	NERC modified the VRF assignment for CIP-006-~~5~~6, Requirement R3 from Lower to Medium and filed the revision with FERC on 5/15/2014.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	the CIP version 5 Standards.4 The Commission agrees that a pilot program will assist responsible entities by offering best practices and lessons learned during this transition. 184. Consistent with our discussion above, the Commission directs NERC to modify the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium, within 90 days of the effective date of this Final Rule.	
192 and 196	192. The Commission adopts the NOPR proposal and directs NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium. This modification is necessary to reflect that access to operationally sensitive computer equipment should be strictly limited to employees or contractors who utilize the equipment in performance of their job responsibilities, and to prevent or mitigate disclosure of sensitive information consistent with Recommendations 40 and 44 of the 2003 Blackout Report. In addition, a Medium VRF assignment	NERC modified the VRF assignment for CIP-004-~~5.1~~7, Requirement R4 from Lower to Medium and filed the revision with FERC on 5/15/2014.

[4] *See* NERC Comments at 39-40.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	ensures consistency with the Commission's VRF guidelines. 196. Consistent with the discussion above, we direct NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium, within 90 days of the effective date of this Final Rule.	
205	Consistent with the NOPR proposal, we direct NERC to develop modifications to the VSLs for certain CIP version 5 Standard requirements to: (1) remove the "identify, assess, and correct" language from the text of the VSLs for the affected requirements; (2) address typographical errors; and (3) clarify certain unexplained ~~element~~sections. For the VSLs that include "identify, assess, and correct" language, we direct NERC to ensure that these VSLs are modified to reflect any revisions to the requirement language in response to our directives. We grant NERC the discretion to decide how best to address these modifications be it through an errata filing to this proceeding or separate filing.	In conjunction with the SDT's response to the directive in PP 67 and 76, the SDT removed the "identify, assess, and correct" language from the following 17 Requirements' VSLs: CIP-003-~~6~~7, Requirements R2 and R4; CIP-004-~~6~~7, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-~~6~~7, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-~~2~~3, Requirements R1 and R2; and CIP-011-~~2~~3, Requirement R1. NERC filed the following revisions with FERC on 5/15/2014: 1. **VSLs for CIP-003-~~5~~7, Requirements R1 and R2**. This standard addresses security management controls for cyber security. Requirement R1 governs management approval of policies on topics addressed in other CIP standards for medium and high impact BES Cyber Systems. Requirement R2 governs policies for low impact

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		BES Cyber Systems. NERC staff, in consultation with the SDT, revised the VSLs in CIP-003-5, Requirements R1 and R2 to eliminate redundant language. 2. **VSLs for CIP-004-~~5.1~~7, Requirement R4**. This standard includes requirements for personnel and training related to cyber security. Requirement R4 governs implementation of access management programs. NERC staff, in consultation with the SDT, revised the VSLs to a percentage-based gradation. 3. **Severe VSL for CIP-008-5, Requirement R2**. This standard addresses incident reporting and response planning for cyber security. Requirement R2 governs implementation of documented Cyber Security Incident response plans. NERC staff revised the Severe VSL to reduce a gap in months between the High VSL and Severe VSL. 4. **VSLs for CIP-009-~~5~~6, Requirement R3**. This standard addresses recovery plans for BES Cyber Systems. Requirement R3 governs maintenance of the recovery plans. NERC staff revised the

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		timeframe contained in the VSLs from 90-210 days to 90-120 days.

Definitions of Terms Used in Standards

This section includes all newly defined or revised terms used in the proposed standards. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standards are approved. When the standards become effective, these defined terms will be added to the Glossary.

Low Impact BES Cyber System Electronic Access Point (LEAP): A Cyber Asset interface that controls Low Impact External Routable Connectivity. The Cyber Asset containing the LEAP may reside at a location external to the asset or assets containing low impact BES Cyber Systems.

Low Impact External Routable Connectivity (LERC): Direct user-initiated interactive access or a direct device-to-device connection to a low impact BES Cyber System(s) from a Cyber Asset outside the asset containing those low impact BES Cyber System(s) via a bi-directional routable protocol connection. Point-to-point communications between intelligent electronic devices that use routable communication protocols for time-sensitive protection or control functions between Transmission station or substation assets containing low impact BES Cyber Systems are excluded from this definition (examples of this communication include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).

Definitions of Terms Used in Standards

This section includes all newly defined or revised terms used in the proposed standards. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standards are approved. When the standards become effective, these defined terms will be added to the Glossary.

Low Impact BES Cyber System Electronic Access Point (LEAP): A Cyber Asset interface that controls~~allows~~ Low Impact External Routable Connectivity. The Cyber Asset containing the LEAP may reside at a location external to the asset or assets containing low impact BES Cyber Systems. ~~The Low Impact BES Cyber System Electronic Access Point is not an Electronic Access Control or Monitoring System.~~

Low Impact External Routable Connectivity (LERC): Direct user-initiated interactive access or a direct device-to-device connection to a~~Bi-directional routable communications between~~ low impact BES Cyber System(s) ~~and~~ from a Cyber Asset~~s~~ outside the asset containing those low impact BES Cyber System(s) via a bi-directional routable protocol connection. ~~Communication protocols created for~~ Point-to-point communications between intelligent electronic devices that use routable communication protocols for time-~~-~~sensitive protection or control functions between Transmission station or substation ~~Intelligent Electronic Device (IED) to IED communication for protection and/or control functions from~~ assets containing low impact BES Cyber Systems are excluded from this definition (examples of this communication include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).

Definitions of Terms Used in Standards

This section includes all newly defined or revised terms used in the proposed standards. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standards are approved. When the standards become effective, these defined terms will be added to the Glossary.

BES Cyber Asset (BCA): A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.

Protected Cyber Assets (PCA): One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP.

Removable Media: Storage media that (i) are not Cyber Assets, (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less to a BES Cyber Asset, a network within an ESP, or a Protected Cyber Asset. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

Transient Cyber Asset: A Cyber Asset that is (i) capable of transmitting or transferring executable code, (ii) is not included in a BES Cyber System, (iii) is not a Protected Cyber Asset (PCA), and (iv) is directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless, including near field or Bluetooth communication) for 30 consecutive calendar days or less to a BES Cyber Asset, a network within an ESP, or a PCA. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Definitions of Terms Used in Standards

This section includes all newly defined or revised terms used in the proposed standards. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standards are approved. When the standards become effective, these defined terms will be added to the Glossary.

BES Cyber Asset (BCA): A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.

Protected Cyber Assets (PCA): One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP.

Removable Media: Storage ~~Media~~media~~,~~ that (i) are not Cyber Assets, (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less~~, capable of transmitting executable code to:~~ to ~~(1)~~ a BES Cyber Asset, ~~(2)~~ a network within an ESP, or ~~(3)~~ a Protected Cyber Asset ~~that can be used to store, copy, move, or access data~~. ~~Removable Media are not Cyber Assets.~~ Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

Transient Cyber Asset: A Cyber Asset~~,~~ that is (i) capable of transmitting or transferring executable code, (ii) is not included in a BES Cyber System, (iii) is not a Protected Cyber Asset (PCA), and (iv) is ~~(e.g., using Ethernet, serial, Universal Serial Bus, and wireless including near field and Bluetooth communication)~~ directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless, including near field or Bluetooth communication) for 30 consecutive calendar days or less~~, capable of transmitting executable code to: (1)~~ to a BES Cyber Asset, ~~(2)~~ a network within an ESP, or ~~(3)~~ a ~~Protected Cyber Asset~~PCA. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Project 2014-02 - CIP Version 5 Revisions

Mapping Document Showing Translation of the Version 5 standards into CIP-003-7, CIP-004-7, CIP-006-6, CIP-007-7, CIP-009-6, CIP-010-3, and CIP-011-3 (CIP-002-5.1, CIP-005-5, and CIP-008-5 were not modified)

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R1	CIP-003-7 R1	To incorporate a policy or policies for low impact BES Cyber Systems, the main requirement language was modified. "For its high impact and medium impact BES Cyber Systems" was struck from the language as new requirement parts were created. See below for part 1.1 and part 1.2 to see the change justification.
NEW	CIP-003-7 R1.1	"For its high impact and medium impact BES Cyber Systems" was added as a qualifier to the sub-parts below.
CIP-003-5 R1.1	CIP-003-7 R1.1.1	Requirement parts for 1.1 through 1.9 have become 1.1.1 through 1.1.9 with the clarifier added above in part 1.1 of CIP-003-7.
CIP-003-5 R1.2	CIP-003-7 R1.1.2	No change.
CIP-003-5 R1.3	CIP-003-7 R1.1.3	No change.
CIP-003-5 R1.4	CIP-003-7 R1.1.4	No change.
CIP-003-5 R1.5	CIP-003-7 R1.1.5	No change.
CIP-003-5 R1.6	CIP-003-7 R1.1.6	No change.
CIP-003-5 R1.7	CIP-003-7 R1.1.7	No change.
CIP-003-5 R1.8	CIP-003-7 R1.1.8	No change.
CIP-003-5 R1.9	CIP-003-7 R1.1.9	No change.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-003-7 R1.2	"For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:" was added as a qualifier to the sub-parts below.
CIP-003-5 R2	CIP-003-7 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. Furthermore, as the SDT modified its approach of using Attachment 1 instead of the table approach, it modified Requirement R2 to "implement one or more document cyber security plan(s) that include the applicable elements in Attachment 1."
CIP-003-5 R2.1	CIP-003-7 R1.2.1	The security awareness requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-7, Requirement R1, Part 1.2.1.
CIP-003-5 R2.2	CIP-003-7 R1.2.2	The physical security controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-7, Requirement R1, Part 1.2.2.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R2.3	CIP-003-7 R1.2.3	The electronic access controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-7, Requirement R1, Part 1.2.3. Furthermore, the SDT modified the "external routable protocol connections" as a new definition is being proposed by the SDT for "Low Impact External Routable Connectivity."
CIP-003-5 R2.4	CIP-003-7 R1.2.4	The incident response to a Cyber Security Incident requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-7, Requirement R1, Part 1.2.4.
NEW	CIP-003-7, Attachment 1	CIP-003-7 Attachment 1 lists the elements required for low impact asset cyber security plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the lack of objective criteria for Low Impact assets protections.
CIP-003-5 R3	CIP-003-7 R3	No change.
CIP-003-5 R4	CIP-003-7 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R1	CIP-004-7 R1	No change.
CIP-004-5.1 R1.1	CIP-004-7 R1.1	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2	CIP-004-7 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken. The SDT has also revised the requirement to allow Responsible Entities the flexibility to have one or more cyber security training programs, as the existing CIP-004-5 R2 had Responsible Entities shall implement “a cyber security training program(s).” That modification was made for clarity and consistency across the standards.
CIP-004-5.1 R2.1	CIP-004-7 R2.1	No change.
CIP-004-5.1 R2.1.1	CIP-004-7 R2.1.1	No change.
CIP-004-5.1 R2.1.2	CIP-004-7 R2.1.2	No change.
CIP-004-5.1 R2.1.3	CIP-004-7 R2.1.3	No change.
CIP-004-5.1 R2.1.4	CIP-004-7 R2.1.4	No change.
CIP-004-5.1 R2.1.5	CIP-004-7 R2.1.5	No change.
CIP-004-5.1 R2.1.6	CIP-004-7 R2.1.6	No change.
CIP-004-5.1 R2.1.7	CIP-004-7 R2.1.7	No change.
CIP-004-5.1 R2.1.8	CIP-004-7 R2.1.8	No change.
CIP-004-5.1 R2.1.9	CIP-004-7 R2.1.9	To respond to the FERC Order No. 791 directives regarding transient devices, the SDT has added Transient Cyber Assets and Removable Media as contents that must be included in a Registered Entity’s cyber security training program. The training must address cyber security risks associated with a BES Cyber System’s electronic interconnectivity and interoperability with Transient Cyber Assets and Removable Media.
CIP-004-5.1 R2.2	CIP-004-7 R2.2	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2.3	CIP-004-7 R2.3	No change.
CIP-004-5.1 R3	CIP-004-7 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R3.1	CIP-004-7 R3.1	No change.
CIP-004-5.1 R3.2	CIP-004-7 R3.2	No change.
CIP-004-5.1 R3.2.1	CIP-004-7 R3.2.1	No change.
CIP-004-5.1 R3.2.2	CIP-004-7 R3.2.2	No change.
CIP-004-5.1 R3.3	CIP-004-7 R3.3	No change.
CIP-004-5.1 R3.4	CIP-004-7 R3.4	No change.
CIP-004-5.1 R3.5	CIP-004-7 R3.5	No change.
CIP-004-5.1 R4	CIP-004-7 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R4.1	CIP-004-7 R4.1	No change.
CIP-004-5.1 R4.1.1	CIP-004-7 R4.1.1	No change.
CIP-004-5.1 R4.1.2	CIP-004-7 R4.1.2	No change.
CIP-004-5.1 R4.1.3	CIP-004-7 R4.1.3	No change.
CIP-004-5.1 R4.2	CIP-004-7 R4.2	No change.
CIP-004-5.1 R4.3	CIP-004-7 R4.3	No change.
CIP-004-5.1 R4.4	CIP-004-7 R4.4	No change.
CIP-004-5.1 R5	CIP-004-7 R5	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R5.1	CIP-004-7 R5.1	No change.
CIP-004-5.1 R5.2	CIP-004-7 R5.2	No change.
CIP-004-5.1 R5.3	CIP-004-7 R5.3	No change.
CIP-004-5.1 R5.4	CIP-004-7 R5.4	No change.
CIP-004-5.1 R5.5	CIP-004-7 R5.5	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-006-5 R1	CIP-006-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R1.1	CIP-006-6 R1.1	No change.
CIP-006-5 R1.2	CIP-006-6 R1.2	No change.
CIP-006-5 R1.3	CIP-006-6 R1.3	No change.
CIP-006-5 R1.4	CIP-006-6 R1.4	No change.
CIP-006-5 R1.5	CIP-006-6 R1.5	No change.
CIP-006-5 R1.6	CIP-006-6 R1.6	No change.
CIP-006-5 R1.7	CIP-006-6 R1.7	No change.
CIP-006-5 R1.8	CIP-006-6 R1.8	No change.
CIP-006-5 R1.9	CIP-006-6 R1.9	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-006-6 R1.10	To respond to the FERC Order No. 791 directive to protect the nonprogrammable components of communication networks, the SDT has added a new Requirement R1, Part 1.10 to restrict physical access to cabling and other nonprogrammable components used for communication between applicable Cyber Assets within the same Electronic Security Perimeter. There are three other mechanisms for an entity to adequately protect those networks, including encryption of data that transits such cabling and components; monitoring the status of the communication link and issuing alarms to detect communication failures; or an equally effective logical protection.
CIP-006-5 R2	CIP-006-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R2.1	CIP-006-6 R2.1	No change.
CIP-006-5 R2.2	CIP-006-6 R2.2	No change.
CIP-006-5 R2.3	CIP-006-6 R2.3	No change.
CIP-006-5 R3	CIP-006-6 R3	No change.
CIP-006-5 R3.1	CIP-006-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R1	CIP-007-7 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R1.1	CIP-007-7 R1.1	No change.
CIP-007-5 R1.2	CIP-007-7 R1.2	The applicable systems column was modified to include the Protected Cyber Assets and nonprogrammable communication components located inside both a Physical Security Perimeter and an Electronic Security Perimeter. The protection again the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media for these additions address the communication networks directive from FERC Order No. 791. Removable Media was capitalized in the requirement because it is newly defined.
CIP-007-5 R2	CIP-007-7 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R2.1	CIP-007-7 R2.1	No change.
CIP-007-5 R2.2	CIP-007-7 R2.2	No change.
CIP-007-5 R2.3	CIP-007-7 R2.3	No change.
CIP-007-5 R2.4	CIP-007-7 R2.4	No change.
CIP-007-5 R3	CIP-007-7 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R3.1	CIP-007-7 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R3.2	CIP-007-7 R3.2	No change.
CIP-007-5 R3.3	CIP-007-7 R3.3	No change.
CIP-007-5 R4	CIP-007-7 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R4.1	CIP-007-7 R4.1	No change.
CIP-007-5 R4.1.1	CIP-007-7 R4.1.1	No change.
CIP-007-5 R4.1.2	CIP-007-7 R4.1.2	No change.
CIP-007-5 R4.1.3	CIP-007-7 R4.1.3	No change.
CIP-007-5 R4.2	CIP-007-7 R4.2	No change.

CIP-010-1 R1.5.2	CIP-010-3 R1.5.2	No change.
CIP-010-1 R2	CIP-010-3 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-010-1 R2.1	CIP-010-3 R2.1	No change.
CIP-010-1 R3	CIP-010-3 R3	No change.
CIP-010-1 R3.1	CIP-010-3 R3.1	No change.
CIP-010-1 R3.2	CIP-010-3 R3.2	No change.

Standard: CIP-010-1 – Cyber Security—Configuration Change Management and Vulnerability Assessments		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-010-1 R3.2.1	CIP-010-3 R3.2.1	No change.
CIP-010-1 R3.2.2	CIP-010-3 R3.2.2	No change.
CIP-010-1 R3.3	CIP-010-3 R3.3	No change.
CIP-010-1 R3.4	CIP-010-3 R3.4	No change.
NEW	CIP-010-3 R4	To respond to the FERC Order No. 791 directive to address transient devices, the SDT modified its approach to use Attachment 1 instead of the table approach. It modified Requirement R4 to "implement one or more documented plan(s) for Transient Cyber Asset and Removable Media that include the applicable elements in Attachment 1, except under CIP Exceptional Circumstances."
NEW	CIP-010-3, Attachment 1	CIP-010-3 Attachment 1 lists the elements required for Transient Cyber Asset and Removable Media Plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the risks posed by transient devices.

Standard: CIP-011-1 – Cyber Security—Information Protection		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-011-1 R1	CIP-011-3 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-011-1 R1.1	CIP-011-3 R1.1	No change.
CIP-011-1 R1.2	CIP-011-3 R1.2	No change.
CIP-011-1 R2	CIP-011-3 R2	No change.
CIP-011-1 R2.1	CIP-011-3 R2.1	No change.
CIP-011-1 R2.2	CIP-011-3 R2.2	No change.

Project 2014-02 - CIP Version 5 Revisions

Mapping Document Showing Translation of the Version 5 standards into CIP-003-~~6~~7, CIP-004-~~6~~7, CIP-006-6, CIP-007-~~6~~7, CIP-009-6, CIP-010-~~2~~3, and CIP-011-~~2~~ 3 (CIP-002-5.1, CIP-005-5, and CIP-008-5 were not modified)

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R1	CIP-003-~~6~~ 7 R1	To incorporate a policy or policies for low impact BES Cyber Systems, the main requirement language was modified. "For its high impact and medium impact BES Cyber Systems" was struck from the language as new requirement parts were created. See below for part 1.1 and part 1.2 to see the change justification.
NEW	CIP-003-~~6~~ 7 R1.1	"For its high impact and medium impact BES Cyber Systems" was added as a qualifier to the sub-parts below.
CIP-003-5 R1.1	CIP-003-~~6~~ 7 R1.1.1	Requirement parts for 1.1 through 1.9 have become 1.1.1 through 1.1.9 with the clarifier added above in part 1.1 of CIP-003-~~6~~7.
CIP-003-5 R1.2	CIP-003-~~6~~ 7 R1.1.2	No change.
CIP-003-5 R1.3	CIP-003-~~6~~ 7 R1.1.3	No change.
CIP-003-5 R1.4	CIP-003-~~6~~ 7 R1.1.4	No change.
CIP-003-5 R1.5	CIP-003-~~6~~ 7 R1.1.5	No change.
CIP-003-5 R1.6	CIP-003-~~6~~ 7 R1.1.6	No change.
CIP-003-5 R1.7	CIP-003-~~6~~ 7 R1.1.7	No change.
CIP-003-5 R1.8	CIP-003-~~6~~ 7 R1.1.8	No change.
CIP-003-5 R1.9	CIP-003-~~6~~ 7 R1.1.9	No change.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-003-~~6~~ 7 R1.2	"For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:" was added as a qualifier to the sub-parts below.
CIP-003-5 R2	CIP-003-~~6~~ 7 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. Furthermore, as the SDT modified its approach of using Attachment 1 instead of the table approach, it modified Requirement R2 to "implement one or more document cyber security plan(s) that include the applicable elements in Attachment 1."
CIP-003-5 R2.1	CIP-003-~~6~~ 7 R1.2.1	The security awareness requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-~~6~~7, Requirement R1, Part 1.2.1.
CIP-003-5 R2.2	CIP-003-~~6~~7~~,~~ R1.2.2	The physical security controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-~~6~~7, Requirement R1, Part 1.2.2.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R2.3	CIP-003-~~6~~ 7 R1.2.3	The electronic access controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-~~6~~7, Requirement R1, Part 1.2.3. Furthermore, the SDT modified the "external routable protocol connections" as a new definition is being proposed by the SDT for "Low Impact External Routable Connectivity."
CIP-003-5 R2.4	CIP-003-~~6~~ 7 R1.2.4	The incident response to a Cyber Security Incident requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-~~6~~7, Requirement R1, Part 1.2.4.
NEW	CIP-003-~~6~~7, Attachment 1	CIP-003-~~6~~ 7 Attachment 1 lists the elements required for low impact asset cyber security plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the lack of objective criteria for Low Impact assets protections.
CIP-003-5 R3	CIP-003-~~6~~ 7 R3	No change.
CIP-003-5 R4	CIP-003-~~6~~ 7 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R1	CIP-004-~~6~~ 7 R1	No change.
CIP-004-5.1 R1.1	CIP-004-~~6~~ 7 R1.1	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2	CIP-004-~~6~~ 7 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. The SDT has also revised the requirement to allow Responsible Entities the flexibility to have one or more cyber security training programs, as the existing CIP-004-5 R2 had Responsible Entities shall implement "a cyber security training program(s)." That modification was made for clarity and consistency across the standards.
CIP-004-5.1 R2.1	CIP-004-~~6~~ 7 R2.1	No change.
CIP-004-5.1 R2.1.1	CIP-004-~~6~~ 7 R2.1.1	No change.
CIP-004-5.1 R2.1.2	CIP-004-~~6~~ 7 R2.1.2	No change.
CIP-004-5.1 R2.1.3	CIP-004-~~6~~ 7 R2.1.3	No change.
CIP-004-5.1 R2.1.4	CIP-004-~~6~~ 7 R2.1.4	No change.
CIP-004-5.1 R2.1.5	CIP-004-~~6~~ 7 R2.1.5	No change.
CIP-004-5.1 R2.1.6	CIP-004-~~6~~ 7 R2.1.6	No change.
CIP-004-5.1 R2.1.7	CIP-004-~~6~~ 7 R2.1.7	No change.
CIP-004-5.1 R2.1.8	CIP-004-~~6~~ 7 R2.1.8	No change.
CIP-004-5.1 R2.1.9	CIP-004-~~6~~ 7 R2.1.9	To respond to the FERC Order No. 791 directives regarding transient devices, the SDT has added Transient Cyber Assets and Removable Media as contents that must be included in a Registered Entity's cyber security training program. The training must address cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with Transient Cyber Assets and Removable Media.
CIP-004-5.1 R2.2	CIP-004-~~6~~ 7 R2.2	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2.3	CIP-004-~~6~~ 7 R2.3	No change.
CIP-004-5.1 R3	CIP-004-~~6~~ 7 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R3.1	CIP-004-~~6~~ 7 R3.1	No change.
CIP-004-5.1 R3.2	CIP-004-~~6~~ 7 R3.2	No change.
CIP-004-5.1 R3.2.1	CIP-004-~~6~~ 7 R3.2.1	No change.
CIP-004-5.1 R3.2.2	CIP-004-~~6~~ 7 R3.2.2	No change.
CIP-004-5.1 R3.3	CIP-004-~~6~~ 7 R3.3	No change.
CIP-004-5.1 R3.4	CIP-004-~~6~~ 7 R3.4	No change.
CIP-004-5.1 R3.5	CIP-004-~~6~~ 7 R3.5	No change.
CIP-004-5.1 R4	CIP-004-~~6~~ 7 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R4.1	CIP-004-~~6~~ 7 R4.1	No change.
CIP-004-5.1 R4.1.1	CIP-004-~~6~~ 7 R4.1.1	No change.
CIP-004-5.1 R4.1.2	CIP-004-~~6~~ 7 R4.1.2	No change.
CIP-004-5.1 R4.1.3	CIP-004-~~6~~ 7 R4.1.3	No change.
CIP-004-5.1 R4.2	CIP-004-~~6~~ 7 R4.2	No change.
CIP-004-5.1 R4.3	CIP-004-~~6~~ 7 R4.3	No change.
CIP-004-5.1 R4.4	CIP-004-~~6~~ 7 R4.4	No change.
CIP-004-5.1 R5	CIP-004-~~6~~ 7 R5	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R5.1	CIP-004-~~6~~ 7 R5.1	No change.
CIP-004-5.1 R5.2	CIP-004-~~6~~ 7 R5.2	No change.
CIP-004-5.1 R5.3	CIP-004-~~6~~ 7 R5.3	No change.
CIP-004-5.1 R5.4	CIP-004-~~6~~ 7 R5.4	No change.
CIP-004-5.1 R5.5	CIP-004-~~6~~ 7 R5.5	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-006-5 R1	CIP-006-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R1.1	CIP-006-6 R1.1	No change.
CIP-006-5 R1.2	CIP-006-6 R1.2	No change.
CIP-006-5 R1.3	CIP-006-6 R1.3	No change.
CIP-006-5 R1.4	CIP-006-6 R1.4	No change.
CIP-006-5 R1.5	CIP-006-6 R1.5	No change.
CIP-006-5 R1.6	CIP-006-6 R1.6	No change.
CIP-006-5 R1.7	CIP-006-6 R1.7	No change.
CIP-006-5 R1.8	CIP-006-6 R1.8	No change.
CIP-006-5 R1.9	CIP-006-6 R1.9	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-006-6 R1.10	To respond to the FERC Order No. 791 directive to protect the nonprogrammable components of communication networks, the SDT has added a new Requirement R1, Part 1.10 to restrict physical access to cabling and other nonprogrammable components used for communication between applicable Cyber Assets within the same Electronic Security Perimeter. There are three other mechanisms for an entity to adequately protect those networks, including encryption of data that transits such cabling and components; monitoring the status of the communication link and issuing alarms to detect communication failures; or an equally effective logical protection.
CIP-006-5 R2	CIP-006-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R2.1	CIP-006-6 R2.1	No change.
CIP-006-5 R2.2	CIP-006-6 R2.2	No change.
CIP-006-5 R2.3	CIP-006-6 R2.3	No change.
CIP-006-5 R3	CIP-006-6 R3	No change.
CIP-006-5 R3.1	CIP-006-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R1	CIP-007-~~6~~ 7 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-007-5 R1.1	CIP-007-~~6~~ 7 R1.1	No change.
CIP-007-5 R1.2	CIP-007-~~6~~ 7 R1.2	The applicable systems column was modified to include the Protected Cyber Assets and nonprogrammable communication components located inside both a Physical Security Perimeter and an Electronic Security Perimeter. The protection again the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media for these additions address the communication networks directive from FERC Order No. 791. Removable Media was capitalized in the requirement because it is newly defined.
CIP-007-5 R2	CIP-007-~~6~~ 7 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-007-5 R2.1	CIP-007-~~6~~ 7 R2.1	No change.
CIP-007-5 R2.2	CIP-007-~~6~~ 7 R2.2	No change.
CIP-007-5 R2.3	CIP-007-~~6~~ 7 R2.3	No change.
CIP-007-5 R2.4	CIP-007-~~6~~ 7 R2.4	No change.
CIP-007-5 R3	CIP-007-~~6~~ 7 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-007-5 R3.1	CIP-007-~~6~~ 7 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R3.2	CIP-007-~~6~~ 7 R3.2	No change.
CIP-007-5 R3.3	CIP-007-~~6~~ 7 R3.3	No change.
CIP-007-5 R4	CIP-007-~~6~~ 7 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-007-5 R4.1	CIP-007-~~6~~ 7 R4.1	No change.
CIP-007-5 R4.1.1	CIP-007-~~6~~ 7 R4.1.1	No change.
CIP-007-5 R4.1.2	CIP-007-~~6~~ 7 R4.1.2	No change.
CIP-007-5 R4.1.3	CIP-007-~~6~~ 7 R4.1.3	No change.
CIP-007-5 R4.2	CIP-007-~~6~~ 7 R4.2	No change.
CIP-007-5 R4.2.1	CIP-007-~~6~~ 7 R4.2.1	No change.
CIP-007-5 R4.2.2	CIP-007-~~6~~ 7 R4.2.2	No change.
CIP-007-5 R4.3	CIP-007-~~6~~ 7 R4.3	No change.
CIP-007-5 R4.4	CIP-007-~~6~~ 7 R4.4	No change.
CIP-007-5 R5	CIP-007-~~6~~ 7 R5	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-007-5 R5.2	CIP-007-~~6~~ 7 R5.2	No change.
CIP-007-5 R5.3	CIP-007-~~6~~ 7 R5.3	No change.
CIP-007-5 R4	CIP-007-~~6~~ 7 R4	No change.
CIP-007-5 R5	CIP-007-~~6~~ 7 R5	No change.
CIP-007-5 R5.1	CIP-007-~~6~~ 7 R5.1	No change.

Standard: CIP-010-1 – Cyber Security—Configuration Change Management and Vulnerability Assessments		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-010-1 R1	CIP-010-~~2~~ 3 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-010-1 R1.1	CIP-010-~~2~~ 3 R1.1	No change.
CIP-010-1 R1.2	CIP-010-~~2~~ 3 R1.2	No change.
CIP-010-1 R1.3	CIP-010-~~2~~ 3 R1.3	No change.
CIP-010-1 R1.4	CIP-010-~~2~~ 3 R1.4	No change.
CIP-010-1 R1.5	CIP-010-~~2~~ 3 R1.5	No change.
CIP-010-1 R1.2	CIP-010-~~2~~ 3 R1.2	No change.
CIP-010-1 R1.3	CIP-010-~~2~~ 3 R1.3	No change.
CIP-010-1 R1.4	CIP-010-~~2~~ 3 R1.4	No change.
CIP-010-1 R1.4.1	CIP-010-~~2~~ 3 R1.4.1	No change.
CIP-010-1 R1.4.2	CIP-010-~~2~~ 3 R1.4.2	No change.
CIP-010-1 R1.4.3	CIP-010-~~2~~ 3 R1.4.3	No change.
CIP-010-1 R1.5	CIP-010-~~2~~ 3 R1.5	No change.
CIP-010-1 R1.5.1	CIP-010-~~2~~ 3 R1.5.1	No change.
CIP-010-1 R1.5.2	CIP-010-~~2~~ 3 R1.5.2	No change.
CIP-010-1 R2	CIP-010-~~2~~ 3 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-010-1 R2.1	CIP-010-~~2~~ 3 R2.1	No change.
CIP-010-1 R3	CIP-010-~~2~~ 3 R3	No change.
CIP-010-1 R3.1	CIP-010-~~2~~ 3 R3.1	No change.
CIP-010-1 R3.2	CIP-010-~~2~~ 3 R3.2	No change.

Standard: CIP-010-1 – Cyber Security—Configuration Change Management and Vulnerability Assessments		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-010-1 R3.2.1	CIP-010-~~2~~ 3 R3.2.1	No change.
CIP-010-1 R3.2.2	CIP-010-~~2~~ 3 R3.2.2	No change.
CIP-010-1 R3.3	CIP-010-~~2~~ 3 R3.3	No change.
CIP-010-1 R3.4	CIP-010-~~2~~ 3 R3.4	No change.
NEW	CIP-010-~~2~~ 3 R4	To respond to the FERC Order No. 791 directive to address transient devices, the SDT modified its approach to use Attachment 1 instead of the table approach. It modified Requirement R4 to "implement one or more documented plan(s) for Transient Cyber Asset and Removable Media that include the applicable elements in Attachment 1, except under CIP Exceptional Circumstances."
NEW	CIP-010-~~2~~3, Attachment 1	CIP-010-~~2~~ 3 Attachment 1 lists the elements required for Transient Cyber Asset and Removable Media Plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the risks posed by transient devices.

Standard: CIP-011-1 – Cyber Security—Information Protection		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-011-1 R1	CIP-011-~~2~~ 3 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-011-1 R1.1	CIP-011-~~2~~ 3 R1.1	No change.
CIP-011-1 R1.2	CIP-011-~~2~~ 3 R1.2	No change.
CIP-011-1 R2	CIP-011-~~2~~ 3 R2	No change.
CIP-011-1 R2.1	CIP-011-~~2~~ 3 R2.1	No change.
CIP-011-1 R2.2	CIP-011-~~2~~ 3 R2.2	No change.

386	Project 2007-02	Project 2007-02 Operating Personnel Protocols: COM-003-1	Successive Ballot	3/27/2013	4/5/2013	Quorum: 78.39% Approval: 57.50%	No Consensus 4/4/13		The RSC did not reach a full consensus however the majority of respondents had indicated they will support the standard - see comment form for further details. Some believe the standard is not necessary and that existing whitepapers alleviate the need for it. In recognition of the NERC BOT's expectations that COM-003 will be approved by the industry and brought before them for approval, NPCC has voted affirmatively and will supply comments for the record outlining our concerns.
387	Project 2007-02	Project 2007-02 Operating Personnel Protocols: COM-003-1	Non-binding Poll	3/27/2013	4/5/2013	Quorum: 77.97% Approval: 54.28%			
388	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-001-2	Initial Ballot	4/16/2013	4/25/2013	Quorum: 88.60% Approval: 66.98%	No Consensus 4/23/13		The majority of NPCC's Balancing Authorities have indicated support for the standard, however NPCC as the Regional Entity has concerns based on results of the field trials that were conducted. These field trials have indicated the potential for an increased number of SOL violations as well as potential for increased ACE due to large inadvertent flows with the proposed BAAL limits based on frequency triggers. To be respectful of the positions of the NPCC BAs who will have to implement this new methodology and the support expressed, NPCC as the Regional Entity will cast an Abstention
389	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-002-2	Initial Ballot	4/16/2013	4/25/2013	Quorum: 88.51% Approval: 42.75%	Oppose 4/23/13		There is a lack of technical justification for the 500 MW threshold within the standard-NPCC will submit suggested improvements

400	Project 2007-02	Project 2007-02 - Operating Personnel Communications Protocols - COM-003	Successive Ballot	7/10/2013	7/19/2013	Quorum: 76.32% Approval: 58.36%	No Consensus 7/19/13 [Due to the concerns expressed over the potential actions by the NERC BOT and FERC as well as the incremental improvement of the standard over the previous versions, NPCC as the Regional Entity will support the standard and submit comments.]		organizations support the standard as written however some members expressed concern that in order to measure compliance with R1 and R2, the standard will require all Reliability Directives to be investigated to determine if RC approved and documented communication protocols have been violated. Also it was identified that TO, BA communication protocols would have to approved by the RC potentially causing some legal issues if protocols aren't approved and casts question on the enforcement of those protocols. NPCC will be submitting some helpful comments should the standard pass and some non-substantive revision be performed prior to the "final" (previously named recirculation) ballot.
401	Project 2007-02	Project 2007-02 - Operating Personnel Communications Protocols - COM-003	Non-binding Poll	7/10/2013	7/19/2013	Quorum: 76.20% Approval: 55.37%			
402	Project 2010-13.2	Project 2010-13.2 - Phase 2 of Relay Loadability: Generation - PRC-025	Successive Ballot	7/10/2013	7/19/2013	Quorum: 85.05% Approval: 72.43%	Support 7/19/13		
403	Project 2010-13.2	Project 2010-13.2 - Phase 2 of Relay Loadability: Generation - PRC-025	Non-binding Poll	7/10/2013	7/19/2013	Quorum: 82.51% Approval: 64.59%			
404	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-001-2	Final Ballot	7/16/2013	7/25/2013	Quorum: 92.31% Approval: 74.54%	No Consensus 7/22/13		The RSC has not reached a full consensus however the majority are in support. Issues outstanding for those not in support are concern over "hitting limits" more frequently and potential issues with BA's potentially "dragging" on the interconnection. NPCC will be voting affirmative on the standard.
405	Project 2010-13.2	Project 2010-13.2 - Phase 2 of Relay Loadability: Generation - PRC-023-3	Initial Ballot	7/26/2013	8/5/2013	Quorum: 80.05% Approval: 93.00%	Support 8/5/13

Information in a Regional Standard Authorization Request (RSAR)

The tables below identify information to be submitted in a Regional Standard Authorization Request to the NPCC Regional Standards Process Manager, NPCCstandard@npcc.org . The NPCC Regional Standards Process Manager shall be responsible for implementing and maintaining this form as needed to support the information requirements of the standards process.

Regional Standard Authorization Request Form

Title of Proposed Standard:
Request Date:

RSAR Requester Information

Name:	**RSAR Type (Check box for one of these selections.)**	
Company:	☐	New Standard
Telephone:	☐	Revision to Existing Standard
Fax:	☐	Withdrawal of Existing Standard
Email:	☐	Urgent Action

Purpose (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.**)**
Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation**.)**
Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.**)**

Reliability Functions

The Standard will Apply to the Following Functions (Check all applicable boxes.)		
☐	Reliability Coordinator	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
☐	Balancing Authority	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☐	Planning Authority	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.
☐	Transmission Service Provider	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.
☐	Transmission Owner	The entity that owns and maintains transmission facilities.
☐	Transmission	The entity responsible for the reliability of its "local" transmission system,

	Operator	and that operates or directs the operations of the transmission facilities.
☐	Transmission Planner	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.
☐	Resource Planner	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
☐	Generator Operator	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
☐	Generator Owner	Entity that owns and maintains generating units.
☐	Purchasing-Selling Entity	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
☐	Distribution Provider	Provides and operates the "wires" between the transmission system and the customer.
☐	Load-Serving Entity	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check all boxes that apply.)*	
☐	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
☐	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

☐	7. The security of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
Recognizing that reliability is an Common Attribute of a robust North American economy:
1. A reliability standard shall not give any market participant an unfair competitive advantage.Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

III. APPENDIX

A) RSAR FORM 19

I. EXECUTIVE SUMMARY

The purpose of the Northeast Power Coordinating Council, Inc. ("NPCC"), is to enhance the reliability of the international, interconnected bulk power system in Northeastern North America through the development of more stringent and specific regional reliability standards and compliance assessment and enforcement of continent-wide and regional reliability standards pursuant to the execution and implementation of a Regional Delegation Agreement with the Electric Reliability Organization ("ERO") and applicable Canadian Memoranda of Understanding that are backstopped by the Federal Energy Regulatory Commission ("FERC") and Canadian Provincial authorities. In the development and enforcement of Regional Reliability Standards, NPCC, to the extent possible, facilitates attainment of fair, effective, efficient, and competitive electric markets.

General Membership in NPCC is voluntary and is open to any person or entity, including any entity participating in the Registered Ballot Body of the ERO that has an interest in the reliable operation of the Northeastern North American bulk power system.

The NPCC Regional Reliability Standards Development Procedure describes the procedures, policies and practices implemented to ensure an "open, fair, and inclusive" process for the transparent initiation, development, implementation and revision of NPCC Regional Reliability Standards necessary for the reliable operation of the international and interconnected bulk power system in Northeast North America. These Standards will, in all cases, not be inconsistent with or less stringent than any requirements of the North American Electric Reliability Council/Electric Reliability Organization (NERC/ERO) Reliability Standards. The procedure will not unnecessarily delay the development of the proposed reliability standards. Each regional reliability standard shall enable or support one or more of the reliability principles, thereby ensuring that each standard serves a purpose in support of the reliability of the regional bulk power system. Each standard shall also be consistent with all of pertinent reliability principles and criteria, thereby ensuring that no standard undermines reliability through an unintended consequence.

II. REGIONAL RELIABILITY STANDARD DEVELOPMENT PROCEDURE

1. CHARACTERISTIC ATTRIBUTES

The NPCC Regional Reliability Standards Development Procedure is:

- **Open** — The NPCC Regional Reliability Standards Development Procedure provides any person the ability to participate in the development of a standard. Any entity that is directly and materially affected by the reliability of the NPCC's bulk power system has the ability to participate in the development and approval of reliability standards. There are no undue financial barriers to participation. Participation in the open comment process is not conditional upon membership in the ERO, NPCC or any organization, and participation is not unreasonably restricted on the basis of technical qualifications or other such requirements. NPCC utilizes a website to accomplish this. Online posting and review of standards and the real time sharing of comments uploaded to the website allow complete transparency.

- **Inclusive** — The NPCC Regional Reliability Standards Development Procedure provides any person with a direct and material interest the right to participate by expressing an opinion and its basis, have that position considered, and appealed through an established appeals process if adversely affected.

- **Balanced** — The NPCC Regional Reliability Standards Development Procedure has a balance of interests and all those entities that are directly and materially affected by the reliability of the NPCC's bulk power system are welcome to participate and shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter. This will be accomplished through the NPCC Bylaws defining eight sectors (categories) for voting.

- **Fair Due Process** — The NPCC Regional Reliability Standards Development Procedure provides for reasonable notice and opportunity for public comment. The procedure includes public notice of the intent to develop a standard, a 45 calendar day public comment period on the proposed standard request, or standard with due consideration of those public comments, and responses to those comments will be posted on the NPCC website. A final draft will be posted for a 30 calendar day pre-balloting period, and then a ballot of NPCC Members will be conducted. Upon approval by the NPCC Members, the NPCC Board then votes to approve submittal of the Regional Standard to NERC.

- **Transparent** — All actions material to the development of Regional Reliability Standards are transparent and information regarding the progress is posted on the NPCC website as well as through extensive email lists.

In as much as NPCC is one of several regional entities within the Eastern Interconnection of North America, there will be **no** *presumption of validity* by the ERO for any NPCC Regional Reliability Standard. In order to receive the approval of the ERO, the NPCC Reliability Standards Development Process must also achieve the following objectives:

- **No Adverse Impact on Reliability of the Interconnection** —An NPCC Regional Reliability Standard provides a level of bulk power system reliability that is necessary and adequate to protect public health, safety, welfare, and North American security and will not have an adverse impact on the reliability of the Interconnection or other Regions within the Interconnection.

- **Justifiable Difference** — An NPCC Regional Reliability Standard is based on justifiable differences between Regions, such as different electrical systems or facilities, sensitivity of load to disruptions, sensitivity of generation to disruptions, frequency and voltage sensitivity, system operating limit development and facilities ratings process, electrical system interactions, etc.

- **Uniformity**- NPCC Regional Reliability Standards shall provide for as much uniformity as possible with reliability standards across the interconnected bulk

power system of the North American continent. A NPCC Reliability Standard shall be more stringent than a continent-wide reliability standard, may include a regional variation that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the northeast's bulk power system, where the interpretation of the phrase "physical difference" will be consistent with FERC's Order, issued September 22, 2004, Granting Request For Clarification regarding Docket No. PL04-5-000, Policy Statement on Matters Related to Bulk Power System Reliability.

- **No Undue Adverse Impact on Commerce** — An NPCC Regional Reliability Standard will not cause any undue adverse impact on business activities that are not necessary for reliability of the Region and its interconnected Regions. All regional reliability standards shall be consistent with NERC's market principles.

Other Attributes of the NPCC Regional Reliability Standards Development Procedure include;

- **Maintenance of Regional Reliability Standards-**NPCC Regional Standards will be reviewed for possible revision at least every three years and follow the same process as a new standard. The old standard will remain in place until such time as the revised version has passed through the entire process, at which point the old standard will be retired in accordance with any applicable new implementation plan associated with the approved revised standard. The review process shall be conducted by soliciting comments from the stakeholders and through open posting on the NPCC website. If no changes are warranted, Regional Standards Committee (RSC) shall recommend to the NPCC Board that the standard be reaffirmed. If the review indicates a need to revise or withdraw a standard, a regional standard authorization request shall be prepared by the RSC and submitted in accordance with the standards development process contained in this procedure.

- **Maintenance of Regional Reliability Standards Development Procedure-** This NPCC Regional Reliability Standards Development Procedure will be reviewed for possible revision at least once every five years or more frequently if needed and subject to the same procedure as that of the development of a standard. All such revisions shall be subject to approval by the NPCC Board, NERC, FERC, and could be subject to approval, if required, by applicable authorities in Canada. The NPCC RSC has the authority to make non-substantive changes to this procedure and subsequently notify the NPCC Board for their concurrence at their next scheduled meeting.

- **Interpretation of Standards-** All persons who are directly and materially affected by the NPCC's bulk power system reliability shall be permitted to request an interpretation of a standard. The person requesting an interpretation will send an email request to the Regional Standards Process Manager (RSPM), as noted on the NPCC website, explaining the specific circumstances surrounding the request and what clarifications are required as applied to those circumstances. The request should indicate the material

impact to the requesting party or others caused by the lack of clarity or a possibly incorrect interpretation of the standard. The RSPM along with guidance from the RSC will forward the request to the originating Task Force which acted as the drafting team for that regional reliability standard. The Task Force will address, through a written response, the request for clarification as soon as practical, but not more than 45 business days from its receipt by the Task Force. This written interpretation will be posted along with the final approved and adopted standard and will stand until such time as the standard is revised through the normal RSAR process, at which time the standard will be modified to incorporate the clarifications provided by the interpretation.

2. ELEMENTS OF A RELIABILITY STANDARD

- **Elements of a Regional Reliability Standard**
  To ensure uniformity of regional reliability standards, a regional reliability standard shall consist of the elements identified in this section of the procedure. These elements are intended to apply a systematic discipline in the development and revision of standards. This discipline is necessary to achieving standards that are measurable, enforceable, and consistent.

  All mandatory requirements of a regional reliability standard shall be within the standard document. Supporting documents to aid in the implementation of a standard may be referenced by the standard but are not part of the standard itself.

  The most current version of the approved NERC Reliability Standard template and its associated elements as or if applicable, will be used at the time of the development of the NPCC Regional Reliability Standard to ensure all essential elements are contained therein to achieve consistency and uniformity and meet all statutory requirements. A sample of the elements contained in the standard appears in Table 1 below, however the latest ERO Board approved Standard template, that may be found on the NERC website, will supersede the list below at the time the regional standard is developed.

Table 1- Elements of a Regional Reliability Standard

Identification Number	A unique identification number assigned in accordance with an administrative classification system to facilitate tracking and reference. (i.e. "NPCC- BAL-002-0-Date" which refers to NPCC Regional Standard, referencing NERC BAL-002 Version 0, with NPCC Effective Date-final adoption by all Regional Authorities)
Title	A brief, descriptive phrase identifying the topic of the standard.
Applicability	Clear identification of the functional classes of entities responsible for complying with the standard, noting any specific additions or exceptions. The standard will be applicable to the Bulk Power System unless otherwise noted.
Effective Date	The effective date of the standard or, prior to approval of the

and Status	standard, the proposed effective date.
Purpose	The purpose of the standard. The purpose shall explicitly state what outcome will be achieved or is expected by this standard.
Requirement(s)	Explicitly stated technical, performance, and preparedness requirements. Each requirement identifies what entity is responsible and what action is to be performed or what outcome is to be achieved. Each statement in the requirements section shall be a statement for which compliance is mandatory.
Risk Factor(s)	The potential reliability significance of each requirement, designated as a High, Medium, or Lower Risk Factor in accordance with the criteria listed below: A High Risk Factor requirement (a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or (b) is a requirement in a planning timeframe that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. A Medium Risk Factor requirement (a) is a requirement that, if violated, could directly affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or (b) is a requirement in a planning timeframe that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

Measure(s)	Each requirement shall be addressed by one or more measures. Measures are used to assess performance and outcomes for the purpose of determining compliance with the requirements stated above. Each measure will identify to whom the measure applies and the expected level of performance or outcomes required demonstrating compliance. Each measure shall be tangible, practical, and as objective as is practical. It is important to realize that measures are proxies to assess required performance or outcomes. Achieving the measure should be a necessary and sufficient indicator that the requirement was met. Each measure shall clearly refer to the requirement(s) to which it applies.

Table 2 — Compliance Elements of a Regional Reliability Standard

Compliance Monitoring Process	Defines for each measure: • The specific data or information that is required to measure performance or outcomes. • The entity that is responsible for providing the data or information for measuring performance or outcomes. • The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes. • The entity that is responsible for evaluating data or information to assess performance or outcomes. • The time period in which performance or outcomes is measured, evaluated, and then reset. • Measurement data retention requirements and assignment of responsibility for data archiving. • Violation severity levels.

Supporting Information Elements

Interpretation	Any interpretation of regional reliability standard that is developed and approved in accordance with the "Interpretation of Standards" section of Appendix A of this procedure, to expound on the application of the standard for unusual or unique situations or to provide clarifications.
Implementation Plan	Each regional reliability standard shall have an associated implementation plan describing the effective date of the standard or effective dates if there is a phased implementation. The implementation plan may also describe the implementation of the standard in the compliance program and other considerations in the initial use of the standard, such as necessary tools, training, etc. The implementation plan must be posted for at least one public comment period and is approved as part of the ballot of the standard.

Supporting References	This section references related documents that support reasons for, or otherwise provide additional information related to the regional reliability standard. Examples include, but are not limited to: • Glossary of terms • Developmental history of the standard and prior versions • Notes pertaining to implementation or compliance • Standard references • Standard supplements • Procedures • Practices • Training references • Technical references • White papers • Internet links to related information

3. TERMS AND FUNCTIONS

- **Regional Standards Committee (RSC)**—An NPCC committee charged with management of the NPCC Standards Procedure under a sector based voting structure as described in the NPCC Bylaws. The NPCC RSC will consider requests for new or revised standards and be available for advisement to the NPCC Board on the standards.

  The RSC may not itself modify the standard without issuing a new notice to stakeholders regarding a vote of the modified standard. Any RSC action will only be activated in the event of a minor correction of a standard such as errata.

  The RSC is an open and balanced stakeholder committee inclusive of all stakeholder interests that provide for or are materially impacted by the reliability of the bulk power system.

  The RSC disposition regarding the regional standard authorization request, which will in all cases be within 60 calendar days of receipt of a completed standard request, shall include:

  - Accept the standard request as a candidate for development of a new standard, revision of an existing standard, or deletion of an existing standard. The RSC may, at its discretion, expand or narrow the scope of the standard request under consideration. The RSC shall prioritize the development of standards in relation to other proposed standards, as may be required based on the volume of requests and resources.

- Reject the standard request. If the RSC rejects a standard request, a written explanation for rejection will be delivered to the requester within 30 calendar days of the decision.
- Remand the standard request back to the requester for additional work. The standards process manager will make reasonable efforts to assist the requester in addressing the deficiencies identified by the RSC. The requester may then resubmit the modified standard request using the process above. The requester may choose to withdraw the standard request from further consideration prior to acceptance by the RSC.

The NPCC Standard Process responsibilities of the RSC will include:

- Review of NPCC Draft Standards for such factors as completeness, sufficient detail, rational result, and compatibility with existing standards; clarifying standard development issues not specified in this procedure. Under no circumstance will the RSC change the substance of a draft standard.
- Due consideration to the work of the drafting team as well as the comments of stakeholders and minority objections, in approving a proposed regional reliability standard to go to ballot.
- Approve standards for pre-ballot posting under a sector based voting structure as described later in the NPCC ~~Inc.~~ Bylaws or
- Remand the standard back to the Task Force acting as the drafting team for further work or recommend a change in those participating in the drafting team (i.e. a new drafting team).

- **Regional Standards Process Manager (RSPM) -** The Regional Reliability Standards Procedure shall be administered by a NPCC staff Regional Standards Process Manager. The RSPM is responsible for ensuring that the development and revision of standards is in accordance with this manual. The RSPM works to ensure the integrity of the process, format, consistency of quality, and completeness of the reliability standards. The RSPM facilitates all steps in the process.

- **Reliability Coordinating Committee (RCC)** —The RCC, will support the standards development process through the assignment of NPCC Task Forces. They will also provide a technical advisory role in the Regional Reliability Standards development procedure through recommendations.

- **Requester**— A Requester is any individual or an entity (organization, company, government authority, etc.) that submits a complete request for development, revision, or withdrawal of a standard. Any person or an entity that is directly and materially affected by an existing standard or the need for a new standard may submit a request for a new standard or revision to a standard. The Requester is assisted by the RSAR drafting team (if one is appointed by the RSC) to respond to comments and to decide if and when the RSAR is forwarded to the RSC with a request to draft a standard. The Requester is responsible for the RSAR, assisted by the RSAR drafting team and Regional Standards Process Manager, until such time the RSC authorizes

development of the standard. The Requester has the option at any time to allow the RSAR drafting team to assume full responsibility for the RSAR. The Requester may chose to participate in subsequent standard drafting efforts related to the RSAR.

- **Task Forces and Working Groups,**—The committees, task forces and working groups within NPCC , serve an active role in the standards process:
  - Identify the need for new or modified regional standards.
  - Initiate NPCC Standards actions by developing Regional Standard Authorization Requests (RSARs).
  - Develop comments (views and objections) to standards actions.
  - Participate in NPCC Standard drafting.
  - Provide technical oversight in response to changing industry conditions and ERO Requirements.
  - Conduct Field Tests as required

4. PROCEDURE DESCRIPTION

STEPS 1 AND 2: REQUEST TO DEVELOP A NEW REGIONAL STANDARD

Requests to develop a new Regional Reliability Standard shall be submitted to the RSPM by completing a **Regional Standard Authorization Request** (RSAR) ***(see Appendix A)***. The RSAR is a description of the new or revised standard in sufficient detail to clearly define the scope, purpose, and importance of the Regional Standard, impacted parties or other relevant information. A "needs" statement will provide the justification for the development of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard. The RSPM shall maintain the RSAR form and make it available electronically on the NPCC website.

Any person or entity ("Requester") directly or materially affected by an existing standard or the need for a new or revised standard may initiate a RSAR.

The Requester will submit the RSAR to the RSPM electronically and the RSPM will acknowledge receipt of the RSAR immediately, through electronic receipt. The RSAR, as a minimum, needs to contain the following information in order to be qualified for consideration. The NPCC RSPM will assist the Requester to ensure all the following information is submitted (on the RSAR) in a form appearing in Appendix A:

1. Proposed Title and Date of New RSAR
2. Requester's Name and Contact Information
3. Purpose of the Regional Standard
4. Description of Industry Need
5. Provide a Brief Description of the Standard
6. Identification of the Entities in the Functional Model as being responsible to adhere to the standard.
7. Necessary information to assist the drafting the team, to the extent feasible, to allow them to draft the standard.
8. A cross references to existing NPCC or NERC documents

The RSPM shall forward all properly completed RSARs to the RSC. The RSC shall meet at established intervals to review all pending RSARs. The frequency of this review process will depend on workload, but in no case shall a properly completed RSAR wait for RSC action more than 60 calendar days from the date of receipt. The RSC may take one of the following actions:

- Remand the RSAR back to the RSPM for additional work. In this case, the RSPM may request additional information or clarification for the RSAR from the Requester.
- Accept the RSAR as a candidate for a new or revised standard. In this case, the RSC will forward the RSAR to the RCC to assign a NPCC Task Force to provide technical support and analysis of comments for that RSAR, and assist the Requester and the RSPM in the remaining steps of the process. The RSPM shall post notification of intent to develop a standard on both NPCC and ERO websites within 30 calendar days of acceptance.
- Reject the RSAR. In this case, the RSC will provide a written explanation for rejection to the Requester within 30 calendar days of the rejection decision.

STEPS 3, 4, AND 5: RSC ACCEPTS RSAR AND RCC ASSIGNS TF TO DRAFT NEW OR REVISED STANDARD

A RSAR that is accepted by the RSC will be submitted to the RCC. Within 60 calendar days the RCC shall assign the development of the standard to a Task Force Drafting Team. The RSPM shall solicit and recommend a list of additional candidates for appointment to the team and shall submit the list to the RSC. This list shall include the Requester. The RSC may select other individuals to serve, with the Task Force to draft the Standard. This team shall consist of a small group of people who collectively have the necessary technical expertise and work process skills.

The RSPM shall assign NPCC staff personnel to assist in the drafting of the standard including compliance measure, process and elements. The drafting of measures and compliance administration aspects of the standard will be coordinated with the Compliance Program.

STEP 6: SOLICIT PUBLIC COMMENTS ON DRAFT STANDARD

Once a draft standard has been verified by the RSC to be within the scope and purpose of the RSAR, the RSPM will post the draft standard for the purpose of soliciting public comments. The posting of the draft standard will be linked to the RSAR for reference. In addition to the standard, an implementation plan shall be posted to provide additional details to the public and aid in their commenting and decision process. Comments on the draft standard will be accepted for a 45 calendar day period from the public notice of posting. Comments will be accepted on-line using the NPCC Open Process web-based application.

Final draft standards will be concurrently posted on the ERO website for comments.

STEPS 7, 8, AND 9: OPEN PROCESS POSTING AND ANALYSIS OF THE COMMENTS

The RSPM will assemble the comments on the new draft standard and distribute those comments to the Task Force acting as the standard drafting team. The Task Force shall give prompt consideration to the written views and comments of all participants. An effort to address all expressed comments shall be made, and each commenter shall be advised of the disposition of the comment and the reasons therefore, in addition to public posting of the responses.

The Task Force acting as the Standard Drafting Team shall take one of the following actions:

- Submit the draft standard for RCC endorsement as it stands, along with the comments received and responses to the comments. Based on the comments received, the Task Force acting as the standard drafting team may include revisions that are not substantive. A substantive change is one that directly and materially affects the application of the standard, including, for example: changing "shall" to "should," changing "should" to "shall"; adding, deleting, or revising requirements; or adding, deleting, or revising measures for which compliance is mandatory.
- Make substantive revisions to the draft standard and reposts it for further open review and comment.
- Task Force recommends Field Test if necessary to RSC.

Requester also may withdraw the request for a standard.

RCC submits proposed RRS to the RSC along with its recommendation based on comments, Task Force statements and any field test results.

STEPS 10 AND 11: RSC APPROVES OF THE NEW OR REVISED STANDARD FOR POSTING

If the RSC, acting with consideration of any recommendations by the RCC and utilizing the composite sector voting structure, as outlined in the NPCC, votes to post the draft standard for approval, the draft standard, all comments received, and the responses to those comments shall be posted electronically for the NPCC Members, by the RSPM and made public through the NPCC Website (www.npcc.org) for a 30 calendar day "pre-ballot review" and request for balloting. If the RSC decides more work is needed, the draft standard will be remanded back to the drafting Task Force. All actions of the RCC, Task Forces acting as drafting teams and the Regional Standards Committee will be recorded in regular minutes of the group(s) and posted on the NPCC website. Once the notice for a ballot has been issued, no substantive modifications may be made to the proposed standard unless the revisions are posted and a new notice of the vote is issued

STEPS 12, 13 AND 14: BALLOT OF STANDARD

Upon notification of a ballot, the Members of NPCC's registered ballot body will cast their vote consistent with the NPCC Bylaws. This ballot shall commence no sooner than 15 calendar days and no later than 30 calendar days following the notification of ballot. All members of the NPCC are eligible to participate in the voting on proposed, standard revisions or deletions of regional standards. The ballot period will typically begin immediately following the 30 calendar day pre-ballot posting and will last at least 10 business days.

The NPCC registered ballot body comprises all entities or individuals that qualify for one of the eight NPCC stakeholder sectors and are registered with NPCC as potential

ballot participants in the voting on standards. Each member of the NPCC registered ballot body is eligible to vote on standards.

In order for a NPCC Regional Standard to be approved;

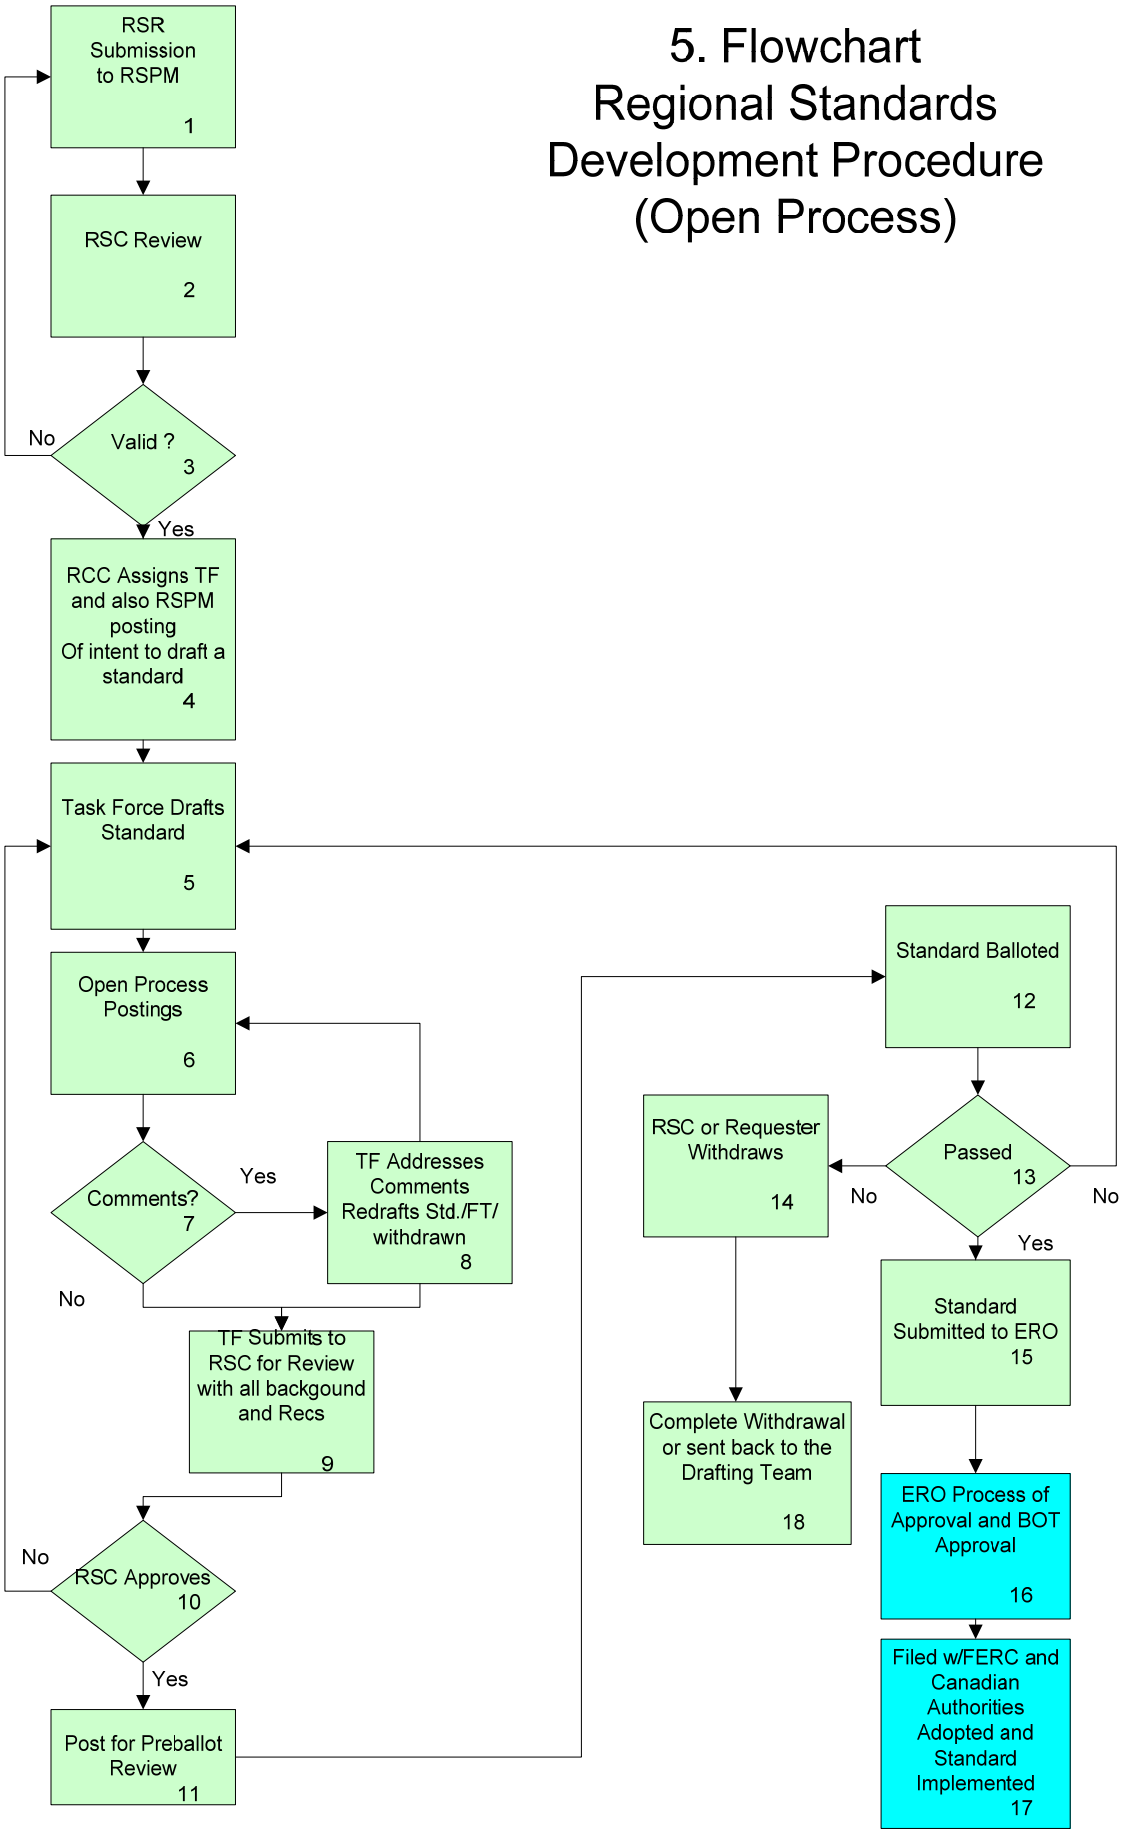
- A quorum must be established by at least 50% of the NPCC Members of at least 60% of the Voting Sectors on the roster of Members maintained by NPCC.
- A two-thirds majority of the total weighted sector votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions, and non-responses. Weighted sector vote will be calculated as follows;
  - Affirmative votes cast in each sector will be divided by the sum of affirmative and negative votes cast, in that same sector, to determine the fractional affirmative vote for each sector. Abstentions and non-responses will not be counted for the purposes of determining the fractional affirmative vote for a sector.
  - The sum of the fractional affirmative votes from all sectors divided by the number of sectors voting will be used to determine if a two-thirds majority has been achieved. (A sector will be considered as "voting" if any member of the sector in the ballot pool casts either an affirmative or a negative vote.)
  - A standard will be approved if the sum of fractional affirmative votes from all sectors divided by the number of voting sectors is at least 2/3.

Ballots will be cast electronically and alternatives are as follows;

- Affirmative
- Affirmative with Comments
- Negative
- Negative with Comments
- Abstain

The RSPM shall post the final outcome of the ballot process. If the standard is rejected, it may be withdrawn by either the RCC or the original Requester, or the standard may be remanded by the RSC back to the Task Force acting as the drafting team to address the issues. All comments submitted during the process will be posted and archived for consideration when redrafting the standard upon review.

The standard, once approved by ballot, and a recommendation will be forwarded to the NPCC Board for final Regional approval. The Board may not make substantive modifications to the standard. If the Board does not approve the standard for transmittal to NERC it will be remanded back to the RSC.



If the standard is approved, the standard will be submitted to the NERC/ERO Board of Trustees for approval.

STEPS 15, 16 AND 17: IMPLEMENTATION OF THE NPCC REGIONAL STANDARD
Upon approval within the NPCC , the standard will be submitted to the NERC/ERO for approval(s) and filing with FERC and applicable Canadian Governmental and/or Regulatory Authorities for adoption.

Once a reliability standard is adopted and made effective, all users, owners, planners, and operators of the Bulk Power System in the NPCC geographic area of the Northeast are required to comply with the standard. The NERC/ERO Board of Trustees has established a separate compliance program, also administered in the Northeast by NPCC , to measure compliance with the standards and administer sanctions as appropriate. After adoption of a NPCC Regional Standard, the standard will be forwarded to the compliance program for compliance monitoring and enforcement.

STEP 18: WITHDRAWAL OF STANDARD
Upon rejection of a proposed standard, the RCC or the requester may withdraw the standard completely or remand it back to the Task Force acting as the standard drafting team for further work.

5. Flowchart Regional Standards Development Procedure (Open Process)

6. ERO and Regulatory Process and Approvals

- **NERC/ERO Comment Period** —NERC/ERO shall publicly notice and request comment on the NPCC Regional Reliability Standard, allowing a minimum of 45 calendar days for comment on NERC's website and actively notify all adjoining Regions. Concurrent with this regional posting, final drafts will be forwarded to NERC for posting on the NERC website to ensure full industry awareness of the standard and expedite and coordinate all commenting. All comments will be responded to electronically through a posted response on the NPCC website or a link on the NERC website. NPCC shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the NPCC Regional Reliability Standard and request another posting for comment, or submit the NPCC Regional Reliability Standard along with a response to any objections received, for approval by NERC.

- **NERC/ERO Approval of NPCC Regional Reliability Standards** — Proposed regional reliability standards shall be subject to approval by the NERC/ERO who shall have a process to evaluate and recommend whether a proposed non-Interconnection-wide NPCC Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether NPCC has considered and addressed stakeholder objections. NPCC Board, having been notified of the results of the regional ballot concerning a NPCC Regional Reliability Standard, shall vote to submit the Standard to the NERC/ERO Board for approval as a NERC Reliability Standard. The NERC/ERO Board shall consider NPCC's request, the scope and implications of the Standard, the recommendation for action on the Standard, any unresolved stakeholder comments, and NPCC's consideration of comments and unresolved issues if any, in determining whether to approve the NPCC Regional Reliability Standard as a NERC Reliability Standard.

- **Regulatory Authority Approval** — An NPCC Regional Reliability Standard that has been approved by the NERC/ERO board shall be filed with FERC and applicable Canadian Governmental and/or Regulatory Authorities for approval and shall become effective and enforceable within the U.S., per Section 215 of the Federal Power Act, only when adopted by FERC, and within Canada, only when adopted by applicable Canadian Governmental and/or Regulatory Authorities. The regional reliability standard, once adopted will be made part of the body of NERC reliability standards and shall be mandatory and enforceable on all applicable bulk power system owners, operators, and users within the NPCC Region, regardless of membership status.

7. Appeals

- Persons who have directly and materially affected interests and who have been or will be adversely affected by any substantive or procedural action or inaction related to the development, approval, revision, reaffirmation, or withdrawal of a regional reliability standard shall have the right to appeal.

This appeals process applies only to the standards process as defined in this procedure.

The burden of proof to show adverse effect shall be on the appellant. Appeals shall be made within 30 calendar days of the date of the action purported to cause the adverse effect, except appeals for inaction, which may be made at any time. In all cases, the request for appeal must be made prior to the next step in the process.

The final decisions of any appeal shall be documented in writing and made public.

The appeals process provides two levels, with the goal of expeditiously resolving the issue to the satisfaction of the participants:

- Level 1 Appeal

Level 1 is the required first step in the appeals process. The appellant submits a complaint in writing to the RSPM that describes the substantive or procedural action or inaction associated with a reliability standard or the standards process. The appellant describes in the complaint the actual or potential adverse impact to the appellant. Assisted by any necessary staff and committee resources, the RSPM shall prepare a written response addressed to the appellant as soon as practical, but not more than 45 calendar days after receipt of the complaint. If the appellant accepts the response as a satisfactory resolution of the issue, both the complaint and response will be made a part of the public record associated with the standard and posted with the standard.

- Level 2 Appeal

If after the Level 1 Appeal the appellant remains unsatisfied with the resolution, as indicated by the appellant in writing to the regional standards process manager, the RSPM shall convene a Level 2 Appeals Panel. This panel shall consist of five members total appointed by the NPCC's board.

In all cases, Level 2 Appeals Panel members shall have no direct affiliation with the participants in the appeal.

The RSPM shall post the complaint and other relevant materials and provide at least 30 calendar days notice of the meeting of the Level 2 Appeals Panel. In addition to the appellant, any person that is directly and materially affected by the substantive or procedural action or inaction referenced in the complaint shall be heard by the panel. The panel shall not consider any expansion of the scope of the appeal that was not presented in the Level 1 Appeal. The panel may in its decision find for the appellant and remand the issue to the RSC with a statement of the issues and facts in regard to which fair and equitable action was not taken. The panel may find against the appellant with a specific statement of the facts that demonstrate fair and equitable treatment of the appellant and the appellant's objections. The panel may not, however, revise,

approve, disapprove, or adopt a reliability standard. The actions of the Level 2 Appeals Panel shall be publicly posted.

In addition to the foregoing, a procedural objection that has not been resolved may be submitted to the NPCC Board for consideration at the time the board decides whether to adopt a particular reliability standard. The objection must be in writing, signed by an officer of the objecting entity, and contain a concise statement of the relief requested and a clear demonstration of the facts that justify that relief. The objection must be filed no later than 30 calendar days after the announcement of the vote on the standard in question.

APPENDIX A

Information in a Regional Standard Authorization Request (RSAR)

The tables below identify information to be submitted in a Regional Standard Authorization Request to the NPCC Regional Standards Process Manager, NPCCstandard@npcc.org . The NPCC Regional Standards Process Manager shall be responsible for implementing and maintaining this form as needed to support the information requirements of the standards process.

Regional Standard Authorization Request Form

Title of Proposed Standard:
Request Date:

RSAR Requester Information

Name:	**RSAR Type (Check box for one of these selections.)**
Company:	☐ New Standard
Telephone:	☐ Revision to Existing Standard
Fax:	☐ Withdrawal of Existing Standard
Email:	☐ Urgent Action
Purpose (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability**.)**	
Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation**.)**	
Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others**.)**	

Reliability Functions

The Standard will Apply to the Following Functions (Check all applicable boxes.)

☐	Reliability Coordinator	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
☐	Balancing Authority	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☐	Planning Authority	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.
☐	Transmission Service Provider	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.
☐	Transmission Owner	The entity that owns and maintains transmission facilities.
☐	Transmission Operator	The entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission facilities.
☐	Transmission Planner	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.
☐	Resource Planner	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
☐	Generator Operator	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
☐	Generator Owner	Entity that owns and maintains generating units.
☐	Purchasing-Selling Entity	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
☐	Distribution Provider	Provides and operates the "wires" between the transmission system and the customer.
☐	Load-Serving Entity	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check all boxes that apply.)*	
☐	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
☐	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*	
Recognizing that reliability is an Common Attribute of a robust North American economy:	
1. A reliability standard shall not give any market participant an unfair competitive advantage.Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes	

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

October 28, 2014

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

Re: North American Electric Reliability Corporation
Docket No. RR14-6-000
Request for Acceptance of 2015 Business Plans and budgets of NERC and Regional Entities and for Approval of Proposed Assessments to Fund Budgets-
Update on CRISP Implementation

Dear Secretary Bose,

The purpose of this letter is to provide the staff of the Federal Energy Regulatory Commission (the Commission) with a brief update regarding the status of CRISP Program implementation which was included in the NERC's 2015 business plan and budget.

Significant progress has been made since the filing of NERC's 2015 business plan and budget in August, 2014. NERC and 15 utilities have executed the Master Agreement (Master Agreement) and related Statements of Work. NERC has also executed the related agreement with Battelle Memorial Institute, the operator of the Pacific Northwest National Laboratory (PNNL). Implementation of the CRISP Program is now underway, and NERC will continue to seek additional industry participation in the CRISP program.

Funding by utility participants is in process. 2015 funding will be in two installments, with the first installment due in early January, 2015. The second installment will be due within 30 days after NERC provides a reconciliation of 2014 actual to budgeted costs, which is anticipated to be on or about March 15, 2015. A separate bank account has been established to segregate CRISP program funds and track funding by utility participants

Budget Recap

The 2014 budget is sufficient to fund 100% of the 2014 CRISP program costs, inclusive of PNNL costs. An overall not to exceed budget, as well as a not to exceed budget by participating utility, has been agreed to with PNNL and each participating utility. Consistent with the NERC board's resolution authorizing the program, 2014 utility funding amounts have been established in a sufficient amount to avoid the use of existing NERC reserves.

The 2015 CRISP program budget reflects final cost reduction negotiations with PNNL from those assumed in the 2015 business plan and budget, as well as the allocation of direct funding of program startup costs

by participating utility in 2014 that were assumed to be incurred in 2015 in the 2015 business plan and budget. As a result, the final 2015 CRISP program budget, inclusive of PNNL costs, has been reduced from the approximately $9.3M included in the 2015 business plan and budget to approximately $5.9M. This is in large part due to the 2014 allocation of funding of startup expenses as noted above. The 2014 CRISP program budget, covering the period from October 1, 2014 thru December 31, 2014, is approximately $4.9M, entirely funded by the utility participants. The total direct utility funding for 2014 and 2015 will be approximately $10.8M. The final total 2014 and 2015 CRISP budgets are set forth in Attachment A. NERC's internal 2015 ES-ISAC department budget, which is exclusive of PNNL subcontract costs and other costs funded directly by utility participants, is consistent with the internal ES-ISAC budget included in NERC's 2015 business plan and budget and which was utilized for purposes of determining the proposed 2015 CRISP program funding from assessments.

Please do not hesitate to contact me should Commission staff have any questions or require further information.

Sincerely,

Michael A. Walker
Senior Vice President
Chief Financial and Administrative Officer

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Reliability Assurance Initiative	**)**	**Docket No. RR15-__-000**

INFORMATIONAL FILING OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

The North American Electric Reliability Corporation ("NERC")[1] hereby submits to the Federal Energy Regulatory Commission ("FERC" or "Commission"), for informational purposes, a description of the various processes and programs developed and deployed through the ERO Enterprise's[2] Reliability Assurance Initiative ("RAI"). The initiative was developed to implement across the ERO Enterprise a risk-based compliance monitoring and enforcement program ("CMEP")[3] that provides reasonable assurance of reliability through compliance monitoring, appropriate deterrence through enforcement, and a feedback loop to improve Reliability Standards.

The processes and programs described herein are fully consistent with existing NERC Rules of Procedure and authority and the Commission's rules, orders, and regulations.

[1] NERC is the Commission-certified electric reliability organization ("ERO") responsible for the development and enforcement of mandatory Reliability Standards. *See North American Electric Reliability Corp.*, 116 FERC ¶ 61,062, *order on reh'g and compliance*, 117 FERC ¶ 61,126 (2006), *aff'd sub nom. Alcoa Inc. v. FERC*, 564 F.3d 342 (D.C. Cir. 2009).

[2] The term "ERO Enterprise" refers to NERC and the eight Regional Entities. The eight Regional Entities are Florida Reliability Coordinating Council ("FRCC"), Midwest Reliability Organization ("MRO"), Northeast Power Coordinating Council ("NPCC"), ReliabilityFirst ("RF"), SERC Reliability Corporation ("SERC"), Southwest Power Pool Regional Entity ("SPP RE"), Texas Reliability Entity ("Texas RE"), and Western Electricity Coordinating Council ("WECC").

[3] As the context requires, "CMEP" refers to the compliance monitoring and enforcement program or the document found at Appendix 4C of the NERC Rules of Procedure, which contains the rules associated with such program.

Therefore, NERC and the Regional Entities are not requesting Commission action on this informational filing.

Section II of this filing describes the context for the development of the initiative. It discusses in summary form, the process of developing the risk-based approach to compliance monitoring and enforcement. Finally, the section describes the oversight and training programs established by the ERO Enterprise to ensure appropriate and consistent application of the processes discussed herein.

Section III of this filing describes the enhancement of a feedback loop between compliance monitoring and enforcement and other activities, including the development of Reliability Standards.

Section IV of the filing describes compliance monitoring processes, as well as the regulatory framework that allows implementation of these processes. This section discusses the identification and prioritization of risk elements, the inherent risk assessment ("IRA"), and internal controls evaluation ("ICE") processes, and the development of compliance oversight plans for registered entities including the planning and execution of Compliance Audits.

Section V of the filing discusses the processes associated with a greater exercise of enforcement discretion by the ERO Enterprise, specifically the use of compliance exceptions and self-logging of minimal risk issues.

I. EXECUTIVE SUMMARY

RAI was a collaborative effort among NERC, the Regional Entities, and industry to identify and implement changes to enhance the effectiveness of compliance monitoring and enforcement. Essentially, the initiative resulted in the adoption of a risk-based approach to compliance monitoring and enforcement. This approach benefits reliability by focusing resources applied to compliance monitoring and enforcement based on risk, thereby allowing the ERO Enterprise and registered entities to focus appropriate time and effort on higher-risk issues. As the reliable operation of the bulk power system ("BPS") is in the public interest, the focusing, by the ERO Enterprise on matters that pose greater risk to that reliable operation is also in the public interest. This approach does not equate to ignoring lesser-risk issues, which, as explained in this filing, continue to be identified, corrected, and tracked.

A risk-based approach is fully consistent with NERC's existing rules and authority, as demonstrated below. Further, this approach focuses on how the ERO Enterprise performs oversight and obtains assurance regarding compliance with Reliability Standards and does not create new or additional requirements (beyond those established in Reliability Standards) for registered entities operating the grid. However, this approach has the benefit of allowing the ERO Enterprise to leverage certain management practices in use at registered entities in focusing its own oversight activities. This ability to leverage management practices also has the effect of disseminating and enhancing such practices throughout industry.

The ERO Enterprise is prepared to implement the new processes described in this filing fully in January 2015. By the end of 2015, the ERO Enterprise expects to measure the success of

this initiative in a number of ways, including through measures related to staff competencies, robustness of outreach, program transparency, and sharing of best practices.

As the ERO, NERC has the oversight authority, responsibility, and obligation to monitor Regional Entities' adherence to the NERC Rules of Procedure, specifically the CMEP, and performance of their delegated responsibilities on behalf of NERC. NERC will continue its oversight activities to ensure consistency throughout the ERO Enterprise in identification of risks and evaluation of processes, procedures, and internal controls, as well as the assessment of risks associated with noncompliance and mitigation. NERC oversight of all components of the risk-based CMEP will be essential to the proper application of the program over the long-term.

Through implementation of the risk-based approach described in this filing, the ERO Enterprise also will strengthen the trust of the Commission and other applicable governmental authorities in the ERO Enterprise's risk-based compliance and enforcement. An appropriate level of transparency will be in place for various facets of risk-based compliance monitoring and enforcement, balancing efficiency and the confidentiality needs of a registered entity with the needs of industry as a whole to learn from others.

II. DEVELOPMENT OF THE RELIABILITY ASSURANCE INITIATIVE

In 2012, the ERO Enterprise initiated a multi-year effort to identify and implement changes that enhance the effectiveness of the CMEP. The experience of the past several years demonstrates that a one-size-fits-all and zero tolerance approach to compliance monitoring and enforcement does not properly allocate time, attention and resources for serious and lesser risk noncompliance, does not demonstrably equate to more reliable operations of the BPS, and is not sustainable. In fact, the risk-based approach outlined herein is more likely to ensure the reliable

operation of the BPS. The case for a risk-based approach to compliance monitoring and enforcement has been previously outlined in a NERC white paper, *Incorporating Risk Concepts into the Implementation of Compliance and Enforcement*.[4]

Over this time, the ERO Enterprise tested, through various pilot programs, a number of concepts, processes, and programs to develop a risk-based compliance monitoring framework and a risk-based enforcement program. This experience is described below.

A. Compliance Pilot Program

The ERO Enterprise compliance pilot program focused on the development and implementation of approaches to risk assessments and testing of internal controls. The purpose of the compliance pilot program was to develop a single, common ERO Enterprise approach to compliance monitoring, focusing on risk-based assessments, scoping, internal controls review concepts, and tests of controls. Specific outcomes from the pilot program included proposed processes and methods for conducting inherent risk assessments of a registered entity and evaluating internal controls.

NERC and the Regional Entities initiated phase one of the pilot program during 2013. This phase explored different approaches to applying risk-based auditing concepts. In phase one, five Regional Entities designed pilots that included various approaches to audit scoping, inherent risk assessments, and testing of internal controls related to Reliability Standards. Regional Entities worked with registered entities to identify entity-specific risks and related internal controls to scope an audit and assess compliance with the Reliability Standards in scope. Both

[4] *See* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/White%20Paper%20–%20The%20Need%20for%20Change%20(paper%201).pdf.

Regional Entity and registered entity representatives involved in the pilots provided feedback on the pilot approaches.

The second phase of the pilot program evaluated the pilot results. Representatives from each of the eight Regional Entities reviewed pilot results and identified specific approaches or processes that the ERO Enterprise should use for its single, common method for compliance monitoring. Converging the various approaches into a single design began in January 2014 and included a detailed review of each pilot and presentation of each individual Regional Entity pilot design to an evaluation team during February 2014. The evaluation team consisted of an independent audit consultant and senior NERC, Regional, and industry representatives. To assist the evaluation team in determining the best approach, NERC and the Regional Entities invited a group of industry professionals to help develop criteria to evaluate the various approaches. The established criteria included transparency, design effectiveness, alignment to Reliability Standards, implementation requirements, and registered entity impact.

The third and final stage of the pilot program, beginning in June 2014, was finalizing the single, common approach to inherent risk assessments and internal controls evaluations. During the final stage, two smaller teams of NERC and Regional Entity staff designed guidance documents to provide an overall framework for how Regional Entities would conduct inherent risk assessments and internals control evaluations. The teams used the pilot results and evaluation criteria to finalize guidance documents. The two design teams coordinated with industry representatives to obtain input into the development and content of the guidance documents. Additionally, the NERC Board of Trustees requested policy input from industry on the draft inherent risk assessment guidance, which the final guidance documents incorporated.

As explained below, the new processes developed through RAI associated with the compliance monitoring program have resulted in the development of a common framework for oversight of registered entities based on the identification of risk elements, assessment of an entity's inherent risk, and evaluation of its internal controls. Each of these components allows the Compliance Enforcement Authority ("CEA")[5] to select the appropriate monitoring tools on the basis of risk. The framework is based on the use of risk-based compliance monitoring practices similar to those utilized in other industries. The focus, method, and frequency of monitoring engagements are based on a common ERO Enterprise approach to assessing a registered entity's risk to the reliability of the BPS and may be further refined based on the strength of the registered entity's management controls related to compliance with Reliability Standards.

B. Enforcement Activities

Recognizing the opportunity for risk-based enforcement improvements, in parallel with the risk-based compliance activities referenced above, the ERO Enterprise began to transition away from a process-driven enforcement strategy to a proactive, risk-based strategy that defines, communicates, and promotes desired entity behavior in an effort to improve the reliability of the BPS. Specifically, this approach allows the ERO Enterprise to focus on the higher risks to the reliability of the BPS, providing clear signals to registered entities about identified areas of concern and risk prioritization, while maintaining the ERO Enterprise's existing visibility into potential noncompliance issues regardless of the level of risk they posed. This approach also

[5] "Compliance Enforcement Authorities" or "CEAs" refer to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

encourages the self-identification of noncompliance and enhancement of internal controls by registered entities. NERC and the Regional Entities worked together to develop a series of activities designed to further align enforcement processes with risk and to increase the transparency regarding the ERO Enterprise's assessment of the risk to the BPS posed by specific instances of noncompliance.

The ability of CEAs to arrive at a final determination with respect to all noncompliance in an efficient manner is in part dependent on the quality of the information they have about the noncompliance and related mitigation. With that in mind, NERC and Regional Entity staff prepared self-report[6] and mitigation plan[7] user guides. These user guides build on guidance previously available from NERC and the Regional Entities and explain, among other things, the type and quality of information that should be submitted with a self-report and mitigation plan in order to allow for a prompt evaluation and, as appropriate, prompt disposition of noncompliance (in particular, of noncompliance that posed a minimal risk to the reliability of the BPS).

The ERO Enterprise also addressed concerns regarding timeliness of resolution of minimal risk issues and communication through the adoption of a triage process. As of January 1, 2014, all Regional Entities implemented a triage process. On average, within 60 days of discovery, regardless of discovery method, the CEA reviews noncompliance and determines whether: (i) there is enough information to support treating the noncompliance as a compliance

[6] *ERO Self-Report User Guide* (April 2014), *available at*: http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/ERO%20Self-Report%20User%20Guide%20(April%202014).pdf.
[7] *ERO Mitigation Plan Guide* (April 2014), *available at*: http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/ERO%20Mitigation%20Plan%20Guide%20(April%202014).pdf.

exception; (ii) more information is required prior to determining the disposition; or (iii) the noncompliance needs to be enforced.

Finally, the ERO Enterprise developed additional processes to allow the continued streamlining of the resolution of minimal risk noncompliance, in particular that which is self-identified.

The Find, Fix, Track and Report ("FFT") program was the first step in implementing a risk-based strategy that recognizes that not all instances of noncompliance require the same type of enforcement process. The natural evolution of the FFT program includes the ability to exercise greater discretion, including by declining to initiate an enforcement action to resolve an instance of noncompliance that did not pose a serious or substantial risk to the reliability of the BPS. The ERO Enterprise developed two new processes to achieve this goal: the self-logging program and the use of compliance exceptions. Both are discussed in greater detail below.

The ERO Enterprise's risk-based approach generally reserves enforcement actions under section 5.0 of the CMEP for those issues that pose a higher risk to the reliability of the BPS. As to issues posing a lesser risk, NERC and the Regional Entities may exercise appropriate discretion whether to initiate a formal enforcement action or resolve the issue outside of the formal enforcement processes. This approach allows the ERO Enterprise to oversee the activities of registered entities in a more efficient manner and to focus resources where they result in the greatest benefit to reliability. In this context, efficiency does not necessarily mean less time or effort. Rather, it is using the requisite time, knowledge, and skills required for each circumstance. In addition, this approach allows the ERO Enterprise to continue to provide clear signals to registered entities about identified areas of concern and risk prioritization, while

maintaining existing visibility into potential noncompliance and emerging areas of risk. Finally, this approach improves reliability by acknowledging and encouraging the enhancement of internal controls and self-identification and mitigation of noncompliance by registered entities. Visibility and accountability is maintained because noncompliance that is not enforced is nevertheless mitigated, tracked for analytical purposes, and subject to oversight by NERC as discussed herein.

This approach is not new. Many enforcement agencies in the United States, including FERC, exercise discretion in addressing noncompliance with the regulations they administer and establish priorities for the allocation of their resources. Such enforcement agencies also acknowledge and reward management practices associated with the self-identification and mitigation of noncompliance by regulated entities.[8] The processes described herein build on the

[8] *See* John C. Moot, *Compliance Programs, Penalty Mitigation and the FERC*, 29 Energy Law Journal 547, 562-563 (2008) discussing a Securities and Exchange Commission ("SEC") action forgoing enforcement because "the company had quickly identified the violations, promptly reported them, remedied them internally through disciplinary actions, and taken prospective corrective action to avoid future violations." *See also id.* at 564-65 *citing, Environmental Protection Agency, Incentives for Self-Policing: Discovery, Disclosure, Correction and Prevention of Violations*, 65 Fed. Reg. 19,618 (2000), which discusses the EPA's policy on *Incentives for Self-Policing, Discovery, Disclosure, Correction and Prevention of Violations*, which provides "[t]he revised Policy … is designed to encourage greater compliance with Federal laws and regulations that protect human health and the environment. It promotes a higher standard of self-policing by waiving gravity-based penalties for violations that are promptly disclosed and corrected, and which were discovered systematically-that is, through voluntary audits or compliance management systems." *See also* Orly Lobel, *Interlocking Regulatory and Industrial Relations: The Governance of Workplace Safety*, 57 ADMIN. L. REV. 1071, 1105-08 (2005) for a discussion of the Occupational Safety and Health Administration ("OSHA") "star" status program, under which OSHA can exempt employers from routine inspections and allow them to claim "star" status in exchange for maintaining exemplary safety records and satisfying other program certification requirements. The pursuit of "star" status improves employee safety and health, decreases regulatory costs, and enhances an entity's reputation.

success of the FFT program, the ERO Enterprise's well-established process for differentiating the resolution of noncompliance based on the risk posed to the reliability of the BPS.

C. From Design to Implementation

The basic framework design for all of these processes was concluded with the posting of program documents and guides on the RAI page of the NERC website in September and October 2014.[9] As discussed below, the ERO Enterprise is continuing to develop tools and templates, and is continuing to perform oversight, in order to obtain assurance that CEAs are implementing the new processes appropriately and consistently. The ERO Enterprise also has strengthened the communication and outreach regarding the processes and program and developed a robust training program.

With the completion of the design, reflected in the various published guides discussed below, and the baseline training provided to ERO Enterprise staff, the program is ready to be implemented in 2015. Over time, and through NERC's oversight of the program, areas that require additional guidance and training will be identified and addressed (either in the form of revised guides or through other means). In identifying such areas, NERC will consider the feedback from Commission staff, Regional Entities, registered entities, and other stakeholders. This iterative review cycle provides the most effective means of quickly adapting to specific implementation challenges.

1. Increased Outreach and Communication

Communication and education also are essential to the successful implementation of the risk-based compliance monitoring and enforcement approach. In recognition of this fact, the

[9] The RAI page is available at: http://www.nerc.com/pa/comp/Pages/Reliability-Assurance-Initiative.aspx.

ERO Enterprise has significantly increased its stakeholder outreach efforts in the second half of 2014. Outreach efforts have taken a number of forms, including workshops, webinars, newsletters, and other communications.

A significant milestone associated with the outreach and communication efforts was the formation, in September 2014, of an advisory group composed of stakeholders representing diverse Standing Committee, Regional, and regulatory perspectives. The advisory group was based on the successful experience of other ERO Enterprise initiatives and provided input and advisory guidance to NERC and Regional Entity staff as it finalized the design of the various components of the risk-based approach to compliance monitoring and enforcement. Currently the advisory group provides assistance on RAI-related outreach and training to the industry, including the format and agenda for the workshops described below.

In November, the ERO Enterprise is hosting two industry outreach workshops (on November 6, 2014 in Atlanta, GA and November 20, 2014 in Phoenix, AZ). The topics and agenda will be the same for each event. At each workshop, a panel of participants from Regional Entities and stakeholder companies will discuss their experiences and expectations about the components of risk-based approach to compliance monitoring and enforcement. Discussion on the panels will also include the application of the risk-based concepts to version 5 of the CIP Reliability Standards. The workshops are designed to foster practical conversations on how risk-based compliance monitoring and enforcement will look and feel to registered entities as the ERO Enterprise implements this approach in 2015.

NERC also conducted webinars to help disseminate information on the new processes.[10] In particular, an "RAI 101" webinar was held on October 3, with over 150 attendees, and presenters from NERC and several Regional Entities. The presentation and recording are also available on the NERC RAI page under "RAI Workshops and Webinars."

In the second half of 2014, NERC also increased its communication efforts associated with the initiative through individual announcements of relevant milestones, and spotlights of recent developments regarding RAI in its weekly and monthly publications. These materials have been distributed to broad distribution lists by email and are also posted on the NERC RAI page under "Program News."

2. Oversight by NERC

Oversight is essential to the long-term success of the compliance monitoring and enforcement program. Oversight ensures consistency in identification of risks and evaluation of processes, procedures, and internal controls, as well as the assessment of risks associated with noncompliance and mitigation. The, ERO Enterprise is currently developing measures of success to evaluate the risk-based approach to compliance monitoring and enforcement.

As part of its oversight role, NERC uses a combination of review processes to ensure that CEAs are implementing the CMEP effectively, to provide constructive feedback where appropriate, to identify trends, and to drive the implementation of best practices. In developing a comprehensive oversight plan, NERC has built, and will continue to build, on its experience overseeing CEAs on matters that involve the exercise of professional judgment. NERC's

[10] A schedule of stakeholder outreach opportunities is available at: http://www.nerc.com/pa/comp/Documents/RAI%20Schedule.pdf.

oversight of and involvement with the Regional Entities' compliance monitoring and enforcement activities are not limited to an after-the-fact determination of the quality of a Regional Entity's performance relative to a given process. NERC will regularly report on the results of its oversight, including performance as measured by certain key metrics, at its board meetings.

Regarding the compliance monitoring activities, NERC will conduct Regional Entity reviews during the first quarter of 2015 with the intent of supporting conceptual consistency in the application of the ERO Enterprise's risk-based approach. Throughout 2015, NERC's oversight will begin to evolve into a more traditional evaluation to assess areas supporting consistency in implementation of the guidance documents and providing feedback on opportunities for greater consistency. During 2015, NERC will focus on samples of Regional Entity IRAs, ICEs, and other aspects of the Framework that utilized the new risk-based approaches.

Regarding the enforcement activities, NERC will continue to perform oversight on an ongoing basis through three main categories of activities: analysis of data and metrics, annual spot checks of various programs, and dissemination of guidance and training. NERC oversight focuses on identifying areas for improvement in the future, rather than reopening closed matters. NERC prepares analyses and reports to assist with monitoring of CMEP processes for consistency and reasonable assurance of reliability, and to help identify trends that may affect BPS reliability. As an example, NERC analyzes repeat violations as well as new violations reported. Analysis of new violations helps identify significant violations that may adversely affect BPS reliability. Performance indices are also computed on a regular basis to quantify the

performance of the Regional Entities and NERC in processing violations and mitigation and to provide insight in determining the effectiveness of regional programs and adequacy of regional and NERC resources. Additional detail regarding NERC oversight of the self-logging and compliance exceptions programs is included below.

NERC also collaborates closely with FERC staff on oversight. A current example of such collaboration is the joint review of the FFT program through a combined annual spot check.

NERC oversight of all components of the risk-based compliance monitoring and enforcement program will be essential to the proper application of the program over the long term.

3. Continuous Training

As the design of RAI is completed, dissemination of guidance and training continues to be an integral component of ongoing CMEP implementation and in support of progressive consistency across the ERO Enterprise. To consistently implement the risk-based compliance oversight framework ("Framework") and its components in 2015, NERC is collaborating with a group of Regional Entity leaders to develop multiregional training covering all of the ERO Enterprise staff.

A NERC and Regional Entity core group of presenters has provided training to ERO Enterprise staff in a number of different venues. First, the group presented to auditors, enforcement and risk staff at the ERO Auditor Workshop in September. The presentations covered all aspects of the risk-based approach to compliance monitoring and enforcement, based on the near final versions of the various program documents available at the time.

This group is also implementing a phased program to provide more focused training to the staff performing IRAs and ICEs. Phase one of the training will address the implementation of the IRA and ICE guides, focusing first on regional staff that will actually perform IRAs and ICEs. Specifically, NERC and the Regional Entity leaders are holding three two-day sessions with Regional Entity staff in November and December. As noted above, to ensure consistency in training and approach, there is a core group of NERC-led presenters and trainers composed of both NERC and Regional Entity staff. The majority of the ERO Enterprise staff performing IRAs and ICEs has committed to attending the in-person training sessions and all staff will be trained. The training will include the discussion of hypotheticals and case studies developed based on the existing guides. This training is expected to be complete in December 2014.

Phase two will occur through the second quarter of 2015, and involves a reevaluation of guidance documents, development of lessons learned, and reevaluation of training needs. NERC and the Regional Entities will continue to assess training needs throughout 2015 and revise existing and ongoing training to incorporate Framework concepts.

Additional information on training is provided below, in connection with the discussions of Compliance Audits and enforcement processes. Training opportunities for industry, beyond those discussed in the context of outreach, above, are also in development.

4. Increased Coordination

Parallel to the adoption of a risk-based approach to compliance monitoring and enforcement, the ERO Enterprise is examining its practices associated with monitoring and enforcement for entities located in more than one Regional Entity footprint. There is an ongoing effort to enhance the coordination among Regional Entities for the execution of the compliance

monitoring and enforcement processes defined in CMEP. These efforts include a more defined structure and transparency for such coordination. Initial results are expected to be available in 2015.

III. FEEDBACK LOOP FOR THE IMPROVEMENT OF RELIABILITY STANDARDS

The ERO Enterprise will factor the knowledge and information gained through the implementation of these new policies into future revisions of existing NERC Reliability Standards to improve their content and clarity. NERC will also use that knowledge and information in the evaluation of patterns that may indicate potential reliability gaps or risks. The ERO Enterprise will use these trends in determining appropriate approaches to address reliability risks, developing training and guidelines, completing reliability assessments, and performing other data-based analysis. This feedback will benefit both the ERO Enterprise and registered entities. In particular, the opportunities to analyze trends to identify and educate entities on reliability risks will facilitate the improved application of resources to minimize reliability risks to the BPS.

In addition to the Standards drafting process, NERC will also ensure appropriate information flows from compliance monitoring and enforcement to other NERC programs, including Reliability Assessment and Performance Analysis, Registration and Certification, and Event Analysis.

IV. RISK-BASED COMPLIANCE MONITORING

A. Regulatory Structure

Risk-based compliance monitoring is fully consistent with NERC's existing rules and authority and does not require a change in the fundamental tenets of the Rules of Procedure (including its Appendix 4C, the CMEP). The ERO Enterprise is implementing risk-based compliance monitoring in accordance with existing rules, regulations, and orders; the framework aligns the ERO Enterprise monitoring with specific requirements set out through the Generally Accepted Government Auditing Standards ("GAGAS") and Institute of Internal Auditors ("IIA")—standard monitoring practices used in various industries. In addition to the CMEP, referenced above, NERC's program for monitoring and enforcing compliance with Commission-approved Reliability Standards is implemented through the Sanction Guidelines (Appendix 4B to the Rules of Procedure) and delegation agreements with the eight Regional Entities.

As specified in section 4.1 of the NERC CMEP, NERC develops and posts an annual Compliance Monitoring and Enforcement Program Implementation Plan ("ERO CMEP IP") each year. The ERO CMEP IP is the annual operating plan for compliance monitoring and enforcement activities to ensure that NERC and the Regional Entities fulfill their responsibilities under applicable legislation.

Beginning with the 2015 CMEP IP and beyond, NERC replaced the approach used to develop the ERO CMEP IP and the Actively Monitored List ("AML") with processes that identify and prioritize continent-wide risks to the reliability of the BPS, as well as related

Reliability Standards and registration functional categories.[11] Specifically, the ERO determines risk elements, taking into account compliance findings and event analysis experiences, data analysis provided in several NERC publications and reports, and expert judgment of ERO Enterprise staff, committees and subcommittees. Examples of such data and reports include the State of Reliability Report, the Long-Term Reliability Assessment, publications from the Reliability Issues Steering Committee, special assessments or reports, the ERO Enterprise Strategic Plan, ERO Event Analysis Process insights, significant occurrences noted by NERC and Regional Entity Situation Awareness staffs, and other relevant documents pertaining to risks to the reliability of the BPS. This revised approach continues to identify a subset of NERC Reliability Standards and Requirements for monitoring purposes, but it provides input to the development of a more individualized compliance oversight plan for registered entities. Therefore, the transformation to focus on identifying and prioritizing risks replaces a static, one-size-fits-all list of Reliability Standards and prioritizes functions and Reliability Standards based on risk to determine the appropriate oversight method.

Regional Entities use the risk elements and other information identified in the annual ERO CMEP IP in developing their own individual annual Regional Entity implementation plans ("Regional Entity IPs"). Regional Entity IPs are based on a common template, developed by the ERO Enterprise, and include: (i) details on Regional Risk Assessment processes and results; (ii) Reliability Standards and Requirements associated with Regional Risk Assessment results; (iii) Regional compliance oversight plan, which includes its annual audit plan; and (iv) other key

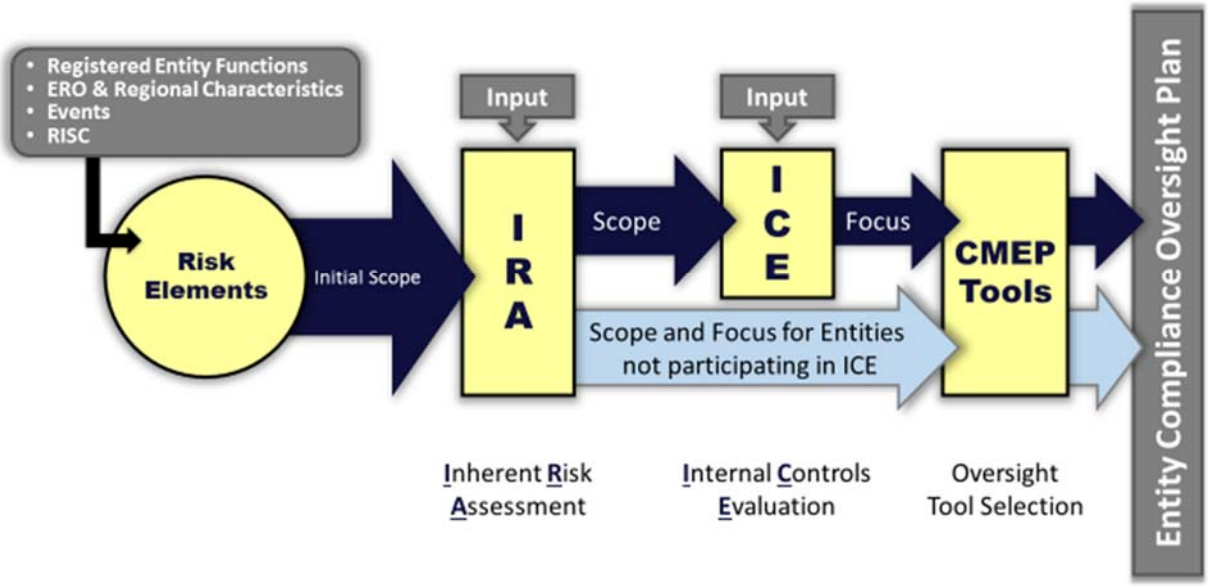
[11] These processes are described in the Risk Elements Guide for the Development of the 2015 CMEP IP, *available at* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/Final_RiskElementsGuide_090814.pdf.

activities and processes used for CMEP implementation. As of the time of this filing, NERC is evaluating the 2015 Regional Entity IPs that incorporate the risk elements outlined within the ERO CMEP IP for approval in accordance with section 4.2 of the CMEP.

The Rules of Procedure provide for seven compliance-monitoring processes, which are also referred to in this filing as CMEP tools (i.e., the main tools by which the monitoring program is executed). These methods include: (i) Compliance Audits; (ii) Self-Certifications; (iii) Spot Checks; (iv) Compliance Investigations; (v) Self-Reports; (vi) Periodic Data Submittals; and (vii) investigation of complaints.[12] The Rules of Procedure set forth steps for these methods, including requirements for the Regional Entity to report the results of the processes to NERC, which will then report to the Commission. The Rules of Procedure also specify the process steps after identifying registered entity noncompliance with a Reliability Standard.[13] These processes are unchanged. As discussed more fully below, all instances of noncompliance will continue to be reported and tracked at the Regional Entity, NERC, and Commission levels.

As explained below, the Regional Entity will determine the type and frequency of the compliance monitoring processes, or CMEP tools (e.g., off-site or on-site audits, spot checks or self-certifications), that are warranted for a particular registered entity based on reliability risks. The determination of the appropriate CMEP tools will be adjusted, as needed.

In selecting CMEP tools, more resource-intensive compliance monitoring activities, particularly Compliance Audits, may be used for these and other functions or entities within a



[12] CMEP §3.0 (Appendix 4C to the Rules of Procedure).
[13] *Id.* § 3.8.

specific Regional Entity that can have the most significant impact on reliability of the BPS. Functional roles or entities that have a lesser impact on reliability to the BPS may have compliance monitoring approaches tailored accordingly, for example, the use of spot checks or self-certifications, instead of Compliance Audits, may be appropriate tools in such instances. Registered entities required to be audited at a minimum three-year interval per the NERC Rules of Procedure will continue to be audited at least once every three years,[14] although the actual frequency and scope will be determined based on the Framework.

B. Risk-Based Oversight Plan Framework

RAI resulted in the development of the Framework depicted below. The Framework illustrates a number of steps including the review of system-wide risk elements, the assessment of a registered entity's inherent risk, and, as applicable, the evaluation of a registered entity's internal controls. These steps allow each CEA to establish a monitoring plan that is tailored to the risk to the BPS posed by a particular entity or group of entities. As a result, the Framework allows the ERO Enterprise to focus its resources, as well as those of registered entities, on those areas that pose the highest risk and have the greatest potential to affect reliability. Each step of the Framework is more fully discussed below.

[14] NERC Rules of Procedure, § 403.11.1.

1. Risk Elements

The first step of the Framework consists of the identification and prioritization of ERO Enterprise-wide risks. Risks are identified and prioritized based on significance, likelihood, vulnerability, and potential impact to the reliability of the BPS through a process outlined in the Risk Elements Guide for the Development of the 2015 CMEP IP ("Risk Elements Guide").[15] Risks may be categorized as operational risks and planning risks, as well as threats to cyber systems or physical security. While risk identification occurs on an annual basis, risks are dynamic. Accordingly, periodic reviews and updates may be necessary and appropriate to address increased and emerging risks or in the alternative, to reflect mitigated risks.

[15] *Available at:* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/Final_RiskElementsGuide_090814.pdf.

Through the review of the ERO Enterprise-wide risks, the ERO develops an annual compilation of risk elements reflected in the ERO CMEP IP.[16] The ERO CMEP IP serves as guidance to Regional Entities in the preparation of their Regional Entity IP. Any needed updates will be reflected in the ERO CMEP IP on a dynamic basis. The Regional Entity IPs are subject to review and approval by NERC as required in the Rules of Procedure.[17]

Reliability Standards are in place to help ensure the reliable operation of the BPS. Through the identification of risk elements, the ERO Enterprise maps a preliminary list of applicable Reliability Standards and responsible registration functional categories to the top reliability risks identified as areas of focus for monitoring purposes. This preliminary list is reflected in the ERO CMEP IP. As discussed above, this list and the processes used to identify and prioritize continent-wide risks to reliability of the BPS, as well as related Reliability Standards and registration functional categories, replaces the AML used in prior years.

The risks and associated Reliability Standards identified through the ERO CMEP IP and Regional Entity IP processes do not reflect the entirety of the risks that may affect the reliability of the BPS. As noted in the Risk Elements Guide, issues being addressed through other mechanisms are not included as areas of focus for compliance monitoring activities.

In order to focus on a complete picture of reliability risks when determining the appropriate compliance tool, Regional Entities then consider local risks and specific circumstances associated with individual registered entities within their footprints in developing

[16] *Available at*: http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/Final_2015%20CMEP%20IP_V7_090814.pdf.
[17] NERC Rules of Procedure, § 402.1.1.

their entity-specific compliance oversight plans. As a result, the scope of monitoring of a particular registered entity may include more, fewer, or different Reliability Standards than those outlined in the ERO and Regional Entity CMEP IPs.

2. Inherent Risk Assessment

After the ERO CMEP IP and Regional Entity IPs identify and prioritize risk elements, the IRA enables the CEAs to determine areas of focus and scoping of oversight for specific registered entities. As a result, the IRA identifies the Reliability Standards and Requirements that should be monitored.

The ERO Enterprise Inherent Risk Assessment Guide ("IRA Guide")[18] describes the process used to assess inherent risk of registered entities and serves as a guide for implementing and performing an IRA. As noted above, the ERO Enterprise is currently training to support the implementation and consistent application of the IRA process. In short, an IRA is a review of potential risks posed by an individual registered entity to the reliability of the BPS. An IRA considers factors such as assets, systems, geography, interconnectivity, prior compliance history, and overall unique entity composition. In considering such factors, a Regional Entity is not limited by the risk elements identified in the ERO CMEP IP. Rather, the IRA considers multiple factors to focus oversight to entity-specific risk. These factors may include the functional role and responsibilities of a registered entity. Risks may differ based on an entity's size, types of facilities, location, or the entity's assets, as applicable. An entity's system geography, population, and seasonal/ambient conditions may affect potential risk to reliability, as will BPS

[18] *Available at:* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/ERO_Enterprise_Inherent_Risk_Assessment_Guide_20141010.pdf.

exposure (transmission, generation, and operating limitations), and interconnection points and critical paths. The existence or nonexistence of certain systems like Special Protection Systems, Undervoltage Load Shedding, Underfrequency Load Shedding, Supervisory Control and Data Acquisition ("SCADA"), and Energy Management Systems may reduce or increase exposure of the BPS to entity-specific risks. In addition to the physical systems and assets of an entity, an entity's past operational performance and compliance and enforcement history informs the IRA's selection of appropriate oversight tools.

While the IRA Guide provides guidance on risk factors and associate criteria/thresholds for Regional Entity consideration, it is important to note that certain risk factors and the associated criteria/thresholds may vary by region, by entity size, or by function. Depending on the unique characteristics of the entity, the conclusion may be that some of the listed risk factors may be more applicable or contributory than others, some may not be applicable at all, or there may be additional risk factors not listed that would be appropriate to consider. For example, while certain characteristics of a registered entity may result in a higher assignment of risk relative to that specific factor, the registered entity's size or function may mean that the risk factor itself does not merit significant consideration in determining an entity's unique inherent risks to the reliability of the BPS. This also reflects the notion that some risk factors that might contribute towards determining overall inherent risk for a larger entity may contribute differently to the evaluation of a smaller entity.

Communication between the Regional Entity and registered entity may provide critical information for a risk determination. As needed, CEAs work with the registered entity to ensure the CEA has appropriate and sufficient information to conduct the IRA and reach accurate

conclusions. After the CEA finalizes IRA results, it communicates a summary of the results to the registered entity (including risk areas and impact on the scope of monitoring).

Below are some hypotheticals and one practical example of the application of the IRA process.

In a June 2014 presentation, MRO explained how the IRA process applies to registered entities.[19] First, a Regional Entity identifies risks at the regional level and categorizes risks into reliability themes. The Regional Entity identifies how susceptible a registered entity is to well-known risk themes such as events, and includes entity-specific data, regional factors affecting reliability, compliance history, and legal or regulatory factors affecting reliability. In addition, the Regional Entity assesses each registered entity by analyzing other specific factors important to its function, such as peak load capacity, BPS exposure, interconnection points, and other resources and trends. MRO illustrated potential results for three similarly situated registered entities.

Specifically, MRO illustrated what the results would be for risk assessments of three wind plants with similar registrations, Generator Owner and Generator Operator. Before conducting the IRAs, MRO would have identified 131 applicable Requirements for each wind plant. The individual risk assessments captured unique aspects of each registered entity and allowed for a tailored monitoring scope for each. Wind Farm #1's IRA resulted in an audit scope of 20 Requirements. Wind Farm #2 was responsible for interconnection of a nuclear facility and therefore had 25 Requirements in its audit scope. Finally, Wind Farm #3, which did not own a

[19] *Reliability Assurance Initiative Update*, June 19, 2014, *available at:* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative%20Workshops/Reliability%20Assurance%20Initiative_RAI_Webinar_6%2019%2014_Final.pdf.

collector bus, had two Requirements in scope. Rather than conducting a Compliance Audit, MRO could determine to use another compliance monitoring tool, such as a guided Self-Certification.

In another example, SERC conducted an IRA of Georgia Transmission Corporation ("GTC") in preparation of a Compliance Audit.[20] SERC collected and reviewed data regarding GTC's potential risks to the BPS through a pre-audit survey, reviewed GTC's compliance history, and used SERC's understanding of GTC from previous audit engagements. Based on its review of communication and coordination of operators, and GTC's related arrangements with other entities for the performance of registered functions, SERC adjusted the audit scope. Specifically, SERC increased the scope of the audit by eight Requirements.

SERC and GTC both agreed that the processes resulted in an improved focus on inherent risk when compared with the 2008 audit of GTC. SERC and GTC also learned that additional communication should occur during the development of the IRA. SERC has adjusted its communication with registered entities while conducting an IRA based on its experience with GTC.

The Regional Entity will perform IRAs on a periodic basis. The frequency may vary based on occurrence of significant changes to existing reliability risks or emergence of new reliability risks. At a minimum, a Regional Entity will be expected to consider whether IRAs should be updated when NERC identifies risk elements through the annual ERO CMEP IP. After consideration of the facts and circumstances, the Regional Entity will determine whether

[20] This experience was the subject of a presentation to the NERC Board of Trustees Compliance Committee on August 13, 2014. The presentation is available at http://www.nerc.com/gov/bot/BOTCC/Compliance%20Committee%202013/BOTCC%20-%20Presentation.pdf.

changes are required from year-to-year or sooner. As NERC performs oversight and observes what factors tend to trigger revisions to IRAs, NERC will consider providing additional guidance on this issue. For monitoring activities performed in 2015, Regional Entities are in various stages of conducting IRAs for registered entities within their footprints. During 2015 and beyond, Regional Entities will continue to expand the IRA process to entities in their footprints based on risk and compliance monitoring schedules.

3. Internal Controls Evaluation

An Internal Controls Evaluation ("ICE") enables a further refinement of the compliance oversight plan for individual registered entities. The ERO Enterprise Internal Compliance Evaluation Guide ("ICE Guide")[21] was developed by NERC in partnership with Regional Entities, registered entities, and various other stakeholders to assist CEAs in identifying and more effectively considering existing internal controls around CMEP objectives - compliance with Reliability Standards.[22]

[21] *Available at:* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/ERO%20Enterprise%20Internal%20Control%20Evaluation%20Guide.pdf.

[22] The most generally accepted definition of the term "internal controls" comes from the Committee of Sponsoring Organizations of the Treadway Commission ("COSO"), "…a process, effected by an entity's board of directors, management and other personnel, designed to provide 'reasonable assurance' regarding the achievement of objectives…" in this case, compliance with NERC Reliability Standards. *Internal Control – Integrated Framework*, 1992, *available at:* http://www.coso.org/documents/internal%20control-integrated%20framework.pdf. In addition, GAGAS defines internal controls in a similar manner under Section 6.15 c.: "Internal control, sometimes referred to as management control, in the broadest sense includes the plan, policies, methods, and procedures adopted by management to meet its missions, goals, and objectives. Internal control includes the processes for planning, organizing, directing, and controlling program operations. It includes the systems for measuring, reporting, and monitoring program performance. Internal control serves as a defense in safeguarding assets and in preventing and detecting errors; fraud; noncompliance with provisions of laws, regulations, contracts or grant agreements; or

Considering internal controls in the scope of audits is required under GAGAS.[23] The ICE is NERC and the Regional Entities' effort to formalize and standardize internal controls evaluation in a broader manner to complement risk-based monitoring of compliance through the IRA and using the breadth of CMEP monitoring tools more effectively. ICE refines the focus on those controls related to the entity-specific risks identified through the IRA and germane to the applicable Reliability Standards and allows CEA staff to leverage the entire breadth of CMEP tools more effectively, including to determine whether a Compliance Audit is necessary. During an ICE, Regional Entities may use existing information from past work with the Registered Entity, such as past audits, mitigation plans, previous Internal Compliance Program reviews conducted through enforcement. Registered entities have an opportunity to provide, on a voluntary basis, additional information related to the ICE including details that demonstrates the effectiveness of detective, corrective, and compensating controls. Because of the ICE, the Regional Entity may further focus the compliance assurance activities for a given entity. The depth and breadth of any particular area of review may decrease based on the Regional Entity's conclusions on its ability to rely on the internal controls of the registered entity. For example, if a registered entity demonstrates effective internal controls for a given Reliability Standard, the Regional Entity may determine that it does not need to audit the registered entity's compliance with that Reliability Standard as frequently or select a different monitoring tool. Conversely, if a registered entity does not demonstrate effective internal controls for a given Reliability Standard during the ICE, the scope will not change from the IRA.

abuse." Government Auditing Standards: 2011 Revision (Reissued on Jan. 20, 2012) p. 131, *available at:* http://gao.gov/assets/590/587281.pdf.

[23] See GAGAS Section 6.16.

Because the controls to be evaluated pursuant to the ICE process are those related to the inherent risk posed by a particular registered entity, the extent of an evaluation will naturally vary in accordance with that inherent risk.

Below are some examples of the application of the ICE process.

In the June 2014 presentation mentioned above, MRO provided examples regarding the evaluation of internal controls.[24] The first example involved a review of American Transmission Company's ("ATC") internal controls related to Reliability Standard COM-002. In this example, ATC's preventive control involved a random review of operator communications, followed by feedback and corrective actions. The review showed that ATC used three-part communication for routine exchanges. In addition, ATC's detective control involved a complete review of any situation in which a directive may be issued. MRO concluded that ATC would identify and address issues on a timely basis. Therefore, MRO determined that it did not need to directly test compliance with Reliability Standard COM-002.

The second example related to the Protection and Control ("PRC") family of NERC Reliability Standards. ATC had implemented preventative controls that tracked activities and alerted any upcoming or missing tests. ATC also had detective controls that involved random monthly management review of 10% of maintenance and testing records. MRO concluded that ATC had internal controls for all of the requirements related to maintenance and testing intervals. Thus, the result allowed for reduced sampling for the related PRC Reliability Standards.

[24] *Reliability Assurance Initiative Update*, June 19, 2014, *available at:* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative%20Workshops/Reliability%20Assurance%20Initiative_RAI_Webinar_6%2019%2014_Final.pdf.

In another example, in preparation for a Compliance Audit, SERC evaluated GTC's internal controls. As part of its evaluation, SERC reviewed GTC's independent audit reports, and accepted the independent audit report findings for 18 of the 38 Requirements in scope. Therefore, SERC did little to no additional testing in these areas. In reaching its conclusions, SERC determined that the independent audit reports: (i) adequately addressed the applicable Reliability Standards and Requirements; (ii) were relevant to the audit period; and (iii) reflected an appropriate level of rigor for SERC staff to draw the same conclusions.

The CEA is ultimately responsible for evaluating internal controls to determine proper oversight scope (i.e. the extent of reliance on internal controls for applicable Reliability Standards). The CEA makes this determination by understanding the BPS risks to which the registered entity is susceptible and gaining an understanding of how the registered entity controls or mitigates those risks in a meaningful manner. When the CEA has reasonable assurance that internal controls are functioning to protect reliability in accord with Reliability Standards, the CEA may rely on those internal controls and therefore, extensive testing may not be necessary.

Depending on regional flexibility and available resources, a CEA may conduct an ICE outside of normal compliance monitoring processes. However, the ERO Enterprise anticipates that during 2015, Regional Entities will generally only conduct an ICE in preparation for a scheduled compliance monitoring activity, e.g., a Compliance Audit.

The complexity of internal controls and the CEA evaluation of such internal controls will be scaled in accordance with the size of the registered entity, as described in the ICE Guide. However, it is possible that after the IRA, few applicable standards may remain as part of the monitoring scope for an entity posing a small inherent risk. In that case, it is possible that an

ICE may not result in a significant further tailoring of monitoring activities. Nevertheless, the ICE provides, even for those entities, an opportunity for continuous improvements in controls that could increase reliability and mitigate risks.

4. CMEP Tools

Ultimately, the Regional Entity will determine the type and frequency of the compliance monitoring tools (i.e., off-site or on-site audits, spot checks or self-certifications)[25] that are warranted for a particular registered entity based on reliability risks. The determination of the appropriate CMEP tools will be adjusted, as needed, within a given implementation year. Regional Entities' IPs may indicate CMEP tools being used during the implementation year (e.g., audit schedules, self-certifications, or periodic data submittals), but the Regional Entity will continue to identify appropriate CMEP tools to use based on results from regional risk assessments, IRAs, and ICEs.

NERC is currently reviewing the 2015 Regional Entity IPs for approval as provided in the Rules of Procedure. These region-specific plans provide the inputs and considerations that impact the development of compliance oversight plans for registered entities. Regional Entity IPs identify how the Regional Entities will use various compliance monitoring tools, such as on- and off-site audits. For example, prior to 2015, Regional Entities conducted audits for all entities on a three- and six-year audit cycle. Using a risk-informed approach, Regional Entities will continue to conduct three-year audits per the Rules of Procedure. However, a registered entity's IRA, and ICE if used, will determine the frequency and Compliance Audit scope rather than a standardized approach based solely on the registered function and the applicability of

[25] CMEP §3.0 (Appendix 4C to the Rules of Procedure).

Requirements contained in an actively monitored list. In their 2015 Regional Entity IPs, the Regional Entities identified registered entities scheduled for Compliance Audits in 2015. However, all registered entities are subject to oversight, and additional registered entities, at the discretion of the Regional Entity, may also be subject to compliance monitoring in 2015.

C. Planning and Execution of Compliance Audits

Compliance Audits remain a relevant part of the ERO Enterprise's risk-based approach to compliance monitoring. Pursuant to the NERC Rules of Procedure, each Regional Entity must maintain and implement a program of proactive Compliance Audits of BPS owners, operators, and users responsible for complying with Reliability Standards.[26] Further, a Compliance Audit of an entity registered as a Balancing Authority, Reliability Coordinator, or Transmission Operator must occur at least once every three years.[27] However, the time since the last audit is no longer the main driver for the audit planning process. Instead, as explained above, NERC and the Regional Entities will look to other key criteria to measure risk to the BPS, including entity processes, controls, and compliance history in determining the appropriate compliance monitoring tool for a particular registered entity. In 2015, some Regional Entity IPs may include Compliance Audits that were scheduled prior to full implementation of risk-based compliance monitoring. Beginning in 2016, however, the decision to conduct a Compliance Audit or select a different monitoring tool should be made in accordance with the risk-based processes outlined herein.

[26] NERC Rules of Procedure, § 403.11.
[27] *Id.* § 403.11.1.

Risk-based audit principles and risk-based auditing are fully consistent with practices of other agencies, including for example, the Division of Audits and Accounting ("DAA") within FERC's Office of Enforcement. As DAA explained in the 2013 Staff Report on Enforcement, "Risk assessment continues to be an important aspect of DAA's audit program because a significant majority of audits are initiated without any allegation of wrongdoing. Audited entities are typically selected using risk-based criteria[.]"[28]

Moving from a strictly time-based audit cycle to a risk-based audit cycle will improve oversight of the reliability of the BPS. If a registered entity now on a minimum three-year audit schedule poses substantial risk to the reliability of the BPS, its CEA may schedule audits more frequently than every three years. Similarly, for registered entities not subject to the three-year cycle, CEAs will monitor these entities, and base compliance monitoring activities' frequency, depth, and breadth on that entity's specific risk to BPS reliability. The ERO Enterprise will also continue to use other compliance monitoring tools such as self-certifications and spot checks. Again, the use and application of compliance monitoring tools will vary based on the risk-based processes outlined above to create the best method for effective oversight of compliance with Reliability Standards.

As the ERO Enterprise implements a risk-based approach to monitoring compliance with Reliability Standards, NERC and the Regional Entities recognize the need for continued CEA

[28] *2013 Report on Enforcement*, Docket No. AD07-13-006, p. 29 (Nov. 21, 2013), *available at:* http://www.ferc.gov/legal/staff-reports/2013/11-21-13-enforcement.pdf.

staff training and additional tools, in addition to and in support of NERC oversight. For example, the ERO Enterprise Compliance Auditor Manual ("Manual"),[29] which includes the Compliance Auditor Handbook, is a recent tool developed to assist CEA staff.

NERC and the Regional Entities jointly developed the Manual to help improve consistency and quality of compliance monitoring across the ERO Enterprise. The Manual, which the Regional Entities adopted and began using in April 2014, contains common tools, techniques, and approaches for compliance auditors. The Manual Drafting Team completed the first draft of the Manual in December 2013 and provided it to the NERC and Regional Entity executive management for review and comment. The Manual is a living document, and revisions will occur as NERC and the Regional Entities improve, develop, and implement compliance monitoring processes. Currently, the Manual includes sections on: an Introduction to Compliance Auditing, the Compliance Auditor Handbook, and the Compliance Auditor Capabilities and Competency Guide. Additional sections continue to be developed for the Manual, including: Ethics and Standards, sampling methodology, supporting diagrams and flow charts, common forms and templates, and other content as needed.

Following the completion of the Manual, NERC and the Regional Entities supported the formal roll-out with training initiatives, information sessions, and workshops. NERC began roll-out and initial training to regional auditors on use of the Manual during the first quarter of 2014, with full implementation in the second half of 2014 and use for all audits scheduled in 2015. NERC and the eight Regional Entities also jointly developed communication and training

[29] *ERO Enterprise Compliance Auditor Manual, available at*: http://www.nerc.com/pa/comp/ERO%20Enterprise%20Compliance%20Auditor%20Manual%20DL/ERO_Enterprise_Compliance_Auditor_Manual_version_1.pdf.

activities. Training modules consisted of a series of presentations, exercises and, on-line and instructor-led training. As tools and processes evolve, they will be added to the Manual, with the development and administering of training to follow. NERC and the Regional Entities continue to incorporate the Manual as part of periodic training for compliance auditors, such as Auditor Team Lead training. In addition, NERC and the Regional Entities have established a process for Manual additions, enhancements, and updates. In addition to training, mid- and long-range revision management and maintenance are being developed to ensure the long-term sustainability of the document. Additionally, in 2015, NERC will perform oversight activities of the Regional Entities to support implementation and process improvements related to the use of the Manual.

V. RISK-BASED ENFORCEMENT

A. FFT as the Platform for the Evolution of a Risk-based Enforcement Program

Over the past several years, the ERO Enterprise has been enhancing its risk-based approach for assessing and processing noncompliance. The ERO Enterprise continues to expect identification and mitigation of all instances of noncompliance, regardless of the level of risk they posed to the reliability of the BPS. However, not all instances of noncompliance require the same level of documentation and processing. The overwhelming majority of the caseload processed by the ERO Enterprise over the years has posed a minimal or moderate risk to the

reliability of the BPS.[30] As a result, it is appropriate to use a variety of means to resolve noncompliance, including the exercise of discretion not to initiate a formal enforcement action.

Since 2011, the ERO Enterprise has used the FFT process to resolve over 2,000 instances of noncompliance with the Reliability Standards, most of which posed a minimal risk to the reliability of the BPS. Since June 2013, the FFT process has been used to resolve noncompliance posing a moderate risk to the BPS.[31] Building on the success of the FFT process, the ERO Enterprise identified and implemented additional processes that enhance its effectiveness while promoting and supporting reliability.

The processes discussed below further streamline the resolution of lesser-risk noncompliance with NERC Reliability Standards. This continued evolution is necessary to allow the ERO Enterprise, as well as industry, to allocate resources to address the issues posing a higher level of risk to reliability. In addition, this approach leverages registered entity existing internal practices relating to self-monitoring and assessment of compliance with Reliability Standards. By appropriately recognizing such efforts, the ERO Enterprise encourages the

[30] In 2012 and 2013, respectively, the ERO Enterprise handled 74% and 72% of the violations and issues posted or filed at FERC as FFTs or in Spreadsheet Notice of Penalty filings. Both of these disposition methods are used for only minimal or moderate risk noncompliance. *NERC Compliance Violation Statistics—Fourth Quarter 2013*, at 10, *available at:* http://www.nerc.com/pa/comp/CE/Pages/Compliance-Violation-Statistics.aspx. In addition, in 2013 and 2014, respectively, 72% and 70% of instances of noncompliance posed a minimal risk to the reliability of the BPS and 27% (in both years) posed a moderate risk. From 2012 through October 1, 2014, only 2% of violations posed a serious or substantial risk to the reliability of the BPS.

[31] *North American Electric Reliability Corp.*, 138 FERC ¶ 61,193 ("2012 FFT Order"), *order on reh'g*, 139 FERC ¶ 61,168 (2012) (approving FFT program); *North American Electric Reliability Corp.*, 143 FERC ¶ 61,253 (2013) (approving expansion of program to include moderate risk issues and issues that will be mitigated within 90 days of posting, as well as proposal to publicly post FFT issues in lieu of submitting an informational filing); and *North American Electric Reliability Corp.*, 148 FERC ¶ 61,214 (2014) (approving continued inclusion of moderate risk issues as well as expansion of program to include issues that will be mitigated within one year of posting, subject to conditions).

enhancement of internal controls and self-identification of noncompliance throughout the industry.

Based on the experience with a streamlined process and a reduced record for resolution of minimal risk noncompliance, since 2013, NERC and the Regional Entities have exercised discretion when deciding whether to initiate a formal enforcement action regarding certain instances of noncompliance posing a minimal risk to the reliability of the BPS. Noncompliance that is not pursued through a formal enforcement action by the ERO Enterprise is referred to as a "compliance exception." As of September 30, 2014, a total 54 instances of noncompliance have received compliance exception treatment.

Beginning in October 2013, NERC and the Regional Entities began to allow select registered entities with demonstrated effective management practices to self-identify, assess, and mitigate instances of noncompliance to self-log minimal risk noncompliance that would otherwise be individually self-reported. Properly logged items are entitled to the presumption of being resolved as compliance exceptions unless there are additional risk factors involved. Logged items will be periodically filed with the Regional Entity. The Regional Entity will validate the logs. This is consistent with the notion that noncompliance that is self-identified through internal controls, corrected through a strong compliance culture, and documented by the entity, should not be resolved through the enforcement process or incur a penalty, absent a higher risk to the BPS.

B. Regulatory Structure and Identification of the Risk Posed by Noncompliance

Section 3.8 of the CMEP, which describes what each CEA must do once it identifies a potential noncompliance with a Reliability Standard Requirement, provides, in part that:

> If the Preliminary Screen results in an affirmative determination with respect to the above criteria, a Possible Violation exists and the Compliance Enforcement Authority shall proceed in accordance with Section 5.0, unless an alternative enforcement process is used. (emphasis added)

Section 5.0 of the CMEP, which describes the processes associated with Enforcement Actions, further provides that:

> The following enforcement process is undertaken by the Compliance Enforcement Authority following identification of a Possible Violation of a Reliability Standard Requirement by a Registered Entity. However, under the circumstances presented by some Possible Violations, Alleged Violations or Confirmed Violations, absolute adherence to the following enforcement process, to the exclusion of other approaches, may not be the most appropriate, efficient or desirable means by which to achieve the overall objectives of the Compliance Program for NERC, the Compliance Enforcement Authority and the Registered Entity. In such circumstances, other approaches may be considered and employed. The Registered Entity shall be entitled to object to the use of any such other approach. (emphasis added)

These provisions allow the ERO Enterprise to use alternative processes that are appropriate, efficient, or desirable means to achieve the overall objectives of the CMEP. The resolution of noncompliance as compliance exceptions through the process described herein is such an alternative approach for the resolution of lesser-risk noncompliance that is fully consistent with the overall objectives of the CMEP.

The Commission has expressed support for NERC and the Regional Entities to use risk-based compliance and enforcement processes, including using appropriate discretion when determining how to treat low-risk instances of noncompliance. For example, in its order approving Version 5 of the Critical Infrastructure Protection Reliability Standards, the Commission stated:

> We understand that NERC has inserted the "identify, assess, and correct" language into the CIP Reliability Standard requirements to move its

> compliance processes towards a more risk-based model. With this objective in mind, we believe that a more appropriate balance might be struck to address the underlying concerns by developing compliance and enforcement processes that would grant NERC and the Regional Entities the ability to decline to pursue low risk violations of the Reliability Standards.[32]

A common understanding of how the ERO Enterprise determines the various levels of risk of instances of noncompliance is fundamental to the continued evolution of the risk-based enforcement program. The ERO Enterprise uses three different levels to identify the risk posed by any instance of noncompliance: "serious and substantial," "moderate," and "minimal." The analysis that is performed is based on prior Commission orders and is discussed in the ERO Enterprise Self-Report User Guide.[33]

In the Commission's 2012 FFT Order, the Commission agreed that examples of serious and substantial issues are those involving or resulting in (i) extended forced outages; (ii) loss of load; (iii) cascading blackouts; (iv) certain vegetation contacts; (v) systemic or significant performance failures; (vi) intentional or willful acts or omissions; (vii) gross negligence; and (viii) other misconduct.[34] The ERO Enterprise concentrates its efforts on such serious and substantial issues when they infrequently arise. NERC files serious and substantial matters with the Commission in Full Notices of Penalty.

[34] *Id.* P49.

Issues are determined to pose a minimal risk to BPS reliability based on the combination of the subject Reliability Standard requirement and the attendant facts and circumstances. If nothing serious could have occurred and there were complete or significant protections in place to reduce the risk, as a general matter, then the risk would likely be minimal.

The lack of harm is not sufficient justification, by itself, for a minimal or moderate risk assessment. The facts and circumstances leading to a moderate risk determination are necessarily different. If something serious could have occurred during a noncompliance and there were only some protections in place to reduce the risk, then the risk assessment would likely be moderate.[35] If the noncompliance is related to a serious event, then the risk would likely be serious and substantial. Examples of serious harm generally include loss of customer load, cascading outages, and malicious actions that affect Critical Assets.

The determination of the level of risk posed by instances of noncompliance resolved through an enforcement action is clearly identified in the Notice of Penalty or FFT spreadsheet. Numerous examples of these determinations are available on the Enforcement and Mitigation page of the NERC website.[36]

C. Compliance Exceptions

Consistent with the above, beginning in November 2013, the ERO Enterprise implemented, on a pilot basis, a method to expand the exercise of enforcement discretion by identifying minimal risk instances of noncompliance that do not warrant a penalty and which

[35] *See ERO Self-Report User Guide*, 11-13 (April 2014), *available at:* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/ERO%20Self-Report%20User%20Guide%20(April%202014).pdf (describing the guidelines to help Registered Entities assess the risk to the reliability of the BPS posed by noncompliance with a Reliability Standard). *See also* 2012 FFT Order at PP44-45 (2012) (FERC discussion of risk assessments including a review of actual versus potential risk).
[36] *Available at:* http://www.nerc.com/pa/comp/CE/Pages/Enforcement-and-Mitigation.aspx.

would be recorded and mitigated as a "compliance exception" without triggering a formal enforcement action under section 5.0 of the CMEP.

As noted above, the process of identifying and recording compliance exception builds on the FFT program. The exercise of discretion by the ERO Enterprise is informed by the facts and circumstances of the noncompliance, the risk posed by the noncompliance to the reliability of the BPS, and the deterrent effect of an enforcement action or penalty, among other things. These considerations are very similar to the considerations that have been used since 2011 to determine whether noncompliance should be processed as an FFT.[37]

Compliance exception is an alternative disposition method and is not a dismissal, FFT, or Notice of Penalty. It is essentially the exercise of enforcement discretion with respect to a noncompliance regardless of its method of discovery (self-report, self-certification, audit finding, etc.).

When an instance of noncompliance is disposed of as a compliance exception, NERC does not publicly post it as in the case of an FFT or file it with the Commission as in the case of a Notice of Penalty. Rather, the Regional Entity retains the record for the compliance exception and provides NERC, through non-public means, a summary of the record. NERC then submits the compliance exceptions to FERC through non-public means.

A compliance exception is part of a registered entity's compliance history only to the extent it serves to inform the Regional Entity and NERC of the minimal risk issues that are detected and corrected by the registered entity, and may inform the Regional Entity's decision on how to treat future noncompliance with the same or similar facts. It should be noted that repeat

[37] *See, e.g.*, 2012 FFT Order at PP17-21.

compliance exceptions may not always be indicative of poor performance; they may in fact be evidence of robust controls in place to detect and correct instances of noncompliance as they occur. A registered entity may object to resolution of any issue as a compliance exception by providing written notification to the Regional Entity within seven days of the communication by the Regional Entity. In the event a registered entity objects to resolution as a compliance exception, the noncompliance will be resolved through one of the other enforcement processes established in the CMEP at the discretion of the Regional Entity.[38]

1. Instances of Noncompliance that Qualify for Recording as Compliance Exceptions

Minimal risk instances of noncompliance are eligible for processing as compliance exceptions regardless of the discovery method. Regardless of the discovery method, however, the noncompliance is recorded and tracked and reviewed by the Regional entity. As noted above, all compliance exceptions are also provided to NERC and FERC.

The Regional Entity determination of whether an instance of noncompliance is eligible for compliance exception treatment is essentially the same as the process it has been using, since 2011, to make a determination of eligibility for FFTs posing a minimal risk to the reliability of the BPS.[39] Regional Entities focus on the underlying facts and circumstances of the noncompliance, including what happened, why, where, and when. Another factor Regional Entities use to determine whether a noncompliance should be eligible for compliance exception treatment is the potential and actual level of risk to reliability, including mitigating factors during the pendency of the noncompliance. Regional Entities consider the registered entity's internal

[38] CMEP (Appendix 4C to the Rules of Procedure) § 5.0 Enforcement Actions.
[39] *See, e.g.*, 2012 FFT Order at PP17-21.

compliance program ("ICP"), including preventative and corrective processes and procedures, management practices, and culture of compliance as factors to help determine whether a noncompliance should receive compliance exception treatment. A robust ICP with strong management practices around Reliability Standards that led to timely discovery and swift mitigation of noncompliance creates a strong argument in favor of compliance exception treatment. Regional Entities also consider the presence and applicability of aggravating factors, such as repeat or repetitive noncompliance. An instance of noncompliance may be eligible for compliance exception treatment even if a registered entity has negative compliance history with a same or similar standard. This ensures that NERC and the Regional Entities do not discourage registered entities from robustly self-reporting noncompliance. However, repeat noncompliance should lead to a deeper look into root causes of mitigation failure and an examination of the connection between the registered entity's ICP, applicable organizational and management practices, and its day-to-day adherence to Reliability Standards in operations.

At this time, only noncompliance posing a minimal risk to the reliability of the BPS is eligible for compliance exception treatment. NERC's annual review of the program will consider the inclusion of moderate risk issues in the future.

2. Applicability throughout ERO Enterprise

Throughout the ERO Enterprise, a noncompliance can qualify for compliance exception treatment in two ways. The first way that noncompliance can qualify for compliance exception treatment is on a case-by-case basis; an individual issue is deemed to have posed a minimal risk to the reliability of the BPS and does not warrant a penalty, as discussed above. Beginning in 2015, this discretionary treatment will be available for any qualified minimal risk

noncompliance, regardless of the registered entity or discovery method, or version of the Reliability Standard and Requirement. The resolution of the noncompliance, including whether it may be resolved as a compliance exception, is based, as noted above, on a review of specific facts and circumstances.

The second way in which noncompliance posing a minimal risk to the reliability of the BPS can be resolved as a compliance exception is through the self-logging program. As explained below, noncompliance that is self-logged is presumed to be appropriate for disposition as a compliance exception. This approach, however, is limited to registered entities designated by the Regional Entity as eligible for self-logging.

As Regional Entities increase use of the compliance exception process for minimal risk issues in 2015 and beyond, the FFT process will remain available for processing of any minimal or moderate risk issue. However, it is likely that the FFT process would be used primarily to process those moderate risk issues that qualify, and minimal risk issues, when appropriate, would be disposed of as compliance exceptions. The FFT process will remain an available processing method for issues that do not qualify for compliance exception treatment when the facts and circumstances, mitigation, internal controls, and other factors, such as the registered entity's compliance history, make a monetary penalty and resolution through a Notice of Penalty filing inappropriate.

3. Processing and Recording of Compliance Exceptions

All noncompliance, including that which is eligible for compliance exception processing, is entered into the Regional Entity system, given a tracking ID, and undergoes the triage process. Upon determination that an item will be disposed of as a compliance exception, the Regional

Entity provides information regarding said item to NERC through nonpublic means. The information provided to NERC includes the relevant Reliability Standard and Requirement, a brief description of the noncompliance, an assessment of the risk to the BPS posed by the issue, and a description of the actions taken (or to be taken) to mitigate the issue and prevent recurrence.

Compliance exceptions must be mitigated within twelve months of the time of the communication to the registered entity resolving the matter without an enforcement action.[40] The timing of completing mitigating activities is not always associated with the risk posed by the noncompliance.[41] Consistent with the Commission's direction in its recent FFT order,[42] in the event Regional Entities dispose of a matter that has yet to be mitigate as a compliance exception, the record must clearly indicate (i) the expected completion date, (ii) the justification for the length of time required, and (iii) a description of all compensating measures in place during the period of noncompliance which reduce the risk to reliability while mitigation is ongoing. NERC will in turn provide this information to Commission staff. In addition, NERC will notify FERC staff when the mitigation is completed for each compliance exception with an extended mitigation period.

[40] Some issues, despite their posing a lower risk, require mitigating steps that may require extra time to complete. Therefore, with the understanding that setting an abbreviated timeframe for mitigation completion as a condition of compliance exception processing does not always accurately reflect the risk posed by the noncompliance, the ERO Enterprise set a twelve-month mitigation completion timeframe for compliance exceptions. *See North American Electric Reliability Corp. Compliance Filing and Report on the Find, Fix, Track and Report Program*, Docket No. RC11-6-004 at pp. 47-49 (June 20, 2014).
[41] *Id.*
[42] *North American Electric Reliability Corp.*, 148 FERC ¶ 61,214 at P 37 (2014).

This mitigation completion period is not intended to allow every issue receiving compliance exception treatment to be unmitigated by the time of the determination. Rather, it is intended to allow flexibility for the Regional Entities to provide appropriate treatment, even for those instances of noncompliance that require additional time for mitigation.[43] The ERO Enterprise goal for the allowance of extended completion periods is to provide appropriate flexibility to ensure full mitigation, not to encourage the delay of mitigation activity. In fact, despite the fact that the ERO Enterprise may exercise discretion over noncompliance that is capable of being mitigated within twelve months, not all minimal risk matters with open mitigating activities may be appropriate for compliance exception treatment. Indeed, where NERC and the Regional Entities determine such mitigating activities are not prompt or are otherwise unnecessarily delayed, NERC and the Regional Entities will evaluate the totality of the facts and circumstances when assessing an appropriate disposition method.

Registered entities will notify the Regional Entity of completion of mitigation through an authorized representative of the registered entity (including through electronic means). The Regional Entity will track mitigation completion and will notify NERC of that completion. Failure to complete mitigation in the established timeframe, or any material misrepresentation of information provided in connection with this program, will result in rescission of the eligibility for compliance exception treatment.

A compliance exception notice indicates to a registered entity that the Regional Entity has completed its review of the matter.

[43] *North American Electric Reliability Corp. Compliance Filing and Report on the Compliance Enforcement Initiative and Proposed Enhancements to the Find, Fix, Track and Report (FFT) Program*, Docket No. RC11-6-004 at pp. 40-41 (March 15, 2013).

4. Experience Gained during Pilot Phase

From November 2013 to the present, Regional Entities have been selecting compliance exception candidates from minimal risk noncompliance. This approach allowed the ERO Enterprise to implement the program gradually and refine the program requirements and processes. As of September 30, 2014, a total of fifty-four instances of noncompliance have been treated as compliance exceptions. Twenty-two compliance exceptions (41%) were low-risk CIP noncompliance; the remaining thirty-two compliance exceptions (59%) were non-CIP noncompliance. Fifty percent of the compliance exceptions were discovered in 2014. Twenty-five (46%) compliance exceptions were externally identified by Regional Entities (Compliance Audits, Spot Checks, or Investigations) and twenty-nine (54%) were internally identified by registered entities. NERC has included in its regular presentations to its Board of Trustees Compliance Committee information on compliance exceptions including levels of utilization, representative examples, and other data.

5. Visibility and Accountability

While the Regional Entity reports all instances of noncompliance to NERC, unlike an enforcement action, compliance exceptions are not filed or publicly posted.

There are, however, various ways for communicating to the public useful information regarding the overall rationale for decisions not to pursue certain matters as well as regarding the use of compliance exceptions throughout the ERO Enterprise. For example, NERC has published a Compliance Exceptions Overview document on its website.[44] This document

[44] Compliance Exceptions Overview, *available at*: http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/Compliance%20Exception%20Overview.pdf.

describes the aspects of the compliance exceptions, including eligibility requirements, mitigation requirements, finality, and how visibility and accountability will be maintained as the program is implemented and expanded across the ERO Enterprise. In addition, to ensure that the public can derive the maximum value of information regarding compliance exceptions without altering the message that these issues are generally not ones worthy of significant attention, NERC will make an annual informational filing to FERC reviewing the progress of the program and considering any enhancements or expansions that may be necessary. The annual report will include observed trends by standard, region or other categories. The report will also include examples of matters treated as compliance exceptions. Similar information will also be reported on a regular basis to the NERC Board of Trustees Compliance Committee.[45]

Non-public enforcement discretion is consistent with other regulatory regimes, including the Commission's. In FERC investigations closed without any action, the existence of the investigation remains non-public in all but rare circumstances.[46] In fact, in the Revised Policy Statement on Enforcement issued May 15, 2008, FERC noted that between 2005 and 2007, "Enforcement staff closed approximately 75 percent of its investigations without any sanctions being imposed, even though Enforcement staff found a violation in about half of those closed investigations. … Additionally, more than half of the self-reports submitted to FERC

[45] An example of the information submitted publicly to the Board of Trustees Compliance Committee is available at http://www.nerc.com/gov/bot/BOTCC/Compliance%20Committee%202013/November%2012%20Compliance%20Committee%20Agenda%20Package.pdf.
[46] *See* 18 C.F.R. Part 1b (2014).

Enforcement staff were closed with no action."[47] From 2007 through 2013, FERC Office of Enforcement, Division of Investigations staff closed approximately 50 percent of its investigations without imposing sanctions—many with findings of violation.[48] The rare circumstances in which FERC does publish both the existence and the results of its investigations underscore their importance and allow FERC to communicate the importance of such matters to the regulated community.

Indeed, an enforcement agency should not, as a general matter, provide precise indications of where the bar is for its exercise of discretion. The Freedom of Information Act acknowledges this rationale in permitting a U.S. agency to withhold law enforcement records that "would disclose techniques and procedures for law enforcement investigations or prosecutions, or would disclose guidelines for law enforcement investigations or prosecutions if such disclosure could reasonably be expected to risk circumvention of the law[.]" 5 U.S.C. § 552(b)(7)(E).

There is also a privacy issue for those registered entities involved where no formal determination regarding a violation has been made. An entity's reputation could be adversely impacted if disclosed, even though there was no formal determination regarding a violation. In the context of investigations, the Commission has acknowledged that "premature disclosure could adversely affect the reputation of the subject. Public disclosure at the outset of an

[47] *Revised Policy Statement on Enforcement*, 123 FERC ¶ 61,156, P 9 (2008) (2008 Revised Policy Statement).
[48] *2013 Staff Report on Enforcement*, Docket No. AD07-13-006 pp. 22-25 (November 21, 2013) *available at:* http://www.ferc.gov/legal/staff-reports/2013/11-21-13-enforcement.pdf.

investigation would risk exposing the subject to undue public suspicion without staff having conducted sufficient discovery to reach a preliminary finding that the subject may have violated a Commission requirement."[49] In the instance of a compliance exception, the CEA does not reach a determination regarding a violation. Therefore, public disclosure could "expose the subject to undue public suspicion."[50]

The nonpublic nature of compliance exceptions also reinforces the need for registered entities to shift focus and attention to higher-risk noncompliance, which is made public. The continuation of publicly posting the resolution of minimal risk noncompliance would dilute the message that is sent through the public disposition of higher-risk matters. As indicated above, trends and analysis associated with such minimal risk noncompliance may be educational or otherwise helpful, and will be provided to the public regularly. However, posting of individual accounts of trivial instances of noncompliance does not provide a benefit and diverts resources from the ERO Enterprise that should be allocated elsewhere. To illustrate this point, the following are examples of minimal risk instances of noncompliance that received compliance exceptions treatment.

- During an internal review, the entity identified that after an internal reorganization took place a year earlier, it had failed to document changes to the CIP senior manager within 30 calendar days of the effective date. The primary cause for the noncompliance was a lack of knowledge by the Primary Compliance Contact, who had been responsible for documenting the change, because the person had been in the position approximately six months at the time of the management change. The risk was minimal because the entity has no Critical Assets and is a small size utility.

[49] *Enforcement of Statutes, Regulations, and Orders*, 129 FERC ¶ 61,247 at P5 (2009); *order on reh'g.*, 134 FERC ¶ 61,054 (2011).
[50] *Id.*

- An entity self-identified that it had missed three work orders associated with three separate batteries each located at different generation facilities. The three instances of monthly frequency missed were from prior years and despite the missed work orders, the three batteries involved had been tested and maintained per prescribed frequency defined by the entity's program on a consistent basis.

- An entity self-identified that it failed to revoke access to Critical Cyber Assets (CCAs) within seven calendar days for personnel who no longer required such access to CCAs. The noncompliance was related to one employee who started working remotely and therefore did not need physical access to the CCAs. The helpdesk misinterpreted the email notification as no access removal is required since the employee is now working remotely.

The review, by the public, of these and other individual accounts of trivial, minimal risk noncompliance does not promote the reliability of the BPS.

6. Oversight by NERC

As discussed above, the resolution of noncompliance as compliance exceptions does not eliminate or reduce oversight or visibility regarding minimal risk noncompliance. NERC will continue to provide oversight of the program. All noncompliance, including that which is eligible for compliance exception processing, will continue to be entered into the Regional Entity compliance data systems and assigned a tracking identification number. Upon its determination that an item will be disposed of as a compliance exception, the Regional Entity will provide information to NERC on a monthly basis. The record will include the relevant Reliability Standard and requirement, a description of the issue, an assessment of the risk to the reliability of the BPS posed by the issue, and the actions taken (or to be taken) to mitigate the issue and prevent recurrence. As with all identified instances of noncompliance, NERC provides the information submitted by the Regional Entity to the Commission through non-public portals.

In 2014, NERC will continue to review all compliance exceptions. Beginning in 2015, however, NERC will, in a manner similar to its oversight of FFT, review a sample of compliance exceptions on a regular basis and provide guidance or adjustments on a prospective basis.

D. Self-logging Program

Beginning in October 2013, NERC and certain Regional Entities began to allow select registered entities with demonstrated effective management practices to self-identify, assess, and mitigate instances of noncompliance to log minimal risk noncompliance that would otherwise be individually self-reported. The logs contains a detailed description of the issue, the risk assessment with factual support, and the mitigating activities completed or to be completed by the Registered Entity. The log is periodically reviewed and approved by the Regional Entity (or in the case of multi-regional logs, Regional Entities). Logged items are presumed to be resolved as compliance exceptions once reviewed and approved by the Region(s). In that review and approval process, the Regional Entity determines that the issue is described accurately, that the minimal risk determination is justified and reasonable, and that the issue is adequately mitigated. This is consistent with the principle that minimal risk noncompliance that is self-identified, corrected, mitigated, and documented by the entity, should not be resolved through the formal enforcement process or incur a penalty absent a higher risk to the BPS.

The program relies on and promotes a closer understanding by Regional Entities of registered entities' management practices. In addition, it creates motivation and incentives for registered entities to implement effective controls to detect and correct instance of noncompliance as they arise. Registered entities currently participating in the program report that they see a significant benefit, particularly associated with the presumption that logged items

will be resolved as compliance exceptions and the efficiency gains associated with streamlining the processing of self-reports and mitigation plans.

1. Eligibility to Participate in the Program

In determining eligibility, the Regional Entities consider whether a registered entity is capable of self-identifying and mitigating minimal risk noncompliance on its own, as demonstrated by, among other things: (i) the registered entity's history of initiative and recognition of compliance obligations; (ii) the registered entity's reliable and accurate self-reporting of noncompliance to the Regional Entities; (iii) the registered entity's history of mitigating its noncompliance in a timely and thorough manner; (iv) the quality, comprehensiveness, and execution of the registered entity's internal compliance program; (v) the registered entity's cooperation with the Regional Entity during enforcement actions, compliance monitoring activities, and Regional Entity outreach; and (vi) the registered entity's performance during regional Compliance Audits.

An ICE, if performed, informs a Regional Entity's decision regarding participation in the self-logging program, but is not a prerequisite for participation. In fact, as noted above, an ICE may not always be necessary given the inherent risk posed by a particular entity for a particular function. However, the Regional Entity may inquire as to the internal controls in place to self-monitor and then identify, assess, and correct issues for which the registered entity is allowed to log minimal risk noncompliance. This inquiry will be scaled in accordance with the risk posed by the registered entity.

Eligibility for the self-logging program is not an all-or-nothing proposition. Each registered entity may receive a set of individualized parameters for its participation in the

program that reflects the risk posed by the registered entity and the strength and maturity of its practices in a given area. For example, a registered entity may be eligible to self-log noncompliance with certain Reliability Standards and not others.

Registered entities may lose eligibility to self-log for various reasons. A Regional Entity may remove a registered entity's ability to self-log minimal risk noncompliance for all or a subset of Reliability Standards if the registered entity has demonstrated deficiencies in identifying, assessing, or correcting noncompliance. Misrepresentation or repeated, avoidable inaccuracies in the log may also result in the loss of the registered entity's self-logging ability.

Participation in the self-logging program is voluntary. Registered entities may contact their Regional Entities regarding participation, but are not required to participate.

2. Processing and Recording of Self-Logged Noncompliance

Registered entities permitted to self-log must maintain a record of instances of noncompliance with NERC Reliability Standards that posed a minimal risk to the reliability of the BPS. Appropriate self-logging replaces the individual Self-Reports and accompanying formal Mitigation Plans for each such instance of noncompliance.

On the log, the registered entity records a detailed description of the minimal risk issue that it has identified, the basis of its minimal risk assessment, and the actions it has taken or will take to correct the issue, specifically the mitigating activities it has undertaken to address the issue and prevent reoccurrence. Because only minimal risk issues are eligible for inclusion on the log, the registered entity's processes in place to determine risk are key to its eligibility for self-logging. The log is currently in the form of a spreadsheet similar to that used for FFT issues.

It is expected that, in the future, subject to successful system upgrades, registered entities will be able to maintain their log electronically on the Regional Entity portal.

The registered entity submits its log for review by the Regional Entity every three months.[51] The Regional Entity must review the log to confirm that the registered entity has adequately identified and described the noncompliance, accurately assessed the risk, and appropriately corrected or identified the steps it will take to correct (i.e. mitigate) the noncompliance. The Regional Entity may submit any concerns, questions, or proposed revisions to the registered entity for consideration. Once the log is finalized, the log is submitted to NERC, and the minimal risk individual issues are processed as compliance exceptions. If compliance exception treatment is not appropriate for any individual instance of noncompliance recorded in the log, the matter may be resolved through any of the remaining disposition tracks. At this time, noncompliance posing a moderate or greater risk to the reliability of the BPS is ineligible for self-logging.

In the event the registered entity identifies a noncompliance and determines that it poses more than a minimal risk, or the registered entity is not certain of the level of risk posed by the noncompliance, the registered entity is encouraged to submit a Self-Report to its Regional Entity.

[51] The Regional Entity may adjust this period to six months based on its experience with the registered entity in the self-logging program.

3. Experience Gained during Pilot Phase

Self-logging began, as a pilot program, in October 2013A few representative experiences are related below.

The New York Power Authority ("NYPA"), a state public power organization, participated in a pilot program and shared its experience during a public webinar.[52] NYPA explained how compliance exceptions and self-logging are implemented and why it will benefit registered entities. NPCC used information gathered from several sources including a 2012 voluntary Entity Impact Evaluation[53] of NYPA and the results of a voluntary 2013 ICE of NYPA to determine the scope of Reliability Standards subject to self-logging. As part of its internal controls structure, NYPA conducts internal investigations of potential compliance concerns, which involve: (i) identification of a concern, (ii) a fact-finding investigation (interviews and evidence collection), (iii) a review of applicable standard requirements and regulatory guidance, (iv) identification of mitigating factors, (v) determination of whether a possible violation occurred and its status (ended or continuing), (vi) an assessment of the potential and actual risks, (vii) analyzing whether it had any previous violations related to the issue, and (viii) mitigation activities in progress or completed. After conducting its internal investigation, NYPA notified NPCC of any noncompliance and its risk assessment. For possible violations identified by NYPA as minimal risk, NPCC conducted a review and, if NPCC affirmed the minimal risk, included it as a violation in the log.

[52] *Available at:* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative%20Workshops/Reliability%20Assurance%20Initiative_RAI_Webinar_6%2019%2014_Final.pdf.

[53] "Entity Impact Evaluation" was a working name for the IRA.

NYPA maintained and submitted tracking spreadsheets to NPCC at least once every six months. NPCC determined if any of the issues needed further mitigation or enforcement action. The implementation required NYPA to internally assess actual and potential risk, process, track, and remediate issues, have a notification procedure for a possible minimal risk issue, and conduct monthly conference calls with NPCC. During monthly conference calls, NPCC and NYPA reviewed actions from the last meeting, tracked spreadsheets, reviewed and discussed each issue, discussed implementation matters, and reviewed the RAI Pilot Program status. Self-logging allowed NYPA to test and investigate its internal controls and address the steps needed to mitigate possible violations.

The American Transmission Company ("ATC"), a multi-state, transmission-only utility, also participated in the June 2014 webinar. ATC explained the scoping process for its audit and espoused the value of compliance exceptions. ATC also indicated that it views self-logging as essential to a truly risk-based approach to compliance oversight.

After participating in the self-logging pilot, ATC communicated that its compliance program will be further enhanced and structured towards an internal controls framework in the future. ATC predicted that by transitioning into the reliability assurance model, it will strengthen its processes and programs that support the COSO fundamental concepts, refine its internal controls, better define activities to monitor the execution of internal controls, bring more formality and structure to its corrective action process, and enhance its position as "audit ready."

One pilot involved a multiregional registered entity, American Electric Power ("AEP"), one of the largest electric utilities in the U.S. AEP participated in an enforcement pilot with RF, Texas RE, and SPP RE. Based on the results of RF's evaluation of AEP's internal controls,

along with other considerations such as AEP's compliance history, its history of self-assessment and self-reporting possible violations, and the quality of its internal controls, AEP logged minimal risk noncompliance (that would otherwise qualify for FFT treatment) of certain CIP standards.

The log, as well as AEP's procedures for maintaining the log and ensuring that noncompliance was discovered, recorded, and mitigated, was periodically checked by the three Regional Entities. After review and approval by the Regional Entities, the minimal risk issues were treated as compliance exceptions.

4. Visibility and Accountability

The ERO Enterprise will continue to have visibility and accountability over all instances of self-logged noncompliance. In practice, as explained in more detail below, in many instances the logged instances of noncompliance may be more comprehensive than self-reports, because of the presumption of compliance exception treatment. The ERO Enterprise will use the information collected through the self-logging program primarily for trending purposes. However, to the extent that items are not properly logged or there is an issue with the risk assessment or mitigation activities, the Regional Entity may, as discussed above, remove the item for processing through any other means and may modify the scope of the entity's ability to log (or exclude the entity from the logging program altogether).

NERC and Regional Entities also will periodically evaluate the registered entities' participation in the self-logging program. If NERC or the Regional Entity determines that a registered entity is no longer eligible to participate in the self-logging program, or if they should

adjust the parameters of its participation, NERC or the Regional Entity will provide notice to the registered entity and each other including an explanation of such determination.

5. Benefits of Self-logging

To date, the ERO Enterprise has identified several benefits of self-logging. First, because the minimal risk issues have the presumption of compliance exception treatment, experience has shown, as noted above, that logs often increase visibility into noncompliance detected and corrected at the registered entity. The experience with the program shows that the registered entity may be more likely to record additional information on its log than it would include in a self-report. There are a number of incentives associated with logging of noncompliance. For instance, logged items treated as compliance exceptions will not incur a financial penalty. Further, logged items treated as compliance exceptions are not part of a registered entity's violation history for purposes of aggravation of penalties.[54] Given these incentives, registered entities have shown a greater inclination to identify potential noncompliance, including at times when they may be uncertain about whether the identified issue is a noncompliance.

Second, the program fosters efficiency and reduces certain formal administrative processes associated with individual Self-Reports. As mentioned previously, efficiency does not necessarily mean less time or effort. Rather, it is using the requisite time, knowledge, and skills required for each circumstance. Once there is an understanding of the registered entity's internal processes associated with identification, assessment, and correction of noncompliance, and there is an alignment as to the expectations of the Regional Entity regarding the type of information to

[54] As explained above, a compliance exception is part of a registered entity's compliance history only to the extent that it serves to inform the ERO Enterprise of potential risk.

be included in the log, including for the risk assessment, the entities participating in the program have reported efficiency gains.

The third benefit of self-logging is that the log is an ideal forum for trend spotting because all minimal risk issues related to a particular area and the mitigation associated with them are contained on the log. Experience has shown that the log review and discussion may trigger productive dialogue between the Regional Entity and the registered entity regarding expanding mitigating activities to prevent broader issues in the future.

Fourth, because the registered entity must do its own risk assessment in order to determine whether the noncompliance qualifies for self-logging, and because the rationale contained within the log must support the risk assessment, Regional Entities see more analysis of risk on the registered entity's part when it comes to noncompliance with Reliability Standards than is common in self-reports.

Finally, self-logging is a valuable tool to recognize management practices around Reliability Standards and good performance on the part of registered entity, and at the same time allow the Regional Entities to focus time and resources on issues that pose a greater risk to reliability of the BPS.

6. Oversight by NERC

The Regional Entities inform NERC of registered entities allowed to self-log minimal risk noncompliance. NERC exercises oversight over the program to ensure it is administered consistently and appropriately.

Regional Entities document the factors they analyzed when determining the eligibility of each registered entity to self-log. In accordance with the program document,[55] this documentation includes (i) evaluation of the registered entity's compliance history, (ii) consideration of the timing and quality of the registered entity's Self-Reports, (iii) assurance of the registered entity's ability to assess the risk of noncompliance accurately, (iv) examination of the registered entity's mitigation performance, (v) review of the registered entity's internal compliance program documents, including the date of the latest review, (vi) determination of the registered entity's risk, including the results of an Inherent Risk Assessment, if applicable, (vii) justification for the scope of Reliability Standards for which the registered entity is permitted to self-log, and (viii) a description of the Regional Entity's structure and process for reviewing requests to join the self-logging program, including the department(s) responsible for making eligibility decisions.

NERC will periodically review the Regional Entities' eligibility determinations. NERC may also request information on eligibility determinations outside of a regular periodic review based on questions about a registered entity's participation.

[55] *Available at:* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/Self-logging%20of%20Minimal%20Risk%20Issues%20Program%20Overview.pdf.

VI. CONCLUSION

The ERO Enterprise has developed the concepts, processes, pilots, and programs detailed above to implement a more robust, risk-based program for compliance monitoring and enforcement of Reliability Standards that benefits reliability. These processes are consistent with existing Rules of Procedure and allow registered entities and the ERO Enterprise to focus on areas posing greater risk to the reliability of the BPS while maintaining appropriate visibility over lesser-risk issues. NERC has posted guides and program documents and provided training and outreach efforts related to the new and expanded processes and programs to allow for full implementation in 2015. This implementation will accompany additional training and outreach efforts directed at ERO Enterprise staff and industry stakeholders. NERC oversight of all these risk-based processes and programs will ensure NERC will identify and address additional guidance and training to adapt quickly to specific implementation challenges. In identifying such areas, NERC will consider the feedback from registered entities, Regional Entities, and other stakeholders.

NERC respectfully requests that the Commission accept this filing for informational purposes.

Re: Informational Filing Regarding Commissioner Philip D. Moeller's Inquiry into the Trading of Natural Gas, and the Proposal to Establish an Electronic Information and Trading Platform, FERC Docket No. AD14-19-000

Dear Ms. Bose:

On September 18, 2014, Commissioner Philip D. Moeller convened a meeting to discuss ideas to facilitate and improve the way in which natural gas is traded, and explore the concept of establishing a centralized information and trading platform for natural gas. As announced at the meeting, the above-captioned docket was created to allow interested parties to file written comments on any issue that was discussed at the meeting.[1]

The North American Electric Reliability Corporation ("NERC") has developed the attached report which is an analysis of the weather condition that occurred in early January of 2014 known as a polar vortex, where frigid arctic condition dipped down to much lower latitudes than normal, resulting in extreme cold weather. As expected, key factors during the event included fuel deliverability issues, natural gas pipeline outages, gas service interruptions, frozen electricity and gas equipment and other extreme cold weather operating challenges. The attached report analyzes the system impacts from the polar vortex and notes that the Bulk-Power System demonstrated resiliency, despite these challenging conditions.

As noted during the meeting convened by Commissioner Moeller, severe weather is a challenge to be addressed in exploring the concept of establishing a centralized information and trading platform for natural gas. For this reason, NERC is submitting the attached report for informational purposes.

Respectfully submitted,

/s/ Stacey Tyrewala
Stacey Tyrewala

Attorney for the North American Electric Reliability Corporation

[1] While the post-meeting notice requests that comments be limited to no more than five pages, NERC is not providing written comments on the conference, it is providing a report strictly for informational purposes.

Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the bulk power system (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.

FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RF	ReliabilityFirst
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electricity Coordinating Council

Executive Summary

This report describes what happened during the polar vortex and why some of the conditions occurred, and it presents lessons learned and recommendations for future actions. In early January of 2014, the Midwest, South Central, and East Coast regions of North America experienced a weather condition known as a polar vortex, where extreme cold weather conditions occurred in lower latitudes than normal, resulting in temperatures 20 to 30° F below average. Some areas faced days that were 35° F or more below their average temperatures. These temperatures resulted in record high electrical demand for these areas on January 6 and again on January 7, 2014.

During the polar vortex, the cold weather also increased demand for natural gas, which resulted in a significant amount of gas-fired generation being unavailable due to curtailments of gas. Balancing Authorities (BAs) and Load-Serving Entities in both the Electric Reliability Council of Texas (ERCOT) and the Eastern Interconnection were mostly able to maintain their operating reserve margins and serve firm load. By properly and appropriately communicating through the NERC Energy Emergency Alert (EEA) process using interruptible load, demand-side management[1] tools, and voltage reduction, only one BA was required to shed firm load. The amount shed was less than 300 MW, representing less than 0.1 percent of the total load for the Eastern and ERCOT Interconnections. Many outages, including a number of those in the southeastern United States, were the result of temperatures that fell below a plant's design basis.

Generation facilities have made improvements in their winter preparation activities since February 2011; however, every extreme event provides insight for future improvements. Generation facilities across all Regions have indicated that they have reviewed or implemented recommendations from the *February 2011 Southwest Cold Weather Event Lessons Learned*, as well as the *Generating Unit Winter Weather Readiness* reliability guideline.

System Operators had many challenging decisions to make as a result of lost capacity from both weather conditions exceeding the design basis of generating units, and from the lack of availability of natural gas. They successfully maintained reliability through extensive training and preparation. For example, during the polar vortex, several System Operators used load reduction techniques such as voltage reduction or interruptible loads. They also made effective use of emergency procedures to manage loads and generation.

While the NERC Event Analysis process has clearly defined categories for electric disturbances in small defined geographic areas, based on the combined unintended loss of generation during the three-day period (January 6–8), this event reached the equivalent of an ERO Event Analysis Process level of Category 5 (unintended loss of more than 10,000 MW of generation). WECC and the majority of the Canadian entities are not included in this analysis as the report is based on the geographic areas that observed effects of this extreme event.

The report also contains more than a dozen observations and recommendations to improve performance ahead of and during cold weather events. The recommendations include:

- Review natural gas supply and transportation issues and work with gas suppliers, markets, and regulators to develop appropriate actions.
- Review and update power plant weatherization programs, including procedures and staff training.
- Continue or consider implementing a program for winter preparation site reviews at generation facilities.
- Review internal processes to ensure they account for the ability to secure necessary waivers of environmental and/or fuel restrictions.

[1] The term for all activities or programs undertaken by Load-Serving Entity or its customers to influence the amount or timing of electricity they use.

- Continue to improve operational awareness of the fuel status and pipeline system conditions for all generators.
- Include in winter assessments reasonable losses of gas-fired generation and considerations of oil burn rates relative to oil replenishment rates to determine fuel needs for continuous operation.
- Ensure that on-site fuel and fuel ordered for winter is adequately protected from the effects of cold weather.
- Consider (where appropriate) the temperature design basis for generation plants to determine if improvements are needed for the plants to withstand lower winter temperatures without compromising their ability to withstand summer temperatures.
- Review the basis for reporting forced and planned outages to ensure appropriate data for unit outages and de-ratings.

Introduction

Review of Polar Vortex Weather

The effects of the polar vortex in the United States were initially felt in the far northwestern portion of the MRO footprint, but these low temperatures quickly spread to nearly all portions of the Eastern and Texas Interconnections. In many areas in the United States, temperatures were far colder than those normally experienced in winter, resulting in record winter peak electric demands associated with increased electric heating requirements.

The average daily temperature for the United States on January 6 was calculated to be 17.9° F (-7.8° C). The last time the average for the country was below 18° F was January 13, 1997. This 17-year period without the national average for the United States dropping below 18° F is the longest gap on record and, since then, a significant portion of the generating fleet is now fueled by natural gas.[2] On January 7, at least 49 record low temperatures were set across North America.

As shown in Table 1 and Figures 1 and 2, the polar vortex started in the northern Great Plains and moved south and east. The selected cities are representative of the Regional Entities affected by the extreme cold and are also large load centers.

[3] These high and low temperatures were gathered from www.accuweather.com and represent the both the average and actual high and low temperatures experienced during this timeframe

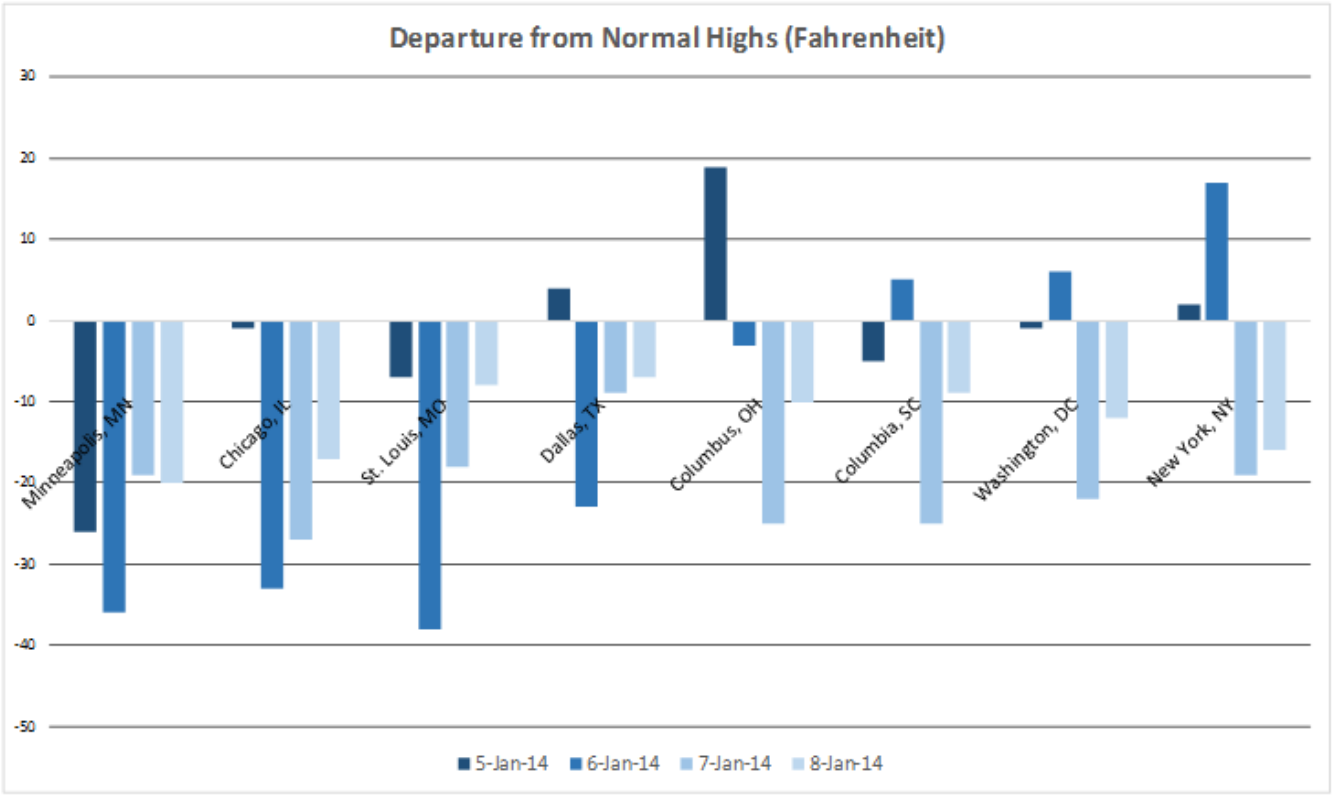

Figure 1: Departure from Normal High Temperatures

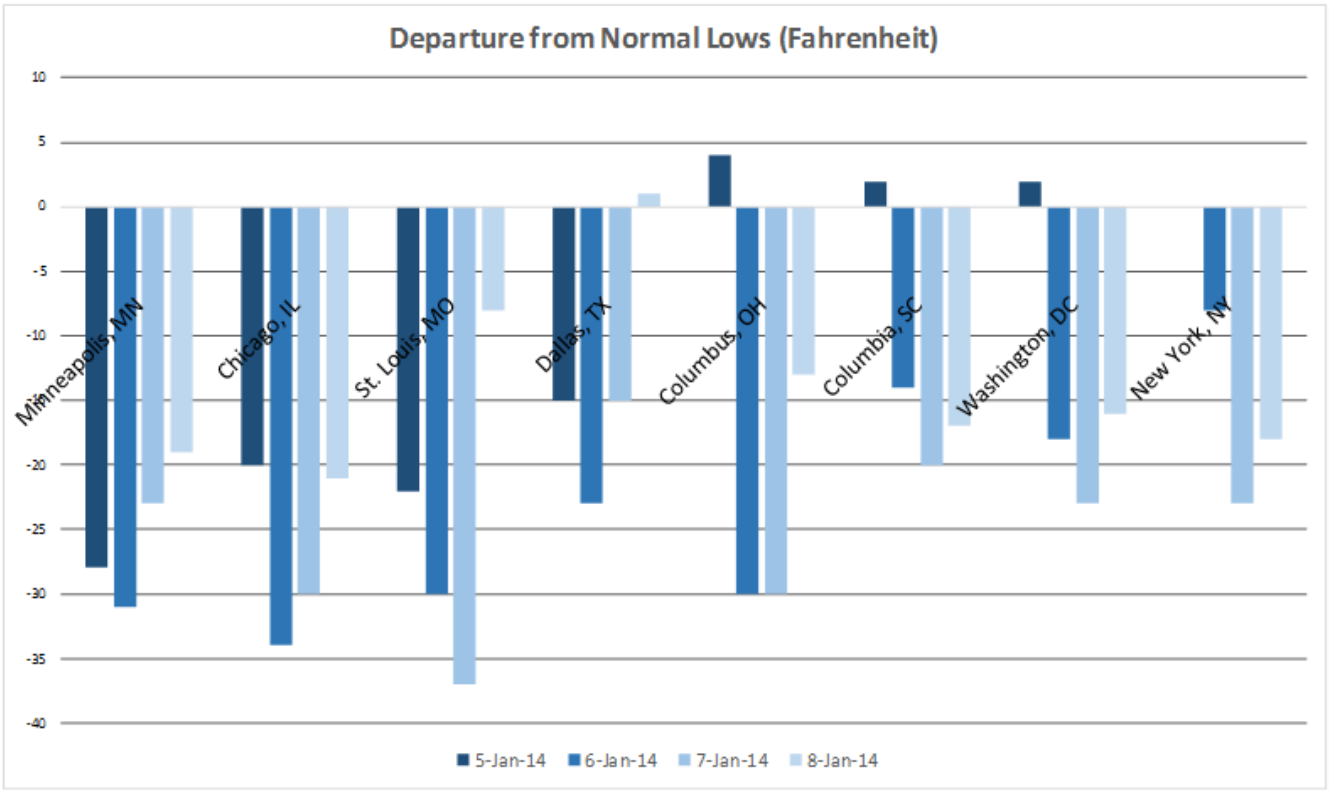

Figure 2: Departure from Normal Low Temperatures

The most significant impacts to the BPS in the MRO Region began on January 5, 2014, and persisted through January 7, 2014. The extremely cold temperature was the primary impacting factor, but heavy precipitation also affected large portions of the Region. Temperatures in many areas were the lowest experienced in 20 years. Minneapolis, where the average high for early January is 23° F, experienced 62 consecutive hours below 0° F from January 5 to January 7.

As the polar vortex extended south and east, it also began to impact the SPP, TRE, RF, SERC, and NPCC Regional Entities. As a result, the majority of the Eastern and ERCOT Interconnections experienced similar variances from normal. For example, St. Louis experienced temperatures up to 38° F below normal, and Chicago up to 34° F below normal; other parts of the country experienced temperatures between 23 and 30° F below normal. In Indianapolis, where they normally experience average highs of 35° F during this period, temperatures remained below 0° F for 33 consecutive hours.

Temperatures in the Canadian regions of MRO were even colder and started earlier. Saskatchewan, for instance, started to experience the polar vortex beginning the evening of January 3, with the greatest impact on the nights of January 5 and 6. Additionally, the city of Regina, Saskatchewan fell to below 0° F temperatures the night of Friday, January 3, and did not climb above 0° F until January 8. Winnipeg, Manitoba experienced a similar plunge in temperature with the mercury falling to -31° F on the night of Saturday, January 4, 2014. The night of January 5, 2014, they experienced a low of -36° F. The temperature in Winnipeg did not climb back above 0° F until Thursday, January 9, 2014.

As shown in Figure 3 and Table 2, these lower temperatures had a drastic impact on load, with many of the Reliability Coordinators (RCs) (e.g., Midcontinent Independent System Operator (MISO), PJM Interconnection (PJM), the Tennessee Valley Authority (TVA), the VACAR South RC (VACS RC), and Southeastern-RC) reporting record or near-record winter peak demands. PJM exceeded its historic winter peak on both January 7 and January 8, 2014, and MISO reported that they exceeded their historic winter peak for three straight days (January 6–8, 2014).

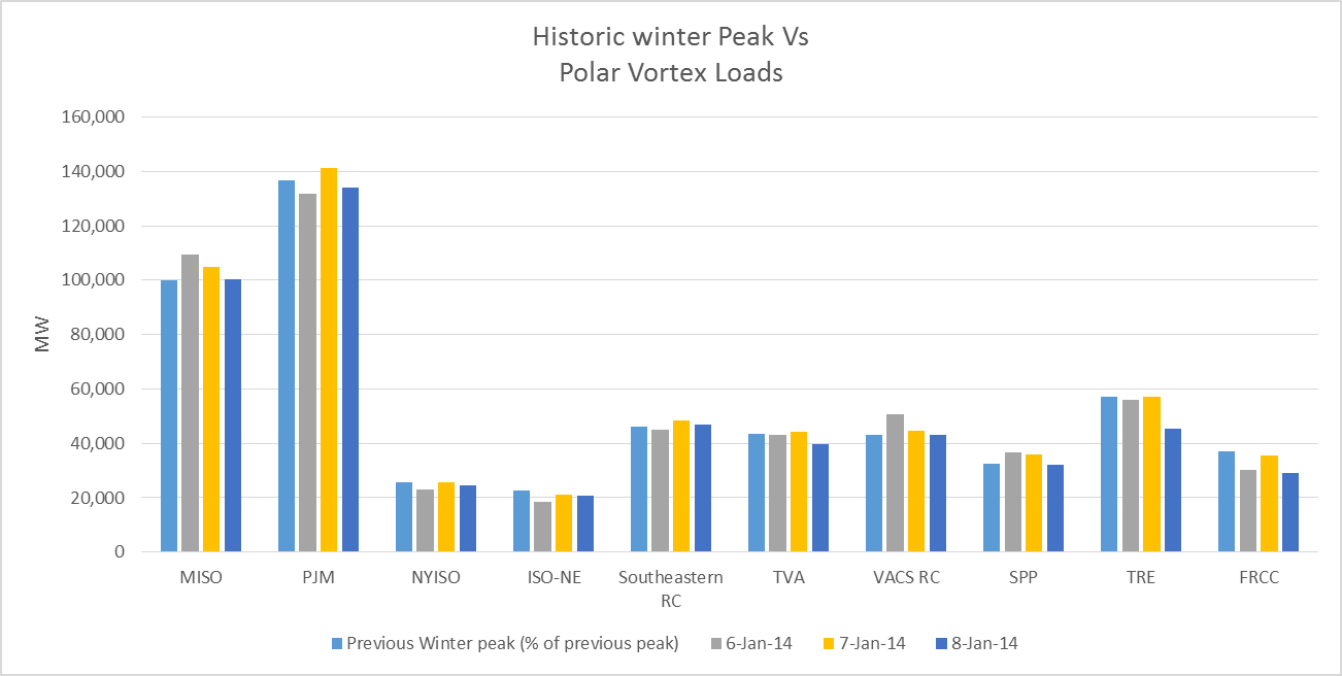

Figure 3: Historic All-Time Winter Peaks vs. Polar Vortex Loads

As seen in Table 2 and Figure 3, each of the RC areas were experiencing either new peak winter electric loads or loads that were close to the previous all-time winter peak, with eight of 10 areas setting new all-time peaks either on January 6 or 7, 2014. VACS RC experienced a new winter electric load peak that was almost 18 percent greater than the previous all-time winter peak.

Table 2: Historic Winter Peak Loads vs. Polar Vortex Loads by Percentage[4]

	MISO	PJM	NYISO	ISO-NE	South-eastern RC	TVA	VACS RC	SPP	ERCOT	FRCC
Previous Winter peak (% of previous peak)	99,855	136,675	25,541	22,818	46,259	43,384	42,983	32,635	57,265	36,926
6-Jan-14	109,307 (109.5%)	131,142 (95.5%)	23,197 (90.8%)	18,500 (81.1%)	44,871 (97.0%)	43,277 (99.8%)	50,659 (117.9%)	36,602 (112.2%)	56,031 (97.8%)	30,231 (81.9%)
7-Jan-14	104,746 (104.9%)	140,510 (103.5%)	25,738 (100.8%)	21,300 (93.3%)	48,279 (104.4%)	44,285 (102.1%)	44,654 (103.9%)	36,079 (110.6%)	57,277 (100.0%)	35,638 (96.5%)
8-Jan-14	100,154 (100.3%)	133,288 (98.1%)	24,551 (96.1%)	20,800 (91.2%)	47,005 (101.6%)	39,820 (91.8%)	43,203 (100.5%)	31,944 (97.9%)	45,281 (79.1%)	29,251 (79.2%)

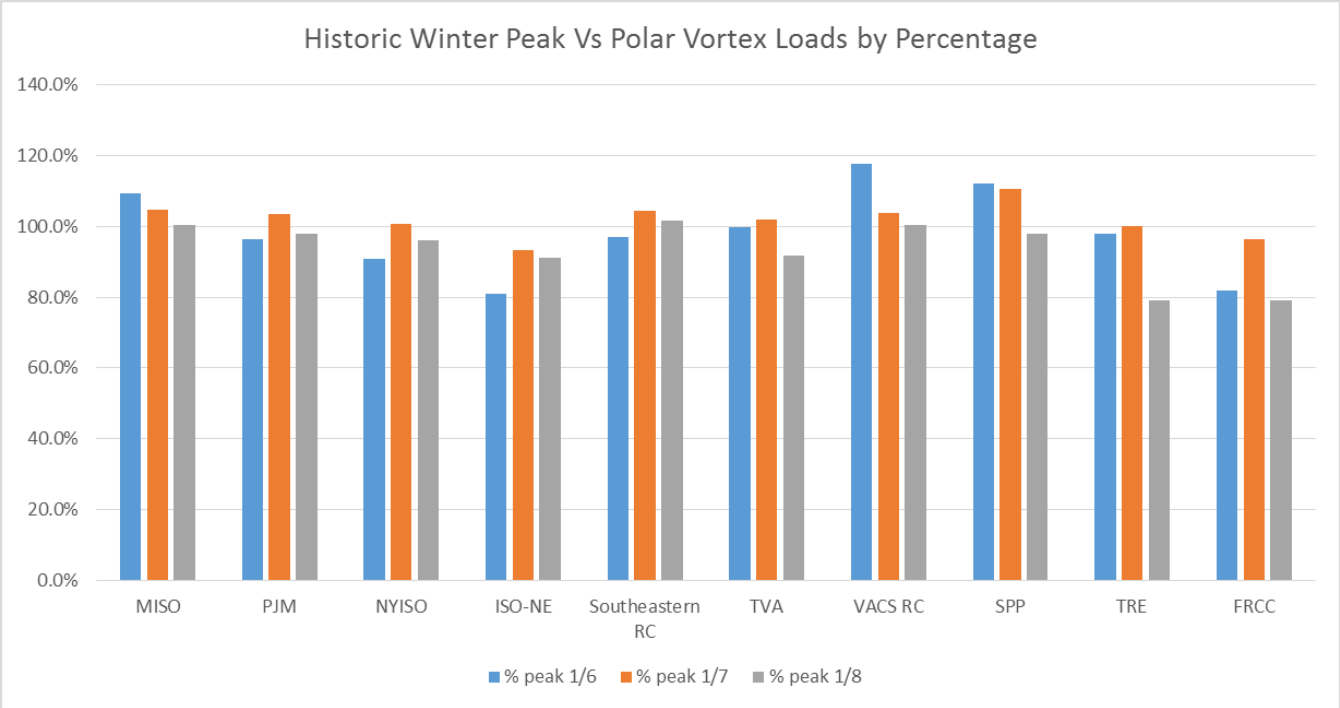

Figure 4: Historic All-Time Winter Peaks vs. Polar Vortex Loads by Percentage

With the significant temperature deviations and the accompanying increases in electric demand over such a wide area, it was challenging for BAs to supply sufficient generation to their areas, therefore making it challenging to

[4] Highlighted blue squares represent new all-time winter peak loads.

supply assistance to neighboring BAs. The peak loads experienced January 6–7 exceeded the combined noncoincident peaks achieved previously. On January 7, the combined load for the impacted BAs was 559,000 MW, or just under 3 percent higher than the nonsimultaneous historical peak.

Chapter 1 – Method of Analysis

GADS Data Review and Validation

NERC introduced the Generating Availability Data System (GADS) in 1982. GADS data is used to calculate important performance statistics and supports bulk power trend analysis by providing information on forced outages, maintenance outages, planned outages, and derates. The NERC Board of Trustees (Board) approved mandatory reporting of data to GADS for conventional generating units on August 4, 2011. Renewable generation (wind and solar) are not part of the mandatory data submittal requirements. The MW size of the conventional units was phased in, with units having a nameplate rating of 50 MW and larger starting January 1, 2012, and those with a nameplate rating of 20 MW and larger starting January 1, 2013. GADS data is collected from all Generator Owners on the NERC Compliance Registry under NERC's Rules of Procedures Section 1600, Request for Data or Information. Generating units less than 20 MW are encouraged to report unit information on a voluntary basis.

NERC collects the equipment information by class of outage and calculates statistics such as Equivalent Forced Outage Rate (EFOR) using IEEE Standard 762 definitions, thereby ensuring a high level of confidence that the statistics are calculated in a uniform process using an industry-approved method. Analysis of GADS data provides trend information on forced, maintenance, and planned outages and derations.

Further, NERC collects information on the fuels burned and fuel-switching activities (coal to gas, oil to gas, and bio-fuels to other fuels). Since GADS was a voluntary database prior to 2012, analysis of data prior to 2012 provides partial information. Additionally, since units less than 50 MW but greater than 20 MW were not reported to NERC until 2013, analysis of 2012 data may be biased toward larger units. With these factors in mind, NERC examined GADS data to determine an expected EFOR for the polar vortex time period. The complete summary of the data analysis is provided in Appendix A.

NERC used the GADS information to analyze generator availability during the polar vortex. A list of generation outages due to planned and forced outages could be obtained, as well as analysis of forced outage cause codes. This data was used to determine the amount of generation that was forced out specifically due to the polar vortex, as opposed to generation that was forced out due to other operational parameters.

GADS also collects additional generation information on a voluntary basis. Examples of this information include reasons for derates, verbal descriptions of outages, and explanatory cause codes. This information is extremely useful in analyzing individual events, but provides limited value when calculating trends of performance characteristics.

Since GADS is used to examine trending information on a high level, the system had never been used to analyze performance information for generating units on as granular a scale as that required for the polar vortex. This presented a few challenges in data validation.

The NERC Performance Analysis staff began by obtaining a list of all generation that had reported outages in GADS. The NERC Event Analysis staff then compared the forced outages and derations list with analysis that was performed by various NERC Regional Entities and registered entities. Discrepancies were sent to the respective Regional Entities for validation and correction. After a period of examination of generator outage data by Regional Entities, 95 percent of generation outage data during the polar vortex was validated.

Chapter 2 – Effects

System Operations

System Operators had many challenging decisions to make as a result of lost capacity from both weather conditions exceeding the design basis of generating units, and from lost fuel due to the lack of natural gas transportation. They successfully maintained reliability through previous extensive training, preparation, and use of tools.

One of the largest issues impacting gas-fired generation was the curtailment or interruption of fuel supply. Unlike other fuel sources, natural gas is not typically stored on-site. Generators rely on real-time delivery of natural gas from their suppliers. When units are not confident that they will be dispatched, the fuel is often obtained on the spot-market on a non-firm, interruptible basis. Therefore, if firm contracts are honored before interruptible contracts, if the firm customers require more gas, and the capacity of the gas transportation is based on firm contracts, less capacity is available for interruptible supply. This can result in generating units becoming unavailable as there is no pipeline capacity to supply interruptible gas.

Extreme cold weather also had a major impact on generator equipment. Of the approximately 19,500 MW of capacity lost due to cold weather conditions, over 17,700 MW was due to frozen equipment. Many outages, including a number of those in the southeastern United States, were the result of temperatures that fell below the plant's design basis for cold weather. At the height of generation outages (January 7 at 0800) the southeastern United States accounted for approximately 9,800 MW of the outages attributed to cold weather.

With the extended duration weather pattern affecting most of the Eastern Interconnection, several of the RCs used load reduction procedures such as voltage reduction, interruptible loads, and demand-side management. In only two instances were these procedures used to maintain generating reserves: PJM used voltage reduction to maintain reserves, and South Carolina Electric and Gas (SCE&G) shed less than 300 MW of firm load, while also using voltage reduction to maintain reliable operation of the BPS. While the shedding of firm load is typically used as a last resort, it is critical that a minimum level of generating reserves be maintained to ensure that the reliability of the BPS is not jeopardized for the loss of the next contingency, and that it is restored within the appropriate time frames after a contingency occurs.

Many areas made effective use of emergency procedures to manage loads and generation. They provided notification to industry through tools such as the Reliability Coordinator Information System (RCIS) and conference calls. For example, MISO issued a Cold Weather Alert for portions of its footprint on January 2 that was effective January 5. On January 3, MISO also declared a Conservative Operations period for January 5. Although MISO did not direct any emergency demand reductions, some of their members used voluntary load reduction procedures at various times during this period.

RCs used voltage reduction and public appeals during the event and provided emergency energy, when available, to other BAs in need. For example, New York ISO (NYISO) appealed to their customers to conserve energy, and at the request of PJM, NYISO also used demand-side management resources to create additional capacity to provide assistance to prevent the shedding of firm load in the neighboring PJM area. Also, ISO-New England (ISO-NE) provided assistance to PJM by dispatching additional units. In addition, ISO-NE issued their Master/Local Control Center Procedure No. 2, "Abnormal Conditions Alert," to ensure that no scheduled work was performed on active equipment. Neither TVA, Southeastern RC, nor SPP RCs made use of emergency procedures such as voltage reductions or load shedding.

In Texas, ERCOT declared an Energy Emergency Alert[5] (EEA) Level 1 and then an EEA Level 2, primarily due to the loss of a number of generating units during the morning load ramp. They were able to recover within two hours and 11 minutes by deploying Non-Spin Reserve Service (NSRS), Responsive Reserve Service from generators, load resources, and Emergency Response Service (ERS).[6]

Two RCs that also experienced challenges were the VACS RC and PJM. In VACS RC, two BAs experienced difficulties when faced with the cold weather. The SCE&G BA experienced record electric demand the evening of January 6, 2014, and the morning of January 7, 2014. During that time, SCE&G lost more than 850 MW of generation from multiple sources. SCE&G addressed this loss of generation by following internal company procedures, which called for implementation of local and reserve-sharing group reserves, obtaining Emergency Assistance from neighbors and neighboring RCs, use of customer standby generators and curtailment of retail interruptible contract customers, appeals for conservation, distribution-level voltage reduction, and controlled firm load shed when reserves were not available for a period. All actions taken by SCE&G were intentional and in accordance with regulatory requirements.

Additionally, on January 7, the Duke Energy Progress (DEP) Carolina Power and Light East (CPLE) and Carolina Power and Light West (CPLW) BAs experienced all-time peak demand during the hour ending 8:00 a.m. Demand-side management resources, including an initial 2.9 percent system-wide voltage reduction, a large industrial load curtailment rider, general public appeal for conservation, and a water heater and strip heat control program, were deployed in the DEP TOP/BA footprint. As part of its General Load Reduction Plan, and while in a NERC Energy Emergency Alert Level 2, CPLE and CPLW BAs subsequently activated a 5 percent system-wide voltage reduction on the distribution system for their footprints at 7:54 a.m. Through the use of generation and demand-side management resources, the CPLE and CPLW BAs were able to serve an all-time peak demand without shedding firm load.

The second RC that experienced challenges was PJM. On January 3, they issued a Cold Weather Alert at approximately 11:00 a.m. for January 6–7. In addition, they successfully used emergency procedures and the EEA process to maintain their required level of reserves. Some of the actions taken included scheduling shared reserves from NYISO and ISO-NE, issuing EERs, using demand response, and initiating a 5 percent voltage reduction across a portion of their operating area.

Figure 5 illustrates the challenges experienced by System Operators with regard to generation capacity unavailability during the study period. The graph shows the cumulative amount of MW unavailable due to forced outages in the following five general categories:

- Unrelated – Outages not related to cold weather or the extremes presented by the polar vortex
- Unknown – Outages still under review to determine cause
- Miscellaneous – Outage types potentially related to extreme cold weather (e.g., opacity issues)
- Cold – Outages directly attributable to cold weather, including on-site fuel issues such as frozen coal piles, frozen equipment and/or sensors under the control of the generating plant, and gelled fuel
- Fuel – Outages that are directly related to the inability of the plant to receive fuel from their provider

[5] An Energy Emergency is a condition when a Load-Serving Entity has exhausted all other options and can no longer provide its customers' expected energy requirements.

[6] An emergency service consistent with P.U.C. SUBST. R. 25.507, Electric Reliability Council of Texas (ERCOT) Emergency Response Service (ERS), used during an Energy Emergency Alert (EEA) Level 2 to assist in maintaining or restoring ERCOT system frequency. ERS is not an Ancillary Service.

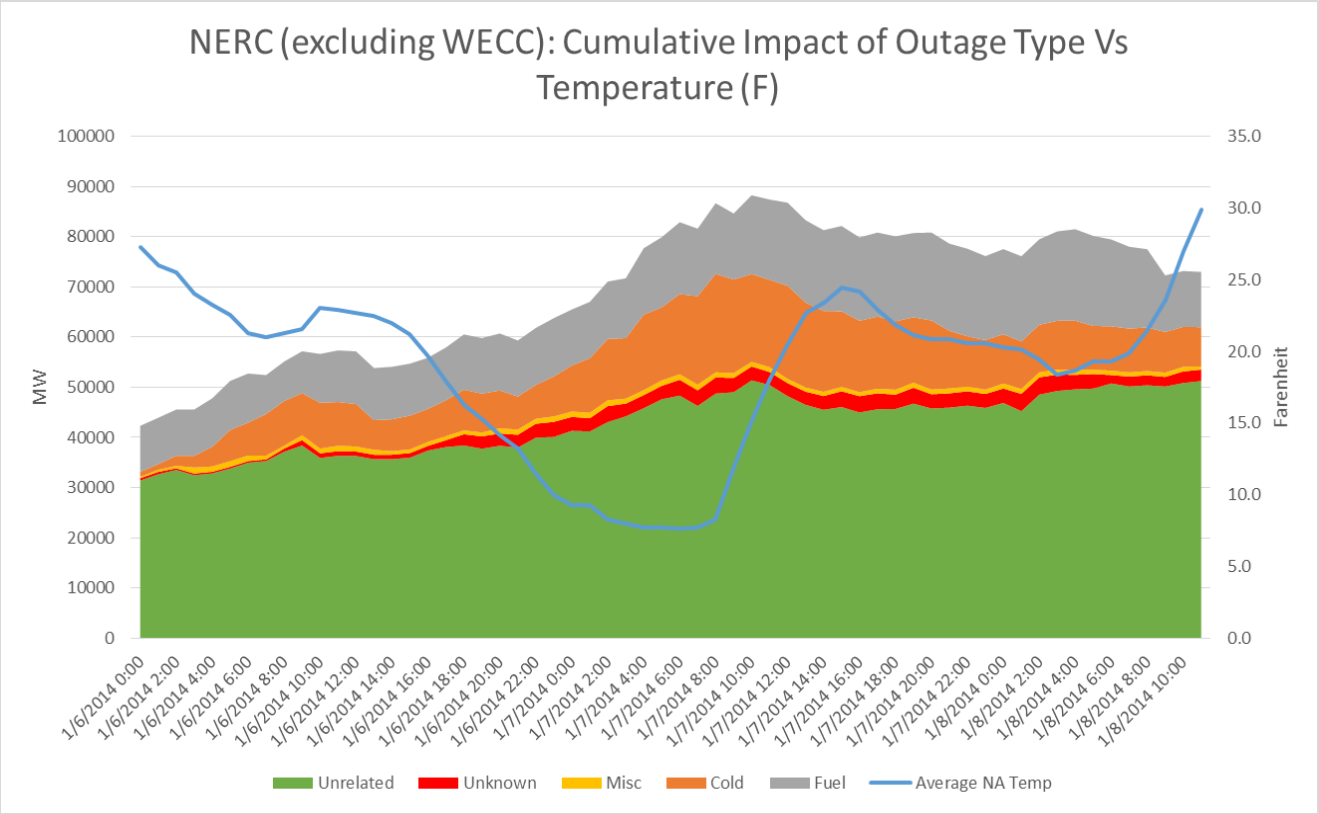

Figure 5: Total Outages in the Eastern Interconnection and ERCOT by Outage Type vs. Temperature

The North American temperature displayed in Figure 5 represents an average of seven selected cities in the approximate geographic centers of the seven studied Regions. The selected cities for each NERC Region are identified in the legends of Figures 6–12. It is important to note that Figures 5–12 are not normalized in any manner; thus, the additive number of the forced-out rate is understandably higher based on the greater number of generators being dispatched. Additionally, figures do not maintain the same scale for total forced-out MW values so that the relationships can be clearly seen between temperature and the outages.

Units were called on to start or increase output as the cold air mass swept down into the United States. The extreme weather challenged the units' preparedness and abilities to withstand ambient conditions, resulting in either forced outages or deratings. Once the cold air was established and units were running, the outages unrelated to cold weather maintained a fairly consistent rate throughout the remainder of the polar vortex time frame even though the number of generators and their individual run times were significantly increased.

All areas of the Eastern and Texas Interconnections were impacted by the polar vortex. These impacts were partially the result of the severe and extended cold spell, but there was also a significant reduction of generating capacity due to curtailments and interruptions of natural gas delivery. The cold weather and issues from fuel combined for over 35,000 MW of outages during the height of the polar vortex weather conditions.

One of the largest issues impacting gas-fired generation was the curtailment or interruption of fuel supply. Unlike other fuel sources, natural gas is not typically stored on site. As a result, generators rely on real-time delivery of natural gas from their suppliers. Often, as units are not confident that they will be dispatched, the fuel is obtained on the spot market as an interruptible fuel supply.

Extreme cold weather also had a major impact on generator equipment. Of the approximately 19,500 MW of capacity lost due to cold weather conditions, over 17,700 MW was due to frozen equipment. Many outages, including a number of those in the southeastern United States, were the result of temperatures that fell below the plant's design basis for cold weather. At the height of generation outages (January 7 at 0800) the southeastern United States accounted for approximately 9,800 MW of the outages attributed to cold weather.

In the following sections, each Region's forced outages have been plotted by type as a stacking chart, with temperature overlaid. A large city close to the center of the Region was selected to represent the temperature for the Region over the 60-hour period. For example, Orlando was chosen for the FRCC Region, and Pittsburgh, PA was chosen for the RF Region. However, cities near large moderating bodies of water, such as New York, Cleveland, and Chicago, were avoided. While these are large cities with significant electric loads, those temperatures may not reflect the temperatures experienced by the RE as a whole.

Florida Reliability Coordinating Council

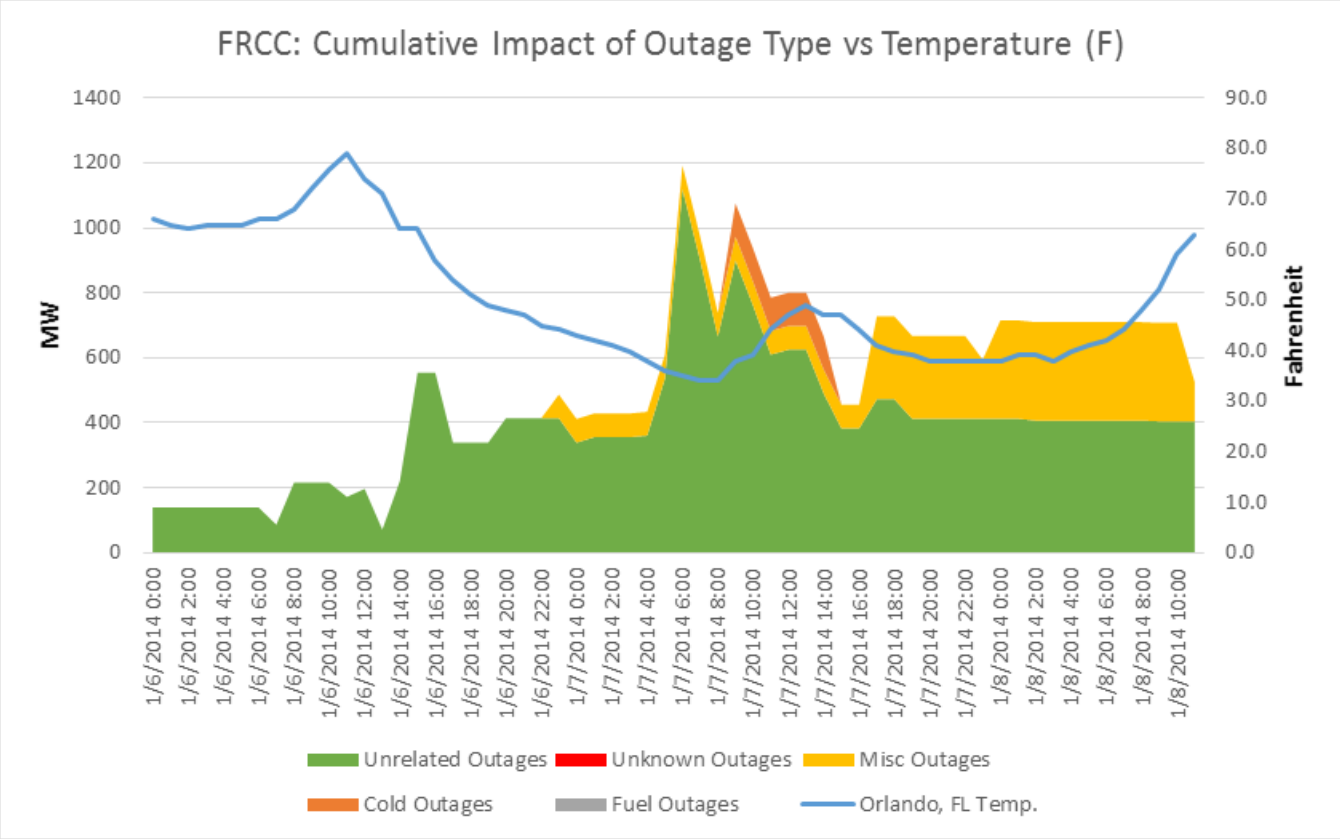

Figure 6: FRCC Cumulative Impact of Outage Type vs. Temperature (F)

While the majority of the outages in FRCC were unrelated to the polar vortex, there was a six-hour period with 102 MW of cold-related outages. Additionally, several units (303 MW) ran into emissions-related outages and derations. Otherwise, the FRCC Region did not experience significant impacts to their system during the polar vortex. Though FRCC is typically an importing Region, it was able to export 1,500 MW to aid the SERC Region during the polar vortex.

Midwest Reliability Organization

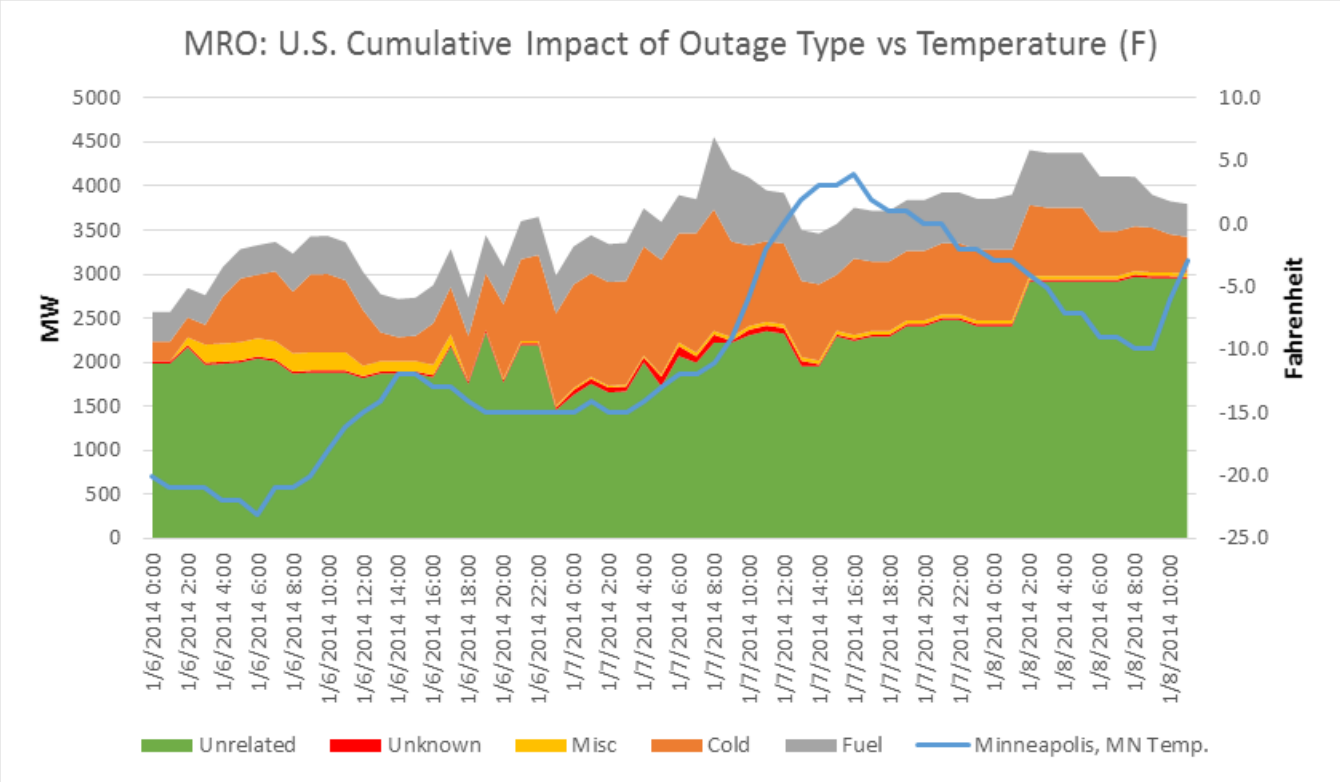

Figure 7: MRO (US): Cumulative Impact of Outage Type vs. Temperature (F)

As shown in Figure 7, unrelated outages were the majority of the generator outages in the MRO Region. The prolonged sub-zero weather eventually resulted in 1,379 MW of cold-weather-related impacts. MRO also experienced as much as 820 MW of generation loss due to fuel issues, with nearly 620 MW due to curtailments and interruptions of natural gas delivery to the plant. As shown in Figure 7, only seven of the 60 hours of interest were above 0° F in Minneapolis, MN.

MRO Generator Owners were prepared for the extreme cold because the design basis for generators in MRO accounts for operation in temperatures well below freezing (7° F is the historical average low in January). Additionally, Generator Owners recognize the reliability significance of outages and the market incentives for availability and continue to look for ways to improve capacity availability during cold weather. For example, MISO's Electric and Natural Gas Coordination Task Force is exploring solutions regarding emerging natural gas issues. The MISO Reliability Subcommittee reviews seasonal preparations by generation owners and Transmission Owners, including cold weather readiness. Additionally, the MISO Supply Adequacy Working Group (SAWG) evaluates appropriate accounting of generation capacity in the Planning Reserve Margin (PRM) calculations and accreditation of capacity to meet the PRM requirements. Currently the SAWG is considering changing from the use of annual capacity values to the use of seasonal capacity values.

Northeast Power Coordinating Council

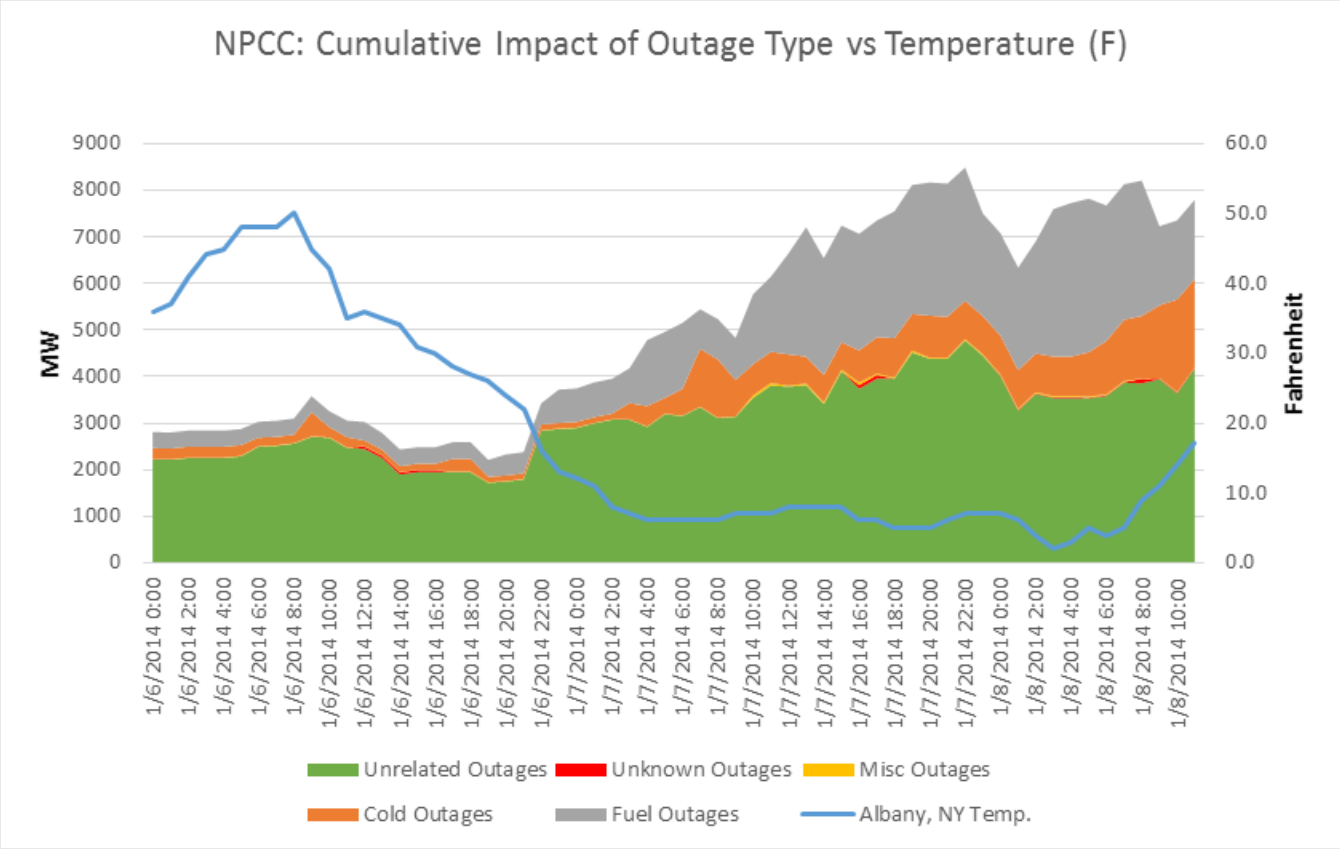

Figure 8: NPCC (US): Cumulative Impact of Outage Type vs. Temperature (F)

NPCC did not experience many cold weather outages at the start of the time frame identified by this report, with a peak of 518 MW of outages in the first 30 hours. However, as the cold air mass that comprised the polar vortex made its way into the Northeast, NPCC did experience more outages from the stress of the extreme event, reaching up to 1,984 MW of lost capacity. A significant portion of the cold-related outages, especially in the final hours of the polar vortex study period, were related to fuel-gelling issues. Of the 1,984 MW of cold-weather-related outages reported at 10:00 a.m. on January 8, 2014, 770 MW were related to fuel-gelling issues. Some dual-fuel units experienced challenges ranging from a lack of natural gas required for starting the alternate fuel, to fuel freezing in the injectors. While many of these units' preparations included testing of the dual-fuel switchover capability, none of the testing was performed under the actual extreme conditions. Excluding the fuel-gelling issues, the non-Canadian portions of NPCC experienced eight hours in the time frame of interest during which the amount of cold-weather-related generation outages exceeded 1,000 MW and never exceeded more than 1,300 MW.

Excluding unrelated outages, outages related to curtailments and interruptions of natural gas delivery were the significant contributor of the NPCC generator outages. These outages totaled a maximum of 3,296 MW of generators and, as shown in Figure 8, they significantly impacted NPCC's generation resources starting at approximately 10:00 a.m. on January 7, 2014.

ReliabilityFirst

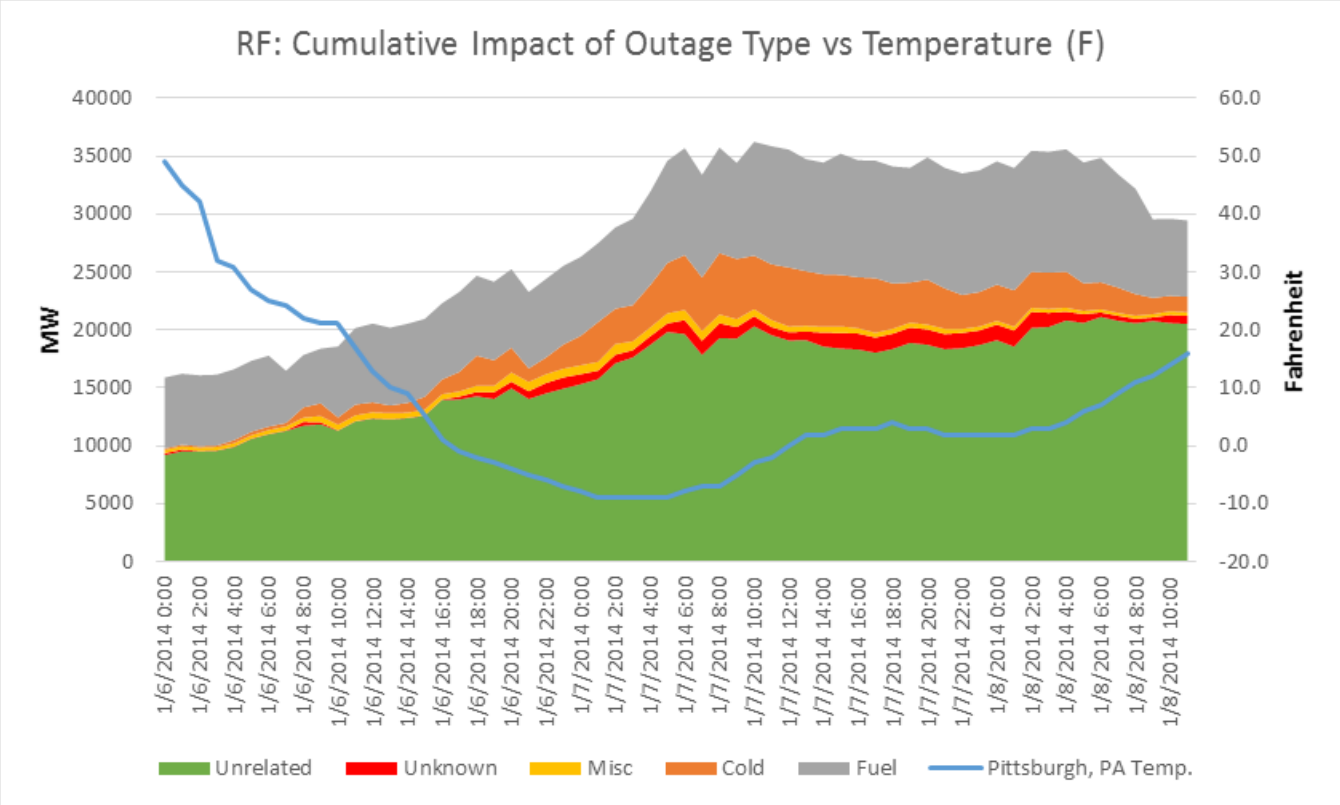

Figure 9: RF: Cumulative Impact of Outage Type vs. Temperature (F)

ReliabilityFirst experienced the greatest number of generator outages of all the Regions. While some of these outages were the result of cold weather, it was the number of units that were either unavailable or derated due to the lack of natural gas availability that was the major issue for RF. This situation was exacerbated by the loss of a natural gas compressor station in Delmont, PA on January 7, 2014, which reduced the delivery capacity of the Texas Eastern (TE) pipeline by 575,000 DTh/day. While the conversion of DTh/day to generating capacity can vary depending on the specific generators and type of generation (simple cycle vs. combined cycle, for instance), this represents approximately 1,700–2,300 MW of generation running 24 hours a day. The variance depends on the heat rates of the units involved, with the higher estimate obtained from the most efficient unit types.

Overall, RF experienced a maximum of just over 5,300 MW of outages due to cold weather issues, and only 13 of the 60 hours had 4,000 MW or more of cold-weather-related outages. In contrast, RF experienced over 9,000 MW of fuel-related outages in 25 of the 60 hours of interest, and reached a peak outage level of approximately 10,700 MW due to fuel.

SERC Reliability Corporation

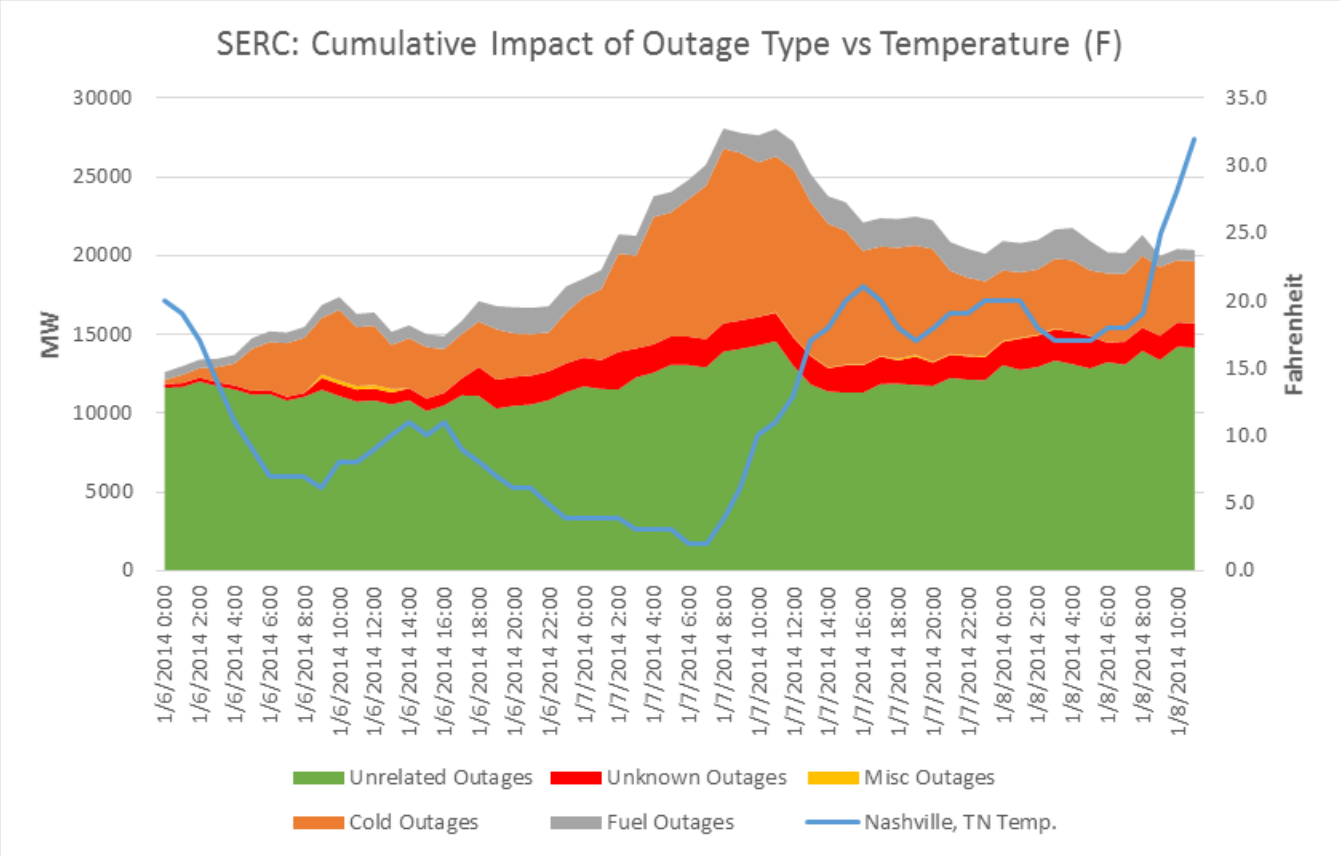

Figure 10: SERC: Cumulative Impact of Outage Type vs. Temperature (F)

Figure 10 shows that SERC's main driver of outages and derations related to polar vortex issues was cold weather, impacting approximately 11,000 MW of generation at 8:00 a.m. on January 7, 2014. Of this generation capacity, approximately 10,600 MW were related to equipment issues. These equipment issues included heat trace, insulation, regulators reacting slowly to change in pressures, frozen sensors, and even cold lubricants. Typically, generation equipment in this geographical area is designed for an expected low of 10° F. The extreme departure from design temperatures coupled with severe wind chills within SERC resulted in significant impact to generation capacity. The extended time below freezing is extremely rare for the southern United States, with the temperatures outside most winter generation design characteristics.

As compared to other Regions, fuel availability issues played a small role within SERC, impacting approximately 2,050 MW of generation. These outages were largely related to curtailments and interruptions of natural gas delivery to the plant. The grid within SERC performed extremely well for the conditions across the three days. As mentioned above, the extended time of below-design-criteria conditions for three days impacted the performance of generators. Entities within SERC have started a thorough review of the event and a review of their practices and procedures for winter preparation, including those that were implemented as a result of the 2011 Southwest Cold Weather event.

Southwest Power Pool Regional Entity

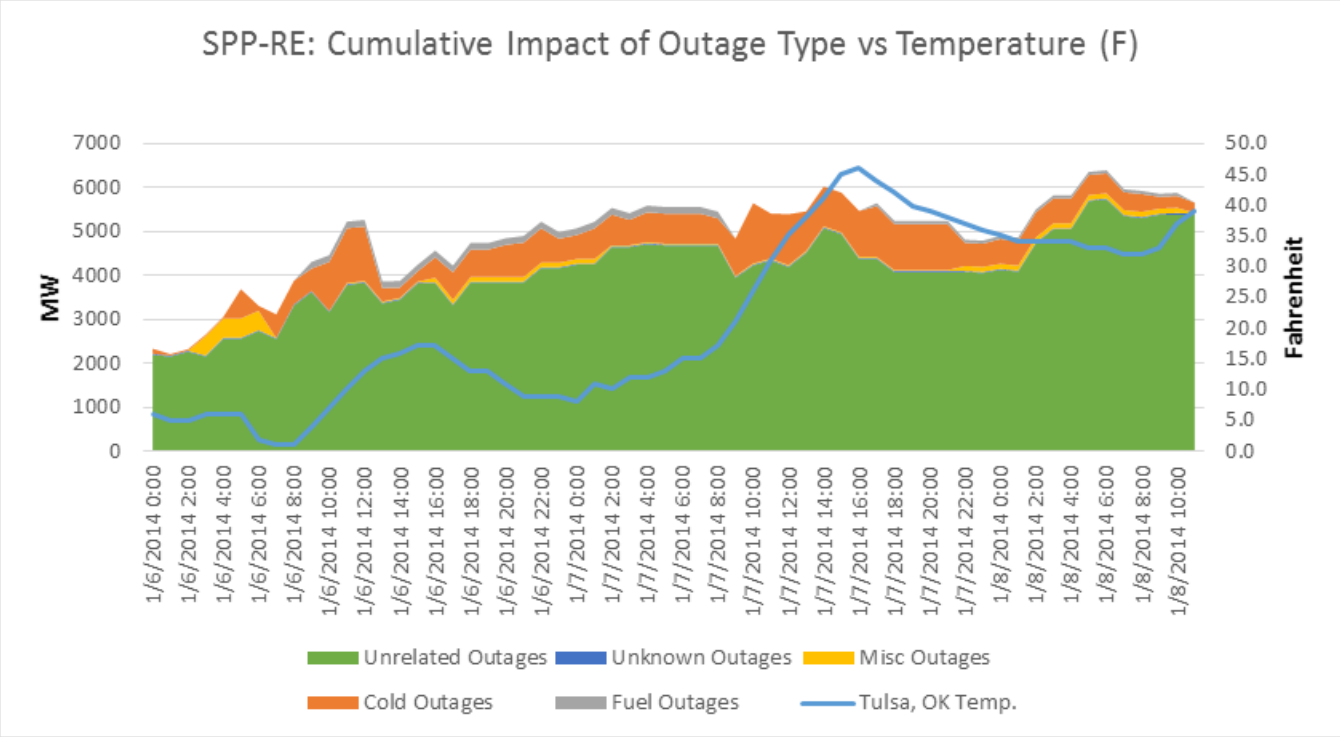

Figure 11: SPP: Cumulative Impact of Outage Type vs. Temperature (F)

SPP was minimally impacted by the fuel outages, with a maximum of approximately 150 MW of fuel-related outages. Additionally, cold weather directly impacted a maximum of approximately 1,200 MW of generation, with 41 hours being under 700 MW of cold-impacted outages. Excluding Florida, SPP experienced the lowest number of cold-impacted outages, despite being one of the first areas impacted by the polar vortex.

Texas Reliability Entity

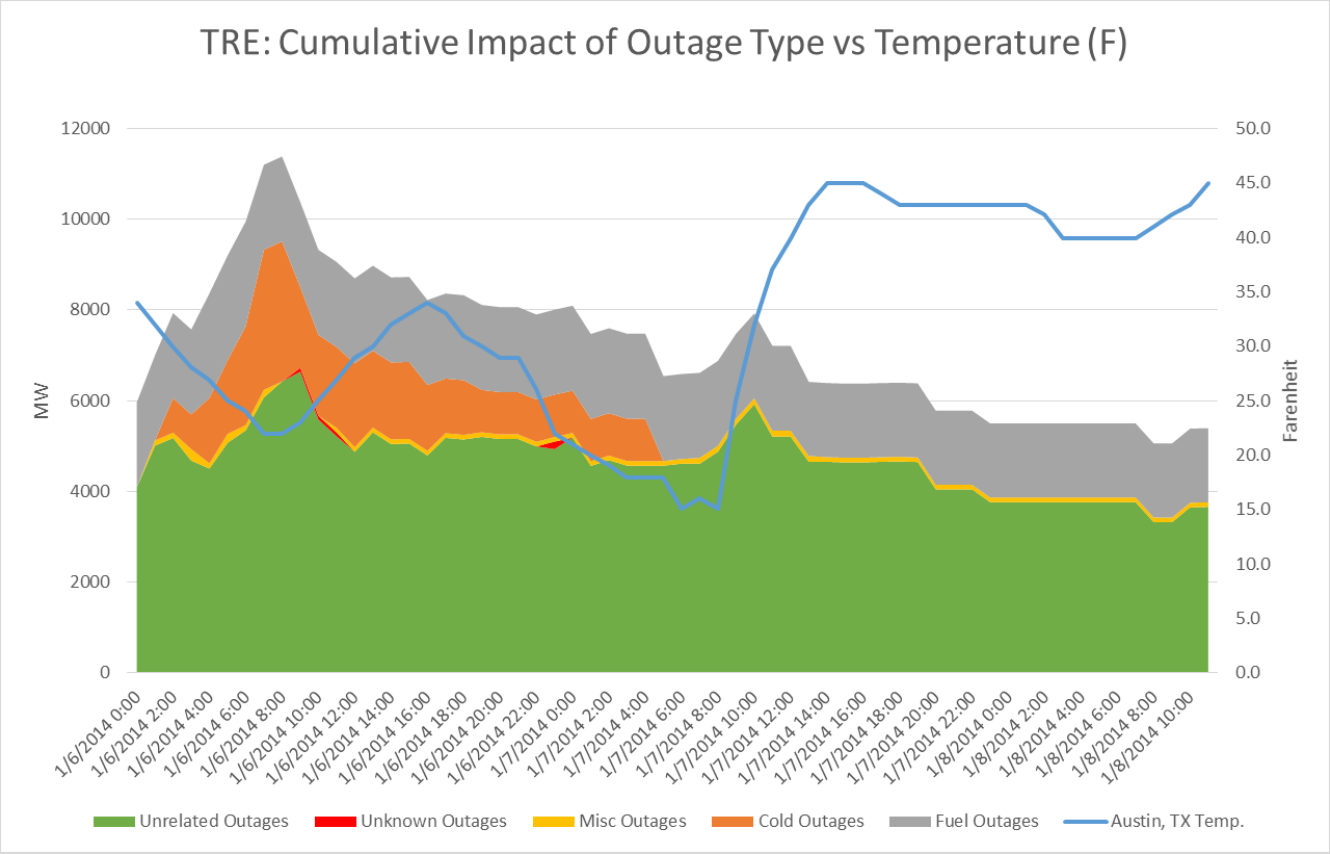

Figure 12: TRE: Cumulative Impact of Outage Type vs. Temperature (F)

Texas Reliability Entity experienced a maximum of 3,087 MW of cold-weather-related generation outages, but by the end of the start of peak hours of January 7, 2014, the interconnection had completely recovered from the cold weather issues. The cold-impacted generation capacity does not include over 700 MW of wind generation low-temperature-related trips, which are currently not reported in GADS. These outages were due to cold temperatures outside the operating limits of the wind turbines. Based on GADS data, the maximum capacity affected by forced outages and derations was 11,385 MW.

Fuel-related issues were fairly consistent, however, ranging from a high of 2,309 MW down to a low of 1,634 MW. These restrictions were the result of the natural gas transportation system experiencing extremely high demand, resulting in fuel restrictions to power plants located near a major metropolitan area.

Generator Issues by Fuel Type

Figure 13 illustrates the percentage of installed capacity sorted by the appropriate fuel types located within the Eastern and ERCOT Interconnections. Of the three major fuel types, representing 83 percent of all generation, over 40 percent is natural gas, 31 percent is coal, and 12 percent is nuclear. Figure 13 shows that of these three fuel types, the polar vortex had the least impact on nuclear plants. Coal plants accounted for 26 percent of the outages. Natural gas represented over 55 percent of the total outages during the polar vortex.

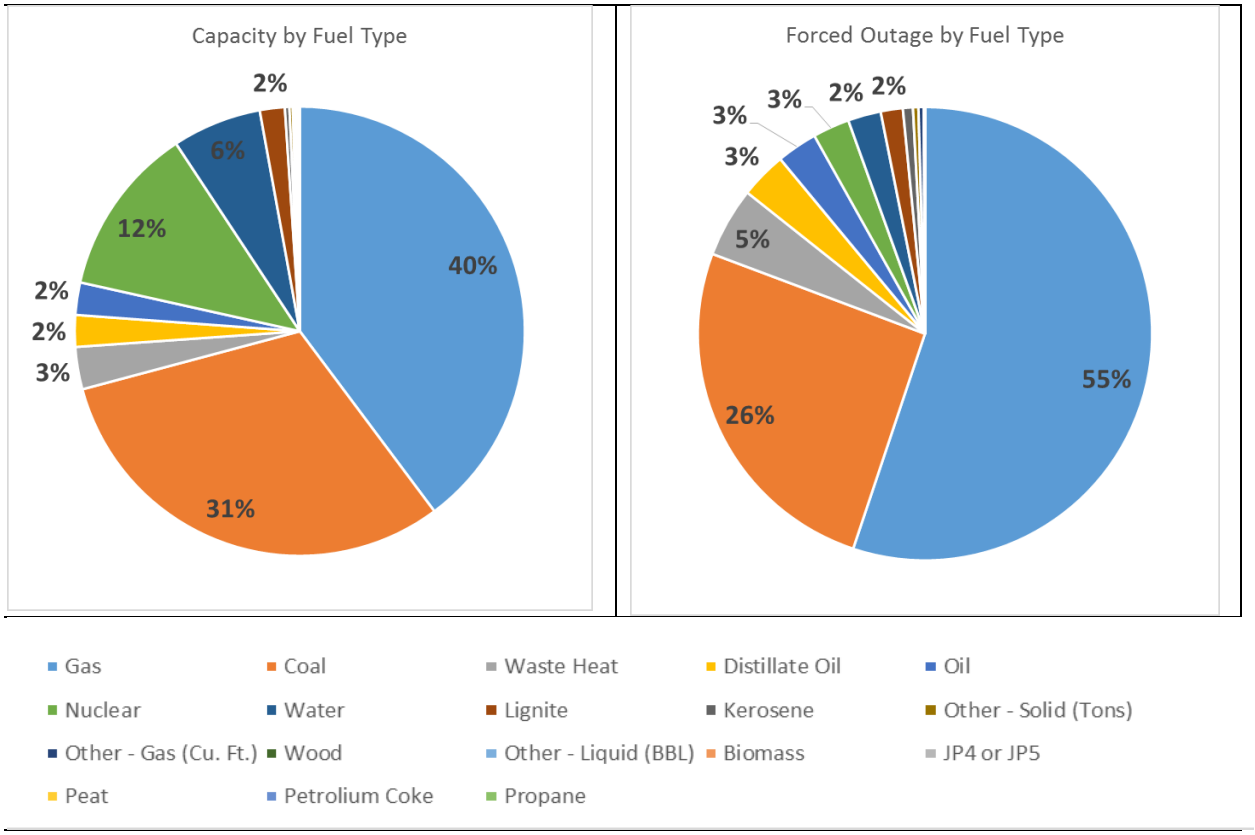

Figure 13: Percentage of Net Dependable Capacity by Fuel Type (left); Percentage of Capacity Lost During Polar Vortex by Fuel Type (right) in Eastern and ERCOT Interconnections

One of the largest issues that impacted gas-fired generation was the curtailment or interruption of fuel supply. Unlike coal and fuel oil, natural gas is not typically stored on site. As a result, generators rely on real-time delivery of natural gas from their suppliers. As natural gas is widely used outside the power sector, the demand from other sectors—in particular residential heating demand during cold winter weather—can critically affect the ability of pipeline operators and suppliers to deliver natural gas to the power sector.

Cold weather effects on equipment

The extreme cold weather had a major impact on generation equipment. Of the approximately 19,500 MW of capacity lost due to cold weather, over 17,700 MW was due to frozen equipment.

The following list illustrates some of the challenges faced by generator owners and operators due to the effects of cold weather on equipment. These challenges affected almost every dimension of the generation, from instrumentation, to fuel quality, to air-fuel mix, etc. Newer generation units' cold weather preparations were tested for potentially the first time for these temperature extremes, and many older units experienced extremes beyond what they were designed to operate. The examples below are individual occurrences that are

representative of the challenges faced during this extreme period. Not all of these instances resulted in a forced outage; many just delayed the unit's ability to come on-line or resulted in the unit's derating.

Examples of extreme cold weather effects on generation:

- The drum level transmitter sensing lines froze, indicating a false drum level and consequently tripping the boiler.
- Moisture ingress caused gear boxes, valve positioners, and solenoid valves to fail due to freezing.
- Heat trace electric circuits not working prior to the event tripped during the event, or were miswired.
- Cold air backflow down the stack and into the boiler affected performance.
- During start-up from the previous outage, the B phase stab disconnect was not fully engaged, which resulted in voltage differential between phases. The unit had to be removed from service to repair the disconnect. Upon investigation, the damage to the disconnect was caused by ice build-up from the unit's cooling towers.
- Circulating water was frozen, causing a loss of supply of needed cooling water.
- Extreme cold weather and cold oil resulted in oil pressure control tripping.
- A plant steam pressure transmitter froze due to extreme cold conditions, which limited the operation of the condenser air removal equipment, and the unit tripped on low vacuum. The transmitter is located inside the main building close to an exterior wall louver.
- Impulse tube lines, level transmitters, or pressure sensing lines were uninsulated or underinsulated, resulting in freezing components.
- A transformer had water in it and froze.
- A feedwater heater pressure sensing line froze, which required the unit to be taken off-line.
- Fan damper operation was sluggish during cold weather due to cold grease, and a deaerator level indication had a frozen sensing line.
- Steam and water flow transmitters were uninsulated or underinsulated, resulting in freezing components.
- The unit tripped due to a frozen super heat pressure transmitter.
- A collector ring failure was caused by insufficient brush tension resulting from very cold temperatures.
- Air entrainment in the sensing lines caused a transmitter to fail. The line did not actually freeze, but it interfered with instrument compensation.
- A frozen gas valve caused a unit outage.
- The diesel fuel changed consistency, rendering the fuel unusable in the cold weather.
- Moisture in an air line to the inlet bleed heat valve froze.
- The static frequency converter initiated a trip during preparation of Static Frequency Converter & Static Excitation System (SFC/SES) caused by not receiving exciter circuit breaker checkback signal for the closed position. Subsequent failures were caused by not receiving the checkback signals from the start disconnect switch in the generator breaker. Extreme cold temperatures caused grease on start disconnect switch stabs to become tacky and not allow it to close without binding.
- Oil pressure was affected due to cold oil from the lube oil (LO) cooler entering the LO supply header too rapidly. The LO temperature control valve has no cold ambient bias to slow down movement in winter.

- Frozen NO_X water header pressure sensing lines in the unit resulted in no available NO_X water injection for emissions control.
- Water froze in a water manifold that had not been purged of water.
- Generator logic tripped the turbine due to a frozen water flush transmitter. The transmitter was frozen due to cold weather; however, the logic should not have tripped the unit.
- The outage was due to a failure of the water injection heating system. Cold weather may have contributed to but was not the primary cause of the outage. Power was removed from the heating system due to a water leak that caused an electrical short circuit. It is not known if cold weather caused or contributed to the initial water leak. Once power was removed from the heat tracing on the water injection pipes, they froze. The situation was corrected by placing a tent around the problem area and using a torpedo heater to unfreeze the water lines.
- A unit water injection variable frequency drive (VFD) controller tripped due to extreme weather, requiring a unit shutdown to prevent emission exceedance.
- A unit heater tripped, which affected operation of VFD. During restarting the water injection VFD, unit was at upper load and flamed out from inrush of water.
- A frozen water valve located outside for the oil cooling system caused the unit to trip. The ambient temperature at the time of the trip was -3° F with an 8 mph SW wind.
- The unit would not transfer to "Pre-Mix Steady State" due to operating in the cold ambient temperatures; it required combustion tuning for the colder conditions.
- A gas transfer purge valve froze.
- The pressure dropped due to regulator not being able to react quickly enough because of the extreme cold temperature.
- An output breaker would not close due to the cold.
- The premix line froze due to heat tracing failure.
- Fuel oil gelled the filters due to the cold temperatures.
- A hydraulic starter pressure sensing line froze.
- Lube oil temperature was below 50° F, causing the unit to be in a not-ready-to-start state.
- The diesel fuel being provided to the starting motor gelled due the extreme cold temperatures.
- The diesel starting engine failed to provide enough turbine speed to initiate firing.
- A liquid fuel modulating valve frozen (located in unheated engine compartment when off-line).
- A starter duct pressure switch located in unheated engine compartment froze.
- A unit tripped on loss of flame due to the combination of fuel oil delivery temperature being low and ignition gas being insufficient to maintain the flame.
- A unit could not start due to hydraulic temperatures too low for proper operation of fuel valves.
- Frozen regulator on monitor valve at meter station caused low fuel gas pressure.
- The inlet air intake was covered with snow and ice.
- Moisture in a fuel oil pressure switch froze and the pressure switch diaphragm burst.

- The fogging and overspray were put in a winterized state. The systems were available but required additional time to return to service.
- Cold weather caused water injection lines to become frozen, which resulted in a transmitter control issue.
- The gas control and purge valves were sluggish due the extreme temperature. The control timers for the valves were adjusted to allow for the longer valve operating time.
- The relay setting did not take into account the higher-than-normal output for the extreme cold weather.
- The lube oil was too cold because the compartment heater malfunctioned. This caused the lube oil temp alarm to trip the unit in start-up.
- A solenoid was frozen on the water injection system. This caused an emissions issue.
- Compressor blade icing caused a unit outage.
- Units tripped when the units were being transferred from gas to liquid fuel. These CTs were running on gas when the site was asked to transfer them to liquid fuel due to limited gas availability. Extremely cold temperatures along with the liquid fuel heaters being out of service contributed to an increase in fuel oil viscosity that led to a high filter differential pressure and subsequent fuel system fault trips while attempting to transfer to liquid fuel.
- Low ambient temperature led to fuel waxing and clouding.
- Frazil ice blocked the intake, causing insufficient water supply to the turbine.
- Due to low temperature, the seal oil regulator froze, allowing the oil pressure to rise above the hydrogen pressure, therefore putting oil inside the steam turbine generator.
- A steam turbine exhaust pressure switch for HP turbine froze, which signaled a false high pressure, thereby tripping the steam turbine.
- Cold temperature caused materials on the generator hydrogen cooler cooling water loop to contract, and the flanged joint at generator shell began to leak hydrogen. The flange bolting was re-torqued to stop the leak.
- A seal steam pressure transmitter sensing line froze, causing pressure to read high opening bypass to condenser, which in turned caused loss of sealing steam to turbine.
- A unit tripped due to cooling tower drift freezing onto and restricting flow through the inlet bird screen; with enough build-up, this caused the implosion doors to open.
- While switching from gas to oil, a process step was missed, resulting in the trip.
- A unit was shut down for inspection because a noise could be heard during the hourly inspections. Ice was found on the inlet guide vanes.

Chapter 3 – Discussion

Increased reliance on natural gas during the polar vortex exposed the industry to various challenges with fuel supply and delivery. This increased reliance, compounded by generation outages during the extreme conditions, increased the risks to the reliable operation of the BPS.

As the industry relies more on natural-gas-fired capacity to meet electricity needs, it is important to examine potential risks associated with increased dependence on a single fuel type. The extent of these concerns varies from Region to Region; however, they are most acute in areas where power generators rely on interruptible natural gas pipeline transportation.

Unlike coal and fuel oil, natural gas is not typically stored on site. As a result, real-time delivery of natural gas through a network of pipelines and bulk gas storage is critical to support electric generators. Natural gas is widely used outside the power sector, and the demand from other sectors—particularly coincident end-user gas peak demand during cold winter weather—critically affects gas providers' ability to deliver interruptible transportation service in the power sector. Additionally, demand for natural gas is expected to grow in other sectors (e.g., transportation, exports, and manufacturing).

The following excerpts are from industry participant discussions about the polar vortex:

> *"Some gas-fired units have the capability to use an alternate fuel (dual-fuel capability), which increases flexibility when gas supply becomes tight. The predominant alternate fuel is oil. While dual-fuel units increase flexibility, there were still challenges operating the units on oil. PJM requested dual-fuel generation owners unable to secure gas to operate their units on oil during the extremely cold weather events. Even with this flexibility, generation owners encountered issues including run-time limits related to permit-defined environmental restrictions, resupply challenges and increased failure rates for unit startup. Units that switch to oil operate with increased emissions, which limits their maximum run times due to environmental constraints. In other cases, units operating on oil may have had only limited ability to make and store demineralized water for the injection systems that must be operated to reduce nitrogen oxide emissions when running on oil. PJM coordinated with generation owners that needed to decrease the maximum run time per day for their units in order to conserve emission credits. Identification and tracking of fuel limitations was done manually by PJM and the generator owners. There were approximately 1,000 MW of generation with decreased run times for emission reasons.*
>
> *The increase in demand for oil caused another challenge for generation owners. Many units in the Northeast switched to oil as gas became unavailable increasing demand for oil. In some cases, oil suppliers began to run low on inventory or deliveries were slow because increased demand was unexpected and available delivery trucks were limited. Generation owners found it difficult to keep oil tanks full on a daily basis and had to limit run hours for their units. There were approximately 2,000-3,000 MW of generation affected by oil supply and delivery issues. Also, generating units running on oil have an increased failure-to-start rate due to clogged fuel lines."*[7]

Many outages, including a number of those in the southeastern United States, were the result of extreme cold weather that was below the design basis of generating units. Industry should identify and protect against failures that occurred within the design basis of their plants. As illustrated in Figure 10 (Chapter 2), SERC experienced 25 hours during the study period where they were below their typical temperature design basis, including 17 continuous hours below that basis.

[7] PJM Report: http://www.pjm.com/~/media/documents/reports/20140509-analysis-of-operational-events-and-market-impacts-during-the-jan-2014-cold-weather-events.ashx pg. 39-40

The analysis of the GADS data provided in Appendix A shows that most generating units performed in the expected range of EFOR during the month of January 2014, based on historical analysis. Overall, most units performed with an EFOR within or slightly better than (i.e., below) the expected range, based on the past five years. The exception is natural gas units, which in two Regions experienced a higher-than-expected EFOR. This observation validates the concerns that NERC raised in the *2013 Long-Term Reliability Assessment*[8] on increased dependence on natural gas for electric power.

Chapter 4 – Conclusion

Unlike the February 2011 Southwest Cold Weather Event, the 2014 polar vortex resulted in many generator outages from entities exceeding the design basis of their plants and difficulties facing the natural gas transportation sector. System Operators were faced with many difficult decisions and were able to successfully maintain reliability through extensive previous training and preparation. During the polar vortex, several System Operators used load reduction techniques such as voltage reduction, interruptible loads, and demand-side management. Many System Operators also made effective use of emergency procedures to manage loads and generation.

Observations and Recommendations

Lessons Learned from the February 2011 Southwest event highlighted the importance of preparation for extreme weather events. The following observations and recommendations are based on the analysis in this report:

Observations

1. Generation facilities have made improvements in their winter preparation activities since February 2011; however, every extreme event provides insight for future improvements. Generation facilities across all Regions have indicated that they have reviewed and/or implemented recommendations from the *February 2011 Southwest Cold Weather Event Lessons Learned*[9] as well as the *Generator Winter Weather Readiness* guideline.
2. The value of regular training and annual drills was demonstrated during events, as the operators and other RC area entities were able to effectively and successfully implement emergency procedures.
3. Proactive communication and coordination between the RCs and within the RC areas themselves helped ensure appropriate situational awareness was maintained and facilitated rapid response as needed.
4. Planned and forced generation outages in some Regions exceeded the worst-case assumptions used in seasonal assessments. These assumptions warrant further review; in particular, the assumptions for generating unit forced and planned outage rates.
5. Some ISO/RTOs conducted detailed seasonal fuel assurance surveys to include gas transportation arrangements, starting oil inventories, and oil replacement capabilities (oil transportation capability).
6. Many outages, including a number of those in the southeastern United States, were the result of extreme ambient temperatures that were below the design basis of the generating unit.

Recommendations

1. Examine and review the natural gas supply issues encountered during the event. Industry should also work with gas suppliers, markets, and regulators to quickly identify issues with natural gas supply and transportation so that appropriate actions can be developed and implemented to allow generators to be able to secure firm supply and transportation at a reasonable rate.
2. Review and update power plant weatherization programs as a result of lessons learned from this event. This includes review of plant procedures, training programs for severe weather and winter weather events, and availability of material and equipment for response to these events. Entities should continue

[9] http://www.nerc.com/pa/rrm/ea/Pages/February-2011-Southwest-Cold-Weather-Event.aspx

to follow the Reliability Guideline (*Generating Unit Winter Weather Readiness – Current Industry Practices*).[10]

3. Continue or consider implementing a program of periodic site reviews of generation facilities' winter preparation. These programs produced tangible benefits in the ERCOT Interconnection by improving generator winter preparation and sharing of good industry practices, and can be implemented within an individual company, an ISO/RTO, an appropriate Regional Entity, or any combination.
4. Review the basis for forced and planned generation outages used in seasonal assessments to ensure that appropriate outage rates for the extreme cases are correct and that unit derates are appropriately included.
5. Review generation and transmission outage scheduling processes to limit planned outages during possible peak winter periods.
6. Entity winter assessments should include base assumptions and stress cases for the loss of varying amounts of gas-fired generation, and should consider oil burn rates relative to oil replenishment rates to determine the duration of continuous operation for oil-fired generation.
7. Continue to improve operations management awareness of the fuel status of all generators, including improved awareness of pipeline system conditions. This might include a daily fuel inventory solicitation process, ability to dispatch plants early in anticipation of extreme winter weather, and increased communication channels with electric and gas industries during extreme events.
8. Ensure that the fuel on hand and/or ordered for the winter season is appropriately protected from the effects of cold weather at the expected extreme temperatures.
9. Industry should work to identify and protect against outages that occurred within the cold weather design basis of the plant. Additionally, entities should review the winter cold weather temperature design basis for their generating units to determine if improvements are needed, while ensuring that the generating unit's ability to withstand higher temperatures in the summer is not compromised.
10. Industry should review internal processes to ensure they are ready to take proactive actions to secure the waivers (market, environmental, fuel, etc.) from the appropriate entities. For example, PJM requested waivers of certain provisions of PJM's governing documents that would permit them to share certain non-public information with natural gas pipeline operators during the forecasted extreme weather conditions. FERC responded promptly to PJM's filing, which enabled those communications to commence quickly.[11]

[11] PJM Report: http://www.pjm.com/~/media/documents/reports/20140509-analysis-of-operational-events-and-market-impacts-during-the-jan-2014-cold-weather-events.ashx pg. 11

Appendix A

Overview of GADS

GADS was developed by utility designers, operating engineers, and system planners to meet the information needs of the electric utility industry. For this purpose, specific objectives for the GADS program were established: compilation and maintenance of an accurate, dependable, and comprehensive database capable of monitoring the performance of electric generating units and major pieces of equipment. GADS is not a substitute for the detailed, often unique, data systems typically found at power plants, or for maintenance data programs that record detailed equipment failures and repair techniques. The objectives of the GADS program can be met through the collective effort of participating GADS members, the cooperation in reporting to GADS, and sharing information with the industry.

Based on research by the IEEE 762 committee, the boundary between the GENCOs and TRANSCOs is as follows: "A generating unit includes all equipment up to (in preferred order): (1) the high-voltage terminals of the generator step-up (GSU) transformer and the station service transformers; (2) the GSU transformer (load) side of the generator-voltage circuit breakers; or (3) at such equipment boundary as may be reasonable considering the design and configuration of the generating unit."

An event occurs any time a generating unit's operating status or capability changes. Four general classifications of events are reported to GADS: outages, deratings, reserve shutdowns, and non-curtailing events. Reporting event data, in addition to performance and design data, provides all the information needed to evaluate generating unit availability. Event data are especially useful since they are often used to do specialized unit and equipment operation and design analyses.

Participation in the GADS program is mandatory for all conventional units 20 MW and larger (as of January 1, 2013). Reporting the level of detail requested in these GADS Data Reporting Instructions enables industry analysts to perform detailed, useful analyses.

All units except hydro and pumped storage units without automatic data recording equipment are required to report reserve shutdown events. All other events (forced, maintenance, and planned) must be reported.

Calculations used to determine equivalent forced outage rate

Service hours (SH) is the sum of all unit service hours.

Available hours (AH) is the sum of all service hours (SH) + reserve shutdown hours (RSH) + pumping hours + synchronous condensing hours.

Period hours (PH) is the number of hours that the unit was in the active state.

Forced outage hours (FOH) is the sum of forced outages + startup failures hours.

Equivalent forced derated hours (EFDH) – Each individual forced derating (D1, D2, and D3) is transformed into equivalent full outage hour(s). This is calculated by multiplying the actual duration of the derating (hours) by the size of the reduction (MW) and dividing by the net maximum capacity (NMC). These equivalent hour(s) are then summed.

Equivalent forced derated hours during reserve shutdown (EFDHRS) – Each individual forced derating (D1, D2, and D3) that occurred during a reserve shutdown (RS) is transformed into equivalent full outage hour(s). This is

calculated by multiplying the actual duration of the derating (hours) by the size of the reduction (MW) and dividing by the NMC. These equivalent hour(s) are then summed.

Equivalent Forced Outage Rate (EFOR) is calculated by:

$$EFOR = \frac{(FOH + EFDH)}{(FOH + SH + Synchronous\ Condensing\ Hours + Pumping\ Hours + EFDHRS)}$$

Weighted versus time-based methods for pooled statistics

Two methods are used to calculate pooled (grouping) unit statistics for generation:

1. Unweighted (time-based) methods for calculating pooled (grouping) unit statistics.
2. Weighted (capacity-based) methods for calculating pooling (grouping) unit statistics.

When a single generating unit's performance statistics are calculated, it does not matter whether unweighted or weighted-based statistics are used. The answer will generally be the same. The real difference between the unweighted and weighted statistics is in pooling (or grouping) of a set of generating units. In such cases, a group of units of similar size will show little or no difference, but for groups of units where the MW size is very different (greater than 50 MW), the statistics will be very different.

With unweighted statistics, all units are considered equal in outage impact. In the unweighted equations, no MW size is introduced into the equations, and the results are based on time, not energy produced (or not produced). In such cases, a 50 MW gas turbine and a 1,000 MW nuclear unit have the same impact of the resulting statistics.

With weighted statistics, the larger MW size unit in the group has more impact on the final statistics than a smaller generating unit. That is because the MW size of the unit (NMC) is part of the equation. In such cases, a 1,000 MW nuclear unit would have 20 times the impact on the final outcome of the calculation than would its 50 MW gas turbine companion.

This study used the weighted method for calculating pooling (grouping) unit statistics for generation.

Analysis of EFOR by Regional Entity

The following is an analysis of EFOR for the months of January, February, and March for 2009–2014. Also, for the purposes of this analysis, FRCC and WECC will not be examined, since they were not directly involved in the polar vortex. In addition, all values of EFOR in this appendix are calculated monthly.

Coal

Figures A1, A2, and A3 provide historical EFOR for coal units for January, February, and March by year and Regional Entity. In all Regions examined, coal units experienced an EFOR in January 2014 well within the range of expected EFOR based on the prior five winter operating periods. The historical winter monthly EFOR performance of coal units in MRO ranged from 4.8 to 7.6 percent, and in January 2014 they experienced an EFOR of 5.3 percent. In NPCC, the historical winter monthly EFOR performance ranged from 6.9 to 21.2 percent, and coal units experienced an EFOR of 7.3 percent in January 2014. Likewise, coal units in RF experienced an EFOR of 9.3 in January 2014, compared with a historical range of 8.5 to 14.2 percent. In SERC, coal units experienced an EFOR of 4.9 in January 2014, which was better than any historical winter monthly EFOR for the years examined (prior monthly values ranged from 5.0 to 10.2). The EFOR performance of coal units in SPP ranged from 3.2 to 13.6 percent, and in January 2014 they experienced an EFOR of 6.4 percent. Finally, coal units in TRE experienced an EFOR of 12.8 percent in January 2014, compared with a historical range of 0 to 14.3 percent.

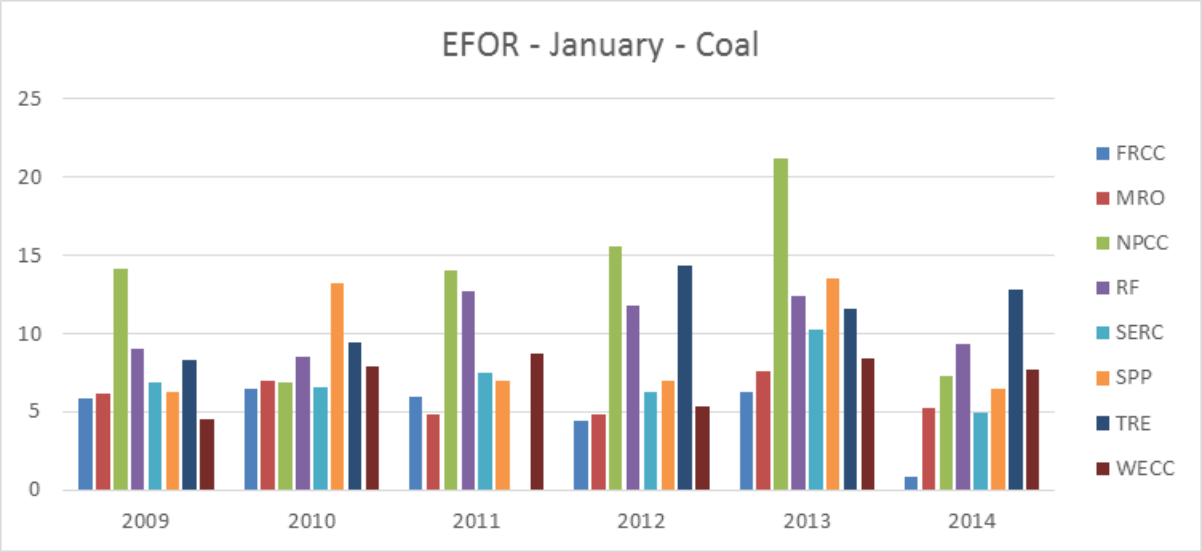

Figure A1: Historical EFOR for Coal Units in January by Year and Regional Entity

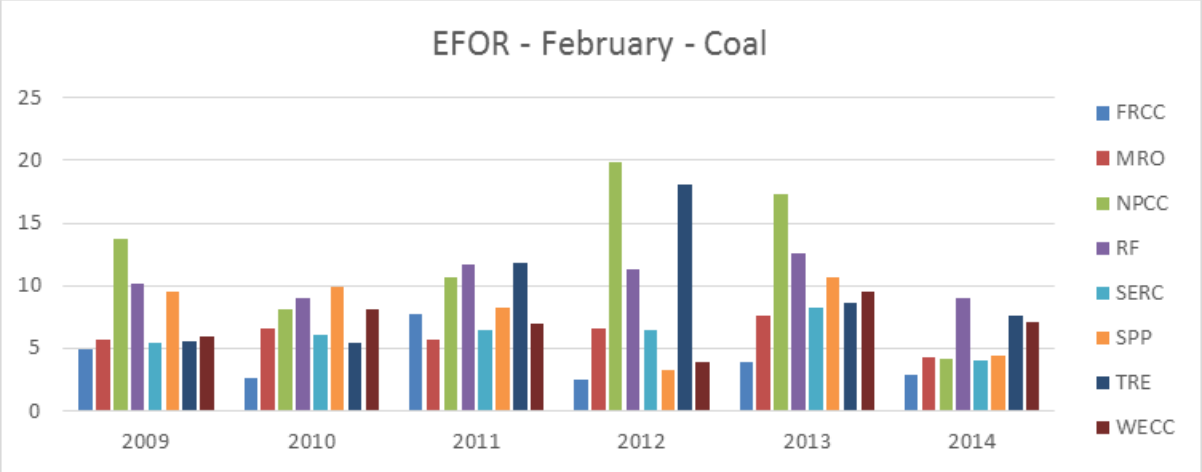

Figure A2: Historical EFOR for Coal Units in February by Year and Regional Entity

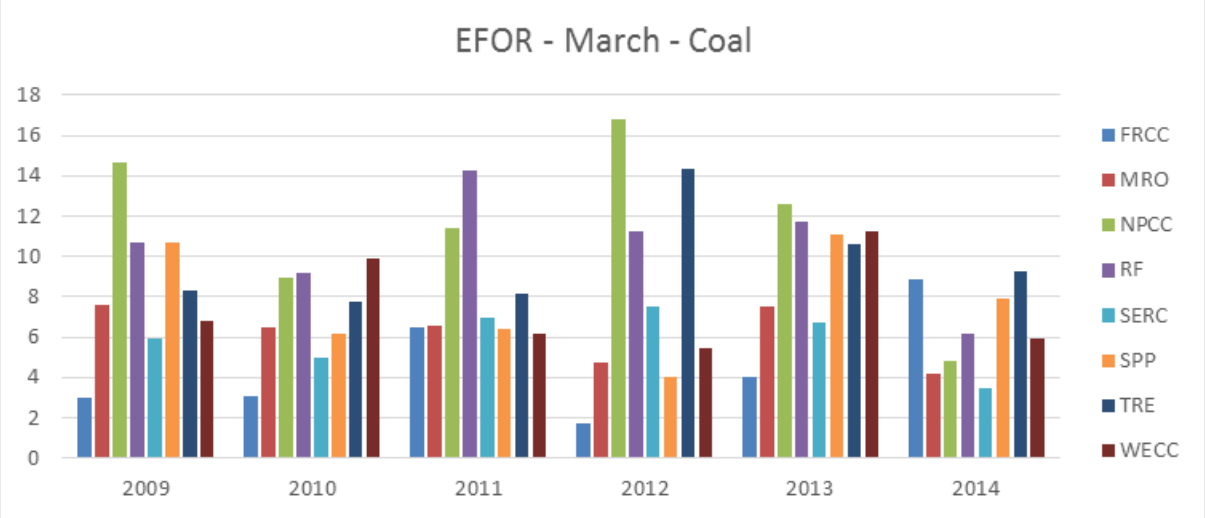

Figure A3: Historical EFOR for Coal Units in March by Year and Regional Entity

Natural Gas

Figures A4, A5, and A6 provide historical EFOR for natural gas units for January, February, and March by year and Regional Entity. In all Regions examined, natural gas units experienced an EFOR in January 2014 within the range of expected EFOR based on the prior five winter operating periods. The EFORs in NPCC, SERC, and SPP were near the top end of the range for their respective Region.

The historical winter monthly EFOR performance of natural gas units in MRO ranged from 8.3 to 18.3 percent, and in January 2014 they experienced an EFOR of 17.8 percent. In NPCC, the historical winter monthly EFOR performance ranged from 16.5 to 39.2 percent, and natural gas units experienced an EFOR of 35.4 percent in January 2014. Likewise, natural gas units in RF experienced an EFOR of 18.5 percent in January 2014, compared with a historical range of 4.8 to 25.5 percent. In SERC, natural gas units experienced an EFOR of 11.4 percent in January 2014, which was the same as the worst monthly EFOR calculated for the years examined (prior monthly values ranged from 6.3 to 11.4 percent). The EFOR performance of natural gas units in SPP ranged from 5.8 to 21.1 percent, and in January 2014 they experienced an EFOR of 19.5 percent. Finally, natural gas units in TRE experienced an EFOR of 5.3 percent in January 2014, compared with a historical range of 2.7 to 16.8 percent.

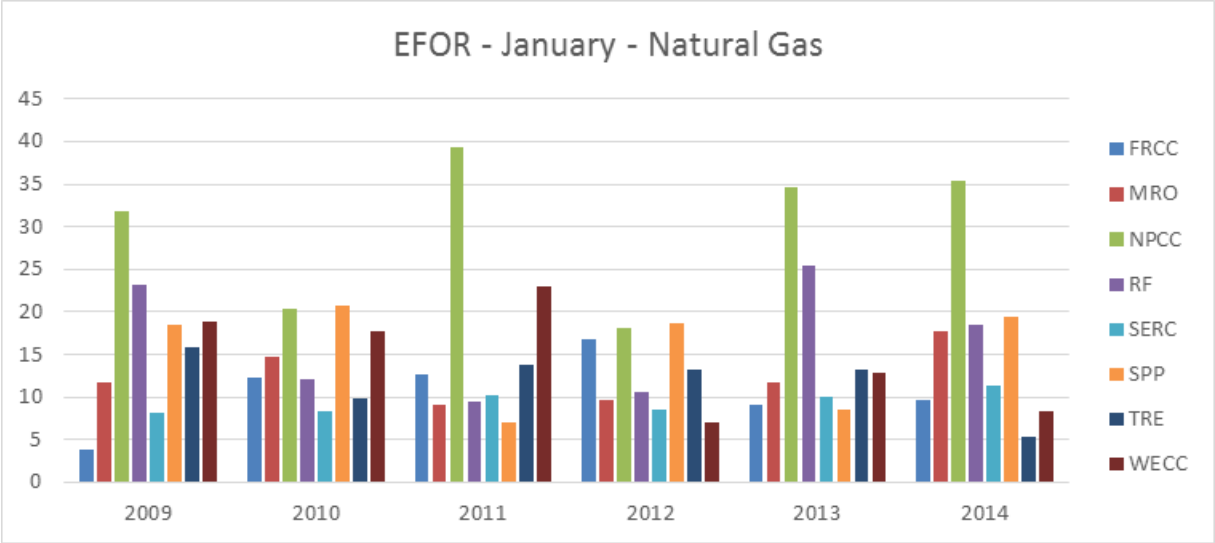

Figure A4: Historical EFOR for Natural Gas in January by Year and Regional Entity

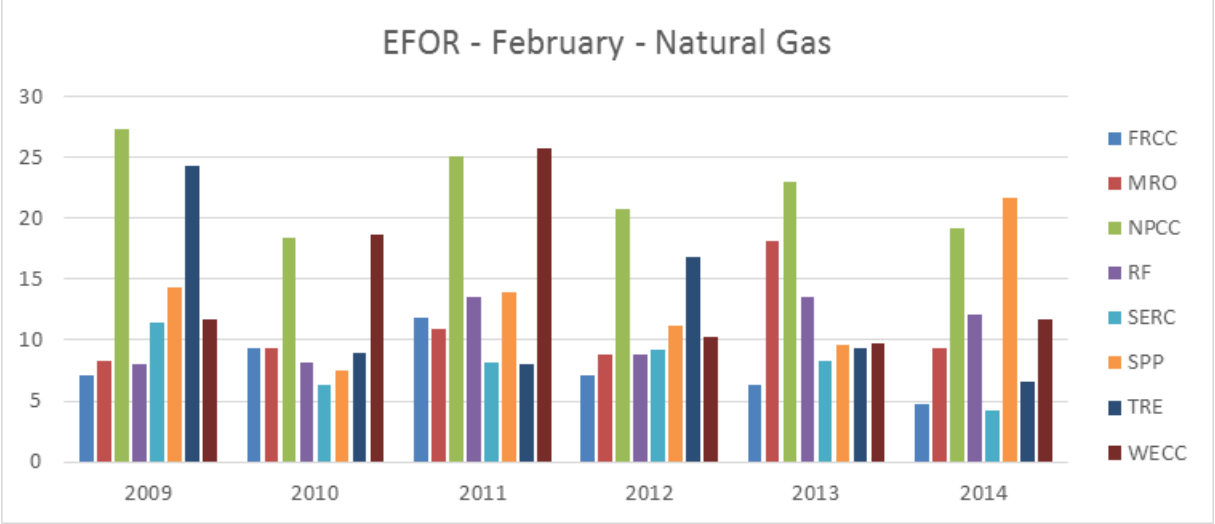

Figure A5: Historical EFOR for Natural Gas in February by Year and Regional Entity

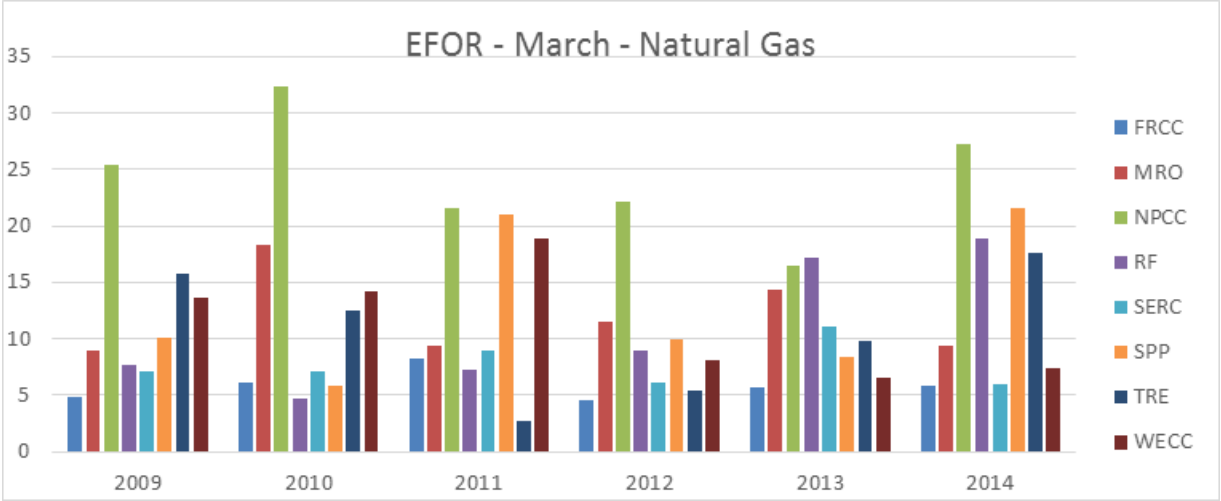

Figure A6: Historical EFOR for Natural Gas in March by Year and Regional Entity

Diesel Units

Figures A7, A8, and A9 provide historical EFOR for diesel units for January, February, and March by year and Regional Entity. Since participation in the GADS program is mandatory for all conventional units 20 MW and larger, many diesel units do not report to GADS. The comparative analysis, therefore, is of limited value and not provided.

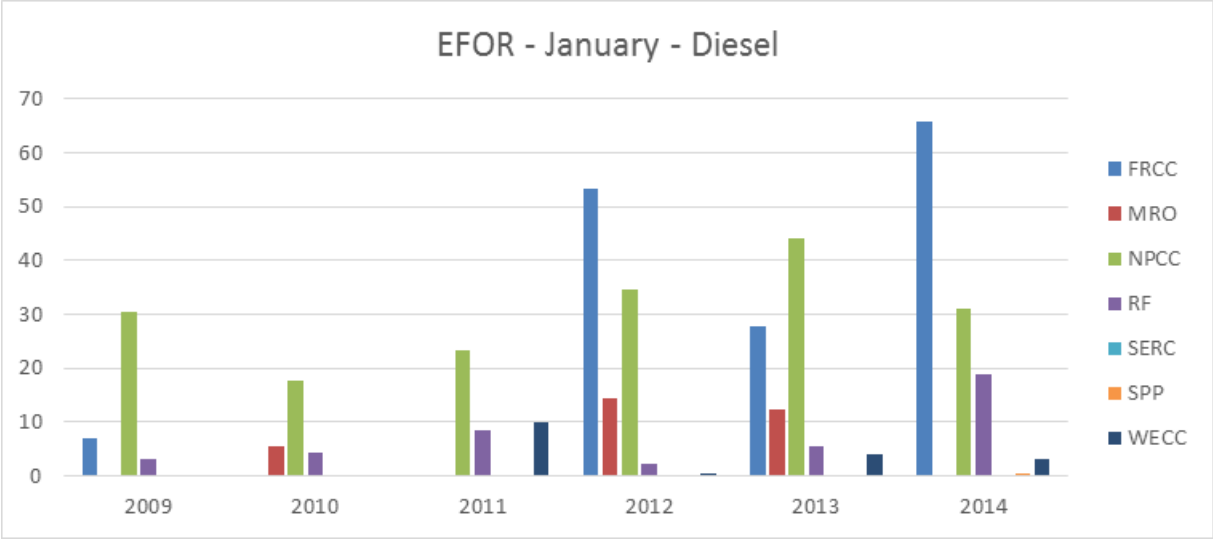

Figure A7: Historical EFOR for Diesel Units in January by Year and Regional Entity

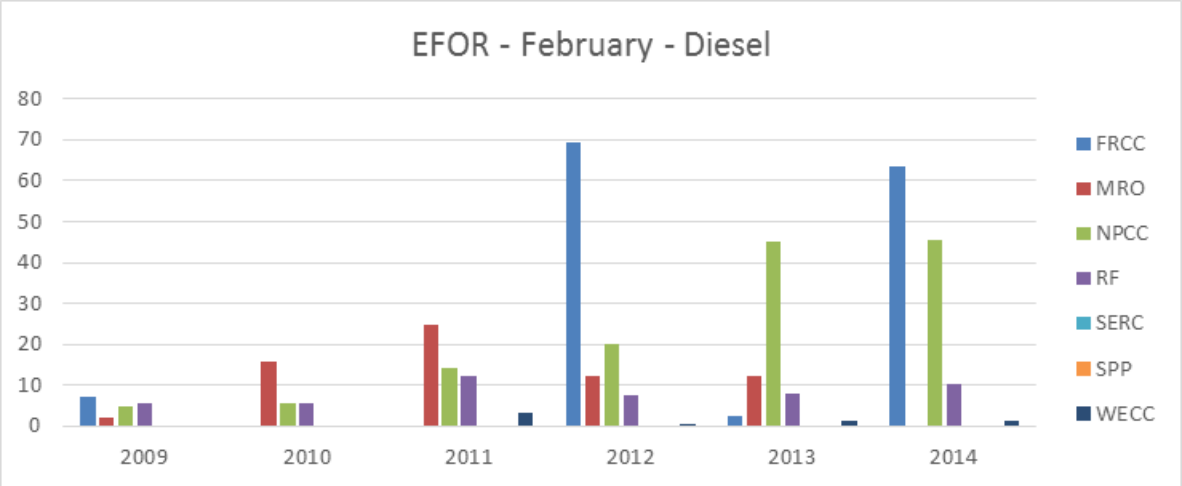

Figure A8: Historical EFOR for Diesel Units in February by Year and Regional Entity

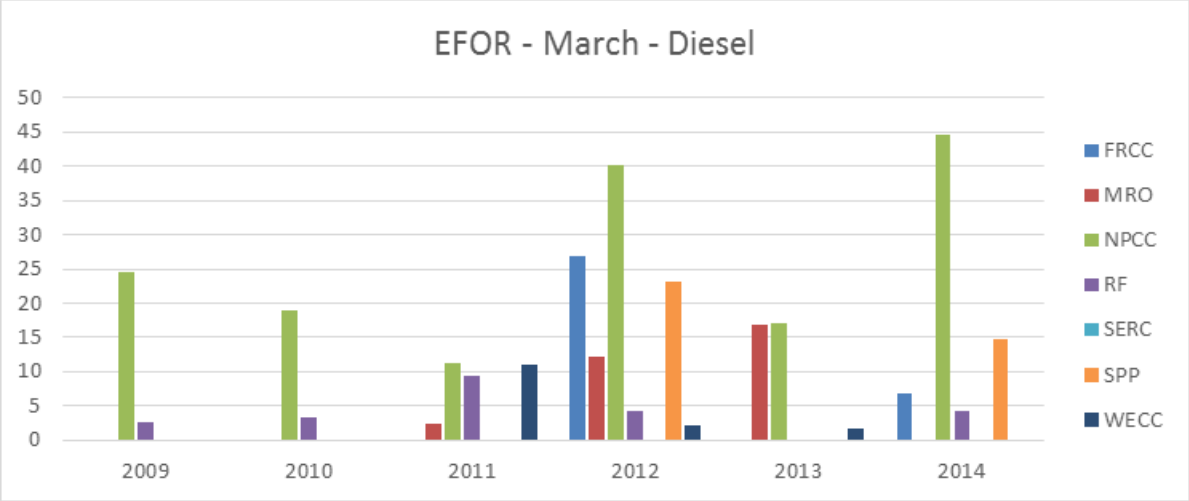

Figure A9: Historical EFOR for Diesel Units in March by Year and Regional Entity

Fluidized Bed Units

Figures A10, A11, and A12 provide historical EFOR for fluidized bed units for January, February, and March by year and Regional Entity. NPCC and SPP have no fluidized bed units reported in their Regions. In all other Regions examined, fluidized bed units experienced an EFOR in January 2014 within the range of expected EFOR based on the prior five winter operating periods.

The historical winter monthly EFOR performance of fluidized bed units in MRO ranged from 0.3 to 34.1 percent, and in January 2014 they experienced an EFOR of 3.2 percent. Fluidized bed units in RF experienced an EFOR of 0.1 percent in January 2014, compared with a historical range of zero to 22.6 percent (excluding the month of March 2013, which was an anomaly at 87.5 percent). The EFOR performance of fluidized bed units in SERC ranged from 0 to 25.4 percent, and in January 2014 they experienced an EFOR of 4.5 percent. Finally, fluidized bed units in TRE experienced an EFOR of 2.9 percent in January 2014, compared with a historical range of zero to 29.6 percent.

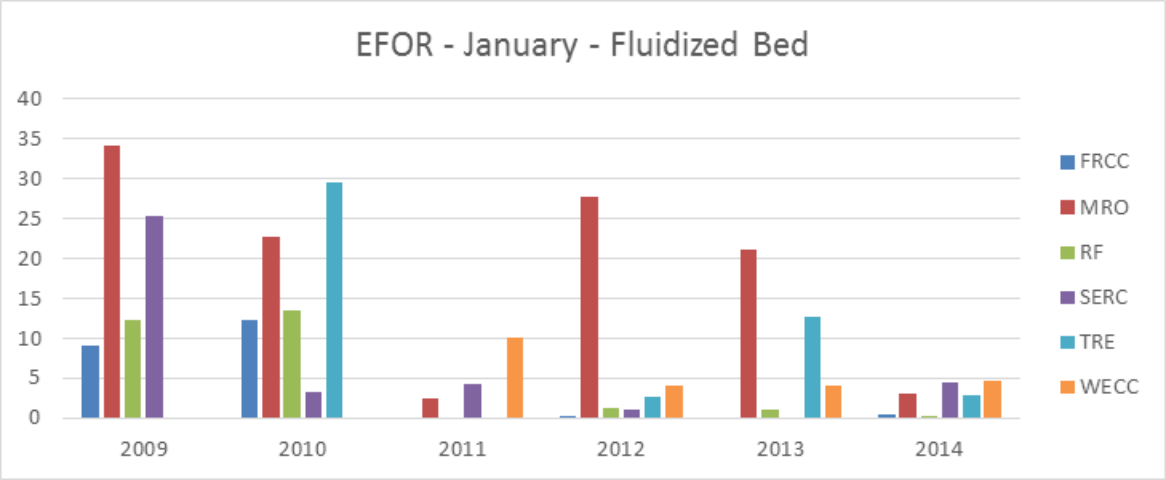

Figure A10: Historical EFOR for Fluidized Bed Units in January by Year and Regional Entity

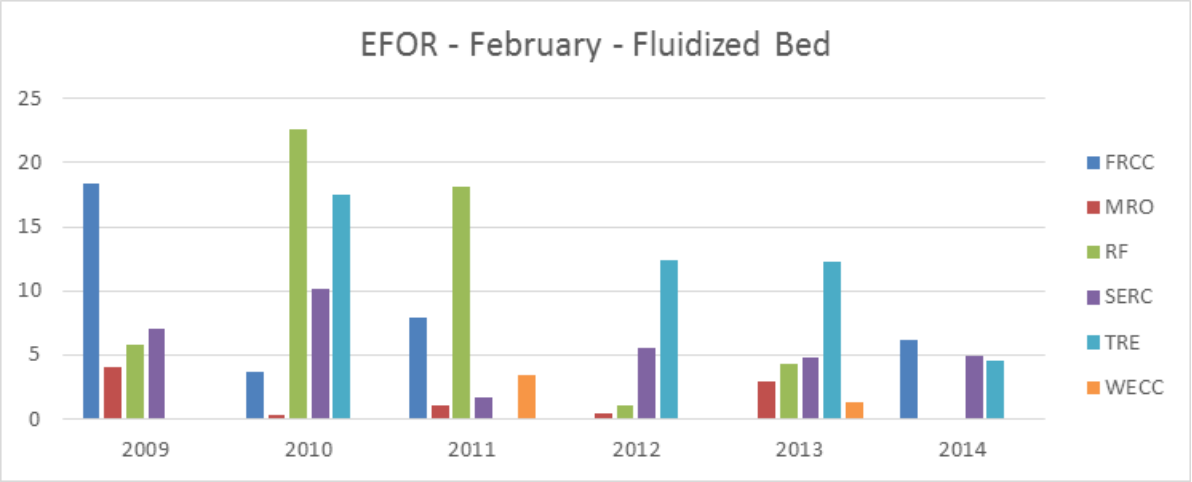

Figure A11: Historical EFOR for Fluidized Bed Units in February by Year and Regional Entity

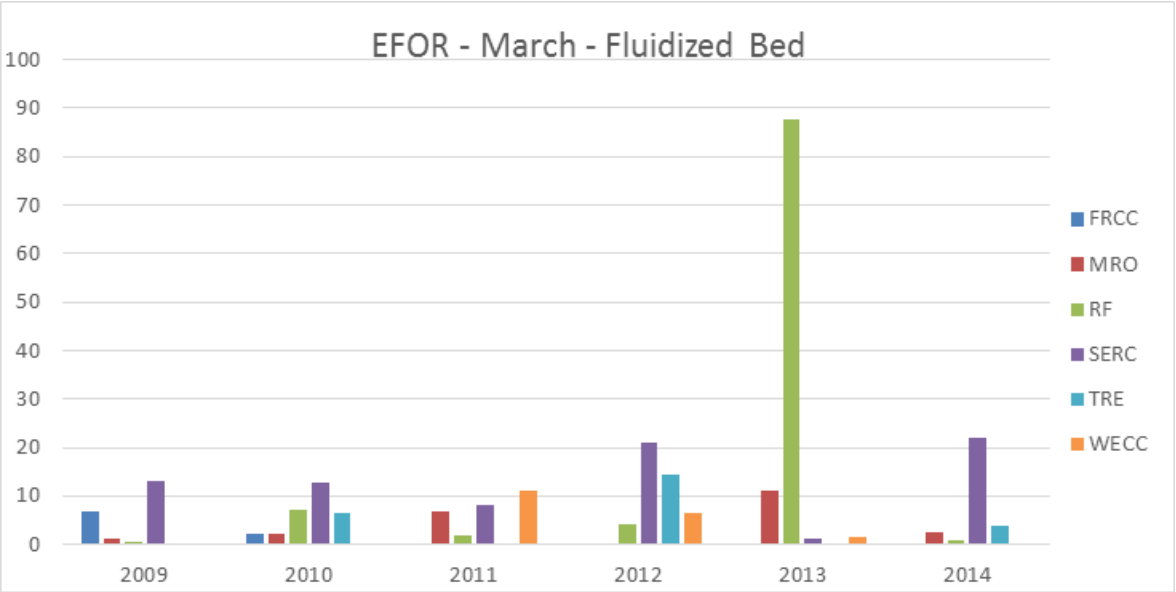

Figure A12: Historical EFOR for Fluidized Bed Units in March by Year and Regional Entity

Hydro/Pumped Storage

Figures A13, A14, and A15 provide historical EFOR for hydro and pumped storage for January, February, and March by year and Regional Entity. In all Regions examined, hydro and pumped storage experienced an EFOR in January 2014 within the range of expected EFOR based on the prior five winter operating periods.

The historical winter monthly EFOR performance of hydro and pumped storage in MRO ranged from 0.3 to 3.3 percent, and January 2014 they experienced an EFOR of 0.8 percent. In NPCC, the historical winter monthly EFOR performance ranged from 1.5 to 11 percent, and hydro and pumped storage experienced an EFOR of 0.3 percent in January 2014. Hydro and pumped storage in RF experienced an EFOR of 8.6 percent in January 2014, compared with a historical range of 0.9 to 10.4 percent. In SERC, hydro and pumped storage experienced an EFOR of 1.5 percent in January 2014, compared with a historical range of 1 to 9.7 percent. The EFOR performance of hydro and pumped storage in SPP ranged from zero to 12.7 percent, and January 2014 they experienced an EFOR of 0.4 percent. Finally, hydro and pumped storage in TRE experienced an EFOR of 0.5 percent in January 2014, compared with a historical range of zero to 21.5 percent.

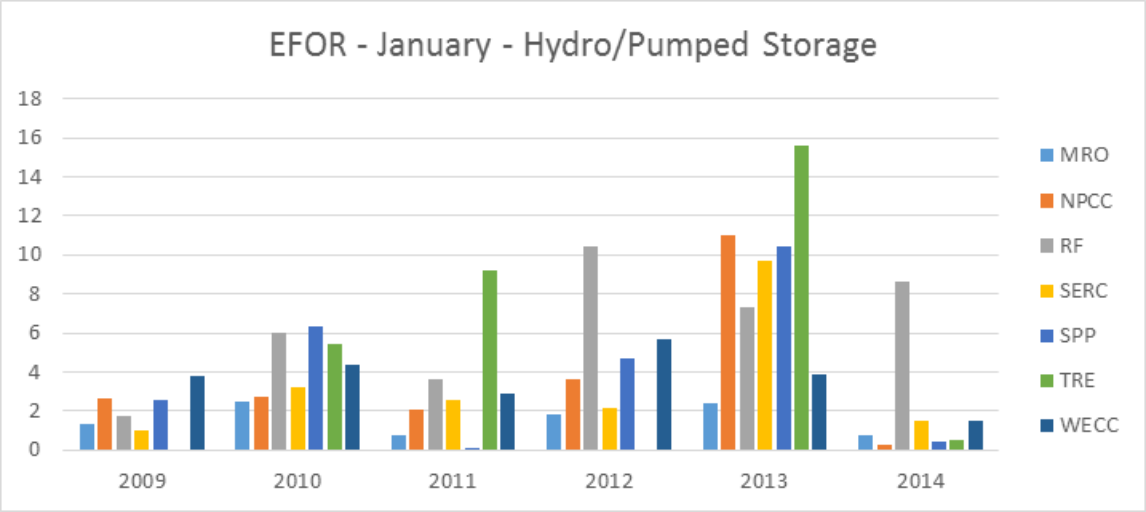

Figure A13: Historical EFOR for Hydro/Pumped Storage in January by Year and Regional Entity

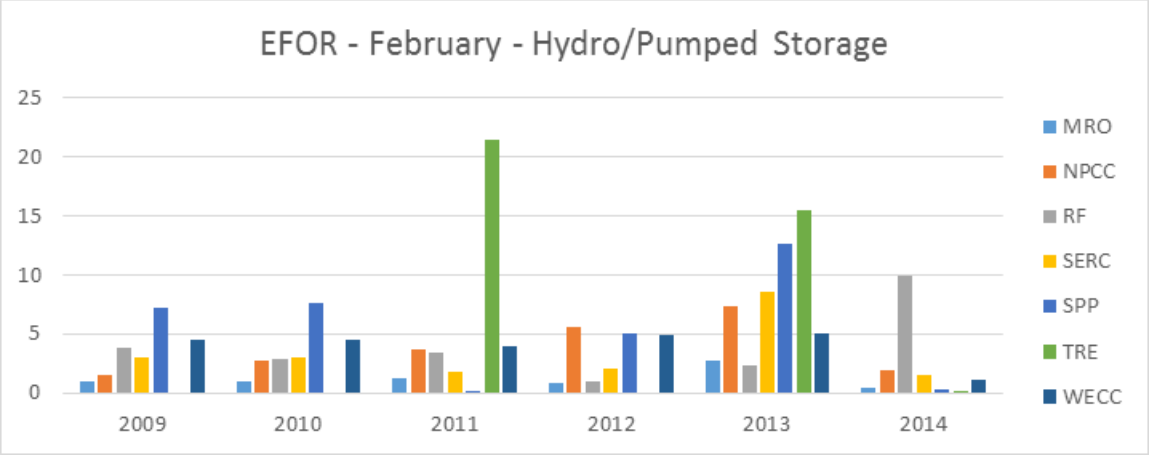

Figure A14: Historical EFOR for Hydro/Pumped Storage in February by Year and Regional Entity

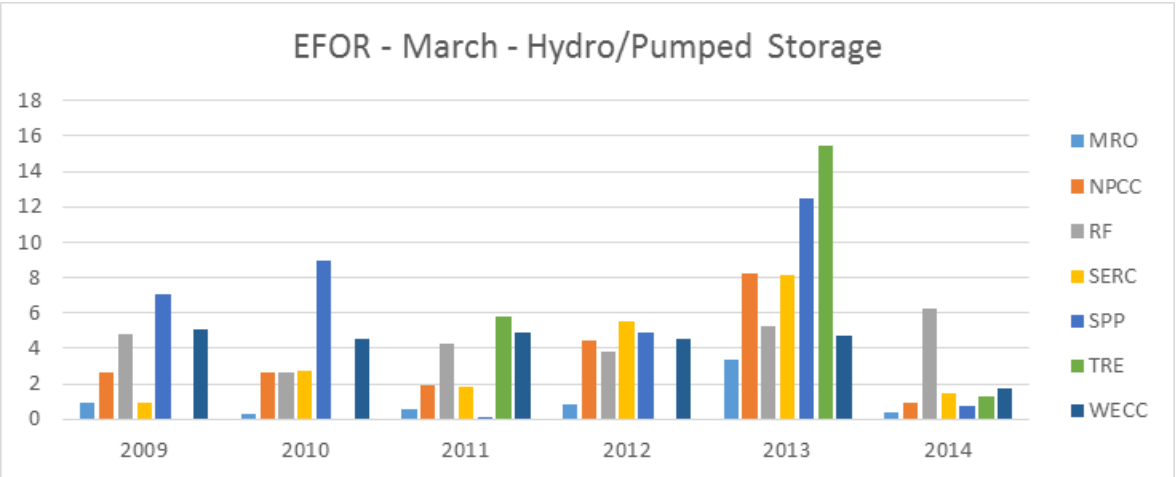

Figure A15: Historical EFOR for Hydro/Pumped Storage in March by Year and Regional Entity

Nuclear

Figures A16, A17, and A18 provide historical EFOR for nuclear units for January, February, and March by year and Regional Entity. In all other Regions examined, nuclear units experienced an EFOR in January 2014 within the range of expected EFOR based on the prior five winter operating periods.

The historical winter monthly EFOR performance of nuclear units in MRO ranged from 0 to 11.7 percent, and in January 2014 they experienced an EFOR of 10.3 percent. In NPCC, the historical winter monthly EFOR performance ranged from 0 to 7.2 percent, and nuclear units experienced an EFOR of 0.3 percent in January 2014. Nuclear units in RF experienced an EFOR of 0.03 percent in January 2014, compared with a historical range of 0.5 to 4.4 percent. In SERC, nuclear units experienced an EFOR of 1.8 percent in January 2014, compared with a historical range of 0 to 4.7 percent. The EFOR performance of nuclear units in SPP ranged from zero to 23.6 percent, and in January 2014 they experienced an EFOR of 0.0 percent. Finally, nuclear units in TRE experienced an EFOR of 3.9 percent in January 2014, compared with a historical range of zero to 26.4 percent.

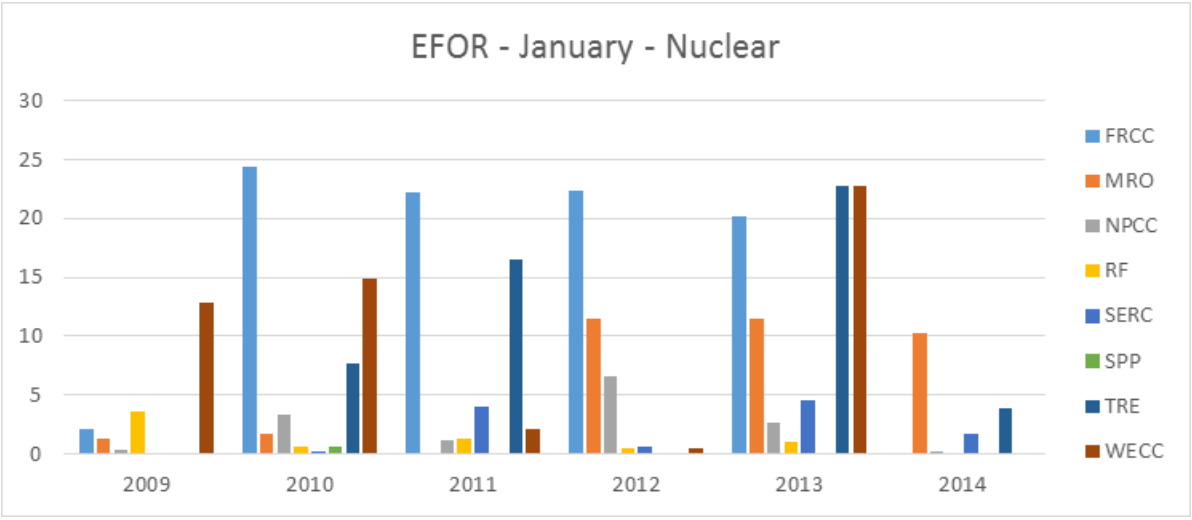

Figure A16: Historical EFOR for Nuclear Units in January by Year and Regional Entity

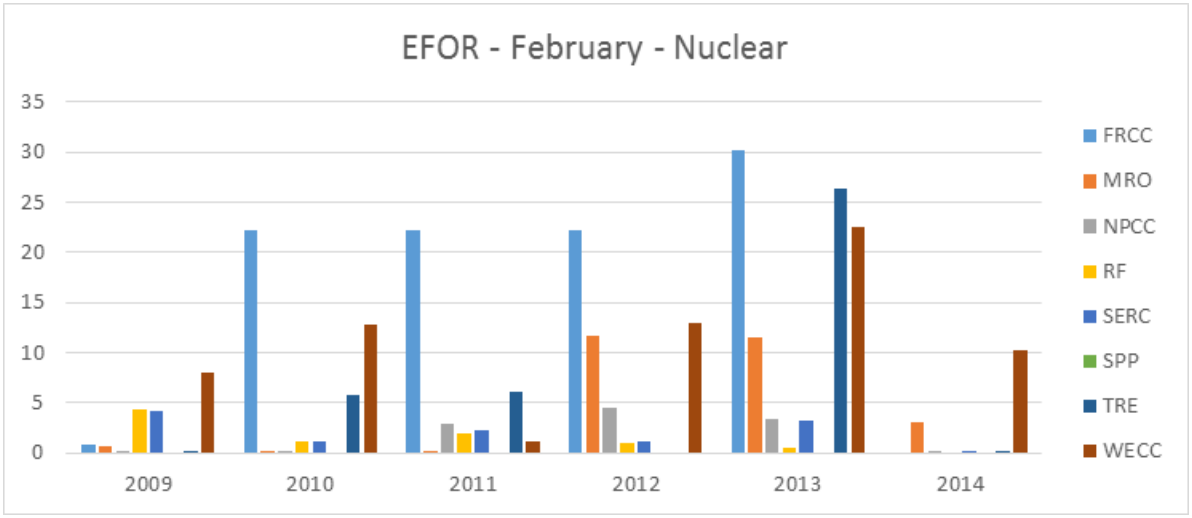

Figure A17: Historical EFOR for Nuclear Units in February by Year and Regional Entity

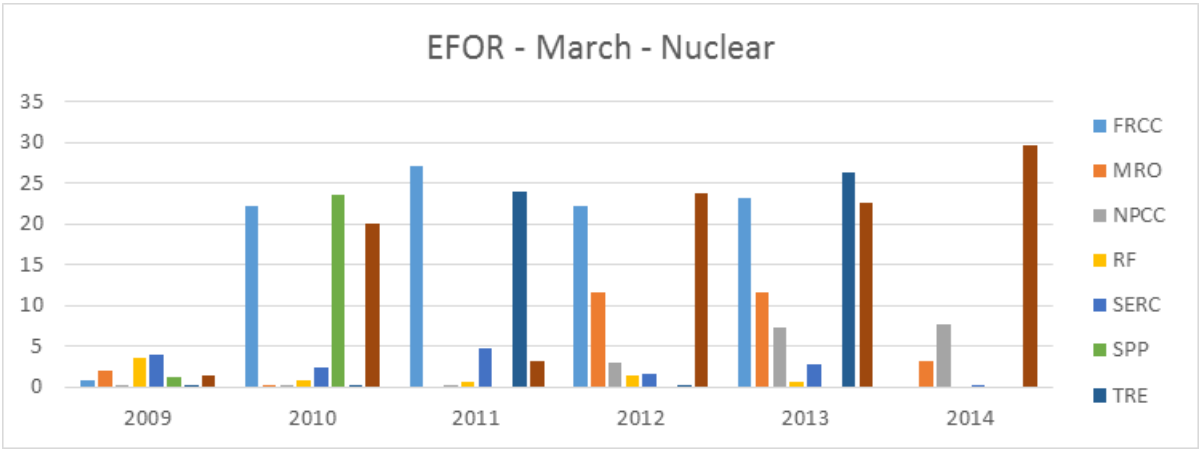

Figure A18: Historical EFOR for Nuclear Units in March by Year and Regional Entity

Other Units

Generation with other fuel types was considered for evaluation but is not included in this analysis. These units represent a small portion of power produced historically, and outage rates and MW produced vary from year to year. They also do not represent a significant portion of generation involved in the polar vortex analysis.

Summary

Most generation units, grouped by fuel type, performed in the expected range of EFOR, based on historical analysis. During the polar vortex, generation units could be expected to perform in the ranges provided in Table A1. Rows highlighted in yellow are for fuel types that experienced an EFOR greater than the previous high, and rows highlighted in light blue are for fuel types that experienced an EFOR less than the previous low. Overall, most units performed with an EFOR in the expected range, based on the past five years.

Appendix B

Background on NERC's Long-Term Assessment of Increasing Dependency on Natural Gas

As of 2008, natural gas is the primary fuel source for on-peak capacity in North America. This trend is expected to continue with the addition of 40 GW of planned gas-fired capacity, accounting for nearly half of all capacity additions over the next decade. An additional 100 GW of gas-fired capacity is included in the generator queue and is not considered in Figure B-1 below.[12] By 2023, natural gas will contribute to well over 50 percent of the on-peak resource mix.

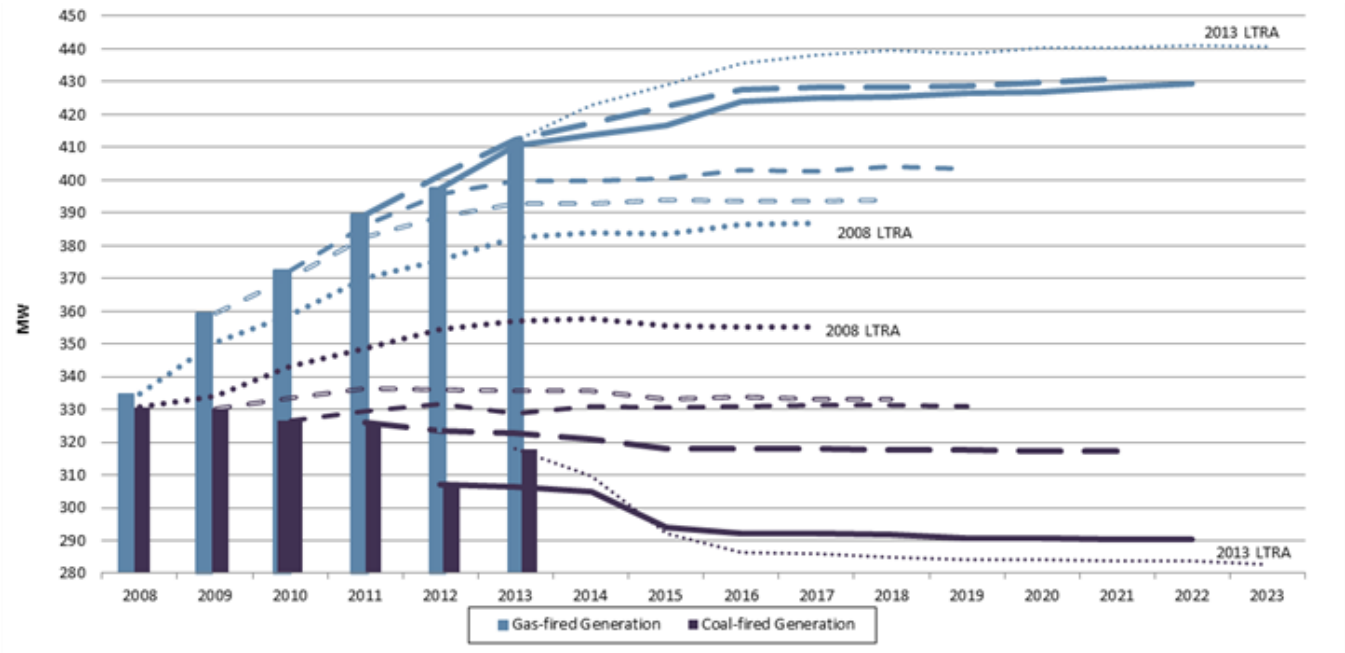

Figure B-1: Gas and Coal On-Peak Capacity: 10-Year Projected Outlook

This trend results from a variety of drivers that make natural-gas-fired capacity an attractive option for resource planners. First, the price of natural gas remains low, relative to other fuels, with abundant supplies due to new access to shale formations throughout North America. The emergence of natural gas combined cycle (NGCC) generating technology provides higher efficiency, and these units often require lower engineering, procurement, and construction costs. NGCC plants are oftentimes less challenging to procure because of shorter build times that might exist with other options. Perhaps the most impactful benefit is the lower carbon emissions when compared to coal-fired power plants without carbon capture and sequestration. Finally, natural-gas-fired units can provide System Operators with needed flexibility to address increased variability as additional renewable resources such as wind and photovoltaics are added to the system.

As the industry relies more on natural-gas-fired capacity to meet electricity needs, it is important to also examine potential risks associated with increased dependence on a single fuel type. The extent of these concerns varies from Region to Region. These concerns are most acute in areas where generators rely on interruptible natural gas pipeline transportation, and in times when the natural gas demand for power generation grows rapidly.

As highlighted in NERC's 2013 Special Assessment, *Accommodating an Increased Dependence on Natural Gas for Electric Power,*[13] a growing dependence on gas-fired generation can increase the BPS's exposure to disruptions from insufficient fuel supply, transportation, and delivery. While the likelihood is low and is largely correlated with

[12] http://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/2013_LTRA_FINAL.pdf
[13] http://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_PhaseII_FINAL.pdf

extreme conditions, disruptions in natural gas supply and transportation to power generators have prompted industry to seek an understanding of the reliability implications associated with increasing gas-fired generation. With fleets of gas-fired generation being more prevalent across North America, common-mode failures are a significant risk for the electric industry.

Unlike coal and fuel oil, natural gas is not easily stored on site. As a result, real-time delivery of natural gas through a network of pipelines and bulk gas storage is critical to support electric generators. Natural gas is widely used outside the power sector, and the demand from other sectors—particularly coincident end-user gas peak demand during cold winter weather—critically affects the gas providers' ability to deliver interruptible transportation service in the power sector. Additionally, demand for natural gas is expected to grow in other sectors (e.g., transportation, exports, and manufacturing).

As observed during the polar vortex, increased reliance on natural gas exposed the industry to various challenges with fuel supply and delivery. These challenges are predicted to escalate as more baseload generating plants are retired. While baseload generators are replaced with renewables, they are generally not available at full rated capacity during extreme weather events and do not significantly contribute to capacity during these periods.

Historical GADS Analysis

NERC has been collecting GADS data since 1982. The NERC Board of Trustees approved mandatory GADS reporting for conventional generating units (excluding renewable generation such as wind and solar) starting January 1, 2012. GADS data was used to perform a historical analysis of natural gas generator outages.

Generators report fuel unavailability related outages to GADS under two different outage (cause) codes:

- **9130 Lack of fuel** (water from rivers or lakes, coal mines, gas lines, etc.) where the operator is not in control of contracts, supply lines, or delivery of fuels
- **9131 Lack of fuel** (interruptible supply of fuel part of fuel contract)

Outages related to lack of fuel are recorded regardless of a unit's dispatch. If the unit becomes unavailable due to fuel unavailability, the event is recorded as an outage in GADS even if the unit is not dispatched. GADS records outage start and end days and hours by Region, unit type, and utility.

Figure B-2 shows the trend of the total gas-fired unit outages reported within the last decade due to lack of fuel (code 9130 and 9131). There were 3,716 hours of cumulative generator outages in the first quarter of 2014, but there were over 80 GW of cumulative net dependable capacity lost. It should be noted that 2014 data only represents the first quarter.

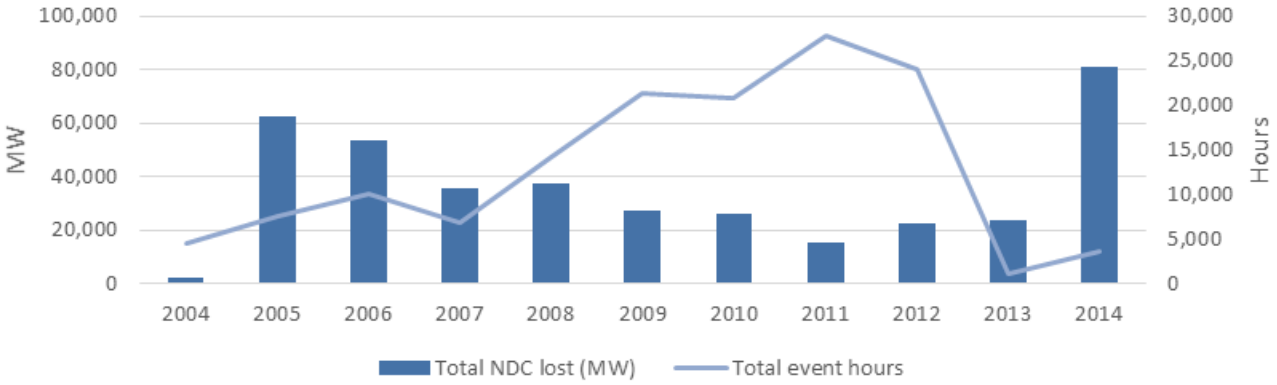

Figure B-2: Natural Gas Historical Outage Events Due to Lack of Fuel (2004–2014Q1)

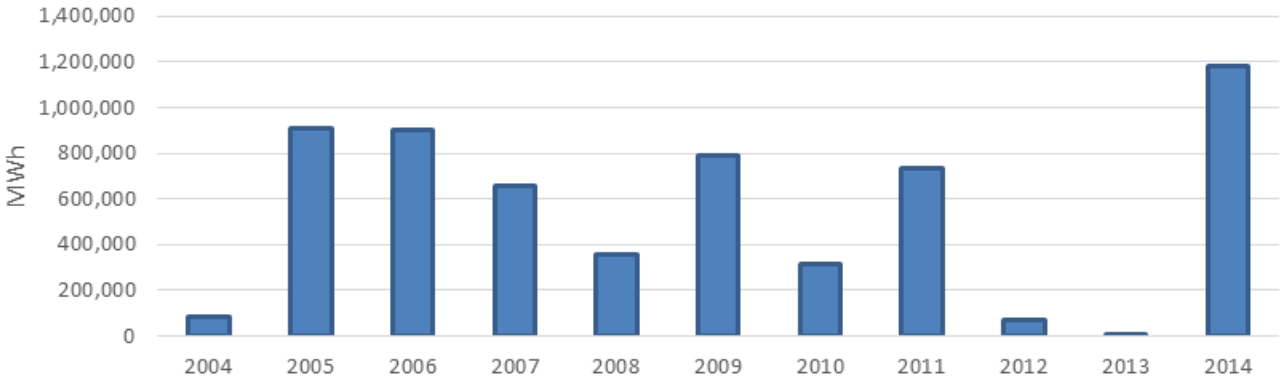

Figure B-3: Natural Gas Generation Historical Q1 and Q4 Energy Outages (MWh) Due to Lack of Fuel (2004–2014)

Plotting the number of events over time measures the trends outside of the normal event-count averages. Figure B-3 shows the total events reported by category. Values from 2014 increased the average to 363 events per year; meanwhile, the average for the last decade was around 296 events per year. The code U1 (Unplanned (forced) Outage – Immediate) accounts for 73 percent of the total events reported since 2004. Code U1 was reported 924 times (90 percent) in 2014 compared to 316 (64 percent) time in 2013. Again, there is a significant increase in 2014 (Q1).

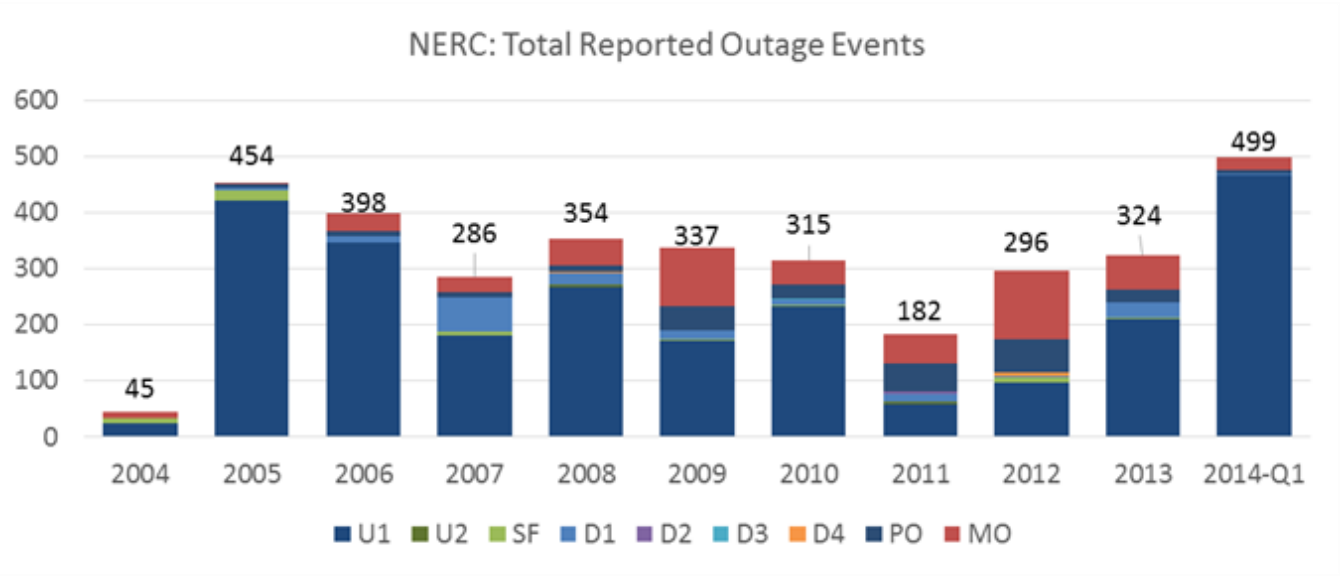

Figure B-4: Total Number of Outage Events Reported[14]

Event Type Codes Used	
Event Type	**Definition**
U1	Unplanned (Forced) Outage — Immediate - An outage that requires immediate removal of a unit from service, another Outage State, or a Reserve Shutdown state. This type of outage usually results from immediate mechanical/electrical/hydraulic control systems trips and operator-initiated trips in response to unit alarms.
U2	Unplanned (Forced) Outage — Delayed - An outage that does not require immediate removal of a unit from the in-service state but requires removal within six hours. This type of outage can only occur while the unit is in service.

[14] More information on GADS and GADS code used are available at GADS Event Reporting

Event Type Codes Used	
Event Type	**Definition**
SF	Start-up Failure - An outage that results when a unit is unable to synchronize within a specified start-up time following an outage or Reserve Shutdown.
D1	Unplanned (Forced) Derating — Immediate - A derating that requires an immediate reduction in capacity.
D2	Unplanned (Forced) Derating — Delayed - A derating that does not require an immediate reduction in capacity but requires a reduction within six hours.
D3	Unplanned (Forced) Derating — Postponed - A derating that can be postponed beyond six hours but requires a reduction in capacity before the end of the next weekend.
D4	Maintenance Derating - A derating that can be deferred beyond the end of the next weekend (Sunday at 2400 or before Sunday turns into Monday) but requires a reduction in capacity before the next Planned Outage (PO). A D4 can have a flexible start date and may or may not have a predetermined duration.
PO	Planned Outage - An outage that is scheduled well in advance that is of a predetermined duration, lasts for several weeks, and occurs only once or twice a year. Turbine and boiler overhauls or inspections, testing, and nuclear refueling are typical Planned Outages.
MO	Maintenance Outage - An outage that can be deferred beyond the end of the next weekend (defined as Sunday at 2400 hours or as Sunday turns into Monday), but requires that the unit be removed from service, another outage state, or Reserve Shutdown state before the next Planned Outage (PO). Characteristically, an MO can occur any time during the year, has a flexible start date, may or may not have a predetermined duration, and is usually much shorter than a PO.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Tilden Mining Company L.C. and Empire Iron Mining Partnership (Complainants)	)	**Docket No. EL14-103-000**
v.	)	
Midcontinent Independent System Operator, Inc., and Wisconsin Electric Power Company (Respondents).	)	

MOTION TO INTERVENE AND COMMENT OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Pursuant to Rules 212 and 214 of the Federal Energy Regulatory Commission's (the "Commission" or "FERC") Rules of Practice and Procedure, 18 C.F.R. §§ 385.212 and 385.214, the North American Electric Reliability Corporation ("NERC") moves to intervene and comment on the Complaint filed by Tilden Mining Company L.C. and Empire Iron Mining Partnership (collectively "the Mines") on September 19, 2014 in the above-referenced docket ("Complaint").

The Complaint against Midcontinent Independent System Operator, Inc. ("MISO") and the Wisconsin Electric Power Company ("WEPCo"), mischaracterizes NERC's action in the review and subsequent certification of WEPCo's proposed Michigan Upper Peninsula Balancing Authority ("MIUP BA"). The Mines assert that the split of WEPCo's BA[1] and establishment of the MIUP BA will result in a significant shift in the allocation of System Support Resource ("SSR") costs under the MISO tariff. The Mines are seeking Commission action to ensure that the SSR rates charged pursuant to MISO's Tariff are just and reasonable under the unique

[1] Under the MISO tariff, Balancing Authorities are referred to as local Balancing Authorities or LBAs. For the purposes of this filing, NERC is using the terms interchangeably.

circumstances of this case. While NERC is not a named party in the Complaint, NERC requests leave to intervene and comment in response to the improper representation of NERC's action set forth therein.

II. MOTION TO INTERVENE

NERC has a substantial interest in this proceeding as it is a party to a complaint pending before FERC on a related matter[2] and to correct the record regarding NERC's certification of the MIUP BA. The Commission certified NERC as the Electric Reliability Organization ("ERO") for the purpose of establishing and enforcing Reliability Standards for the Bulk Power System ("BPS") in the United States.[3] As the ERO, NERC's mission is to improve the reliability and security of the BPS in North America.[4] Under its FERC-approved Rules of Procedure, NERC certifies entities such as BAs to ensure that a newly operating entity "(*i.e.*, an applicant [seeking]

[2] *See Michigan Pub. Serv. Comm'n. v. No. American Elec. Reliability Corp. and Wisconsin Elec. Power Co.*, Docket No. EL14-104-000.
[3] *North American Electric Reliability Council, Order Certifying North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing*, 116 FERC ¶ 61,062 (2006) ("ERO Certification Order").
[4] *See Id.*

to be an RC, BA, or TOP that is not already performing the function for which it is applying to be certified as) has the tools, processes, training, and procedures," to meet the "Requirements/sub-Requirements of all Reliability Standards applicable to the function(s) for which it is applying."[5]

While the Mines acknowledge that issues related to the allocation of SSR costs are outside of NERC's purview, the Mines accuse NERC of being an unwitting participant to WEPCo's scheme to shift the allocation of SSR costs under MISO's Tariff between customers in Wisconsin and those in the Upper Peninsula of Michigan. No other party can adequately represent NERC's interests or adequately respond to the Mines' improper representation of NERC's action. Therefore, it is in the public interest to permit this intervention.

III. COMMENTS

Despite NERC's efforts to advise the Mines of the FERC-approved rules governing the certification of BAs, the Mines continue to misrepresent NERC's action as "approving WEPCo's proposal."[6] NERC did not approve WEPCo's proposal; NERC only certified WEPCo's proposed MIUP BA in accordance with its FERC-approved Rules of Procedure ("ROP") and, in its review of that certification, evaluated the competency of WEPCo to reliably operate the BA. NERC advised the Mines of its jurisdiction before the Mines filed the instant complaint with FERC.[7] NERC's role in the certification process is to ensure that entities are technically capable of performing their functions so as to better ensure grid reliability; issues such as cost allocation are not relevant to that determination and are beyond the scope of NERC's jurisdiction.

[5] *See* ROP § 501.
[6] *See* Complaint at 2.
[7] *See* NERC's August 29, 2014 Letter to W. Demarest (The Mines counsel), Complaint at Exhibit L.

In addition to improperly describing NERC's action as approving the WEPCo proposal, the Mines allege that NERC does not have jurisdiction to certify the MIUP BA. The Mines assert that "[a]s a cost-shifting mechanism rather than a reliability enhancement, the cost allocation consequences of the split of the WEC LBA and formation of the MIUP LBA fall outside NERC's purview."[8] NERC does not dispute FERC's jurisdiction over the cost allocation issues that flow from MISO's tariff and the calculation of SSR costs; however, the certification of the newly formed MIUP BA falls squarely within NERC's jurisdiction. NERC's certification process is governed by the FERC-approved ROP and is tied to registration on the NERC Compliance Registry and not, as the Mines assert, tied to reliability enhancements.

The NERC certification process flows from NERC's obligation to "clearly identify those entities that are responsible for compliance with the FERC approved Reliability Standards."[9] Under the FERC-approved ROP, for all geographical or electrical areas of the BPS, NERC is to register entities on the NERC Compliance Registry to ensure that: (i) no areas are lacking any entities to perform the duties and tasks identified in and required by NERC's Reliability Standards to the fullest extent practical; and (ii) there is no unnecessary duplication of such coverage or of required oversight of such coverage.[10] In addition to NERC's registration requirements as outlined above, NERC is to certify all entities such as BAs with primary reliability responsibilities.[11] NERC's certification review evaluates the competency of a registered entity to perform the evaluated functions.[12] The proper scope of NERC's review is not to ensure that the proposed BA remedies any physical reliability issues; rather, NERC's

	)	
North American Electric Reliability Corporation, and	)	
	)	
Wisconsin Electric Power Company	)	
	)	
Respondents.	)	

THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION'S ANSWER TO THE MICHIGAN PUBLIC SERVICE COMMISSION'S COMPLAINT

Pursuant to Rules 206(f) and 213 of the Federal Energy Regulatory Commission's ("FERC" or "Commission") Rules of Practice and Procedure[1] and the Commission's "Notice of Complaint" issued on September 22, 2014, the North American Electric Reliability Corporation ("NERC") hereby submits this Answer to the Complaint filed by the Michigan Public Service Commission ("MPSC") in the above-captioned docket ("the Complaint"). MPSC seeks an order from the Commission that reverses NERC's certification outlined in the August 28, 2014 Balancing Certification Final Report ("Certification")[2] issued by ReliabilityFirst ("RF"). MPSC alleges, among other things, that NERC's August 28 Certification approved Wisconsin Electric Power Company's ("WEPCo") proposal to split its existing WEC Balancing Authority ("BA") footprint into two BAs - the new Michigan Upper Peninsula ("MIUP") BA and the WEC BA. MPSC further argues NERC's approval of the new BA could result in an unjust and

[1] *See* 18 C.F.R. §§ 385.206(f) and 385.213 (2013).
[2] *See* Complaint at Exhibit MI-1.

unreasonable change in the allocation of System Support Resource ("SSR") costs. As discussed in greater detail below, MPSC's Complaint should be dismissed given that it mischaracterizes NERC's action in the certification of WEPCo's proposed MIUP BA, and as a result, seeks an improper form of relief.

I. SUMMARY OF MPSC'S COMPLAINT AND EXECUTIVE SUMMARY OF NERC'S ANSWER

A. SUMMARY OF MPSC'S COMPLAINT

At the core of the MPSC Complaint are the following three allegations:[3]

1) The administrative decision-making process before ReliabilityFirst was procedurally defective, and denied affected parties an opportunity to be heard and to present evidence regarding the impact of WEPCo's proposal upon ratepayers of affected Load Serving Entities ("LSEs");

2) NERC failed to address evidence that WEPCo's proposed split of its BA between the portion covering Wisconsin and the portion covering the Michigan Upper Peninsula, either intentionally or coincidentally, could result in a dramatic and unjust and unreasonable change in the allocation of SSR costs recently approved by the Commission in its July 29 Order; and

3) There is a lack of substantial evidence supporting any finding that the requested split is needed to address any physical reliability issues.

MPSC argues that for these reasons, NERC's Certification of the MIUP BA should be reversed. In the alternative, MPSC requests that the Commission make clear that NERC's approval will not have any impact upon the allocation of SSR costs that would otherwise occur under the Midcontinent Independent System Operator ("MISO") Tariff and the related MISO Business Practice Manual. MPSC argues that without the requested reversal or clarification, NERC's approval could "impose dramatic and unreasonable shifts in the allocation of SSR costs without providing any opportunity or forum for affected parties to be heard and present evidence

[3] Complaint at 4–5.

concerning the impact of proposed changes to BA boundaries upon areas potentially outside of NERC's purview, such as cost allocation."[4]

B. EXECUTIVE SUMMARY OF NERC'S ANSWER

In response to MPSC's Complaint, NERC asserts the following:

1) The administrative decision-making process before RF was not procedurally defective. NERC complied with its FERC-approved Rules of Procedure ("ROP) in certifying the MIUP BA.

2) NERC was not obligated to address evidence that the proposed split of WEPCo's BA could result in a change in the allocation of SSR costs. Issues related to costs such as the SSR allocation are beyond the scope of NERC's jurisdiction.

3) NERC's Certification review was properly scoped to evaluate whether the proposed split of the WEC BA would cause reliability concerns. The proper scope of NERC's review is not to ensure that the proposed BA remedies any physical reliability issues; rather, NERC's certification review is designed to ensure that the proposed BA does not create any reliability issues.

As a threshold matter, MPSC's Complaint fails to meet even the minimal requirements set forth in Rule 206 of the Commission's Rules of Practice and Procedure.[5] The Complaint does not "clearly identify the action or inaction which is alleged to violate applicable statutory or regulatory requirements" and does not "explain how the action or inaction violates applicable statutory standards or regulatory requirements."[6] Instead, the Complaint requests the Commission's reversal of NERC's Certification for failure to consider evidence that NERC has no jurisdiction to consider. MPSC's Complaint should be dismissed and evidence relating to the allocation of SSR costs, the underlying cause of MPSC's concern, should be evaluated by the only entity with the requisite jurisdiction—FERC.

III. ANSWER

A. NERC'S CERTIFICATION OF THE MIUP BA WAS NOT PROCEDURALLY DEFECTIVE

NERC's certification of the MIUP BA was done in full accordance with the FERC-approved ROP. The certification review was not procedurally defective and any claims to the contrary demonstrate a fundamental misunderstanding of NERC's processes. The ROP clearly sets forth the process for registration and certification of a BA. Under the ROP, the purpose of NERC's Certification program is to ensure that a "new entity (*i.e.*, an applicant seeking to be an RC, BA, or TOP that is not already performing the function for which it is applying to be certified as) has the tools, processes, training, and procedures," demonstrating its ability to meet the "Requirements/sub-Requirements of all of the Reliability Standards applicable to the function(s) for which it is applying," demonstrating that it is qualified for certification and operation.[7]

[7] *See* ROP § 501.

The registration and certification process requires NERC to ensure that all geographical or electrical areas of the Bulk Power System ("BPS"): (i) do not lack any entity to perform the duties and tasks identified in and required by NERC's Reliability Standards to the fullest extent practical; and (ii) that there is no unnecessary duplication of such coverage or of required oversight of such coverage.[8] NERC evaluates each proposed BA under specific criteria articulated in the ROP. In doing so, NERC is to: (i) ensure an applicant's ability to meet certification requirements; (ii) document the certification process; (iii) maintain records of currently certified entities; and (iv) issue a Certification document to an applicant that successfully demonstrates its competency to perform the evaluated functions.[9] NERC made each of the relevant determinations required by the ROP.

Contrary to MPSC's allegations otherwise, NERC is not required to entertain comments or evidence from stakeholders. NERC's evaluation is limited to a technical evaluation of the entity's operational capabilities and ability to meet NERC's Reliability Standards. NERC conducted an in-depth review of WEPCo's capacity to reliably operate the MIUP BA. Specifically, NERC's evaluation included: (i) interviewing MIUP's management and reviewing pertinent documentation to verify necessary requirements for BA operation; (ii) reviewing procedures and other documentation developed by MIUP to meet applicable standards and requirements; (iii) interviewing MIUP system operations personnel; (iv) reviewing MIUP's Energy Management System, communication facilities, operator displays, etc., to assess its capabilities; (v) performing other validation review as necessary; and (vi) conducting an in-person site check on August 12, 2014 through August 13, 2014.[10] NERC's evaluation confirmed

[8] *See Id.* at § 501.1.4.; *see also* § 501.1.4.2 *et seq.*
[9] *See* ROP §§ 501.2–501.2.5 (specifying the criteria NERC must use before issuing certification of a new BA).
[10] *See* Complaint at Exhibit MI-1.

WEPCo's competency to operate the MIUP BA reliably and thus NERC issued its Certification report on August 28, 2014.

B. MPSC MISCHARACTERIZED NERC'S ACTION: NERC CERTIFIED THE MIUP BA, NERC DID NOT APPROVE WEPCO'S PROPOSAL

Despite NERC's efforts to inform the MPSC of its process and responsibilities, the MPSC has repeatedly failed to recognize NERC's limited and narrowly scoped certification process. Instead, the MPSC continues to assert that NERC approved WEPCo's proposal to create a new BA. NERC did not approve any such proposal, and advised the MPSC of that fact[11] before MPSC filed its Complaint with FERC. NERC only certified WEPCo's proposed MIUP BA and, in its review of that Certification, evaluated the competency of WEPCo to reliably operate the BA.[12] NERC's role in the certification process is to ensure that entities are technically capable of performing their functions so as to better ensure grid reliability; issues such as cost allocation are not relevant to that determination and are beyond the scope of NERC's jurisdiction. In fact, under the ROP, cost allocation is not among the factors NERC is to consider as part of its registration or certification program.[13]

MPSC's concerns about cost allocation issues relate to tariff revisions proposed by the MISO that are currently before the Commission in a separate proceeding.[14] Pursuant to Section 205(a) of the FPA, the Commission has exclusive jurisdiction over all rules that affect or pertain to rates and charges received by any public utility for or in connection with the transmission and sale of electric energy. MISO's tariff and the related allocation of SSR rates falls squarely in the

[11] *See, inter alia*, NERC's August 29, 2014 Letter to the Michigan Public Service Commission, Attachment L to the Complaint.
[12] *See Id.*
[13] *See* ROP § 500 (governing NERC's registration and certification process for BAs); *see also* Appendices 5A and 5B of the ROP (providing the criteria evaluated and guidance for evaluation in NERC's certification process).
[14] *See, inter alia*, Docket Nos. ER14-1242 and ER14-1243 (In a January 31, 2014 filing, MISO proposed a *pro rata* allocation of SSR costs associated with the Presque Isle generators to all LSEs of the ATC LLC footprint).

Commission's jurisdiction. Therefore, NERC does not have the jurisdiction or ability to evaluate evidence relating to these issues as they are entirely within the Commission's purview.

NERC's Certification of the MIUP BA should not be improperly expanded to provide the MPSC with another attempt to change the Commission's ruling on SSR costs. MPSC has had the opportunity to comment on MISO's tariff restructuring before FERC,[15] and NERC's certification process is not meant to address these issues.

C. NERC's certification review was properly scoped to evaluate whether the proposed split of the WEC BA would cause reliability concerns.

The proper scope of NERC's review is not to ensure that the proposed BA remedies any physical reliability issues; rather, NERC's certification review is designed to assure that the proposed BA does not create any reliability issues. On February 17, 2014, WEPCo submitted an Entity Certification form to RF for certification and registration of the MIUP BA. In its request, WEPCo provided all required documentation including a reliability proposal, procedures, and list of personnel needed for NERC to evaluate and determine whether the MIUP BA would cause any reliability concerns.[16] NERC's primary objective for conducting its certification review is to ensure that the MIUP BA can competently fulfill its responsibilities as a BA and comply with NERC's Reliability Standards (*i.e.* the MIUP BA will not affect reliability in the region).[17] NERC met its responsibility in the evaluation of the MIUP BA and subsequent determination that it has the technical ability to act as a BA. That is the limited, technical role that NERC plays in this process, despite MPSC's protestations to the contrary.

[15] *See Id.*
[16] *See* ROP § 501 (requiring any utility seeking registration to provide proper documentation demonstrating its ability to satisfactorily function as a BA); *see also* Complaint at Exhibit MI-1.
[17] *Id.*

IV. CONCLUSION

WHEREFORE, NERC respectfully requests that the Commission deny the relief sought by MPSC and uphold NERC's certification of the MIUP BA.

Respectfully submitted,

/s/ Meredith M. Jolivert

COMPLIANCE FILING OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

The North American Electric Reliability Corporation ("NERC")[1] submits this compliance filing in accordance with the Commission's January 16, 2013 Order in Docket No. FA11-21-000.[2] In the January 16 Order, the Commission approved a Settlement Agreement between the Office of Enforcement ("Enforcement") and NERC related to Enforcement's findings and recommendations arising out of its 2012 performance audit of NERC. Specifically, Section II.7(b)(i) of the Settlement Agreement requires that:

> Within forty-five days of the end of each quarter, beginning with the quarter ending March 31, 2013, NERC will file with the Commission the unaudited report of the NERC budget-to-actual spending variances during the preceding quarter. This report will include information regarding sources and uses of operating and working capital reserves and will match or exceed the level of detail of the quarterly budget-to-actual variance report of NERC expenditures attached to the agenda of NERC Board of Trustees Finance and Audit Committee's October 2012 meeting.[3]

Attached hereto is the unaudited report of NERC's budget-to-actual variance information for the third quarter of 2014, in accordance with the January 16 Order. This variance information was

---

[1] NERC was certified by FERC as the electric reliability organization ("ERO") authorized by Section 215 of the Federal Power Act. FERC certified NERC as the ERO in its order issued July 20, 2006 in Docket No. RR06-1-000. *Order Certifying North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing*, 116 FERC ¶ 61,062 (2006) ("ERO Certification Order").

North American Electric Reliability Corporation- Review of September 30, 2014 Unaudited Results – Budget to Actual Variance Analysis

Summary of Results as of September 30, 2014

The Total Budget for expenses plus fixed asset purchases was under budget $4.1M, 9.6%, through September 30, 2014, which is generally consistent with June 30th results, which were $2.9M, 10.0%, under budget. With the exception of rent expense and professional services, all expense categories were under budget.

SEPTEMBER YTD ACTUAL VERSUS BUDGET BY CATEGORY COMPARED TO JUNE YTD

	As of September 30, 2014				Results through June 30, 2014		
	2014 YTD Actual	2014 YTD Budget	2014 YTD Variance Over(Under)	%	Variance Over/(Under)		Change in Variance Compare September to June

As reflected in the following table, we project to be approximately $2.4M under budget at the end of the year, compared to the June 30, 2014 year-end projection of $944.7k under budget, which was utilized in preparation the final 2015 business plan and budget. The change in the year-end projection is primarily due to: (i) lower projected personnel expenses as a result of staff vacancies and turnover; (ii) lower projected contract and consulting expenses due to reductions in the cost of various IT projects and outside consulting support for internal controls and risk management; and (iii) lower fixed asset expenditures for software application development. Significant contract and consultant expenses projected for the fourth quarter include: (i) $150k for FAC3 and $230k for study of the reliability effects of GMD in RAPA; (ii) $135k for SOCCED database; (iii) $80k for a survey assessing ERO effectiveness; and (iv)

approximately $618k for various projects in IT as further described below. The projection also reflects approximately $1.4M in fixed assets costs to complete or begin ERO Enterprise projects and for NERC IT infrastructure investments. The year end projection does not include approximately $285k in costs to make various improvements to the company's office space in Atlanta which are required to accommodate existing and projected staff. Further information regarding these improvement costs is included under the discussion below related to fixed asset purchases. These costs were not anticipated at the time the 2014 business plan and budget was prepared.

2014 YEAR-END PROJECTION VERSUS BUDGET BY CATEGORY

	As of September 30, 2014				As of June 30, 2014	
	2014 Projection	2014 Annual Budget	2014 Projected Variance from Budget Over(Under)	%	2014 Projected Variance from Budget as of June 30, 2014	Change in Projected Variance
TOTAL FUNDING	53,586,819	53,735,382	(148,563)	-0.3%	**(132,500)**	**(16,063)**
BUDGET - EXPENSES and FIXED ASSETS						
PERSONNEL EXPENSES	32,974,998	34,059,655	(1,084,657)	-3.2%	(270,107)	(814,550)
MEETINGS, TRAVEL and CONFERENCE CALLS	3,524,929	3,789,525	(264,596)	-7.0%	(325,079)	60,483
CONSULTANTS and CONTRACTS	7,100,985	6,828,973	272,012	4.0%	687,146	(415,134)
RENT	2,720,299	2,617,299	103,000	3.9%	33,000	70,000
OFFICE COSTS, PROFESSIONAL SERVICES and MISCELLANEOUS	5,760,631	5,832,854	(72,223)	-1.2%	(99,467)	27,244
Other Non-Operating Expenses	95,061	144,000	(48,939)	-34.0%	(64,633)	15,693
FIXED ASSET PURCHASES (excludes the credit for depreciation)	1,805,558	3,117,790	(1,312,232)	-42.1%	(905,593)	(406,639)
TOTAL BUDGET	**53,982,460**	**56,390,096**	**(2,407,636)**	**-4.3%**	**(944,733)**	**(1,462,902)**
FTEs	**179.87**	**189.53**	**(9.66)**	**-5.1%**	**(4.02)**	**(5.64)**

Year-to-date actual results and the 2014 year end projection reflected in the tables above do not include any expenses or funding related to CRISP. Further information regarding CRISP contract, budget and funding status is set forth in a separate section below.

Actual to Budget Variances for Expenses and Fixed Assets by Category

Personnel expenses were under budget $921.0k, 3.6%, under budget through September 30th and are projected to be $1.1M, 3.2%, under budget at year end. Total FTEs were under budget 10.4, 5.5%, as of September 30th and are projected to be 9.7, 5.1%, under budget at year end.

- Salaries expense, which includes salaries, ($663.0k under budget), incentive compensation, ($133.2k over budget), employment agency fees, ($130.9k over budget), and temporary office services, ($22.9k over budget), was $376.0, 1.9%, under budget as of September 30th. Salaries expense is projected to be $475.8k, 1.8%, under budget at year end due to lower than budgeted salaries as a result of staff vacancies, offset by: (i) higher than budgeted incentive compensation based upon the 3-year average of 18.4%; (ii) higher than budgeted employment agency fees; and (iii) higher than budgeted temporary office services which have been utilized during periods of staff vacancies and to support NERC's current operations.

- Payroll taxes were $49.6k, 3.7% over budget as of September 30th and are projected to be over budget $133.1k, 8.5% at year end due to an increase in the maximum taxable earnings cap which is higher than the assumption in the budget.

- Benefits were $229.7k, 9.0% under budget as of September 30th and are projected to be $410.0k, 12.1%, under budget at year end due to open positions, lower than budgeted renewal rates for employee health benefits and lower than budgeted relocation expense. Education benefits were over budget $43.1k through September 30th, and are projected to be equal budget at year end. Workers compensation expense is projected to be $11.6k over budget at year end based upon the final audit of the July 1, 2013 through June 30th.

- Retirement costs were $364.9k, 17.2%, under budget as of September 30th and are projected to be $332.0k, 11.5%, under budget at year end due to having fewer FTEs on staff, delayed eligibility related to timing of hiring and attrition and due to forfeiture of unvested employer contributions.

Meetings, Travel, and Conferencing expenses were collectively under budget $126.8k, 4.5%, through September 30th due to lower than budgeted travel and meeting expenses, offset by higher than budgeted conferencing expenses. Meetings and workshop expenses were $18.9k, 2.6%, under budget due to lower than budgeted workshop expenses related to the elimination of NERC funding of NASPI workshops, offset by higher than budgeted meeting expenses for the CIP V5 and physical security standards. Travel expenses were $112.1k, 6.2%, under budget through September 30th, and are projected to be $307.1k, 12.7%, under budget at year end based upon the current spend trend compared to the actual monthly spending trend in 2013.

Consultant and Contract expenses were under budget $1.2M, 22.2%, through September 30th and are projected to be over budget $272.0k, 4.0%, at year end. As further explained below, contracts for a number of projects were executed late in the third quarter and work has begun, but invoices have not been received.

CONSULTANTS and CONTRACTS	As of September 30, 2014 Actual	Budget	Over(Under)	2014 Projection	2014 Annual Budget	Variance from Budget Over(Under)

FINANCE and ACCOUNTING	107,559	285,000	(177,441)	225,647	400,000	(174,353)
TOTAL CONTRACTS and CONSULTANTS	**4,226,724**	**5,431,535**	**(1,204,811)**	**7,100,985**	**6,828,973**	**272,012**

- Regional Entity Oversight and Assurance – Over budget $44.2k through September 30th and projected to be $50.5k over budget at year end for consulting support to review RAI pilot programs and development of associated internal control evaluation and testing processes.
- Reliability Assessments and Performance Analysis – Under budget $234.9 through September 30th due to delays in execution of the contracts for FAC 3 vegetation management project and to study the reliability effects of GMD. The $155.7k over budget 2014 year end projection is primarily related to the FAC 3 vegetation management project. The contract for FAC 3 was executed in August and was identified as a use of Known Contingency Reserves in the 2014 Business Plan and Budget.
- Reliability Risk Management – $148.8k over budget primarily due to higher than budgeted expenses for NERCnet, offset by lower than budgeted expenses for SAFNR, which is due to timing of actual expenses versus the allocation of the budget for the project. The $261.1k year end over budget projection is due to higher than budgeted expenses for NERCnet and higher than budgeted expenses for the current secure alert system which is still being used pending transition to a new system.
- Critical Infrastructure Department – Under budget $43.6k through September 30th due to timing. The $59.6k over budget year end projection is for contract support to begin the planning process in 2014 for GridEx III, which will take place in 2015.
- Training, Education and Operator Certification – Under budget $420.8k through September 30th and projected to be $290.1k under budget at year end due to: (i) timing and projected lower than budgeted expenses related to the system operator database improvement project and examination development project; (ii) lower than budgeted system operator testing expenses due to a new vendor contract that was negotiated after the 2014 budget was developed; and (iii) lower than budgeted costs for industry and staff training.

- General and Administrative – The $80k over budget projection is related to the survey to assess the effectiveness of the ERO.
- Policy and External Affairs – Under budget $47.4k through September 30th and projected to be $60.0k under budget at year end due to a reduction in the need for outside consulting to support external affairs as a result of these duties being managed by NERC staff.
- Information Technology – Under budget $148.8k through September 30th and projected to be $230.1k over budget at year end. The plan developed by the IT department for completion or initiation of ERO Enterprise projects during the remainder of 2014 and included in the year end projection includes consulting support for: (i) $209.0k for review and development of IT architecture and enterprise application development strategy; (ii) $120.0k for development of an enterprise reporting tool for GADS/TADS/DADS data; and (iii) $88.6k for applications support for BESnet, SBS and the ERO portal with a new vendor. The spend plan for the remainder of 2014 for NERC infrastructure projects includes contract and consulting expenses for: (i) $208.0k for implementation of a document management system; and (ii) $45.0k for disaster recovery hardware and software, installation of new microphones in the Atlanta office large conference rooms and installation of new wireless network equipment. The projected over budget variance will be offset by lower than budgeted fixed asset costs for infrastructure equipment.
- Human Resources – Over budget $12.1k through September 30th and projected to be $64.5k over budget at year end due primarily to higher than budgeted expenses for executive training and development.
- Finance and Accounting – Under budget $177.4k through September 30th and projected to be $174.4k under budget at year end due to lower than budgeted consulting support for internal controls and risk management.

Rent expense is projected to be $103.0k, 3.9%, over budget at year end due to an approximate reduction of $24.5k in sublease revenue from NERC's former Washington, DC office in connection with negotiation and execution of a sublease amendment as a result of the subtenant's bankruptcy reorganization and due to an $80.0k increase in property taxes in Atlanta as a result of an increase in the tax assessment on the building by Fulton County based on a recent property tax revaluation. With respect to the sublease agreement, the company received an upfront payment in connection with the execution of its current lease space in Washington, D.C. to offset potential liabilities associated with the sublease. This upfront payment is included in the company's working capital reserves and is being amortized over the term of the lease and is sufficient to offset the reduction in sublease revenue resulting from the subtenant bankruptcy

Office Costs, Professional Services and Miscellaneous were collectively $60.2k, 1.4%, over budget through September 30th, and are projected to be $72.2k, 1.2%, under budget at year end.

- Office costs were $98.9k, 3.8%, under budget through September 30th and are projected to be $64.3k, 1.8%, under budget at year end primarily due to lower than budgeted costs for maintenance and service agreements.
- Professional services expenses were $179.0k, 10.7%, over budget through September 30th due to: (i) higher outside legal fees related to closing on the capital financing loan and preparation of the special assessment filing with FERC on behalf of Peak Reliability; (ii) higher trustee search fees, which were budgeted to occur in the fourth quarter, but were incurred in the third quarter; and (iii) higher than budgeted accounting and auditing fees related to review of NERC's retirement plans. Professional services are projected to be approximately equal to budget at year end. $171.6k in outside legal expense incurred to date related to development of CRISP contracts is not included in 2014 YTD Actual or the 2014 Projection for Office Costs, Professional Services and Miscellaneous since these costs will be funded by CRISP participants.
- Miscellaneous expenses were $19.9k, 72.8%, under budget as of September 30th and are projected to be approximately equal to budget at year end.

Other Non-Operating Expenses were under budget $23.2k, 21.5%, through September 30th due to lower than budgeted interest expense associated with the capital financing loan. Interest expense is lower than budget due to a lower than budgeted interest rate and a delay in closing the capital financing program loan. The actual interest rate on the loan, which closed in January, 2014 instead of fourth quarter, 2013, is 2.9%. The 2014 budget was developed using an interest rate of 3.5%. Other non-operating expenses are projected to be $48.9k, 34.0%, under budget at year end due to the reduction in interest expense.

Fixed Asset Purchases, which excludes the credit for depreciation, were $1.9M, 80.3%, under budget as of September 30th and are projected to be $1.3M, 42.1%, under budget at year end. $209.0k in fixed asset purchases are being used to offset the use of operating reserves to fund Enterprise IT strategy and application consulting support noted above. The plan developed by the IT department for completion or initiation of ERO Enterprise projects during the remainder of 2014 and included in the year end projection includes: (i) $162.5k completion of the Standards Balloting System; (ii) $87.6k to begin the RADS and Event Analysis projects; and (iii) $549.4k for hardware and software licenses for implementation of the xRM Platform. The spend plan for the remainder of 2014 for NERC infrastructure projects includes $350k for disaster recovery hardware and software, $100k for a new microphone system for the Atlanta conference rooms, and approximately $150k for other network infrastructure requirements.

In addition to the forgoing, management is recommending that certain improvements be undertaken to the Atlanta office space to better accommodate current budgeted staffing levels, as well as allow personnel within each department to be located in close proximity to their co-workers. An architect was retained to prepare drawings and estimate of the costs to undertake these improvements. The estimate is approximately $285k and management is separately requesting the committee's authorization to proceed with these improvements.

OPERATING RESERVE ANALYSIS

As of September 30, 2014, the available balance in working capital and operating reserves was $4.75M, after the adjustment of reserves for future liabilities. The total balance in working capital and operating reserves, including the reserves for future liabilities was $8.2M[1]. The current balances in the Known Contingency Reserve, Unknown Contingency Reserve and the System Operator Reserves as of September 30, 2014, were $1.0M, $2.35M, and $1.4M, respectively. After taking into consideration the use of reserves which are restricted for future liabilities associated with NERC's lease obligations, the balance in available operating reserves was approximately $2.6M higher than budget.

OPERATING RESERVE ANALYSIS - as of September 30, 2014

				2014 Current Reserve Balances			
	2014 Actual	2014 Budget*	Variance - Actual to Budget	Known Contingency Reserves	Unknown Contingency Reserves	System Operator Reserves	CRISP
WORKING CAPITAL and OPERATING RESERVES							
Balance as of 01/01/2014	6,264,672	8,217,862	(1,953,190)				
Less: Adjustment for future liabilities	(3,817,478)	(3,788,645)	(28,833)				
Beginning Available Operating Reserves	**2,447,194**	**4,429,217**	**(1,982,023)**	**1,000,000**	**(69,672)**	**1,516,866**	**-**
Proceeds from Financing Activities (non-current portion only)	562,222		562,222		562,222		
Change in Reserves from Current Year Operations	1,741,545	(2,320,011)	4,061,558	-	1,857,482	(115,937)	
Other adjustments to reserves**	2,648		2,648		2,648		
Available Reserve Balance	**4,753,609**	**2,109,206**	**2,644,405**	**1,000,000**	**2,352,680**	**1,400,929**	**-**

*The 2014 budget includes a $1.2M reduction in Known and Unknown reserves and a $438.3k planned reduction in the System Operator Reserves, for a total budgeted reduction in reserves of $1,660,724.

**Represents transactions recorded only on the Statement of Financial Position (balance sheet) and do not impact the Statement of Activities (income statement)

As of September 30th, the projected use of Unknown Contingency Reserves was $894.0k: (i) $48.5k for RAI contract support to develop the internal control evaluation and testing processes; (ii) $48.6k for data modeling and change orders related to generation databases; (iii) $25.1k for preliminary work on the development of E-GAR, which is a replacement for pcGAR; (iv) $59.6k for a cyber asset survey and to begin preparations for GridEx III in 2015; (v) $64.5k for executive coaching and HR administrative support; (vi) $80.0k for ERO effectiveness assessment; and (vii) $567.7k for IT architecture and strategy consulting, compliance database maintenance, and various IT infrastructure projects, including disaster recovery and network simplification, as explained above. Management projects to use $150k of Known Contingency Reserves for the FAC3 vegetation research project.

Based upon the revised 2014 spend plan for ERO Enterprise applications and NERC IT infrastructure projects included in the 2014 year end projection, the projected 2014 draw on the capital financing loan

[1] Refer to the Statement of Financial Position on page 10.

in 2014 for completed projects has been reduced from the budgeted amount of $1.416M to $1.28M. The $1.28M includes $379.2k for completion of Standards Balloting System, $549.4k for hardware and software to implement the xRM platform, and $350.0k for disaster recovery hardware. With this revision to the draw on the capital financing loan and based upon the current 2014 projection, the projected year end balances in the Known Contingency Reserve, Unknown Contingency Reserve and the System Operator Reserves are $850.0k, $1.37M, and $1.14M, respectively, for a total of approximately $3.4M, which is approximately $1.36M more than assumed for purposes of NERC's 2015 business plan and budget before taking into account any expenditure of reserves for the Atlanta office space improvements noted above. The projected 2014 year end balances in NERC's 2015 Business Plan and Budget in the Known Contingency Reserve, Unknown Contingency Reserve and the System Operator Reserves were $850.0k, $159.1k, and $996.4k, respectively, for a total of approximately $2.0M.

OPERATING RESERVE ANALYSIS - as of September 30, 2014

2 - Liquidity to Debt Service Ratio > 1.5 to 1.0 (= Cash - Regional Assessments - Restricted Net Assets)	32.00

CRISP

Significant progress has been made on CRISP. All legal documentation has been finalized. 2014 and 2015 budgets and funding mechanics have also been finalized with PNNL and participating utilities. NERC and an initial group of 15 utilities have signed the Master Agreement (MA) and associated statements of work and another 6 utilities have indicated an intent to sign in the future. Management expects this number may grow now that the program is officially launched.

A separate bank account has been established to segregate CRISP funds and track funding by utility participant. We are in the process of collecting 2014 funding requirements from participating utilities. 2015 funding will be in two installments, with the first installment due in early January, 2015. The second installment will be due within 30 days after NERC provides a reconciliation of actual to budgeted costs, which is anticipated to be on or about March 15, 2015.

The 2014 CRISP budget is sufficient to fund 100% of the 2014 CRISP program costs, inclusive of PNNL costs. An overall not to exceed budget, as well as a not to exceed budget by participating utility, has been agreed to with PNNL and each participating utility. Consistent with the NERC Board's authorizing resolution, 2014 utility funding was established in a sufficient amount to avoid the use of existing reserves.

The 2015 budget reflects final cost reduction negotiations with PNNL, as well as the allocation of direct funding of program startup costs by participating utility in 2014. The final 2015 budget, inclusive of PNNL costs and the MSA defense fund, has been reduced from approximately $9.8M to approximately $5.9M. This is in large part due to the inclusion of the funding of PNNL startup capital costs and certain other startup expenses in the 2014 budget, which are thus not required in the 2015 budget. The 2014 budget, covering the period from October 1, 2014 thru December 31, 2014, is approximately $4.9M. The aggregate direct utility funding for 2014 and 2015 will be approximately $10.3M. The final total 2014 and 2015 CRISP budgets are set forth in Attachment A. NERC's internal 2015 ES-ISAC department budget, which is exclusive of PNNL subcontract costs and other costs funded directly by utility participants, is consistent with the internal ES-ISAC budget included in the company's 2015 business plan and budget and utilized to determine the portion of the 2015 CRISP budget funded through assessments.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation	**)** **)**	**Docket No. _____**

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF AMENDMENTS TO REGIONAL RELIABILITY STANDARDS DEVELOPMENT PROCEDURE OF THE NORTHEAST POWER COORDINATING COUNCIL, INC.

Pursuant to § 215(e)(4) of the Federal Power Act ("FPA")[1] and 18 C.F.R. §§ 39.8 and 39.10, the North American Electric Reliability Corporation (NERC) requests Federal Energy Regulatory Commission (FERC or Commission) approval of the proposed Northeast Power Coordinating Council, Inc. (NPCC) Regional Standard Processes Manual (RSPM). The RSPM is contained in Exhibit C to the Amended and Restated Delegation Agreement between NERC and NPCC (NPCC Delegation Agreement). The proposed amendments to the NPCC Delegation Agreement consist of amendments to Exhibit C, the NPCC Regional Reliability Standards Development Procedure (RRSDP). The RRSDP is a "Regional Entity Rule" as defined in 18 C.F.R. § 39.1; thus, in accordance with 18 C.F.R. § 39.10, amendments to the RRSDP require Commission approval. By approving the proposed amendments to Exhibit C of the NPCC Delegation Agreement, the Commission will also be approving the amendments to the RRSDP as a "Regional Entity Rule."

Revisions to the RRSDP were executed by NPCC Staff and were posted for comment from May 21, 2013 until July 5, 2013. The comments received were reviewed by NPCC Staff and incorporated as necessary, and the document was posted for a second comment period between

[1] 16 U.S.C. §824o (2005).

September 5, 2013 and October 20, 2013. After this second review of the comments received, the NPCC Regional Standards Committee ("RSC") approved the document to be posted for a pre-ballot review from November 12, 2013 until December 12, 2013. The ballot period for document approval was December 13, 2013 until January 27, 2014. The amended RRSDP, renamed to the RSPM, was approved by the NPCC Board of Directors ("BOD") at its March 11, 2014 meeting. The approved package was forwarded to NERC for approval, and it was approved by the NERC Board of Trustees on August 14, 2014.

As described in greater detail in Section III of this Petition, the principal purposes of the amendments to the RRSDP are:

(1) to change the name of the RRSDP to the Northeast Power Coordinating Council, Inc. Regional Standard Processes Manual (RSPM),

(2) to provide organization and clarity to the RSPM by developing separate sections for:

(i) the withdrawal of a request for approval of a regional standard before it has been approved,

(ii) retirement of an approved NPCC regional standard,

(iii) requirements for approval of a process waiver, and

(iv) process for correcting errata;

(3) to incorporate NPCC's Cost Effectiveness Analysis Procedure (CEAP) into the RSPM;

(4) to further develop NPCC's clarification process for regional standards,

(5) to create new appendices for the newly revised RSPM, and

(6) to recognize the Reliability Standard Audit Worksheet (RSAW) as necessary to a regional standard developed by the NPCC Standard Drafting Team and the NPCC

Compliance Staff. The proposed revisions also implement various updates, corrections, and typographical and format changes.

Attachment 1 to this filing is a "Clean" version of the RSPM incorporating the proposed amendments. Attachment 2 is a "Redline" version of the RSPM, marked to show the proposed amendments. By approving the proposed amendments to the RSPM included in this filing, the Commission will also be approving the amendments for purposes of Exhibit C to the NPCC Delegation Agreement.[2]

[2] The complete currently effective NPCC RE Delegation Agreement is available at: http://www.nerc.com/AboutNERC/Pages/Regional-Entity-Delegation-Agreements.aspx. Upon approval by the Commission of the amended RRSDP, the RSPM will be inserted into Exhibit C of the posted version of the NPCC Delegation Agreement.

I. NOTICES AND COMMUNICATIONS

Notices and communications with respect to this filing may be addressed to the following:[3]

[3] Persons to be included on the Commission's service list are identified by an asterisk. NERC respectfully requests a waiver of Rule 203 of the Commission's regulations, 18 C.F.R. § 385.203 (2014), to allow the inclusion of more than two persons on the service list in this proceeding.

II. PROPOSED NPCC RSPM

The currently effective version of the NPCC Regional Reliability Standard Development Procedure ("NPCC RRSDP") is Version 0 adopted by FERC on March 21, 2008.[4] The proposed amendments to the NPCC RRSDP include numerous improvements. As a preliminary matter, the title of the document has been changed from Northeast Power Coordinating Council, Inc. Regional Reliability Standards Development Procedure to the Northeast Power Coordinating Council, Inc. Regional Standards Processes Manual ("RSPM") to achieve consistency with the names of similar documents in the Delegation Agreements of other Regional Entities and NERC. The other proposed amendments revise the RRSDP to accomplish a number of objectives, including:

- developing separate sections within the RRSDP (hereafter referred to as "RSPM") for (i) "Withdrawal of a Regional Standard Pending Approval," (ii) "Retirement of an Approved NPCC Regional Standard," (iii) "Discontinuance of Regional Standard Development," (iv) "Approval of Process Waiver," and (v) "Process for Correcting Errata."
- integrating NPCC's CEAP into the RSPM,
- further developing NPCC's interpretation process for regional standards by moving to a clarification process instead of an interpretation process to ensure all statutory requirements are met while maintaining an expedited process to produce clarifications for stakeholders,
- revising Appendix A: Regional Standard Authorization Request (RSAR)

[4] *The North American Electric Reliability Corporation*, 122 FERC ¶ 61,245 (March 21, 2008).

Completion Guidelines and Form and developing three new appendices for the RSPM, including (i) Appendix B: Selection of Drafting Team Members and Nomination Form, (ii) Appendix C: Maintenance of Regional Standards and Process and (iii) Appendix D: NPCC Clarification Request;

- identifying the Reliability Standard Audit Worksheet (RSAW) as a companion document to a regional standard that is collaboratively developed by the NPCC Standard Drafting Team and the NPCC Compliance Staff; and,
- implementing other corrections, clarifications and typographical, formatting, and minor language changes.

The discussions in the following subsections describe the proposed amendments to the RRSDP.

A. Table of Contents

The original Table of Contents is removed and replaced with a more expansive and inclusive Table of Contents to account for all of the additional requirements and information added to the RRSDP since the last filing. The revisions to the Table of Contents provide reference to each new section, including the various background information provided in the "Regional Standard Characteristics and Elements" section and the additional subsections added under the "Regional Standards Development Process" section. Further, the Table of Contents provides reference to the page numbers for each of the steps under Regional Standards Development Process as well as the Appendices A, B, C, and D.

B. Section I: Executive Summary

The Executive Summary is substantially revised to remove a majority of the

background information about NPCC and to add revision history of the RSPM. Of particular importance is a section describing the close work of the NPCC Reliability Standards Staff in concert with the RSC to complete the revisions to the RSPM that are the subject matter of this filing. Several lines are inserted in this section which describe "Key changes" that were approved by the BOD including, among other changes, the incorporation of process improvements, provision of greater clarity, inclusion of the new CEAP, development of the RSAW, and the creation of three new appendices.

C. Section II: Introduction

New subsections for the Introduction section organize the subject matter further into "Purpose" and "Background" subsections.

The "Purpose" subsection describes the purpose and scope of regional standards and of the RSPM. The revisions to the subsection also list numerous guiding principles describing the development of standards as well as the proper procedure for regulatory approval following both industry and NPCC approval of proposed regional reliability standards.

The "Background" subsection describes the responsibilities of NPCC for "promoting and improving the reliability of the international, interconnected, Bulk Electric System in Northeastern North America." It also provides a description of NPCC's delegated authority to develop reliability standards, and it describes the legal and historical background for the creation of NPCC, the mission of NPCC, the statutory authority for the delegation of power to NPCC, the legal framework for the ERO and Regional Entity model, and the relationship of NPCC to NERC.

D. Section III: Regional Standard Characteristics and Elements

Under the "Characteristic Attributes" subsection, text is amended to describe the key

characteristics of the regional standards development process, including: (i) fair due process, (ii) openness, (iii) inclusive, (iv) balanced, (v) transparent, and (vi) without undue delay. The subsection is also augmented to account for objectives of the regional standards development process, including: (i) No Adverse Impact on Reliability of the Interconnection, (ii) Justifiable Difference, (iii) Uniformity, and (iv) No Undue Adverse Impact on Commerce. Each of these characteristics and objectives include appropriate explanations of their purpose, scope, and application to the NPCC regional standards development process.

Under the "Elements of a Regional Standard" subsection, minor revisions were made to improve the text and style of language as well as to correct grammatical inconsistencies. Also, Table 1 and Table 2 were removed from this subsection. Table 1 and Table 2 were removed to improve the readability of this section of the RSPM.

The "Types of Reliability Requirements" subsection is added to describe the variety of requirements that should be represented in the Drafting Team's portfolio of requirements to achieve an effective defense-in-depth strategy. The Types of Reliability Requirements are Performance-based, Risk-based, and Capability-based; for each of those types, a brief definition is added.

The "Elements of a Regional Standard" subsection is added to describe the necessary components of a reliability standard. As is developed further in that subsection, the standard should, at a minimum, include: (1) Applicability, (2) Requirements, and (3) the Effective Dates. Additional components are included for informational purposes, but they are not mandatory and enforceable. A description of each of the possible elements for a reliability standard is added to this subsection to provide additional information for the development of regional standards. A description of "Compliance Elements," or "elements to aid in the administration of compliance

monitoring and enforcement responsibilities" is also added to provide explanations for various compliance elements, including (i) Measure, (ii) Violation Risk Factors and Violation Severity Levels, (iii) Version History, (iv) Variance, (v) Compliance Enforcement Authority (CEA), and (vi) Reliability Standard Audit Worksheets (RSAWs). A description of "Informational Elements: Elements to aid in the implementation of the regional standard" is also added to provide explanations for various informational elements, including (i) Application Guidelines and (ii) Procedures. The information in the "Terms and Functions" subsection is relocated to Section IV. Regional Standards Development Process.

E. Section IV: Regional Standards Development Process

The Regional Standards Development Process section is added to encompass the entire process for the development of a regional standard. Within this section, subsections are added to provide clarity to the process, including the addition of subsections for (i) Roles in the NPCC Regional Standards Process, (ii) Standard Development Process Steps, (iii) Standard Clarification Process Steps, (iv) Discontinuance Of Regional Standard Development, (v) Withdrawal of a Regional Standard Pending Approval, (vi) Retirement Of An Approved NPCC Regional Standard, (vii) Approval Of Process Waiver, (viii) Process For Correcting Errata, and (ix) Appeals (process broken down into two levels).

"Roles in the NPCC Regional Standards Process" is a subsection added to provide rules for Nomination, Revision, Interpretation, or Retirement of a Standard and to provide information on Process Roles and Responsibilities for various NPCC regional standard development participants. Full descriptions of each of the Process Roles and Responsibilities are added to this subsection, including descriptions for: Board of Directors, Drafting Team, Manager of Reliability Standards, NPCC Members, Non-NPCC Members, NPCC Standards Staff, NPCC

Committees, Task Forces and Working Groups, Regional Standards Committee (RSC), Reliability Coordinating Committee (RCC), Requester, and Quality Review Team.

"Standard Development Process Steps" is a subsection added to provide individual process steps for the development of a regional standard. Step 2.1 is created to describe a Regional Standard Authorization Request (RSAR), the first step in the development, modification or retirement of a standard. Steps 2.1.A, 2.1.B, and 2.1.C are created to describe different actions to be taken by Requesters, NPCC Manager of Reliability Standards, and the RSC for submission of the RSAR. Step 2.2 is added for the purpose of describing the timeline and process for responding to the RSAR, and also the creation of a Drafting Team for a new or revised standard. Step 2.3 is added to describe the actual development process of the standard and associated documents, including all of the work product expected from the Drafting Team. Steps 2.4.A and 2.4.B are created to provide information for posting for comment and the resolution of those comments during a final comment period, respectively. Step 2.5 "Posting for Ballot Period in the Open Process" is created to describe the posting, quorum, and voting requirements. Steps 2.5.A, 2.5.B, 2.5.B.1, and 2.5.B.2 are added to provide situational responses based on the number of votes received. Step 2.6 is added to direct the BOD to either approve, approve with the stipulation that non-substantive comments be incorporated, or remand a standard presented to them upon the affirmative vote of the NPCC Members, and Step 2.7 provides direction for submission of the new or revised standard to NERC for filing with FERC. Finally, Step 2.8 is created to provide the process for the implementation of a regional standard upon recognition and approval of the standard by the Applicable Governmental Authority.

"Standard Clarification Process Steps" is a subsection that is added to provide individual process steps for requests for standard clarifications. Step 3.1 is added to allow any Member of

NPCC or group within the NPCC region to submit a Clarification Request (CR). As this Step explains, a valid CR is one that seeks additional clarity about one or more requirements in an approved regional standard, but does not request approval as to how to comply with any requirements of the standard. Step 3.1 also provides that a request may alternatively seek a Request for Interpretation and explains that an interpretation will be initiated under the NERC process for developing an interpretation. Step 3.2, Review and Validation of Clarification Request (CR) is added so that the NPCC Manager of Reliability Standards may determine the validity of a CR. Step 3.3 is added to explain the Regional Standards Committee (RSC) Actions and its role in accepting or rejecting the CR jointly with the NPCC Manager of Reliability Standards. Step 3.4, Formation of a Drafting Team for the Response to CR, and Step 3.5 are created to provide guidance on the process for developing a response to the CR. Step 3.6 is added to explain the procedure for posting the CR for a comment period and resolution of said comments. Step 3.7 is added to explain the actions to be taken by the RSC upon receipt of the CR from the NPCC Manager of Reliability Standards. Finally, Step 3.8 is added to direct the BOD to take an action on the CR once it has been endorsed by the RSC.

"Discontinuance of Regional Standard Development" is a subsection added to define the term "discontinuance" as used in the RSPM, and refers to the termination of the standard development process after RSAR approval but prior to posting for industry ballot.

"Withdrawal of a Regional Standard Pending Approval" is a subsection added to define the term "withdrawal" as used in the RSPM. This process allows the requester to revoke a request for approval of a regional standard, variance, clarification, or definition that has already "been approved by the NPCC Board of Directors and has not been filed with Applicable Governmental Authorities or has been filed but not yet approved by Applicable Governmental

Authorities".

"Figure 5" of the RSPM, the "Flowchart Regional Standards Development Procedure (Open Process)," is removed from the RRSDP because its content is included in Figure 1 Flowchart of Regional Standards Development Process Overview.

"Retirement of an Approved NPCC Regional Standard" is a subsection added to define the term "retirement" as used in the RSPM, and to explain the discontinuance of a regional standard, variance, clarification, or definition that has been approved by the Applicable Governmental Authority.

"Approval of Process Waiver" is a subsection added to give NPCC the authority to develop a new or modified regional standard, implementation plan, variance, clarification, or definition when extenuating circumstances arise. As is explained in that subsection, the RSC may override the requirements for standard development in the RSPM if good cause exists, limited to extenuating circumstances. That subsection also allows any individual to submit a waiver request to the RSC, and it requires certain notice to be provided before the waiver request may be considered.

"Process for Correcting Errata" is a subsection added to give the RSC the ability to make minor errata changes after final ballot approval by the NPCC ballot body. More detailed directions for submitting these errata changes are also added to this subsection.

The "Appeals" section is edited to account for non-substantive grammatical errors, updated terms, style, and improved text, and it is not amended substantively from the original RRSDP.

F. Appendix A: RSAR Completion Guidelines

Appendix A: RSAR Completion Guidelines is added to provide guidance that results in a streamlined, efficient process for submitting an RSAR to the NPCC Manager of Reliability Standards. Also included in this Appendix is a revised version of the RSAR with some minor stylistic changes and limited typographical and grammatical revisions. Substantively, the RSAR is updated to reflect the requirements for RSARs in the RSPM, including revisions to the following fields in the RSAR, which are edited to become a "Required Field" for purposes of submission to NPCC: (i) information for the standard and of the RSAR requester, (ii) detailed description of the "Purpose" of the proposed standard, (iii) the technical justification for "Industry Need," (iv) a "Brief Description" of the proposed standard, (v) identification of "Reliability Functions," (vi) a "Detailed Description" of the standard, (vii) "Related Standards," and (viii) "Related SARs or RSARs."

G. Appendix B: Selection of Drafting Team Members

Appendix B: Selection of Drafting Team Members is added to explain the process by which Drafting Team Members are selected. Precise criteria for each member and for the selection process are added to this Appendix. Also included in this Appendix is the newly created Nomination Form for NPCC [Name of Drafting Team] Drafting Team, used to allow parties to nominate candidates to the Drafting Teams.

H. Appendix C: Maintenance of Regional Standards and Process

Appendix C: Maintenance of Regional Standards and Process is added to provide for periodic review and revision to NPCC regional standards and to the RSPM so that those documents remain current and viable. To provide clarity, Appendix C is further separated into two

subsections: Maintenance of Regional Standards and Maintenance of Regional Standards Process. These two subsections provide a timeline for review of these documents and the requirements for the review process.

I. Appendix D: NPCC Clarification Request

Appendix D: NPCC Clarification Request is added to provide a standard form for submitting a clarification request.

III. CONCLUSION

The North American Electric Reliability Corporation respectfully requests that the Commission approve the proposed amendments to NERC's Delegation Agreement with NPCC which includes the currently effective RRSDP, shown in **Attachment 1** to this Petition, including approving the amendments to the RRSDP and renaming the RRSDP to RSPM (included in Exhibit C to the NPCC Delegation Agreement) as amendments to Regional Entity Rules.

Respectfully submitted,

Gerald W. Cauley

I. EXECUTIVE SUMMARY

The NPCC Bylaws state "NPCC shall develop a Regional Reliability Standards Development Procedure that provides the design-basis approach to a consensus building process by which NPCC may develop Regional Reliability Standards and Regional Variances to be proposed to the ERO for adoption, under delegated authority by the FERC and the Canadian Provincial regulatory and/or governmental authorities."

The NPCC Regional Reliability Standards Development Procedure was originally adopted by the NPCC Board of Directors on September 19, 2007. The NPCC Reliability Standards Staff in concert with the NPCC Regional Standards Committee (RSC) has completed a revision to the NPCC Regional Reliability Standards Process Manual to incorporate process improvements, provide greater clarity and reflect the new NPCC Cost Effectiveness Analysis Procedure (CEAP).

Key changes addressed in this revision include:

- Replacing interpretation with clarification and expanding the Clarification Section narrative into process steps and including an associated flowchart
- Creating separate sections for: 1) Withdrawal of a Regional Standard Pending Approval; 2) Retirement of an Approved NPCC Regional Standard; and 3) Approval of Process Waiver; 4) Process for Correcting Errata
- Recognizing the new NPCC Cost Effectiveness Analysis Procedure (CEAP)
- Identifying the Reliability Standard Audit Worksheet (RSAW) as a companion document to a regional standard that needs to be collaboratively developed by the drafting team and NPCC Compliance Staff
- Creating three new appendices: 1) Appendix A: Regional Standard Authorization Request (RSAR) Completion Guidelines and Form; 2) Appendix B: Selection of drafting team Members and Nomination Form; and 3) Appendix C: Maintenance of Regional Standards and Process

In addressing areas for improvement in the NPCC Regional Reliability Standards Development Procedure, recent improvements made to the NERC Standards Process Manual (e.g., Standards Process Input Group (SPIG) recommendations) as well as the manuals of other Regional Entities were benchmarked to identify best practices for inclusion in this manual.

The process improvements and clarity captured in this revision to the NPCC Regional Reliability Standards Development Procedure, will result in a more timely and efficient manner to address the development of regional standards to ensure the reliability of the Bulk Electric System within the NPCC geographical area.

II. INTRODUCTION

PURPOSE

This manual defines the characteristics of a Northeast Power Coordinating Council, Inc. (NPCC) regional Reliability Standard (hereinafter referred to as "regional standard") and establishes the process by which NPCC regional standards are developed, approved, revised, clarified and retired. The NPCC regional standards process is a stakeholder process that is approved by the NPCC members to ensure a transparent standard development process that is "open, fair, and inclusive."

NPCC regional standards address the reliability of the international and interconnected Bulk Electric System in Northeast North America. NPCC regional standards shall enable or support one or more NERC/ERO reliability principles[1] and will, in all cases, not be inconsistent with or less stringent than any requirements of the North American Electric Reliability Council/Electric Reliability Organization (NERC/ERO) continent-wide Reliability Standards.

The development of NPCC regional standards is performed according to the following principles using the process contained in this manual:

- Developed in a fair and open process that provides an opportunity for all interested parties to participate;
- Does not have an adverse impact on commerce that is not necessary for reliability;
- Provides a level of Bulk Electric System reliability that is adequate to protect public health, safety, welfare, and national security and would not have a significant adverse impact on reliability; and
- Based on a justifiable difference between Regions or between sub-Regions within the Regional geographic area.

Following industry approval, NPCC regional standards process and NPCC regional standards require approval by the NPCC Board of Directors, NERC as the Electric Reliability Organization (ERO) and the applicable regulatory authorities in the United States (FERC) and Canada.

BACKGROUND

Northeast Power Coordinating Council, Inc. (NPCC) is responsible for promoting and improving the reliability of the international, interconnected Bulk Electric System in Northeastern North America. NPCC carries out its mission through (i) the development of regional standards and compliance assessment and enforcement of continent-wide and regional standards, coordination of system planning, design and operations, and assessment of reliability, (collectively, "Regional Entity activities"), and (ii) the establishment of regionally-specific criteria, and monitoring and enforcement of compliance with such criteria (collectively, "criteria services activities").

The Energy Policy Act (EPA) of 2005 (Section 1211) amended the Federal Power Act (FPA) by adding Section 215, Electric Reliability. Specifically regarding standards development and pursuant with Section 215(e)(4) of the FPA, NPCC as a Regional Entity with delegated authority from NERC may propose regional standards to NERC for eventual enforcement within the NPCC region.

[1] Reliability Principles are available on the NERC website as amended from time to time

As a condition of NPCC membership, NPCC General and Full Members[2] agree to adhere to NERC Reliability Standards. NERC Reliability Standards are comprised of both continent-wide and regional standards. The NPCC regional standards apply only to that part of the Eastern Interconnection within the NPCC geographical area.

III. REGIONAL STANDARD CHARACTERISTICS AND ELEMENTS

1. CHARACTERISTIC ATTRIBUTES

The NPCC regional standards development process has the following key characteristics:

- **Fair due process** — The NPCC regional standards development process provides for reasonable notice and opportunity for public comment. At a minimum, the procedure shall include public notice of the intent to develop a standard, a public comment period on the proposed standard, due consideration of those public comments, and a ballot of interested stakeholders. Upon approval by the NPCC Members, the NPCC Board of Directors then votes to approve submittal of the regional standard to NERC for ERO approval, followed by submission to FERC and Canadian Authorities for their approvals.
- **Openness** — Participation in the NPCC regional standards development process is open to all persons and organizations that are directly and materially affected by the reliability of the NPCC's Bulk Electric System. There is no undue financial burden to participation. Participation shall not be conditioned upon membership in the ERO, NPCC or any organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.
- **Inclusive** — Any entity (person, organization, company, government agency, individual, etc.) with a direct and material interest in the reliability of NPCC's Bulk Electric System has the right to participate by: (a) expressing an opinion and its basis; (b) having their position considered, and (c) having the right to appeal a response through an established appeal process.
- **Balanced** — The NPCC regional standards development process strives to have an appropriate balance of interest and shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter. Pursuant with the NPCC By-Laws[3] there are seven (7) stakeholder voting sectors and the votes for each sector are weighted to achieve an appropriate balance.
- **Transparent** — All actions material to the development of NPCC regional standards are transparent and information regarding the progress of a standard's development action is made available to the public through postings on the NPCC website as well as through E-mail lists.
- **Without undue delay** — The NPCC regional standards development process shall be performed within a reasonable time.

In as much as NPCC is one of six Regional Entities within the Eastern Interconnection of North America, there will be no presumption of validity by the ERO for any NPCC regional standard.

[2] As defined in the NPCC By-Laws – available on the NPCC website
[3] NPCC By-Laws are available on the NPCC website

In order to receive the approval of the ERO, the NPCC regional standards development process must also achieve the following objectives:

- **No Adverse Impact on Reliability of the Interconnection** — A NPCC regional standard provides an Adequate Level of Reliability[4] as defined by NERC.
- **Justifiable Difference** — A NPCC regional standard addresses a justifiable difference within the NPCC geographical area that results from a physical difference[5] or operating difference in the Northeast's Bulk Electric System. Although a justifiable difference allows for a unique regional standard, a NPCC regional standard shall be no less stringent than a continent-wide standard.
- **Uniformity** — To the extent possible, the NPCC regional standards provides uniformity with Reliability Standards across the interconnected Bulk Electric System of North America.
- **No Undue Adverse Impact on Commerce** — A NPCC regional standard will not cause any undue adverse impact on business activities that are not necessary for reliability of the Region and its interconnected Regions. All regional standards shall be consistent with NERC's market principles[6].

2. ELEMENTS OF A REGIONAL STANDARD

To ensure uniformity of regional standards and avoid inconsistency with NERC continent-wide standards, a NPCC regional standard shall be consistent with the elements identified in this section of the procedure. These elements are intended to apply a systematic discipline in the development and revision of regional standards. The application of a systematic discipline is necessary for achieving regional standards that are measurable, enforceable, and consistent as well as results oriented[7], i.e.:

- Performance-based,
- Risk-based, and
- Capability-based.

TYPES OF RELIABILITY REQUIREMENTS

Regional reliability standards should be viewed as a portfolio of requirements designed to achieve an effective defense-in-depth strategy. Each requirement should identify a clear and measurable expected outcome, such as: a) a stated level of reliability performance, b) a reduction in a specified reliability risk, or c) a necessary competency.

a) **Performance-based** - defines a specific reliability objective or outcome that has a direct, observable effect on the reliability of the Bulk Electric System, i.e. an effect that can be measured using power system data or trends.

---

[4] Adequate Level of Reliability is available on the NERC website as amended from time to time

[5] The meaning of the phrase "physical difference" will be consistent with FERC's Order, issued September 22, 2004, Granting Request For Clarification regarding Docket No. PL04-5-000, Policy Statement on Matters Related to Bulk Power System Reliability.

[6] Market Principles are available on the NERC website as amended from time to time

[7] Results-based Standards see http://www.nerc.com/pa/Stand/Resources/Documents/ResultsBasedStandardGuidance.pdf

b) **Risk-based** - defines actions of entities that reduce a stated risk to the reliability of the Bulk Electric System and can be measured by evaluating a particular product or outcome resulting from the required actions.

c) **Capability-based** - defines capabilities needed to perform reliability functions and can be measured by demonstrating that the capability exists as required.

Each regional standard shall enable or support one or more of the reliability principles[8] as identified in the most recent set posted on the NERC website. Each regional standard shall also be consistent with all of the reliability principles. The intent of the set of NPCC regional standards is to deliver an Adequate Level of Reliability[9] as defined by NERC.

Recognizing that Bulk Electric System reliability and electricity markets are inseparable and mutually interdependent, all regional standards shall be consistent with the most recent set of Market Principles[10] as posted on the NERC website. Consideration of the Market Principles is intended to ensure that regional standards are written such that they achieve their reliability objective without placing undue restrictions or causing adverse impacts on competitive electricity markets.

ELEMENTS OF A REGIONAL STANDARD

A regional standard includes several components designed to work collectively to identify what entities must do to meet their reliability-related obligations as an owner, operator or user of the Bulk Electric System. The components of a NPCC regional standard identified below are based on the NERC Standard Processes Manual (SPM) that was approved by the NERC Board of Trustees at its February 2013 meeting. Future revisions of the NERC SPM will be used at the time of development of a NPCC regional standard if different from the elements listed below.

The only mandatory and enforceable components of a regional standard are the: (1) Applicability, (2) Requirements, and (3) the Effective Dates. The additional components are included in the regional standard for informational purposes, to establish the relevant scope and technical paradigm, and to provide guidance to functional entities concerning how compliance will be assessed by the Compliance Enforcement Authority.

The components of a regional standard may include the following:

Title:	A brief, descriptive phrase identifying the topic of the regional standard.
Number:	A unique identification number assigned in accordance with a published classification system to facilitate tracking and reference to the regional standards.
Purpose:	The reliability outcome achieved through compliance with the requirements of the regional standard.
Applicability:	Identifies which entities are assigned reliability requirements; i.e., the specific functional entities and facilities to which the regional standard applies.
Effective Dates:	Identification of the date or pre-conditions determining when each Requirement becomes effective in each jurisdiction.

[8] Reliability Principles are available on the NERC website as amended from time to time
[9] Adequate Level of Reliability is available on the NERC website as amended from time to time
[10] Market Principles are available on the NERC website as amended from time to time

Requirement: An explicit statement that identifies the functional entity responsible, the action or outcome that must be achieved, any conditions achieving the action or outcome, and the reliability-related benefit of the action or outcome. Each requirement shall be a statement for which compliance is mandatory.

Compliance Elements: Elements to aid in the administration of compliance monitoring and enforcement responsibilities.

Measure: Provides identification of the evidence or types of evidence that may demonstrate compliance with the associated requirement.

Violation Risk Factors and Violation Severity Levels: Violation risk factors (VRFs) and violation severity levels (VSLs) are used as factors when determining the size of a penalty or sanction associated with the violation of a requirement in an approved Reliability Standard. Each requirement in each Reliability Standard has an associated VRF and a set of VSLs. VRFs and VSLs are developed by the drafting team, working with NPCC Standards Staff and Compliance Staff, at the same time as the associated Reliability Standard, but are not part of the Reliability Standard. The Board of Directors is responsible for approving VRFs and VSLs.

- Violation Risk Factors
  VRFs identify the potential reliability significance of noncompliance with each requirement. Each requirement is assigned a VRF in accordance with the latest approved set of VRF criteria.
- Violation Severity Levels
  VSLs define the degree to which compliance with a requirement was not achieved. Each requirement shall have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs. Each requirement is assigned one or more VSLs in accordance with the latest approved set of VSL criteria.

Version History: The version history is provided for informational purposes and lists information regarding prior versions of the regional standard.

Variance: As applied to a NPCC regional standard is a Requirement (to be applied in the place of the NPCC region-wide Requirement) that is applicable to a specific geographic area or to a specific set of Registered Entities.

Compliance Enforcement Authority (CEA): The entity that is responsible for assessing performance or outcomes to determine if an entity is compliant with the associated regional standard. The Compliance Enforcement Authority will be NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the ERO regional standards.

Reliability Standard Audit Worksheets (RSAWs)[11] Reliability Standard Audit Worksheets (RSAWs) are developed as companion documents to regional and continent-wide Reliability Standards to facilitate the CEA assessment of a registered entity's compliance with a standard.

[11] While RSAWs are not part of the regional standard, they are developed through collaboration of the drafting team and NPCC Compliance Staff.

Informational Elements: Elements to aid in the implementation of the regional standard.

Application Guidelines:	Guidelines or reference documents to support the implementation of the associated regional standard.
Procedures:	Procedures to support implementation of the associated regional standard.

IV. REGIONAL STANDARDS DEVELOPMENT PROCESS

1. ROLES IN THE NPCC REGIONAL STANDARD PROCESS

NOMINATION, REVISION, CLARIFICATION, OR RETIREMENT OF A STANDARD:

Any member of NPCC or group within the NPCC region shall be allowed to request that a NPCC regional standard be developed, modified, clarified, or retired. Additionally, any person (organization, company, government agency, individual, etc.) who is directly and materially affected by the reliability of the NPCC Bulk Electric System shall be allowed to request that a NPCC regional standard be developed, modified, clarified, or retired. The following section identifies the process roles in the NPCC regional standards process. Refer to Step 2 STANDARD DEVELOPMENT PROCESS STEPS and FIGURE 1: FLOWCHART OF REGIONAL STANDARDS DEVELOPMENT PROCESS OVERVIEW for the regional standards development process steps and associated flowchart. Refer to Step 3 STANDARD CLARIFICATION PROCESS STEPS and FIGURE 2: FLOWCHART OF REGIONAL STANDARDS CLARIFICATION PROCESS OVERVIEW for the regional standards clarification process steps and associated flowchart.

PROCESS ROLES AND RESPONSIBILITIES

BOARD OF DIRECTORS

The NPCC Board of Directors (Board) shall consider for adoption regional standards, definitions, variances and clarifications and associated implementation plans that have been processed according to the processes identified in this manual.

DRAFTING TEAM

The drafting team (DT) should strive to achieve a portfolio of performance, risk, and capability-based mandatory reliability requirements that support an effective defense-in-depth strategy. The drafting team develops standards-related regional products as directed by the NPCC RSC and within the scope of an approved Regional Standard Authorization Request (RSAR) or a Clarification Request (CR). The product that is developed is typically a new or revised regional standard, but could also be a definition, a reference document, a set of Violation Risk Factors, a set of Violation Severity levels, or the team could be appointed to assist an author in refining a Regional Standard Authorization Request (RSAR). The drafting team also works collaboratively with NPCC Compliance Staff to develop Reliability Standard Audit Worksheets (RSAWs) at the same time regional standards are developed. The drafting team shall remain in place until such time as the NERC Board of Trustees adopts the regional standard.

MANAGER OF RELIABILITY STANDARDS

The NPCC Manager of Reliability Standards has the overall responsibility for managing the NPCC regional standards processes in accordance with this manual. As used herein, the NPCC Manager of Reliability Standards will be the NPCC Manager of Reliability Standards or his/her designee.

NPCC MEMBERS

NPCC members may participate in the comment and ballot periods associated with the development and industry approval of regional standards. The ballot body is comprised of all

entities or individuals that qualify for one of the stakeholder sectors within NPCC as stated in the most recently approved NPCC Bylaws. All General and Full Members of NPCC can participate in the balloting of regional standards. Any entity or person, including non-NPCC members, may submit comments during the open process comment periods for standards.

NON-NPCC MEMBERS

Any entity or person that is neither a General nor Full Member of NPCC is not eligible to participate in the ballot body voting on a regional standard. However, any entity or person, including non-NPCC members, may submit comments during the open process comment periods for standards. Subject Matter Experts (SMEs), regardless of NPCC membership status, are encouraged to participate in comment periods for regional standards.

NPCC STANDARDS STAFF

The Standards Staff is responsible for assisting the NPCC Manager of Reliability Standards and the RSC in administering the NPCC regional standards processes in accordance with this manual.

NPCC COMMITTEES, TASK FORCES AND WORKING GROUPS

The Committees, Task Forces and Working Groups within NPCC serve an active role in the standards process. Activities performed by these groups include, but are not limited to, the following:

- Identify the need for new or modified regional standards
- Initiate NPCC Standards actions by developing Regional Standard Authorization Requests (RSARs)
- Develop comments (views and objections) to standards actions
- Participate in NPCC Standard drafting
- Dispensation of Clarification Requests (CRs)
- Provide technical oversight in response to changing industry conditions and ERO Requirements
- Conduct Field Tests, as required

REGIONAL STANDARDS COMMITTEE (RSC)

The NPCC Regional Standards Committee (RSC), a committee of the NPCC Board of Directors, is charged with oversight of all drafting team activities and managing the NPCC regional standards development process in accordance with this manual.

The RSC is responsible for maintenance of the Regional Standard Processes Manual (RSPM), including the endorsement of RSPM revisions for NPCC Board review and approval.

RELIABILITY COORDINATING COMMITTEE (RCC)

The Reliability Coordinating Committee (RCC) supports the standards development process through the assignment of NPCC Task Forces to serve as technical resources for: (1) staffing drafting teams, and (2) performing a technical advisory role in the regional standards process through comments, recommendations and technical justifications.

REQUESTER

Any individual representing an organization (entity, company, government agency, etc.) that is directly and materially affected by the reliability of the Bulk Electric System within the NPCC

geographical area may request a regional standard be developed or an existing regional standard be modified, clarified, or deleted.

QUALITY REVIEW TEAM

The NPCC Standards Staff shall coordinate a quality review of the "final draft" of the regional standard, implementation plan, VRFs and VSLs to assess whether the documents are within the scope of the associated RSAR, whether the regional standard is clear and enforceable as written and the VRFs and VSLs are developed according to NERC and FERC guidelines. The Quality Review Team may be comprised of legal and compliance representatives, a technical writer, and NPCC Standards Staff. It will not involve individuals who participated on the drafting team of the standard undergoing the Quality Review.

2. STANDARD DEVELOPMENT PROCESS STEPS

STEP 2.1: REGIONAL STANDARDS AUTHORIZATION REQUEST TO DEVELOP, MODIFY OR RETIRE

A Regional Standard Authorization Request[12] (RSAR) is the form used to document the scope and reliability benefit of a proposed project for one or more new or modified regional standards or the benefit of retiring one or more approved regional standards.

A RSAR shall be used to seek approval and initiate the development, modification or retirement of a NPCC regional standard. A RSAR is not used to seek a Clarification Request (CR) of a NPCC regional standard. The initiation and handling of a CR is covered in Step 3 STANDARD CLARIFICATION PROCESS STEPS, of this manual.

Any individual representing an organization which is directly or materially impacted by the operation of the Bulk Electric System within the geographical footprint of NPCC may request, via a submittal of a RSAR to the NPCC Manager of Reliability Standards, the development, modification, or deletion of a NPCC regional standard. The individual completing the form is referred to herein as the Requester.

STEP 2.1.A. REQUESTER ACTIONS

> *Note: The NPCC Manager of Reliability Standards will assist the Requester, as necessary, to ensure all required information is submitted on the RSAR.*

The Requester shall complete a RSAR form in accordance with the guidance provided in APPENDIX A: RSAR COMPLETION GUIDELINES.

The Requester shall submit the completed RSAR to the NPCC Manager of Reliability Standards, via npccstandard@npcc.org, for processing.

STEP 2.1.B. NPCC MANAGER OF RELIABILITY STANDARDS ACTIONS

The NPCC Manager of Reliability Standards shall review the submitted RSAR and verify that the submitted form has been adequately completed. Within fifteen (15) calendar days[13] of receipt of the submitted RSAR, the NPCC Manager of Reliability Standards will electronically acknowledge

[12] The RSAR is located on the NPCC website under Standards – Regional Standards General

[13] Time periods specified in this manual may be extended as deemed appropriate by NPCC Staff. When business days are specified, this provision could be used to take into account differing Canadian and US holiday schedules. When calendar days are specified, this provision could be used to take into account due dates that fall on a weekend.

receipt of the RSAR. If, at that time, the NPCC Manager of Reliability Standards finds the RSAR to be deficient, the Requester will be contacted to determine how to proceed.

Within ten (10) calendar days of the receipt of an adequately completed RSAR, the NPCC Manager of Reliability Standards shall forward the properly completed RSAR to the NPCC Regional Standards Committee (RSC) for its review and processing. Included in the transmittal of the RSAR to the RSC, the NPCC Manager of Reliability Standards shall include a statement indicating the applicability of the NPCC Cost Effectiveness Analysis Procedure (CEAP) for the proposed change.

STEP 2.1.C. NPCC REGIONAL STANDARDS COMMITTEE (RSC) ACTIONS

Note:	*The RSC shall meet to review all pending RSARs. The frequency of this review process will depend on workload, but in no case shall a properly completed RSAR wait for RSC action more than 60 calendar days from the date of receipt by the RSC.*

The RSC shall review the RSAR and take one of the following actions:

- Remand the RSAR back to the NPCC Manager of Reliability Standards for additional work. In this case, the NPCC Manager of Reliability Standards shall work with the Requester to provide additional information or clarification for the RSAR as specified by the RSC.
- Reject the RSAR. In this case, the RSC will provide its determination to the NPCC Manager of Reliability Standards, who will then provide a written explanation for rejection to the Requester within ten (10) calendar days of the rejection decision.

Note:	*Before the RSC can accept a RSAR for a new or modified standard the applicable CEAP process steps shall be completed.*

- Accept the RSAR.
  - If a new or modified standard has been authorized, within ten (10) calendar days of the authorization the NPCC Manager of Reliability Standards shall: 1) post notification on the NPCC website of the intent to develop or modify a regional standard; 2) notify the ERO for processing in accordance with its process, as applicable; and 3) notify the Requester of the acceptance of the RSAR.
  - If the retirement of an existing regional standard has been authorized, within ten (10) calendar days of the authorization the NPCC Manager of Reliability Standards shall: 1) post notification on the NPCC website of the intent to retire an existing regional standard; 2) notify the ERO for processing in accordance with its process, as applicable; and 3) notify the Requester of the acceptance of the RSAR. The process to retire an existing regional standard is included in Step 6 RETIREMENT OF AN APPROVED NPCC REGIONAL STANDARD.

STEP 2.2: FORMATION OF DRAFTING TEAM FOR NEW OR MODIFIED STANDARD

A RSAR that has been accepted by the RSC shall, within ten (10) calendar days of the acceptance of the RSAR, be submitted by the NPCC Manager of Reliability Standards to the NPCC Reliability Coordinating Committee (RCC). The RCC shall, within sixty (60) calendar days, assign the development of the regional standard to a NPCC Task Force, and notify the NPCC Manager of Reliability Standards of its decision within ten (10) calendar days.

After receipt of the notification of drafting team assignment, the NPCC Manager of Reliability Standards shall oversee solicitation and recommendation of a list of additional qualified[14] candidates over and above the appropriate NPCC Task Force members, for appointment to the drafting team. The Requester and a NPCC Compliance Staff person will be included on the drafting team. Within sixty (60) calendar days of the drafting team assignment notification from the RCC, the NPCC Manager of Reliability Standards shall submit the list of the entire drafting team membership to the RSC for acceptance. The RSC may accept the recommendations of the NPCC Manager of Reliability Standards as presented or revise the recommendations as necessary.

Upon acceptance of the drafting team slate, the RSC shall provide a target date on which the drafting team is expected to have ready a completed draft regional standard and associated supporting documentation available for consideration by the NPCC membership. Additionally, the RSC shall provide the drafting team with any preliminary development products including, but not limited to, a draft standard, comments, and related white papers.

The RSC shall designate one of its members to actively monitor and assist NPCC staff in the oversight of drafting team milestones and deadlines, and extend or expedite milestones and deadlines, as appropriate, acting as a liaison between the drafting team and the RSC to help resolving any issues.

STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS

Prior to beginning work on the development of a new or revised regional standard and the associated supporting documentation, the drafting team should develop a work plan for completing the regional standard development work, including the establishment of milestones for completing critical elements of the work in sufficient detail to ensure that the drafting team will meet the target date established by the RSC, or the drafting team shall propose an alternative date. This work plan must be submitted to the RSC for its concurrence. When a drafting team begins its work, it shall regularly (at least quarterly) report progress against that aforementioned work plan to the NPCC Manager of Reliability Standards for presentation to the RSC.

> *Note: During the regional standards development, the drafting team will deliberate on whether the requirements in the regional standard are developed enough to begin the Cost Effectiveness Analysis (CEA) of the NPCC Cost Effectiveness Analysis Procedure (CEAP). When appropriate, the drafting team shall request that the RSC initiate the second phase (CEA) of the CEAP process.*

The drafting team shall create and manage its work structure (e.g., sub-teams) and meeting schedule (face-to-face as well as electronic meetings), as necessary, to meet the milestone dates and project deliverables outlined in the work plan.

The work products of the drafting team should consist of the following

- A draft regional standard consistent with the RSAR on which it was based
- An implementation plan, including the nature, extent and duration of field-testing, if any
- Identification of any existing regional standard and NPCC criteria that will be deleted, in part or whole, or otherwise impacted by the implementation of the draft regional standard

[14] Refer to Appendix B: Selection of Drafting Team Members

- Technical reports, white papers and/or work papers that provide technical justification for the draft regional standard under consideration
- Reliability Standard Audit Worksheet (RSAW) collaboratively developed by the drafting team and NPCC Compliance Staff

Any proposed changes to definitions in existing regional standards should be sent to the appropriate Task Force (TF) for consideration of the impact to the standard. If necessary, the TF can produce a RSAR.

NPCC Standards Staff can assist in the drafting of the regional standard including compliance measures, process and elements. The drafting of measures and compliance administration aspects of the standard will be coordinated with the NPCC Compliance Staff.

The drafting team shall submit the initial and subsequent interim drafts of the regional standard and associated documents to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post documents for comment.

STEP 2.4: POSTING FOR COMMENT PERIOD AND RESOLUTION OF COMMENTS

Note: There are no limits to the number of public comment periods and ballots that can be conducted to result in a regional standard that is clear and enforceable, and achieves a quorum and sufficient affirmative votes for approval.

STEP 2.4.A. COMMENT PERIOD

Note: For Final Comment Period skip this step and proceed to STEP 2.4.B. FINAL COMMENT PERIOD.

As authorized by the RSC, the NPCC Manager of Reliability Standards shall post the draft of the regional standard on the NPCC website, along with a draft implementation plan and available supporting documents, for a forty-five (45) calendar day comment period. The NPCC Manager of Reliability Standards shall also notify NERC to process the draft document in accordance with NERC's regional standards review procedure, as applicable.

Following the conclusion of the NPCC comment period, the NPCC Manager of Reliability Standards will assemble the comments on the draft regional standard and associated documents and provide all comments to the drafting team for consideration.

Within thirty (30) calendar days of the conclusion of the comment period the drafting team shall convene and consider changes to the draft Standard, the implementation plan and/or supporting technical documents based upon comments received. All submitted comments shall be addressed, and each commenter shall be advised of the disposition, with reasons, of their comments. The NPCC Manager of Reliability Standards shall publicly post all of the drafting team's responses to stakeholder comments on the NPCC website.

Based on the comments received, the drafting team may elect to:

- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the draft regional standard, the implementation plan and/or supporting technical documents.
- Recommend that the RSC authorize Field Testing of the draft regional standard. Upon completion of the Field Test, return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD

AND ASSOCIATED DOCUMENTS to revise the draft regional standard based on insights learned during the Field Test.

- Obtain RSC concurrence to post documents for Final Comment Period and request that the RSC initiate the second phase (CEA) of the CEAP process

STEP 2.4.B. FINAL COMMENT PERIOD

The NPCC Standards Staff shall coordinate a Quality Review of "final draft" of the regional standard, implementation plan, VRFs and VSLs to assess whether the documents are within the scope of the associated RSAR, whether the regional standard is clear and enforceable as written and the VRFs and VSLs are developed according to NERC and FERC guidelines. Upon Completion of the Quality Review, including resolution of comments, the drafting team shall submit the regional standard to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post these documents for comment.

As authorized by the RSC, the NPCC Standards Staff shall post the "final draft" of the regional standard on the NPCC website, along with the implementation plan, supporting documents and the Cost Effectiveness Analysis (CEA) survey[15] for a forty-five (45) calendar day comment period. NPCC Standards Staff shall also notify NERC to process the proposed final document in accordance with NERC's regional standards review procedure, as applicable.

Following the conclusion of the NPCC comment period, the NPCC Manager of Reliability Standards will assemble the comments on the posted regional standard and associated documents and provide all comments to the drafting team for consideration.

In addition, the RSC, pursuant with the requirements of the Cost Effectiveness Analysis Procedure (CEAP), will use the responses to the posted CEA survey to develop a recommendation based on the cost effectiveness of the proposed regional standard.

The NPCC Task Forces (TFs) or Working Groups (WGs) may develop recommendations for submittal to the RSC. Following the RSC deliberations to determine a course of action, the RSC will communicate to the drafting team to:

- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the Standard to address the results of the CEAP
- Accept the Standard "as is" to move forward through the remainder of the process
- Hold the Standard in abeyance until such time as additional guidance can be provided regarding whether or how to continue
- Decide not to pursue the development of certain requirements or the entire Standard due to cost effectiveness considerations

Upon Completion of the final comment period the drafting team shall submit the proposed regional standard, along with any supporting materials, consideration of comments and field test results, to the NPCC Manager of Reliability Standards to obtain RSC concurrence to post the regional standard for ballot and concurrently provide an information copy to the RCC.

[15] In accordance to the Cost Effectiveness Analysis Procedure (CEAP) the Cost Effectiveness Analysis (CEA) survey may be assigned directly to NPCC Task Forces (TFs) or Working Groups (WGs) in addition to the posting process.

The NPCC Manager of Reliability Standards shall also publicly post all of the drafting team's responses to stakeholder comments on the NPCC website.

STEP 2.5: POSTING FOR BALLOT PERIOD IN THE OPEN PROCESS

> *Note: There are no limits to the number of public comment periods and ballots that can be conducted to result in a regional standard that is clear and enforceable, and achieves a quorum and sufficient affirmative votes for approval.*

As authorized by the RSC, the NPCC Manager of Reliability Standards shall post the proposed regional standard on the NPCC website, along with supporting documentation [16] (e.g., implementation plan, consideration of comments, technical reports, white papers and any field test results), for a thirty (30) day pre-ballot review period and a subsequent ten (10) day ballot period. The ten (10) day ballot period will commence immediately following the pre-ballot review period. In the event that a quorum exists for purposes of an electronic vote but the ballot purpose has not been resolved, NPCC may continue to solicit additional responses in order to resolve the matter by electronic voting. In the event that quorum has not been achieved for purposes of an electronic vote, NPCC may continue to solicit electronic ballots, including abstentions, to obtain quorum and resolve the matter.

At the time the regional standard is posted for ballot, the NPCC Manager of Reliability Standards shall also notify NERC to process the proposed regional standard in accordance with NERC's regional standards review procedure, as applicable.

During the ballot period, the NPCC Members of the ballot body can cast their vote as follows:

- Affirmative, with or without comments
- Negative with comments
- Abstain

In accordance with the NPCC Bylaws, a quorum and receipt of a two-thirds (2/3) affirmative majority of the weighted sector votes is required for a ballot to pass.

The NPCC Manager of Reliability Standards shall post the final outcome of the ballot process on the NPCC website.

STEP 2.5.A. BALLOT DOES NOT RECEIVE 2/3 AFFIRMATIVE VOTE

If a ballot fails to achieve the 2/3 majority vote the NPCC Manager of Reliability Standards may:

- Direct the drafting team to respond to ballot comments and return to STEP 2.5: POSTING FOR BALLOT PERIOD IN THE OPEN PROCESS to re-ballot the regional standard. The consideration of comments from prior ballot will be included with the re-posting.
- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the regional standard to address the comments received.
- Pursue the discontinuance of the regional standard development by soliciting the Requester to withdraw the RSAR or by soliciting the RSC to reject the RSAR pursuant with STEP 2.1.C. NPCC REGIONAL STANDARDS COMMITTEE (RSC) ACTIONS. The NPCC Manager of

[16] The ballot posting is for the regional standard, definition, variance or clarification. Supporting documentation is included for information only and is not balloted.

Reliability Standards, in the event of a discontinuance of the development of a regional standard, shall post a notice of the discontinuance and will post and archive all comments submitted during the process for future consideration, if required. The NPCC Manager of Reliability Standards will also notify NERC to process the proposed regional standard in accordance with NERC's regional standards review procedure, as applicable.

STEP 2.5.B. BALLOT RECEIVES ≥ TWO-THIRDS (2/3) AFFIRMATIVE VOTE

A ballot that achieved two-thirds or greater affirmative vote has successfully passed. However, negative votes with comments should still be reconciled. If there is at least one negative vote with comments proceed to STEP 2.5.B.1 APPROVED BALLOT WITH "NEGATIVE VOTE WITH COMMENT". If there was not any negative vote with comments proceed to STEP 2.5.B.2 APPROVED BALLOT WITHOUT "NEGATIVE VOTE WITH COMMENT".

STEP 2.5.B.1 APPROVED BALLOT WITH "NEGATIVE VOTE WITH COMMENT"

Following the conclusion of the NPCC ballot period, the NPCC Manager of Reliability Standards will assemble the comments on the posted regional standard and provide all comments to the drafting team for consideration. The drafting team shall review all negative votes with comments and elect to:

- Recommend to the RSC to accept the regional standard "as is" and seek RSC endorsement to move forward through the remainder of the process. Upon receiving RSC endorsement to proceed, the regional standard and associated documents, approved by the NPCC ballot body, shall be forwarded by the Assistant Vice President Standards to the NPCC Board of Directors for final Regional approval. If comments that were received during balloting should be considered in future revisions to the regional standard then the NPCC Manager of Reliability Standards should log comments in an issues database.
- Return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the regional standard to address the comments received.
- Respond to ballot comments and recommend to the RSC endorse the return to STEP 2.5: POSTING FOR BALLOT PERIOD IN THE OPEN PROCESS to re-ballot the regional standard. The NPCC Manager of Reliability Standards should include the consideration of comments from the prior ballot with the re-posting.

STEP 2.5.B.2 APPROVED BALLOT WITHOUT "NEGATIVE VOTE WITH COMMENT"

Regional standard and associated documents, approved by the NPCC ballot body, shall be forwarded by the Assistant Vice President Standards to the NPCC Board of Directors for final Regional approval.

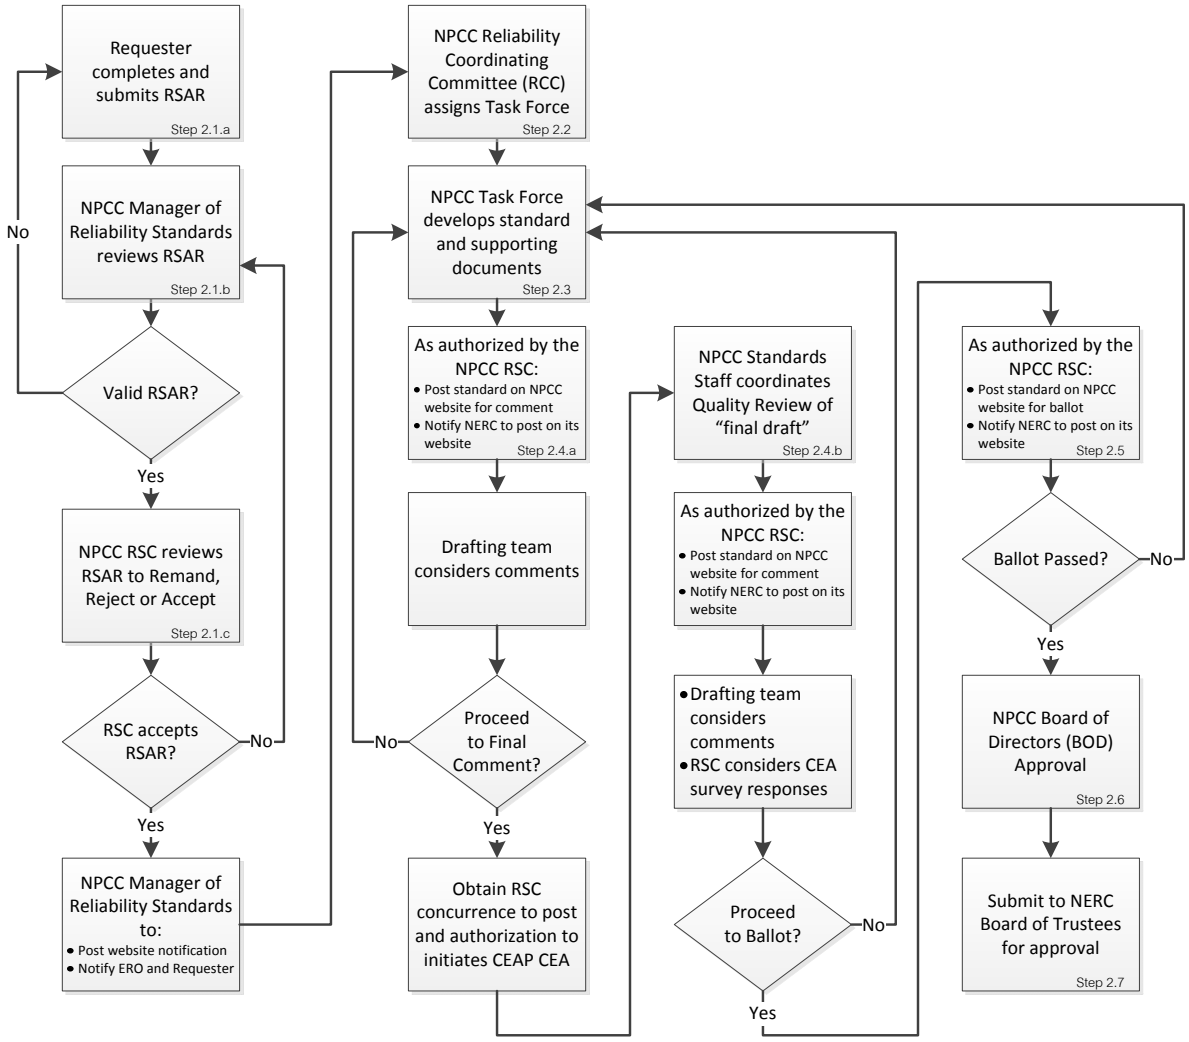
STEP 2.6: NPCC BOARD OF DIRECTORS APPROVAL

Following approval by the NPCC Members, regional standards require review and approval by the NPCC Board of Directors. The NPCC Board of Directors may take the following actions:

- Approve the regional standard as presented.
- Approve the regional standard with comments to incorporate non-substantive revisions. [The NPCC Board of Directors may not make substantive revisions to the standard.]
- Remand the regional standard back to the RSC and the drafting team to address their concerns. The RSC / drafting team can address the BOD comments and re-submit for BOD

approval or return to STEP 2.3: DEVELOPMENT OF A REGIONAL STANDARD AND ASSOCIATED DOCUMENTS to revise the regional standard to address the comments received.

STEP 2.7: NERC BOARD OF TRUSTEES SUBMITTAL



Upon approval by the NPCC Board of Directors, the NPCC Manager of Reliability Standards shall submit the regional standard to NERC, as the Electric Reliability Organization, for approval and subsequent filing with FERC and the applicable Canadian Provincial regulatory and/or governmental authorities for adoption.

STEP 2.8: IMPLEMENTATION OF A NPCC REGIONAL STANDARD

Following the approval of a NPCC regional standard by FERC and the applicable Canadian Provincial regulatory and/or governmental authorities, all users, owners, and operators of the Bulk Electric System in the NPCC geographic area are required to comply with the standard as of its enforcement date.

ERO approved Reliability Standards (both continent-wide and regional) are included in both the NERC and NPCC Compliance Monitoring and Enforcement Programs (CMEPs).

FIGURE 1: FLOWCHART OF REGIONAL STANDARDS DEVELOPMENT PROCESS OVERVIEW

3. STANDARD CLARIFICATION PROCESS STEPS

This section applies to NPCC regional standards that have been approved[17] and are currently enforceable or have a future enforcement date. A clarification request is not permitted for regional standards under development. For regional standards under development, an explanation of a requirement or its meaning can be sought during a comment period. Refer to Step 2, STANDARD DEVELOPMENT PROCESS STEPS of this manual for details on the comment process for a standard under development.

STEP 3.1: REGIONAL STANDARDS CLARIFICATION REQUEST (CR)

Any member of NPCC or group within the NPCC region shall be allowed to submit a Clarification Request (CR) for a NPCC regional standard.

Additionally, any person (organization, company, government agency, individual, etc.) who is directly and materially affected by the reliability of the NPCC Bulk Electric System shall be allowed to submit a Clarification Request (CR) for a NPCC regional standard.

> *Note: A valid Clarification Request is one that seeks additional clarity about one or more requirements in an approved regional standard, but does not request approval as to how to comply with any requirements of the standard.*

The Requester should submit a Clarification Request[18] (CR) for a NPCC regional standard directly to the NPCC Manager of Reliability Standards, via npccstandard@npcc.org, for processing. Alternatively, the Requester can submit a Request for Interpretation (RFI) of a NPCC regional standard under the NERC process for developing an interpretation[19] to the NERC Reliability Standards Staff explaining the clarification required, the specific circumstances surrounding the request, and the impact of not having the clarification provided. A copy of the completed RFI form should also be sent to the NPCC Manager of Reliability Standards.

NERC Reliability Standards Staff will refer the RFI to NPCC and delegate its resolution to NPCC. NPCC will process the NERC delegation pursuant with the NPCC Clarification Request (CR) process described herein.

STEP 3.2: REVIEW AND VALIDATION OF CLARIFICATION REQUEST (CR)

Upon receipt of a Clarification Request (CR) for a NPCC regional standard, the NPCC Manager of Reliability Standards shall review the CR to determine whether:

- It meets the requirements for a valid Clarification Request
- A compliance process or approach could be used in lieu of a clarification

The NPCC Manager of Reliability Standards will utilize, as necessary, the NPCC Standards Staff, NPCC Compliance and Legal Staffs when determining the validity of the CR. Based on this review, the NPCC Manager of Reliability Standards will recommend to the RSC whether to accept or reject the CR. The recommendation to the RSC should be made within thirty (30) calendar days of the receipt of the CR.

[17] Approval is granted by FERC and the Canadian Provincial regulatory and/or governmental authorities, as applicable.
[18] The NPCC Clarification Request form is included as Appendix D
[19] The *Request for Interpretation* form is posted under Resource Documents on the NERC Standards webpage.

The following examples identify situations that may warrant a recommendation from the NPCC Manager of Reliability Standards to reject the CR:

- Requests approval of a particular compliance approach
- Identifies a gap or perceived weakness in the approved regional standard (Requester should be redirected to initiate a RSAR rather than a CR)
- Where an issue can be addressed by an active (regional or continent-wide) standard drafting team
- Where an issue can be better addressed by a compliance process or approach
- Where it requests clarification of any element of a regional standard other than a requirement
- Where a question has already been addressed in the record
- Where the clarification identifies an issue and proposes the development of a new or modified regional or continent-wide standard (such issues should be addressed via submission of a RSAR or SAR)
- Where a clarification seeks to expand the scope of a regional standard
- Where the requirement of the regional standard is clear

STEP 3.3: NPCC REGIONAL STANDARDS COMMITTEE (RSC) ACTIONS

The RSC shall review the CR along with the recommendation from the NPCC Manager of Reliability Standards and take one of the following actions:

- Reject the CR. In this case, the RSC will provide its determination to the NPCC Manager of Reliability Standards, who will then provide a written explanation for rejection to the CR to the entity requesting the clarification within ten (10) calendar days of the decision to reject.
- Accept the CR. In this case, the RSC will provide its determination to the NPCC Manager of Reliability Standards, who will then: 1) post notification on the NPCC website of the intent to develop a clarification; 2) notify the NPCC Reliability Coordinating Committee (RCC) of the need to assign the resolution of the CR to one or more Task Forces (if more than one Task Force is assigned, one of them shall be assigned the lead role); and 3) notify the Requester of the acceptance of the CR. The notifications shall be made within ten (10) calendar days of the acceptance of the CR.

STEP 3.4: FORMATION OF DRAFTING TEAM FOR RESPONSE TO CR

A CR that has been accepted by the RSC shall be assigned by the RCC to the responsible NPCC Task Force to make up the clarification drafting team (CDT) and develop the CR response.

STEP 3.5: DEVELOPMENT OF RESPONSE TO CR

> *Note: A valid clarification response provides additional clarity about one or more requirements, but does not expand on any requirement and does not explain how to comply with any requirement.*

Within sixty (60) calendar days from the receipt of being assigned to respond to a CR, the CDT shall submit a proposed clarification response to the NPCC Manager of Reliability Standards. Upon receipt of the proposed clarification response from the CDT, the NPCC Manager of

Reliability Standards shall present the response to the RSC to obtain concurrence to post the proposed response for comment.

Along with the proposed clarification response, the drafting team shall also develop and submit a set of questions to be included in the comment form, for approval by the RSC.

If the RSC concurrence is not received, the drafting team will continue to refine the clarification response.

Note: There are no limits to the number of public comment periods that can be conducted to result in a clear and concise clarification of a regional standard requirement.

STEP 3.6: POSTING CR FOR COMMENT PERIOD AND RESOLUTION OF COMMENTS

As authorized by the RSC, the NPCC Manager of Reliability Standards shall post the proposed clarification response on the NPCC website for a forty-five (45) calendar day comment period.

Following the conclusion of the NPCC comment period, the NPCC Manager of Reliability Standards will assemble the comments on the proposed clarification response and provide all comments to the drafting team for consideration.

Within thirty (30) calendar days of the conclusion of the comment period the drafting team shall convene and consider changes to the proposed clarification response based upon comments received. All submitted comments shall be addressed, which may be in the form of a summary response addressing each of the issues raised in comments received. The NPCC Manager of Reliability Standards shall publicly post all of the drafting team's responses to stakeholder comments on the NPCC website.

Based on the comments received, the drafting team may elect to:

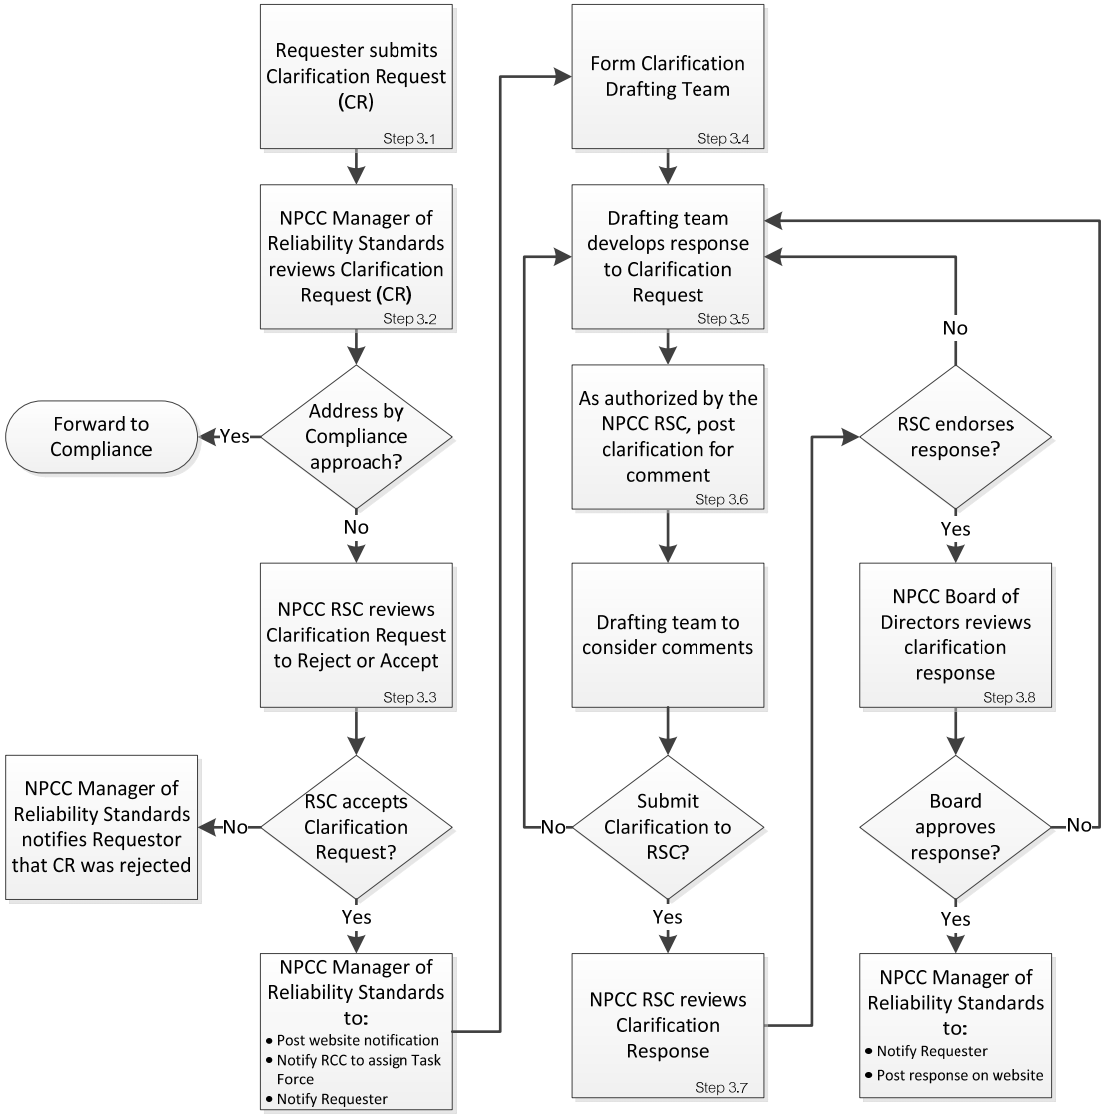
- Return to STEP 3.5: DEVELOPMENT OF RESPONSE TO CR to revise the proposed clarification response.
- Accept the proposed clarification response "as is" to move forward through the remainder of the process.

Upon acceptance of the proposed clarification response "as is," the drafting team shall submit the proposed clarification response to the NPCC Manager of Reliability Standards to obtain RSC endorsement to the submitted CR response.

STEP 3.7: REGIONAL STANDARDS COMMITTEE APPROVAL OF CR

Upon receipt of the CR response from the NPCC Manager of Reliability Standards, the RSC shall elect to:

- Endorse the proposed clarification response and direct the NPCC Assistant Vice President Standards to forward the CR to the NPCC Board of Directors for final Regional approval; or
- Direct the drafting team to return to STEP 3.5: DEVELOPMENT OF RESPONSE TO CR to revise the proposed clarification response



STEP 3.8: NPCC BOARD OF DIRECTORS APPROVAL OF CR

Following endorsement by the RSC, clarification responses require review and approval by the NPCC Board of Directors. The NPCC Board of Directors may take the following actions:

- Approve the clarification response as presented
- Approve the clarification response with comments to incorporate non-substantive revisions. [The NPCC Board of Directors may not make substantive revisions to the clarification response.]
- Remand the clarification response back to the RSC and the drafting team to address their concerns

Upon receipt of Board approval, the NPCC Manager of Reliability Standards shall notify the Requestor and post the approved clarification on the NPCC website.

FIGURE 2: FLOWCHART OF REGIONAL STANDARDS CLARIFICATION PROCESS OVERVIEW

4. DISCONTINUANCE OF REGIONAL STANDARD DEVELOPMENT

The term "discontinuance" as used herein refers to terminating the standard development process after RSAR approval but prior to posting a regional standard for industry ballot. From time to time the need or rationale for a regional standard may change thereby necessitating the curtailment

of the regional standard development. Upon notification or determination that a regional standard under development should be considered for discontinuance due to a perceived change in the need for the standard, the NPCC Manager of Reliability Standards will submit the recommendation for discontinuance to the RSC for approval.

5. WITHDRAWAL OF A REGIONAL STANDARD PENDING APPROVAL

The term "withdrawal" as used herein, refers to the revocation of a request for approval of a regional standard, variance, clarification or definition that has been approved by the NPCC Board of Directors and has not been filed with Applicable Governmental Authorities or has been filed but not yet approved by Applicable Governmental Authorities. The RSC may withdraw a regional standard, variance, clarification or definition for good cause subject to approval by the NPCC Board of Directors. Upon approval by the NPCC Board of Directors, the NPCC Manager of Reliability Standards will notify NERC Staff to petition the Applicable Governmental Authorities, as necessary, to allow for withdrawal in the case that the regional standard has been filed.

6. RETIREMENT OF AN APPROVED NPCC REGIONAL STANDARD

The term "retirement" refers to the discontinuation of a regional standard in whole, certain requirements within a regional standard, a variance, clarification or definition that: 1) has been approved by Applicable Governmental Authorities and 2) is not being superseded by or merged into a new or revised regional standard, clarification or definition.

Upon identification of a need for retirement, a RSAR containing the proposal of the retirement will be handled in accordance with the STEP 2.1: REGIONAL STANDARDS AUTHORIZATION REQUEST TO DEVELOP, MODIFY OR RETIRE. The proposal shall include the rationale for the retirement and a statement regarding the impact of retirement on the reliability of the Bulk Electric System. Upon approval by the NPCC Members and the NPCC Board of Directors, the NPCC Manager of Reliability Standards shall submit the request for retirement to NERC, as the Electric Reliability Organization, for approval and to subsequently petition the Applicable Governmental Authorities to allow for retirement.

7. APPROVAL OF PROCESS WAIVER

While it is NPCC's intent to adhere to this manual under normal circumstances, NPCC may need to develop a new or modified regional standard, implementation plan, variance, clarification or definition under extenuating circumstances. Extenuating circumstances may include, but not be limited to, specific time constraint imposed by a regulatory body and urgent reliability issue that requires expedited handling outside of the normal regional Reliability Standards process.

The RSC, by two-thirds (2/3) majority vote, may waive any of the provisions contained in this manual for good cause shown, but limited to the following circumstances:

- Where necessary to meet regulatory deadlines
- Where necessary to address an urgent reliability issue identified by regulatory and/or governmental authorities, including response to national emergency declared by the United States or Canadian government that involves the reliability of the Bulk Electric System or cyber-attack on the Bulk Electric System
- Where necessary to meet deadlines imposed by the NPCC Board of Directors

- Where the RSC determines that a revision to a proposed regional standard, implementation plan, variance, clarification or definition has already been vetted by the industry through the standards development process or is so insubstantial that developing the revision through the processes contained in this manual will add significant time delay without any corresponding benefit.

In no circumstances shall this provision be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard.

A waiver request may be submitted to the RSC by any entity or individual, including NPCC committees or subgroups and NPCC Standards Staff. Prior to consideration of any waiver request, the NPCC Manager of Reliability Standards must provide notification to stakeholders at least five (5) business days prior to RSC consideration and action. Posting the waiver request on the NPCC website satisfies the notification provision.

Action on the waiver request will be included in the minutes of the RSC. Following the approval of the RSC to waive any provision of the regional Reliability Standards process, the Assistant Vice President Standards shall report the exercise of this waiver provision to the NPCC Board of Directors prior to adoption of the related Reliability Standard, clarification, definition or variance. Actions taken pursuant to an approved waiver request will be posted on the NPCC Standards webpage.

8. PROCESS FOR CORRECTING ERRATA

From time to time, an error may be discovered in a regional standard after it has received final ballot approval by the NPCC ballot body. Such errors may be corrected by the RSC without re-balloting if the RSC agrees that the correction of the error does not change the scope or intent of the associated regional standard, and agrees that the correction has no material impact on the end users of the regional standard.

If the regional standard containing errata is pending approval by the NPCC Board of Directors, the corrected regional standard shall be presented to the NPCC Board for approval in lieu of the regional standard approved by the NPCC ballot body.

If a regional standard containing errata had received prior approval by the NPCC Board of Directors, the corrected regional standard shall be presented to the NPCC Board for approval. Upon approval by the Board, the corrected regional standard will be filed for approval by NERC.

The NPCC Board of Directors has resolved to concurrently approve any errata approved by the RSC associated with a regional standard that has received prior approval by the NPCC Board.

9. APPEALS

Persons who have directly and materially affected interests and who have been or will be adversely affected by any substantive or procedural action or inaction related to the approval, revision, reaffirmation, or withdrawal of a regional standard (appellant) shall have the right to appeal. This appeals process applies only to the regional standards process as defined in this manual.

The burden of proof to show adverse effect shall be on the appellant. Appeals shall be made within thirty (30) calendar days of the date of the action purported to cause the adverse effect, except appeals for inaction, which may be made at any time. In all cases, the request for appeal must be made prior to the next step in the process.

The final decisions of any appeal shall be documented in writing and made public.

The appeals process provides two levels, with the goal of expeditiously resolving the issue to the satisfaction of the participants:

LEVEL 1 APPEAL

Level 1 is the required first step in the appeals process. The appellant submits a complaint in writing to the NPCC Manager of Reliability Standards that describes the substantive or procedural action or inaction associated with a Reliability Standard or the standards process. The appellant describes in the complaint the actual or potential adverse impact to the appellant. Assisted by any necessary NPCC Standards Staff and Committee resources, the NPCC Manager of Reliability Standards shall prepare a written response addressed to the appellant as soon as practical, but not more than forty-five (45) calendar days after receipt of the complaint. If the appellant accepts the response as a satisfactory resolution of the issue, both the complaint and response will be made a part of the public record associated with the standard and posted with the standard.

LEVEL 2 APPEAL

If after the Level 1 Appeal the appellant remains unsatisfied with the resolution, as indicated by the appellant in writing to the NPCC Manager of Reliability Standards, the NPCC Board of Directors shall appoint a five member panel to serve as a Level 2 Appeals Panel.

In all cases, Level 2 Appeals Panel members shall have no direct affiliation with the participants in the appeal.

The NPCC Manager of Reliability Standards shall post the complaint and other relevant materials and provide at least a thirty (30) calendar day notice of the meeting of the Level 2 Appeals Panel.

In addition to the appellant, any person that is directly and materially affected by the substantive or procedural action or inaction referenced in the complaint shall be heard by the panel. The panel shall not consider any expansion of the scope of the appeal that was not presented in the Level 1 Appeal. The panel may in its decision find for the appellant and remand the issue to the RSC with a statement of the issues and facts in regard to which unfair and/or inequitable action was taken, or which fair and/or equitable action was not taken. The panel may find for or against the appellant with a specific statement of the facts that demonstrate fair and equitable treatment of the appellant and the appellant's objections. The panel may not, however, revise, approve, disapprove, or adopt a Reliability Standard. The actions of the Level 2 Appeals Panel shall be publicly posted.

In addition to the foregoing, a procedural objection that has not been resolved may be submitted to the NPCC Board of Directors for consideration at the time the Board decides whether to adopt a particular Reliability Standard. The objection must be in writing, signed by an officer of the objecting entity, and contain a concise statement of the relief requested and a clear demonstration of the facts that justify that relief. The objection must be filed no later than thirty (30) calendar days after the announcement of the vote on the standard in question.

APPENDIX A: RSAR COMPLETION GUIDELINES

The Requester shall complete a RSAR form in accordance with the guidance provided below.

The RSAR, at a minimum, shall contain information in the required fields in order to be qualified for consideration. The NPCC Manager of Reliability Standards will assist the Requester to ensure all required information is submitted on the RSAR.

Information in a Regional Standard Authorization Request (RSAR)

The tables below identify information to be submitted in a Regional Standard Authorization Request to the NPCC Manager of Reliability Standards, at npccstandard@npcc.org. The NPCC Manager of Reliability Standards shall be responsible for implementing and maintaining this form as needed to support the information requirements of the standards process.

Regional Standard Authorization Request Form

Title of Proposed Standard:	***[Required Field]***
Request Date:	***[Required Field]***

RSAR Requester Information

Name:	***[Required Field]***	**RSAR Type (Check box for one of these selections.)**	
Company:	***[Required Field]***	☐	New Standard
Telephone:	***[Required Field]***	☐	Revision to Existing Standard
Fax:		☐	Withdrawal of Existing Standard
Email:	***[Required Field]***	☐	Urgent Action

Purpose: (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.) ***[Required Field]***
Industry Need: (Provide a detailed statement justifying the need for the proposed standard, along with a technical justification and any supporting documentation.) ***[Required Field -- must include technical justification (relevant studies, documentation, etc.) for a new standard or revision to an existing standard.]***

Brief Description: (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

[Required Field]

Reliability Functions *[Required Field]*

The Standard will Apply to the Following Functions (Check all applicable boxes.)		
☐	Reliability Coordinator	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
☐	Balancing Authority	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☐	Planning Authority	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.
☐	Transmission Service Provider	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.
☐	Transmission Owner	The entity that owns and maintains transmission facilities.
☐	Transmission Operator	The entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission facilities.
☐	Transmission Planner	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.
☐	Resource Planner	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
☐	Generator Operator	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
☐	Generator Owner	Entity that owns and maintains generating units.

☐	Purchasing-Selling Entity	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
☐	Distribution Provider	Provides and operates the "wires" between the transmission system and the customer.
☐	Load-Serving Entity	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check all boxes that apply.)*	
☐	1. Interconnected Bulk Electric System shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected Bulk Electric System shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected Bulk Electric System shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected Bulk Electric System shall be developed, coordinated, maintained, and implemented.
☐	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected Bulk Electric System.
☐	6. Personnel responsible for planning and operating interconnected Bulk Electric System shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected Bulk Electric System shall be assessed, monitored, and maintained on a wide-area basis.
Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*	
Recognizing that reliability is an Common Attribute of a robust North American economy:	
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	

4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description: (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.) ***[Required Field – Provide: 1) Necessary information to assist the drafting team (which is to include relevant study results and documentation), to the extent feasible, to allow them to draft the standard, 2) Any existing known cross references to NPCC or NERC documents and 3) Technical background for the RSAR to properly address the need for the standard.]***

APPENDIX B: SELECTION OF DRAFTING TEAM MEMBERS

A regional standard drafting team shall be comprised of Subject Matter Experts (SMEs) from NPCC Task Forces and Working Groups as determined by the RCC, and from industry. The guidelines provided herein primarily address overall team requirements and more specifically those of a SME.

Formal membership on a drafting team should be reserved only for those individuals who intend to work consistently, diligently, and professionally on what is required to be done for a regional standard. Drafting team members are expected to contribute meaningfully to the ongoing development of the standard.

Drafting Team members must be:

- Committed to participating in scheduled drafting team meetings, teleconferences, as well as industry outreach (e.g., workshops and webinars)
- Willing to lead teams / sub-teams, as necessary
- Champions for standard development and promoters of the approval of the standard
- Open to consider the comments of others and provide constructive feedback

Subject Matter Experts should possess the necessary expertise and knowledge regarding the topic of the standard. The SMEs should represent a cross section of the registered entities applicable to the standard under development as well as geographical areas within the NPCC footprint.

Industry stakeholders may nominate themselves for consideration by the NPCC Regional Standards Committee (RSC) for the specific drafting team vacancies by completing the following drafting team Self Nomination form and submitting it to NPCC Manager of Reliability Standards, at npccstandard@npcc.org.

Nomination Form for NPCC [Name of drafting team] Drafting Team

Please return this form as soon as possible. If you have any questions, please contact the NPCC Standards Staff at npccstandard@npcc.org.

By submitting the following information you are indicating your willingness and agreement to actively participate in the drafting team meetings if appointed to the drafting team by the NPCC Regional Standards Committee (RSC). This means that if you are appointed to the DT you are expected to attend all (or at least the vast majority) of the face-to-face DT meetings as well as participate in all the DT meetings held via conference calls. Failure to do so shall result in your removal from the DT.

Name:	
Organization:	
Address:

APPENDIX C: MAINTENANCE OF REGIONAL STANDARDS AND PROCESS

NPCC regional standards and the Regional Standard Processes Manual are living documents that will be updated periodically to remain current and viable (e.g., respond to changing conditions, as well as to incorporate lessons learned and process improvements).

MAINTENANCE OF REGIONAL STANDARDS

NPCC regional standards will be posted for open process review by the RSC for possible revision at least once every five (5) years[21] after the first regulatory approval and follow the same process as in the case of a new standard. If no changes are warranted, the Regional Standards Committee (RSC) shall recommend to the NPCC Board that the standard be reaffirmed. If the review indicates a need to revise or retire a regional standard, a Regional Standard Authorization Request shall be prepared by the RSC and submitted in accordance with the NPCC regional standards process. The existing, approved standard subject to revision will remain in effect until such time as the revised version has received FERC or applicable Provincial Governmental Authorities approvals, as appropriate, at which time it will be retired in accordance with any applicable implementation plan associated with the newly approved regional standard.

MAINTENANCE OF THE REGIONAL STANDARDS PROCESS

This NPCC Regional Standards Process will be reviewed for possible revision at least once every five (5) years, or more frequently if needed, and subject to the same procedure as applies to the development of a Regional Standard. All such revisions shall be subject to approval by the NPCC Board of Directors, NERC Board of Trustees, FERC, and may be subject to approval, if required, by Applicable Governmental Authorities in Canada.

[21] More frequent reviews of NPCC regional standards may be required to promptly evaluate new or revised NERC reliability standards to ensure NPCC regional standards remain consistent and more stringent than continent-wide reliability standards.

APPENDIX D: NPCC CLARIFICATION REQUEST

NPCC, Inc.
NORTHEAST POWER COORDINATING COUNCIL, INC.
1040 AVE. OF THE AMERICAS, NEW YORK, NY 10018 (212) 840-1070 FAX (212) 302-2782

Note: A valid clarification request is one that requests additional clarity about one or more requirements in approved NPCC regional standards, but does not request approval as to how to comply with one or more requirements.

When completed, email this form to:
npccstandard@npcc.org
For questions about this form or for assistance in completing the form, call Lee Pedowicz at 212-840-1070.

DRAFT

~~I. EXECUTIVE SUMMARY~~

~~The purpose of the Northeast Power Coordinating Council, Inc. ("NPCC"), is to enhance the reliability of the international, interconnected bulk power system in Northeastern North America through the development of more stringent and specific regional reliability standards and compliance assessment and enforcement of continent-wide and regional reliability standards pursuant to the execution and implementation of a Regional Delegation Agreement with the Electric Reliability Organization ("ERO") and applicable Canadian Memoranda of Understanding~~ that ~~are backstopped by the Federal Energy Regulatory Commission ("FERC") and~~ provides the design-basis approach to a consensus building process by which NPCC may develop Regional Reliability Standards and Regional Variances to be proposed to the ERO for adoption, under delegated authority by the FERC and the Canadian Provincial regulatory and/or governmental authorities~~. In the development and enforcement of Regional Reliability Standards, NPCC, to the extent possible, facilitates attainment of fair, effective, efficient, and competitive electric markets.~~

~~General Membership in NPCC is voluntary and is open to any person or entity, including any entity participating in the Registered Ballot Body of the ERO that has an interest in the reliable operation of the Northeastern North American bulk power system.~~."

The NPCC Regional Reliability Standards Development Procedure ~~describes~~was originally adopted by the ~~procedures, policies~~NPCC Board of Directors on September 19, 2007. The NPCC Reliability Standards Staff in concert with the NPCC Regional Standards Committee (RSC) has completed a revision to the NPCC Regional Reliability Standards Process Manual to incorporate process improvements, provide greater clarity and reflect the new NPCC Cost Effectiveness Analysis Procedure (CEAP).

Key changes addressed in this revision include:

- Expanding the interpretation Section narrative into process steps and including an associated flowchart
- Creating separate sections for: 1) Withdrawal Of A Regional Standard Pending Approval; 2) Retirement Of An Approved NPCC Regional Standard; and 3) Approval Of Process Waiver; 4) Process For Correcting Errata
- Recognizing the new NPCC Cost Effectiveness Analysis Procedure (CEAP)
- Identifying the Reliability Standard Audit Worksheet (RSAW) as a companion document to a regional standard that needs to be collaboratively developed by the Drafting Team and NPCC Compliance Staff
- Creating three new appendices: 1) Appendix A: Regional Standard Authorization Request (RSAR) Completion Guidelines and Form; 2) Appendix B: Selection Of Drafting Team Members and Nomination Form; and 3) Appendix C: Maintenance Of Regional Standards and Process

In addressing areas for improvement in the NPCC Regional Reliability Standards Development Procedure, recent improvements made to the NERC Standards Process Manual (e.g., Standards Process Input Group (SPIG) recommendations) as well as the manuals of other Regional Entities were benchmarked to identify best practices ~~implemented~~for inclusion in this manual.

DRAFT

The process improvements and clarity captured in this revision to the NPCC Regional Reliability Standards Development Procedure, will result in a more timely and efficient manner to address the development of regional standards to ensure the reliability of the Bulk Electric System within the NPCC geographical area.

DRAFT

II. INTRODUCTION

PURPOSE~~an~~

This manual defines the characteristics of a Northeast Power Coordinating Council, Inc. (NPCC) regional Reliability Standard (hereinafter referred to as "regional standard") and establishes the process by which NPCC regional standards are developed, approved, revised, formally interpreted and retired. The NPCC regional standards process is a stakeholder process that is approved by the NPCC members to ensure a transparent standard development process that is "open, fair, and inclusive"~~ process for the transparent initiation, development, implementation and revision of NPCC Regional Reliability Standards necessary for the reliable operation~~."

NPCC regional standards address the reliability of the international and interconnected ~~bulk power system~~Bulk Electric System in Northeast North America. ~~These Standards~~NPCC regional standards shall enable or support one or more NERC/ERO reliability principles[1] and will, in all cases, not be inconsistent with or less stringent than any requirements of the North American Electric Reliability Council/Electric Reliability Organization (NERC/ERO) ~~Reliability Standards. The procedure will not unnecessarily delay the development of the proposed reliability standards. Each regional reliability standard shall enable or support one or more of the reliability principles, thereby ensuring that each standard serves a purpose in support of the reliability of the regional bulk power system. Each standard shall also be consistent with all of pertinent reliability principles and criteria, thereby ensuring that no standard undermines reliability through an unintended consequence~~continent-wide Reliability Standards.

~~II.~~ The development of NPCC regional standards is performed according to the following principles using the process contained in this manual:

- Developed in a fair and open process that provides an opportunity for all interested parties to participate;
- Does not have an adverse impact on commerce that is not necessary for reliability;
- Provides a level of Bulk Electric System reliability that is adequate to protect public health, safety, welfare, and national security and would not have a significant adverse impact on reliability; and
- Based on a justifiable difference between Regions or between sub-Regions within the Regional geographic area.

Following industry approval, NPCC regional standards process and NPCC regional standards require approval by the NPCC Board of Directors, NERC as the Electric Reliability Organization (ERO) and the applicable regulatory authorities in the United States (FERC) and Canada.

BACKGROUND

Northeast Power Coordinating Council, Inc. (NPCC) is responsible for promoting and improving the reliability of the international, interconnected Bulk Electric System in Northeastern North America. NPCC carries out its mission through (i) the development of regional standards and compliance assessment and enforcement of continent-wide and regional standards, coordination of system planning, design and operations, and assessment of reliability, (collectively, "Regional

[1] Available on the NERC website: Reliability Principles

Entity activities"), and (ii) the establishment of regionally-specific criteria, and monitoring and enforcement of compliance with such criteria (collectively, "criteria services activities").

The Energy Policy Act (EPA) of 2005 (Section 1211) amended the Federal Power Act (FPA) by adding Section 215, Electric Reliability. Specifically regarding standards development and pursuant with Section 215(e)(4) of the FPA, NPCC as a Regional Entity with delegated authority from NERC may propose regional standards to NERC for eventual enforcement within the NPCC region.

As a condition of NPCC membership, NPCC General and Full Members[2] agree to adhere to NERC Reliability Standards. NERC Reliability Standards are comprised of both continent-wide and regional standards. The NPCC regional standards apply only to that part of the Eastern Interconnection within the NPCC geographical area.

III. REGIONAL STANDARD ~~DEVELOPMENT PROCEDURE~~CHARACTERISTICS AND ELEMENTS

1. ~~1.~~ CHARACTERISTIC ATTRIBUTES

~~The NPCC Regional Reliability Standards Development Procedure is:~~

~~**Open** — The NPCC Regional Reliability Standards Development Procedure provides any person the ability to participate in the development of~~ The NPCC regional standards development process has the following key characteristics:

- **Fair due process** — The NPCC regional standards development process provides for reasonable notice and opportunity for public comment. At a minimum, the procedure shall include public notice of the intent to develop a standard~~. Any entity~~, a public comment period on the proposed standard, due consideration of those public comments, and a ballot of interested stakeholders. Upon approval by the NPCC Members, the NPCC Board of Directors then votes to approve submittal of the regional standard to NERC for ERO approval, followed by submission to FERC and Canadian Authorities for their approvals.

- **Openness** — Participation in the NPCC regional standards development process is open to all persons and organizations that ~~is~~are directly and materially affected by the reliability of the NPCC's ~~bulk power system has the ability to participate in the development and approval of reliability standards~~Bulk Electric System. There ~~are~~is no undue financial ~~barriers~~burden to participation. Participation ~~in the open comment process is~~shall not ~~conditional~~be conditioned upon membership in the ERO, NPCC or any organization, and ~~participation is~~shall not be unreasonably restricted on the basis of technical qualifications or other such requirements. ~~NPCC utilizes a website to accomplish this. Online posting and review of standards and the real time sharing of comments uploaded to the website allow complete transparency.~~

- **Inclusive** — ~~The NPCC Regional Reliability Standards Development Procedure provides any person~~Any entity (person, organization, company, government agency, individual, etc.) with a direct and material interest in the reliability of NPCC's Bulk Electric System has the right to participate by: (a) expressing an opinion and its basis~~, have that~~; (b) having their

[2] As defined in the NPCC By-Laws – available on the NPCC website

position considered, and ~~appealed~~(c) having the right to appeal a response through an established ~~appeals~~appeal process ~~if adversely affected.~~.

- ~~**Balanced** — The NPCC Regional Reliability Standards Development Procedure has a balance of interests and all those entities that are directly and materially affected by the reliability of the NPCC's bulk power system are welcome to participate~~**Balanced** — The NPCC regional standards development process strives to have an appropriate balance of interest and shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter. ~~This will be accomplished through~~Pursuant with the NPCC ~~Bylaws defining eight~~By-Laws[3] there are seven (7) stakeholder voting sectors ~~(categories)~~and the votes for ~~voting.~~each sector are weighted to achieve an appropriate balance.

  - ~~**Fair Due Process** — The NPCC Regional Reliability Standards Development Procedure provides for reasonable notice and opportunity for public comment. The procedure includes public notice of the intent to develop a standard, a 45 calendar day public comment period on the proposed standard request, or standard with due consideration of those public comments, and responses to those comments will be posted on the NPCC website. A final draft will be posted for a 30 calendar day pre-balloting period, and then a ballot of NPCC Members will be conducted. Upon approval by the NPCC Members, the NPCC Board then votes to approve submittal of the Regional Standard to NERC.~~

- **Transparent** — All actions material to the development of ~~Regional Reliability Standards~~NPCC regional standards are transparent and information regarding the progress ~~is posted~~of a standard's development action is made available to the public through postings on the NPCC website as well as through ~~extensive email~~E-mail lists.

- **Without undue delay** — The NPCC regional standards development process shall be performed within a reasonable time.

In as much as NPCC is one of ~~several regional entities~~six Regional Entities within the Eastern Interconnection of North America, there will be no presumption of validity by the ERO for any NPCC ~~Regional Reliability Standard.~~regional standard. In order to receive the approval of the ERO, the NPCC ~~Reliability Standards Development Process~~regional standards development process must also achieve the following objectives:

- **No Adverse Impact on Reliability of the Interconnection** —~~An~~ A NPCC ~~Regional Reliability Standard~~regional standard provides a level of ~~bulk power system~~Bulk Electric System reliability that is necessary and adequate to protect public health, safety, welfare, and North American security and will not have an adverse impact on the reliability of the Interconnection or other Regions within the Interconnection.

  - ~~**Justifiable Difference** — An NPCC Regional Reliability Standard is based on justifiable differences between Regions, such as different electrical systems or~~

[3] NPCC By-Laws are available on the NPCC website

~~facilities, sensitivity of load to disruptions, sensitivity of generation to disruptions, frequency and voltage sensitivity, system operating limit development and facilities ratings process, electrical system interactions, etc.~~

- ~~**Uniformity** - NPCC Regional Reliability Standards shall provide for as much uniformity as possible with reliability standards across the interconnected bulk power system of the North American continent. A NPCC Reliability Standard shall be more stringent than a continent-wide reliability standard, may include a regional variation that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the northeast's bulk power system, where the interpretation of the phrase "physical difference" will be consistent with FERC's Order, issued September 22, 2004, Granting Request For Clarification regarding Docket No. PL04-5-000, Policy Statement on Matters Related to Bulk Power System Reliability.~~

- **Justifiable Difference** — A NPCC regional standard addresses a justifiable difference within the NPCC geographical area that results from a physical difference[4] or operating difference in the Northeast's Bulk Electric System. Although a justifiable difference allows for a unique regional standard, a NPCC regional standard shall be no less stringent than a continent-wide standard.
- **Uniformity** — To the extent possible, the NPCC regional standards provides uniformity with Reliability Standards across the interconnected Bulk Electric System of North America.
- **No Undue Adverse Impact on Commerce** — ~~An~~A NPCC ~~Regional Reliability Standard~~regional standard will not cause any undue adverse impact on business activities that are not necessary for reliability of the Region and its interconnected Regions. All regional ~~reliability~~ standards shall be consistent with NERC's market principles[5].

~~**Other Attributes of the NPCC Regional Reliability Standards Development Procedure include;**~~

- ~~**Maintenance of Regional Reliability Standards** - NPCC Regional Standards will be reviewed for possible revision at least every three years and follow the same process as a new standard. The old standard will remain in place until such time as the revised version has passed through the entire process, at which point the old standard will be retired in accordance with any applicable new implementation plan associated with the approved revised standard. The review process shall be conducted by soliciting comments from the stakeholders and through open posting on the NPCC website. If no changes are warranted, Regional Standards Committee (RSC) shall recommend to the NPCC Board that the standard be reaffirmed. If the review~~

[4] The interpretation of the phrase "physical difference" will be consistent with FERC's Order, issued September 22, 2004, Granting Request For Clarification regarding Docket No. PL04-5-000, Policy Statement on Matters Related to Bulk Power System Reliability.

[5] Available on the NERC website: www.nerc.com

~~indicates a need to revise or withdraw a standard, a regional standard authorization request shall be prepared by the RSC and submitted in accordance with the standards development process contained in this procedure.~~

- ~~**Maintenance of Regional Reliability Standards Development Procedure** This NPCC Regional Reliability Standards Development Procedure will be reviewed for possible revision at least once every five years or more frequently if needed and subject to the same procedure as that of the development of a standard. All such revisions shall be subject to approval by the NPCC Board, NERC, FERC, and could be subject to approval, if required, by applicable authorities in Canada. The NPCC RSC has the authority to make non-substantive changes to this procedure and subsequently notify the NPCC Board for their concurrence at their next scheduled meeting.~~

- ~~**Interpretation of Standards** All persons who are directly and materially affected by the NPCC's bulk power system reliability shall be permitted to request an interpretation of a standard. The person requesting an interpretation will send an email request to the Regional Standards Process Manager (RSPM), as noted on the NPCC website, explaining the specific circumstances surrounding the request and what clarifications are required as applied to those circumstances. The request should indicate the material impact to the requesting party or others caused by the lack of clarity or a possibly incorrect interpretation of the standard. The RSPM along with guidance from the RSC will forward the request to the originating Task Force which acted as the drafting team for that regional reliability standard. The Task Force will address, through a written response, the request for clarification as soon as practical, but not more than 45 business days from its receipt by the Task Force. This written interpretation will be posted along with the final approved and adopted standard and will stand until such time as the standard is revised through the normal RSAR process, at which time the standard will be modified to incorporate the clarifications provided by the interpretation.~~

2. ELEMENTS OF A ~~RELIABILITY~~REGIONAL STANDARD

- ~~**Elements of a Regional Reliability Standard**~~

To ensure uniformity of regional ~~reliability~~standards and avoid inconsistency with NERC continent-wide standards, a NPCC regional ~~reliability~~ standard shall ~~consist of~~be consistent with the elements identified in this section of the procedure. These elements are intended to apply a systematic discipline in the development and revision of regional standards. ~~This~~The application of a systematic discipline is necessary ~~to~~for achieving regional standards that are measurable, enforceable, and consistent~~.~~ as well as results oriented[6], i.e.:

[6] Results-based Standards see http:www.nerc.com/filez/standards/Project2010-06_Results-based_Reliability_Standards.html

~~All mandatory requirements of a regional reliability standard shall be within the standard document. Supporting documents to aid in the implementation of a standard may be referenced by the standard but are not part of the standard itself.~~

~~The most current version of the approved NERC Reliability Standard template and its associated elements as or if applicable, will be used at the time of the development of the NPCC Regional Reliability Standard to ensure all essential elements are contained therein to achieve consistency and uniformity and meet all statutory requirements. A sample of the elements contained in the standard appears in Table 1 below, however the latest ERO Board approved Standard template, that may be found on the NERC website, will supersede the list below at the time the regional standard is developed.~~

~~Table 1- Elements of a Regional Reliability Standard~~

- Performance-based,
- Risk-based, and
- Capability-based.

TYPES OF RELIABILITY REQUIREMENTS

The Drafting Team (DT) should strive to achieve a portfolio of performance, risk, and capability-based mandatory reliability requirements that support an effective defense-in-depth strategy. Each requirement should identify a clear and measurable expected outcome, such as: a) a stated level of reliability performance, b) a reduction in a specified reliability risk, or c) a necessary competency.

a) **Performance-based** - defines a specific reliability objective or outcome that has a direct, observable effect on the reliability of the Bulk Electric System, i.e. an effect that can be measured using power system data or trends.

b) **Risk-based** - defines actions of entities that reduce a stated risk to the reliability of the Bulk Electric System and can be measured by evaluating a particular product or outcome resulting from the required actions.

c) **Capability-based** - defines capabilities needed to perform reliability functions and can be measured by demonstrating that the capability exists as required.

Each regional standard shall enable or support one or more of the reliability principles[7] as identified in the most recent set posted on the NERC website. Each regional standard shall also be consistent with all of the reliability principles. The intent of the set of NPCC regional standards is to deliver an Adequate Level of Reliability[8] as defined by NERC.

Recognizing that Bulk Electric System reliability and electricity markets are inseparable and mutually interdependent, all regional standards shall be consistent with the most recent set of Market Principles[9] as posted on the NERC website. Consideration of the Market Principles is intended to ensure that regional standards are written such that they achieve their reliability

[7] Available on the NERC website: Reliability Principles
[8] Available on the NERC website: Adequate Level of Reliability
[9] Available on the NERC website: Market Principles

objective without placing undue restrictions or causing adverse impacts on competitive electricity markets.

ELEMENTS OF A REGIONAL STANDARD

A regional standard includes several components designed to work collectively to identify what entities must do to meet their reliability-related obligations as an owner, operator or user of the Bulk Electric System. The components of a NPCC regional standard identified below are based on the NERC Standard Processes Manual (SPM) that was approved by the NERC Board of Trustees at its February 2013 meeting. Future revisions of the NERC SPM will be used at the time of development of a NPCC regional standard if different from the elements listed below.

The only mandatory and enforceable components of a regional standard are the: (1) Applicability, (2) Requirements, and (3) the Effective Dates. The additional components are included in the regional standard for informational purposes, to establish the relevant scope and technical paradigm, and to provide guidance to functional entities concerning how compliance will be assessed by the Compliance Enforcement Authority.

The components of a regional standard may include the following:

Title:	A brief, descriptive phrase identifying the topic of the regional standard.
~~***Identification Number:***~~	A unique identification number assigned in accordance with ~~an administrative~~a published classification system to facilitate tracking and reference~~. (i.e. "NPCC-BAL-002-0-Date" which refers~~ to ~~NPCC Regional Standard, referencing NERC BAL-002 Version 0, with NPCC Effective Date-final adoption by all Regional Authorities)~~the regional standards.
~~***Title*** ***Purpose:***~~	~~A brief, descriptive phrase identifying~~The reliability outcome achieved through compliance with the ~~topic~~requirements of the regional standard.
Applicability:	~~Clear identification of~~Identifies which entities are assigned reliability requirements; i.e., the specific functional ~~classes of~~ entities ~~responsible for complying with~~and facilities to which the regional standard~~, noting any specific additions or exceptions.~~ ~~The standard will be applicable to the Bulk Power System unless otherwise noted~~ applies.
Effective ~~**Date and Status**~~ ***Dates:***	~~The effective date of the standard or, prior to approval of the standard, the proposed effective date.~~Identification of the date or pre-conditions determining when each Requirement becomes effective in each jurisdiction.

~~**Purpose**~~	~~The purpose of the standard. The purpose shall explicitly state what outcome will be achieved or is expected by this standard.~~
~~**Requirement(s)**~~	~~Explicitly stated technical, performance, and preparedness requirements. Each requirement identifies what entity is responsible and what action is to be performed or what outcome is to be achieved. Each statement in the requirements section shall be a statement for which compliance is mandatory.~~

DRAFT

~~**Risk Factor(s)**~~ ***Requirement:***	~~The potential reliability significance of each requirement, designated as a High, Medium, or Lower Risk Factor in accordance with the criteria listed below:~~ ~~A High Risk Factor requirement (a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or (b) is a requirement in a planning timeframe that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.~~ ~~A Medium Risk Factor requirement (a) is a requirement that, if violated, could directly affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or (b) is a requirement in a planning timeframe that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ ~~A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.~~An explicit statement that identifies the functional entity responsible, the action or outcome that must be achieved, any conditions achieving the action or outcome, and the reliability-related benefit of the action or outcome. Each requirement shall be a statement for which compliance is mandatory.
~~**Measure(s)**~~	~~Each requirement shall be addressed by one or more measures. Measures are used to assess performance and outcomes for the purpose of determining compliance with the requirements stated above. Each measure will identify to whom the measure applies and the expected level of performance or outcomes required demonstrating compliance. Each measure shall be tangible, practical, and as objective as is practical. It is important to~~

DRAFT

	~~realize that measures are proxies to assess required performance or outcomes. Achieving the measure should be a necessary and sufficient indicator that the requirement was met. Each measure shall clearly refer to the requirement(s) to which it applies.~~

~~**Table 2 —**~~ Compliance Elements: Elements to aid in the administration of ~~**a Regional Reliability Standard**~~compliance monitoring and enforcement responsibilities.

Measure: Provides identification of the evidence or types of evidence that may demonstrate compliance with the associated requirement.

~~**Compliance Monitoring Process**~~***Violation Risk Factors and Violation Severity Levels:***

~~Defines for each measure:~~

- ~~The specific data or information that is required to measure performance or outcomes.~~
- ~~The entity that is responsible for providing the data or information for measuring performance or outcomes.~~
- ~~The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.~~
- ~~The entity that is responsible for evaluating data or information to assess performance or outcomes.~~
- ~~The time period in which performance or outcomes is measured, evaluated, and then reset.~~
- ~~Measurement data retention requirements and assignment of responsibility for data archiving.~~

~~Violation severity levels.~~Violation risk factors (VRFs) and violation severity levels (VSLs) are used as factors when determining the size of a penalty or sanction associated with the violation of a requirement in an approved Reliability Standard. Each requirement in each Reliability Standard has an associated VRF and a set of VSLs. VRFs and VSLs are developed by the Drafting Team, working with NPCC Standards Staff, at the same time as the associated Reliability Standard, but are not part of the Reliability Standard. The Board of Directors is responsible for approving VRFs and VSLs.

- Violation Risk Factors
  VRFs identify the potential reliability significance of noncompliance with each requirement. Each requirement is assigned a VRF in accordance with the latest approved set of VRF criteria.
- Violation Severity Levels
  - VSLs define the degree to which compliance with a requirement was not achieved. Each requirement shall have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs. Each requirement is assigned one or more VSLs in accordance with the latest approved set of VSL criteria.

DRAFT

Version History:	The version history is provided for informational purposes and lists information regarding prior versions of the regional standard.
Variance:	As applied to a NPCC regional standard is a Requirement (to be applied in the place of the NPCC region-wide Requirement) that is applicable to a specific geographic area or to a specific set of Registered Entities.
Compliance Enforcement Authority (CEA):	The entity that is responsible for assessing performance or outcomes to determine if an entity is compliant with the associated regional standard. The Compliance Enforcement Authority will be NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the ERO regional standards.
Reliability Standard Audit Worksheets (RSAWs)[10]	Reliability Standard Audit Worksheets (RSAWs) are developed as companion documents to regional and continent-wide Reliability Standards to facilitate the CEA assessment of a registered entity's compliance with a standard.

~~*Supporting Information Elements*~~

Informational Elements: Elements to aid in the implementation of the regional standard.

~~Interpretation~~	~~Any interpretation of regional reliability standard that is developed and approved in accordance with the "Interpretation of Standards" section of Appendix A of this procedure, to expound on the application of the standard for unusual or unique situations or to provide clarifications.~~

~~Implementation Plan~~*Application Guidelines:*	~~Each regional reliability standard shall have an associated implementation plan describing the effective date of the standard or effective dates if there is a phased implementation. The implementation plan may also describe the implementation of the standard in the compliance program and other considerations in the initial use of the standard, such as necessary tools, training, etc. The implementation plan must be posted for at least one public comment period and is approved as part of the ballot of the standard.~~Guidelines to support the implementation of the associated regional standard.

[10] While RSAWs are not part of the regional standard, they are developed through collaboration of the Drafting Team and NPCC Compliance Staff.

~~Supporting References~~*Procedures:* ~~This section references related documents that~~ Procedures to support ~~reasons for, or otherwise provide additional information related to~~ implementation of the associated regional ~~reliability~~ standard. ~~Examples include, but are not limited to:~~

- ~~Glossary of terms~~
- ~~Developmental history of the standard and prior versions~~
- ~~Notes pertaining to implementation or compliance~~
- ~~Standard references~~
- ~~Standard supplements~~
- ~~Procedures~~
- ~~Practices~~
- ~~Training references~~
- ~~Technical references~~
- ~~White papers~~
- ~~Internet links to related information~~

~~3. Terms And Functions~~

- ~~**Regional Standards Committee (RSC)** – An NPCC committee charged with management of the NPCC Standards Procedure under a sector based voting structure as described in the NPCC Bylaws. The NPCC RSC will consider requests for new or revised standards and be available for advisement to the NPCC Board on the standards.~~

  ~~The RSC may not itself modify the standard without issuing a new notice to stakeholders regarding a vote of the modified standard. Any RSC action will only be activated in the event of a minor correction of a standard such as errata.~~

  ~~The RSC is an open and balanced stakeholder committee inclusive of all stakeholder interests that provide for or are materially impacted by the reliability of the bulk power system.~~

  ~~The RSC disposition regarding the regional standard authorization request, which will in all cases be within 60 calendar days of receipt of a completed standard request, shall include:~~

  - ~~Accept the standard request as a candidate for development of a new standard, revision of an existing standard, or deletion of an existing standard. The RSC may, at its discretion, expand or narrow the scope of the standard request under consideration. The RSC shall prioritize the development of standards in relation to other proposed standards, as may be required based on the volume of requests and resources.~~

DRAFT

- ~~Reject the standard request. If the RSC rejects a standard request, a written explanation for rejection will be delivered to the requester within 30 calendar days of the decision.~~
- ~~Remand the standard request back to the requester for additional work. The standards process manager will make reasonable efforts to assist the requester in addressing the deficiencies identified by the RSC. The requester may then resubmit the modified standard request using the process above. The requester may choose to withdraw the standard request from further consideration prior to acceptance by the RSC.~~

IV. ~~The NPCC~~ REGIONAL STANDARDS DEVELOPMENT PROCESS

1. ROLES IN THE NPCC REGIONAL STANDARD PROCESS ~~responsibilities of the RSC will include:~~

- ~~Review of NPCC Draft Standards for such factors as completeness, sufficient detail, rational result, and compatibility with existing standards; clarifying standard development issues not specified in this procedure. Under no circumstance will the RSC change the substance of a draft standard.~~
- ~~Due consideration to the work of the drafting team as well as the comments of stakeholders and minority objections, in approving a proposed regional reliability standard to go to ballot.~~
- ~~Approve standards for pre-ballot posting under a sector based voting structure as described later in the NPCC Inc. Bylaws or~~
- ~~Remand the standard back to the Task Force acting as the drafting team for further work or recommend a change in those participating in the drafting team (i.e. a new drafting team).~~

- ~~**Regional Standards Process Manager (RSPM)** - The Regional Reliability Standards Procedure shall be administered by a NPCC staff Regional Standards Process Manager. The RSPM is responsible for ensuring that the development and revision of standards is in accordance with this manual. The RSPM works to ensure the integrity of the process, format, consistency of quality, and completeness of the reliability standards. The RSPM facilitates all steps in the process.~~

- ~~**RELIABILITY COORDINATING COMMITTEE (RCC)** - The RCC, will support the standards development process through the assignment of NPCC Task Forces. They will also provide a technical advisory role in the Regional Reliability Standards development procedure through recommendations.~~

~~REQUESTER~~ ~~**A Requester is any individual or an entity**~~ NOMINATION, REVISION, INTERPRETATION, OR RETIREMENT OF A STANDARD:

Any member of NPCC or group within the NPCC region shall be allowed to request that a NPCC regional standard be developed, modified, interpreted, or retired. Additionally, any person (organization, company, government ~~authority~~agency, individual, etc.) ~~that submits a complete~~

~~request for development, revision, or withdrawal of a standard. Any person or an entity that~~ who is directly and materially affected by ~~an existing standard or the need for a new standard may submit a~~ the reliability of the NPCC Bulk Electric System shall be allowed to request ~~for a new standard or revision to a standard. The Requester is assisted by the RSAR drafting team (if one is appointed by the RSC) to respond to comments and to decide if and when the RSAR is forwarded to the RSC with a request to draft a standard. The Requester is responsible for the RSAR, assisted by the RSAR drafting team and Regional Standards~~ that a NPCC regional standard be developed, modified, interpreted, or retired. The following section identifies the process roles in the NPCC regional standards process. Refer to Step 2 STANDARD DEVELOPMENT PROCESS STEPS and FIGURE 1: FLOWCHART OF REGIONAL STANDARDS DEVELOPMENT PROCESS for the regional standards development process steps and associated flowchart.

PROCESS ~~**Manager, until such time the RSC authorizes**~~ ROLES AND RESPONSIBILITIES

BOARD OF DIRECTORS

The NPCC Board of Directors (Board) shall consider for adoption regional standards, definitions, variances and interpretations and associated implementation plans that have been processed according to the processes identified in this manual. Once the Board adopts a regional standard, definition, variance or interpretation, the Board shall direct NPCC Standards Staff to submit the document(s) for approval to the NERC Board of Trustees.

COMPLIANCE COMMITTEE (CC)

The NPCC Compliance Committee, a committee of the NPCC Board of Directors, manages the NPCC Compliance Monitoring and Enforcement Program (CMEP). The CMEP is used to monitor, assess and enforce mandatory compliance with both NERC continent-wide and NPCC regional standards. The CC aides in the regional standards development, as necessary, by: (1) performing compliance reviews of technical requirements, (2) assisting the Drafting Team with the development of ~~the standard. The Requester has the option at any time to allow the RSAR drafting team to assume full~~Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs), Reliability Standard Audit Work Sheets (RSAWs) and (3) participating on quality review teams.

DRAFTING TEAM

The Drafting Team develops standards-related regional products as directed by the NPCC RSC and within the scope of an approved Regional Standard Authorization Request (RSAR) or a formal Request for Interpretation (RFI). The product that is developed is typically a new or revised regional standard, but could also be a definition, a reference document, a set of Violation Risk Factors, a set of Violation Severity levels, or the team could be appointed to assist an author in refining a Regional Standard Authorization Request (RSAR). The Drafting Team also works collaboratively with NPCC Compliance Staff to develop Reliability Standard Audit Worksheets (RSAWs) at the same time regional standards are developed. The Drafting Team shall remain in place until such time as the NERC Board of Trustees adopts the regional standard.

MANAGER OF RELIABILITY STANDARDS

The NPCC Manager of Reliability Standards has the overall responsibility for ~~the RSAR. The Requester may chose to~~managing the NPCC regional standards processes in accordance with this manual. As used herein, the NPCC Manager of Reliability Standards will be the NPCC Manager of Reliability Standards or his/her designee.

DRAFT

NPCC MEMBERS

NPCC members may participate in the comment and ballot periods associated with the development and industry approval of regional standards. The ballot body is comprised of all entities or individuals that qualify for one of the stakeholder sectors within NPCC as stated in the most recently approved NPCC Bylaws. All General and Full Members of NPCC can participate in ~~subsequent standard drafting efforts related to the RSAR.~~the balloting of regional standards. Any entity or person, including non-NPCC members, may submit comments during the open process comment periods for standards.

NON-NPCC MEMBERS

Any entity or person that is neither a General nor Full Members of NPCC is not eligible to participate in the ballot body voting on a regional standard. However, any entity or person, including non-NPCC members, may submit comments during the open process comment periods for standards. Subject Matter Experts (SMEs), regardless of NPCC membership status, are encouraged to participate in comment periods for regional standards.

NPCC STANDARDS STAFF

The Standards Staff is responsible for assisting the NPCC Manager of Reliability Standards and the RSC in administering the NPCC regional standards processes in accordance with this manual.

NPCC COMMITTEES, TASK FORCES AND WORKING GROUPS

The Committees, Task Forces and Working Groups~~. The committees, task forces and working groups~~ within NPCC~~,~~ serve an active role in the standards process. Activities performed by these groups include, but are not limited to, the following:

- Identify the need for new or modified regional standards~~ Identify the need for new or modified regional standards.~~
- ~~•~~
- Initiate NPCC Standards actions by developing Regional Standard Authorization Requests (RSARs~~).~~)
- ~~•~~ Develop comments (views and objections) to standards actions~~.~~
- ~~•~~ Participate in NPCC Standard drafting~~.~~
- ~~•~~ Provide technical oversight in response to changing industry conditions ~~—~~and ERO Requirements~~.~~
- ~~•~~ Conduct Field Tests, as required

REGIONAL STANDARDS COMMITTEE (RSC)

The NPCC Regional Standards Committee (RSC), a committee of the NPCC Board of Directors, is charged with oversight of all Drafting Team activities and managing the NPCC regional standards development process in accordance with this manual.

The RSC is responsible for maintenance of the Regional Standards Process Manual (RSPM), including the endorsement of RSPM revisions for NPCC Board review and approval.

DRAFT

RELIABILITY COORDINATING COMMITTEE (RCC)
