NPCC REGIONAL STANDARDS COMMITTEE

AGENDA FOR MEETING #14-3
June 18, 2014, 10:00 a.m. - 5:00 p.m. EST
June 19, 2014, 8:00 a.m. - 3:00 p.m. EST
Hampton Inn & Suites Saratoga Springs Downtown Hotel
25 Lake Avenue
Saratoga Springs, New York
Attire: Business Casual

Dial-In: 415-655-0003 (USA) / 416-915-6530 (Canada) **Guest Code: 28796919**

For Reference: Glossary of Terms Used in NERC Reliability Standards, dated April 3, 2014
NPCC Glossary of Terms, dated January 18, 2012

Introductions and Chair's Remarks

NPCC Antitrust Compliance Guidelines

Agenda Items:

1.0 Review of Agenda

2.0 RSC Meeting Minutes

2.1 Approval of Minutes: April 10-11, 2014 RSC Meeting #14-2*

3.0 Drafting Team Members and Executive Tracking Summary

3.1 NPCC Members on NERC Drafting Teams*
3.2 Executive Tracking Summary*
3.3 NERC Project Tracking Spreadsheet (*link*)

4.0 Open Action Items*

4.1 Open Action Items List

5.0 Items Requiring RSC Discussion / Approval

5.1 NERC Weekly Standards Bulletin

5.2 Project 2014-01 – Standards Applicability for Dispersed Generation Resources

-Michael Jones from Nation Grid requested a discussion regarding a cut-off time for submission of comments.

5.3 Project 2010-02 - Connecting Facilities to the Grid - FAC-001-2 and FAC-002-2

* Item in Meeting Material

5.4 Project 2007-17.3 - Protection System Maintenance and Testing - Phase 3 (Sudden Pressure Relays) - PRC-005-X

-https://cc.readytalk.com/cc/playback/Playback.do?id=19ak93

5.5 NERC Bulk Electric System Update

5.6 Project 2012-13 - NUC - Nuclear Plant Interface Coordination

5.7 Project 2013-03 - Geomagnetic Disturbance Mitigation

5.8 NERC State of Reliability Report Finds Bulk Power System Performance Level Remains High

5.9 Project 2010-05.2 - Special Protection Systems - Phase 2 of Protection Systems

5.10 NERC RAPA Meeting

5.11 NPCC RCC Meeting Minutes

6.0 NERC Reliability Standards

http://www.nerc.com/pa/Stand/Pages/Standards-Under-Development.aspx

6.1 Currently Posted Projects

Project	Comment Period	Ballot Period	Standards Developer	6/18/14 Call-In
Project 2007-11 Disturbance Monitoring - PRC-002-2	6/23/14		Steve Crutchfield	1:00 PM
Project 2008-02 Undervoltage Load Shedding & Underfrequency Load Shedding - PRC-010, PRC-020, PRC-021 and PRC-022	4/16/14 6/23/14 (I)		Erika Chanzes Lacey Ourso	1:15 PM
Project 2010-05.1 - Protection System: Phase 1 (Misoperations) - PRC-004	6/30/14 (F)	6/30/14 (A)	Scott Barfield	1:30 PM
Project 2014-02 - Critical Infrastructure Protection Standards Version 5 Revisions	7/16/14 (F)	7/16/14 (I)	Marisa Hecht Ryan Stewart	1:45 PM
Project 2014-03 - Revisions to TOP/IRO Reliability Standards	7/2/14 (F)	6/17/14 (I)	Ed Dobrowolski	2:00 PM
Project 2013-03 - Geomagnetic Disturbance Mitigation			Luis Marti	2:30 PM
Comments: (I) – Informal; (F) – Formal **Ballots:** (I) – Initial; (A) – Additional; (F) – Final				

6.2 Ballot History (Since last RSC Meeting)*

6.3 Comment Form History (Since last RSC Meeting)*

7.0 NERC Drafting Team Nominations

http://www.nerc.com/pa/Stand/Pages/Drafting-Team-Vacancies.aspx

7.1 Currently Posted Drafting Team Vacancies

7.1.1 None at this time

7.2 Closed Drafting Team Nominations (Since last RSC Meeting)

7.2.1 None at this time

7.3 Solicitation For Informal Development Teams

7.3.1 None at this time

* Item in Meeting Material

8.0 NPCC Regional Reliability Standards*
https://www.npcc.org/Standards/default.aspx

8.1 Current Activities: Regional Standards (PRC-002-NPCC-01 Update)
8.2 Current Activities: Regional Standard Interpretations

9.0 NPCC Non-Standards*
https://www.npcc.org/Standards/SitePages/NonStandardsList.aspx

9.1 Directories Posted to the Open Process
9.1.1 Directory #1 Design and Operation of the Bulk Power System
9.1.2 Directory#3 Maintenance Criteria BPS
9.2 Directory Interpretations
9.2.1 None at this time
9.3 Criteria (A) / Guides (B) / Procedures (C) Documents
9.4 Directory Manual Revisions
9.4.1 Cost Revisions
9.4.2 Other (Comment Form)

10.0 RSC Member Items of Interest
10.1 RSC Roster*

11.0 Standards Activity Post NERC BOT Approval*
(Since last RSC Meeting)

11.1 NERC Filings to FERC
http://www.nerc.com/FilingsOrders/Pages/default.aspx
11.2 FERC Orders / Rules
http://www.nerc.com/FilingsOrders/Pages/default.aspx
11.3 Federal Register
https://www.federalregister.gov/
11.4 FERC Sunshine Act Meeting Notice

12.0 NERC Meetings

12.1 Standards Committee (SC)
http://www.nerc.com/comm/SC/Pages/default.aspx

January 15th - Meeting	January 29th - Call	February 12th - Call
March 12th & 13th - Meeting	April 9th - Call	May 14th - Call
June 10th & 11th - Meeting	July 16th - Call	August 20th - Call
September 23rd & 24th Meeting	October 22nd - Call	November 19th - Call
December 9th & 10th - Meeting		

* Item in Meeting Material

12.2 Standards Committee Process Subcommittee (SCPS)
http://www.nerc.com/comm/SC/Pages/Standards%20Committee%20Process%20Subcommittee%20SCPS/Standards-Committee-Process-Subcommittee-SCPS.aspx

February 6th & 7th	March 12th & 13th	April 23rd Call
June 10th & 11th	September 23rd & 24th	

12.3 Standards Committee Project Management and Oversight Subcommittee (PMOS)
http://www.nerc.com/comm/SC/Pages/ProjectManagementandOversightSubcommittee(PMOS).aspx

February 21st - Call	February 28th - Meeting	April 17th - Meeting

12.4 Member Representatives Committee (MRC) Meeting
http://www.nerc.com/gov/bot/MRC/Pages/AgendaHighlightsandMinutes2013.aspx

February 5th	May 6th & 7th	August 13th & 14th
November 12th & 13th		

12.5 Board of Trustees (BOT) Meeting
http://www.nerc.com/gov/bot/Pages/Agenda-Highlights-and-Minutes-.aspx

February 6th	May 6th & 7th	August 13th & 14th
November 12& 13		

12.6 Reliability Issues Steering Committee (RISC)
http://www.nerc.com/comm/RISC/Pages/AgendasHighlightsandMinutes.aspx

February 13th - Call	March 19th - Meeting	April 9th - Call
May 7th - Meeting	June 17th - Meeting	June 10th - Call
August 14 - Meeting	September 12th - Meeting	October 7th – Call
November 13th - Meeting	December 2nd - Meeting	

13.0 NERC Compliance Tools (Since last RSC Meeting)

13.1 Compliance Analysis Reports (CARs)
http://www.nerc.com/pa/comp/Pages/Compliance-Analysis-Reports.aspx

13.1.1 There have not been any CARs posted since the last RSC meeting

13.2 Reliability Standard Audit Worksheets (RSAWs)
http://www.nerc.com/pa/comp/Pages/Reliability-Standard-Audit-Worksheets-(RSAWs).aspx

13.2.1 Four RSAWs have been issued since the last RSC meeting:

- FAC-003-3, Transmission Vegetation Management, issued 4/24/2014
- NUC-001-2.1, Nuclear Plant Interface Coordination, issued 4/24/2014
- PRC-001-1.1, System Protection Coordination, issued 4/24/2014
- PRC-005-1.1b, Transmission and Generation Protection System Maintenance and Testing, issued 5/15/2014

13.2.2 One RSAW has been posted for comment since the last RSC meeting:

- PRC-002-2, Disturbance Monitoring and Reporting Requirements, issued 6/6/2014

* Item in Meeting Material

13.3 Compliance Application Notices (CANs)
http://www.nerc.com/pa/comp/Resources/Pages/Compliance-Application-Notices.aspx

14.0 NERC Items of Interest (Since last RSC Meeting)

14.1 Lessons Learned
http://www.nerc.com/pa/rrm/ea/Pages/Lessons-Learned.aspx

14.1.1 Three Lessons Learned have been issued since the last RSC meeting:

- LL20140503 - Facilities Design, Commission, and Maintenance - Improved Contractor Oversight Needed

  Issued 5/20/2014

  Primary Interest Groups: Transmission Owners (TOs), Generator Owners (GOs), Generator Operators (GOPs), Distribution Providers (DPs)
- LL20140502 - Facilities Design, Commission, and Maintenance - Circuit Breaker Modification Leads to Inadvertent Trips

  Issued 5/20/2014

  Primary Interest Groups: Transmission Owners (TOs), Transmission Operators (TOPs), Generator Owners (GOs), Generator Operators (GOPs),
- LL20140501 - Relaying and Protection Systems - High AC Voltage can Lead to Remote Terminal Unit Failures

  Issued 5/20/2014

  Primary Interest Groups: Generator Owners (GOs), Generator Operators (GOPs), Transmission Owners (TOs), Transmission Operators (TOPs)

14.2 Alerts
http://www.nerc.com/pa/rrm/bpsa/Pages/Alerts.aspx

14.2.1 One NERC Alert has been released since the last RSC meeting:

- Industry Advisory: Elevated Risk due to large Scale Encryption Vulnerability
  Issued 4/11/14
  Responsible Entities: Balancing Authorities, Distribution Providers, Generator Operator, Generator Owner, Interchange Authority, Load Serving Entity, Planning Authority, Purchasing-Selling Entity, Reliability Coordinator, Resource Planner, Reserve Sharing Group, Transmission Owner, Transmission Operator, Transmission Planner, Transmission Service Provider.

14.3 Five Year ERO Performance Accessmenet

15.0 Other Items of Interest

15.1 NERC Reliability Leadership Summit – September 11, 2014, Washington, DC

15.2 NERC Fall Standards and Compliance Workshop – September 23-25, 2014, Atlanta, GA

* Item in Meeting Material

15.3 2015 Regional Entity Business Plans and Budgets

16.0 Future RSC Meetings and Conference Calls

16.1 RSC 2014 Meeting Dates

Feb. 19th – 20th, NextEra Energy Offices
April 10th & 11th, NPCC Offices
June 18th & 19th, Saratoga, NY
September 17th & 18th, Montreal, Quebec
December 4th & 5th, Halifax, Nova Scotia

Have a joint CC Meeting at Halifax?

16.2 RSC 2014 Conference Call Schedule (calls can be scheduled as needed)
all Calls are planned to start at 10:00 a.m. (call: 415-655-0003 (USA) / 416-915-6530 (Canada), Guest Code 29173141)

July 3	July 18	August 1
August 15	August 29	September 12
September 26	October 10	October 24
November 7	November 21	December 19

Respectfully Submitted,

Guy V. Zito, Chair RSC
Assistant Vice President-Standards
Northeast Power Coordinating Council, Inc.

* Item in Meeting Material

Northeast Power Coordinating Council, Inc. (NPCC)
Antitrust Compliance Guidelines

It is NPCC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. The antitrust laws make it important that meeting participants avoid discussion of topics that could result in charges of anti-competitive behavior, including: restraint of trade and conspiracies to monopolize, unfair or deceptive business acts or practices, price discrimination, division of markets, allocation of production, imposition of boycotts, exclusive dealing arrangements, and any other activity that unreasonably restrains competition.

It is the responsibility of every NPCC participant and employee who may in any way affect NPCC's compliance with the antitrust laws to carry out this commitment.

Participants in NPCC activities (including those participating in its committees, task forces and subgroups) should refrain from discussing the following throughout any meeting or during any breaks (including NPCC meetings, conference calls and informal discussions):

- Industry-related topics considered sensitive or market intelligence in nature that are outside of their committee's scope or assignment, or the published agenda for the meeting;
- Their company's prices for products or services, or prices charged by their competitors;
- Costs, discounts, terms of sale, profit margins or anything else that might affect prices;
- The resale prices their customers should charge for products they sell them;
- Allocating markets, customers, territories or products with their competitors;
- Limiting production;
- Whether or not to deal with any company; and
- Any competitively sensitive information concerning their company or a competitor.

Any decisions or actions by NPCC as a result of such meetings will only be taken in the interest of promoting and maintaining the reliability and adequacy of the bulk power system.
Any NPCC meeting participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NPCC's antitrust compliance policy is implicated in any situation should call NPCC's Secretary, Andrianne S. Payson at 212-335-4765.

NPCC REGIONAL STANDARDS COMMITTEE

AGENDA FOR MEETING #14-1
February 19, 2014, 10:00 a.m. - 5:00 p.m. EST
February 20, 2014, 8:00 a.m. - 3:00 p.m. EST
NextEra Energy, 700 Universe Boulevard, Juno Beach, FL
Attire: Business Casual
Dial-In: 415-655-0003 (USA) / 416-915-6530 (Canada) **Guest Code 29173141**

Note: For reference – Links to the Glossary of Terms Used in NERC Reliability Standards, updated February 13, 2014 and the NPCC Glossary of Terms, updated January 18, 2012, are provided here.

MEETING MINUTES

Attendees:

	Name	***Organization***	***Sector***	***Day(s)***	***Comment***
1.	*Kal Ayoub*	*FERC*	*Guest*	*1 & 2*	
2.	*Guy Zito*	*Northeast Power Coordinating Council*		*1 & 2*	
3.	*Lee Pedowicz*	*Northeast Power Coordinating Council*		*1 & 2*	
4.	*Gerry Dunbar*	*Northeast Power Coordinating Council*		*1 & 2*	
5.	*Damase Hebert*	*Northeast Power Coordinating Council*		*1*	*Part-time via phone*
6.	*Michael Lombardi*	*Northeast Power Coordinating Council*		*1 & 2*	
7.	*Peter Yost Sector 1 Proxy for Chris de Graffenried*	*Consolidated Edison Co. of NY, Inc.*	*1 / 3*	*1*	*via phone*
8.	*Ben Wu*	*Orange and Rockland Utilities*	*1*	*1 & 2*	
9.	*Si-Truc Phan Sector 1 Proxy for Sylvain Clermont*	*Hydro Québec TransÉnergie*	*1 / 2*	*1 & 2*	
10.	*Brian Shanahan*	*National Grid*	*1*	*1 & 2*	
11.	*Alan MacNaughton*	*New Brunswick Power Transmission*	*1*	*1 & 2*	*via phone*
12.	*Mark Kenny*	*Northeast Utilities*	*1*	*1 & 2*	*via phone*
13.	*Ayesha Sabouba*	*Hydro One Networks Inc.*	*1*	*1 & 2*	*via phone*
14.	*Helen Lainis*	*Independent Electricity System Operator*	*2*	*1*	*via phone*
15.	*Kathleen Goodman*	*ISO-NE*	*2*	*1 & 2*	*via phone*
16.	*Jim Grant Proxy for Greg Campoli*	*New York Independent System Operator*	*2*	*1 & 2*	*via phone*
17.	*Michael Jones*	*National Grid*	*3*	*1 & 2*	
18.	*Thomas Neglia Proxy for David Burke*	*Orange and Rockland Utilities, Inc.*	*3*	*1*	*via phone*

DRAFT

	Name	*Organization*	*Sector*	*Day(s)*	*Comment*
19.	*Mike Garton*	*Dominion Resources Services, Inc.*	*4*	*1 & 2*	
20.	*Silvia Parada Mitchell*	*NextEra Energy, LLC*	*4*	*1 & 2*	
21.	*Herb Schrayshuen*	*Power Advisors, LLC – Proxy for NextEra Energy, LLC*	*4*	*1 & 2*	*via phone*
22.	*Bruce Metruck Sector 4 Proxy for Wayne Sipperly*	*New York Power Authority*	*4 / 5*	*1 & 2*	
23.	*Brian Robinson*	*Utility Services*	*5*	*1 & 2*	
24.	*Vijay Puran*	*NYS Department of Public Services*	*6*	*1 & 2*	*via phone*
25.	*Don Nelson*	*Massachusetts DPU*	*Guest*	*2*	*via phone*
26.	*Don Weaver*	*New Brunswick Energy and Utilities Board*	*Guest*	*1 & 2*	
27.	*Ron Falsetti*	*AESI*	*Guest*	*1*	
28.	*Jack Ng*	*Consolidated Edison Co. of NY, Inc.*	*Guest*	*1 & 2*	*via phone*
29.	*Franck Leblanc*	*Florida Power & Light Company*	*Guest*	*1 & 2*	
30.	*Mike O'Neil*	*Florida Power & Light Company*	*Guest*	*1*	*Part-time*
31.	*Edina Bajrektarevic*	*NextEra Energy, LLC*	*Guest*	*1*	*Part-time*

Introductions and Chair's Remarks

- Guy Zito called the meeting to order at 10:00 AM on Wednesday February 19, 2014. [Subsequent technical delays with the phone line postponed the start of the meeting to 10:15AM]

NPCC Antitrust Compliance Guidelines**

- NPCC Antitrust Compliance Guidelines were read.

Agenda Items:

1.0 Review of Agenda

- The review of the agenda resulted in the addition of: 1) Project 2007-06 - System Protection Coordination PRC-027-1, under Agenda Item 10.0 RSC Member Items of Interest; 2) Project 2010-01 - Training under Agenda Item 11.0, Standards Activity Post NERC BOT Approval

2.0 RSC Meeting Minutes

2.1 Approval of Minutes: December 5 & 6, 2013 RSC Meeting #13-6**

- The December 2013 meeting minutes were reviewed. A motion was made and seconded (by Mike Garton and Silvia Parada Mitchell, respectively) to approve the minutes as written. The motion passed.

3.0 Drafting Team Members and Executive Tracking Summary

3.1 NPCC Members on NERC Drafting Teams**

- The spreadsheet of NPCC Members on NERC Drafting Teams was reviewed. It was noted that the spreadsheet was unchanged since the last RSC meeting; however, the NERC Standards Committee (SC) has recently approved the drafting team recommendations for the CIP V5 and Dispersed Generation teams. Both the CIP V5 and Dispersed Generation teams have NPCC representation. The spreadsheet of NPCC Members on NERC Drafting Teams will be updated accordingly.

3.2 Executive Tracking Summary**

- The NERC Executive Tracking Summary (ETS) spreadsheet was reviewed. Updates to the spreadsheet, since the last RSC meeting were related to:

- *NERC Reliability Standards*
- *NERC RSAWs*
- *NPCC Regional Reliability Standards*
- *NPCC Directory Tracking*

3.3 NERC Project Tracking Spreadsheet (*link*)

- A link to the PMOS Project Tracking Spreadsheet was included for information.

4.0 Open Action Items**

- The Open Action Items from previous RSC meetings were reviewed and status updates provided.

- *Item 4.1, "Coordination with the Compliance Committee to develop Joint Activity Action List"*
  - No joint items requiring a combined Compliance Committee and Regional Standards Committee meeting were identified.
- *Item 4.2, "New York Adoption of More Stringent/Specific NPCC Criteria - determine more stringent criteria and submit filing"*
  - NPCC Legal is currently working on the filing and anticipates the submittal no later than the April RSC Meeting.
- *Item 13-5.6,* "NPCC outreach program development – discussion item: members provide input and opportunities for development of an outreach program"
  - Ongoing: A meeting with NYPA is scheduled in March 2014
- *Item 13-6.1 "Research the use of Google Docs"*
  - Completed - The use of Google Doc as a collaboration tool for the development of comment forms for NERC Reliability Standards was discussed. The information provided was useful but it was determined that no action will be taken at this time to change the current process.
- *Item 13-6.2 "Revise Ballot History Spreadsheet to include record of how NPCC voted"*
  - Completed

5.0 Items Requiring RSC Discussion / Approval

5.1 NPCC Regional Standard Processes Manual (RSPM)

- It was reported that the ballot of the NPCC Regional Standard Processes Manual (RSPM) passed. The next step is to present the RSPM to the NPCC Board for approval in March 2014.

5.2 Standards Outreach

- This item was discussed under Agenda Item 4.0, "Open Action Items" - specifically, Open Action Item 13-5.6. As noted, a meeting at NYPA is scheduled in March 2014.

6.0 NERC Reliability Standards

http://www.nerc.com/pa/Stand/Pages/Standards-Under-Development.aspx

6.1 Currently Posted Projects

Project	Comment Period	Ballot Period	Call-In
2014 Work Plan for NERC Reliability Standards Development	2/6/14 – 2/21/14 (I)		11:00 AM
Project 2010-17 - Definition of Bulk Electric System (Phase 2) – Reference Document	1/29/14 – 2/27/14 (I)		11:15 AM

Project	Comment Period	Ballot Period	Call-In
Project 2010-05.1 - Protection System: Phase 1 (Misoperations) – PRC-004-3	1/16/14 - 3/3/14 (F)	2/21/14 – 3/3/14 (A)	10:30 AM
Project 2012-13 - NUC - Nuclear Plant Interface Coordination – NUC-001-2.1 SAR	2/12/14 – 3/13/14 (I)		10:45 AM
Project 2007-17.3 - Protection System Maintenance and Testing - Phase 3 (Sudden Pressure Relays) - PRC-005-4	2/13/14 – 3/14/14 (I)		
Project 2010-04 Demand Data (MOD C) – MOD-031-1	2/14/14 – 3/20/14	3/11/14 – 3/20/14 (A)	11:30 AM
2010-14.2 - Phase 2 of Balancing Authority Reliability-based Control; Time Error, AGC, and Inadvertent: BAL-004, BAL-005-0.1b, BAL-006-2	Future		11:45 AM

- The currently posted continent-wide projects were addressed used a two pronged approach. On day one of the RSC meeting the NERC Standards Developers called into the meeting to provide an overview of the currently posted projects and to field questions from the RSC members. On day two of the RSC meeting, the currently posted continent-wide projects were discussed by the RSC along with a review of the comments forms and all comments received by NPCC to date. Based on RSC comments, Lee Pedowicz added responses to the appropriate Comment Forms. Comments will be finalized and submitted to NERC.

- *2014 Work Plan for NERC Reliability Standards Development*
  - 2014 Work Plan is a Project Management Tool. It currently captures "what we know" but is meant to be a dynamic living tool to which new projects can be added.
  - TPL Directives may not move forward – when more data becomes available in January 2017, NERC will evaluate the additional data
  - A Projected Posting Schedule is available on the NERC Standards web page
- *Project 2010-17 - Definition of Bulk Electric System (Phase 2) – Reference Document*
  - The Phase 2 Reference Document is meant to assist the industry with the application of the revised BES definition.
  - Follow up with Drafting Team to identify established set of criteria for when an entity can request an exclusion and what should be provided ***[Action]***
- *Project 2010-05.1 - Protection System: Phase 1 (Misoperations) – PRC-004-3*
  - NERC Standards Developer confirmed an RSC member's observation that composite protection could result in reduced reporting of misoperations. Specifically, the application of composite protection would mean a failure of the primary protection would not be reported as a misoperation if the backup protection functioned properly.
- *Project 2012-13 - NUC - Nuclear Plant Interface Coordination – NUC-001-2.1 SAR*
  - Periodic review of NUC-001 recommended revisions to provide greater clarity and to sharpen industry focus on tasks that have a more direct impact on reliability. The proposed changes are intended to reduce administrative burden, add clarity, remove redundancy, and bring compliance elements in accordance with NERC guidelines. An RSC member indicated that the associated implementation plan should take into account the time needed to revise the agreements between the Transmission Entities and the nuclear plants.
- *Project 2007-17.3 - Protection System Maintenance and Testing - Phase 3 (Sudden Pressure Relays) - PRC-005-4*

- Comments were reviewed and discussed. Prior to submittal to NERC, the RSC will forward the comments to TFSP for its review

- *Project 2010-04 Demand Data (MOD C) – MOD-031-1*
  - The RSC Agenda incorrectly identified this project as currently posted. Although not currently posted, this project will be posted soon.
  - The NERC Standards Developer gave a brief overview of pending changes
- *2010-14.2 - Phase 2 of Balancing Authority Reliability-based Control; Time Error, AGC, and Inadvertent: BAL-004, BAL-005-0.1b, BAL-006-2*
  - This project is not currently posted.
  - The NERC Standards Developer gave a brief overview of pending changes

6.2 Ballot History (Since last RSC Meeting)**

- Ballot History spreadsheet was included in the meeting materials for information. As discussed under Agenda Item 4.0, "Open Action Items," a new column has been added to the spreadsheet to identify how NPCC voted.

- The RSC indicated that prior to a final ballot; a ballot position does not need to be disseminated if the prior ballot position is unchanged.

- It was indicated that NPCC will vote in support of NERC standards unless there is a deal breaker identified

6.3 Comment Form History (Since last RSC Meeting)**

- Comment Form History spreadsheet was included in the meeting materials for information.

6.4 Project 2007-11 Disturbance Monitoring – PRC-002-2

- Drafting Team is currently responding to comments received from the prior posting and should be done in the next couple of weeks. The guidelines and implementation plan will be changed. A 45 comment period is expected to begin in mid-April and will have an associated ballot period at the end.

- CEAP report is currently being developed with the intent of having it completed prior to the next posting. A second CEAP posting is not expected as significant changes to the standard have not been identified.

- The standard is about capturing data and getting results and not about the equipment. Some push back on DDRs for generator has been received. If the Transmission Owner is capturing data on a nearby bus then the Generator Owner does not have to. A suggestion was made by an RSC member that the RSAW address and clarify this issue for the generators.

- The necessity to revise or retire the NPCC Regional Standard will be made once the continent-wide standard is finished

7.0 NERC Drafting Team Nominations

http://www.nerc.com/pa/Stand/Pages/Drafting-Team-Vacancies.aspx

7.1 Currently Posted Drafting Team Vacancies

7.1.1 None at this time

7.2 Closed Drafting Team Nominations (Since last RSC Meeting)

7.2.1 Project 2010-02 - Connecting New Facilities to the Grid (Implement FAC Five-Year Review Recommendations)

7.2.2 Project 2010-05.2 - Protection Systems – Special Protection Systems (SPS)

- Proposed under this project is the expansion from 3 types to 4 types of Special Protection Systems. It was noted that the RSC should follow this closely.

7.2.3 Project 2010-13.3 - Relay Loadability – Stable Power Swings
7.2.4 Project 2014-01 - Standards Applicability for Dispersed Power Producing Resources
7.2.5 TOP/IRO Revisions
7.2.6 CIP Version 5 Revisions

- *As discussed under Agenda Item 4.0, "Open Action Items," the NERC Standards Committee (SC) has recently approved the drafting team recommendations for the Dispersed Generation (Item 7.2.4) and CIP V5 (Item 7.2.6) teams*

7.3 Solicitation For Informal Development Teams

7.3.1 None at this time

8.0 NPCC Regional Reliability Standards**

https://www.npcc.org/Standards/default.aspx

8.1 Current Activities: Regional Standards

- *There are not any Regional Standards currently in active development*

8.2 Current Activities: Regional Standard Interpretations

- *There are no outstanding Regional Standard Interpretations*
- *At the RSC meeting it was noted that the Compliance Clarification for PRC-002-NPCC-01 has been received and will be posted to the NPCC web site. Subsequent to the meeting the clarification was posted and can be found under Standards - PRC-002-NPCC-01 Regional Standard Clarifications & Interpretations*

9.0 NPCC Non-Standards**

https://www.npcc.org/Standards/SitePages/NonStandardsList.aspx

9.1 Directories In Development

- *Gerry Dunbar provided updates for Directories 1, 3, 9 and 10:*
  - *Directory#1 --- Posted to the Open Process for 45 days concluding on Jan. 25th, 2014. Combined working group of the CP11 and CO7 have reconvened on behalf of the TFCO and TFCP to consider comments and draft responses.*
  - *Directory#3 --- TFSP has completed its comparison of the FERC approved PRC-005-2 Protection System Maintenance standard with Directory #3 and has determined that the standard is sufficiently comprehensive to allow Directory #3 to be retired without creating a reliability gap. TFSP is finalizing its recommendation and will be posting Directory#3 to the Open Process to receive comments on its proposal in accordance with the NPCC Directory Manual.*
  - *Preliminary comparison of D#9/ D#10 and NERC BOT approved MOD-025-2 complete. Pending TFCO formal review.*
- *As indicated by the NPCC Board, the consideration of cost effectiveness should be extended to include Directories. Revise the Directory Development Manual to address cost effectiveness **[Action]***

9.2 Directory Interpretations

- *There are no outstanding Directory Interpretations*

9.3 Criteria (A) / Guides (B) / Procedures (C) Documents

- *The following (C) Documents were retired by TFCO in December 2013:*
  - *C-05 Monitoring Procedures for Emergency operations Criteria*
  - *C-07 Monitoring Procedures for the Guide for Rating Generating Capability*

- *C-21 Monitoring Procedures for Conformance with Normal and Emergency Transfer Limits*
- *C-44 Regional Methodology and Procedures for Forecasting TTC and ATC*

10.0 RSC Member Items of Interest

- Information on the following topics can be found in the meeting materials, the links provided and additional notes provided herein.

10.1 2014 NERC Standards Committee Overview**

10.2 NPCC and ERO 2015 Business Plan and Budget Preparation Schedule**

10.3 Cybersecurity Capability Maturity Model**

- The RSC was introduced to the Cybersecurity Capability Maturity Model (aka C2M2) which was developed in support of a White House initiative led by the DOE. The model is included in the meeting material.

- In addition, it was noted that the Department of Homeland Security announced the creation of the Critical Infrastructure Cyber Community "C³" [pronounced C-Cubed] Voluntary Program. This program is an innovative public-private partnership designed to help align critical infrastructure owners and operators with existing resources that will assist their efforts to adopt the Cybersecurity Framework and manage their cyber risks. The C³ Voluntary Program emphasizes three C's:

- *Converging critical infrastructure community resources to support cybersecurity risk management and resilience through use of the Framework;*
- *Connecting critical infrastructure stakeholders to the national resilience effort through cybersecurity resilience advocacy, engagement and awareness; and*
- *Coordinating critical infrastructure cross sector efforts to maximize national cybersecurity resilience.*

To learn more about the C³ Voluntary Program, visit: http://www.dhs.gov/ccubedvp

10.4 NPCC Board of Directors Policy Input**

10.5 NERC Standards Balloting System**

- NERC is rolling out a new Standards Balloting System (SBS). During the transition period from the current to the new system:

- *Ongoing projects will be balloted in the current system*
- *Once available, the new SBS will be used for new and future projects (This will result in the old and new ballot systems being used concurrently until the projects are currently ongoing are completed or retired.)*

10.6 Events Analysis "Lessons Learned" Template**

- NPCC has created a new Events Analysis "Lessons Learned" Template. The RSC reviewed the new template along with previous recommendations made by TFSP

- Recommend that comments note the process surrounding the form is not clear

10.7 NERC TOP/IRO Technical Conference – St. Louis, MO & Washington, DC

10.8 NERC created Word .doc version of the EOP-004-2 Attachment 2: Event Reporting Form

- Additional Items discussed:

10.9 Guy Zito is working with NERC on a potential revision to the NERC Interpretation process that could result in NERC adoption of a Clarification process.

10.10 NERC posted a Loss of Generator Guideline for comment. The RSC will not be submitting comments on the Guideline.

10.11 Concerns were raised regarding Project 2007-06 - System Protection Coordination PRC-027-1. For example, there were concerns regarding: coordination between entities; tracking and notification of 10% or greater change in fault current at an interconnecting bus; need for a common tool to facilitate data exchange. The specific concerns were emailed to the RSC during the meeting. These concerns will be shared with the Standard Drafting Team. ***[Action]***

11.0 <u>Standards Activity Post NERC BOT Approval</u>**

(Since last RSC Meeting)

- Damase Hebert reviewed the standards activities, post NERC BOT approval, which has transpired since the last RSC meeting. The review of NERC Filings to FERC included:

- *Petition of NERC for Approval of Proposed Reliability Standard PRC-005-3 (Protection System Maintenance), one new (Automatic Reclosing) and five revised definitions (Unsolved Maintenance Issue, Segment, Component Type, Component, and Countable Event), the implementation plan for PRC-005-3 and the Violation Factors (VSFs) and the revised Violation Severity Levels (VSLs).*
- *Petition of NERC for Approval of Reliability Standard MOD-001-2 and Retirement of Reliability Standards MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-1a, and MOD-030-2. NERC also requests approval of (1) the associated implementation plan (2) the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs), and (3) the proposed retirement of Reliability Standards MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-1a, and MOD-030-2.*
- *Reply Comments of NERC on BES Phase 2 Proceeding in which NERC responded to comments submitted by the Electricity Consumers Resource Council, American Forest & Paper Association, Council of Industrial Boiler Owners and American Fuel & Petrochemical Manufacturers (collectively, "ELCON"), First Wind Holdings, LLC Wind Holdings, LLC ("First Wind"), and the American Wind Energy Association ("AWEA").*

- The review of FERC Orders included:

- *Order on Motion to Defer Action on Notice of Proposed Rulemaking. FERC issues an order granting the motion to defer action on the Notice of Proposed Rulemaking (NOPR) in connection with the revisions to the Transmission Operations (TOP) and Interconnection Reliability Operations and Coordination (IRO) Reliability Standards until January 31, 2015.*
- *Notice of Proposed Rulemaking to Approve EOP-010-1 Geomagnetic Disturbance Operations. FERC issues a Notice of Proposed Rulemaking (NOPR) proposing to approve Reliability Standard EOP-010-1 (Geomagnetic Disturbance Operations).*
- *Order No. 794 Approving Reliability Standard BAL-003-1 (Frequency Response and Frequency Bias Setting). FERC issues a final rule approving the Reliability Standard BAL-003-1 (Frequency Response and Frequency Bias Setting).*
- *Order No. 793 Final Rule Approving Protection System Maintenance Reliability Standard. FERC issues a final rule approving NERC's revised Reliability Standard, PRC-005-2 (Protection System Maintenance), which will supersede four existing Reliability Standards, PRC-005-1.1b (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance), PRC-011-0 (Undervoltage Load Shedding*

Equipment Maintenance), and PRC-017-0 (Special Protection System Maintenance and Testing).

- *Rehearing Requests of Interest were reviewed regarding the CIP 5 requests filed in mid-December 2013, specifically*
  - *Utility Services requests that FERC clarify that the implementation periods (24 and 36 months) start after the effective date of the standard on April 1, 2016. In the alternative, Utility Services requests that FERC clarify that the implementation plan for entities without applicability under CIP V3 Reliability Standards and entities with potential for Low Impact assets starts after the CIP V5 Reliability Standards become effective.*
  - *EEI and EPSA request clarification with respect to FERC's directive to request NERC to conduct a survey and to submit an informational filing within one year regarding cyber assets included or excluded under the new BES Cyber Asset definition, including its "15 minute parameter."*
  - *EEI and EPSA seek clarification on the effective date. Both the NERC petition and the FERC Order use the terms "issued" and "effective date of order." This means that the effective date for implementation could be either January 1, 2016 or April 1, 2016. EEI and EPSA seek clarification.*
  - *EEI and EPSA state that the April 1, 2017 effective date for low assets was based on the 36 month implementation period but did not take into account the additional directives made by the Commission related to low impact assets. EEI and EPSA state that such an effective date may or may not be reasonable, but it is impossible to tell at this point because the record is still being developed. Therefore, they request a stay on any determination of the effective date for low assets pending NERC's filing in response to the FERC directives.*
  - *APPA and NRECA request FERC to clarify how entities can address day 1 compliance in view of the FERC's directive to address the identify, assess, and correct language. They argue that it is conceivable if not likely that CIP version 5 will become mandatory and enforceable before revised standards that address the Commission's directive have been completed and approved. The question whether entities should assume IAC isn't there or request FERC to provide more guidance on what IAC means, even temporarily*

11.1 NERC Filings to FERC
http://www.nerc.com/FilingsOrders/Pages/default.aspx

11.2 FERC Orders / Rules
http://www.nerc.com/FilingsOrders/Pages/default.aspx

11.3 Federal Register
https://www.federalregister.gov/

- *Project 2010-01, Support Personnel Training (PER-005-2) was NERC BOT approved on 2/6/14. An RSC member indicated that "independently" should be added when referring to operations. A request was made that the NOPR (when issued) be circulated to the RSC and this concern be followed up on.*

12.0 NERC Meetings

12.1 Standards Committee (SC)
http://www.nerc.com/comm/SC/Pages/default.aspx

January 15th - Meeting	January 29th - Call	February 12th - Call
March 12th & 13th - Meeting	April 9th - Call	May 14th - Call
June 10th & 11th - Meeting	July 16th - Call	August 20th - Call
September 23rd & 24th Meeting	October 22nd - Call	November 19th - Call
December 9th & 10th - Meeting		

12.2 Standards Committee Process Subcommittee (SCPS)
http://www.nerc.com/comm/SC/Pages/Standards%20Committee%20Process%20Subcommittee%20SCPS/Standards-Committee-Process-Subcommittee-SCPS.aspx

February 6th & 7th	March 12th & 13th	June 10th & 11th
September 23rd & 24th		

12.3 Standards Committee Project Management and Oversight Subcommittee (PMOS)
http://www.nerc.com/comm/SC/Pages/ProjectManagementandOversightSubcommittee(PMOS).aspx

February 21st - Call	February 28th - Meeting	April 17th - Meeting

12.4 Member Representatives Committee (MRC) Meeting
http://www.nerc.com/gov/bot/MRC/Pages/AgendaHighlightsandMinutes2013.aspx

February 5th	May 7th & May 8th	August 13th & 14th
November 12th & 13th		

12.5 Board of Trustees (BOT) Meeting
http://www.nerc.com/gov/bot/Pages/Agenda-Highlights-and-Minutes-.aspx

February 6th	May 6th & 7th	August 13th & 14th
November 12& 13		

12.6 Reliability Issues Steering Committee (RISC)
http://www.nerc.com/comm/RISC/Pages/AgendasHighlightsandMinutes.aspx

February 13th - Call	March 19th - Meeting	April 9th - Call
May 7th - Meeting	June 17th - Meeting	June 10th - Call
August 14 - Meeting	September 12th - Meeting	October 7th – Call
November 13th - Meeting	December 2nd - Meeting	

13.0 NERC Compliance Tools (Since last RSC Meeting)

13.1 Compliance Analysis Reports (CARs)
http://www.nerc.com/pa/comp/Pages/Compliance-Analysis-Reports.aspx

13.1.1 There have not been any CARs posted since the last RSC meeting

13.2 Reliability Standard Audit Worksheets (RSAWs)
http://www.nerc.com/pa/comp/Pages/Reliability-Standard-Audit-Worksheets-(RSAWs).aspx

13.2.1 There have not been any RSAWs issued since the last RSC meeting

- *Follow up with NERC on current RSAW development process* ***[Action]***

14.0 NERC Items of Interest (Since last RSC Meeting)

14.1 Lessons Learned
http://www.nerc.com/pa/rrm/ea/Pages/Lessons-Learned.aspx

14.1.1 There have not been any Lessons Learned published since the last RSC Meeting

14.2 Alerts
http://www.nerc.com/pa/rrm/bpsa/Pages/Alerts.aspx

14.2.1 There have not been any NERC Alerts released since the last RSC meeting

15.0 Other Items of Interest

15.1 NERC-Led CIP Version 5 Technical Conferences were held January 21, 2014 and January 23, 2014

15.2 NERC State of Standards was held January 30, 2014

15.3 NERC Spring Standards and Compliance Workshop – April 1-3, 2014, San Diego, CA (Registration) (Details)

- *Subsequent to the RSC meeting, the NERC Announcement was issued to which provided the hotel registration, meeting agenda and additional meeting details for the Workshop. The Announcement was distributed to the RSC email list and is also available on the NERC web site at: http://www.nerc.com/pa/Stand/Pages/Workshops.aspx*

15.4 NERC Reliability Leadership Summit – September 11, 2014, Washington, DC

15.5 NERC Fall Standards and Compliance Workshop – September 23-25, 2014, Atlanta, GA

- *Added:*

15.6 Added: NPCC Spring Compliance and Standards Workshop – May 28-30, 2014, Cooperstown, NY

16.0 Future RSC Meetings and Conference Calls

16.1 RSC 2014 Meeting Dates

Feb. 19th – 20th, NextEra Energy Offices
April 10th & 11th, NPCC Offices
June 18th & 19th, Saratoga, NY
September 17th & 18th, Montreal, Quebec
December 4th & 5th, Halifax, Nova Scotia

16.2 RSC 2014 Conference Call Schedule
all Calls are planned to start at 10:00 a.m. (call: 415-655-0003 (USA) / 416-915-6530 (Canada), Guest Code 29173141)

February 28	March 14	March 28
April 11	April 25	May 9
May 23	June 6	June 20
July 3	July 18	August 1
August 15	August 29	September 12
September 26	October 10	October 24
November 7	November 21	December 5
December 19		

- *The meeting adjourned at 10:50 AM on Thursday February 20, 2014. RSC Members were invited to stay for the 11:00 AM Industry Webinar regarding Project 2010-05.1 Protection Systems: Misoperations*

Respectfully Submitted,

Guy V. Zito, Chair RSC
Assistant Vice President-Standards
Northeast Power Coordinating Council, Inc.

Source = NERC Standard Drafting Team Rosters - March 2014

Change Control: Changes Since March 2014:

Projects Removed:

1. Project 2010-13.2, Phase 2 of Relay Loadability: Generation

Projects Added:

1. Project 2014-04, Physical Security

NPCC Representative Changes:

1. Project 2010-17, Removed Jennifer Dering as the NPCC Representative as she is no longer at NYPA
2. Project 2012-13, Added Kevin Donnelly, Con Edison, as the NPCC Representative
3. Project 2014-03, Added Kyle Russell, IESO, as the NPCC Representative
4. Project 2014-04, Added Kathy Judge, National Grid, as the NPCC Representative

NPCC Directory Executive Tracking Summary

Revised: 12/11/2013 Further details regarding the individual documents may be found at: https://www.npcc.org/Standards/SitePages/NonStandardsList.aspx

Line No.	Document	Developed From	Title of Directory	Phase	Task Force Review	Posted Open Process?	RCC Approval?	Full Membership Ballot?	Comments	Status
1	Directory #1	Criteria A-2	Design and Operation of the Bulk Power System		TFCP(CP11) and TFCO (CO7)	Yes (Posted thru 1/25/14)				Open Process x
2	Directory #2	Criteria A-3	Emergency Operations		TFCO					Phase 2 reformatting pending TFCO resources.
3	Directory #3	Criteria A-4	Maintenance Criteria for Bulk Power System Protection		TFSP					TFSP to identify differences/gaps between Directory #3 and draft revised PRC-005 and evaluate impact of retiring Directory #3 – pending FERC approval of PRC -005-2
4	Directory #4	Criteria A-5	Bulk Power System Protection Criteria		TFSP				Open Process posting expected in 2013.	TFSP currently reviewing D#4.
5	Directory #5	Criteria A-6	Reserve		TFCO				Revisions to Version 0 of Directory #5 approved by the NPCC Full Members in October 2012.	
6	Directory #6		Regional Reserve Sharing	1/2/1900				Passed 04/09/2012	Directory #6 approved by the NPCC Full Members in Phase 2 format in April 2012.	
7	Directory #7	Criteria A-11	Special Protection Systems		TFSP			Passed 7/9/2013	TFSP Revisions.	
8	Directory #8	Criteria A-12	System Restoration		TFCO					TFCO working group CO11 reviewing initial Phase 2 draft of Directory #8.
9	Directory #9	Criteria A-13	Verification of Generator Gross and Net Real Power Capability	1/2/1900	TFCO			Passed 12/28/11	Directory#9 Phase 2 reformatting complete December 2011.	
10	Directory #10	Criteria A-14	Verification of Generator Gross and Net Reactive Power Capability	1/2/1900	TFCO			Passed 12/28/11	Directory#10 Phase 2 reformatting complete December 2011.	
11	Directory #11									
12	Directory #12		Under frequency Load Shedding Program Requirements		TFSS			Passed 7/9/2013	TFSS Revisions	Directory#12 will be retired once PRC-006-NPCC-1 is fully implemented.
13	Manual		Directory Development and Revision Manual			Yes (Posted thru 9/29/13)			Comment Response Document posted publicly on 11/12/13.	Open Process x

NPCC Directory Interpretations

Revised: 10/25/2013 Further details regarding the individual documents may be found at: https://www.npcc.org/Standards/Directory%20Interpretations/Forms/Public%20List.aspx

Line No.	Document	Title of Directory	Date Final	Task Force Review	Posted Open Process?	RCC Approval?	Full Membership Ballot?	Comments	Status
1	Directory #8 Interpretation	System Restoration	6/18/2012	TFCO	N/A		N/A	Interpretation on behalf of the NYSRC	Complete
2	Directory#3 Interpretation	Maintenance Criteria for Bulk Power System Protection	8/28/2012	TFSP	N/A		N/A	Interpretation on behalf of Bangor Hydro	Complete
3	Directory #3 Interpretation	Maintenance Criteria for Bulk Power System Protection	12/14/2012	TFSP	N/A		N/A	Interpretation on behalf of Con Ed	Complete
4	Directory #3 Interpretation	Maintenance Criteria for Bulk Power System Protection	2/15/2013	TFSP	N/A		N/A	Response Clarified - Interpretation on behalf of Acumen Engineered Solutions	Complete
5	Directory#3 Interpretation	Maintenance Criteria for Bulk Power System Protection	10/25/2013	TFSP	N/A		N/A	Interpretation on behalf of Hydro One Networks	
6	Directory#3 Interpretation	Maintenance Criteria for Bulk Power System Protection		TFSP	N/A		N/A	Interpretation on behalf of IESO	Pending TFSP Review

Quarterly Application to the Nova Scotia Utility and Review Board (NSUARB) for Approval of NPCC Regional Reliability Criteria

Revised: **8/13/2013**

Line No.	Filing Period	Filing Due	Filing Submitted	Comments
1	October 1 to December 31, 2012	3/1/2013	3/1/2013	This filing is NPCC's initial quarterly filing covering the October 1 to December 31, 2012 period and covers the changes to the NPCC Criteria as a result of voting by the Full Members of NPCC.
2	January 1 to March 31, 2013	6/1/2013	N/A	No changes were made during the refeenced period which required filing.
3	April 1 to June 30, 2013	9/1/2013	N/A	No changes were made during the referenced period which required filing.
4	July 1 to September 30, 2013	12/1/2013	N/A	Revisions to D#7 and D#12 approved by the Full Members on 7/9/2013.
5	October 1 to December 31, 2013	3/1/2014	N/A	

Milestone Keys:

IC- Initial Comment
IB- Initial Ballot
AB - Additional Ballot
PB- Presented to BOT
F-Projected filing with
FERC
EVRP- Five-year Review Posting
FYRR - Five-year Review Recommendation to SC

Project Off Schedule by Two or more Quarters
No Development Work in Progress

Project Tracking Spreadsheet: 2014 Project Work Plan (Status Updated: 3/11/2014)

This worksheet displays estimates of anticipated standards development milestones for projects in 2014, and it is intended to be a project management tool for use in tracking the status of projects under development compared to their anticipated milestones. Detailed information for each project is available from their respective project pages on the NERC website. Projects that remained from 2013's Project Tracking Spreadsheet that were not prioritized in the RSDP, but that are continuing beyond the first quarter of 2014, are also represented here. Projects not anticipated to continue beyond the first quarter of 2014 are not included (information for those projects remains available under the "Standards Under Development" page on the NERC website). Note that projects listed here represent known projects for 2014. As facts and circumstances warrant, it may be necessary to update this tool, and additional projects may be added in response to regulatory directives, input from RISC, or to meet goals of the NERC strategic plan.

Projected Posting Schedule

The above is a link to the schedule of upcoming postings, which is updated weekly. It includes near term posting projections.

Project Number	Activity/Project (Project Names Hyperlinked to Project Page)	Deliverable	Deadline, if any	Priority in 2014-2016 RSDP, if applicable (see Note 1, below)	2013 PRI Resp	Number of Directives	# of Guidances (see Note 2)	Comments	PMOS Liaison	NERC Contact	Status: Green, Yellow, Red	Milestones: Planned vs. Actual/Projected (See Notes 3 and 4)
2007-06	System Protection Coordination	PRC-003, PRC-027		N/A		1			Jennifer Sterling	Al McMeekin	Project extended to address an additional issue by FERC	Plan
												Actual/Projected
2007-11	Disturbance Monitoring	PRC-002, PRC-018		Medium	2		1		Guy Zito	Steve Crutchfield		Plan
												Actual/Projected
2007-17.3	Protection System Maintenance: Sudden Pressure Relays	PRC-005-4		Pending Prioritization in 1Q 2014	1	1			Charles Yeung	Jordan Mallory		Plan
												Actual/Projected
2008-02	Undervoltage Load Shedding	PRC-010, PRC-022		High	2	1	1		Jennifer Sterling	Erika Chances	Delayed to coordinate with the development of the SPS definition	Plan
												Actual/Projected
2009-02	Real-time Reliability Monitoring and Analysis Capabilities	New Standards	January 31, 2015 deadline to address concerns in NOPR proposing to remand TOP/IRO standards	High		3			Jennifer Sterling	Ed Dobrowolski		Plan
												Actual/Projected
2009-03	Emergency Operations	EOP-001, EOP-002, EOP-003		High	14	3	2		Gary Kruempel	Laura Anderson	Delayed to coordinate with PER-5 batching	Plan
												Actual/Projected
2010-02	Connecting new facilities to the grid/Five-year Review of FAC standards	FAC-001, FAC-002		Low		1	1	Standards that were affirmed during FYR were presented to the Board in Q1 2014. Standards recommended for revision are continuing development in 2014.	Ken Goldsmith	Mallory Huggins		Plan
												Actual/Projected
2010-03	Demand Data (MOD-C)	MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021		N/A	10	10	4	The project received a 57.59% approval on its second ballot. The SDT is reviewing industry comments.	Scott Miller	Darrel Richardson		Plan
												Actual/Projected
2010-05.1	Phase 1 of Protection Systems - Misoperations	PRC-003, PRC-004		N/A			2		Jennifer Sterling	Scott Barfield		Plan
												Actual/Projected
2010-05.2	Special Protection Systems: Phase 2 of Protection Systems	PRC	Self-imposed deadline for definition of SPS is February 2015 for coordination with other PRC projects.	Medium				Additional BOT milestone added. First is for definition of SPS; the second is for the standards.	Matt Morais	Al McMeekin		Plan
												Actual/Projected
2010-13.3	Relay Loadability Stable Power Swings	PRC	December 31, 2014 deadline to address phase 3 directives covered by this project	Pending Prioritization in 1Q 2014				The technical committee provided a report, but the project has not yet been evaluated for prioritization.	Charles Lyne	Scott Barfield		Plan
												Actual/Projected
2010-14.1	NAMC Directives and Issues-Project 2010-14.1 Balancing Authority Reliability-based Controls	BAL-001, BAL-002, BAL-013		N/A	4				Ron Parsons	Darrel Richardson	Project extended to address an additional issue raised by FERC	Plan
												Actual/Projected
2010-14.2	Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent	BAL-004, BAL-005-0.1b, BAL-006-2		Medium	11	7	6	Periodic review project delayed for completion of Project 2014-01.1 due to limited subject matter experts in BAL standards	Ken Goldsmith	Sean Cavote		Plan
												Actual/Projected
2012-09	Implementation of IRO Review Recommendations	IRO-003, IRO-004, IRO-008, IRO-009, IRO-010		Medium	2	2			Brian Murphy	Soo Jin Kim		Plan
												Actual/Projected
2012-13	Implementation of NUC Review Recommendations	NUC-001		Low					PMOS Oversight	Stephen Eldridge		Plan
												Actual/Projected
2013-03	Geomagnetic Disturbance Mitigation Stage II	New Standards	FERC filing deadline of January 21, 2015	High		14			Brian Murphy	Mark Olson		Plan
												Actual/Projected
2013-04	VAR Directives	VAR-002		N/A	3	6	5	VAR-001, which addresses the FERC directives, passed final ballot 12/23/2013 with 75.35% approval. VAR-002 received a 66.16% approval rating in November 2013, and the SDT is reviewing industry comments.	Ron Parsons	Soo Jin Kim		Plan
												Actual/Projected
2014-01	Standards Applicability for Dispersed Generation Resources	Various	Goal is to complete (including regulatory approval) prior to BES Phase 2 implementation 7/1/2016	Medium (prioritized by SC January 2014)					Gary Kruempel	Sean Cavote		Plan
												Actual/Projected
2014-02	CIP Version 5 Revisions	CIP	FERC filing deadline for certain directives of February 3, 2015.	Pending Prioritization in 1Q 2014		8			Brian Murphy	Marisa Hecht and Ryan Stewart		Plan
												Actual/Projected
2014-03	TOP/IRO Revisions	TOP/IRO	Deadline of January 31, 2015	Pending Prioritization in 1Q 2014					Brian Murphy	Ed Dobrowolski		Plan
												Actual/Projected
TBD	TPL Directive	TPL-001-4	Goal is to complete directives and file in time for FERC action prior to implementing TPL-001-4	Pending Prioritization in 1Q 2014		1		May not move forward.	Matt Morais	Ed Dobrowolski		Plan
												Actual/Projected

Note 1: The prioritizations here reflect those prioritizations assigned as part of the 2014-2016 Reliability Standards Development Plan (RSDP). In its approach to prioritizing Reliability Standards projects, the RSDP considered how Reliability Standard family priorities are applied to individual projects and outstanding work. Specific elements included: (1) RISC Category Rankings; (2) regulatory directives; (3) regulatory deadlines; (4) Reliability Standard requirement candidates for retirement; (5) the IDRP content and quality assessments; and (6) additional considerations (fill-in-the-blank status and five-year assessment commitments). Some projects were not prioritized in the RSDP, as they were originally anticipated to be complete before the end of the first quarter of 2014, and those projects have an "N/A" designation in this column. Other projects have been added to the Project Tracking Spreadsheet that were not prioritized in the RSDP. These were added in response to regulatory directives that were issued following completion of the RSDP, and they will be prioritized according to the same process during the first quarter of 2014 according to the same process described in the RSDP. Those projects are designated as "Pending Prioritization in 1Q 2014." As discussed in the 2014-2016 RSDP, the prioritization will occur in collaboration between NERC Staff and the Standards Committee.

Note 2: Refers to guidances from regulatory orders for standards activity to consider, but that do not carry the same effect as a directive.

Note 3: In the columns at right, in some cases, an "additional ballot" is not indicated for planning purposes, but if consensus is not supported on an initial ballot, or if substantive changes occur, one will be scheduled.

Note 4: In the columns at right, there are no "plan" milestones in some cases because the project was originally planned to be complete in 2013, and the project's "actual" milestones have extended into 2014).

RSC Meeting #14-3, Agenda Item 4.0 Open Action Items

Item	Description	Owner	Due	Status
4.1	Coordination with the Compliance Committee to develop Joint Activity Action List	Greg Campoli	RSC Meeting	Ongoing
4.2	New York Adoption of More Stringent/Specific NPCC Criteria - determine more stringent criteria and submit filing	Gerry Dunbar	April 2014	Update: An initial draft has been completed and is being reviewed by NPCC senior staff. NPCC estimates filing with the NYSPSC in late April or early May.
13-5.6	NPCC outreach program development – discussion item: members provide input and opportunities for development of an outreach program	RSC	RSC Meeting	Ongoing
14-1.1	Project 2010-17, BES - Follow up with Drafting Team to identify established set of criteria for when an entity can request an exclusion and what should be provided	Guy Zito		Update: On March 31, 2014, the Standards Committee endorsed posting the final Reference Document as a supporting document. This action item will remain open to facilitate future discussions regarding the BES exception process
14-1.2	Revise the Directory Development Manual to address cost effectiveness	G. Dunbar		Update: Preliminary revisions incorporating cost concepts into the Manual have been completed. Posting to the Open Process pending.

DRAFT

RSC Meeting #14-3, Agenda Item 4.0 Open Action Items

Item	Description	Owner	Due	Status
14-1.3	Project 2007-06 - System Protection Coordination – share concerns raised at the RSC meeting with the Standard Drafting Team *[At the February RSC meeting there were concerns regarding: coordination between entities; tracking and notification of 10% or greater change in fault current at an interconnecting bus; need for a common tool to facilitate data exchange.]*	Guy Zito		
14-1.4	Follow up with NERC on current RSAW development process	Guy Zito		Update: - An RSAW that is being developed during the standards development process will be posted concurrently with the standard - A working group developed a process to vet proposed changes to an RSAW that is already in place for an existing standard. The working group was formed with representation from the MRC, NERC staff, and the NERC Board. The proposed process is slated to be on the MRC agenda for the May 2014 meeting. (See meeting handout Item 4a for additional information)
14-2.1	Update NPCC Members on NERC Drafting Teams based on feedback received at the April 2014 RSC meeting			

DRAFT

RSC Meeting #14-3, Agenda Item 4.0 Open Action Items

Item	Description	Owner	Due	Status
14-2.2	Update Executive Tracking Summary spreadsheet for: • Project 2007-02 Operating Personnel Communications Protocols: COM-002-4 Final Ballot • Project 2010-05.1 was updated under the Reliability Standards tab but was missing from summary of changes. The summary of changes should be corrected.			
14-2.3	Update the rscmembers email list to include both Primary and Alternate RSC members			
14-2.4	Project 2010-02, the use of the term "Facilities" rather than entities defined by the function model was not supported by the RSC. Provide alternate language for consideration	Helen Lainis

- NEW Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings Webinar – Noon-2 p.m. Eastern, May 12, 2014 (Register)
- NEW Project 2007-17.3 - Protection System Maintenance and Testing - Phase 3 (Sudden Pressure Relays) Webinar – 1-3 p.m. Eastern, May 15, 2014 (Register)
- NEW Project 2013-03 - Geomagnetic Disturbance Mitigation Technical Conference – 8:30-4 p.m. Eastern, May 20, 2014, Atlanta, GA (In-Person Registration) (Webinar Registration) (Details)

Drafting Team Meetings

The Standards calendar provides dial-in information for the in-person meetings below. The calendar also provides information about conference calls that drafting teams may hold in addition to in-person meetings.

- Project 2008-02 - Undervoltage Load Shedding – May 5-7, 2014, Atlanta, GA (Register) (Details) (Agenda)
- Project 2014-02 - Critical Infrastructure Protection Standards Version 5 Revisions – May 12-14, 2014, Columbus, OH (Register) (Details)
  - A meeting and conference call schedule has been posted to the Related Files portion of the project page.
- Project 2009-03 - Emergency Operations – May 13-15, 2014, Dallas, TX (Register) (Details) (Agenda)
- **NEW** Project 2010-05.2 - Special Protection Systems - Phase 2 of Protection Systems – May 20-22, 2014, Denver, CO (Registration and Details)
- Project 2010-02 - Connecting New Facilities to the Grid – May 21-22, 2014, San Francisco, CA (Register) (Details)
- **NEW** Project 2014-01 - Standards Applicability for Dispersed Generation Resources – May 28-29, 2014, Salt Lake City, UT (Register) (Details)
- **NEW** Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves – May 28-30, 2014, Atlanta, GA (Register)
- **NEW** Project 2013-03 - Geomagnetic Disturbance Mitigation – June 2-4, 2014, Atlanta, GA (Register) (Details)
- **NEW** Project 2010-13.3 - Relay Loadability: Stable Power Swings – June 16-20, 2014, Westminster, CO (Register) (Details) (Agenda)

Standards Committee Meetings and Conference Calls

The Standards calendar provides dial-in information for the meetings and calls below. The calendar also provides information about Project Management and Oversight Subcommittee and Process Subcommittee meetings and calls.

- Standards Committee Conference Call – 1-5 p.m. Eastern, May 14, 2014
- Standards Committee In-Person Meeting – June 10-11, 2014, Denver, CO
- Standards Committee Conference Call – 1-5 p.m. Eastern, July 16, 2014

RESOURCES POSTED LAST WEEK

Webinar Slides and Recordings

- Project 2014-01 - Standards Applicability for Dispersed Generation Resources – April 28, 2014 (Presentation) (Recording)
- Project 2010-02 - Connecting New Facilities to the Grid – April 29, 2014 (Presentation) (Recording)

Drafting Team Meeting Notes

- Project 2014-04 - Physical Security – April 2-3, 2014 (Meeting Notes)

OTHER

NEW NERC News Posted

The April issue of NERC News has been posted to the Newsroom web page.

NEW ERO Enterprise Compliance Auditor Manual Posted

NERC posted version 1 of the ERO Enterprise Compliance Auditor Manual (Manual), which was developed by NERC and the Regional Entities to help improve consistency and quality of compliance monitoring across the ERO. The Manual contains common tools, techniques, and approaches for Compliance Auditors. It is a living document, and revisions will occur as NERC and the Regional Entities improve, develop, and implement compliance monitoring processes. NERC and the Regional Entities will begin using the Manual and address update needs and other content in future versions. The Manual will be a public document posted on the NERC website under Compliance & Enforcement/Compliance Tools and Auditor Resources.

In addition to the release of the Manual, NERC posted a Manual Navigation Guide to provide information on the functionality of the Manual and to help users navigate through the document.

New Balloting and Commenting Software System: Practice Balloting and Commenting Events

NERC recently launched a new balloting and commenting software system (the Standards Balloting System or SBS). Please take this opportunity to register in the SBS if you have not already done so, and once registered, access the sample practice ballots on the Balloting and Commenting web page. The first projects will be balloted in the SBS next month; taking a few minutes during this time period to practice the steps needed to submit a vote and comment will make your balloting experience for the first live ballots an easier transition.

The sample practice ballots are open at staggered time periods, allowing ample opportunity to vote and comment. Practice is just a few clicks away:

- Access the **SBS system**
- Click on '**View Ballot Events'** to practice submitting a vote

- Click on '**View Surveys'** to practice submitting comments and accessing Social Survey

Gaining familiarity with the new features and functionality will be very helpful before new projects are open for balloting and commenting in the SBS. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Helpful Tools:
Standards Balloting and Commenting System (SBS) Login, Registration, Validation and Permissions
Standards Balloting and Commenting System (SBS) Webinar
Frequently Asked Questions
Register for the NEW Registered Ballot Body

***Note**: If you are currently registered in the original NERC Registered Ballot Body, you will need to register for the SBS to vote and comment.*

Northeast Power Coordinating Council (NPCC) Regional Standards Processes Manual Posted for Comment

NERC posted the proposed NPCC's Regional Standards Processes Manual for a 45-day industry review through **8 p.m. Eastern on Wednesday, May 7, 2014**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the Regional Reliability Standards-Under Development Page.

NEW Western Electricity Coordinating Council (WECC) Reliability Development Procedures and Common Attributes Posted for Comment

NERC posted WECC's Reliability Standards Development Procedures & Exhibit C – Common Attributes for a 45-day industry review through **8 p.m. Eastern on Thursday, June 12, 2014.** Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the Regional Reliability Standards-Under Development Page.

ABOUT THE BULLETIN

This weekly bulletin compiles a list of Standards work with actionable deadlines, upcoming Standards events, recently posted standards resources, and other news and information relevant to NERC Standards development. Please email Wendy Muller with questions about commenting and balloting and Mallory Huggins with feedback on this bulletin. The current bulletin and old bulletins are available under "Program News" on the Standards home page.

2014-2016 Reliability Standards Development Plan

If you would like to receive this bulletin or be added to the distribution list for a particular project, please email Wendy Muller.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.

Description of Current Draft

This version of PRC-005 contains revisions to the ~~-~~a ~~A~~pplicability ~~section~~ of the Standard intended to clarify application of ~~the~~ its Requirements to Bulk Electric System dispersed power producing resources. PRC-005-3, a~~A~~ subsequent version of PRC-005, ~~PRC-005-3,~~ has been adopted by the NERC Board of Trustees and is pending regulatory approval. Depending on the timing of regulatory approval, this interim version, which has been labeled PRC-005-2(X) for balloting purposes, may be filed for regulatory approval. The Protection System Maintenance and Testing Standard Drafting Team (PSMT SDT) is concurrently making technical revisions to PRC-005 in Project 2007-17.3 to address FERC directives. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the Requirements of PRC-005 to dispersed power-producing resources.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Initial Ballot	June – July 2014
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	August – September 2014
Final ballot	October 2014
BOT adoption	November 2014

When this standard has received ballot approval, the text boxes within the Applicability section of the Standard will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: **Protection System Maintenance**

2. Number: PRC-005-~~2~~ X

3. Purpose: To document and implement programs for the maintenance of all Protection Systems affecting the reliability of the Bulk Electric System (BES) so that these Protection Systems are kept in working order.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)

4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.

4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.

4.2.4 Protection Systems installed as a Special Protection System (SPS) for BES reliability.

The only revisions made to this version of PRC-005 are revisions to section 4.2, to clarify applicability of the Requirements of the standard at generator Facilities. These applicability revisions are intended to clarify and provide for consistent application of the Requirements to BES generator Facilities included in the BES through Inclusion I4 – Dispersed Power Producing Resources.

This version is labeled PRC-005-2(X) for balloting purposes. The 'X' indicates that a version number will be applied at a later time, because multiple versions of PRC-005 are in development to reflect the fact that applicability changes need apply for versions of the standard that are approved (PRC-005-2), pending regulatory approval (PRC-005-3), and in development in Project 2007-17.3. Depending on the timing of approvals of other versions, NERC may file this interim version to provide regulatory certainty for entities as the revised BES definition is implemented.

4.2.5 Protection Systems for the following BES generator Facilities ~~that are part of the BES, including~~ for generators not identified through Inclusion I4 of the BES definition:

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.

~~**4.2.5.3** Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).~~

~~**4.2.5.4**~~**4.2.5.3** Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

Rationale for 4.2.5: In order to differentiate between typical BES generator Facilities and BES generators at dispersed power producing facilities, section 4.2.5 was separated into two sections (4.2.5 and 4.2.6). The applicability to non-dispersed power producing Facilities has been maintained and can be found in 4.2.5. The applicability to dispersed power producing Facilities has been modified and relocated from 4.2.5 to 4.2.6.

4.2.6 Protection Systems for the following BES generator Facilities for dispersed power producing resources identified through Inclusion I4 of the BES definition:

4.2.6.1 Protection Systems for ~~electrical equipment~~Facilities used in aggregating dispersed BES generation from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above.

Rationale for 4.2.6: Applicability of the Requirements of PRC-005-2 to dispersed power producing resources is separated out in section 4.2.6. The intent is that for such resources, the Requirements would apply only to Protection Systems on equipment used in aggregating the BES dispersed power producing resources from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or higher including the Protection Systems for those transformers used in aggregating generation.

5. Effective Date: See Implementation Plan.

B. Requirements

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems identified in Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

Component Type *- Any one of the five specific ~~elements~~elements of the Protection System*

1.2. Include the applicable monitored Component attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components.

Component – *A component is any individual discrete piece of equipment included in a Protection System, including but not limited to a protective relay or current sensing device. The designation of what constitutes a control circuit component is very dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit components. Another example of where the entity has some discretion on determining what constitutes a single component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single component.*

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

Unresolved Maintenance Issue *- A deficiency identified during a maintenance activity that causes the component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.*

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each protection Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, and Table 3. (Part 1.2)

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

D. Compliance

1. Compliance Monitoring Process

~~**1.1. Compliance Enforcement Authority**~~

1.1.

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards

~~Regional Entity~~

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking
Compliance Investigation
Self-Reporting
Complaint

1.3. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System Component, or all performances of each distinct maintenance activity for the Protection System Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1) OR The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)	The responsible entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to include the applicable monitoring attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components. (Part 1.2).	The responsible entity failed to establish a PSMP. OR The responsible entity failed to specify whether three or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1).
R2	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The responsible entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR 3) Maintained a Segment with less than 60 Components OR 4) Failed to: • Annually update the list of Components, OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				• Annually perform maintenance on the greater of 5% of the segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.
R4	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.
R5	The responsible entity failed to undertake efforts to correct 5 or	The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10	The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15	The responsible entity failed to undertake efforts to correct greater

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
	fewer identified Unresolved Maintenance Issues.	identified Unresolved Maintenance Issues.	identified Unresolved Maintenance Issues.	than 15 identified Unresolved Maintenance Issues.

E. Regional Variances

None

F. Supplemental Reference Document

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

1. PRC-005-2 Protection System Maintenance Supplementary Reference and FAQ — July 2012.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. 3. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/05
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by Board of Trustees	
1a	September 26, 2011	FERC Order issued approving interpretation of R1 and R2 (FERC's Order is effective as of September 26, 2011)	
1.1a	February 1, 2012	Errata change: Clarified inclusion of generator interconnection Facility in Generator Owner's responsibility	Revision under Project 2010-07
1b	February 3, 2012	FERC Order issued approving interpretation of R1, R1.1, and R1.2 (FERC's Order dated March 14, 2012). Updated version from 1a to 1b.	Project 2009-10 Interpretation
1.1b	April 23, 2012	Updated standard version to 1.1b to reflect FERC approval of PRC-005-1b.	Revision under Project 2010-07

Version	Date	Action	Change Tracking
1.1b	May 9, 2012	PRC-005-1.1b was adopted by the Board of Trustees as part of Project 2010-07 (GOTO).	
2	November 7, 2012	Adopted by Board of Trustees	Complete revision, absorbing maintenance requirements from PRC-005-1b, PRC-008-0, PRC-011-0, PRC-017-0
2	October 17, 2013	Errata Change: The Standards Committee approved an errata change to the implementation plan for PRC-005-2 to add the phrase "or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities;" to the second sentence under the "Retirement of Existing Standards" section.	
2	December 19, 2013	FERC Order issued approving PRC-005-2. (The enforcement date for PRC-005-2 will be April 1, 2015, which is the first date entities must be compliant with part of the standard. The implementation plan for PRC-005-2 includes specific compliance dates and timeframes for each of the Requirements. The regulatory approval date in the U.S. is February 24, 2014.	
TBD (balloted as 2(X)	TBD	~~.~~Standard revised in Project 2014-01~~.~~	Applicability section revised to clarify application of Requirements to BES dispersed power producing resources

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**[1]	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 calendar years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (see Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. • Alarming for power supply failure (see Table 2).	12 calendar years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

[1] For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**[1]	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 calendar years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 calendar months	Verify that the communications system is functional.
	6 calendar years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 calendar years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 calendar years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 calendar years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) **Note:** Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 calendar years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 calendar years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS.	12 calendar years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 calendar years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPS whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5 and Table 3, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5 and Table 3 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 calendar years	Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 calendar years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).	12 calendar years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 calendar years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 calendar years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 calendar years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 calendar years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment of the Protection System Component population, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5 and Table 3 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

> **Segment** – *Protection Systems or components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual components.*

> **Countable Event** – *A failure of a component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5 and Table 3 which requires corrective action, or a Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System component configuration errors, or Protection System application errors are not included in Countable Events.*

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Protection System Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.

4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Protection System Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.

Description of Current Draft

~~The Protection System Maintenance and Testing Standard Drafting Team (PSMT SDT) is posting draft 1 of PRC-005-X for a 45-day comment period and ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).~~

~~This draft contains the technical content of the standard.~~ ~~A parallel effort in the~~ The Project 2014-01, Standards Applicability for Dispersed Generation Resources Standards Drafting Team (DGR SDT)~~,~~ ~~will~~ is posting proposed ~~an~~ applicability changes to ~~PRC-005-2 and~~ PRC-005-3 for comment and ballot. This draft contains the DGR SDT's recommended changes within ~~technical content of~~ the standard. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the Requirements of PRC-005 to dispersed power-producing resources.

In a parallel effort, the Protection System Maintenance and Testing Standard Drafting Team (PSMT SDT) has posted draft 1 of PRC-005-X for a 45-day comment period, and ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Initial Ballot	June – July 2014
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	August – September 2014
Final ballot	October 2014
BOT adoption	November 2014

When this standard has received ballot approval, the text boxes within the Applicability section of the Standard will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: **Protection System and Automatic Reclosing Maintenance**

2. Number: PRC-005-3(X)

3. Purpose: To document and implement programs for the maintenance of all Protection Systems and Automatic Reclosing affecting the reliability of the Bulk Electric System (BES) so that they are kept in working order.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)

4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.

4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.

4.2.4 Protection Systems installed as a Special Protection System (SPS) for BES reliability.

The only revisions made to this version of PRC-005 are revisions to section 4.2, to clarify applicability of the Requirements of the standard at generator Facilities. These applicability revisions are intended to clarify and provide for consistent application of the Requirements to BES generator Facilities included in the BES through Inclusion I4 – Dispersed Power Producing Resources.

This version is labeled PRC-005-3(X) for balloting purposes. The 'X' indicates that a version number will be applied at a later time, because multiple versions of PRC-005 are in development to reflect the fact that applicability changes need apply for versions of the standard that are approved (PRC-005-2), pending regulatory approval (PRC-005-3), and in development in Project 2007-17.3.

4.2.5 Protection Systems for the following BES generator Facilities ~~that are part of the BES, including~~ for generators not identified through Inclusion I4 of the BES definition:

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.

~~**4.2.5.3** Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).~~

~~**4.2.5.4**~~**4.2.5.3** Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

Rationale for 4.2.5: In order to differentiate between typical BES generator Facilities and BES generators at dispersed power producing facilities, section 4.2.5 was separated into two sections (4.2.5 and 4.2.6). The applicability to non-dispersed power producing Facilities has been maintained and can be found in 4.2.5. The applicability to dispersed power producing Facilities has been modified and relocated from 4.2.5 to 4.2.6.

4.2.6 Protection Systems for the following BES generator Facilities for dispersed power producing resources identified through Inclusion I4 of the BES definition:

4.2.6.1 Protection Systems for ~~electrical equipment~~Facilities used in aggregating dispersed BES generation from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above.

Rationale for 4.2.6: Applicability of the Requirements of PRC-005-2 to dispersed power producing resources is separated out in section 4.2.6. The intent is that for such resources, the Requirements would apply ~~-~~only to Protection Systems on equipment used in aggregating the BES dispersed power producing resources from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or higher including the Protection Systems for those transformers used in aggregating generation.

~~4.2.6~~4.2.7 Automatic Reclosing[1], including:

~~4.2.6.1~~4.2.7.1 Automatic Reclosing applied on the terminals of Elements connected to the BES bus located at generating plant substations where the total installed gross generating plant capacity is greater than the gross capacity of the largest BES generating unit within the Balancing Authority Area.

~~4.2.6.2~~4.2.7.2 Automatic Reclosing applied on the terminals of all BES Elements at substations one bus away from generating plants specified in Section 4.2.6.1 when the substation is less than 10 circuit-miles from the generating plant substation.

~~4.2.6.3~~4.2.7.3 Automatic Reclosing applied as an integral part of an SPS specified in Section 4.2.4.

5. Effective Date: See Implementation Plan.

6. Definitions Used in this Standard: The following terms are defined for use only within PRC-005-3, and should remain with the standard upon approval rather than being moved to the Glossary of Terms.

Automatic Reclosing – Includes the following Components:

- Reclosing relay
- Control circuitry associated with the reclosing relay.

Unresolved Maintenance Issue – A deficiency identified during a maintenance activity that causes the component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

Segment – Components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual Components.

Component Type – Either any one of the five specific elements of the Protection System definition or any one of the two specific elements of the Automatic Reclosing definition.

Component – A Component is any individual discrete piece of equipment included in a Protection System or in Automatic Reclosing, including but not limited to a protective relay, reclosing relay, or current sensing device. The designation of what constitutes a control circuit

[1] Automatic Reclosing addressed in Section 4.2.6.1 and 4.2.6.2 may be excluded if the equipment owner can demonstrate that a close-in three-phase fault present for twice the normal clearing time (capturing a minimum trip-close-trip time delay) does not result in a total loss of gross generation in the Interconnection exceeding the gross capacity of the largest BES generating unit within the Balancing Authority Area where the Automatic Reclosing is applied.

Component is dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit Components. Another example of where the entity has some discretion on determining what constitutes a single Component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single Component.

Countable Event – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 which requires corrective action or a Protection System Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component or Automatic Reclosing configuration or application errors are not included in Countable Events.

B. Requirements

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems and Automatic Reclosing identified in Facilities Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System and Automatic Reclosing Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

1.2. Include the applicable monitored Component attributes applied to each Protection System and Automatic Reclosing Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System and Automatic Reclosing Components.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System and Automatic Reclosing Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System and Automatic Reclosing Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System and Automatic Reclosing Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each Protection System and Automatic Reclosing Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate

monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. (Part 1.2)

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System and Automatic Reclosing Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System and Automatic Reclosing Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.3. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component, or all performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1) OR The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)	The responsible entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to specify whether three Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1). OR The responsible entity's PSMP failed to include the applicable monitoring attributes applied to each Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Components. (Part 1.2).	The responsible entity failed to establish a PSMP. OR The responsible entity's PSMP failed to specify whether four or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1).
R2	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The responsible entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				3) Maintained a Segment with less than 60 Components OR 4) Failed to: • Annually update the list of Components, OR • Annually perform maintenance on the greater of 5% of the Segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.
R4	For Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Component Type in accordance with their performance-based PSMP.	maintenance for a specific Component Type in accordance with their performance-based PSMP.	scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP.	maintenance for a specific Component Type in accordance with their performance-based PSMP.
R5	The responsible entity failed to undertake efforts to correct 5 or fewer identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 15 identified Unresolved Maintenance Issues.

E. Regional Variances

None

F. Supplemental Reference Document

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

1. PRC-005-2 Protection System Maintenance Supplementary Reference and FAQ — March 2013.
2. Considerations for Maintenance and Testing of Autoreclosing Schemes — November 2012.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. 3. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/05
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by Board of Trustees	
1a	September 26, 2011	FERC Order issued approving interpretation of R1 and R2 (FERC's Order is effective as of September 26, 2011)	
1.1a	February 1, 2012	Errata change: Clarified inclusion of generator interconnection Facility in Generator Owner's responsibility	Revision under Project 2010-07
1b	February 3, 2012	FERC Order issued approving interpretation of R1, R1.1, and R1.2 (FERC's Order dated March 14, 2012). Updated version from 1a to 1b.	Project 2009-10 Interpretation
1.1b	April 23, 2012	Updated standard version to 1.1b to reflect FERC approval of PRC-005-1b.	Revision under Project 2010-07

Version	Date	Action	Change Tracking
1.1b	May 9, 2012	PRC-005-1.1b was adopted by the Board of Trustees as part of Project 2010-07 (GOTO).	
2	November 7, 2012	Adopted by Board of Trustees	Project 2007-17 - Complete revision, absorbing maintenance requirements from PRC-005-1.1b, PRC-008-0, PRC-011-0, PRC-017-0
2	October 17, 2013	Errata Change: The Standards Committee approved an errata change to the implementation plan for PRC-005-2 to add the phrase "or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities;" to the second sentence under the "Retirement of Existing	
3	November 7, 2013	Adopted by the NERC Board of Trustees	Revised to address the FERC directive in Order No.758 to include Automatic Reclosing in maintenance programs.
TBD (balloted as 2(X)	TBD	Standard revised in Project 2014-01	Applicability section revised to clarify application of Requirements to BES dispersed power producing resources

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[2]**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (see Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. • Alarming for power supply failure (see Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

[2] For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[2]**	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 Calendar Months	Verify that the communications system is functional.
	6 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 Calendar Years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 Calendar Years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) Note: Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS. (See Table 4-2(b) for SPS which include Automatic Reclosing.)	12 Calendar Years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 Calendar Years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPSs whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate. For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 Calendar Years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 Calendar Years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

Table 4-1 Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Reclosing Relay		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored reclosing relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.
Monitored microprocessor reclosing relay with the following: • Internal self diagnosis and alarming (See Table 2). • Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.

Table 4-2(a) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that are NOT an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Unmonitored Control circuitry associated with Automatic Reclosing that is not an integral part of an SPS.	12 Calendar Years	Verify that Automatic Reclosing, upon initiation, does not issue a premature closing command to the close circuitry.
Control circuitry associated with Automatic Reclosing that is not part of an SPS and is monitored and alarmed for conditions that would result in a premature closing command. (See Table 2)	No periodic maintenance specified	None.

Table 4-2(b) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that ARE an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Close coils or actuators of circuit breakers or similar devices that are used in conjunction with Automatic Reclosing as part of an SPS (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each close coil or actuator is able to operate the circuit breaker or mitigating device.
Unmonitored close control circuitry associated with Automatic Reclosing used as an integral part of an SPS.	12 Calendar Years	Verify all paths of the control circuits associated with Automatic Reclosing that are essential for proper operation of the SPS.
Control circuitry associated with Automatic Reclosing that is an integral part of an SPS whose integrity is monitored and alarmed. (See Table 2)	No periodic maintenance specified	None.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.

Description of Current Draft

The Project 2014-01, Standards Applicability for Dispersed Generation Resources Standards Drafting Team (DGR SDT) is posting proposed applicability changes to PRC-005-3 for comment and ballot. This draft contains the DGR SDT's recommended changes within the standard, which are intended to clarify application of the Requirements to Bulk Electric System (BES) dispersed power producing resources. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the Requirements of PRC-005 to dispersed power-producing resources.

In a parallel effort, the Protection System Maintenance and Testing Standard Drafting Team (PSMT SDT) has posted draft 1 of PRC-005-X for a 45-day comment period, and ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Initial Ballot	June – July 2014
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	August – September 2014
Final ballot	October 2014
BOT adoption	November 2014

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, this defined term will be removed from the individual standard and added to the Glossary.

Protection System Maintenance Program (PSMP) — An ongoing program by which Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components are kept in working order and proper operation of malfunctioning components is restored. A maintenance program for a specific Component includes one or more of the following activities:

- Verify — Determine that the Component is functioning correctly.
- Monitor — Observe the routine in-service operation of the Component.
- Test — Apply signals to a Component to observe functional performance or output behavior, or to diagnose problems.
- Inspect — Examine for signs of Component failure, reduced performance or degradation.
- Calibrate — Adjust the operating threshold or measurement accuracy of a measuring element to meet the intended performance requirement.

See Section A.6, Definitions Used in this Standard, for additional definitions that are new or modified for use within this standard.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System, Automatic Reclosing, and Sudden Pressure Relaying Maintenance**
2. **Number:** **PRC-005-X**
3. **Purpose:** To document and implement programs for the maintenance of all Protection Systems, Automatic Reclosing, and Sudden Pressure Relaying affecting the reliability of the Bulk Electric System (BES) so that they are kept in working order.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1** Transmission Owner
     - **4.1.2** Generator Owner
     - **4.1.3** Distribution Provider
     - **4.1.4** Balancing Authority
   - **4.2. Facilities:**
     - **4.2.1** Protection Systems and Sudden Pressure Relaying that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)
     - **4.2.2** Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.
     - **4.2.3** Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.
     - **4.2.4** Protection Systems installed as a Special Protection System (SPS) for BES reliability.
     - **4.2.5** Protection Systems for the following BES generator Facilities ~~that are part of the BES, including~~ for generators not identified through Inclusion I4 of the BES definition:

The only revisions made to this version of PRC-005 are revisions to section 4.2, to clarify applicability of the Requirements of the standard at generator Facilities. These applicability revisions are intended to clarify and provide for consistent application of the Requirements to BES generator Facilities included in the BES through Inclusion I4 – Dispersed Power Producing Resources.

This version is labeled PRC-005-~~2(~~X~~)~~ for balloting purposes. The 'X' indicates that a version number will be applied at a later time, because multiple versions of PRC-005 are in development to reflect the fact that applicability changes need applied~~y~~ for versions of the standard that are approved (PRC-005-2), pending regulatory approval (PRC-005-3), and in development in Project 2007-17.3. ~~-~~Depending on the timing of approvals of other versions, NERC may file this interim version to provide regulatory certainty for entities as the revised BES definition is implemented.

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems and Sudden Pressure Relaying for generator step-up transformers for generators that are part of the BES.

~~**4.2.5.3** Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind farms to the BES).~~

4.2.5.3 Protection Systems and Sudden Pressure Relaying for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

Rationale for 4.2.5: In order to differentiate between typical BES generator Facilities and BES generators at dispersed power producing facilities, section 4.2.5 was separated into two sections (4.2.5 and 4.2.6). The applicability to non-dispersed power producing facilities has been maintained and can be found in 4.2.5. The applicability to dispersed power producing Facilities has been modified and relocated from 4.2.5 to 4.2.6.

4.2.6 Protection Systems for the following BES generator Facilities for dispersed power producing resources identified through Inclusion I4 of the BES definition:

4.2.6.1 Protection Systems for ~~electrical equipment~~Facilities- used in aggregating dispersed BES generation from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above.

Rationale for 4.2.6: The Facilities listed that are applicable to dispersed power producing facilities are covered within 4.2.6. The intent is to NOT include the individual generating resources in the Protection System Maintenance Program, and as such the Protection Systems within the individual generating resources would not be within the scope of PRC-005. Only Protection Systems on equipment used in aggregating the dispersed BES generation from the point where those resources aggregate to greater than 75MVA to a common point of connection at 100kV would be included in the Protection System Maintenance Program, including the Protection Systems for those transformers used in aggregating generation.

~~4.2.6~~4.2.7 Automatic Reclosing[1], including:

~~4.2.6.1~~4.2.7.1 Automatic Reclosing applied on the terminals of Elements connected to the BES bus located at generating plant substations where the total installed gross generating plant capacity is greater than the gross capacity of the largest BES generating unit within the Balancing Authority Area.

~~4.2.6.2~~4.2.7.2 Automatic Reclosing applied on the terminals of all BES Elements at substations one bus away from generating plants specified in Section 4.2.6.1 when the substation is less than 10 circuit-miles from the generating plant substation.

4.2.6.3. Automatic Reclosing applied as an integral part of an SPS specified in Section 4.2.4.

[1] Automatic Reclosing addressed in Section 4.2.7.1 and 4.2.7.2 may be excluded if the equipment owner can demonstrate that a close-in three-phase fault present for twice the normal clearing time (capturing a minimum trip-close-trip time delay) does not result in a total loss of gross generation in the Interconnection exceeding the gross capacity of the largest BES generating unit within the Balancing Authority Area where the Automatic Reclosing is applied.

5. **Effective Date:** See Implementation Plan.

6. **Definitions Used in this Standard:**

Automatic Reclosing – Includes the following Components:

- Reclosing relay
- Control circuitry associated with the reclosing relay.

Sudden Pressure Relaying – A system that trips an interrupting device(s) to isolate the equipment it is monitoring and includes the following Components:

- Fault pressure relay – a mechanical relay or device that detects rapid changes in gas pressure, oil pressure, or oil flow that are indicative of Faults within liquid-filled, wire-wound equipment
- Control circuitry associated with a fault pressure relay

Unresolved Maintenance Issue – A deficiency identified during a maintenance activity that causes the Component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

Segment – Components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual Components.

Component Type –

- Any one of the five specific elements of a Protection System.
- Any one of the two specific elements of Automatic Reclosing.
- Any one of the two specific elements of Sudden Pressure Relaying.

Rationale for the deletion of part of the definition of Component: The SDT determined that it was explanatory in nature and adequately addressed in the Supplementary Reference and FAQ Document.

Component – Any individual discrete piece of equipment included in a Protection System, Automatic Reclosing, or Sudden Pressure Relaying.

Countable Event – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5, Table 3, Tables 4-1 through 4-2, and Table 5, which requires corrective action or a Protection System Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component, Automatic Reclosing, or Sudden

Pressure Relaying configuration or application errors are not included in Countable Events.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems, Automatic Reclosing, and Sudden Pressure Relaying identified in Section 4.2, Facilities. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning*]

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System, Automatic Reclosing, and Sudden Pressure Relaying Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

1.2. Include the applicable monitored Component attributes applied to each Protection System, Automatic Reclosing, and Sudden Pressure Relaying Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, Table 4-1 through 4-2, and Table 5 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components.

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System, Automatic Reclosing, and Sudden Pressure Relaying Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each Protection System, Automatic Reclosing, and Sudden Pressure Relaying Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, Table 3, Table 4-1 through 4-2, and Table 5. (Part 1.2)

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure

established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include, but is not limited to, Component lists, dated maintenance records, and dated analysis records and results.

Rationale for R3 part 3.1 and 3.1.1.: The SDT, upon further reflection, determined that the PRC-005-3 Implementation Plan actually included a requirement that entities with newly-identified Automatic Reclosing Components implement its PSMP for those Components, and therefore determined that it was more appropriate to include this information in the standard rather than the implementation plan.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall, except as provided in part 3.1, maintain its Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Table 4-1 through 4-2, and Table 5. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

3.1. For each newly-identified Automatic Reclosing Component following a notification under Requirement R6, each Transmission Owner, Generator Owner, and Distribution Provider shall perform maintenance activities or provide documentation of prior maintenance activities according to either 3.1.1 or 3.1.2.

3.1.1. Complete the maintenance activities prescribed within Tables 4-1, 4-2(a), and 4-2(b) for the newly-identified Automatic Reclosing Component prior to the end of the third calendar year following the notification under Requirement R6; or

3.1.2. Provide documentation that the Automatic Reclosing Component was last maintained in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1, 4-2(a), and 4-2(b).

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components included within its time-based program in accordance with Requirement R3. The evidence may include, but is not limited to, dated maintenance records, dated

maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

Rationale for R4 part 4.1 and 4.1.1.: The SDT, upon further reflection, determined that the PRC-005-3 Implementation Plan actually included a requirement that entities with newly-identified Automatic Reclosing Components implement its PSMP for those Components, and therefore determined that it was more appropriate to include this information in the standard rather than the implementation plan.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall, except as provided in part 4.1, implement and follow its PSMP for its Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

4.1. For each newly-identified Automatic Reclosing Component following a notification under Requirement R6, each Transmission Owner, Generator Owner, and Distribution Provider shall perform maintenance activities or provide documentation of prior maintenance activities according to either 4.1.1 or 4.1.2.

4.1.1. Complete the maintenance activities prescribed within Tables 4-1, 4-2(a), and 4-2(b) for the newly-identified Automatic Reclosing Component prior to the end of the third calendar year following the notification under Requirement R6; or

4.1.2. Provide documentation that the Automatic Reclosing Component was last maintained in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1, 4-2(a), and 4-2(b).

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components included in its performance-based program in accordance with Requirement R4. The evidence may include, but is not limited to, dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance

Issues in accordance with Requirement R5. The evidence may include, but is not limited to, work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

Rationale for R6: The information addressed in Requirement R6 is necessary for Transmission Owners, Generator Owners, and Distribution Provides to accurately apply Section 4.2.7, Applicability. The Balancing Authority is the entity that maintains the information and should have the responsibility to provide this information to the applicable entities. The drafting team reconsidered the inclusion of the Balancing Authority and determined it is appropriate to include the requirement the standard. This requirement may be relocated to another standard during future reviews of standards for quality and content.

The periodicity was chosen to balance the needs of the Transmission Owner, Generator Owner, and Distribution Provider to obtain the information with the needs of the Balancing Authority to provide an accurate gross capacity (considering retirement or installation of generating units and/or changes in its Balancing Authority Area) in order to properly include Automatic Reclosing in a PSMP.

R6. Each Balancing Authority shall, at least once every calendar year with not more than 15 calendar months between notifications, notify each Transmission Owner, Generator Owner, and Distribution Provider within its Balancing Authority Area of the gross capacity, in MW or MVA, of the largest BES generating unit within the Balancing Authority Area. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M6. Each Balancing Authority shall have dated documentation that it notified each Transmission Owner, Generator Owner, and Distribution Provider in accordance with Requirement R6. Examples of evidence may include, but are not limited to, copies of correspondence, such as e-mails or memoranda.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time

since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Distribution Provider, and Balancing Authority shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the most recent performance of each distinct maintenance activity for the Protection System, Automatic Reclosing, or Sudden Pressure Relaying Component, or all performances of each distinct maintenance activity for the Protection System, Automatic Reclosing, or Sudden Pressure Relaying Component since the previous scheduled audit date, whichever is longer.

For Requirement R6, the Balancing Authority shall keep documentation for three calendar years that it provided information identifying the largest BES generating unit to the Transmission Owners, Generator Owners, and Distribution Providers in its Balancing Authority Area.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

Table of Compliance Elements

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both (part 1.1).	The entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both (part 1.1).	The entity's PSMP failed to specify whether three Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (part 1.1). OR The entity's PSMP failed to include the applicable monitoring attributes applied to each Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Components (part 1.2).	The entity failed to establish a PSMP. OR The entity's PSMP failed to specify whether four or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both (part 1.1). OR The entity's PSMP failed to include applicable station batteries in a time-based program (part 1.1).
R2	The entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				3) Maintained a Segment with less than 60 Components OR 4) Failed to: • Annually update the list of Components, OR • Annually perform maintenance on the greater of 5% of the Segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Components included within a time-based maintenance program, the entity failed to maintain 5% or less of the total Components included within a specific Component Type in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5. For Automatic Reclosing Components added to a time-based maintenance program per information from the Balancing	For Components included within a time-based maintenance program, the entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Component Type in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5. For Automatic Reclosing Components added to a time-based maintenance program per	For Components included within a time-based maintenance program, the entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Component Type in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5. For Automatic Reclosing Components added to a time-based maintenance program per	For Components included within a time-based maintenance program, the entity failed to maintain more than 15% of the total Components included within a specific Component Type in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5. For Automatic Reclosing Components added to a time-

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Authority, the entity failed to maintain 5% or less of the total Components in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1 through 4-2.	information from the Balancing Authority, the entity failed to maintain more than 5% but 10% or less of the total Components in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1 through 4-2.	information from the Balancing Authority, the entity failed to maintain more than 10% but 15% or less of the total Components in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1 through 4-2.	based maintenance program per information from the Balancing Authority, the entity failed to maintain more than 15% of the total Components in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1 through 4-2.
R4	For Components included within a performance-based maintenance program, the entity failed to maintain 5% or less of the annual scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP. For Automatic Reclosing Components added to a performance-based maintenance program per information from the Balancing Authority, the entity failed to maintain 5% or less of the total Components in accordance with their performance-based PSMP.	For Components included within a performance-based maintenance program, the entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP. For Automatic Reclosing Components added to a performance-based maintenance program per information from the Balancing Authority, the entity failed to maintain more than 5% but 10% or less of the total Components in accordance with their performance-based PSMP.	For Components included within a performance-based maintenance program, the entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP. For Automatic Reclosing Components added to a performance-based maintenance program per information from the Balancing Authority, the entity failed to maintain more than 10% but 15% or less of the total Components in accordance with their performance-based PSMP.	For Components included within a performance-based maintenance program, the entity failed to maintain more than 15% of the annual scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP. For Automatic Reclosing Components added to a performance-based maintenance program per information from the Balancing Authority, the entity failed to maintain more than 15% of the total Components in accordance with their performance-based PSMP.

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	The entity failed to undertake efforts to correct 5 or fewer identified Unresolved Maintenance Issues.	The entity failed to undertake efforts to correct greater than 5 but less than or equal to 10 identified Unresolved Maintenance Issues.	The entity failed to undertake efforts to correct greater than 10 but less than or equal to 15 identified Unresolved Maintenance Issues.	The entity failed to undertake efforts to correct greater than 15 identified Unresolved Maintenance Issues.
R6				The entity failed to notify each Transmission Owner, Generator Owner, and Distribution Provider within its Balancing Authority Area at least once every calendar year of the gross capacity, in MW or MVA, of the largest BES generating unit within the Balancing Authority Area. OR The entity had more than 15 calendar months between notifications to each Transmission Owner, Generator Owner, and Distribution Provider of the gross capacity, in MW or MVA, of the largest BES generating unit within the Balancing Authority Area.

D. Regional Variances

None.

E. Interpretations

None.

F. Supplemental Reference Documents

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**[2]	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (see Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. • Alarming for power supply failure (see Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

[2] For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**[2]	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 Calendar Months	Verify that the communications system is functional.
	6 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 Calendar Years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 Calendar Years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) Note: Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS. (See Table 4-2(b) for SPS which include Automatic Reclosing.)	12 Calendar Years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 Calendar Years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPSs whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate. For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
• Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).		
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 Calendar Years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 Calendar Years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

Table 4-1 Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Reclosing Relay		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored reclosing relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.
Monitored microprocessor reclosing relay with the following: • Internal self-diagnosis and alarming (See Table 2). • Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.

Table 4-2(a) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that are NOT an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Unmonitored Control circuitry associated with Automatic Reclosing that is not an integral part of an SPS.	12 Calendar Years	Verify that Automatic Reclosing, upon initiation, does not issue a premature closing command to the close circuitry.
Control circuitry associated with Automatic Reclosing that is not part of an SPS and is monitored and alarmed for conditions that would result in a premature closing command. (See Table 2)	No periodic maintenance specified	None.

Table 4-2(b) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that ARE an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Close coils or actuators of circuit breakers or similar devices that are used in conjunction with Automatic Reclosing as part of an SPS (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each close coil or actuator is able to operate the circuit breaker or mitigating device.
Unmonitored close control circuitry associated with Automatic Reclosing used as an integral part of an SPS.	12 Calendar Years	Verify all paths of the control circuits associated with Automatic Reclosing that are essential for proper operation of the SPS.
Control circuitry associated with Automatic Reclosing that is an integral part of an SPS whose integrity is monitored and alarmed. (See Table 2)	No periodic maintenance specified	None.

Table 5 Maintenance Activities and Intervals for Sudden Pressure Relaying		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any fault pressure relay.	6 Calendar Years	Verify the pressure or flow sensing mechanism is operable.
Control circuitry associated with Sudden Pressure Relaying from the fault pressure relay to the interrupting device trip coil(s).	12 Calendar Years	Verify all paths of the control circuits that are essential for proper operation of the Sudden Pressure Relaying.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5, Table 3, Tables 4-1 through 4-2, and Table 5 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

If the Components in a Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

NERC BES Kickoff Webinar

May 2, 2014

RELIABILITY | ACCOUNTABILITY

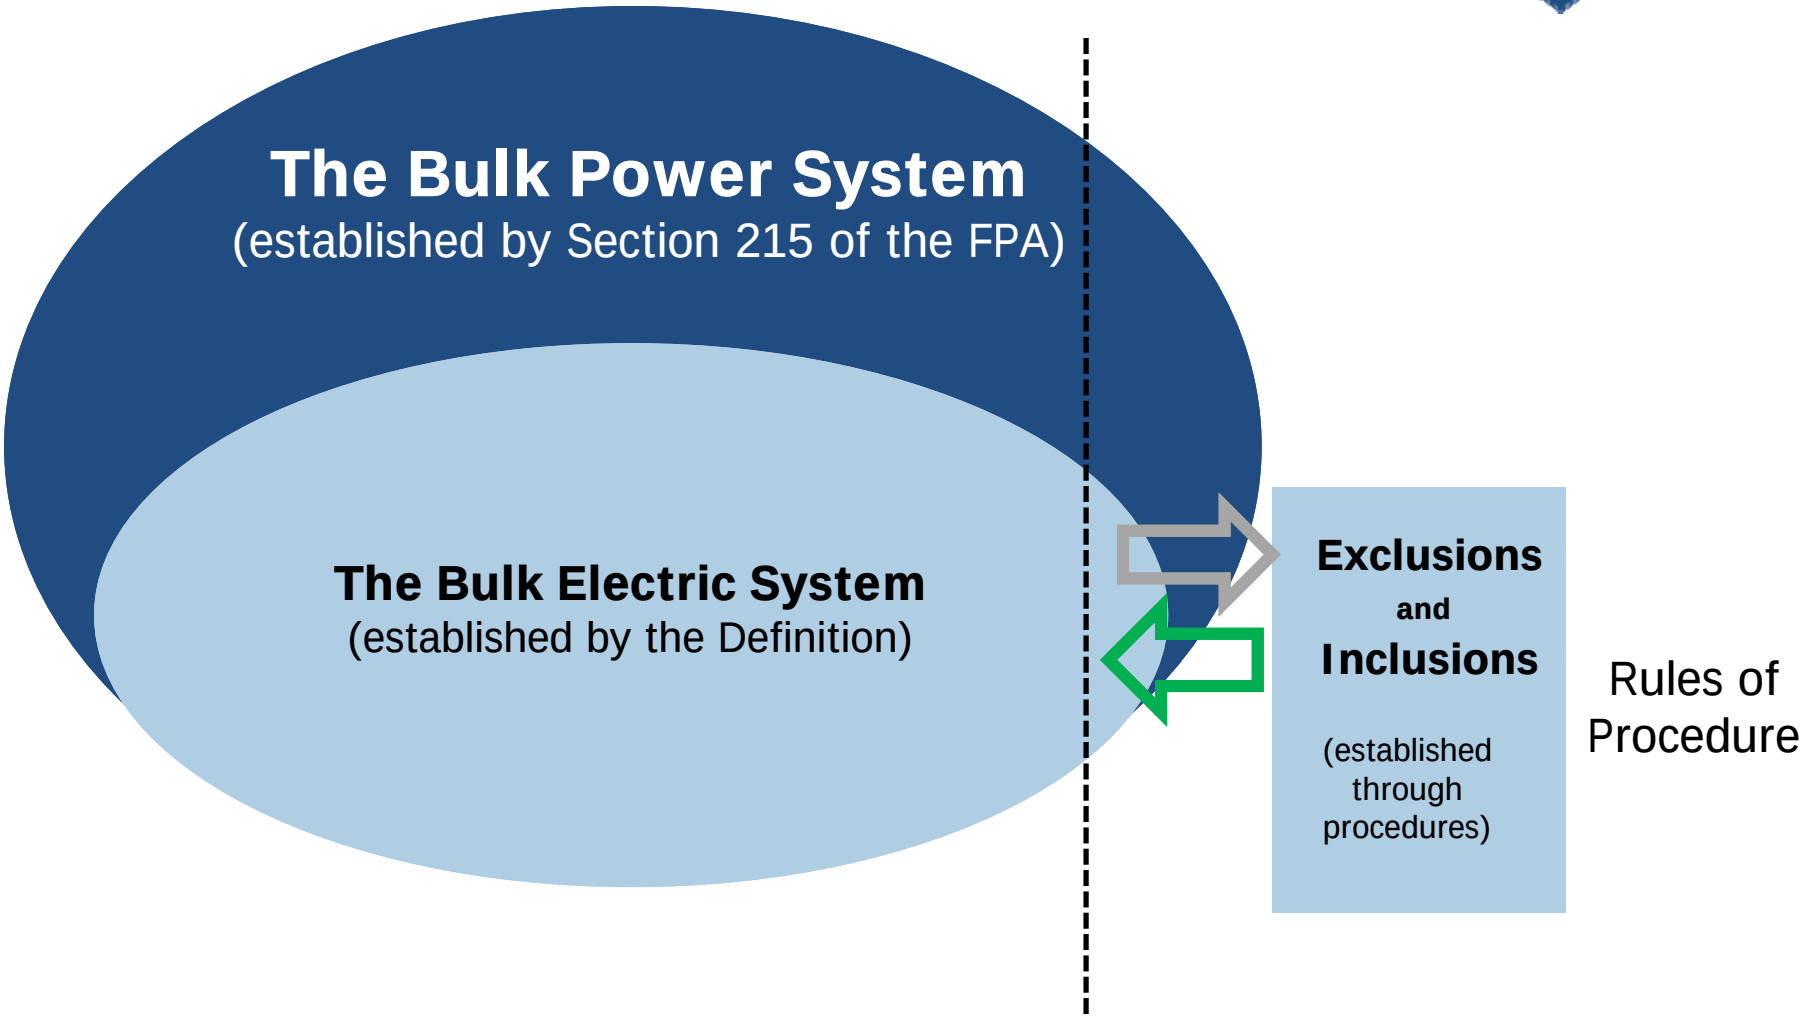
BES Definition at a Glance

- Consistent, uniform way to determine BES assets
- Effective 7/1/2014
- Transition period through 7/2016
- ERO enterprise common process and tool for implementation
- Documents and training readily available
- BES web page – one stop shopping
- Regional and NERC staff resources available to answer detailed questions and implementation

What is the Bulk Electric System?



BES 'Core' Definition

Bulk Electric System (BES): Unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

- Establishes the overall demarcation point between BES and non-BES Elements.

Inclusions

Provide additional clarification for the purposes of identifying specific Elements that are included in the BES.

I1. BES Transformers

I2. Real Power Resources

I3. Blackstart Resources

I4. Dispersed power producing resources meeting certain criteria

I5. Reactive Power Resources

Exclusions

Provide additional clarification for the purposes of identifying specific Elements that may be excluded from the BES.

E1. Radial Systems

E2. Retail Generation

E3. Local Networks

E4. Reactive Power Devices installed solely for retail customers

How to Apply the BES Definition, Inclusions, and Exclusions

Consistent methodology outlined in the BES Definition Reference Document

STEP 1: CORE DEFINITION

STEP 2: INCLUSIONS

STEP 3: EXCLUSIONS

STEP 3: EXCLUSIONS should be applied in the following sequence:

- **E2 Retail Generation** (supersedes **I2 Real Power Resources**)
- **E4 Retail Reactive Power Devices** (supersedes **I5 Reactive Power Resources**)
- **E3 Local Networks** (does not exclude interconnection facilities or generators)
- **E1 Radial Systems** (does not exclude interconnection facilities or generators)

BES Notifications

- Applies to newly self-identified inclusions to and exclusions from the BES
- Assures that entities are appropriately implementing the revised definition
- Compliance obligations cease for facilities excluded from the BES
- 24-month implementation period to bring newly-identified Facilities included in the BES into compliance

Self-Determination Notification Information Requirements

Each notification **should at a minimum include the following:**

- Current one-line diagrams
- For **E2 Retail Generation** Exclusion notifications
  - Net Capacity Transactional Data (12 months of hourly data)
  - Standby, back-up and maintenance power service documentation
- For **E3 Local Network** Exclusion notifications
  - Power Flow Transactional Data (24 months of hourly data)

BES Exceptions

Considerations:

- Applicable to all Exception Requests
- Applicable to specific Elements or groups of Elements

Must demonstrate that the requested facilities **are** (for inclusions) or **are not** (for exclusions) necessary for the reliable operation of the interconnected transmission system

Who can Submit an Exception Request?

- Owner of the Element(s)
- Regional Entity
- Entity with Scope of Responsibility for the Element(s) under consideration:
  - Regional Entity
  - Planning Authority
  - Reliability Coordinator
  - Transmission Operator
  - Transmission Planner
  - Balancing Authority

The Exception Request Process

The Main Steps in the Exception Process:

- Exception Request Submittal
- Regional Entity (RE) Initial Review
- Regional Entity Substantive Review and Recommendation
- NERC Review and Final Decision

For Additional Information

Program Areas & Departments > Reliability Assessment and Performance Analysis > Bulk Electric System (BES) Definition, Notification, and Exception Process Project Page

Bulk Electric System (BES) Definition, Notification, and Exception Process Project Page

This page contains information related to the NERC BES Definition, and the Notification and Exception Processes. The materials linked to this page are the current compilation of materials that support the application of the BES definition, and detailed materials designed to provide entities with the information needed to make uniform determinations of BES elements. This page will be continuously updated as additional materials become available. An overall schedule of training and orientation activities is included for general reference, and separate registration and logistics details will be provided as events approach.

Background

On March 20, 2014, the Commission approved the revised definition of Bulk Electric System, as envisioned in Order Nos. 743, 773 and 773-A. The definition includes bright line core criteria, with various enumerated inclusions and exclusions. As a result of the application of these BES Definition provisions, all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system will be included as BES elements. The Commission also approved the process for review of Elements on a case-by-case basis to allow for exceptions from the definition, where appropriate, as well as a process for entities to self-notify Regions of their respective determinations of BES elements. Entities should apply the definition of Bulk Electric System, including the respective inclusions and exclusions, to their asset inventory effective July 1, 2014.

An ERO enterprise-wide software application, the BES Notification and Exceptions Tool or BESNet, has been developed to support implementation of the definition. BESNet will be live on July 1, 2014 for submittal of self-notifications and exception requests, and entity administrative sign-on processes are targeted to begin mid-May.

Entities should use the BESNet to submit to their respective Regional Entity notifications of changes to Bulk Electric System assets that affect the Registered Entity's responsibilities for compliance with the Reliability Standards. BESNet is the official means of notifications to Regional Entities of newly identified inclusions and exclusions as a result of application of the definition. Entities are encouraged to have preliminary discussions with their Regional Entities prior submitting notifications for the record.

Entities also should use BESNet to request to include or exclude an Element from the Bulk Electric System on a case-by-case basis.

Introduction

NOTE: This pre-implementation manual ONLY addresses Account Management for Registered Entities. As we near the July 1, 2014, implementation date, additional sections will be made available regarding other parts of the process and application.

Entity Administrator accounts should be the first accounts set up within the BESnet Application. Once the Primary Compliance Contact has established his or her Entity Administrator account, they can then work with the other individuals within their companies to set up additional User and Administrator accounts.

This user manual provides a guided walkthrough to illustrate the BES Notifications and Exceptions Tool (BESNet). The system provides a workflow-based process that emulates the BES Exceptions Procedure, as outlined in NERC RoP Appendix 5, to route, evaluate and take actions on Exception Requests and Self-Determined Notifications.

Users have the ability to login to a secure portal and create both Exception Requests and Self-Determination Notifications. Depending upon the selection, the user is provided with the appropriate Exception or Self-Determination form to which they are able to provide details regarding the Request / Notification. Each form captures the relevant details for the Submitting and Owning Entities, Inclusion and Exclusion rules, Element Descriptions and one or more elements.

Upon completion of the form, the Entity is able to submit the Request / Notification. The system will automatically notify all appropriate parties of the submission. This includes Submitting and Owning Entities, Scope of Responsibility Entities, Regional Entities and NERC. BESNet provides facilities for Regional Entities to acknowledge notification elements and process Exception Requests, request and receive supplemental information, alert and notify participants, issue recommendations, and monitor periodic re-certification of requests. In addition, NERC can create proposed and final decisions, as well as manage appeals to those decisions.

Queries have been created for accessing information about Exception Requests and Notifications enabling the BESNet to produce a list of facilities and Elements for which: 1) exceptions to the definition have been granted and 2) self-determination Notifications have been submitted. NERC will publicly post reports on its website that will provide interested persons, including applicable governmental authorities, information regarding submitted Exception Requests that may be of interest to them.

BESNet Program Cautions

The following cautions should be followed when using the BESNet program.

A. DO NOT use the back button in your browser.

B. Be sure to scroll right and left within your browser (depending on your screen resolution) to ensure that all required information can be entered in the browser.

Version History

The following is the history of changes to this document.

Version	Date	Change(s) Made	Change Tracking
1-0	May 9, 2014	Initial Release – User Account Management Section only	

User Account Management

Introduction

The BESNet application operates within the framework of the ERO Enterprise Platform which includes several applications such as the NERC Standards Balloting System.

Note – If you already have an ERO Platform Account (for the new Standards Balloting System), please proceed to Setting up New Account in the BESNet Application section of this User Guide.

Creating a New Account

If you do not have an existing ERO Platform user ID, you will need to create a new account for the BESNet application. The new user must supply user profile information and identify the organization the user represents.

Once an account is created, an administrator will vet the user as a person for role-based, individual access to the system. Once vetted, a user will be notified through email that they can login to the system.

Creating Account Step 1: User Name and Password

Navigate to the BESnet application. Contact your Entity BESnet Administrator for the URL to the application.

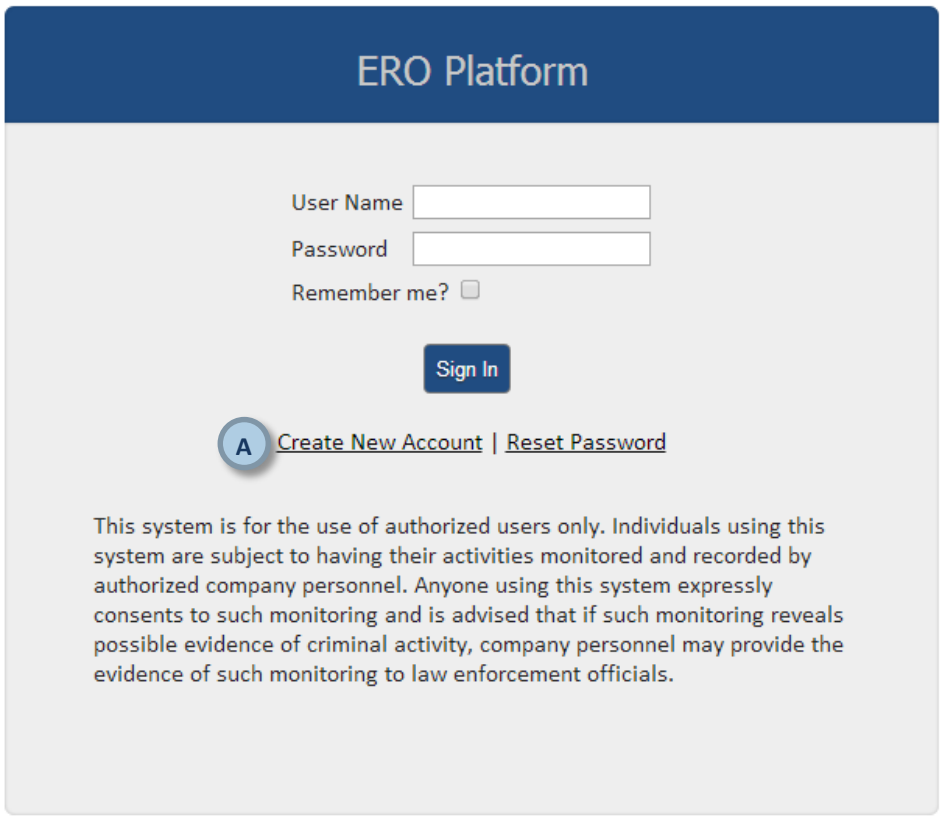

Figure 1: ERO Platform Login Screen

A. Click on **Create New Account** (A). The following screen will appear.

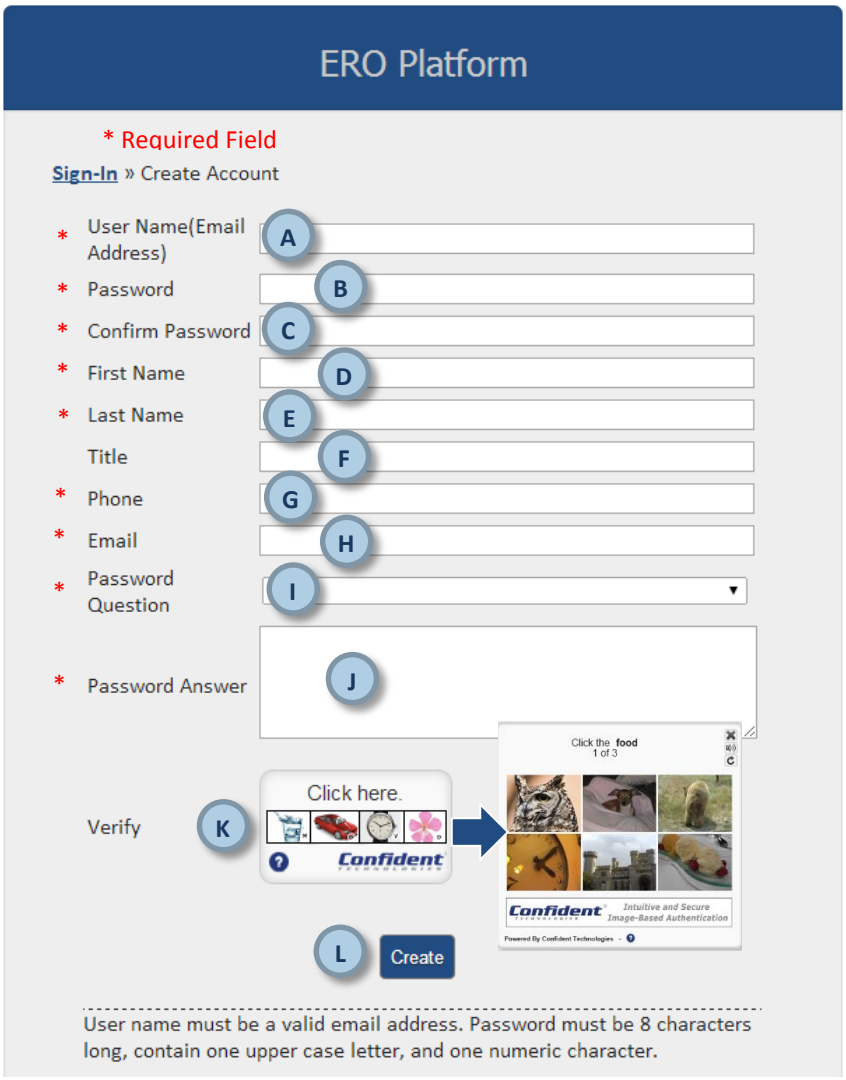

Figure 2: Create Account Screen

To create a new account,

A. Enter a **User Name** (MUST be a business email address - this can be the same email in step H).
B. Enter a **Password**. As the on-screen instructions indicate, this password:
    a. Must be at least eight (8) characters in length.
    b. Must contain at least one uppercase letter.
    c. Must contain at least one numeric character.
C. Re-enter the **Password**.
D. Enter the user's **First Name**.
E. Enter the user's **Last Name**.
F. Enter the user's **Title**.
G. Enter a valid business **Phone Number** where the user may be reached.
H. Enter an **Email Address**. This ***MUST*** be a valid email address, as it will be used to send ***ALL*** notifications of actions and status updates within the system. Both **User Name** and **Email Address** may be the same.
NOTE: Changing this field does not change a user's username.
I. For security purposes, select a **Password Question** from the list of questions.
J. Enter the **Password Answer** to the security question (I).
K. Select the **Verify** icon (K). Several images display. Select the correct image of each description as instructed until all three pictures have been verified.
L. Click the **Create** button (L).

Creating Account Step 2: Verify Account

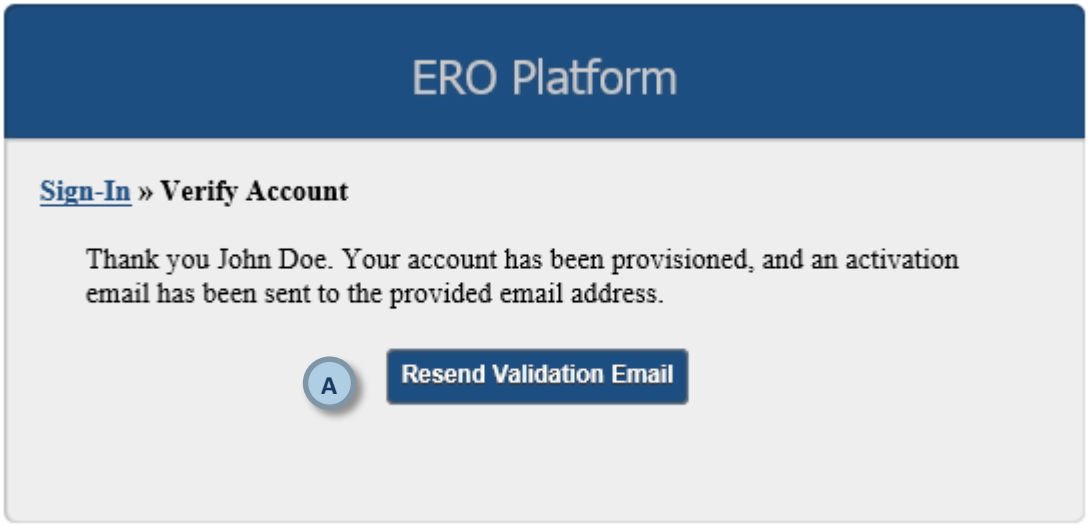

Figure 3: Verify Account Screen

Upon successful verification of the account information provided on the **Create Account** form, a verification email will be sent to the email account used to create your user account.

A. If you have not received the activation email, SELECT the **Resend Validation Email** (A) to have the activation email resent to the email address provided.

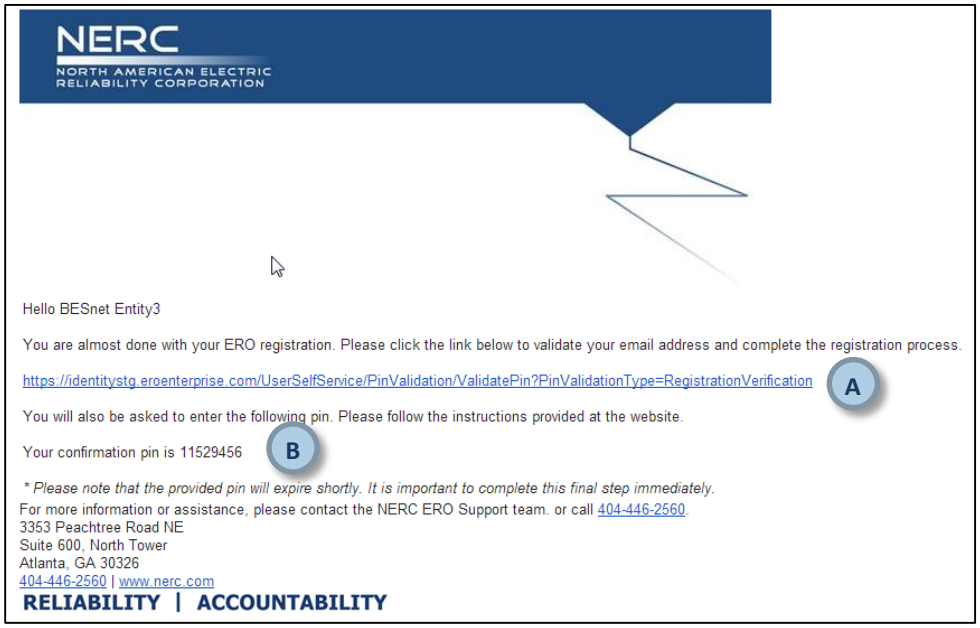

Figure 4: Sample Activation E-Mail

A. Click on the **link** (A) provided in the verification email above. The following screen will appear:

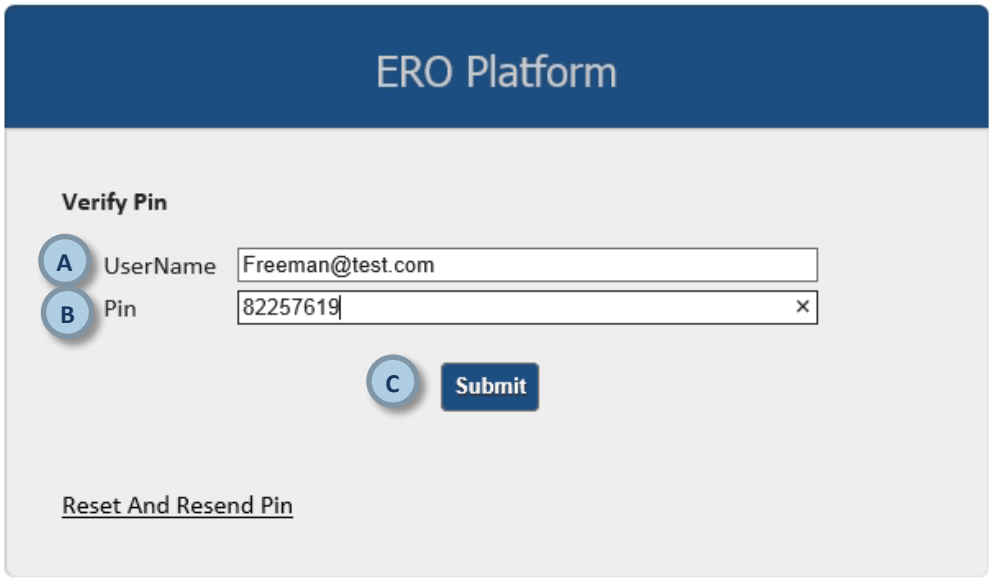

Figure 5: PIN Verification Screen

A. Enter your **User Name** (A).
B. Enter the **PIN** (B) contained in the verification email.
C. Click **Submit** (C).

PIN Expiration Procedure

If the PIN has expired, the following screen will appear:

NOTE: PINs expire 60 minutes after issuance.

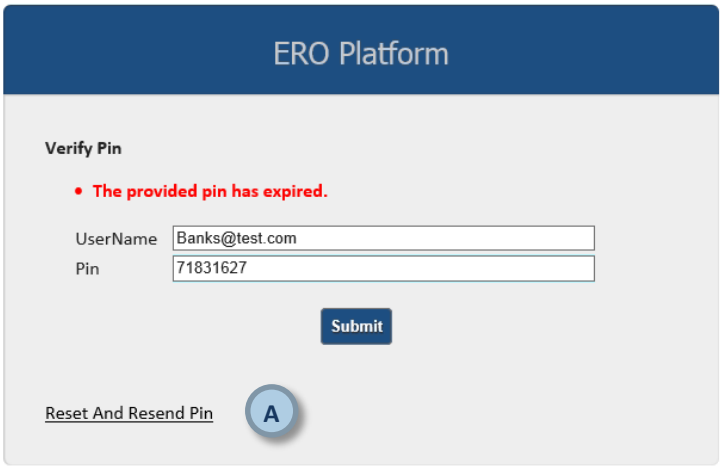

Figure 6: PIN Expiration Screen

A. Click on **Reset and Resend PIN** (A). A new verification email will be sent with a new PIN.

Once you have successfully created a user ID and it has been verified, the **ERO Platform Screen** will appear.

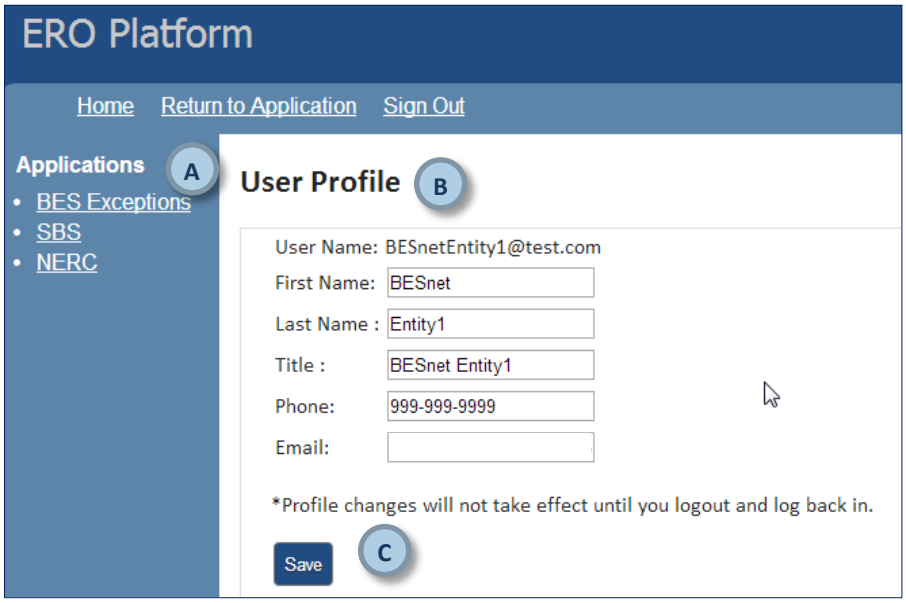

Figure 7: ERO Platform Screen

A. To enter the BESNet application, click on **BES Exceptions** (A).
B. At this screen, you also have the opportunity to modify your **User Profile** (B).If you have updated your profile, click **Save** (C) to save the changes.
Note: You will have to logout of the application and log back in for the profile changes to take effect.

Logging Into the BESNet Application

For users who already have an account, navigate to the BESnet application. Contact your Entity BESnet Administrator if you do not have the URL to the application.

A. Enter the **User Name** (A).
B. Enter the **Password** (B) entered during the user registration process defined in Section **Creating a New Account.**
C. If desired, check the **Remember me?** (C) Checkbox, which gives permission for the system to remember the credentials entered.
D. Once completed with these fields, complete the login process by pressing the **Sign In** (D) button.

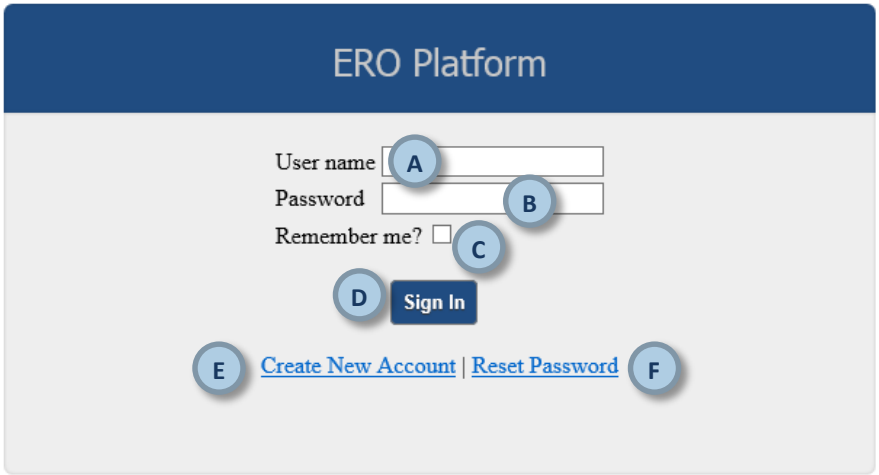

Figure 8: ERO Platform Log-In Screen

For users who do not have an account:

E. Click the **Create New Account** (E) link. See Section **Creating a New Account** for more details.

To reset your password.

F. Click the **Reset Password** (F) link. See Section **Resetting the User Password** for more details.

Selecting the User's Entity to Use

If the User has been vetted as a representative for more than one Entity, the User will first be prompted to select the Entity they wish to represent for the current session. Users who are only vetted for a single Entity will skip this step.

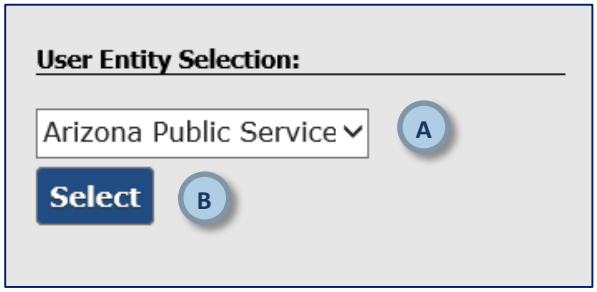

Figure 9: User Entity Selection Screen

To identify the Entity the User will represent during this session:

A. Select the **Entity Name** (A) from the Entity list. Only those for which this User has been vetted will appear.
B. Click the **Select** (B) button.

Setting up Your BESNet Application Account

Once your BESNet User ID has been established, you will need to finish setting up the functions of the new account. Navigate to the BESnet application. Contact your Entity BESnet Administrator is you do not have the URL to the application.

You will be shown your user profile.

Select the BES Exceptions tab on the left (A) of the **ERO Enterprise Platform Entry Page**.

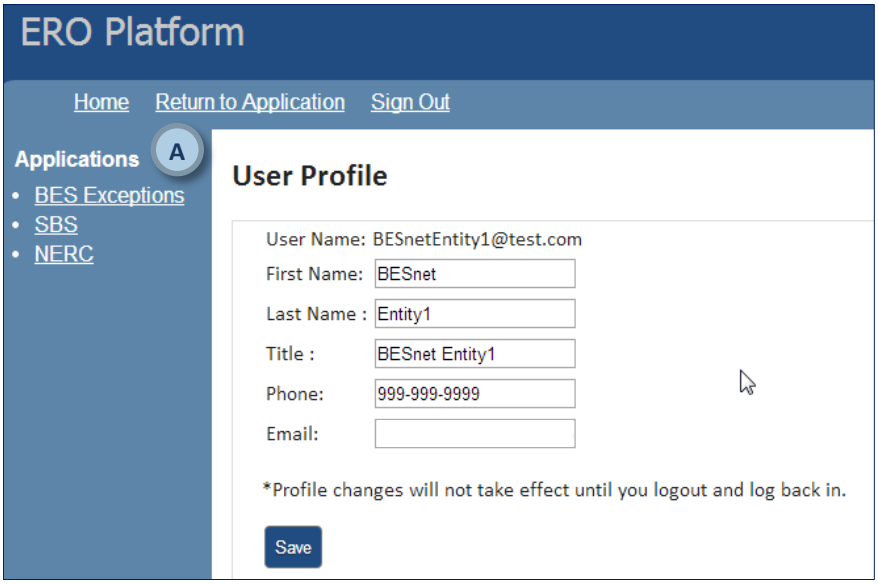

Figure 10: ERO Enterprise Platform Entry Page

Account Setup Step 1: Select Account Type

You must select an **Account Type**. Registered Entities may only select the Registered Entity account type.

A. Select Registered Entity as your **Account Type** (A).

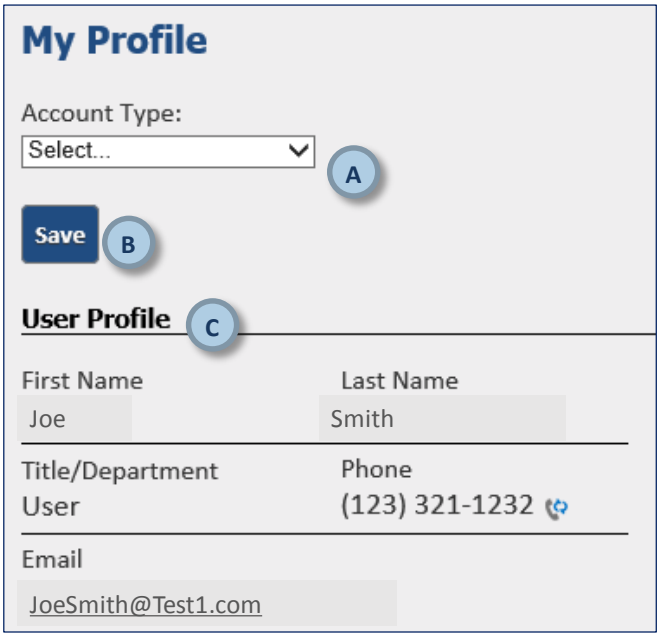

Figure 11: Account Type Selection Screen

Account Type	Description
Registered Entity	Accounts for members of the entities registered with NERC and/or the national Regions. Includes members of submitting, owning, and scope of responsibility entities.

NOTE: Each user account may only be created for a single account type. Account type selection is only available one time following new account creation. ***The account type cannot be changed once it has been selected.***

B. Click the **Save** button (B). This will take you to the **My Profile** screen.

NOTE: The user's profile information entered during the first step of account creation appears in the ***User Profile*** *area (C).*

Account Setup Step 2: Association of Account with Entities

The next step in the registration process is to associate the user's account with one or more Entities on the **My Profile Screen**.

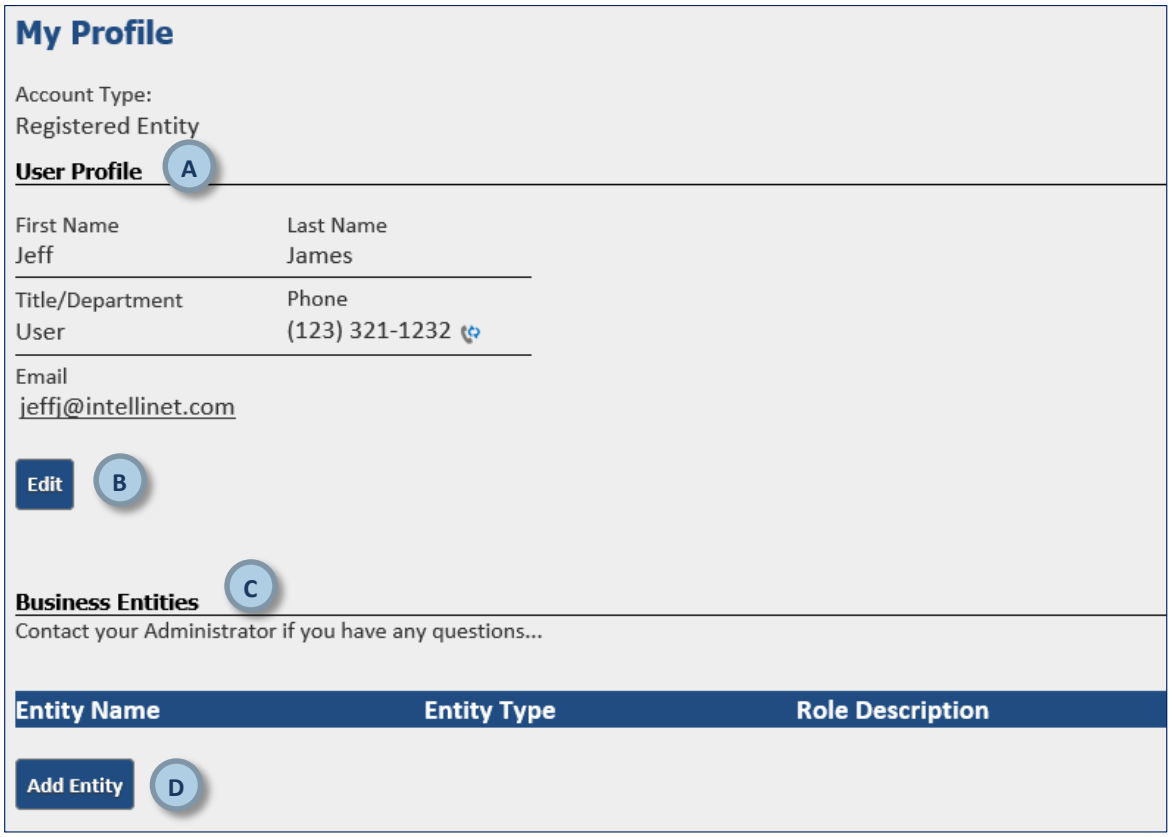

Figure 12: My Profile Screen

The next step in the registration process is to associate the account with one or more Entities.

A. View the User Profile information in the **User Profile** section (A).
B. If desired, edit the **User Profile** information by clicking the **Edit** button (B). See the **Editing Your User Profile** section for further details.
C. View the listing of the **Business Entities** (C) with which the account is currently associated in the **Business Entities** list. When initially registering, this list will be empty.
D. To associate the account with an Entity, click the **Add Entity** button (D). This displays the **Entity Listing Screen** allowing you to select the Entities to be applicable to this User.

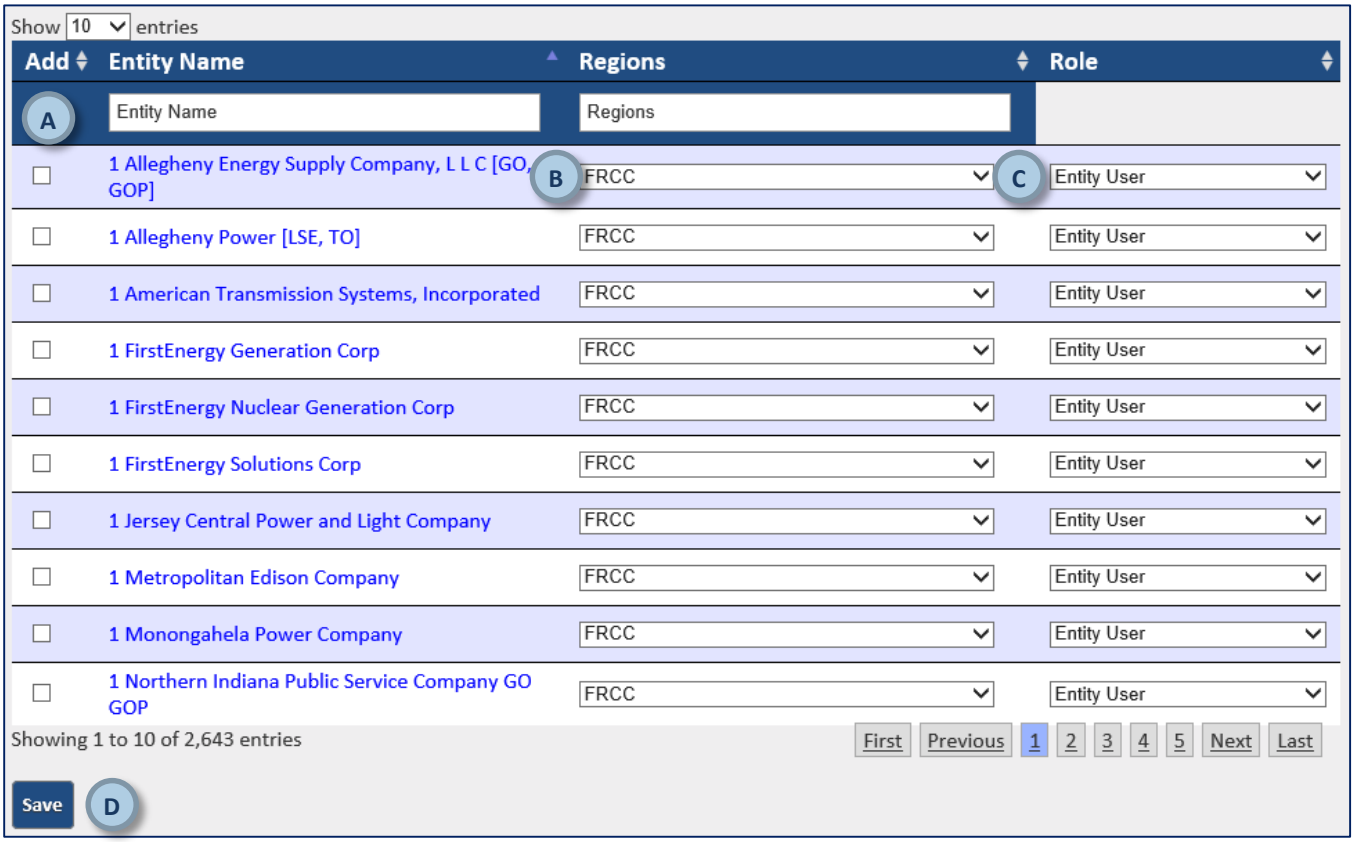

Figure 13: Entity Selection Screen

A. From this list, select the Entity to associate with the account by clicking the checkbox to the left of the Entity record, in the **Add** column (A).
   a. The Entity listing can be filtered by typing in the **Entity Name** filter textbox in the header (directly beneath the **Entity Name** label).

B. Select the **Region** (B) that will be responsible for vetting the user account if an administrator for this Registered Entity does not yet exist in the system. (If there is an Entity Administrator role already associated to the Registered Entity, a vetting request will be sent to that Entity Administrator).

   NOTE: Choosing the Regional Entity in this screen does not associate a Registered Entity to a Region within the system; this is only used for vetting requests for account access.

   NOTE: If you do not see your Entity listed in the list, contact your Regional Entity.

C. Select the **Role** (C) the account will perform for that Entity. Roles are:
   a. Entity User: A general user of the system.
   b. Entity Administrator: A user who has the ability to vet user accounts for that Registered Entity, as well as perform all functions of the Entity User role.

   NOTE: The system does not allow a user to change his or her role for an Entity. Instead, the Entity Administrator must remove the user's association with the Entity, after which the user must submit a new request to be associated to the Entity with the new role.

D. **Repeat steps A through C for each Entity to be associated with the account**. When complete, click the **Save** button(D). This will bring up the **Vetting Request Confirmation Screen**. This confirms that your request has been submitted to be vetted by the Entity Administrator(s) associated for each selected Entity (See the **Vetting Users** section for further detail), and the following screen will be displayed.

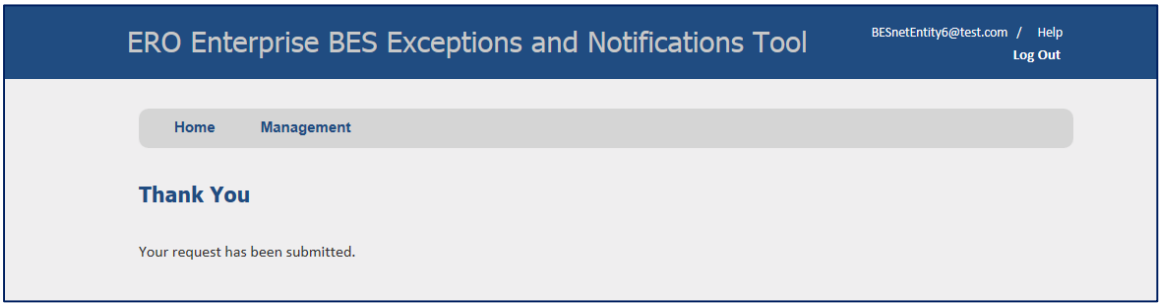

Figure 14: Vetting Request Confirmation Screen

The Entity User will be notified by e-mail when each association request has been vetted (approved or rejected).

If a request for association with an Entity has been rejected, there will be an e-mail notification that you have been rejected.

If the User has not received a vetting response within five business days, contact your Regional Entity or your Entity Administrator.

Once the account user has received notification that the request has been vetted and approved, the user will see the Entities associated with his account in the **My Profile Screen (A)**.

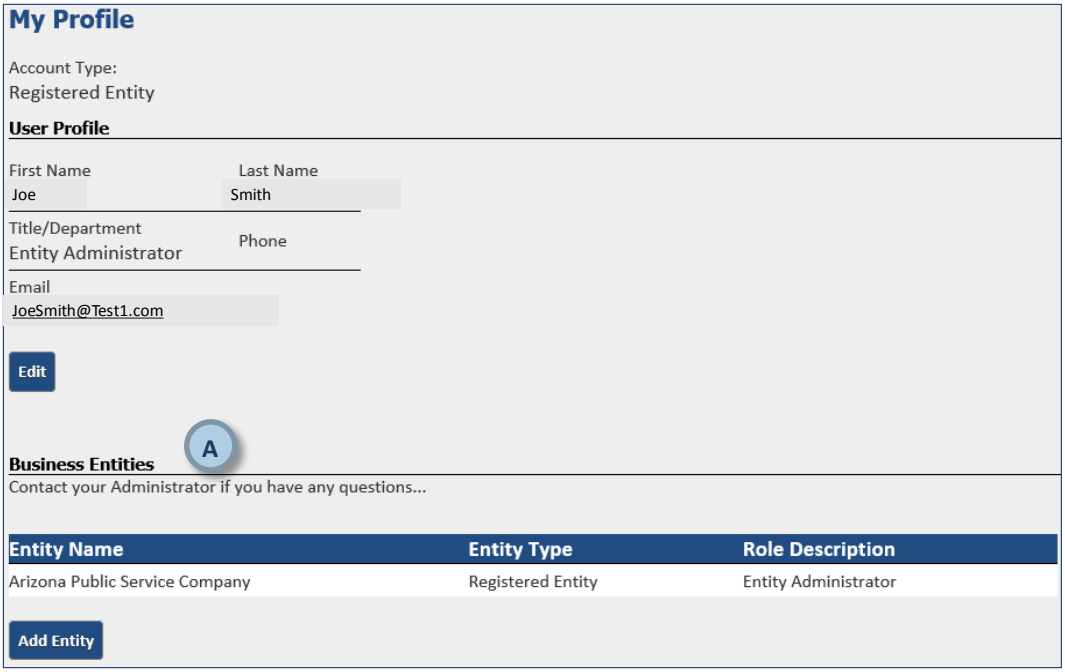

Figure 15: My Profile Screen with Entity Association

The user can then access the information for that Entity in the BESNet application.

Editing Your User Profile

To update your User Profile, enter the desired update(s) in the appropriate field on the **User Profile Screen** and press **Save** (A).

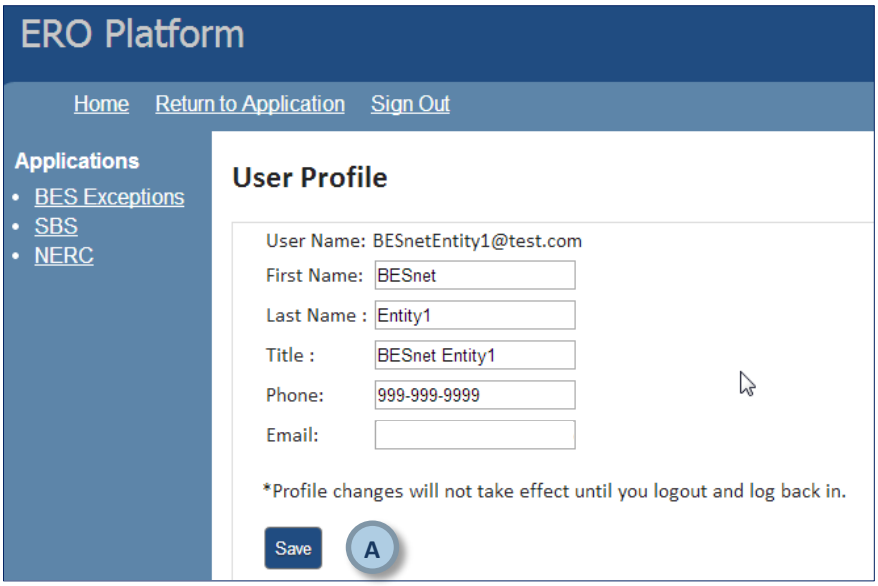

Figure 16: User Profile Screen

If your profile changes have been successful, the **Profile Update Confirmation Screen** will be displayed.

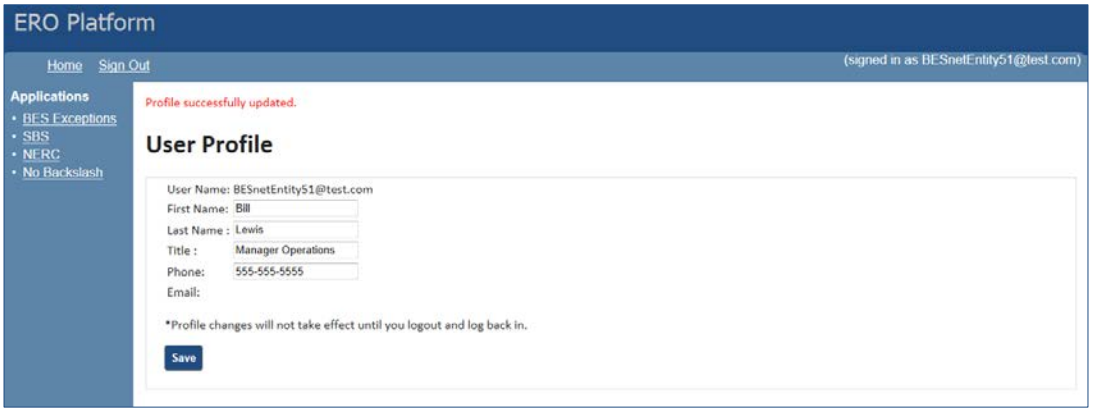

Figure 17: Profile Update Confirmation Screen

Log out and back into the BESNet application.

NOTE: Profile changes will NOT take effect until you log out and log back into the BESNet application.

Password Management

Changing User Password

A. If a User wishes to change his password, he should hover over the **User** tab in the header of the **BESNet Dashboard** and then click on the **My Profile** tab in the dropdown. This will bring you to the **My Profile Screen**.

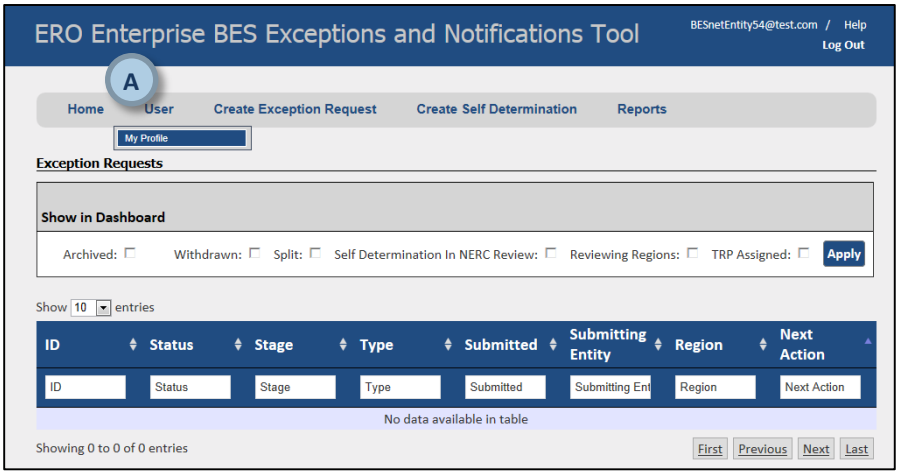

Figure 18: BESNet Home Page

B. Click on the **Edit** button (A) on the **My Profile Screen**. This will bring you to the **User Profile Screen**.

Figure 19: My Profile Screen

C. Click on the **Reset Password** link (A) under **Password** on the **User Profile Screen**.

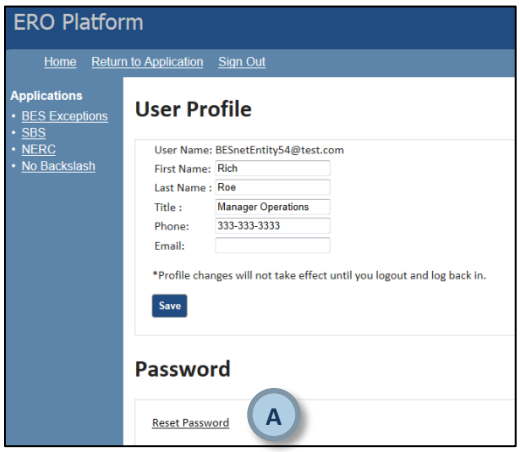

Figure 20: User Profile Screen

D. Continue from **Step B** of the **Forgot/Resetting the User Password** instructions below.

Forgot/Resetting the User Password

If a user has forgotten his password, the password must be reset.

A. To reset a user's password, the user should select **Reset Password** (A) from the **ERO Platform Log-In Screen**. The system then displays the **Password Reset Screen**.

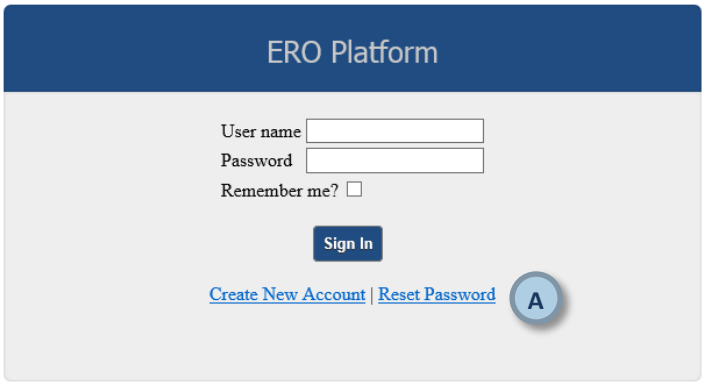

Figure 21: ERO Platform Log-In Screen

B. From the **Password Reset Screen**, the user can
- Enter the **User Name** (A).
- Enter the **Email Address** (B) associated to the Account
- Select the **Verify** icon (C). Several images display. Select the correct image of each description as instructed until all three pictures have been verified.
- Click the **Submit** (D) button.

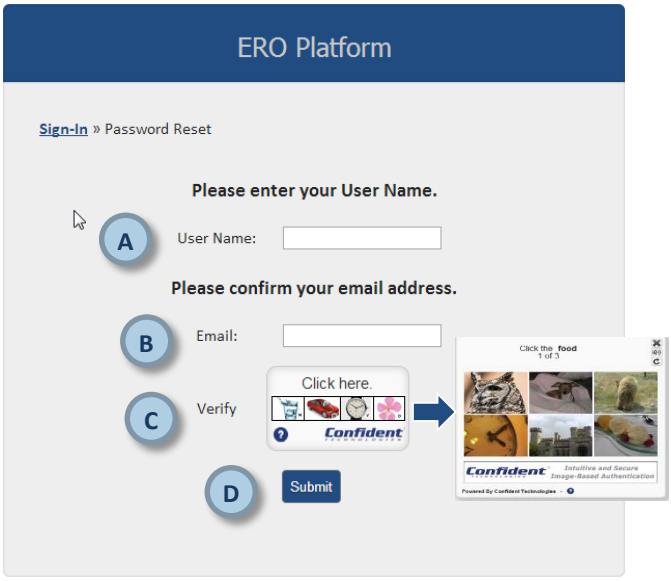

Figure 22: Password Reset Screen

C. The BESNet application will send a **Password Reset Request E-mail** to the user and display the **Password Reset Validation Screen**. If necessary, the User can request that the **Password Reset Request E-mail** be resent pressing the **Resend Validation Email** (A).

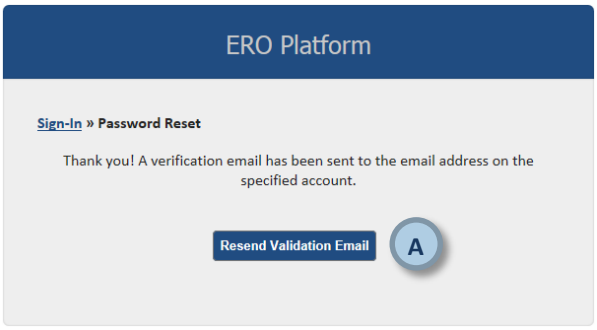

Figure 23: Password Reset Validation Screen

D. The User should then copy the **Confirmation Pin** (A) and click on the **URL** (B) for to change the password

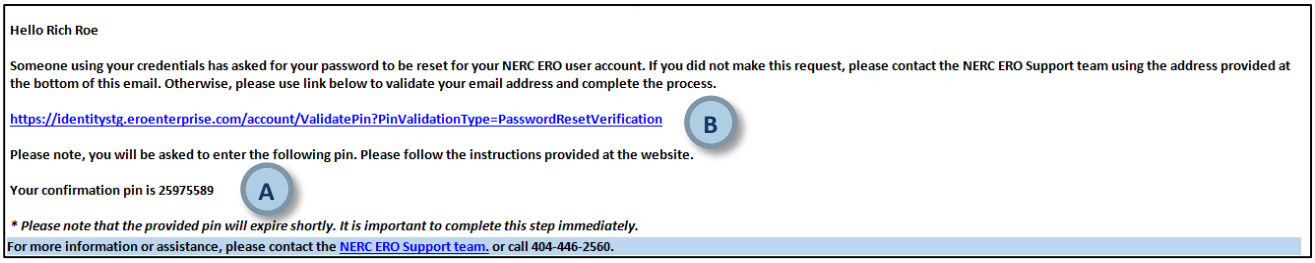

Figure 24: Password Reset Request E-mail

E. The User should then enter his **User Name** (A) and paste the **PIN** (B) on the **Verify Pin Screen** and press **Submit** (C).

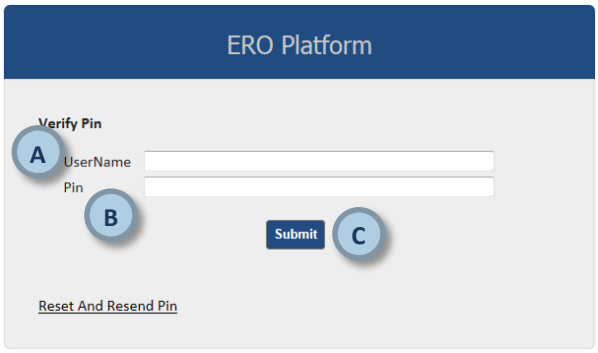

Figure 25: Verify Pin Screen

F. Once the PIN has been entered, the User must enter the **Password Answer** (A) selected during the registration process and click the **Submit Question** (B) button on the **Password Recovery Screen.**

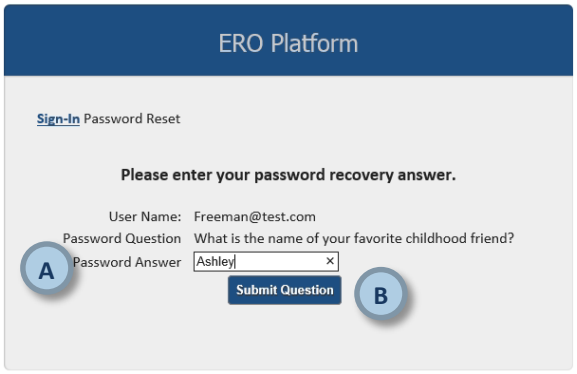

Figure 26: Password Recovery Screen

G. The User should then enter the desired **New Password** (A), Confirm Password (B), and click the **Save Password** (C) button on the **Enter Net Password Screen**.

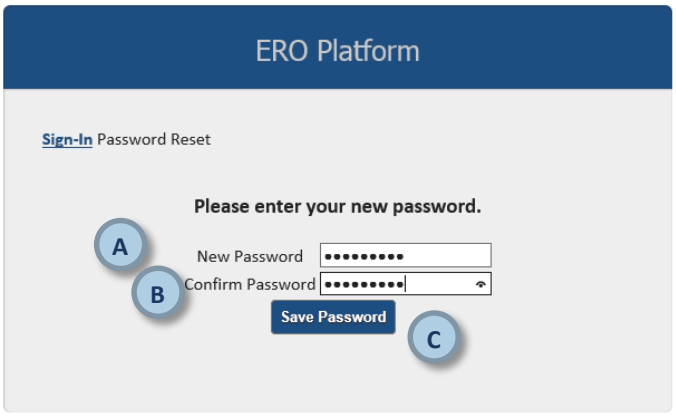

Figure 27: Enter New Password Screen

H. The BESNet application will send a **Password Change Confirmation E-mail** to the user and display the **User Profile Screen**.

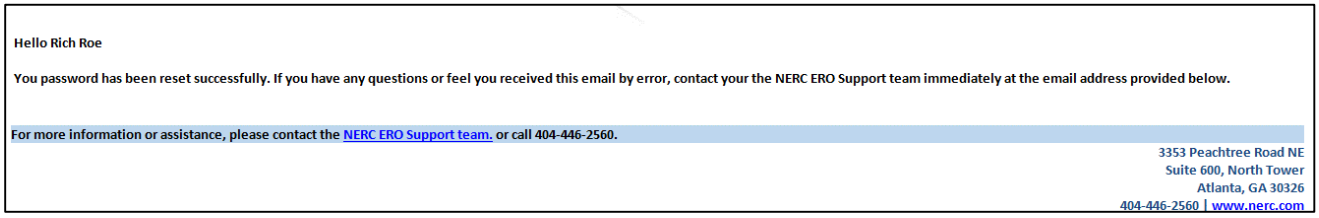

Figure 28: Password Change Confirmation E-mail

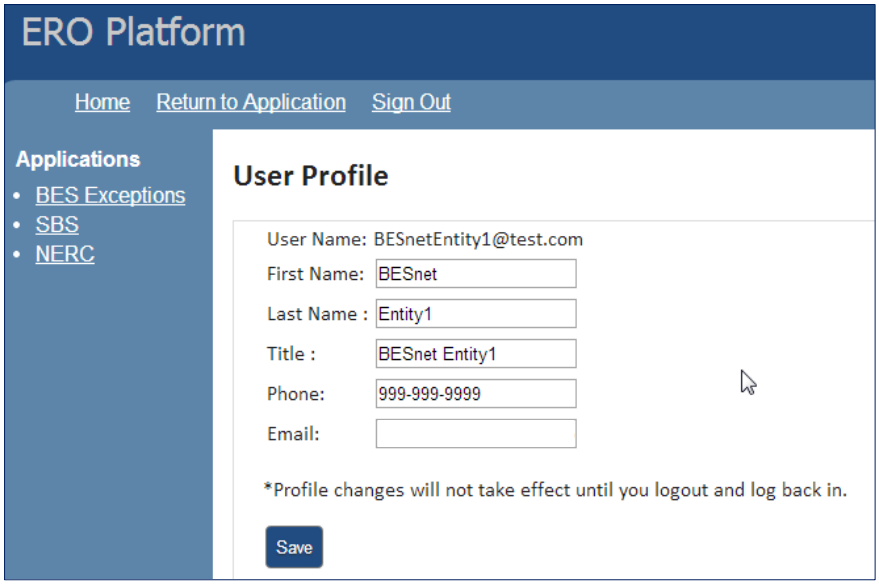

Figure 29: User Profile Screen

Managing Your User Account Properties

A User of the BESNet application can manage their account properties whenever they are logged on to the system. This allows them to edit their user profile or associate themselves with a new Entity. User can access their user account properties in one of two ways:

A. Clicking on the **User Name** in the upper right corner of the BESNet application screen.

Figure 30: BES Application Screen Header

A. Selecting **User > My Profile** from the dashboard menu.

Figure 31: Dashboard Menu Detail

These will display the **User Profile Management** screen.

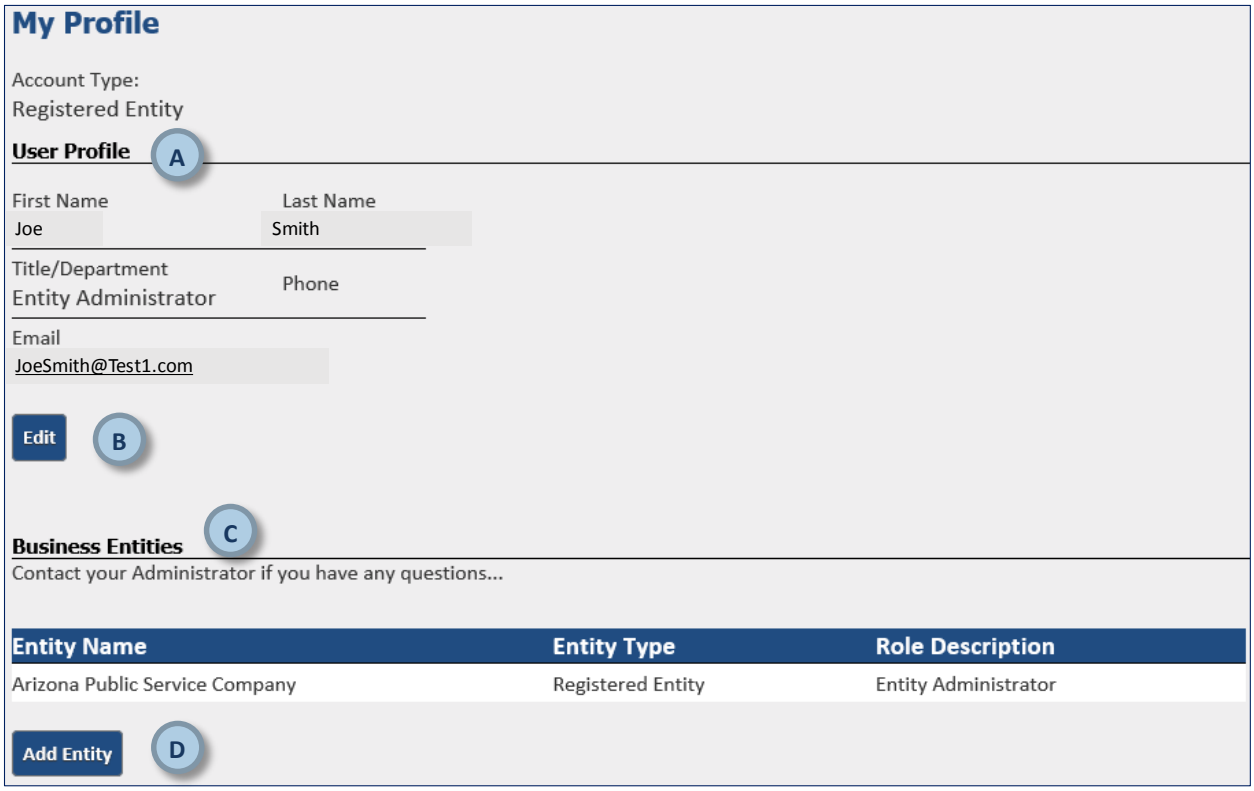

Figure 32: User Profile Management Screen

From here the user can:

A. View the **User Profile** (A) information.
B. Edit the **User Profile** information by clicking the **Edit** button (B).
C. View the listing of **Business Entities** (C) for which the user has access or has requested access.
D. Add an additional Business Entity request, by clicking the **Add Entity** (D) button.

Logging Out

To log out of the system, click the **Log Out** link (A) at the upper right of the BESNET system screen.

Figure 33: BESNet System Screen Header

Administrator User Account Management

Administrative User Management

The Administrator of a Registered Entity has the ability to vet new user account requests and manage users' roles within the Entity.

The Administrator will be notified by email of new user account requests.

To perform this function, on the **BESNet Dashboard** the Administrator should click **User** > **User Administration** pull-down menu (A).

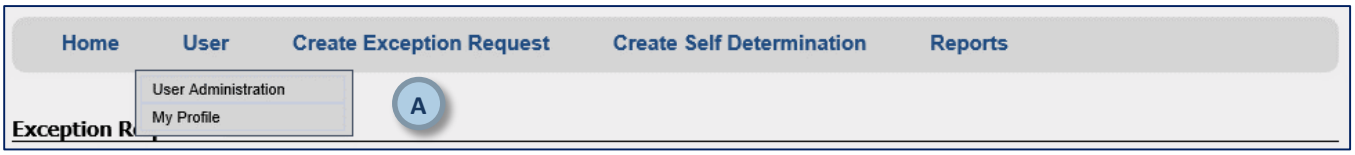

Figure 34: BESNet Dashboard Header

Vetting New Users

On the **User Management Screen**, the Administrator will see a **Vet Requests** list, containing a listing of all users who have requested accounts associated with the Registered Entity for which the user has Administrative privileges.

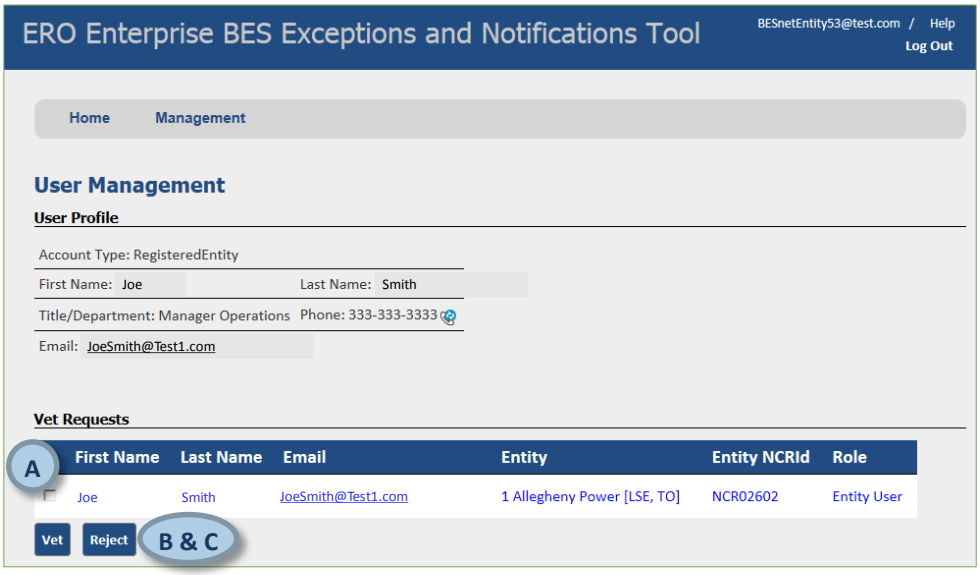

Figure 35: User Management Screen

A. Check the checkbox (A) next to each record to select it as one to approve or reject.
B. To approve the selected request(s), click the **Vet** button (B).
C. To reject the selected request(s), click the **Reject** button (C).

The decision to approve or reject the request will be e-mailed to the user.

User Role Management

The Administrator is responsible for management of the roles of all of the users within his purview.

A. To perform this function, on the **BESNet Dashboard** the Administrator should click **User** > **User Administration** pull-down menu (A). This will bring you to the User Management Screen

Figure 36: BESNet Dashboard Header

The **User Management** on the lower part of the **User Management Screen** displays a list of all users for which the user has Administrator privileges.

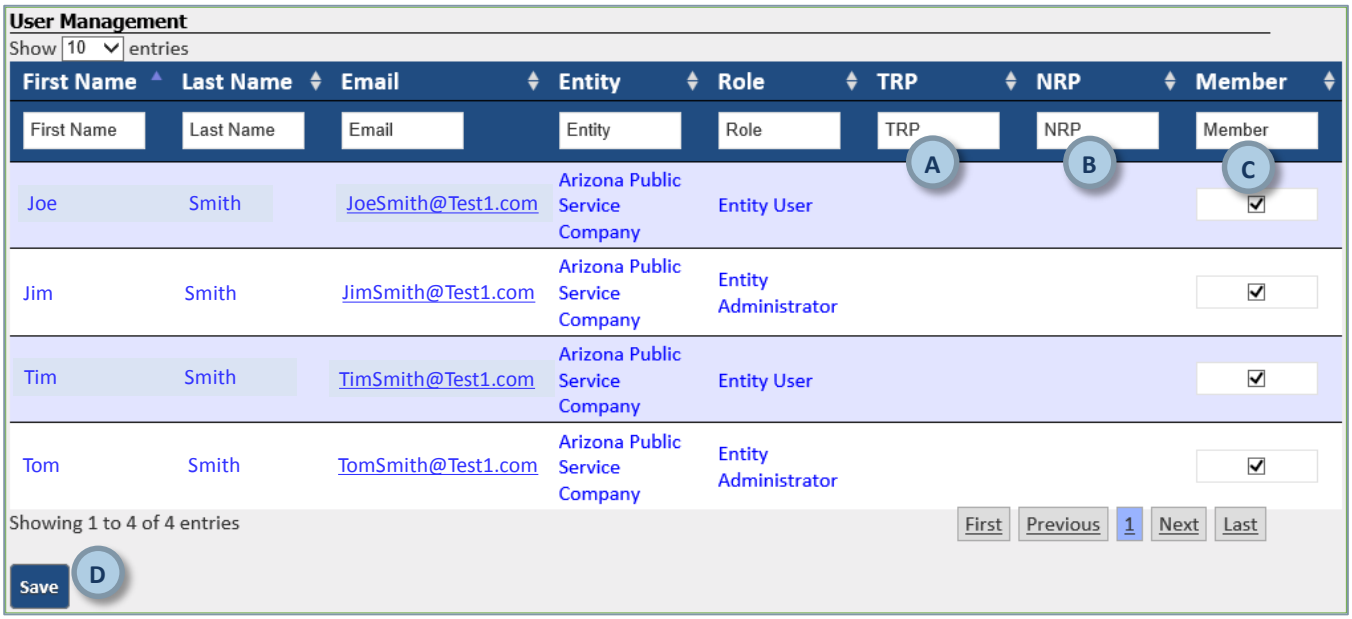

Figure 37: User Management Screen

A. The **Technical Review Panel** (TRP) membership can only be set by a **Regional Administrator**, and therefore cannot be set here.
B. The **NERC Review Panel** (NRP) membership can only be set by a **NERC Administrator**, and therefore cannot be set here.
C. To disassociate a user account from the Entity, uncheck the **Member** checkbox (C) for that account/Entity relationship. By default, all vetted members appear checked in the **Member** checkbox (C).
D. Once all the role changes have been made, click the **Save** button (D).

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Request for Public Comment on Proposed Request for Data or Information

Survey Regarding the Scope of the Term "BES Cyber Asset"

5/30/2014

RELIABILITY | ACCOUNTABILITY

Introduction and Survey Scope

The North American Electric Reliability Corporation ("NERC") requests public comment by 8:00 p.m. EST, July 14, 2014 on its proposal to collect data (the "Data Request") pursuant to Section 1600 of the NERC *Rules of Procedure* ("ROP")[1] regarding the scope of the term "BES Cyber Asset," as defined in NERC's *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary"). Comments must be submitted in an electronic document to BESCyberAssetSurvey@nerc.net.

After the close of this comment period, NERC will make any necessary revisions to the proposed Data Request based on comments received and submit the proposed Data Request, as revised, along with the comments received, NERC's evaluation of the comments, and recommendations, to the NERC Board of Trustees for authorization to issue the Data Request. Upon NERC Board of Trustees approval, the proposed Data Request will be issued and become mandatory.

In accordance with Section 1600 of the ROP, NERC may request data or information from Registered Entities that is necessary to meet NERC's obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d)[2] of the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission").

The purpose of the proposed Data Request is to respond to FERC's directive from Order No. 791[3] to conduct a survey regarding the scope of the term "BES Cyber Asset" and submit an informational filing based on the data collected. Specifically, in Order No. 791, FERC approved new and modified Critical Infrastructure Protection ("CIP") Reliability Standards, referred to as the CIP Version 5 Standards, as well as new and modified terms to be incorporated into the NERC Glossary. Among others, FERC approved the following definition for the term "BES Cyber Asset":

> A Cyber Asset that if rendered unavailable, degraded, or misused would, *within 15 minutes of its required operation, misoperation, or non-operation*, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. (*Emphasis added*)

To better understand the scope and reach of the term "BES Cyber Asset," the Commission directed NERC to conduct a survey of responsible entities during the implementation period for the CIP Version 5 Reliability Standards to determine the types of Cyber Assets that are included

[1] NERC's *Rules of Procedure* are available at: http://www.nerc.com/files/NERC_Rules_of_Procedure_EFFECTIVE_20111117.pdf.

[2] 18 C.F.R. § 39.2(d) (2013).

[3] *Version 5 Critical Infrastructure Protection Reliability Standards*, Order No. 791, 145 FERC ¶ 61,160 (2013).

or excluded from the definition of BES Cyber Asset due to the 15-minute parameter.[4] Based on the survey data, NERC is required to explain, in an informational filing due within one year of the effective date of Order No. 791, the following: (1) specific ways in which entities determine which Cyber Assets meet the 15-minute parameter; (2) types or functions of Cyber Assets that are excluded from being designated as BES Cyber Assets and the rationale as to why; (3) common problem areas with entities improperly designating BES Cyber Assets; and (4) feedback from each region participating in the implementation study on lessons learned with the application of the BES Cyber Asset definition.[5] This proposed Data Request is designed to satisfy the Commission's directive to conduct a survey of responsible entities on the scope of the term "BES Cyber Asset" and to collect the data necessary for the informational filing.

This request for public comment satisfies NERC's obligation under Section 1602.2 of the ROP to post a proposed Data Request for a 45-day public comment period prior to obtaining NERC Board of Trustee authorization to issue the Data Request.[6] In accordance with Section 1602.2.1 of the ROP, this request for public comment contains the following information:

1. a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements;

2. a description of how the data or information will be collected and validated;

3. a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("Reporting Entities");

4. the schedule or due date for the data or information;

5. a description of any restrictions on disseminating the data or information (e.g., "confidential," "critical energy infrastructure information," "aggregating" or "identity masking"); and

6. an estimate of the relative burden imposed on the reporting entities to accommodate the data or information request.

[4] Order No. 791 at PP 123-125.

[5] Order No. 791 at P 124.

[6] Consistent with Section 1602.1, NERC provided the proposed Data Request to the Commission's Office of Electric Reliability on April 18, 2014.

NERC Contact Information

If you have any questions regarding this request for public comment, please contact Scott Mix, CIP Technical Manager, Critical Infrastructure Department, at 215-853-8204 or by e-mail at Scott.Mix@nerc.net.

Authority

Under Section 215 of the Federal Power Act (16 U.S.C. § 824o), Congress entrusted FERC with the duties of approving and enforcing rules to ensure the reliability of the Nation's Bulk Power System, and with the duties of certifying an Electric Reliability Organization ("ERO") that would be charged with developing and enforcing mandatory Reliability Standards, subject to FERC approval. NERC was certified as the ERO on July 20, 2006. NERC's authority for issuing this survey is derived from Section 215 of the Federal Power Act, and from the following sources:

Section 39.2(d) of the Commission's regulations (18 C.F.R. §39.2(d)), which provides:

> Each user, owner or operator of the Bulk-Power System within the United States (other than Alaska and Hawaii) shall provide the Commission, the Electric Reliability Organization and the applicable Regional Entity such information as is necessary to implement section 215 of the Federal Power Act as determined by the Commission and set out in the Rules of the Electric Reliability Organization and each applicable Regional Entity. The Electric Reliability Organization and each Regional Entity shall provide the Commission such information as is necessary to implement section 215 of the Federal Power Act.

NERC Rules of Procedure Section 1600, which provides:

> ***1601. Scope of a NERC or Regional Entity Request for Data or Information***
>
> *Within the United States, NERC and regional entities may request data or information that is necessary to meet their obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of the Commission's regulations, 18 C.F.R. § 39.2(d). In other jurisdictions NERC and regional entities may request comparable data or information, using such authority as may exist pursuant to these rules and as may be granted by ERO governmental authorities in those other jurisdictions. The provisions of Section 1600 shall not apply to requirements contained in any Reliability Standard to provide data or information; the requirements in the Reliability Standards govern. The provisions of Section 1600 shall also not apply to data or information requested in connection with a compliance or enforcement action under Section 215 of the Federal Power Act, Section 400 of these Rules of Procedure, or any procedures adopted pursuant to those authorities, in which case the Rules of Procedure applicable to the production of data or information for compliance and enforcement actions shall apply.*

1602. Procedure for Authorizing a NERC Request for Data or Information

1. *NERC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to the Office of Electric Reliability is for the information of the Commission. NERC is not required to receive any approval from the Commission prior to posting the proposed request or modification for public comment in accordance with paragraph 1602.2 or issuing the request or modification to reporting entities following approval by the Board of Trustees.*

2. *NERC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.*

2.1. *A proposed request for data or information shall contain, at a minimum, the following information: (i) a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements; (ii) a description of how the data or information will be collected and validated; (iii) a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("reporting entities"); (iv) the schedule or due date for the data or information; (v) a description of any restrictions on disseminating the data or information (e.g., "confidential," "critical energy infrastructure information," "aggregating" or "identity masking"); and (vi) an estimate of the relative burden imposed on the reporting entities to accommodate the data or information request.*

2.2. *A proposed modification to a previously authorized request for data or information shall explain (i) the nature of the modifications; (ii) an estimate of the burden imposed on the reporting entities to accommodate the modified data or information request, and (iii) any other items from paragraph 1.1 that require updating as a result of the modifications.*

3. *After the close of the comment period, NERC shall make such revisions to the proposed request for data or information as are appropriate in light of the comments. NERC shall submit the proposed request for data or information, as revised, along with the comments received, NERC's evaluation of the comments and recommendations, to the Board of Trustees.*

4. *In acting on the proposed request for data or information, the Board of Trustees may authorize NERC to issue it, modify it, or remand it for further consideration.*

5. *NERC may make minor changes to an authorized request for data or information without board approval. However, if a reporting entity objects to NERC in writing to such changes within 21 days of issuance of the modified request, such changes shall require board approval before they are implemented.*

6. *Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the Board of Trustees, an affected party appeals the authorization under this Section 1600 to the ERO governmental authority.*

1603. Owners, Operators, and Users to Comply

Owners, operators, and users of the bulk power system registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a reporting entity within the United States fails to comply with an authorized request for data or information under Section 1600, NERC may request the Commission to exercise its enforcement authority to require the reporting entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. NERC will make any request for the Commission to enforce a request for data or information through a non-public submission to the Commission's enforcement staff.

1605. Confidentiality

If the approved data or information request includes a statement under Section 1602.1.1(v) that the requested data or information will be held confidential or treated as Critical Energy Infrastructure Information, then the applicable provisions of Section 1500 will apply without further action by a Submitting Entity. A Submitting Entity may designate any other data or information as Confidential Information pursuant to the provisions of Section 1500, and NERC or the Regional Entity shall treat that data or information in accordance with Section 1500. NERC or a Regional Entity may utilize additional protective procedures for handling particular requests for data or information as may be necessary under the circumstances.

1606. Expedited Procedures for Requesting Time-Sensitive Data or Information

1. *In the event NERC or a Regional Entity must obtain data or information by a date or within a time period that does not permit adherence to the time periods specified in Section 1602, the procedures specified in Section 1606 may be used to obtain the data or information. Without limiting the circumstances in which the procedures in Section*

1606 may be used, such circumstances include situations in which it is necessary to obtain the data or information (in order to evaluate a threat to the reliability or security of the Bulk Power System, or to comply with a directive in an order issued by the Commission or by another Applicable Governmental Authority) within a shorter time period than possible under Section 1602. The procedures specified in Section 1606 may only be used if authorized by the NERC Board of Trustees prior to activation of such procedures.

2. *Prior to posting a proposed request for data or information, or a modification to a previously-authorized request, for public comment under Section 1606, NERC shall provide the proposed request or modification, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability. The submission to the Commission's Office of Electric Reliability shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information. The submission shall be made to the Commission's Office of Electric Reliability as far in advance, up to twenty-one (21) days, of the posting of the proposed request or modification for public comments as is reasonably possible under the circumstances, but in no event less than two (2) days in advance of the public posting of the proposed request or modification.*

3. *NERC shall post the proposed request for data or information or proposed modification to a previously-authorized request for data or information for a public comment period that is reasonable in duration given the circumstances, but in no event shorter than five (5) days. The proposed request for data or information or proposed modification to a previously-authorized request for data or information shall include the information specified in Section 1602.2.1 or 1602.2.2, as applicable, and shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information.*

4. *The provisions of Sections 1602.3, 1602.4, 1602.5 and 1602.6 shall be applicable to a request for data or information or modification to a previously-authorized request for data or information developed and issued pursuant to Section 1606, except that (a) if NERC makes minor changes to an authorized request for data or information without Board approval, such changes shall require Board approval if a Reporting Entity objects to NERC in writing to such changes within five (5) days of issuance of the modified request; and (b) authorization of the request for data or information shall be final unless an affected party appeals the authorization of the request by the Board of Trustees to the Applicable Governmental Authority within five (5) days following the decision of the Board of Trustees authorizing the request, which decision shall be promptly posted on NERC's website.*

Proposed Data Request

NERC proposes to issue the Data Request provided below to comply with FERC's directives from Order No. 791 to conduct a survey of responsible entities during the implementation period for the CIP Version 5 Reliability Standards to determine the types of Cyber Assets that are included or excluded from the definition of BES Cyber Asset. The proposed Data Request has two parts.

In Part 1 of the Data Request, NERC requests that Balancing Authorities, Distribution Providers (as described in Applicability Section 4.1.2 of Reliability Standard CIP-003-5), Generator Operators, Generator Owners, Interchange Coordinators or Interchange Authorities, Reliability Coordinators, Transmission Operators, and Transmission Owners, as applicable, provide data on (1) the number of Control Centers, transmission stations or substations, or generation plants that they own or operate; and (2) the types and number of Cyber Assets at each of those locations (i.e., their Control Centers, Transmission stations or substations, or generation plants) that are included or excluded from the definition of BES Cyber Asset.

To lessen the burden on entities in responding to Part 1 of the Data Request and aid NERC's analysis of the data, NERC has created tables to be completed by applicable entities that list the Cyber Assets commonly installed and used at Control Centers, transmission stations or substations, or generation plants. For an explanation of the listed Cyber Assets and examples of their functional uses, please refer to Attachment 1 hereto.

In Part 2 of the Data Request, NERC requests that applicable entities provide a description of the process they are using or will use to determine if a particular Cyber Asset is categorized as a BES Cyber Asset, including how an entity determines if a particular piece of equipment is a Cyber Asset, and whether the Cyber Asset meets the 15-minute parameter.

Below is the proposed Data Request:

***Part 1**: Please provide the information requested below with respect to the Cyber Assets contained in your Control Centers, transmission stations or substations, and generation plants, as applicable.*

I. *Control Centers:*

For purposes of identifying Control Centers under this survey, if you have separate locations that contain the operating elements (i.e., control room where System Operators interact with HMI devices) and data centers (i.e., "computer rooms" containing servers, data communications and data storage), please count each location separately in the count of Control Center locations. Alternatively, if you have a one-to-one relationship between the operating and data centers, and they are located in the same building or location, only count those as a single location.

a. *Please specify the total number of Control Centers you own or operate: _____*

   i. *Please specify the number of Control Centers you own or operate that meet the description of a Control Center in Section 1 (High Impact Rating) of Attachment 1 to CIP-002-5.1: _____*

   ii. *Please specify the number of Control Centers you own or operate that meet the description of a Control Center in Section 2 (Medium Impact Rating) of Attachment 1 to CIP-002-5.1: _____*

   iii. *Please specify the number of Control Centers you own or operate that meet the description of a Control Center in Section 3 (Low Impact Rating) of Attachment 1 to CIP-002-5.1: _____*

   iv. *If the total number of Control Centers you own or operate identified above does not equal the sum of High, Medium, and Low Impact Control Centers identified in parts i, ii, and iii, please explain why:*

   _____

   _____

b. *Please complete the tables below for each Control Center you own or operate that contain the specified Cyber Assets in the ranges provided. (For example, if you have two Control Centers, one of which has three application servers and meets the description in Section 2.12 of Attachment 1 to CIP-002-5.1 (Medium Impact) and the other with 11 application servers that meets the description in Section 1.3 of Attachment 1 (High Impact), you would complete the two separate tables, one for the Medium Impact Control Center and one for the High Impact*

Control Center. For the Medium Impact Control Center table you would enter X in the row for application servers under the 1-4 column and indicate it is a Medium Impact Control Center, and in a separate table, mark an X under the 10-19 column and indicate it is a High Impact Control Center.) In addition, many of the Cyber Assets performing the functions described below perform multiple functions. When responding to the survey, only account for each Cyber Asset once, picking the most applicable function performed by the Cyber Asset.

(For an example of how to complete the tables, please see Attachment 2, hereto.)

For Cyber Assets that Meet the Definition of BES Cyber Asset at Control Centers ***Type of Control Center: _____ (Select High, Medium, or Low)***

a. *If you have any other Cyber Assets that control BES Elements outside of Control Centers, transmission stations or substations, and generation plants, please describe their location and function, and explain whether they meet the definition of BES Cyber Asset.*

_____

_____

Part 2 *– Please describe the process you are using or will use to determine if a particular Cyber Asset meets the definition of BES Cyber Asset. Please also describe any challenges you have encountered while creating or executing your process.*

_____

_____

Which systems or network components associated with BES Cyber Systems would not be considered in scope of the CIP standards? Are these systems considered programmable? If not, what are their characteristics?

_____

_____

How would you define programmable electronic device?

_____

_____

Information Required by ROP Section 1602.2

1. **A description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements.**

    a. *A Description of the Data or Information Requested*

A description of the data or information to be requested is provided above. A link to a document showing the drop-down menus is provided on the web page where this request is posted.

    b. *How the data or information will be used*

NERC will use the data to complete the informational filing that NERC must submit to the Commission by February 3, 2015. As noted above, in Order No. 791, the Commission directed NERC to conduct a survey of responsible entities during the implementation period for the CIP Version 5 Reliability Standards to determine the types of Cyber Assets that are included or excluded from the definition of BES Cyber Asset. NERC is required to submit an informational filing within one year of the effective date of Order No. 791 explaining, based on the survey data, the following: (1) specific ways in which entities determine which Cyber Assets meet the 15-minute parameter; (2) types or functions of Cyber Assets that are excluded from being designated as BES Cyber Assets and the rationale as to why; (3) common problem areas with entities improperly designating BES Cyber Assets; and (4) feedback from each region participating in the implementation study on lessons learned with the application of the BES Cyber Asset definition. NERC will also use information learned from the Transition Study for the informational filing.

    c. *How is the availability of the data or information necessary for NERC to meet its obligations under applicable laws and agreements*

As noted above, the proposed Data Request will provide NERC the data and information needed to comply with FERC's directive in Order No. 791 to conduct a survey and submit an informational filing based on that survey.

2. **A description of how the data or information will be collected and validated.**

NERC will identify the Registered Entities required to comply with the CIP Version 5 Reliability Standards and will prepare the survey, provide instruction to the identified registered entities for submitting the data, and collect and sort the data. NERC will compare the list of Registered Entities with the Data Request respondents to ensure that responses are received as requested. NERC staff will further validate the data provided.

3. **A description of the entities that will be required to provide the data or information ("Reporting Entities").**

All U.S. Balancing Authorities, Distribution Providers (as described in Applicability Section 4.1.2 of Reliability Standard CIP-003-5), Generator Operators, Generator Owners, Interchange Coordinators or Interchange Authorities, Reliability Coordinators, Transmission Operators, and Transmission Owners required to comply with the CIP Version 5 Reliability Standards must respond to the proposed Data Request.

4. **The schedule or due date for the data or information.**

NERC proposes to require Reporting Entities to respond to the proposed Data Request within 70 days of its issuance.

NERC expects to present the proposed Data Request for NERC Board of Trustees approval at the meeting of the Board of Trustees on August 13-14, 2014. Upon NERC Board of Trustees approval, the proposed Data Request will be issued and become mandatory.

5. **A description of any restrictions on disseminating the data or information (e.g., "confidential," "critical energy infrastructure information," "aggregating" or "identity masking").**

NERC's treatment of confidential information is governed by Section 1500 of the ROP. Although the proposed Data Request does not require the disclosure of confidential or critical energy infrastructure information, any confidential information obtained will be protected in accordance with Section 1500. Further, none of the individual responses to the proposed Data Requests will be publicly posted or shared. In the informational filing with the Commission, NERC will only present aggregated data.

6. **An estimate of the relative burden imposed on the reporting entities to accommodate the data or information request:**

The proposed Data Request is a one-time request for information with respect to an issue that applicable entities will already be reviewing as part of their transition to compliance with the CIP Version 5 Reliability Standards. The incremental burden for this one-time data collection will be the effort required to complete the survey based on the information learned during their transition activities. For small entities, the burden would expected to be minimal, approximately 40 hours total per entity to complete the Data Request, whereas for larger entities, the estimated time to complete the Data Request is estimated at less than 100 hours total per entity.

Request for Comments

Please provide comments on the substance and scope of the proposed Data Request. Comments are due by 8:00 p.m. EST on July 14, 2014. Comments must be submitted in an electronic document to BESCyberAssetSurvey@nerc.net.

In addition to any overall comments on the proposed Data Request, comments on the following would be appreciated:

1) Please describe any additional equipment types that should be included in the tables in Part 1 of the Data Request.

2) Are the ranges for numbers of Cyber Assets provided in the tables in Part 1 of the Data Requests appropriate to capture useable data from the survey?

ATTACHMENT 1

Explanation and Functional Uses of Asset Types

The following is a description of the Cyber Assets commonly installed and used at Control Centers, transmission stations or substations, or generation plants. The Cyber Assets listed here include BES Cyber Assets, as well as support systems and Electronic Control and monitoring Systems (EACMS) and Physical Access Control Systems (PACS).

Many of the Cyber Assets described below perform multiple functions. When responding to the survey, only account for each Cyber Asset once, picking the most applicable function performed by the Cyber Asset.

1. **Control Center**

- **Application Server**: Traditional computer nodes used for executing Bulk Electric System operations applications such as status monitoring, limit checking, alarm generation, log management, automatic generation control (AGC), economic dispatch, interchange scheduling, unit scheduling, state estimation, contingency analysis, power flow analysis, switching studies, etc.
- **Data Server:** Similar to an application server, but primarily used to provide data to application servers. Data servers include "traditional" servers running database software with locally attached storage, as well as network-attached storage servers (disk servers).
- **HMI (Human Machine Interface) Workstation**: A workstation computer consisting of display and keyboard attached to a small computer. HMI Workstations are used to provide human grid operators with status and values, and allow them to enter parameters to control the process.
- **Network Printer**: A printer that is attached directly to the network, and is therefore shared by multiple users and applications.
- **Data Acquisition Server**: Communications front-end processors used to communicate to other computer sites, control centers, field devices, or generation plants by receiving data from remote sites, process the data into local format, and store it for local use. Some data acquisition servers contain specialized hardware used to communicate to field devices; other data acquisition servers receive data via computer network connections.
- **Data Interchange**: Communications servers (e.g. ICCP servers) used to communicate intersite data between control centers and other facilities that serve a BES function.
- **Phasor Data Concentrator (PDC)**: A device that manages data feeds from multiple Phasor Measurement Units (PMUs).

- **Computer Networking Devices**: Hardware used to provide connectivity between other computers. Examples include hubs, switches, routers, firewalls, intrusion detection/prevention systems, terminal servers, security event and incident management systems, EACMS, etc.
- **Communications Processing Devices**: Devices used to perform protocol conversions, encapsulate serial data into a routable protocol, encrypt communications, etc.
- **Diagnostic Devices**: Devices used to troubleshoot hardware or software; at a control center diagnostic devices are most often attached to the local area network but could be attached to other Cyber Assets. Diagnostic devices can be normal Cyber Assets such as laptop computers or specialized diagnostic equipment.
- **Fault Recorder**: Device used to detect faults and record the electrical behavior of the transmission elements for after-the-fact analysis.
- **Historian**: Generally, a combination of compute server and data server with specialized software used for storing a historical record of Bulk Electric System operations data. Historians also can be used to provide access to data outside of the control center without impacting the control center processing.
- **Situational Awareness**: Systems used to provide situational awareness in a real-time Bulk Electric System operations environment (e.g. video mapboards, tile mapboard controllers, video trending).
- **Precision Time Device:** Device (e.g. Symmetricom TrueTime) used to synchronize the time on electronic equipment with a highly accurate reference such as a GPS master clock.
- **Training Simulator**: Computers (including application servers, database servers, HMI) that are used to train operators on various power system operations scenarios, and to test new operational procedures for validity.
- **Development & Testing**: Computers (including application servers, database servers, HMI) that are used to develop and test new application programs, database updates, and power system model changes prior to their inclusion in the real-time operations environment.
- **Infrastructure Support**: Computers that provide support functions to other Cyber Assets, such as domain name system (DNS), active directory, certificate management, administrative workstations, patch management, etc.
- **Marketing Systems**: Systems supporting marketing functions that may be located inside ESPs containing BES Cyber Systems. Examples include OASIS calculators, market pricing systems, market clearing systems, market billing systems, etc.
- **Physical Access Control System**: A Cyber Asset that controls, alerts, or logs access to the Physical Security Perimeter.

- **Locally Mounted Physical Security Device:** Devices typically located outside the Physical Security Perimeter (PSP) that control access to the PSP, such as motion sensors, electronic lock control mechanisms, badge readers, etc.
- **Other**: Any other computer node not described above. Please specify the application or function.

2. Transmission Station / Substation

- **Intelligent Electronic Device (IED) / Relay**: IED or relay device protection system used to sense fault conditions (e.g., on transmission lines), and take rapid autonomous actions to isolate the fault to prevent cascading fault conditions or equipment damage
- **Remote Terminal Unit (RTU)**: A device or system used to send telemetry data from the substation to the control center, and to receive control commands from the control center.
- **Programmable Logic Controller (PLC)**: Substation automation device used to coordinate actions taken by multiple IEDs, or when processing capabilities beyond the capability of an IED are required.
- **Data Concentrator**: A device or system used to collect data from multiple IEDs and provide a single data interface to the RTU.
- **Meter / Indicator**: A device used to provide local readout of values (e.g., bus voltage) or indication of status (e.g., breaker open/close). Meters / indicators may also collect and transmit values to other Cyber Assets.
- **Intelligent instrumentation**: Primary instrumentation used to sense values (e.g., voltage, current) or status (e.g., breaker or switch position). Primarily used by IEC 61850 enabled substations.
- **Tap Changer**: A device located on a transformer that allows the transformer winding ratio to be controlled remotely.
- **HMI Workstation**: A workstation computer consisting of display and keyboard attached to a small computer. HMI Workstations are used to provide human operators with status and values, and allow them to enter parameters to control the process.
- **Network Printer**: A printer that is attached directly to the network, and is therefore shared by multiple users and applications.
- **Computer Networking Devices**: Hardware used to provide connectivity between other computers. Examples include hubs, switches, routers, firewalls, intrusion detection/prevention systems, terminal servers, EACMS etc.
- **Communications Processing Devices**: Devices used to perform protocol conversions, encapsulate serial data into a routable protocol, encrypt communications, etc.

- **Equipment Diagnostic / Maintenance**: Devices used to monitor the behavior of the substation computers, calibrate the instrumentation, or diagnose problems with the control or networking components.
- **Fault Recorder**: Device used to detect faults and record the electrical behavior of the transmission elements for after-the-fact analysis.
- **Phasor Measurement Unit** (**PMU)**: A device that performs high-speed monitoring and analysis of voltage and current values and waveforms. In some cases, PMU data is used for after-the-fact analysis; in other cases, PMU data is used for real-time autonomous control.
- **Phasor Data Concentrator** (**PDC)**: A device that manages data feeds from multiple PMUs.
- **Historian**: Generally, a combination of compute server and data server with specialized software used for storing a historical record of Bulk Electric System operations data. Historians also can be used to provide access to data outside of the control center without impacting the control center processing.
- **Precision Time Device:** Device (e.g. Symmetricom TrueTime) used to synchronize the time on electronic equipment with a highly accurate reference such as a GPS master clock.
- **Development & Testing**: Computers (including application servers, database servers, HMI) that are used to develop and test new application programs, and database updates prior to their inclusion in the real-time operations environment.
- **Infrastructure Support**: Computers that provide support functions to other Cyber Assets, such as domain name system (DNS), active directory, certificate management, administrative workstations, patch management, etc.
- **Physical Access Control System**: A Cyber Asset that controls, alerts, or logs access to the Physical Security Perimeter.
- **Locally Mounted Physical Security Device:** Devices typically located outside the Physical Security Perimeter (PSP) that control access to the PSP, such as motion sensors, electronic lock control mechanisms, badge readers, etc.
- **Other**: Any other computer node not described above. Please specify the application or function.

3. <u>Generation Plants</u>

- **Controller (PLC)**: First level control system, used to coordinate the actions of a specific set of sensors and actuators. Controllers are programmed to take the input of specific sensors, process their data, and send output control commands to actuators, generally with a feedback loop to assess the impact of the control action, and take additional

control actions if necessary. Individual controllers send status and values to higher level controllers and application servers for supervisory control and display to operators.

- **Distributed Control System (DCS)**: Modules, processors, communications relays, and other sub-components that control the plant and allow operators at HMI interfaces to manipulate the plant.
- **Sensor / Actuator / Transmitter**: Primary input and output elements in a distributed control system. Sensors sense process values (e.g., pressure, temperature); actuators invoke changes in the process (e.g., open and close valves, change the speed of motors), and transmitters provide the local interface between the sensor and actuator to the control system hardware. Modern sensors and actuators contain embedded transmitters, older sensors and actuators require transmitters to translate analog signals to digital signals, or to allow the analog control signals to travel longer distances.
- **Meter / Indicator**: Device used to provide local readout of values (e.g., pressure, temperature) or indication of status (e.g., valve position). Meters / indicators may also collect and transmit values to other Cyber Assets.
- **HMI Workstation**: A workstation computer consisting of display and keyboard attached to a small computer. HMI Workstations are used to provide human operators with status and values, and allow them to enter parameters to control the process.
- **Network Printer**: A printer that is attached directly to the network, and is therefore shared by multiple users and applications.
- **Application Server**: Traditional computer nodes used for executing Bulk Electric System operations applications such as plant optimization, or to coordinate the action of multiple independent control systems.
- **Data Server**: Similar to an application server, but primarily used to provide data to application servers. Data servers include "traditional" servers running database software with locally attached storage, as well as network-attached storage servers (disk servers).
- **Historian**: Generally, a combination of compute server and data server with specialized software used for storing a historical record of Bulk Electric System operations data. Historians also can be used to provide access to data outside of the control center without impacting the control center processing.
- **Computer Networking Devices**: Hardware used to provide connectivity between other computers. Examples include hubs, switches, routers, firewalls, intrusion detection/prevention systems, terminal servers, EACMS, etc.
- **Equipment Diagnostic / Maintenance Devices**: Devices used to monitor the behavior of the generation plant computers, calibrate the instrumentation, or diagnose problems with the control or networking components.
- **Fault Recorder**: Device used to detect faults and record the electrical behavior of the transmission elements for after-the-fact analysis.

- **IED / Relay**: IED or relay device protection system used to sense fault conditions (e.g., on a generator bus), and take rapid autonomous actions to isolate the fault to prevent cascading fault conditions or equipment damage.
- **Remote Terminal Unit (RTU):** A device or system used to send telemetry data from the substation to the control center, and to receive control commands from the control center.
- **Phasor Measurement Unit (PMU)**: A device that performs high-speed monitoring and analysis of voltage and current values and waveforms. In some cases, PMU data is used for after-the-fact analysis; in other cases, PMU data is used for real-time autonomous control.
- **Phasor Data Concentrator (PDC):** A device that manages data feeds from multiple PMUs.
- **Precision Time Device:** Device (e.g. Symmetricom TrueTime) used to synchronize the time on electronic equipment with a highly accurate reference such as a GPS master clock.
- **Development & Testing**: Computers (including application servers, database servers, HMI) that are used to develop and test new application programs, and database updates prior to their inclusion in the real-time operations environment.
- **Infrastructure Support**: Computers that provide support functions to other Cyber Assets, such as domain name system (DNS), active directory, certificate management, administrative workstations, patch management, etc.
- **Physical Access Control System**: A Cyber Asset that controls, alerts, or logs access to the Physical Security Perimeter.
- **Locally Mounted Physical Security Device:** Devices typically located outside the Physical Security Perimeter (PSP) that control access to the PSP, such as motion sensors, electronic lock control mechanisms, badge readers, etc.
- **Other**: Any other computer node not described above. Please specify the application or function.

ATTACHMENT 2

Example of Completed Table for Part 1 of the Data Request

The following provides an example of how to complete the tables under Part 1 of the data request. This example addresses Control Centers for illustration purposes.

Assume an entity, which owns and operates both transmission Facilities and generation plants, has the following three Control Centers:

1) a primary Control Center used to perform the functions of a Transmission Operator that meets the description in Section 1.3 of Attachment 1 to CIP-002-5.1;

2) a backup Control Center used to perform the functions of a Transmission Operator that meets the description in Section 1.3 of Attachment 1 to CIP-002-5.1; and

3) a Control Center used to perform the functions of the Generator Operator that meets the description in Section 2.11 of Attachment 1 to CIP-002-5.1.

The Control Centers have the following equipment:

Primary Transmission Control Center

6 HMI workstations (production)
2 database servers (production)
4 front-end processors for telemetry and control (production)
2 data exchange processors for exchanging ICCP information (production)
2 AGC application servers (production)
2 real-time contingency analysis application servers (production)
2 study contingency analysis application servers (production)
1 historian (production)
1 long-term forecasting application server (production)
1 mapboard controller (production)
10 video trending displays (production)
2 network switches (production)
2 network printer (production)
2 HMI workstation (development / testing)
1 database server (development / testing)
1 application server (development / testing)
1 historian (development / testing)
1 network switch (development / testing)
1 network printer (development / testing)

Backup Transmission Control Center:

4 HMI workstations (production)

1 database servers (production)
2 front-end processors for telemetry and control (production)
1 data exchange processors for exchanging ICCP information (production)
1 AGC application servers (production)
1 real-time contingency analysis application servers (production)
1 study contingency analysis application servers (production)
6 video trending displays (production)
1 network switches (production)
1 network printer (production)

Generation Control Center
4 HMI workstations (production)
2 database servers (production)
2 data exchange processors for exchanging ICCP information (production)
2 application servers (production)
1 historian (production)
2 network switches (production)
2 network printer (production)

The entity would complete Part 1.1 of the Data Request as follows:

Part 1: Please provide the information requested below with respect to the Cyber Assets contained in your Control Centers, transmission stations or substations, and generation plants, as applicable.

I. Control Centers:

For purposes of identifying Control Centers under this survey, if you have separate locations that contain the operating elements (i.e., control room where System Operators interact with HMI devices) and data centers (i.e., "computer rooms" containing servers, data communications and data storage), please count each location separately in the count of Control Center locations. Alternatively, if you have a one-to-one relationship between the operating and data centers, and they are co-located in the same building or location, only count those as a single location.

a. *Please specify the total number of Control Centers you own or operate:* 3

i. *Please specify the number of Control Centers you own or operate that meet the description of a Control Center in Section 1 (High Impact Rating) of Attachment 1 to CIP-002-5.1:* 2

ii. *Please specify the number of Control Centers you own or operate that meet the description of a Control Center in Section 2 (Medium Impact Rating) of Attachment 1 to CIP-002-5.1:* 1

iii. *Please specify the number of Control Centers you own or operate that meet the description of a Control Center in Section 3 (Low Impact Rating) of Attachment 1 to CIP-002-5.1:* 0

b. *Please complete the tables below for each Control Center you own or operate that contain the specified Cyber Assets in the ranges provided. (For example, if you have two Control Centers, one of which has three application servers and meets the description in Section 2.12 of Attachment 1 to CIP-002-5.1 (Medium Impact) and the other with 11 application servers that meets the description in Section 1.3 of Attachment 1 (High Impact), you would complete the two separate tables, one for the Medium Impact Control Center and one for the High Impact Control Center. For the Medium Impact Control Center table you would enter X in the row for application servers under the 1-4 column and indicate it is a Medium Impact Control Center, and in a separate table, mark an X under the 10-19 column and indicate it is a High Impact Control Center.) In addition, many of the Cyber Assets performing the functions described below perform multiple functions. When responding to the survey, only account for each Cyber Asset once, picking the most applicable function performed by the Cyber Asset.*

(For the Transmission Control Center, entity would complete the table as follows.)

For Cyber Assets that Meet the Definition of BES Cyber Asset at Control Centers ***Type of Control Center: __High____ (Select High, Medium, or Low)***							
Type of Cyber Asset	***Number of Cyber Assets at Each Control Center***						
	0	*1-4*	*5-9*	*10-19*	*20-39*	*40-59*	*> 60*
Application Servers		*X*					
Data Servers		*X*					
HMI Workstations			*X*				
Network Printer		*X*					
Data Acquisition		*X*

Fault Recorder	*X*						
Historian		*X*					
Situational Awareness	*X*						
Precision Time Device	*X*						
Training Simulator	*X*						
Development & Testing	*X*						
Infrastructure Support	*X*						
Marketing Systems	*X*						
Physical Access Control	*X*						

System							
Locally Mounted Physical Security	*X*						
*Other **	*X*						

** Please describe the type and function(s) of the Cyber Asset(s):*

N/A

(Entity would not complete tables for Cyber Assets not meeting definition of BES Cyber Asset because it did not have any out of scope in this example.)

c. *Please describe the functions performed by the Cyber Assets that do not meet the 15-minute impact threshold, and the rationale for not including them.*

1. Study application server – used to analyze potential line switching issues.
2. Long term forecasting server – used to forecast next-season and next-year load patterns.
3. Historian – used for archival and remote display of data to non-operational personnel.
4. Mapboard controller – used to drive mapboard; HMI one-line diagrams used as primary operational tool.

d. *Please describe why Cyber Assets or functions performed by the Cyber Assets are excluded from the definition of BES Cyber Asset for a reason other than the 15-minute impact threshold.*

N/A

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SC authorized moving the SAR forward to standard development to implement recommendations of Five-year review of NUC-001-2 - October 17, 2013.
2. SAR posted for informal comment February 12-March 13, 2014.
3. NUC-001-3 for 45 day Comment Period and I~~i~~nitial B~~b~~allot April 8 – May 22, 2014.

Description of Current Draft

~~(Describe~~Draft 1 of NUC-001-3 implements recommendations from the NUC-001-2.1 ~~type of action associated with this posting such as 30-day informal comment period, 30~~F~~f~~ive-Y~~y~~ear R~~r~~eview Team (NUC FYRT)~~of NUC-001-2~~. The FYRT's ~~These~~ recommendations ~~of the FYR team~~ were~~as~~ accepted by the Standards Committee in October 2013. This draft is being posted for a 45-day formal comment period~~, 45 day formal comment period with parallel~~ and initial ballot~~, 30-day formal comment period with parallel successive ballot, recirculation ballot).~~

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	April 8, 2014
Recirculation ballot	June 2014
BOT adoption	August 2014

~~Effective Dates:~~ ~~April 1, 2010~~**Effective Dates:** First day of the first calendar quarter that is twelve months beyond the date that this standard is approved by applicable regulatory authorities or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve~~six~~ months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
1	May 2, 2007	Approved by Board of Trustees	New
2	To be determined	Modifications for Order 716 to Requirement R9.3.5 and footnote 1; modifications to bring compliance elements into conformance with the latest version of the ERO Rules of Procedure.	Revision
2	August 5, 2009	Adopted by Board of Trustees	Revised
2	January 22, 2010	Approved by FERC on January 21, 2010 Added Effective Date	Update
2	February 7, 2013	R9.1, R9.1.1, R9.1.2, R9.1.3, and R9.1.4 and associated elements approved by NERC Board of Trustees for retirement as part of the Paragraph 81 project (Project 2013-02) pending applicable regulatory approval.	
2.1	April 11, 2012	Errata approved by the Standards Committee; (Capitalized “Protection System” in accordance with Implementation Plan for Project 2007-17 approval of revised definition of “Protection System”)	Errata associated with Project 2007-17
3	March, 2014	Modifications to implement the recommendations of the five-year review of NUC-001, which was accepted by the Standards Committee on October 17, 2013.	Revision

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

~~**Term:** definition.~~

None

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Nuclear Plant Interface Coordination**

2. **Number:** **NUC-001-~~2.1~~3**

3. **Purpose:** This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Nuclear Plant Generator Operator~~s~~.

   4.2. Transmission Entities shall mean all entities that are responsible for providing services related to Nuclear Plant Interface Requirements (NPIRs). Such entities may include one or more of the following:

   4.2.1 Transmission Operators.

   4.2.2 Transmission Owners.

   4.2.3 Transmission Planners.

   4.2.4 Transmission Service Providers.

   4.2.5 Balancing Authorities.

   4.2.6 Reliability Coordinators.

   4.2.7 Planning Coordinators.

   4.2.8 Distribution Providers.

   4.2.9 Load-serving Entities.

   4.2.10 Generator Owners.

   4.2.11 Generator Operators.

5. Background:

Project 2012-13 Nuclear Power Interface Coordination seeks to implement the changes that were proposed by the NUC FYRT~~-001-2.1 Five Year Review Team~~. ~~-~~The NUC ~~Five Year Review Team (~~FYRT~~)~~ was appointed by the Standards Committee Executive Committee on April 22, 2013. The NUC FYRT reviewed the NUC-001-2.1 standard to identify opportunities for consolidation and additional improvements. The NUC FYRT posted its recommendation to revise NUC-001-2.1 for industry comment on July 27, 2013~~for industry comment its recommendation to revise NUC-001-2.1 on July 27, 2013.~~. The NUC FYRT considered comments and submitted its final recommendation to revise NUC-001-2.1, along with a Standards Authorization Request (SAR) to the Standards Committee on October 17, 2013 ~~its final recommendation to revise NUC-001-2.1, along with a Standards Authorization Request (SAR) on October 17, 2013~~. The Standards Committee accepted the recommendation of the FYRT and appointed the team as the Standard Drafting Team (SDT) to implement the recommendation.

B. Requirements and Measures

R1. The Nuclear Plant Generator Operator shall provide the proposed NPIRs in writing to the applicable Transmission Entities and shall verify receipt. *[Violation Risk Factor: ~~Lower~~Medium] [Time Horizon: -Long-term Planning]*

M1. The Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, provide a copy of the transmittal and receipt of transmittal of the proposed NPIRs to the responsible Transmission Entities.

R2. The Nuclear Plant Generator Operator and the applicable Transmission Entities shall have in effect one or more Agreements[1] that include mutually agreed to NPIRs and document how the Nuclear Plant Generator Operator and the applicable Transmission Entities shall address and implement these NPIRs. *[Violation Risk Factor: Medium] [Time Horizon: ~~]~~ Long-term Planning]*

M2. The Nuclear Plant Generator Operator and each Transmission Entity shall each have a copy of the Agreement(s) addressing and implementing the ~~elements in Requirement 9~~NPIRs available for inspection upon request of the Compliance Enforcement Authority.

R3. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall incorporate the NPIRs into their planning analyses of the electric system and shall communicate the results of these analyses to the Nuclear Plant Generator Operator.: *[Violation Risk Factor: Medium] [Time Horizon: ~~]~~ Long-term Planning]*

[1]. Agreements may include mutually agreed upon procedures or protocols in effect between entities or between departments of a vertically integrated system.

M3. Each Transmission Entity responsible for planning analyses in accordance with the Agreement shall, upon request of the Compliance Enforcement Authority, provide a copy of the planning analyses results transmitted to the Nuclear Plant Generator Operator, showing incorporation of the NPIRs. The Compliance Enforcement Authority shall refer to the Agreements developed in accordance with this standard for specific requirements.

R4. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall *[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]*

4.1. Incorporate the NPIRs into their operating analyses of the electric system.

4.2. Operate the electric system to meet the NPIRs.

4.3. Inform the Nuclear Plant Generator Operator when the ability to assess the operation of the electric system affecting NPIRs is lost.

M4. Each Transmission Entity responsible for operating the electric system in accordance with the Agreement shall demonstrate or provide evidence of the following, upon request of the Compliance Enforcement Authority:

M4.1 The NPIRs have been incorporated into the current operating analysis of the electric system. (Requirement 4.1)

M4.2 The electric system was operated to meet the NPIRs. (Requirement 4.2)

M4.3 The Transmission Entity informed the Nuclear Plant Generator Operator when it became aware it lost the capability to assess the operation of the electric system affecting the NPIRs

R5. ~~The Nuclear Plant Generator Operator shall operate per~~Per the Agreements developed in accordance with this standard~~.~~, the Nuclear Plant Generator Operator shall operate the nuclear plant to meet the NPIRs. *[Violation Risk Factor: High] [Time Horizon: ~~]~~Operations Planning]*

Rationale for R5: Rationale for R5: The FYRT recommended R5 be revised for consistency with R4 and to clarify that nuclear plants must be operated to meet the Nuclear Plant Interface Requirements.

M5. The Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, demonstrate or provide evidence that the Nuclear Power Plant is being operated consistent with the NPIRs~~. as per the Agreements developed in accordance with this standard.~~

R6. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities and the Nuclear Plant Generator Operator shall coordinate outages and maintenance activities which affect the NPIRs. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M6. The Transmission Entities and Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, provide evidence of the coordination between the Transmission Entities and the Nuclear Plant Generator Operator regarding outages and maintenance activities which affect the NPIRs.

R7. Per the Agreements developed in accordance with this standard, the Nuclear Plant Generator Operator shall inform the applicable Transmission Entities of actual or proposed changes to nuclear plant design~~,~~ (e.g., protective relay setpoints), configuration, operations, limits, ~~Protection Systems,~~ or capabilities that may impact the ability of the electric system to meet the NPIRs. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

M7. The Nuclear Plant Generator Operator shall provide evidence that it informed the applicable Transmission Entities of changes to nuclear plant design~~,~~ (e.g., protective relay setpoints), configuration, operations, limits~~, Protection Systems~~, or capabilities that would impact the ability of the Transmission Entities to meet the NPIRs.

Rationale for R7 and R8: The FYRT recommended deleting “Protection Systems” in Requirements R7 and R8 since it is a subset of the "nuclear plant design" and "electric system design" elements currently contained in R7 and R8 respectively; and adding a parenthetical clause (e.g. protective setpoints) to R7 following "nuclear plant design" and parenthetical clause (e.g. relay setpoints) to R8 following "electric system design."

R8. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall inform the Nuclear Plant Generator Operator of actual or proposed changes to electric system design~~,~~ (e.g., protective relay setpoints), configuration, operations, limits, ~~Protection Systems~~, or capabilities that may impact the ability of the electric system to meet the NPIRs. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

M8. The Transmission Entities shall each provide evidence that it informed the Nuclear Plant Generator Operator of changes to electric system design~~,~~ (e.g., protective relay setpoints), configuration, operations, limits~~, Protection Systems~~, or capabilities that would impact the ability of the Nuclear Plant Generator Operator to meet the NPIRs.

R9. The Nuclear Plant Generator Operator and the applicable Transmission Entities shall include~~, as a minimum,~~ the following elements in aggregate within the ~~a~~Agreement(s) identified in R2.

- Where multiple Agreements with a single Transmission Entity are put into effect, the R9 elements must be addressed in aggregate within the Agreements; however, each Agreement does not have to contain each element. The Nuclear Plant Generator Operator and the Transmission Entity are responsible for ensuring all the R9 elements are addressed in aggregate within the Agreements.
- Where Agreements with multiple Transmission Entities are required, the Nuclear Plant Generator Operator is responsible for ensuring all the R9 elements are addressed in aggregate within the Agreements with the Transmission Entities. The Agreements with each Transmission Entity do not have to contain each element; however, the Agreements with the multiple Transmission Entities, in the aggregate, must address all R9 elements. For each Agreement(s), the Nuclear Plant Generator Operator and the Transmission Entity are responsible to ensure the Agreement(s) contain(s) the elements of R9 applicable to that Transmission Entity. : *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

Rationale for R9: The FYRT recommended that R9 be revised to clarify that all agreements do not have to discuss each of the elements in R9, but that the sum total of the agreements need to address the elements.
In addition, for clarity in Part 9.4.1, the FYRT recommended that "affecting the NPIRs" be inserted following "Provisions for communications" and "applicable unique" be inserted following ""definitions of."

~~8.1.~~ Retired~~Administrative elements:~~

~~8.1.1.~~ ~~Definitions of key terms used in the agreement.~~

~~8.1.2.~~ ~~Names of the responsible entities, organizational relationships, and responsibilities related to the NPIRs.~~

~~8.2.~~9.1. ~~A requirement to review the agreement(s) at least every three years. A dispute resolution mechanism.~~. *[Note: Part 9.1 was retired under the Paragraph 81 project~~.~~. The NUC SDT proposes to leave this Part blank to avoid renumbering Requirement parts that would impact existing agreements throughout the industry.]*

~~8.3.~~9.2. Technical requirements and analysis:

~~8.3.1.~~9.2.1. Identification of parameters, limits, configurations, and operating scenarios included in the NPIRs and, as applicable, procedures for providing any specific data not provided within the Agreement.

~~8.3.2.~~9.2.2. Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.

~~8.3.3.~~9.2.3. Types of planning and operational analyses performed specifically to support the NPIRs, including the frequency of studies and types of Contingencies and scenarios required.

~~8.4.~~9.3. Operations and maintenance coordination

8.4.1.9.3.1. Designation of ownership of electrical facilities at the interface between the electric system and the nuclear plant and responsibilities for operational control coordination and maintenance of these facilities.

8.4.2.9.3.2. Identification of any maintenance requirements for equipment not owned or controlled by the Nuclear Plant Generator Operator that are necessary to meet the NPIRs.

8.4.3.9.3.3. Coordination of testing, calibration and maintenance of on-site and off-site power supply systems and related components.

8.4.4.9.3.4. Provisions to address mitigating actions needed to avoid violating NPIRs and to address periods when responsible Transmission Entity loses the ability to assess the capability of the electric system to meet the NPIRs. These provisions shall include responsibility to notify the Nuclear Plant Generator Operator within a specified time frame.

8.4.5.9.3.5. Provision for considering, within the restoration process, the requirements and urgency of a nuclear plant that has lost all off-site and on-site AC power.

8.4.6.9.3.6. Coordination of physical and cyber security protection ~~of the Bulk Electric System~~ at the nuclear plant interface to ensure each asset is covered under at least one entity's plan.

8.4.7. Coordination of the NPIRs with transmission system Special Protection Systems and any programs that reduce or shed load based on underfrequency ~~and~~or undervoltage ~~load shedding programs~~.

9.3.7.

8.5.9.4. Communications and training Administrative elements:

8.5.1.9.4.1. Provisions for communications affecting the NPIRs between the Nuclear Plant Generator Operator and Transmission Entities, including communications protocols, notification time requirements, and definitions of applicable unique terms.

8.5.2.9.4.2. Provisions for coordination during an off-normal or emergency event affecting the NPIRs, including the need to provide timely information explaining the event, an estimate of when the system will be returned to a normal state, and the actual time the system is returned to normal.

8.5.3.9.4.3. Provisions for coordinating investigations of causes of unplanned events affecting the NPIRs and developing solutions to minimize future risk of such events.

8.5.4.9.4.4. Provisions for supplying information necessary to report to government agencies, as related to NPIRs.

8.5.5.9.4.5. Provisions for personnel training, as related to NPIRs.

M9. The Nuclear Plant Generator Operator ~~and each Transmission Entity~~ shall ~~each~~ have a copy of the Agreement(s) addressing the elements in Requirement 9 available for inspection upon request of the Compliance Enforcement Authority. Each Transmission Entity shall have a copy of the Agreement(s) addressing the elements in Requirement 9 for which it is responsible available for inspection upon request of the Compliance Enforcement Authority.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.3. Data Retention

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- For Measure 1, the Nuclear Plant Generator Operator shall keep its latest transmittals and receipts.
- For Measure 2, the Nuclear Plant Generator Operator and each Transmission Entity shall have its current, in-force ~~a~~Agreement.
- For Measure 3, the Transmission Entity shall have the latest planning analysis results.
- For Measures 4.3, 6 and 8, the Transmission Entity shall keep evidence for two years plus current.
- For Measures 5, 6 and 7, the Nuclear Plant Generator Operator shall keep evidence for two years plus current.

If a Responsible Entity is found non-compliant it shall keep information related to the noncompliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1		~~Lower~~**Medium**	The Nuclear Plant Generator Operator provided the NPIR's to the applicable entities but did not verify receipt.	The Nuclear Plant Generator Operator did not provide the proposed NPIR to one of the applicable entities~~.~~ unless there was only one entity.	The Nuclear Plant Generator Operator did not provide the proposed NPIR's to two of the applicable entities~~.~~ unless there was only two entities.	The Nuclear Plant Generator Operator did not provide the proposed NPIR's to more than two of applicable entities. OR For a particular Nuclear Power Plant, if the number of possible applicable transmission entities is equal to the number of applicable transmission entities not provided NPIRs

D. Regional Variances

The design basis for Canadian (CANDU) Nuclear Power Plants (NPPs) does not result in the same licensing requirements as U.S. NPPs. Nuclear Regulatory Commission (NRC) design criteria specifies that in addition to emergency on-site electrical power, electrical power from the electric network also be provided to permit safe shutdown. ~~This requirement is specified in such NRC Regulations as 10 CFR 50 Appendix A — General Design Criterion 17 and 10 CFR 50.63 Loss of all alternating current power.~~ There are no equivalent Canadian Regulatory requirements for ~~Station Blackout (SBO) or coping times as they do not form part of~~electrical power from the ~~licensing basis for CANDU NPPs.~~electric network to be provided to permit safe shutdown. Therefore the definition of Nuclear Plant Licensing Requirements (NPLR) for Canadian CANDU ~~units~~ NPPs will be as follows:

Canadian Nuclear Plant Licensing Requirements (CNPLR) are requirements included in the design basis of the nuclear plant and are statutorily mandated for the operation of the plant; when used in this standard, NPLR shall mean nuclear power plant licensing requirements for avoiding preventable challenges to nuclear safety as a result of an electric system disturbance, transient, or condition.

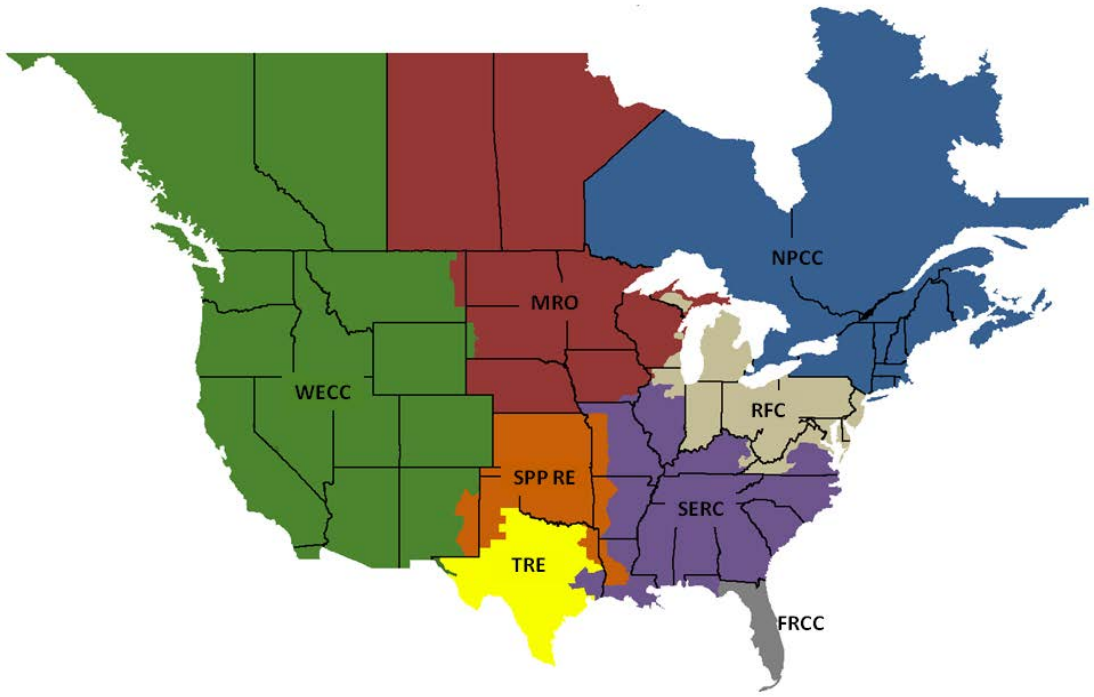
Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the Bulk-Power System (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.



FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RFC	Reliability*First* Corporation

Introduction

Background

The purpose of the benchmark geomagnetic disturbance (GMD) event description is to provide ~~uniform evaluation criteria~~a defined event for assessing system performance during a low probability ~~GMD event. It is to be used in conjunction with Reliability Standards that establish requirements for system modeling, vulnerability assessment, and mitigation planning.~~, high magnitude GMD event as required by proposed standard TPL-007-1 – Transmission System Planned Performance ~~during~~for Geomagnetic Disturbance Events~~s~~. The benchmark GMD event defines the geoelectric field values used to compute geomagnetically-induced current (GIC) flows for a GMD Vulnerability Assessment.

On May 16, 2013, FERC issued Order No. 779, directing NERC to develop Standards that address risks to reliability caused by geomagnetic disturbances in two stages:

- Stage 1 Standard(s) that require applicable entities to develop and implement Operating Procedures. ~~The Stage 1 Standard,~~ EOP-010-1 – Geomagnetic Disturbance Operations is pending at FERC in Docket No. RM14-1-000.
- Stage 2 Standard(s) that require applicable entities to conduct assessments of the potential impact of benchmark GMD events on their systems. If the assessments identify potential impacts, the Standard(s) will require the applicable entity to develop and implement a plan to mitigate the risk.

TPL-007-1 is a new Reliability Standard developed to specifically address the Stage 2 directives in Order No. 779. The benchmark GMD event will define the scope of the Stage 2 Reliability Standard.

General Characteristics

The benchmark GMD event described herein takes into consideration the known characteristics of a severe GMD event and its impact on an interconnected transmission system. These characteristics include:

- Geomagnetic Latitude – The amplitude of the induced geoelectric field for a given GMD event is reduced as the observation point moves away from the earth's magnetic poles.
- Earth Conductivity – The amplitude and phase of the geoelectric field depends on the local or regional earth ground resistivity structure. Higher geoelectric field amplitudes are induced in areas of high resistivity.
- Transformer Electrical Response – Transformers can experience half-cycle saturation when subjected to GIC. Transformers under half-cycle saturation absorb increas~~ing~~ed amounts of reactive power (var) and inject harmonics into the system. However, half-cycle saturation does not occur instantaneously and depends on the electrical characteristics of the transformer and GIC amplitude [1]. Thus, the effects of transformer reactive power absorption and harmonic generation do not occur instantaneously ~~and~~, but instead may take up to several seconds. ~~From a practical point of view, assuming~~It is conservative, therefore, to assume that the effects of GIC on transformer var absorption and harmonic generation are instantaneous ~~is conservative~~.
- Transformer Thermal Effects (e.g. hot spot transformer heating) – Heating of the winding and other structural parts can occur in power transformers during a GMD event. However, the thermal impacts are not instantaneous and are dependent on the thermal time constants of the transformer. Thermal time constants for hot spot heating in power transformers are in the 5-20 minute range.
- Geoelectric Field Waveshape – The geoelectric field waveshape has a strong influence on the hot spot heating of transformer windings and structural parts since thermal time constants of the transformer and time to peak of storm maxima are both on the order of minutes. The frequency content of the magnetic field (dB/dt) is a function of the waveshape, which in turn has a direct effect on the geoelectric field since the earth response to external dB/dt is frequency-dependent.
- Wide Area Geomagnetic Phenomena – The influence of GMD events is typically over a very broad area (e.g. continental scale); however, there can be pockets or very localized regions of enhanced geomagnetic

activity. Since geomagnetic disturbance impacts within areas of influence of approximately 100-200 km do not have a widespread impact on the interconnected transmission system (see Appendix I), statistical methods used to assess the frequency of occurrence of a severe GMD event need to consider broad geographical regions ~~in order~~ to avoid bias caused by spatially localized geomagnetic phenomena.

Benchmark GMD Event Description

Severe geomagnetic disturbance events are high-impact, low-frequency (HILF) events [2]; thus, any benchmark event should consider the probability ~~of occurrence of~~that the event ~~and~~will occur, as well as the impact or consequences of ~~the~~such an event. The benchmark event is composed of the following elements: ~~(~~1) a reference peak geoelectric field amplitude (V/km) derived from statistical analysis of historical magnetometer data; ~~(~~2) scaling factors to account for local geomagnetic latitude; ~~(~~3) scaling factors to account for local earth conductivity; and ~~(~~4) a reference geomagnetic field time series or waveshape to facilitate time-domain analysis of GMD impact on equipment.

Reference Geoelectric Field Amplitude

The reference geoelectric field amplitude was determined through statistical analysis using the plane wave method [3]-[10] geomagnetic field measurements from geomagnetic observatories in northern Europe [11] and the reference (Quebec) earth model shown in **Table 1** [12]. For details of the statistical considerations, see Appendix I. The Quebec earth model is generally resistive and the geological structure is relatively well understood.

Table 1: Reference earth model (Quebec)

Thickness (km)	Resistivity (Ω-m)
15	20,000
10	200
125	1,000
200	100
∞	3

The statistical analysis (see Appendix II) resulted in a conservative peak geoelectric field amplitude of approximately 8 V/km. For steady-state GIC and load flow analysis, the direction of the geoelectric field is assumed to be variable meaning that it can be in any direction (Eastward, Northward, or a vectorial combination thereof).

The frequency of occurrence of this benchmark GMD event is estimated to be approximately 1 in 100 years (see Appendix I). The selected frequency of occurrence is consistent with utility practices where a design basis frequency of 1 in 50 years is currently used as the storm return period for determining wind and ice loading of transmission infrastructure [13], for example.

The regional geoelectric field peak amplitude, E_{peak}, to be used in calculating GIC in the GIC system model can be obtained from the reference value of 8 V/km using the following relationship

$$E_{peak} = 8 \times \alpha \times \beta \text{ (V/km)} \quad (1)$$

where α is the scaling factor to account for local geomagnetic latitude, and β is a scaling factor to account for the local earth conductivity structure (see Appendix II).

Reference Geomagnetic Field Waveshape

The reference geomagnetic field waveshape was selected after analyzing a number of recorded GMD events, including the reference storm of the NERC interim report of 2012 [14], measurements at the Nurmijarvi (NUR) and Memanbetsu (MMB) geomagnetic observatories for the "Halloween event" of October 29-31, 2003, and the March 1989 GMD event that caused the Hydro Quebec blackout. The geomagnetic field measurement record of

the March 13-14 1989 GMD event, measured at NRCan's Ottawa geomagnetic observatory, was selected as the reference geomagnetic field waveform because it provides generally conservative results when performing thermal analysis of power transformers (see Appendix I). The reference geomagnetic field waveshape is used to calculate the GIC time series, GIC(t), required for transformer thermal impact assessment.

The geomagnetic latitude of the Ottawa geomagnetic observatory is 55°; therefore, the amplitude of the geomagnetic field measurement data were scaled up to the 60° reference geomagnetic latitude (see **Figure 1**) such that the resulting peak geoelectric field amplitude computed using the reference earth model was 8 V/km (see **Figures 2** and **3**). Sampling rate for the geomagnetic field waveshape is 10 seconds.

Appendix I – Technical Considerations

The following sections describe the technical justification of the assumptions that were made in the development of the benchmark GMD event.

Statistical Considerations

Due to the lack of long-term accurate geomagnetic field observations, assigning probabilities to the occurrence of historical extreme geomagnetic storms is difficult because of the lack of high fidelity geomagnetic recordings of ~~pre-1980s~~ events prior to the 1980s. This is particularly true for the Carrington event for which data that allow the direct determination of the geoelectric fields experienced during the storm are not available [15].

The storm-time disturbance index Dst has often been used as a measure of storm strength even though it does not provide a direct correspondence with GIC[1]. One of the reasons for using Dst in statistical analysis is that Dst data are available ~~pre~~ for events occurring prior to 1980. Extreme value analysis of GMD events, including the Carrington, September 1859 and March 1989 events, has been carried out using Dst as an indicator of storm strength. In one such study [16], the (one sigma) range of 10-year occurrence probability for another March 1989 event was estimated to be between 9.4-27.8 percent. The range of 10-year occurrence probability for Carrington event in Love's analysis is 1.6-13.7 percent. These translate to occurrence rates of approximately 1 in 30-100 years for the March 1989 event and 1 in 70-600 years for the Carrington event. ~~It should be noted that the~~The error bars in such analysis are significant, ~~but~~however it ~~can be concluded~~is reasonable to conclude that statistically the March 1989 event is~~, statistically speaking,~~ likely more frequent than 1-in-100 years and the Carrington event is likely less frequent than 1-in-100 years.

The benchmark GMD event is based on a 1 in 100 year frequency of occurrence which is a conservative design basis for power systems. Also, the benchmark GMD event is not biased towards local geomagnetic field enhancements since it must address wide-area effects in the interconnected power system. Therefore, the use of Dst-based statistical considerations is not adequate in this context and only relatively modern data have been used.

The benchmark GMD event is derived from modern geomagnetic field data records and corresponding calculated geoelectric field amplitudes. Using such data allows rigorous statistical analysis of the occurrence rates of the physical parameter (i.e. rate of change in geomagnetic field, dB/dt) directly related to the geoelectric field. Geomagnetic field measurements from the IMAGE magnetometer chain for 1993-2013 have been used to study the occurrence rates of the geoelectric field amplitudes.

With the use of modern data it is possible to avoid bias caused by localized geomagnetic field enhancements. The spatial structure of high-latitude geoelectric fields can be very complex during strong geomagnetic storm events [17]-[18]. One reflection of this spatial complexity is localized geomagnetic field enhancements that result in high amplitude geoelectric fields in regions of a few hundred kilometers or less. **Figure I-1**[2] illustrates this spatial complexity of the storm-time geoelectric fields. In areas indicated by the bright red location, the geoelectric field can be a factor of 2-3 larger than at neighboring locations. Localized geomagnetic phenomena should not be confused with local earth structure/conductivity ~~conductivity~~ features that result~~s~~ in consistently high geoelectric fields (e.g., coastal effects). Localized field enhancements can occur at any region exposed to auroral ionospheric electric current fluctuations.

[1] Dst index quantifies the amplitude of the main phase disturbance of a magnetic storm. The index is derived from magnetic field variations recorded at four low-latitude observatories. The data is combined to provide a measure of the average main-phase magnetic storm amplitude around the world.

[2] **Figure I-1** is for illustration purposes only, and is not meant to suggest that any one area is more likely to experience a localized enhanced geoelectric field.

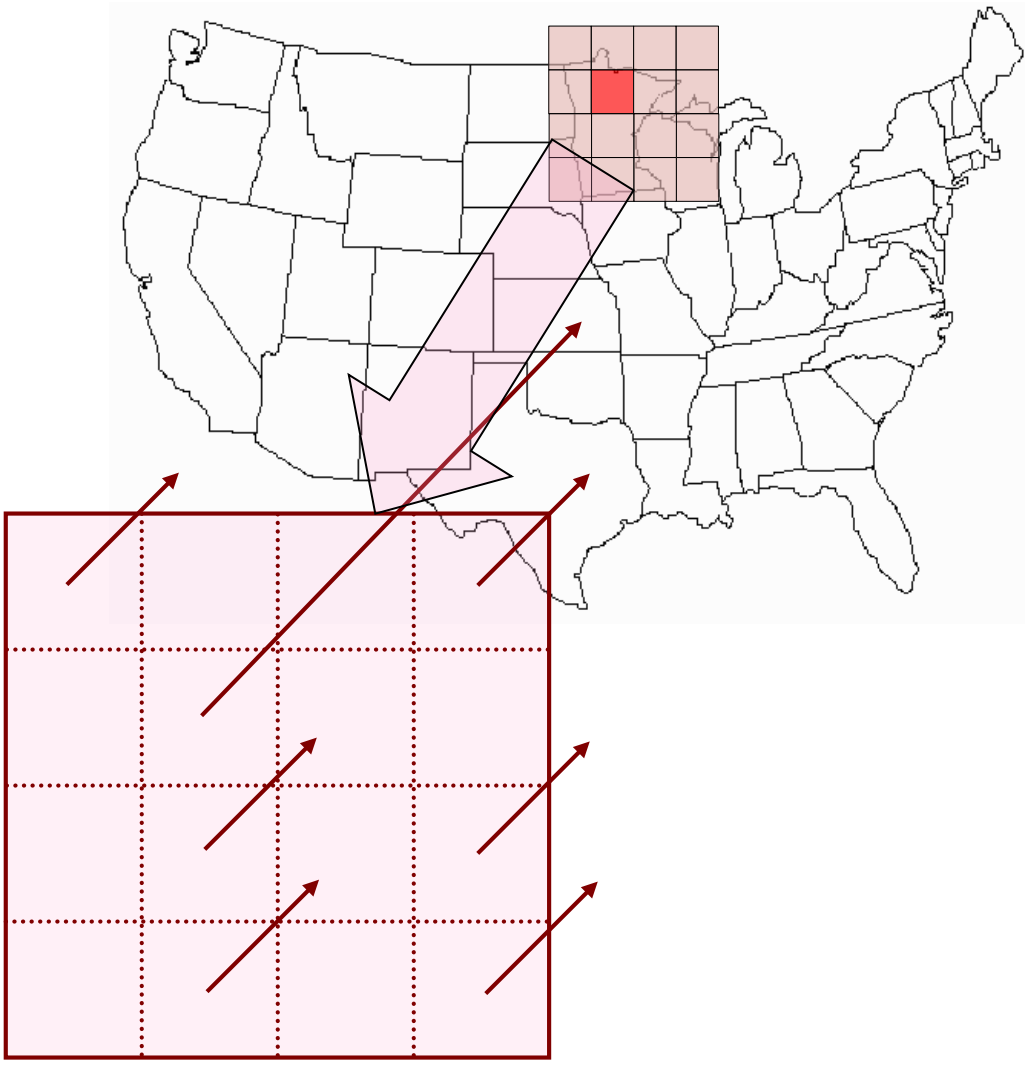

Figure I-1: Illustration of the ~~spatial scale~~Spatial Scale between ~~localized enhancements~~Localized Enhancements and ~~larger spatial scale amplitudes~~Larger Spatial Scale Amplitudes of ~~geoelectric field observed~~Geoelectric Field Observed during a ~~strong geomagnetic storm.~~ Strong Geomagnetic Storm.
In this illustration, the red square illustrates a spatially localized field enhancement.

The benchmark event is designed to address wide-area effects caused by a severe GMD event, such as increased var absorption and voltage depressions. Without ~~characterization of~~characterizing GMD on regional scales, statistical estimates could be weighted by local effects and suggest unduly pessimistic conditions ~~from~~when considering cascading failure and voltage collapse~~ points of view~~. It is important to note that most earlier geoelectric field amplitude statistics and extreme amplitude analyses have been built for individual stations thus reflecting only localized spatial scales [10], [19]-[22]. A modified analysis is required to account for geoelectric field amplitudes at larger spatial scales. Consequently, analysis of spatially averaged geoelectric field amplitudes is presented below.

Figure I-2 shows statistical occurrence of spatially averaged high latitude geoelectric field amplitudes for the period of January 1, 1993 – December 31, 2013. The geoelectric field amplitudes were calculated using 10-s IMAGE magnetometer array observations and the Quebec ground conductivity model, which is used as a reference in the benchmark GMD event. Spatial averaging was carried out over four different station groups spanning a square

area of approximately 500 km in width. For the schematic situation in **Figure I-1** the averaging process ~~would involve~~involves taking the average of the geoelectric field amplitudes over all 16 points or squares.

As can be seen from **Figure I-2**, the computed spatially averaged geoelectric field amplitude statistics indicate the 1-in-100 year amplitude is approximately between 3-8 V/km. Using extreme value analysis as described in the next section, it can be shown that the upper limit of the 95% confidence interval for a 100-year return level is more precisely 5.77 V/km.

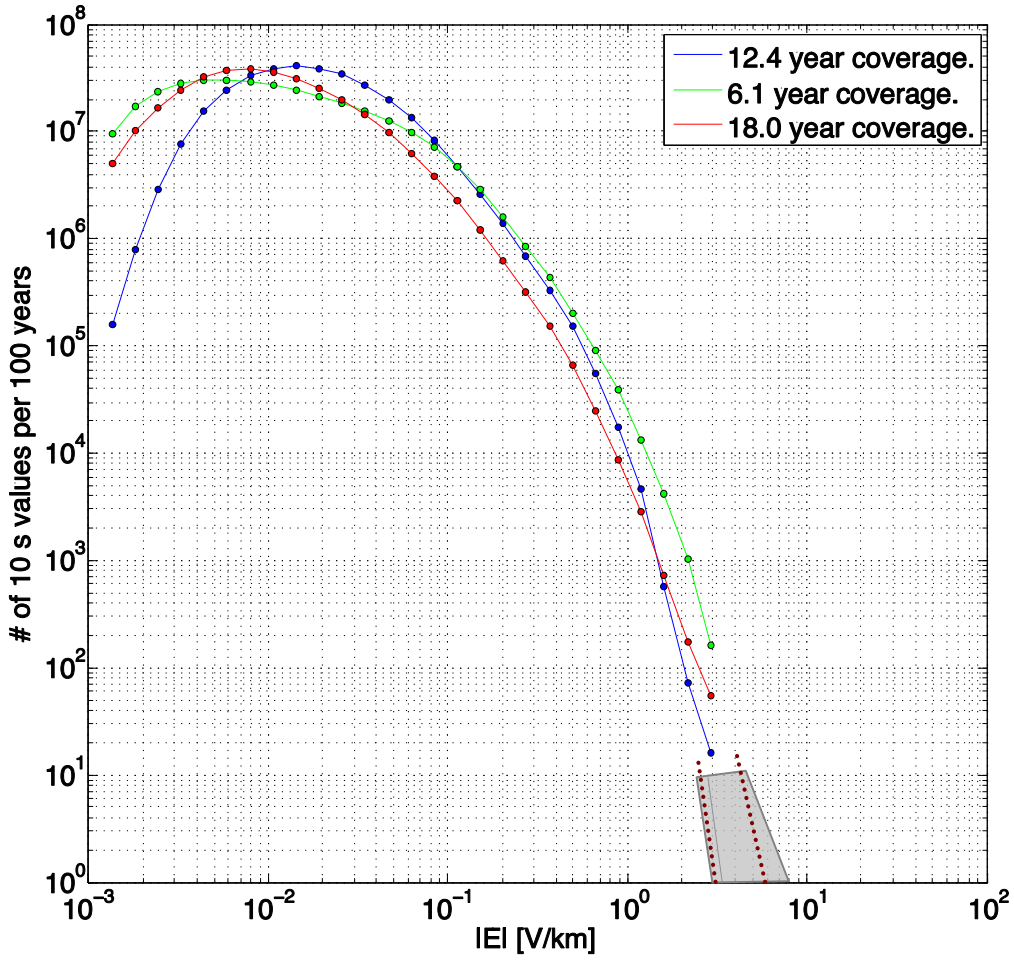

Figure I-2: Statistical ~~o~~Occurrence of ~~spatially averaged geoelectric field amplitudes~~Spatially Averaged Geoelectric Field Amplitudes. Four curves with dots correspond to different station groups and the gray area shows a visual extrapolation to 1-in-100 year amplitudes. Dashed lines represent the values predicted with extreme value analysis. The legend shows the data coverage for each station group used in computing the averaged geoelectric field amplitudes.

Extreme Value Analysis

The objective of extreme value analysis is to describe the behavior of a stochastic process at extreme deviations from the median. In general, the intent is to quantify the probability of an event more extreme than any previously observed. In particular, we are concerned with estimating the 95 percent confidence interval of the maximum geo-electric field amplitude to be expected within a 100-year return period.[3] In the context of this document, extreme value analysis has been used to rigorously support the extrapolation estimates used in the statistical considerations of the previous section.

The data set consists of 21 years of daily maximum geoelectric field amplitudes derived from the IMAGE magnetometer chain, using the Quebec earth model as reference. **Figure I-3** shows a scatter plot of the 10-largest geoelectric field amplitudes per year across the IMAGE stations. The plot indicates that both the amplitude and standard deviation of extreme geoelectric fields are not independent of the solar cycle. The data clearly exhibits heteroskedasticity[4] and an 11-year seasonality in the mean.

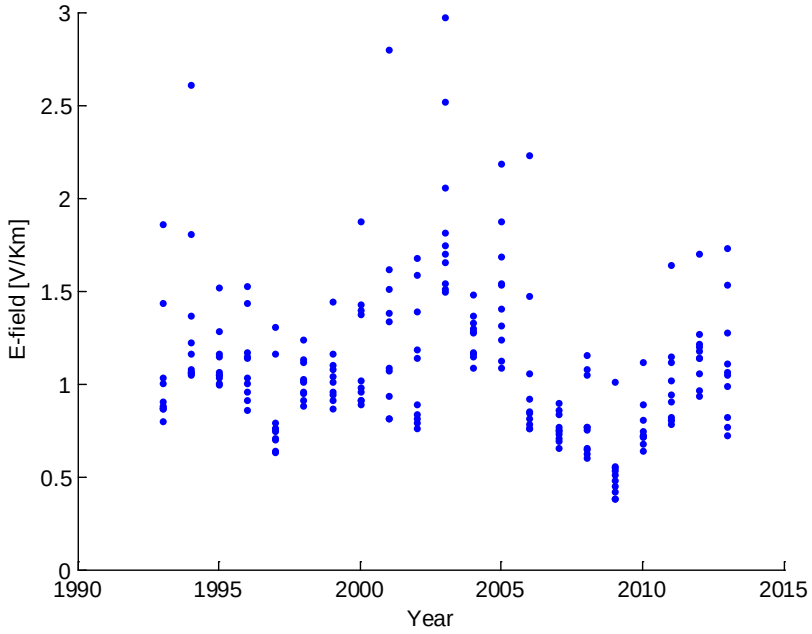

Figure I-3: Scatter Plot of Ten Largest Geoelectric Fields per Year

Data source: IMAGE magnetometer chain from 1993-2013

Several statistical methods can be used to conduct extreme value analysis. The most commonly applied include: Generalized Extreme Value (GEV), Point Over Threshold (POT), R-Largest, and Point Process (PP). In general, all methods assume independent and identically distributed (iid) data [23].

Two of these methods, GEV and POT, have been applied to the geoelectric field data, and their suitability for this application has been examined. **Table I-1** shows a summary of the estimated parameters and return levels obtained from GEV and POT methods. The parameters were estimated using the Maximum Likelihood Estimator (MLE). Since the distribution parameters do not have an intuitive interpretation, the expected geoelectric field amplitude for a 100-year return period is also included in **Table I-1.** The 95 percent confidence interval of the 100-year return level was calculated using the delta method and the profile likelihood. The delta method relies on the

[3] A 95 percent confidence interval means that, if we were to obtain repeated samples, the return level would lie within the confidence interval for 95 percent of the samples.

[4] Heteroskedasticity means that the skedastic function depends on the values of the conditioning variable; i.e., *var(Y|X=x) = f(x)*.

Gaussian approximation to the distribution of the MLE; this approximation can be poor for long return periods. In general, the profile likelihood provides a better description of the return level.

Table I-1: Extreme Value Analysis

Statistical Method	Estimated Parameters	Hypothesis Testing	100 Year Return Level Mean [V/km]	95% CI [V/km]	95% CI P-Likelihood [V/km]
(1) GEV	μ=1.4499 (0.1090) σ=0.4297 (0.0817) ξ=0.0305 (0.2011)	H0: ξ=0 *p* = 0.877	3.57	[1.77 , 5.36]	[2.71, 10.26]
(2) GEV ~~$\mu = \beta_0 + \beta_1 \cdot \sin\left(\frac{t}{T} + \phi\right)$~~ $\mu = \beta_0 + \beta_1 \cdot \sin\left(\frac{t}{T} + \phi\right)$	β_0=1.5047 (0.0753) β_1=0.3722 (0.0740) σ=0.2894 (0.0600) ξ=0.1891 (0.2262)	H0: β_1=0 *p*= 0.0003 H0: ξ=0 *p* = 0.38	4	[2.64, 4.81]	[2.92, 12.33]
(3) POT, threshold=1V/km	σ=0.3163 (0.0382) ξ=0.0430 (0.0893)		3.4	[2.28, 4.52]	[2.72,5.64]
(4) POT, threshold=1V/km ~~$\sigma = \alpha_0 + \alpha_1 \cdot \sin\left(\frac{t}{T} + \phi\right)$~~ $\sigma = \alpha_0 + \alpha_1 \cdot \sin\left(\frac{t}{T} + \phi\right)$	α_0=0.2920 (0.0339) α_1=0.1660 (0.0368) ξ=-0.0308 (0.0826)	H0: α_1=0 *p*= 3.7e-5	3.724	[2.64, 4.81]	[3.02, 5.77]

Statistical model (1) in **Table I-1** is the traditional GEV estimation using blocks of 1 year maxima; i.e., only 21 data points are used in the estimation. The mean expected amplitude of the geolectric field for a 100-year return level is 3.57 V/km. Since GEV works with blocks of maxima, it is typically regarded as a wasteful approach. This is reflected in the comparatively large confidence intervals: [1.77, 5.36] V/km for the delta method and [2.71, 10.26] V/km for the profile likelihood.

As discussed previously, GEV assumes that the data is iid. Based on the scatter plot shown in **Figure 1-3**, the iid statistical assumption is not warranted by the data. Statistical model (2) in **Table I-1** is a re-parameterization of the GEV distribution contemplating the 11-year seasonality in the mean,

~~$\mu = \beta_0 + \beta_1 \cdot \sin\left(\frac{t}{T} + \phi\right)$~~ $\mu = \beta_0 + \beta_1 \cdot \sin\left(\frac{t}{T} + \phi\right)$

where β_0 represents the offset in the mean, β_1 describes the 11-year seasonality, *T* is the period (11 years), and ϕ is a constant phase shift.

A likelihood ratio test is used to test the hypothesis that β_1 is zero. The null hypothesis, H0: β_1=0, is rejected with a p-value of 0.0003; as expected, the 11-year seasonality has explanatory power. The blocks of maxima during the

solar minimum are better represented in the re-parameterized GEV. The ~~upshot~~benefit is an increase in the mean return level to 4 V/km and a wider confidence interval: [2.63, 4.81] V/km for the delta method and [2.92, 12.33] V/km for the profile likelihood (calculated at solar maximum).

Statistical model (3) in **Table I-1** is the traditional POT estimation using a threshold *u* of 1 V/km; the data was de-clustered using a 1-day run. The data set consists of normalized excesses over a threshold, and therefore, the sample size for POT is increased if more than one extreme observation per year is available (in the GEV approach, only the maximum observation over the year was taken; in the POT method, a single year can have multiple observations over the threshold). The selection of the threshold *u* is a compromise between bias and variance. The asymptotic basis of the model relies on a high threshold; a threshold that is too low ~~a threshold~~ will likely lead to bias. On the other hand, ~~too high~~ a threshold that is too high will reduce the sample size and result in high variance. The stability of parameter estimates can guide the selection of an appropriate threshold. **Figure I-4** shows the estimated parameters (modified scale $\sigma^*=\sigma_u-\xi\cdot u$, and shape ξ) for a range of thresholds. The objective is to select the lowest threshold for which the estimates remain near constant; 1V/km appears to be a good choice.

The mean return level for statistical model (3), 3.4 V/km, is similar to the GEV estimates. However, due to the larger sample size the POT method is more efficient, and consequently, the confidence intervals are significantly reduced: [2.28, 4.52] V/km for the delta method, and [2.72, 5.64] V/km for the profile likelihood method.

In order to cope with the heteroskedasticity exhibited by the data, a re-parameterization of POT is used in statistical model (4) in **Table I-1**,

~~$\sigma = \alpha_0 + \alpha_1 \cdot \sin\left(\frac{t}{T} + \phi\right)$~~ $\sigma = \alpha_0 + \alpha_1 \cdot \sin\left(\frac{t}{T} + \phi\right)$

where α_0 represents the offset in the standard deviation, α_1 describes the 11-year seasonality, *T* is the period (365.25 · 11), and ϕ is a constant phase shift.

The parameter α_1 is statistical significant; the null hypothesis, H0: $\alpha_1=0$, is rejected with a p-value of 3.7e-5. The mean return level has slightly increased to 3.72 V/km. The upper limit of the confidence interval, calculated at solar maximum, also increases: [2.63, 4.81] V/km for the delta method and [3.02, 5.77] V/km for the profile likelihood method. As a final remark, it is emphasized that the confidence interval obtained using the profile likelihood is preferred over the delta method. **Figure I-5** shows the profile likelihood of the 100-year return level of statistical model (4). Note that the profile likelihood is highly asymmetric with a positive skew, rendering a larger upper limit for the confidence interval. Recall that the delta method assumes a normal distribution for the MLEs, and therefore, the confidence interval is symmetric around the mean.

To conclude, traditional GEV (1) and POT (3) models are misspecified; the statistical assumptions (iid) are not warranted by the data. The models were re-parameterized to cope with heteroskedasticity and the 11-year seasonality in the mean. Statistical model (4) better utilizes the available extreme measurements and it is therefore preferred over statistical model (2). The upper limit of the 95 percent confidence interval for a 100-year return level is 5.77 V/km. This analysis shows that the geoelectric field amplitude of 8 V/km for the benchmark is conservative for a 100-year return level and it includes an implicit 25 percent ~~safety~~engineering margin.

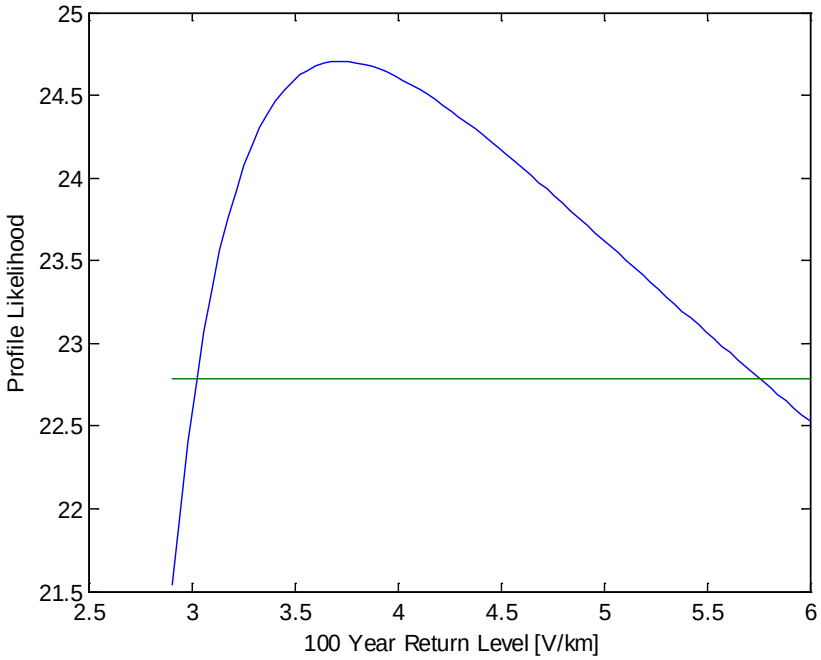

Figure I-5: Profile Likelihood for 100-year Return Level for Statistical Model (4)

Impact of Local Geomagnetic Disturbances on GIC

The impact of local disturbances on a power network is illustrated with the following example. A 500 km by 500 km section of a North American transmission network ~~was~~is subdivided into 100 km by 100 km sections. The geoelectric field is assumed to be uniform within each section. The analysis is performed by scaling the geoelectric field in each section individually by an intensification factor of 2.5 and computing the corresponding GIC flows in the network, resulting in a total of 25 GIC distribution simulations.[5] In these simulations the peak geomagnetic field amplitude has been scaled according to geomagnetic latitude of the network under study.

Figure I-6 shows the number of transformers that experience a GIC increase greater than 10 Amps (in red), those that experienced a reduction in GIC of more than 10 Amps (in blue), and those that remain essentially the same (in green). It can be observed that there is a small set of transformers that are affected by the local amplification of the geo-electric field but that the impact on the GIC distribution of the entire network due to a local intensification of the geoelectric field in a "local peak" is minor. Therefore, it can be concluded that the effect of local disturbances on the larger transmission system is relatively minor and do~~es~~ not warrant further consideration in network analysis.

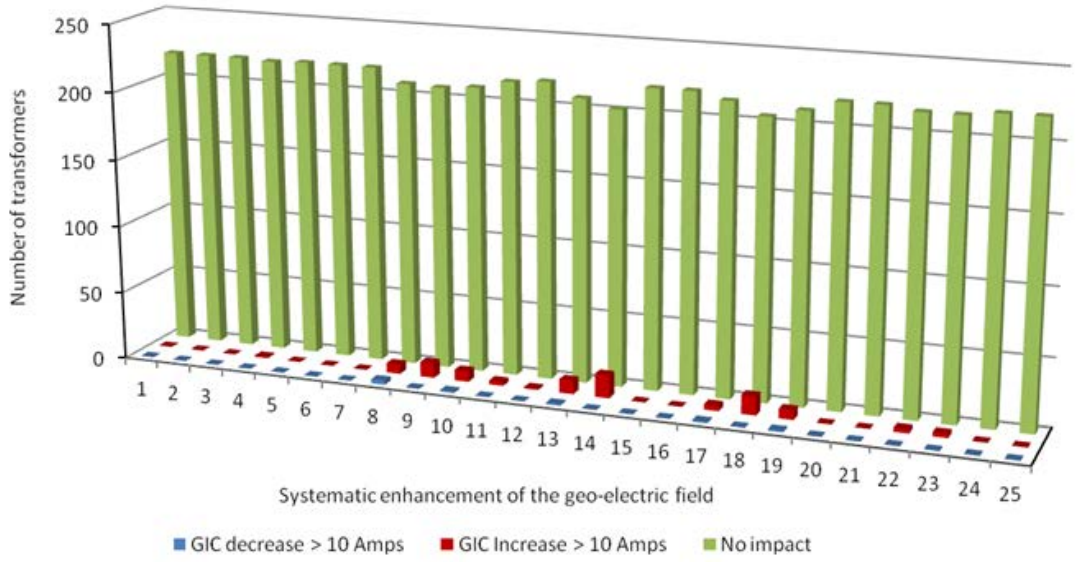

Figure I-6: Number of Transformers ~~That See~~that see a 10 A/phase Change in GIC ~~Due To~~due to Local Geoelectric Field Intensification

Impact of Waveshape on Transformer Hot-spot Heating

Thermal effects (e.g. hot spot transformer heating) in power transformers are not instantaneous. Thermal time constants associated with hot spot heating in power transformers are in the 5-20 minute range; therefore, the waveshape of the geomagnetic and geoelectric field has a strong impact on transformer hot spot heating of windings and metallic parts since thermal time constants are of the same order of magnitude as the time-to-peak of storm maxima. The waveshape of the March 13-14 1989 GMD event measured at the Ottawa geomagnetic observatory was found to be a conservative choice when compared with other events of the last 20 years, such

[5] An intensification factor of 2.5 would make a general 8 V/km peak geoelectric field in the entire network show a 20 V/km intensified geoelectric field in one of the twenty five 100 km by 100 km sections.

as the reference storm of the NERC interim report of 2012 [14], measurements at the Nurmijarvi (NUR) and Memanbetsu (MMB) geomagnetic observatories for the "Halloween event" of October 29-31, 2003.

To illustrate, the results of a thermal analysis performed on a relatively large test network with a diverse mix of circuit lengths and orientations is provided in **Figures I-7** and **I-8**. These results illustrate the relative effect of different waveshapes in a broad system setting and should not be interpreted as a vulnerability assessment of any particular network.

Appendix II – Scaling the Benchmark GMD Event

The intensity of a GMD event depends on geographical considerations such as geomagnetic latitude[6] and local earth conductivity[7] [3]**.** Scaling factors for geomagnetic latitude take in consideration that the intensity of a GMD event varies according to latitude-based geographical location. Scaling factors for earth conductivity take into account that the induced geoelectric field depends on earth conductivity, and that different parts of the continent have different earth conductivity and deep earth structure.

Scaling the Geomagnetic Field

The benchmark GMD event is defined for geomagnetic latitude of 60° and it must be scaled to account for regional differences based on geomagnetic latitude. To allow usage of the reference geomagnetic field waveshape in other locations, **Table II-1** ~~provides a~~summarizes the scaling factor α correlating peak geoelectric field to geomagnetic latitude as described in **Figure II-1** [3]. This scaling factor α has been obtained from a large number of global geomagnetic field observations of all major geomagnetic storms since the late 1980s [15], [24]-[25], and can be approximated with the empirical expression in (II.1)

$$\alpha = 0.001 \cdot e^{(0.115 \cdot L)} \quad \text{(II.1)}$$

where L is the geomagnetic latitude in degrees and $0.1 \leq \alpha \leq 1.0$.

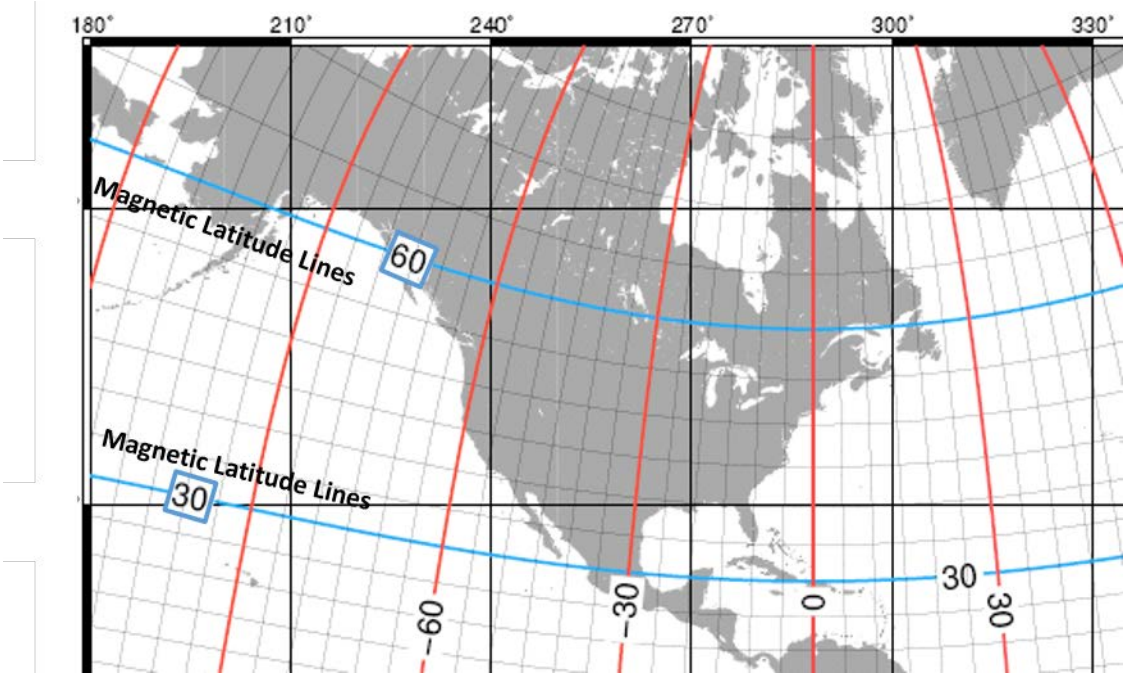

Figure II-1: Geomagnetic Latitude Lines in North America

[6] Geomagnetic latitude is analogous to geographic latitude, except that bearing is ~~with respect~~in relation to the magnetic poles, as opposed to the geographic poles. Geomagnetic phenomena are often best organized as a function of geomagnetic coordinates.

[7] Local earth conductivity refers to the electrical characteristics to depths of hundreds of km down to the earth's mantle. In general terms, lower ground conductivity results in higher geoelectric field amplitudes.

≥ 60	1.0

Scaling the Geoelectric Field

The benchmark GMD event is defined for the reference Quebec earth model provided in **Table 1**. This earth model has been used in many peer-reviewed technical articles [12, 15]. The peak geoelectric field depends on the geomagnetic field waveshape and the local earth conductivity. Ideally, the peak geoelectric field, E_{peak}, is obtained by calculating the geoelectric field from the scaled geomagnetic waveshape using the plane wave method and taking the maximum value of the resulting waveforms

$$E_N = (z(t)/\mu_o) * B_E(t)$$
$$E_E = -(z(t)/\mu_o) * B_N(t) \quad \text{(II.2)}$$
$$E_{peak} = \max\left\{\left|E_E(t), E_N(t)\right|\right\}$$

where,

* denotes convolution in the time domain,

z(t) is the impulse response for the earth surface impedance calculated from the laterally uniform or 1D earth model,

$B_E(t)$, $B_N(t)$ are the scaled Eastward and Northward geomagnetic field waveshapes,

$E_E(t)$, $E_N(t)|$ are the magnitudes of the calculated Eastward and Northward geoelectric field $E_E(t)$ and $E_N(t)$.

As noted previously, the response of the earth to B(t) (and dB/dt) is frequency dependent. **Figure II-2** shows the magnitude of Z(ω) for the reference earth model.

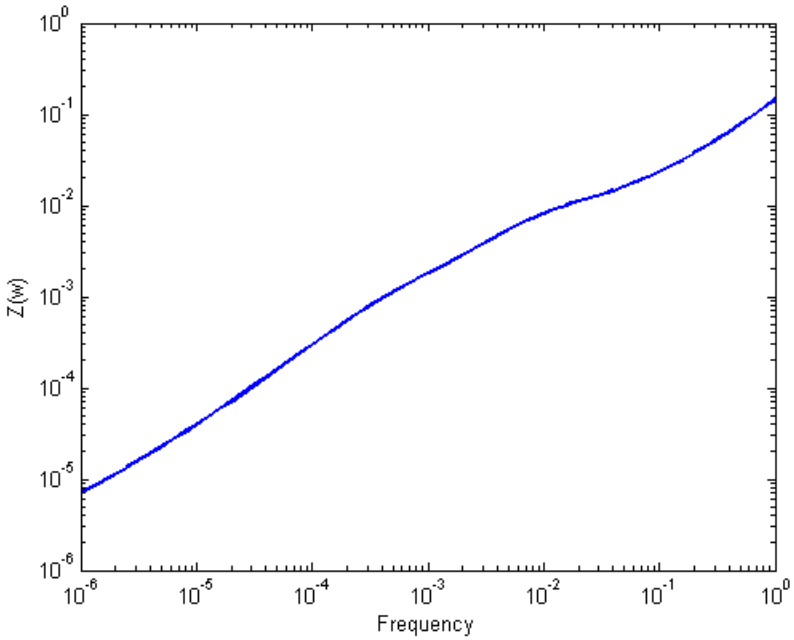

Figure II-2: Magnitude of the Earth Surface Impedance for the Reference Earth Model

If a utility does not have the capability of calculating the waveshape or time series for the geoelectric field, an earth conductivity scaling factor β can be obtained from **Table II-2**. Using α and β, the peak geoelectric field E_{peak} for a specific service territory shown in **Figure II-3** can be obtained using (II.3)

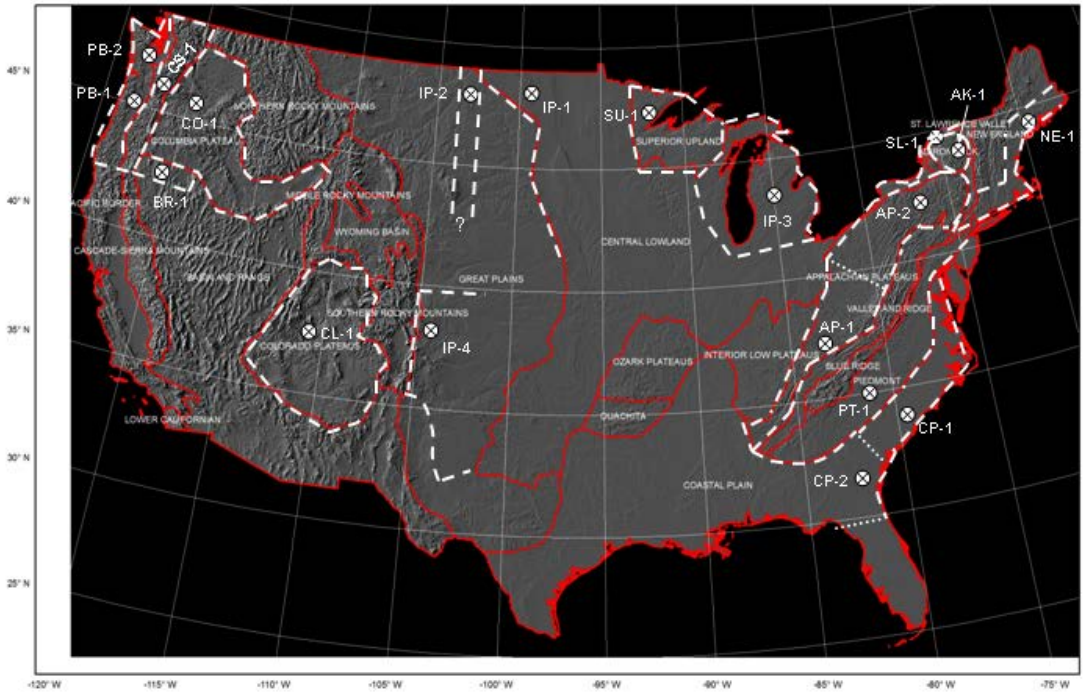
$$E_{peak} = 8 \times \alpha \times \beta \text{ (V/km)} \quad \text{(II.3)}$$

It should be noted that (II.3) is an approximation based on the following assumptions:

- The earth models used to calculate Table II-2 for the United States ~~is~~are from magnetotelluric data and ~~is~~are available from the USGS website.
- The models used to calculate Table II-2 for Canada were obtained from NRCan and reflect the average structure for large regions. When models are developed for sub-regions these will all be different (to a greater or lesser degree) from the average model. For instance, detailed models for Ontario have been developed by NRCan and ~~comprise~~consist of seven major sub-regions.
- The conductivity scaling factor β is calculated as the quotient of the local geoelectric field peak amplitude in a physiographic region with respect to the reference peak amplitude value of 8 V/km. Both geoelectric field peaks amplitudes are calculated using the reference geomagnetic field time series. If a different geomagnetic field time series were used, the calculated scaling factors β would be different than the values in Table II-2 because the frequency content of storm maxima is, in principle, different for every storm. However, the reference time series produces generally more conservative values of β when compared to the time series of reference storm of the NERC interim report of 2012 [14], measurements at the Nurmijarvi (NUR) and Memanbetsu (MMB) geomagnetic observatories for the "Halloween event" of October 29-31, 2003, and other recordings of the March 1989 event at high latitudes (Meanook observatory, Canada). The average variation between minimum and maximum β is approximately 12 percent. **Figure II-4** illustrates the values of β calculated using the 10-second ~~geomagnetic field~~ recordings for these geomagnetic field time series.

- If a utility has technically-sound earth models for its service territory ~~of~~and sub-regions thereof, then the use of such earth models is preferable to estimate E_{peak}.

Location of 1D Earth Resistivity Models with respect to Physiographic Regions of the USA



- When a ground conductivity model is not available the planning entity should use a β factor of 1 or other technically-justified value.

Example Calculations

Example 1

Consider a transmission service territory that lies in a geographical latitude of 45.5°, which translates to a geomagnetic latitude of 55°. The scaling factor α ~~from **Table**~~calculated using II-1 is 0.56~~2~~; therefore, the benchmark waveshape and the peak geoelectric field will be scaled accordingly. If the service territory has the same earth conductivity as the benchmark then β=1, and the peak geoelectric field will be

$$\alpha = 0.56$$
$$\beta = 1.0$$
$$E_{peak} = 8 \times 0.56 \times 1 = 4.5 V/km$$
$$\alpha = 0.562$$
$$\beta = 1$$
$$Epeak = 8 \times 0.562 \times 1 = 4.5 \text{ V/km}$$

If the service territory spans more than one physiographic region (i.e. several locations within the service territory have a different earth model) then the largest α can be used across the entire service territory for conservative results. Alternatively, the network can be split into multiple subnetworks, and the corresponding geoelectric field amplitude can be applied to each subnetwork.

Example 2

Consider a service territory that lies in a geographical latitude of 45.5° which translates to a geomagnetic latitude of 55°. The scaling factor α ~~from **Table**~~calculated using II-.1 is 0.56~~2~~; therefore, the benchmark waveshape and the peak geoelectric field will be scaled accordingly.

The service territory has lower conductivity that the reference benchmark conductivity, and according to the conductivity factor β from Table II-2. Then:

Conductivity factor β=1.17

$$\alpha = 0.56$$

$$E_{peak} = 8 \times 0.56 \times 1.17 = 5.2V / km$$

$$\alpha = 0.562$$

$$\beta = 1.17$$

$$Epeak = 8 \times 0.562 \times 1.17 = 5.3\ \mathrm{V/km}$$

Transformer Thermal Impact Assessment White Paper (Draft)

Project 2013-03 (Geomagnetic Disturbance Mitigation)

TPL-007-1 Transmission System Planned Performance ~~during~~for Geomagnetic ~~Disturbances~~Disturbance Events

Background

On May 16, 2013, FERC issued Order No. 779, directing NERC to develop Standards that address risks to reliability caused by geomagnetic disturbances (GMDs) in two stages:

- Stage 1 Standard(s) that require applicable entities to develop and implement Operating Procedures. ~~The Stage 1 Standard,~~ EOP-010-1 – Geomagnetic Disturbance Operations is pending at FERC in Docket No. RM14-1-000.
- Stage 2 Standard(s) that require applicable entities to conduct assessments of the potential impact of benchmark GMD events on their systems. If the assessments identify potential impacts, the Standard(s) will require the applicable entity to develop and implement a plan to mitigate the risk.

TPL-007-1 is a new Reliability Standard to specifically address the Stage 2 directives in Order No. 779.

Large power transformers connected to the EHV transmission system can experience both winding and structural hot spot heating as a result of GMD events. TPL-007-1 will require owners of such transformers to conduct thermal analyses of their transformers to determine if the transformers will be able to withstand the thermal transient effects associated with the Benchmark GMD event. This paper discusses methods that can be employed to conduct such analyses, including example calculations.

The primary impact of GMDs on large power transformers is a result of the quasi-dc current that flows through wye-grounded transformer windings. This geomagnetically-induced current (GIC~~),~~) results in an offset of the ac sinusoidal flux resulting in asymmetric or half-cycle saturation (see **Figure 1**).

Half-cycle saturation results in a number of known effects:

- Hot spot heating of transformer windings due to harmonics and stray flux;
- Hot spot heating of non-current carrying transformer metallic members due to stray flux;
- Harmonics;
- Increase in reactive power absorption; and
- Increase in vibration and noise level.

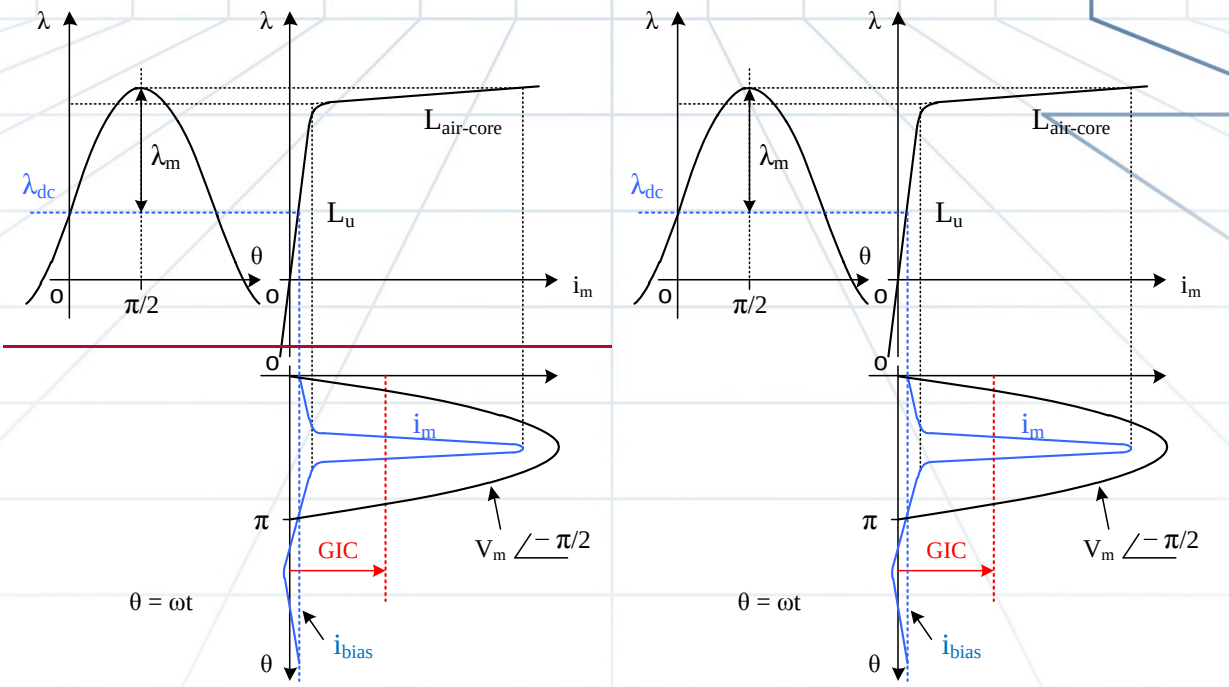

Figure 1: Mapping Magnetization Current to Flux through Core Excitation Characteristics

This paper focuses on hot spot heating of transformer windings and non current-carrying metallic parts. Effects such as the generation of harmonics, increase in reactive power absorption, vibration and noise are not within the scope of this document.

Technical Considerations

The effects of half-cycle saturation on HV and EHV transformers, namely localized "hot spot" heating, are relatively well understood, but are difficult to quantify. A transformer GMD impact assessment must consider GIC amplitude, duration, and transformer physical characteristics such as design and condition (e.g., age, gas content, and moisture in the oil). A single threshold value of GIC cannot be justified as a "pass or fail" screening criterion where "fail" means that the transformer will suffer damage. A single threshold value of GIC only makes sense in the context where "fail" means that a more detailed study is required and that "pass" means that GIC in a particular transformer is so low that a detailed study is unnecessary. Such a threshold would have to be technically justifiable and sufficiently low to be considered a conservative value within the scope of the benchmark.

The following considerations should be taken into account when assessing the thermal susceptibility of a transformer to half-cycle saturation:

- In the absence of manufacturer specific information, use the temperature limits for safe transformer operation such as those suggested in the IEEE Std. C57.91-2011 standard [1] for hot spot heating during short-term emergency operation. This standard does not suggest that exceeding these limits will result in transformer failure, but rather that it will result in additional aging of cellulose in the paper-oil insulation, and the potential for the generation of gas bubbles in the bulk oil. Thus, from the point of view of evaluating possible transformer damage due to increased hot spot heating, these thresholds can be considered conservative for a transformer in good operational condition.
- The worst case temperature rise for winding and metallic part (e.g., tie plate) heating should be estimated taking into consideration the construction characteristics of the transformer as they pertain to dc flux offset in the core (e.g., single-phase, shell, 5 and 3-leg three-phase construction).
- Bulk oil temperature due to ambient temperature and transformer loading must be added to the incremental temperature rise caused by hot spot heating. For planning purposes, maximum ambient and loading temperature should be used unless there is a technically justified reason to do otherwise.
- The time series or "waveshape" of the reference GMD event in terms of peak amplitude, duration and frequency of the geoelectric field has an important effect on hot spot heating. Winding and metallic part hot spot heating have different thermal time constants and their temperature rise will be different if the GIC currents are sustained for 2, 10, or 30 minutes for a given GIC peak amplitude.
- The "effective" GIC in autotransformers (reflecting the different GIC ampere-turns in the common and the series windings) must be used in the assessment. The effective current $I_{dc,eq}$ in an autotransformer is defined by [2]

~~$I_{dc,eq} = I_H + (I_N/3 - I_H)V_X/V_H$~~ $I_{dc,eq} = I_H + (I_N/3 - I_H)V_X/V_H$

(1)

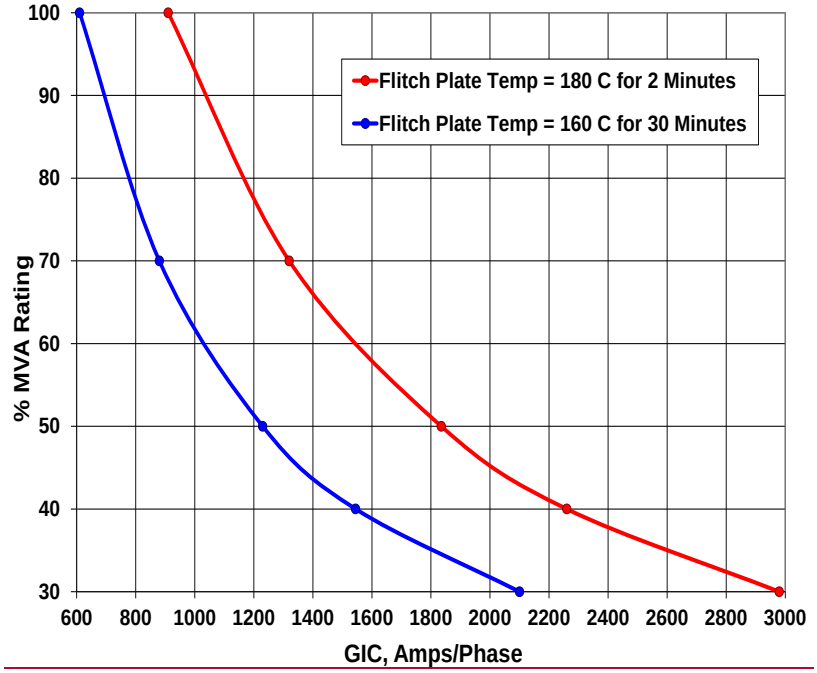
where,

I_H is the dc current in the high voltage winding;
I_N is the neutral dc current;
V_H is the rms rated voltage at HV terminals;
V_X is the rms rated voltage at the LV terminals.

Transformer Thermal Impact Assessment Process

There are two different ways to carry out a detailed thermal impact screening:

1. Transformer manufacturer GIC capability curves. These curves relate permissible peak GIC (obtained by the user from a steady-state GIC calculation) and loading for a specific transformer. An example of manufacturer capability curves is provided in **Figure 2**. Presentation details vary between manufacturers and limited information is available regarding the assumptions used to generate these curves, in particular the assumed waveshape or duration of the effective GIC. Some manufacturers assume that the waveshape of the GIC in the transformer windings is a square pulse of 2, 10, or 30 minutes in duration. In the case of the transformer capability curve shown in **Figure 2** [3], a square pulse of 900 A/phase with a duration of 2 minutes would cause the Flitch plate hot spot to reach a temperature of 180 °C at full load. While GIC capability curves are relatively simple to use, a fair amount of engineering judgment is necessary to ascertain what portion of a GIC waveshape is equivalent to, for instance, a 2 minute pulse. Also, manufacturers generally maintain that in the absence of transformer standards defining thermal duty due to GIC, such capability curves have to be developed for every transformer design and vintage.



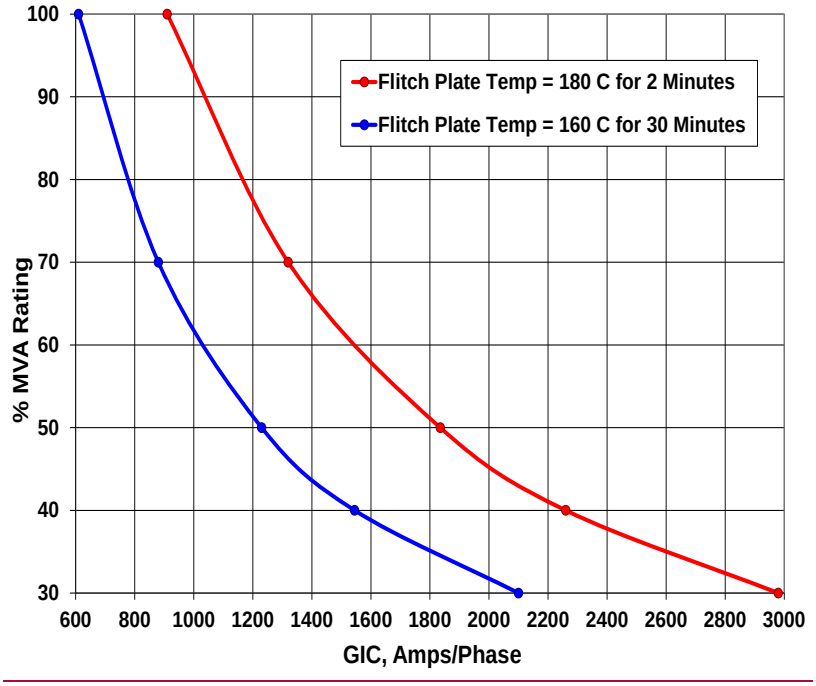


Figure 2: Sample GIC ~~manufacturer capability curve~~Manufacturer Capability Curve of a ~~large single-phase transformer design~~Large Single-Phase Transformer Design using the Flitch ~~plate temperature criteria~~Plate Temperature Criteria [3]

2. Thermal response simulation[1]. The input to this type of simulation is the time series or waveshape of effective GIC flowing through a transformer (taking into account the actual configuration of the system) and the result of the simulation is the hot spot temperature (winding or metallic part) time sequence for a given transformer. An example of GIC input and hotspot temperature time series values from [4] are shown in **Figure 3**. The hot spot thermal transfer functions can be obtained from measurements or calculations provided by transformer manufacturers. ~~Default~~Conservative default values can be used (e.g. those provided in [4]) when specific data are not available. Hot spot temperature thresholds shown in **Figure 3** are consistent with IEEE Std. C57.91 emergency loading hot spot limits. Emergency loading time limit is usually 30 minutes.

[1] Technical details of this methodology can be found in [4].

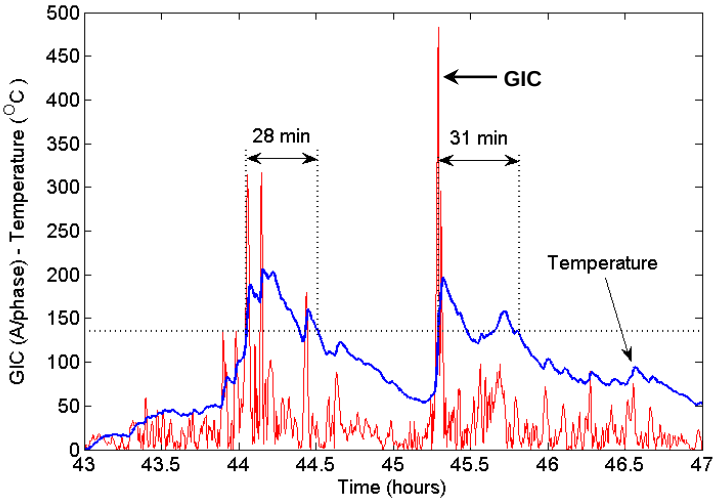

Figure 3: Sample Tie Plate Temperature Calculation

Blue trace is incremental temperature and red trace is the magnitude of the GIC/phase [4]

It is important to reiterate that the characteristics of the time sequence or "waveshape" are very important in the assessment of the thermal impact of GIC on transformers. Transformer hot spot heating is not instantaneous. The thermal time constants of transformer windings and metallic parts are typically on the order of minutes to tens of minutes; therefore, hot spot temperatures are heavily dependent on GIC history and rise time, amplitude and duration of GIC in the transformer windings, bulk oil temperature due to loading, ambient temperature and cooling mode.

Calculation of the GIC ~~w~~Waveshape for a ~~t~~Transformer

The following procedure can be used to generate time series GIC data, i.e. GIC(t), using a software program capable of computing GIC in the steady-state. The steps are as follows:

1. Calculate contribution of GIC due to eastward and northward geoelectric fields for the transformer under consideration;
2. Scale the GIC contribution according to the reference geoelectric field time series to produce the GIC time series for the transformer under consideration.

Most available GIC–capable software packages can calculate GIC in steady-state in a transformer assuming a uniform ~~E~~eastward geoelectric field of 1 V/km (GIC_E) while the ~~N~~northward geoelectric field is zero. Similarly, GIC_N can be obtained ~~when~~for a uniform ~~N~~northward geoelectric field of 1 V/km while the ~~E~~eastward geoelectric field is zero. GIC_E and GIC_N are the normalized GIC contributions for the transformer under consideration.

If the earth conductivity is assumed to be uniform (or laterally uniform) in the transmission system of interest, then the transformer GIC (in A/phase/V/km) for any value of E_E (t) and E_N(t) can be calculated using (2) [2].

~~$$GIC(t) = |E(t)| \cdot \{GIC_E \sin(\varphi(t)) + GIC_N \cos(\varphi(t))\}$$~~

$$GIC(t) = |E(t)| \cdot \{GIC_E \sin(\varphi(t)) + GIC_N \cos(\varphi(t))\} \quad (2)$$

where

~~$$|E(t)| = \sqrt{E_N^2(t) + E_E^2(t)}$$~~ $$|E(t)| = \sqrt{E_N^2(t) + E_E^2(t)} \quad (3)$$

~~$$\varphi(t) = \tan^{-1}\left(\frac{E_E(t)}{E_N(t)}\right)$$~~ $$\varphi(t) = \tan^{-1}\left(\frac{E_E(t)}{E_N(t)}\right) \quad (4)$$

$$GIC(t) = E_E(t) \cdot GIC_E + E_N(t) \cdot GIC_N \quad (5)$$

GIC_N is the effective GIC due to a ~~N~~northward geoelectric field of 1 V/km and GIC_E is the effective GIC due to an ~~E~~eastward geoelectric field of 1 V/km.

The geoelectric field time series $E_N(t)$ and $E_E(t)$ is obtained, for instance, from the reference geomagnetic field time series [5] after the appropriate geomagnetic latitude ~~factor α is applied[2]. Applying (2~~scaling factor α is applied[3]. The reference geoelectric field time series is calculated using the reference earth model. When using this geoelectric field time series where a different earth model is applicable, it should be scaled with the conductivity scaling factor β[4]. Alternatively the geoelectric field can be calculated from the reference geomagnetic field time series after the appropriate geomagnetic latitude scaling factor α is applied and the appropriate earth model is used. In such case, the conductivity scaling factor β is not applied because it is already taken into account by the use of the appropriate earth model.

~~[2] The geomagnetic factor α is described in [2] and is used to scale the geomagnetic field according to geomagnetic latitude. The lower the geomagnetic latitude (closer to the equator) the lower the amplitude of the geomagnetic field.~~

[3] The geomagnetic factor α is described in [2] and is used to scale the geomagnetic field according to geomagnetic latitude. The lower the geomagnetic latitude (closer to the equator) the lower the amplitude of the geomagnetic field.

[4] The conductivity scaling factor β is described in [2] and is used to scale the geoelectric field according to the conductivity of different physiographic regions. Lower conductivity results in higher β scaling factors.

Applying (5) to each point in $E_N(t)$ and $E_E(t)$ results in GIC(t).

GIC(t) Calculation Example

Let us assume that from the steady-state solution, the effective GIC in this transformer is GIC_E = -~~6A~~20 A/phase if E_N=0, E_E=1 V/km and GIC_N = ~~9.6A~~26 A/phase if E_N=1 V/km, E_E=0. Let us also assume the geomagnetic field time series corresponds to a geomagnetic latitude where α = 1 and that the earth conductivity corresponds to the reference earth model in [5]. The resulting geoelectric field time series is shown in **Figure 4**. Therefore,

$$GIC(t) = E_E(t) \cdot GIC_E + E_N(t) \cdot GIC_N \text{ (A/phase)}$$

$$GIC(t) = -E_E(t) \cdot 20 + \cdot E_N(t) \cdot 26 \text{ (A/phase)}$$

The resulting GIC waveshape GIC(t) is shown in **Figures 5 and 6** and can subsequently be used for thermal analysis.

It should be emphasized that even for the same reference event, the GIC(t) waveshape in every transformer will be different, depending on the location within the system and the number and orientation of the circuits connecting to the transformer station. Assuming a single generic GIC(t) waveshape to test all transformers is incorrect.

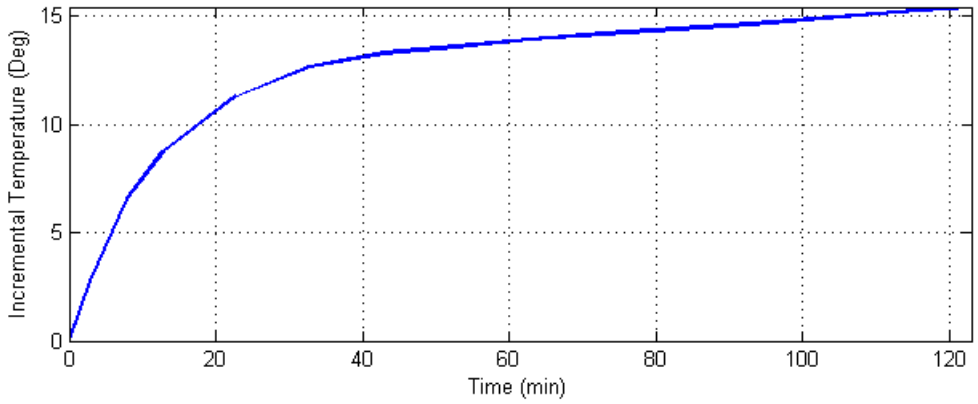
Transformer Thermal Assessment Examples

There are two basic ways to carry out a transformer thermal analysis once the GIC time series GIC(t) is known for a given transformer: 1) ~~using manufacturer's capability curves, and 2)~~ calculating the thermal response as a function of time; and 2) using manufacturer's capability curves.

Example 1: ~~Using~~Calculating the thermal response as a function of time using a thermal response tool

The thermal step response of the transformer can be obtained for both winding and metallic part hot spots from: ~~(a~~1) measurements; ~~(b~~2) manufacturer's calculations; or ~~(c~~3) generic published values. **Figure 7** shows the measured metallic hot spot thermal response to a dc step of 16.67 A/phase of the top yoke clamp from [~~4~~6] that will be used in this example. **Figure 8** shows the ~~estimated~~measured incremental temperature rise (asymptotic response) of the same hot spot to long duration GIC steps.[5] ~~The asymptotic response in **Figure 8** is extrapolated linearly from relatively low magnitude dc measurements. This is a conservative approximation for illustration purposes. In the Fingrid transformer tests reported in 2002 [6], the measured maximum value of the asymptotic response of the inside of the yoke clamp (highest hot spot temperature) is 15% lower than the value obtained using linear extrapolation. The linear extrapolation results in a calculated temperature peak 9% higher than the measured asymptotic behavior when the GIC(t) time series in **Figure 6** is used.~~



[5] The heating of the bulk oil due to the hot spot temperature increase is not included in the asymptotic response because the time constant of bulk oil heating is at least an order of magnitude larger than the time constants of hot spot heating.

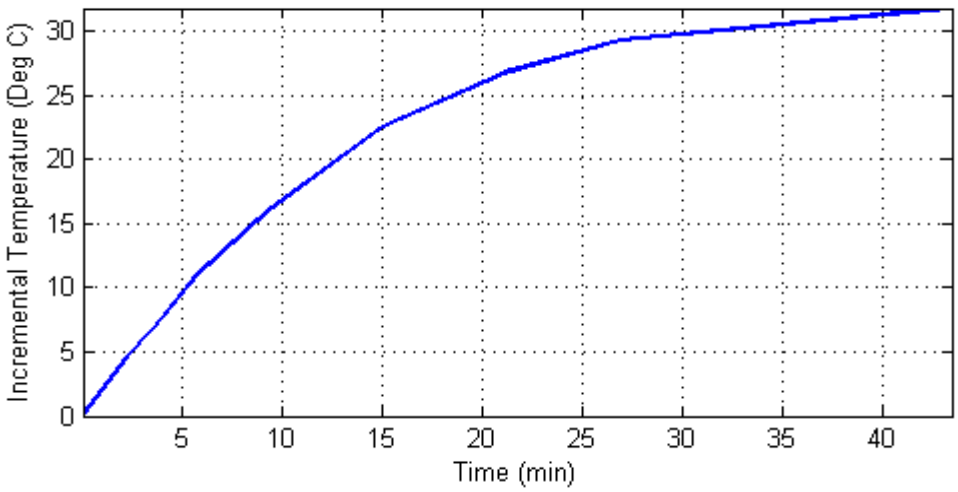


Figure 7: Thermal Step Response to a ~~5 A/phase~~ 16.67 Amperes per Phase dc Step ~~[3]~~

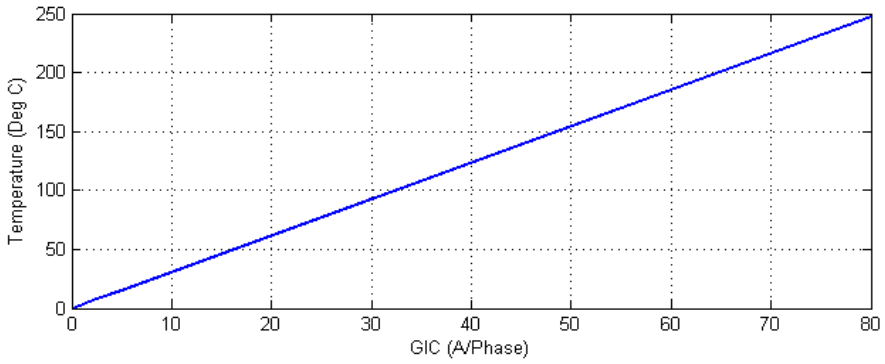
Metallic hot spot heating.



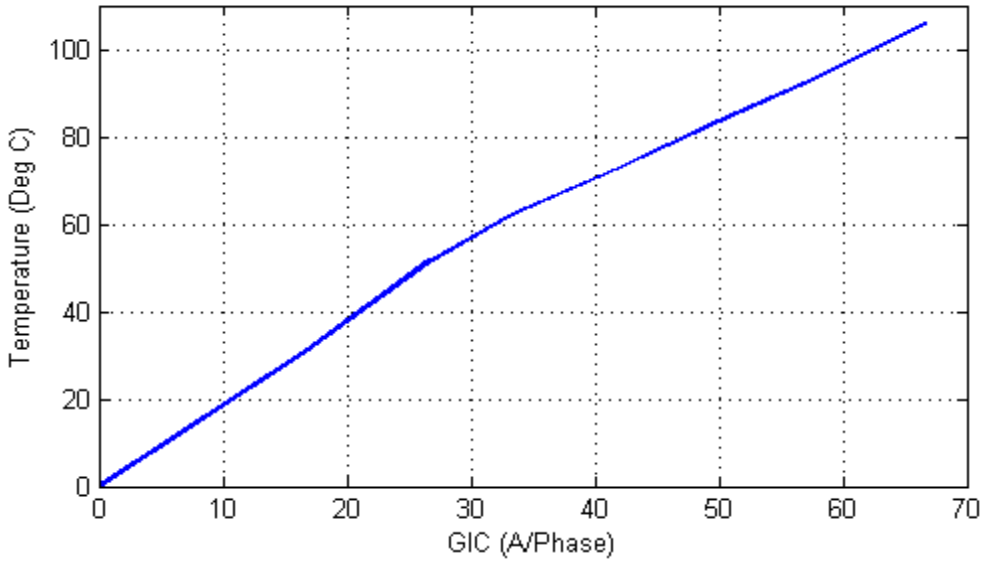


Figure 8: Asymptotic Thermal Step Response ~~[4]~~
Metallic hot spot heating.

In order to obtain the thermal response of the transformer to a GIC waveshape such as the one in **Figure 6**, a thermal response model is required. To create a thermal response model, the measured or manufacturer-calculated transformer thermal step responses (winding and metallic part) for various GIC levels are required. The GIC(t) time series or waveshape is then applied to the thermal model to obtain the incremental temperature rise as a function of time $\theta(t)$ for the GIC(t) waveshape. The total temperature is calculated by adding the oil temperature, for example, at full load.

Figure 9 shows the calculated GIC(t) and the corresponding hot spot temperature time series $\theta(t)$. **Figure 10** shows a close-up of the peak transformer temperatures calculated in this example.

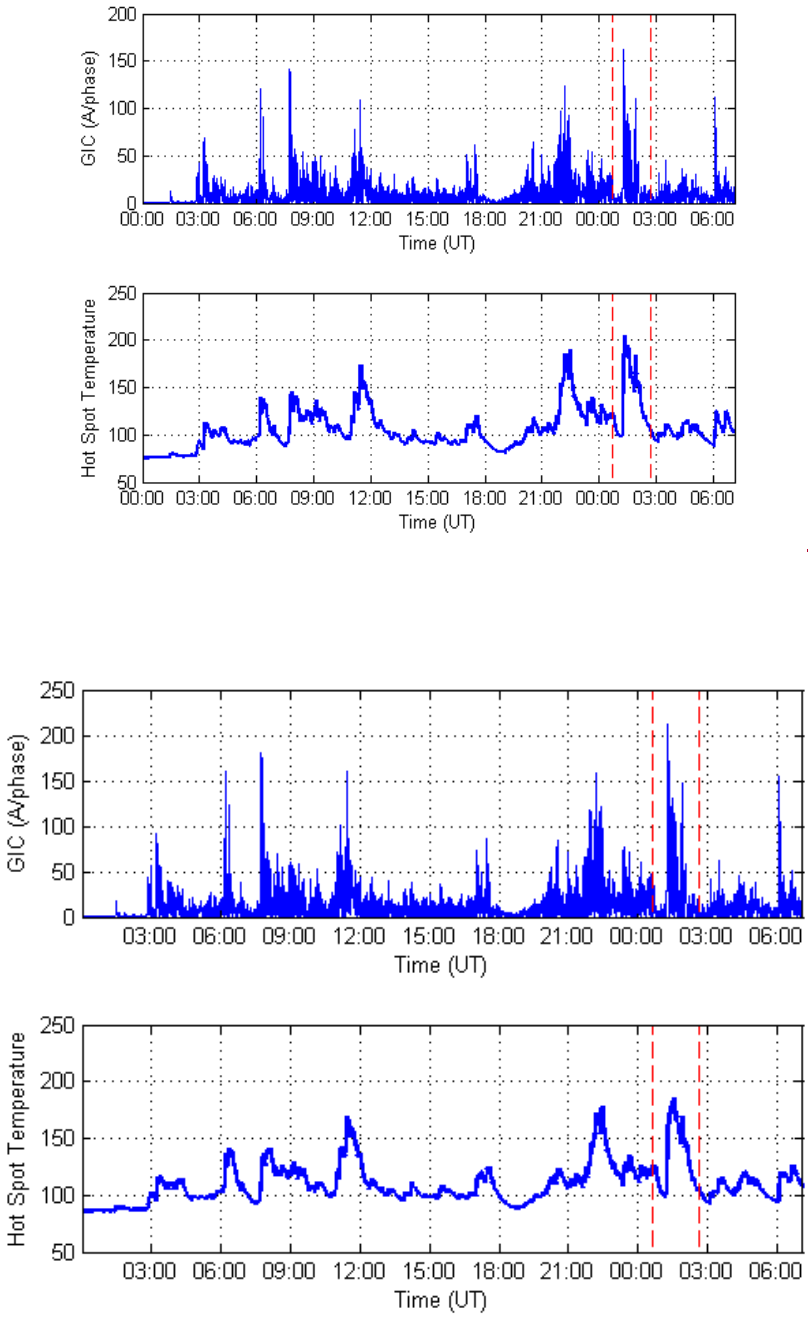

Figure 9: Magnitude of GIC(t) and ~~metallic hot spot temperature~~Metallic Hot Spot Temperature θ(t) ~~assuming full load oil temperature~~Assuming Full Load Oil Temperature of ~~75~~85.3°C (~~30~~40°C ambient~~)~~). Dashed lines approximately show the close-up area for subsequent Figures.

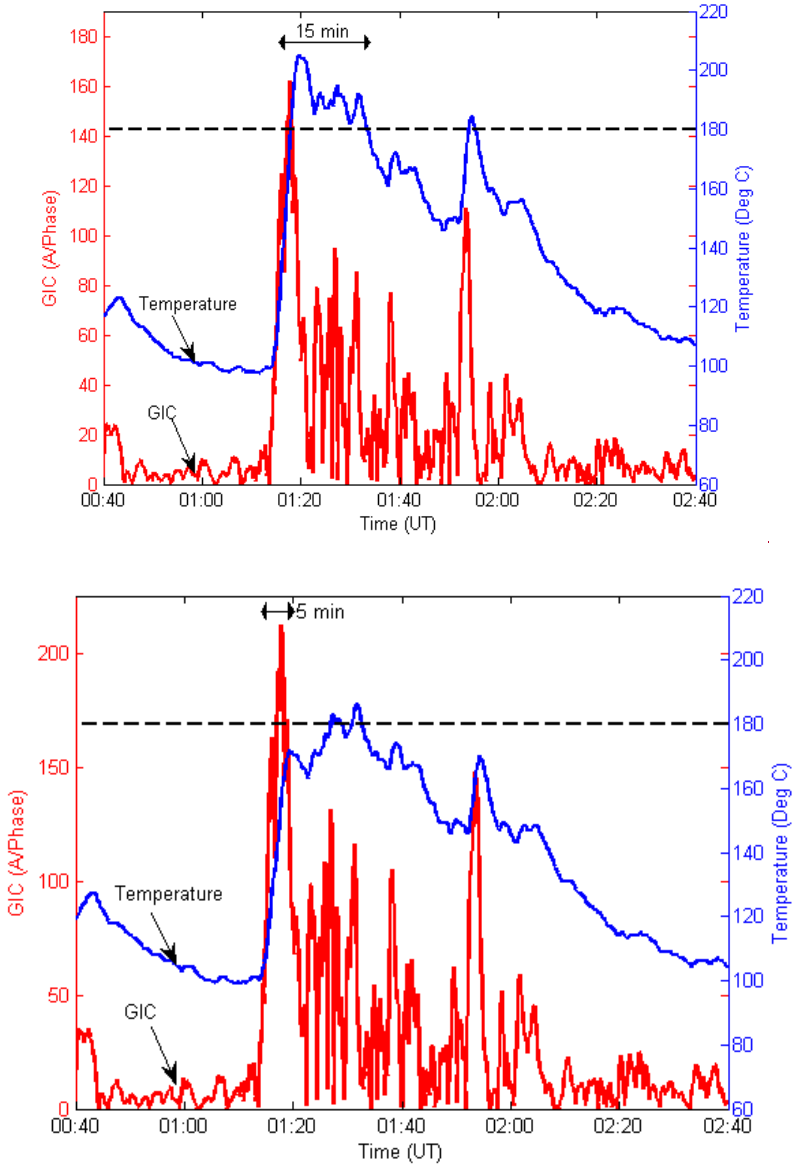

Figure 10: Close-up of Metallic ~~hot spot temperature~~ Hot Spot Temperature Assuming a Full Load

(Blue trace is θ(t~~) assuming a full load (blue trace)~~). Red trace is GIC(t~~)~~))

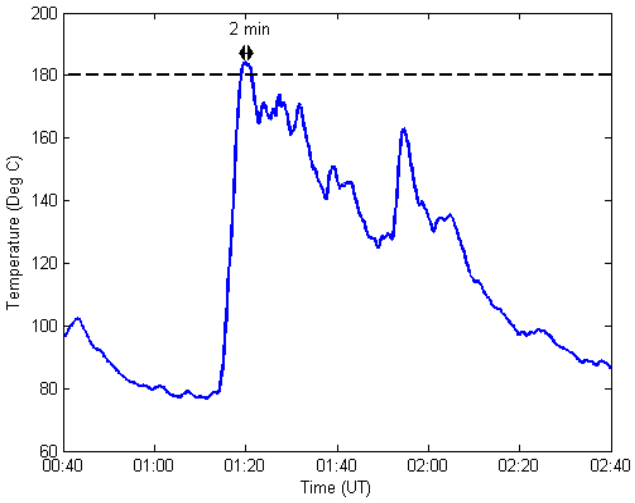
In this example the IEEE Std. C57.91 emergency loading hot spot threshold of 200°C for metallic hot spot heating is not exceeded ~~for 3 minutes (as opposed to 30 minutes for emergency overloading).~~ . Peak

temperature is ~~204~~186°C. The IEEE standard is silent as to whether the temperature can be higher than 200°C for less than 30 minutes. Manufacturers can provide guidance on individual transformer capability.

It is not unusual to use a lower temperature threshold of 180°C to account for calculation and data margins as well as transformer age and condition. **Figure 10** shows that 180°C will be exceeded for ~~15~~5 minutes.

At ~~70~~75% loading, the initial temperature is ~~54.5~~64.6 °C rather than ~~75~~85.3 °C and the hot spot temperature peak is ~~183~~165°C~~. In this case~~, well below the 180°C threshold ~~is~~(see **Figure 11**).

If a conservative threshold of 160°C were to be used to take into account the age and condition of the transformer, then the full load limits would exceeded for ~~2~~approximately 22 minutes~~ (see **Figure 11**).~~.



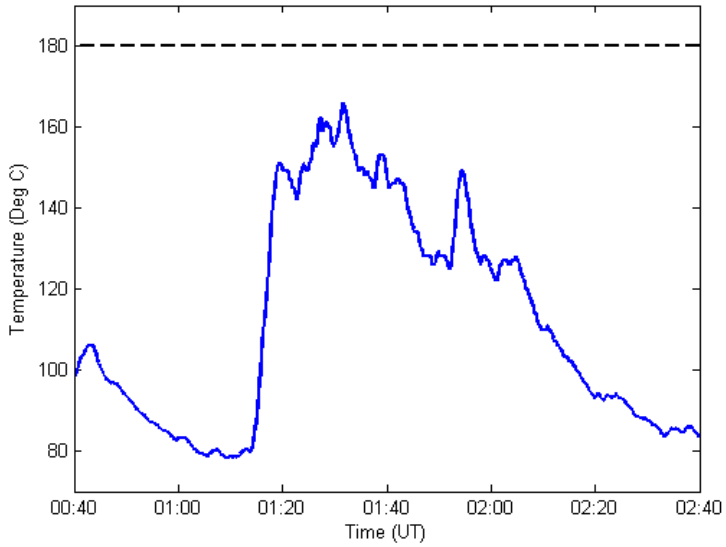


Figure 11: Close-up of Metallic ~~hot spot temperature assuming a 70% load~~ Hot Spot Temperature Assuming a 75% Load
(Oil temperature of ~~54~~64.5°C)

Example 2: Using a ~~manufacturer's capability curves~~Manufacturer's Capability Curves

The capability curves used in this example are shown in **Figure 12**. To be consistent with the previous example, these particular capability curves have been reconstructed from the thermal step response shown in **Figures 8** and **9**, and the simplified loading curve shown in **Figure 14** (calculated using formulas from IEEE Std. C57.91).

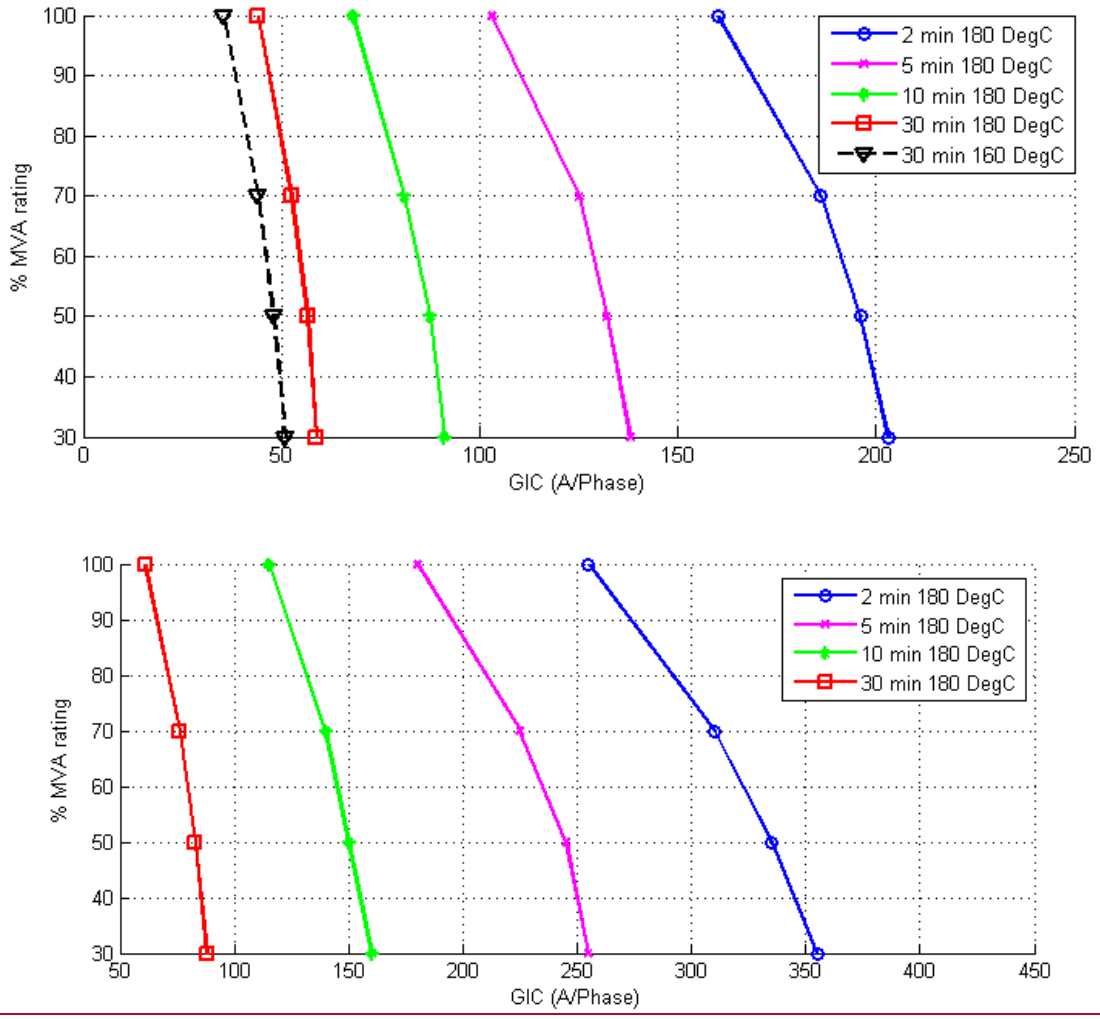

Figure 12: Capability ~~c~~Curve of a ~~transformer based~~Transformer Based on the ~~thermal response shown~~Thermal Response Shown in Figures 8 and 9~~.~~.

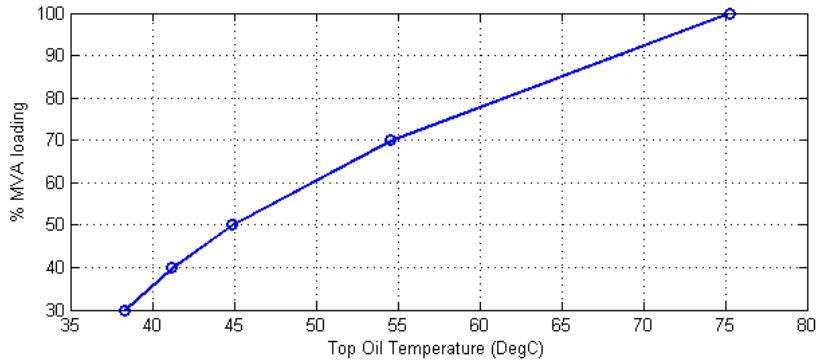

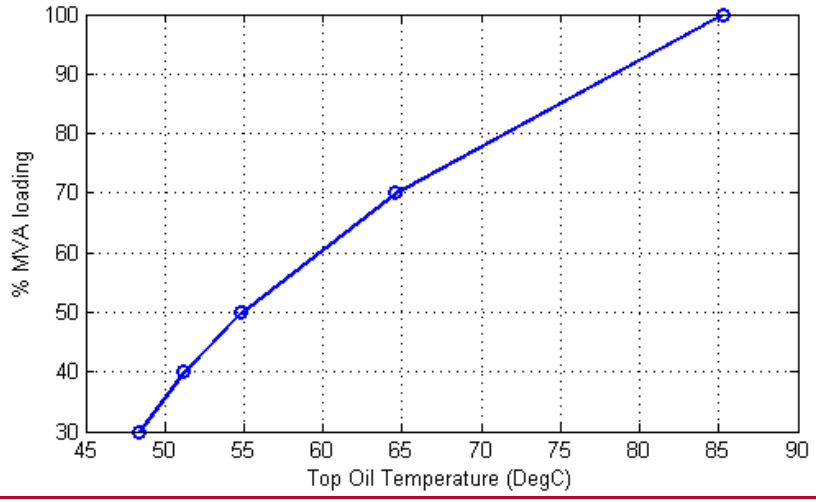

Figure 13: Simplified ~~loading curve assuming 30~~Loading Curve Assuming 40°C ~~ambient temperature~~Ambient Temperature.

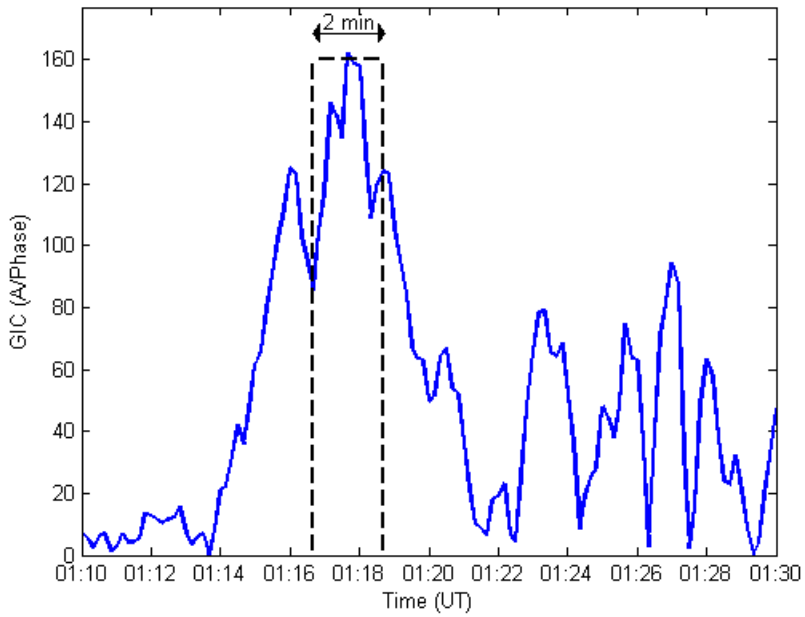
The basic notion behind the use of capability curves is to compare the calculated GIC in a transformer with the limits at different GIC pulse widths. A narrow GIC pulse has a higher limit than a longer duration or wider one. If the calculated GIC and assumed pulse width falls below the appropriate pulse width curve then the transformer is within its capability.

To use these curves it is necessary to estimate an equivalent square pulse that matches the waveshape of GIC(t), generally at a GIC(t) peak. **Figure 14** shows a close-up of the GIC near its highest peak superimposed to a ~~160 A/~~255 Amperes per phase, 2 minute pulse at 100% loading from **Figure 12**. Since a narrow 2-minute pulse is not representative of GIC(t) in this case, a 5 minute pulse with an amplitude of 1803 A/phase at 100% loading has been superimposed on **Figure 15**. It should be noted that a ~~160~~255 A/phase, 2 minute pulse is equivalent to a ~~103A~~180 A/phase 5 minute pulse from the point of view of transformer capability. Deciding what GIC pulse is equivalent to the portion of GIC(t) under consideration is a matter of engineering judgment.



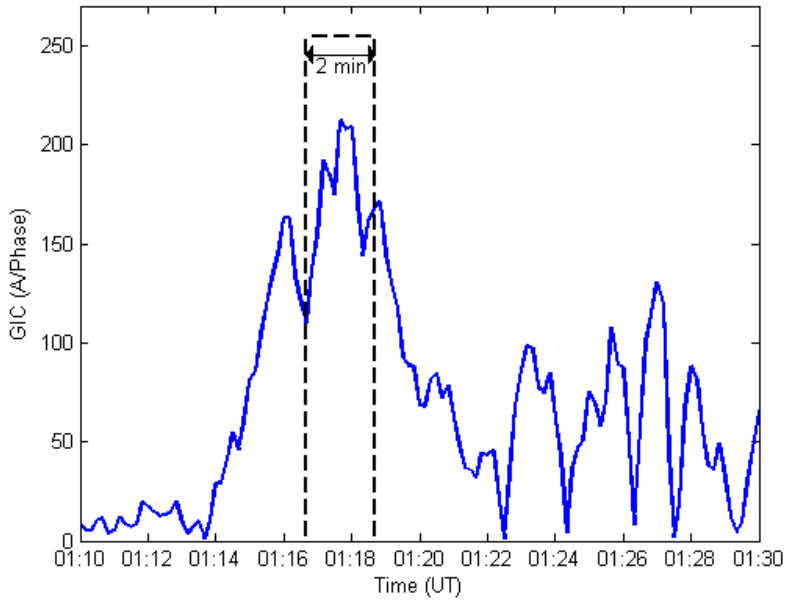


Figure 14: Close-up of GIC(t) and a 2 minute 255 A/phase GIC pulse at full load

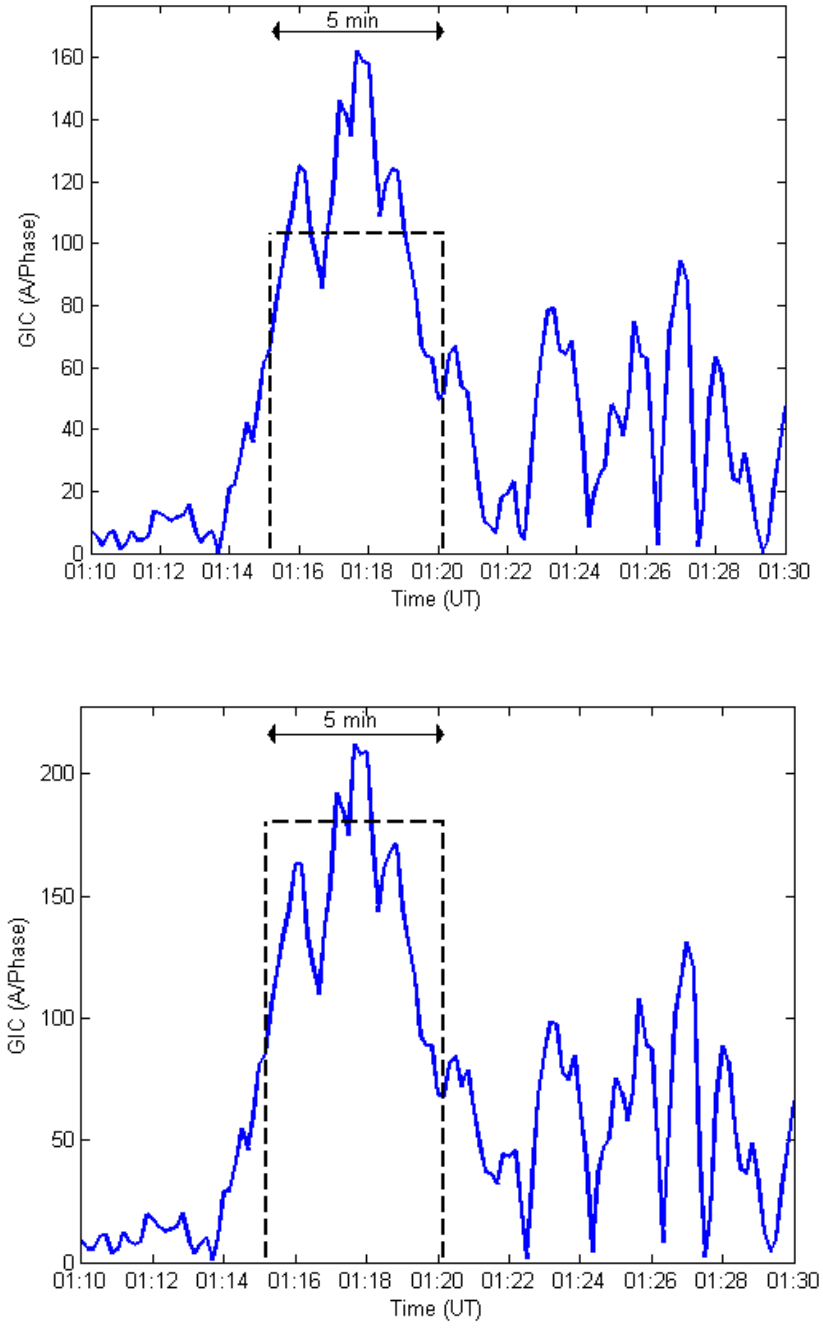

Figure 15: Close-up of GIC(t) and a ~~5 minute~~Five Minute 180 A/phase GIC ~~p~~Pulse at ~~full load~~Full Load

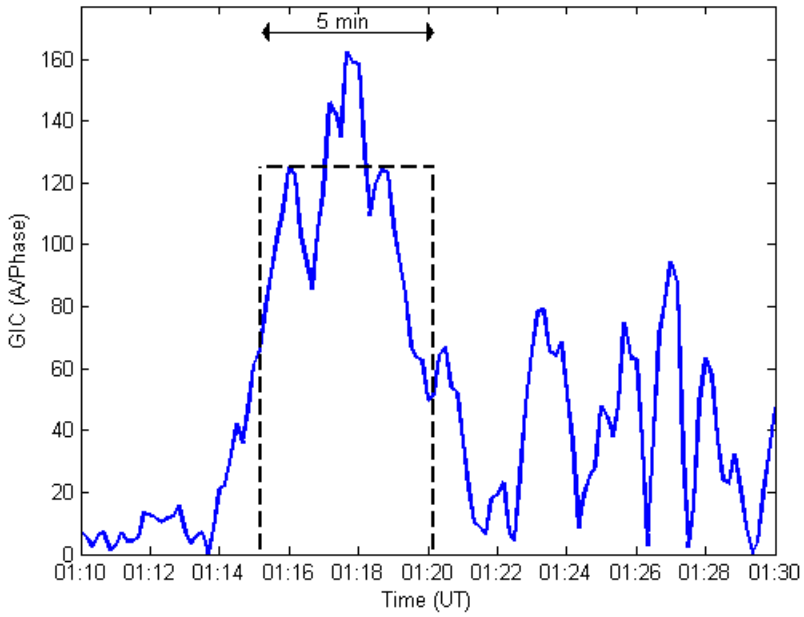
When using a capability curve it should be understood that the curve is derived assuming that there is no hot spot heating due to prior GIC at the time the GIC pulse occurs (only an initial temperature due to loading). Therefore, in addition to estimating the equivalent pulse that matches GIC(t), allowances have to

be made in terms of prior hot spot heating. From these considerations it is ~~apparent that~~unclear whether the capability curves would be exceeded at full load with a 180 °C threshold in this example.

At 70% loading, the two and five minute pulses from **Figure 12** would have amplitudes of ~~186~~310 and ~~1~~225 A/phase, respectively. The 5 minute pulse is illustrated in **Figure 16**. In this case, ~~it~~judgment is ~~not easy~~also required to assess if the GIC(t) is within the capability curve for 70% loading. In general, capability curves are easier to use when GIC(t) is substantially above or clearly below the GIC thresholds for a given pulse duration.



If a conservative threshold of 160°C were to be used to take into account the age and condition of the transformer, then a new set of capability curves would be required.

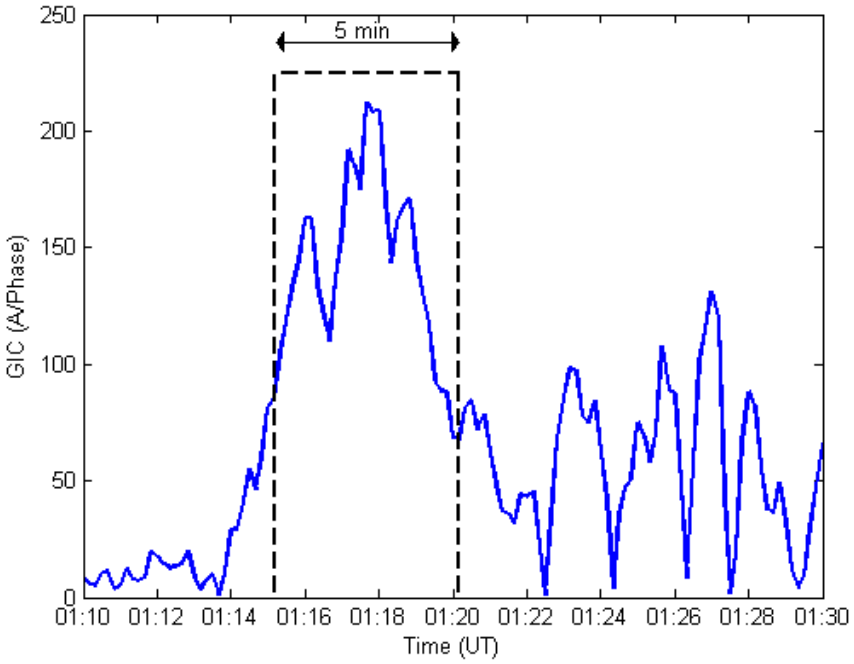


Figure 16: Close-up of GIC(t) and a 5 ~~minute~~Minute 225 A/phase GIC ~~pulse assuming 70% load~~Pulse Assuming 75% Load

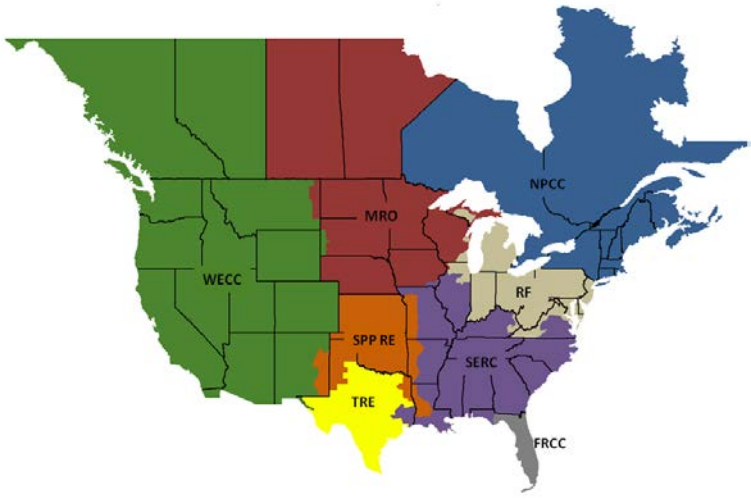
Preface

The North American Electric Reliability Corporation (NERC) prepared this assessment in accordance with the Energy Policy Act of 2005, in which the United States Congress directed NERC to conduct periodic assessments of the reliability and adequacy of the bulk power system (BPS) of North America.[1, 2]

NERC is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the BPS[3] in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.



FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RF	ReliabilityFirst
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electric Coordinating Council

[1] H.R. 6 as approved by the One Hundred Ninth Congress of the United States, the Energy Policy Act of 2005: http://www.gpo.gov/fdsys/pkg/BILLS-109hr6enr/pdf/BILLS-109hr6enr.pdf.

[2] The NERC Rules of Procedure, Section 800, further detail the objectives, scope, data and information requirements, and reliability assessment process requiring annual, seasonal, and long-term reliability assessments.

Notice

This report presents metrics and trends derived from the data available at the time of publication and may be modified pending further review and analysis.

Executive Summary

The *State of Reliability 2014* report represents NERC's independent view of ongoing BPS trends to objectively provide an integrated view of reliability performance. The key findings and recommendations serve as technical input to NERC's risk assessment, Reliability Standards project prioritization, compliance process improvement, event analysis, reliability assessment, and critical infrastructure protection. The analysis of BPS performance developed as part of this report provides an industry reference of historical reliability, offers analytical insights regarding industry action, and enables the identification and prioritization of specific steps that can be taken to manage risks to reliability.

Sustained High Performance for Bulk Power System Reliability

The daily severity risk index (SRI_{bps})[4] value, which measures risk impact or "stress" from events resulting in the loss of transmission, generation, and load, has been stable to improving from 2008 to 2013. Including weather-initiated events, 2013 had no high-stress days (i.e., there were no days with an SRI_{bps} greater than 5.0). On average, the SRI_{bps} was approximately as good as the performance achieved during 2008, which is the best year on record. From 2008 through 2013, the majority of high-stress days (days with high SRI_{bps} scores) were weather-initiated or weather-exacerbated; only a small number of days were associated with initiating events internal to the BPS.

The availability of the bulk transmission system remained high from 2008 to 2013. The ac transmission circuit availability remained above 97 percent, and transmission transformer availability was above 98 percent for the 2010 to 2013 period (unavailability includes both forced and planned outages). High transmission availability demonstrates that the BPS is able to perform reliably over a variety of operating conditions.

NERC continues activity on several projects to maintain the availability and resiliency of the BPS. For example, several standards projects were completed in 2013 that support sustained high performance of BPS reliability by providing the data necessary for bulk transmission system analysis: 1) the Modeling Data standards[5] provide a foundational framework for consistent data requirements and reporting procedures needed to develop planning horizon simulation models that are critical supporting the analysis of the reliability of the interconnected BPS; 2) the Demand Data standard[6] provides authority for applicable entities to collect demand, energy, and related data to support reliability studies and assessments, measuring whether there is an adequate amount of resources available to serve peak demand while also maintaining a sufficient margin to address operating events; and 3) the ATC standard[7] requires the determination of available transmission system capability and specifies that the methods and data underlying those determinations must be disclosed to those registered entities that need the information for reliability purposes.

Frequency Response Remains Stable

From 2009 to 2013, the Eastern Interconnection, ERCOT Interconnection, Québec Interconnection[8] and the Western Interconnection have shown steady frequency response performance, trending above the recommended interconnection frequency response obligation (IFRO) at all times during the study period. The Eastern Interconnection data showed a slightly downward trend in frequency response; however, this trend is not statistically significant. It is important to continue to monitor these trends to determine whether they approach or drop below the IRFO for any interconnection. The study methods and statistical results of the frequency response evaluation are summarized in Chapter 4 (ALR1-12) and detailed in Appendix B.

[6] MOD-031-1, Demand Data (MOD C), http://www.nerc.com/pa/Stand/Pages/Project2010-04DemandData(MOD-C).aspx
[7] ATC Revisions (MOD A), http://www.nerc.com/pa/Stand/Pages/Project201205MODAAvailableTransferCapability.aspx
[8] Only Québec Interconnection 2011 and 2013 frequency response data is available.

Several projects are ongoing at NERC to monitor and maintain frequency response. For example, NERC completed the development of BAL-003-1 in 2013, and FERC approved the standard on January 16, 2014. BAL-003-1 establishes a minimum frequency response obligation for each Balancing Authority (BA), provides a uniform calculation of frequency response and frequency bias settings that transition to values closer to natural frequency response, and encourages coordinated Automatic Generation Control operation. This standard, in partnership with BAL-001-2, maintains interconnection steady-state frequency within defined limits by balancing real power demand and supply in real time, ensuring that BAs take actions to maintain interconnection frequency and that they each contribute their fair share to frequency control. NERC also completed development of BAL-001-2 in 2013, which is pending regulatory approval.

RECOMMENDATION:
EXAMINE INCIDENTS IN 2013 WHERE FREQUENCY RESPONSE WAS LESS THAN IFRO. DETERMINE ACTIONS TO MAINTAIN AND IMPROVE FREQUENCY RESPONSE PERFORMANCE.

Protection System Misoperations Cause Transmission Events

Similar to the key finding in the *State of Reliability 2013* report, protection system misoperations continued to be a significant contributor to automatic transmission outage severity in 2013, as shown in Chapter 3. On average, transmission system events with protection system misoperations were more impactful than other transmission events. They were also, in aggregate, a significant contributor to transmission outage severity, indicating that a reduction in protection system misoperations would lead to an improvement in system reliability.

Protection system misoperations continues to be an area of NERC concentration. The Reliability Issues Steering Committee (RISC) has identified system protection reliability, uncoordinated protection systems, and protection system misoperations as top-priority risks to reliability. NERC has focused its Reliability Standards efforts in these areas, with the completion of the relay loadability standards[9] and continued work on relay misoperations[10] and coordination.[11] In addition, NERC staff is coordinating with the North American Transmission Forum to find ways to reduce protection system misoperations and develop ways to minimize their impact. NERC's Event Analysis activities continue to examine system events to identify actions needed to address protection system trends and common causes of misoperations.

RECOMMENDATION:
COMPLETE DEVELOPMENT OF PRC-004-3. DEVELOP ACTIONS TO ADDRESS THE THREE MOST COMMON CAUSES OF PROTECTION SYSTEM MISOPERATIONS.

Substation Equipment Failures Impact Transmission Event Severity

AC substation equipment failures can exacerbate the severity of transmission outages, as observed in the *State of Reliability 2013* report.

As recommended in the *State of Reliability 2013* report, NERC (through joint action of the Planning Committee and Operating Committee) formed the AC Substation Equipment Task Force (ACSETF) in 2013 to address ac substation equipment failures. The ACSETF has gathered ac substation equipment failure data from multiple sources, including but not limited to the Event Analysis Program, the Transmission Availability Data System (TADS), a supplemental TADS survey conducted by the ACSETF, and the WECC trouble report dataset. The data is being analyzed, and a report will be completed by the end of 2014.

[9] Generator Relay Loadability and Transmission Relay Loadability, http://www.nerc.com/pa/Stand/Pages/Project-2010-13-2-Phase-2-Relay-Loadability-Generation.aspx

[10] Protection System (Misoperations), http://www.nerc.com/pa/Stand/Pages/Project2010-05_Protection_System_Misoperations.aspx

[11] Protection System Coordination, http://www.nerc.com/pa/Stand/Pages/Project-2007-06-System-Protection-Coordination.aspx

In addition, NERC is focusing on increasing awareness of this risk to reliability. For example, NERC developed the adequate level of reliability metric, ALR6-13 AC Transmission Outages Initiated by Failed AC Substation Equipment, to measure performance changes in failed ac substation equipment. The metric shows that outages per element demonstrate year-over-year improvement from 2011 to 2013; this is posted on NERC's website.[12]

NERC's analysis of substation equipment, specifically circuit breakers, identified a failure trend for a specific type of circuit breaker in many of the reported events. A case history was established for a specific type of 345 kV SF_6 puffer-type circuit breaker failure. The average time between reported failures of these breakers was 4.2 months for the six failures discovered in the NERC Event Analysis program. NERC further uncovered a maintenance advisory published for this equipment that indicated the need for equipment modification. These analyses resulted in NERC issuing a Level 1 Advisory Alert regarding identification of a trend in 345 kV SF_6 puffer-type circuit breaker failures and the potential risk it posed to reliability. The purpose of the alert was to ensure industry was aware of the recent failures and previously published maintenance advisories, so appropriate action could be taken by entities that have this particular equipment. Since the alert was published, there have been no reported events caused by this failure mechanism.

RECOMMENDATION:
ASSESS THE EFFECTIVENESS OF NERC ADVISORY ADDRESSING 345 KV SF_6 BREAKER FAILURES. DEVELOP A PLAN TO ADDRESS THE CAUSES OF SUBSTATION EQUIPMENT FAILURES.

Use of Energy Emergency Alert Level 3 Declines

In 2013 there were seven Energy Emergency Alert (EEA) Level 3[13] events declared, which is significantly less than the number that occurred in prior years. EEA trends provide a relative indication of performance measured at a BA or interconnection level. By definition, when an EEA Level 3 Alert is issued, firm-load interruptions are imminent or in progress. An EEA Level 3 Alert indicates an issue with the real-time adequacy of the electric supply system. It may be due to a lack of fuel or dependence on transmission for imports into a constrained area, not simply a lack of available generation resources. In 2013, NERC began to collect and analyze more information surrounding EEA Level 3 events, including load shed, if any. Only one of the seven EEA 3 events in 2013 required firm load to be shed to preserve reliability of the BPS. This further demonstrates the ability of the BPS to perform well under stressed conditions.

There were eight instances of load shedding to mitigate actual and post-contingency transmission system conditions in 2013. The total amount of load shed did not exceed 300 MW in any of these events, and all but one lasted less than four hours.

RECOMMENDATION:
ANALYZE SYSTEM EVENTS THAT RESULTED IN FIRM LOAD SHEDDING TO DETERMINE ANY COMMON CAUSES OR TRENDS

NERC Continues to Focus on Risks to Reliability

The goal of the *State of Reliability 2014* report is to quantify risk and performance, highlight areas for improvement, and reinforce and measure success in controlling these risks. A number of activities are in place to further these objectives.

The RISC was formed in 2011 and continues to identify top-priority risks to reliability. The ongoing work in NERC's Performance Analysis area provides a foundation for their risk assessments. These highest-priority risks are being packaged into specific project work aimed at addressing components of reliability risk. NERC is actively addressing many of these risks, as called for in its corporate goals*: Review the BES[14] risk profile each year to determine actual and potential risks. The target is to identify, select, and mitigate the high-priority risks.*

[12] Reliability Indicators: Automatic Outages Initiated by Failed AC Substation Equipment / Automatic Outages Initiated by Failed AC Circuit Equipment, http://www.nerc.com/pa/RAPA/ri/Pages/Automatic-OutagesInitiatedbyFailedACSubstationACCirc.aspx

[13] http://www.nerc.com/pa/rrm/ea/Documents/EOP-002-2.pdf, EEA3 definition, page 9

[14] http://www.nerc.com/files/glossary_of_terms.pdf, BES Definition, page 20

For example, in 2014, the following projects are now ongoing:

- Changing Resource Mix
- Extreme Physical Events
- Protection System Misoperations
- Cold Weather Preparedness
- Right-of-Way Clearances
- 345 kV Breaker Failures

The NERC Standards department continues to review standards to improve the performance of the BPS.[15] This work focuses on improving the quality and content of standards while addressing key system risks identified by analyzing existing trends.

NERC continues to develop solutions to evolving threats to reliability. The BPS is a highly interconnected system with some remaining challenges, including weather (e.g., droughts, floods, severe winter) and the potential for major cyber and physical attacks. Under the direction of the Critical Infrastructure Protection Committee (CIPC), the Performance Analysis Subcommittee[16] (PAS) is collaborating with the Bulk Electric System Security Metrics Working Group to develop security performance metrics.

Development of Reliability Standards is also ongoing. On November 22, 2013, FERC approved the CIP Version 5 standards, which offer several improvements over previous versions, including increased flexibility in implementing risk mitigation to individual entity operations, elimination of unnecessary documentation requirements, and transitions from the "in or out" classification of critical assets to a "Low-Medium-High" impact-based classification at the system level. The set of CIP Version 5 standards are currently being revised to address FERC directives issued in the order approving the standards.[17]

A physical security standard is being developed in response to a FERC order issued on March 7, 2014, which stated "…the Commission directs the ERO to develop and file for approval proposed Reliability Standards that address threats and vulnerabilities to the physical security of critical facilities on the Bulk-Power System. Such Reliability Standards will enhance the Commission's ability to assure the public that critical facilities are reasonably protected against physical attacks." The FERC order directed NERC to develop the standard in 90 days. The proposed Reliability Standard would require owners or operators of the BPS, as appropriate, to identify facilities on the BPS that are critical to the reliable operation of the BPS and then develop, validate, and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities.

NERC continues to examine impacts on the BPS related to the changing resource mix. Reliably integrating high levels of variable resources (wind, solar, and some forms of hydro) into the BPS will require significant changes to traditional methods used for system planning and operation. The amount of variable generation is expected to grow considerably as policy and regulations on greenhouse gas emissions are being developed and implemented by federal authorities and individual states and provinces throughout North America. Power system planners must consider the impacts of variable generation in power system planning and design and develop the necessary practices and methods to maintain long-term BPS reliability. Operators will require new tools and practices, including potential enhancements to NERC Reliability Standards or guidelines to maintain BPS reliability. NERC is defining essential reliability services and possible sources for those services and expects to form a task force to continue related work.

Report Organization

Chapter 1 outlines key findings and conclusions, and Chapter 2 details the SRI_{bps} trend analysis. Chapter 3 presents a framework and statistical analysis studies that identify the top risks to the BPS using transmission outage data. Chapter 4 provides an assessment for a set of adequate level of reliability metrics. Chapter 5 outlines NERC Event Analysis efforts and findings. Chapter 6 highlights the NERC Spare Equipment Database program, an emerging NERC program that provides an important tool for industry participants to use when sharing information on the availability of spare equipment.

This report was prepared by NERC staff and the NERC PAS under the direction of the Operating Committee and Planning Committees, in collaboration with many stakeholder groups,[18] including:

- Operating Committee (OC):
  - Resources Subcommittee (RS)
  - Frequency Working Group (FWG)
  - Event Analysis Subcommittee (EAS)
  - Operating Reliability Subcommittee (ORS)
- Planning Committee (PC)
  - Reliability Assessment Subcommittee (RAS)
  - System Protection and Control Subcommittee (SPCS)
  - Protection System Misoperations Task Force (PSMTF)
  - Transmission Availability Data System Working Group (TADSWG)
  - Generating Availability Data System Working Group (GADSWG)
  - Demand Response Availability Data System Working Group (DADSWG)
  - Spare Equipment Database Working Group (SEDWG)
- Compliance and Certification Committee (CCC)

Since the initial 2010 annual reliability metrics report,[19] the PAS (formerly the Reliability Metrics Working Group)[20] has enhanced data collection and trend analysis for 16 reliability indicators[21] through NERC's voluntary or mandatory data requests.

Chapter 1 – Key Findings and Conclusions

2014 State of Reliability

The BPS remains reliable and performance is high, as reflected in metrics analysis provided in Chapter 4. The revised SRI_{bps}[22] and 16 metrics that measure system characteristics and performance indicate that the BPS maintained acceptable reliability performance during observed system conditions in 2013. The system is defined as having an adequate level of reliability when the following performance objectives are maintained or achieved:[23]

1. The BES does not experience instability, uncontrolled separation, cascading, or voltage collapse under normal operating conditions and when subject to predefined disturbances.
2. BES frequency is maintained within defined parameters under normal operating conditions and when subject to predefined disturbances.
3. BES voltage is maintained within defined parameters under normal operating conditions and when subject to predefined disturbances.
4. Adverse reliability impacts on the BES following low-probability disturbances (e.g., multiple contingences, unplanned and uncontrolled equipment outages, cybersecurity events, and malicious acts) are managed.
5. Restoration of the BES after major system disturbances that result in blackouts and widespread outages is performed in a coordinated and controlled manner.
6. BES transmission capability is assessed to determine the availability to meet anticipated BES demands during normal operating conditions and when subject to predefined disturbances.
7. Resource capability is assessed to determine the BES's availability to meet anticipated BES demands during normal operating conditions and when subject to predefined disturbances.

2013 Overall Reliability Performance

An adequate level of reliability was preserved in 2013 as performance remained high, as evidenced by no significant upward or downward trends in the metrics for the 2008 to 2013 period. The SRI_{bps} and 16 metrics that measure the characteristics of an adequate level of reliability indicate the BPS is within the defined acceptable ALR performance objectives. Based on the data and analysis in the latter chapters of this report, the following key findings were identified:

- Sustained high performance for BPS reliability
- Frequency response remains stable
- Protection system misoperations cause transmission events
- Substation equipment failures impact transmission event severity
- Use of Energy Emergency Alert Level 3 declined

[22] SRI_{bps} is a "stress" index, measuring risk impact from events resulting in transmission loss, generation loss, and load loss.

[23] Definition of "Adequate Level of Reliability," http://www.nerc.com/comm/Other/Adequate Level of Reliability Task Force ALRTF DL/Final Documents Posted for Stakeholders and Board of Trustee Review/10_04_12_ALR_Definition_clean.pdf

Key Finding 1: Sustained High Performance for Bulk Power System Reliability

Daily Performance Severity Risk Assessment

Based on the SRI_{bps} and 16 metrics that measure the characteristics of an ALR, BPS reliability is adequate and within the defined acceptable ALR performance objectives. Seven out of the top-10 most severe events in 2013 were initiated or exacerbated by weather. There were no high-stress days (i.e., there were no days with an SRI_{bps} greater than 5.0) in 2013, compared to three days in 2012.

Figure 1.1 captures the daily SRI_{bps} value from 2008 to 2013, including the historic significant events. The SRI_{bps} is a daily, blended metric where transmission loss, generation loss, and load loss events are aggregated into a single value that represents the performance of the system. Accumulated over one year, these daily performance measurements are sorted in descending order to evaluate the year-on-year performance of the system. Since there is a significant difference between best days, normal days, and high-stress days in terms of SRI values, the curve is depicted using a logarithmic scale.

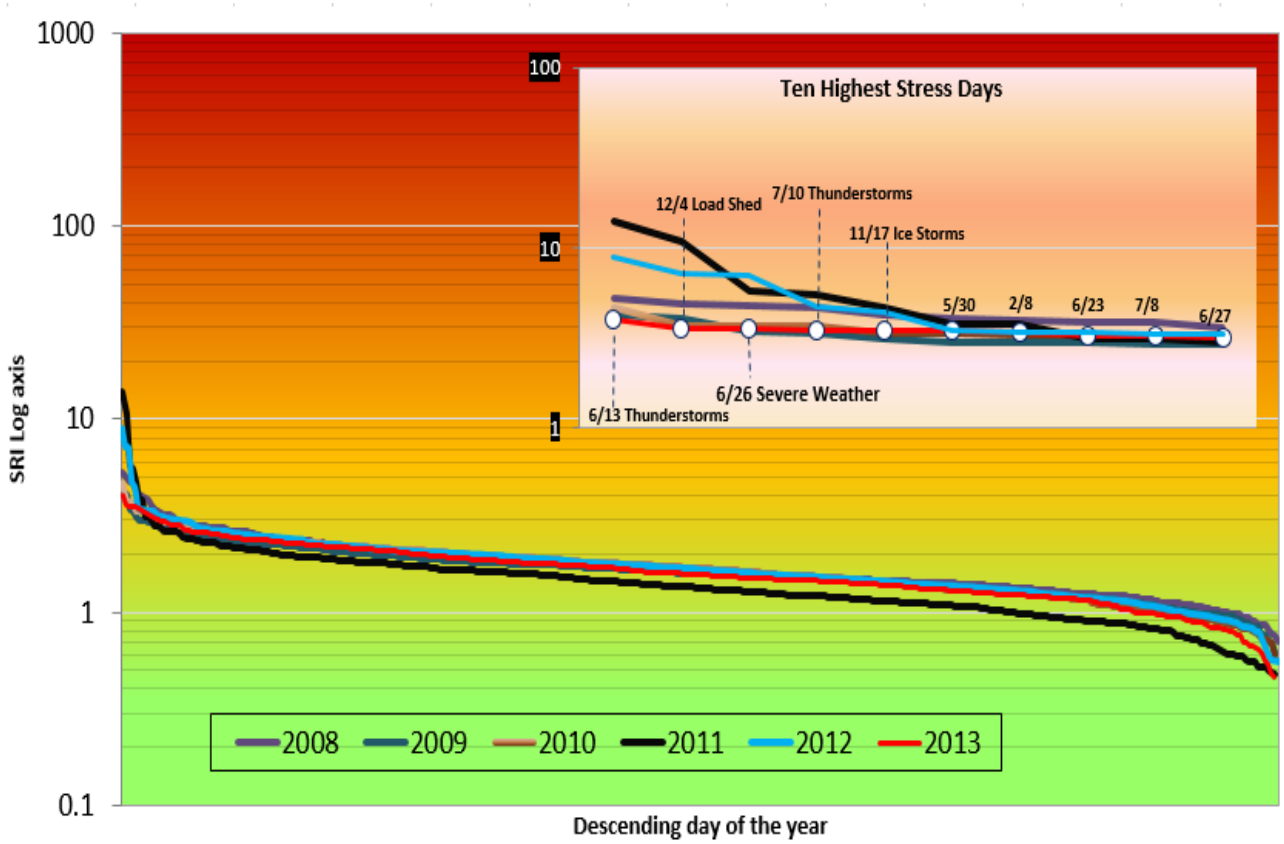

Figure 1.1: NERC Daily Severity Risk Index Sorted Descending by Year

Table 1.1: 2013 Top-Ten SRI Days							
Date	NERC SRI and Components				Weather Influenced (Y/N)	Cause Description	Interconnection
		Components and Weighting					
	SRI_{bps}	Generation (10%)	Transmission (30%)	Load Loss (60%)			
6/13/2013	4.1	14.5	4.4	2.1	Y	Severe Thunderstorms	Eastern
12/4/2013	3.6	11.1	1.7	3.3	Y	Cold/Load Shed	Western
6/26/2013	3.6	16.8	4.9	0.7	Y	Severe Weather	Eastern and Western

6/27/2013	3.2	13.2	3.8	1.2	N	Fault and Equipment Failure	Western and Eastern

Steady Transmission System Availability and Metrics

Availability of the transmission system remains high with no statistically significant change in performance from 2008 to 2013. Operated at 200 kV and above, ac circuit availability is greater than 97 percent, and transformer availability is greater than 98 percent for the period of 2010–2013, the only years that planned outage data (an integral component in total availability) is available.

This availability includes both planned and unplanned outages. Planned outages for maintenance and construction have a long-term positive impact on transmission system reliability. AC circuit and transformer unavailability was well below 3 percent, as shown in Figures 1.2 and 1.3. The unavailability due to automatic sustained outages was 0.30 percent for ac circuits, and 0.10 percent for transformers. These relative percentages provide an indication of the overall availability of the transmission system operated at 200 kV and above.

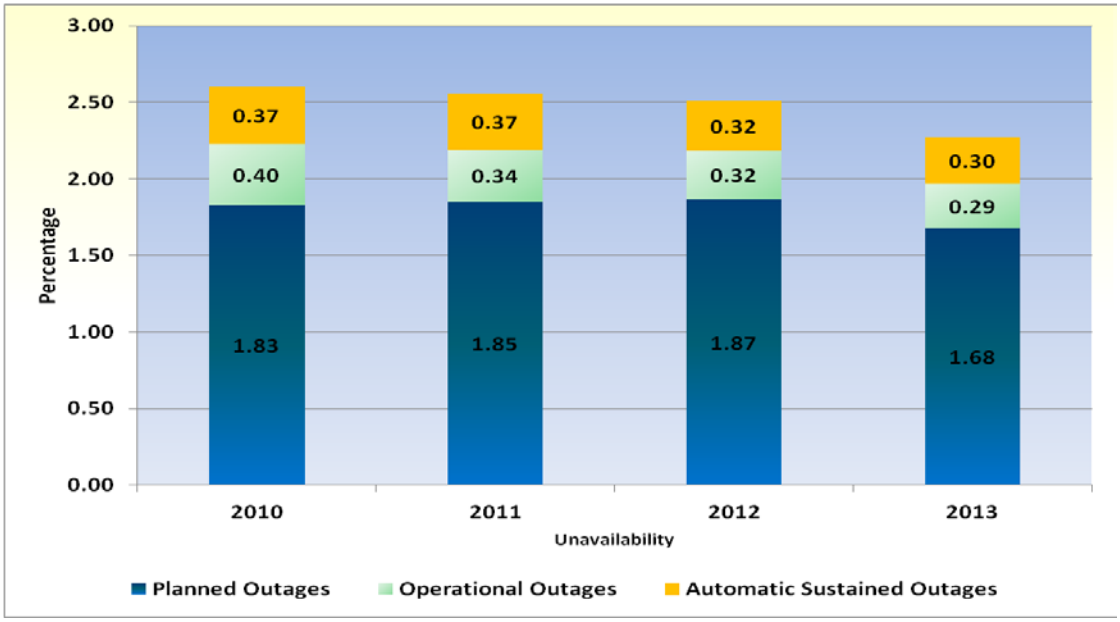

Figure 1.2: NERC Transmission AC Circuits Unavailability by Outage Type (2010–2013)

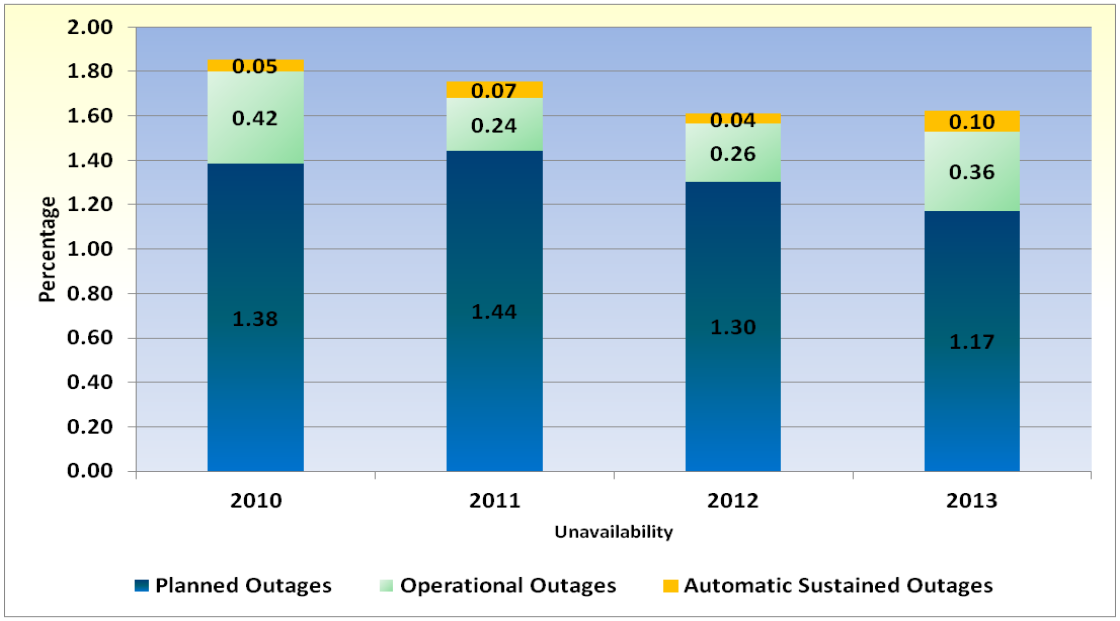

Figure 1.3: NERC Transmission Transformers Unavailability by Outage Type (2010–2013)

Figure 1.4 illustrates that during winter (December, January, and February) and summer (June, July, and August) months, the number of transmission planned and operational outages are lower compared to other months of the year, when most construction and maintenance work occurs.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2010	1,005	1,093	1,650	1,621	1,688	1,440	1,195	1,282	1,670	1,991	1,803	1,213
2011	1,225	1,287	1,567	1,670	1,758	1,464	1,076	1,308	1,573	1,879	1,577	1,222
2012	1,226	1,382	1,717	1,883	1,789	1,490	1,107	1,130	1,746	1,978	1,579	1,180

4-Year Average	1,130	1,241	1,627	1,738	1,743	1,420	1,118	1,222	1,664	1,916	1,550	1,160

Figure 1.4: NERC Transmission Planning and Operational Outages by Month (2010–2013)

Overview of NERC Actions Supporting Sustained High Performance

NERC's Reliability Risk Management (RRM) group performs assessments (including real-time or near-real-time assessments) of the reliability and adequacy of the BPS and identifies potential issues of concern relating to system, equipment, entity, and human performance. RRM focuses on awareness of BPS conditions and events. The group analyzes events and addresses the most significant risks to BPS reliability, ensuring that industry is well informed of system events, emerging trends, risk analysis, lessons learned, and expected actions. The observations from RRM's focused situation awareness and event analysis activities are consistent with the broader conclusions above and provided context and depth to all 10 of the top SRI days as shown in Table 1.1.

In 2013, several standards projects were completed that support sustained high performance of BPS reliability by providing the data necessary for bulk transmission system analysis. The Modeling Data standards[24] provide a foundational framework for consistent data requirements and reporting procedures needed to develop planning horizon simulation models critical to support the analysis of the interconnected BPS's reliability. The standards establish clear expectations of who provides what data to whom to support each interconnection model construction and introduces Planning Coordinator-level data validation within each planning area. The Demand Data standard[25] provides authority for applicable entities to collect demand, energy, and related data to support reliability studies and assessments measuring whether there is an adequate amount of resources available to serve peak demand while also maintaining a sufficient margin to address operating events. This Reliability Standard enumerates the responsibilities and obligations of requestors and respondents of the data. The ATC standard[26] requires available transmission system capability to be determined to support the reliable operation

[24] MOD-032-1 and MOD-033-1, Modeling Data (MOD B), http://www.nerc.com/pa/Stand/Pages/Project2010-03ModelingData(MOD-B).aspx
[25] MOD-031-1, Demand Data (MOD C), http://www.nerc.com/pa/Stand/Pages/Project2010-04DemandData(MOD-C).aspx
[26] MOD-001-2, ATC Revisions (MOD A), http://www.nerc.com/pa/Stand/Pages/Project201205MODAAvailableTransferCapability.aspx

of the BPS, and that the methods and data underlying those determinations must be disclosed to those registered entities that need such information for reliability purposes.

In early 2014, NERC completed work on modifications to a standard on operator communications protocols, COM-002-4.[27] The purpose of the standard is to improve communications for the issuance of operating instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the BES. The standard addresses communications protocols for operating personnel in emergency and non-emergency conditions.

Key Finding 2: Frequency Response Remains Stable

NERC annually applies statistical tests to interconnection frequency response datasets,[28] including additional analyses on time of year, load levels, and other attributes. From 2009 to 2013, the Eastern Interconnection, ERCOT Interconnection, Québec Interconnection,[29] and Western Interconnection have shown steady frequency response performance, trending above the recommended IFRO at all times during the study period. The Eastern Interconnection data showed a slightly downward trend in frequency response; however, this trend is not statistically significant. It is important to continue to monitor these trends to determine whether any numbers approach or drop below the IRFO for any interconnection. The study methods and statistical results are summarized in Chapter 4 (ALR1-12) and detailed in Appendix B.

Overview of NERC Actions Supporting Sustained Frequency Response

FERC approved BAL-003-1 on January 16, 2014. This standard establishes a minimum frequency response obligation for each BA, provides a uniform calculation of frequency response and frequency bias settings that transition to values closer to natural frequency response, and encourages coordinated Automatic Generation Control operation. This standard, in partnership with BAL-001-2, maintains interconnection steady-state frequency within defined limits by balancing real power demand and supply in real time. BAL-003-1 will ensure that BAs take actions to maintain interconnection frequency, with each BA contributing its fair share to frequency control. BAL-001-2 is pending regulatory approval.

NERC is continuing development work in 2014 on the Reliability Standards that relate to frequency response. The Balancing Authority Reliability-Based Controls: Reserves project[30] is modifying BAL-002 to measure the ability of an entity to recover from a reportable event with the deployment of its reserves. The reliable operation of the interconnected BPS requires that adequate generating capacity be available at all times to maintain scheduled frequency and avoid loss of firm load following loss of transmission or generation contingencies. This generating capacity is necessary to replace generating capacity and energy lost due to forced outages of generation or transmission equipment. The Disturbance Monitoring project[31] is modifying PRC-002 to establish requirements for recording and reporting sequence-of-events (SOE) data, fault-recording (FR) data, and dynamic-disturbance-recording (DDR) data to facilitate analyses of disturbances. The proposed modifications to the standard will not specify what equipment must be used to capture this data but will focus on ensuring that the requisite data is captured. This will improve system reliability by providing personnel with necessary data to enable more effective analysis of events that affect the BES.

There were no reported Event Analysis Program[32] qualified events in 2013 where frequency response performance was cited as a causal factor for initiating or sustaining an event. NERC will examine incidents in 2013

[27] Operating Personnel Communications Protocols, http://www.nerc.com/pa/Stand/Pages/Op_Comm_Protocol_Project_2007-02.aspx

[31] Disturbance Monitoring, http://www.nerc.com/pa/Stand/Pages/Project_2007-11_Disturbance_Monitoring.aspx
[32] http://www.nerc.com/pa/rrm/ea/Pages/EA-Program.aspx

where frequency response was below the IFRO to determine any actions that should be taken in response to the frequency response performance.

Recommendation
NERC will examine and develop root causes for incidents in 2013 where frequency response was less than the IFRO. NERC will determine additional actions, beyond those currently being worked on in NERC Standards, that should be taken to maintain and improve frequency response performance.

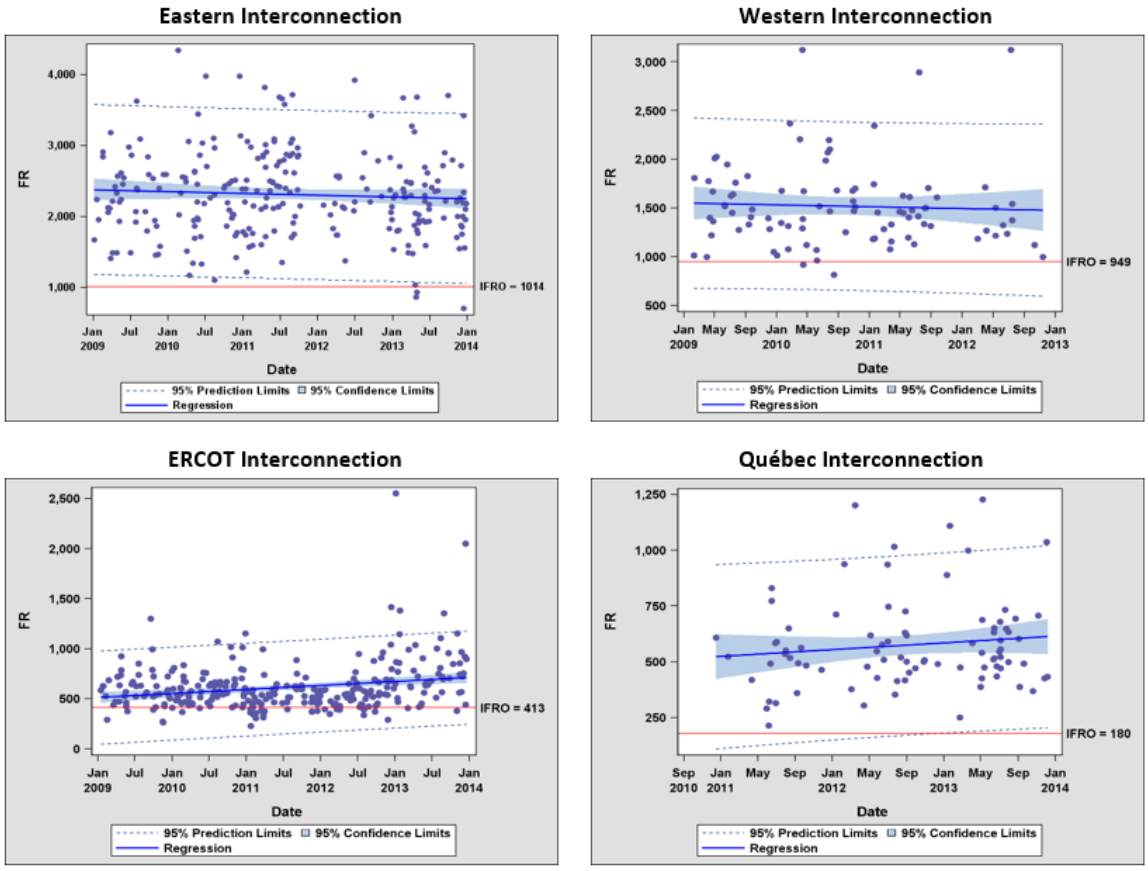

Figure 1.5: Interconnection Frequency Response Trend (2009–2013)

Key Finding 3: Protection System Misoperations Cause Transmission Events

Protection System Misoperation was identified in previous years as a cause code that has significant probability of occurrence and is positively correlated with transmission severity when outages do occur. Below are additional findings from analyses of misoperations from 2011 through 2013:

- Misoperation occurrences have been consistent over the past three years, with approximately 2,000 misoperations per year.
- The rate of misoperations, as a percentage of total operations, has remained consistent during this period at approximately 10 percent (i.e., roughly one in 10 operations is a misoperation).
- The three most common causes of misoperations remain the same (approximately 65 percent of misoperations are caused by settings/logic/design errors, communication failures, and relay failures).

Three datasets are available to better understand the impact of misoperations on reliability. One dataset is a database of all misoperations that occur on the BES (100 kV and above) that is collected on a quarterly basis by the Regions and NERC. This database provides a comprehensive set of data for all transmission and generation misoperations. It is submitted by the system protection owners and includes detailed information about the misoperation, including a description of the misoperation, its category, its causes, and the proposed mitigation and completion date.

A second dataset that is used to assess risk associated with misoperations is the event reports that are submitted to the Regions and NERC through the event analysis program document that was established by the Events Analysis Subcommittee (EAS). When misoperations are associated with reported system disturbances, NERC can then assess their actual impact on the BES and also identify whether they were causal or contributory to the event through cause coding.

A third source of misoperations reporting occurs through the TADS data collection. Misoperations that were identified as being caused by human error or relay failure are identified in TADS reporting. This occurs for transmission facilities operated at 200 kV and above.

Focusing the statistical analysis of the 2012–2013 TADS data on the transmission severity and initiating causes of TADS events yields the following results and observations:

- Excluding Weather-related and Unknown Initiating Cause Codes (ICC),[33] Misoperations is one of the two largest contributors to the transmission severity risk.
- TADS events initiated by Misoperations and Failed AC Substation Equipment ICCs have a greater expected severity than all other TADS ICC events.

In 2013, there were 71 transmission-related system disturbances that resulted in a NERC Event Analysis reported event. Of those 71 events, 47 (about 66 percent) had associated misoperations. Of these 47 events, 38 (about 81 percent) experienced misoperations that were contributory to or exacerbated the severity of the event. In several cases, multiple misoperations occurred during a single disturbance. Cause coding has not yet been completed for all 2013 events, but it is estimated that there were 60–75 misoperations associated with these 38 reportable events. Therefore, out of approximately 2,000 total misoperations in 2013, approximately 3.0 to 3.5 percent were causal to or exacerbated by the severity of reportable system disturbances.

Two complementary views of misoperations data have been provided in this report. Based upon the total number of misoperations experienced by the industry, the relationship between the Misoperations ICC and transmission risk, and the positive correlation between misoperations and transmission severity, understanding and reducing misoperations should remain a focus of NERC and industry participants.

Overview of NERC Actions Addressing System Protection Misoperations

NERC is continuing activity on several projects to address protection system misoperations. The Reliability Issues Steering Committee (RISC) has identified system protection reliability, uncoordinated protection systems, and protection system misoperations as top-priority risks to reliability. NERC has focused its Reliability Standards efforts in this area with the completion of the relay loadability standards[34] and continues work on relay misoperations[35] and coordination.[36] In addition, NERC staff is coordinating with the North American Transmission

[33] ICC - The Automatic Outage Cause Code that describes the initiating cause of the outage, page 16, Appendix 7, http://www.nerc.com/docs/pc/tadswg/Appendix%207%2020101202a%20clean.pdf

[35] Protection System (Misoperations), http://www.nerc.com/pa/Stand/Pages/Project2010-05_Protection_System_Misoperations.aspx

[36] Protection System Coordination, http://www.nerc.com/pa/Stand/Pages/Project-2007-06-System-Protection-Coordination.aspx

Forum to find ways to reduce protection system misoperations and develop methods to minimize their impact. NERC Event Analysis continues to examine system events to identify those that are impacted by protection system misoperations to determine if action is needed to address trends and common modes of misoperations.

Recommendation
NERC will complete development of Reliability Standard PRC-004-3 — Protection System Misoperation Identification and Correction. NERC will develop a plan and catalyze industry action to address the three most common causes of protection system misoperations (settings/logic/design errors, communication failures, and relay failures).

Key Finding 4: Substation Equipment Failures Impact Transmission Event Severity

As mentioned in Chapter 3, AC Substation Equipment Failures had the largest positive correlation with automatic transmission outage severity in 2013. The correlation is statistically significant: a pattern and underlying dependency exists between ac substation equipment failures and transmission outage severity. A similar observation was made in Key Finding #5 of the *State of Reliability 2013* report. NERC recommended that a small subject matter expert technical group be formed to further validate the findings and root causes to understand the contributing factors of ac substation equipment failures and provide solutions to improve performance. The AC Substation Equipment Task Force (ACSETF) was created to address high-priority reliability issues related to ac substation equipment. The ACSETF has gathered ac substation equipment failure data from multiple sources, including but not limited to the Event Analysis Program, TADS, a supplemental TADS survey conducted by the ACSETF, and the WECC trouble report dataset. The failure data is currently being analyzed by the ACSETF.

ACSETF Work Status

Based on the data reviewed through March of 2014, the ACSETF has observed:

1. The highest percentages of outages involve circuit breaker failures, as previously reported in the *State of Reliability 2013* report.[37]
2. The top-four sub-components that result in circuit breaker failures, in descending order of frequency, are: interrupters, mechanism, trip coil, and bushing.
3. Inherent in circuit breaker failure is an increased probability that additional BPS elements will also be out of service.
4. Inherent in transformer failure is an increased probability of longer outage duration.
5. Further data collection and analysis is needed, including maintenance strategies, bus configurations, and failure event SRI calculation.

The ACSETF will provide a summary of its analysis along with suggestions for improvement and other observations to the NERC PC and OC for review and approval. The final report is scheduled to be completed by December 31, 2014, and results are anticipated to be incorporated in *State of Reliability 2015* report.

Overview of NERC Actions Addressing AC Substation Equipment Failures

In addition, NERC is focusing on increasing awareness of this risk to reliability. For example, NERC developed the adequate level of reliability metric, ALR6-13 AC Transmission Outages Initiated by Failed AC Substation Equipment,

[37] http://www.nerc.com/pa/RAPA/PA/Performance%20Analysis%20DL/2013_SOR_May%2015.pdf

to measure performance changes in failed ac substation equipment. The metric shows that outages per element demonstrates year-over-year improvement from 2011 to 2013; this is posted on NERC's website.[38]

Circuit breaker failures, in conjunction with another system fault, may lead to more BES facilities being removed from service than required to clear the original fault. High-voltage circuit breaker failures are one of the leading contributors of severe disturbances on the BES. When NERC identified a potential trend of 345 kV SF_6 puffer-type breakers failing, a Level 1 NERC Advisory was issued.[39]

Recommendation
NERC will assess the implementation and effectiveness of the Level 1 NERC Advisory issued to address 345 kV SF_6 puffer-type breaker failures. NERC will develop a plan with milestones to address the causes of substation equipment failures identified by the ACSETF. NERC will develop and facilitate data collection necessary to perform future analysis of substation equipment failures, as recommended by the ACSETF.

Key Finding 5: Use of Energy Emergency Alert Level 3 Declines

In 2013 there were seven Energy Emergency Alert (EEA) Level 3 events declared, which is significantly lower than the number that occurred in prior years. Additionally in 2013, changes were made to the metric ALR6-2 to include duration in hours that an EEA was in effect at any level and the amount of load shed that was necessitated by an EEA Level 3 event.

This data collection was first performed for 2013 EEA data, and it showed that of the seven EEA Level 3 events declared, only one resulted in any amount of load shed. The other six fell into two categories. One category pertained to significant unplanned outages of resource supply due to generator trip or equipment failure—either the unplanned loss of one or more generation resources, or the unplanned loss of a major transmission facility that supplied generation into an area. These included quickly evolving events in which the entity had to use its reserves to serve its load and had to prepare for load shed to meet the next possible contingency. The other category consisted of events in which transmission limitations in the form of Transmission Loading Relief (TLR)[40] events were in place and were affecting entities that rely upon import transactions to serve their load. These events did not involve unplanned loss of generation or equipment failures; rather, they occurred as loading increased over a period of time and the affected Transmission Operator (TOP) responded by requesting various levels of TLR relief. The entities in this category used the EEA Level 3 Alert to protect their firm transactions, to avoid having to reduce load, and to call upon reserve-sharing provisions to restore reserves.

Throughout 2013, there were eight instances of firm load shedding not driven by EEA Level 3 events. These eight load-shedding instances were distributed across four distinct events. Of the eight instances where firm load was shed, five instances were required to mitigate post-contingency transmission facility overloads, one instance was to mitigate actual transmission facility overloads and low voltages following a major transmission system disturbance, and one instance was to mitigate non-convergence of state estimation, indicating an unknown operating state. In all eight instances, the use of load shedding was successful at preventing greater and more widespread impacts.

Recommendation
NERC will analyze system events that resulted in firm load shedding to determine any common causes or trends that warrant action.

Recent Changes

The state of reliability is an ever-changing landscape. A number of activities were pursued in 2013 to further improve the metrics and assessments:

Modified SRI calculation

In 2013, the Performance Assessment Subcommittee received concerns that the SRI calculation was dominated by loss-of-load impacts. Since the weather-related events often have distribution-related outages to a greater degree than generation or transmission impacts, the SRI calculation was modified to remove most of the distribution facility outage causes from the load-loss component of the calculation. Only load loss caused by loss of supply from either the generation or transmission system is now included in the SRI calculation. This report describes the new calculation of SRI, referred to as SRI_{bps}. Consistent with observations in prior state of reliability reports, severe weather remained a major contributor to many of the high-severity days.

Retired KCMI

The PAS reviewed the existing Key Compliance Monitoring Index (KCMI)[41] and in collaboration with the Compliance and Certification Committee (CCC) retired it in 2013. Prior state of reliability reports noted that the trend for this index continued to reflect fewer violations of standards. It became increasingly difficult to update the standards violations that were included in the KCMI to stay current with evolving Reliability Standards and provide a meaningful metric. As a part of NERC's three-element view of risk, compliance violations associated with Reliability Standards remain an important part of the analysis of reliability. Therefore, an effort has begun to create a new metric to track performance with regard to violations of Reliability Standard requirements that are considered to have a serious risk to the BES. The expectation is that the replacement of KCMI in 2014 with an improved compliance metric would provide more meaningful information on standards violations with a potentially serious impact to reliability.

Revised Adequate Level of Reliability Definition

In late 2012, NERC adopted a revised definition of Adequate Level of Reliability, which forms the basis for the reliability indicators that are used as metrics to evaluate the performance of the BES. The seven performance objectives and associated expected performance outcomes were developed to encompass NERC's responsibility to ensure reliability of the BES. This year's state of reliability report contains a mapping of the seven performance objectives to the existing performance metrics. Also, a new naming convention has been proposed to move from the former six-element definition to the new definition, which has seven categories of performance objectives.

Modification of Metrics

Finally, in the annual review of the existing metrics, efforts were made to consolidate metrics that were similar, and to add dimension to metrics in areas where additional information may provide insight, particularly in capturing duration of events and magnitude of impact to the BES with load interruption. To meet these goals, two metrics were retired, and several were modified to either add additional criteria or provide additional dimensions of data collection to the metrics. These modified metrics are included in more detail in Chapter 4.

Additional NERC Initiatives

NERC continues to develop solutions to evolving threats to reliability. The BPS is a highly interconnected system with some remaining challenges, including weather (e.g., droughts, floods, severe winter) and the potential for major cyber and physical attacks. Under the direction of the CIPC, the PAS is collaborating with the Bulk Electric System Security Metrics Working Group to develop security performance metrics.

[41] http://www.nerc.com/pa/RAPA/PA/Performance%20Analysis%20DL/2013_SOR_May%2015.pdf KCMI definition, page 42

NERC's Standards department continues to review the standards to improve performance of the BPS via the Standards Development Plan.[42] This work focuses on improving the quality and content of standards while addressing key system risks as identified through analysis of existing trends.

In response to FERC directives, through 2014 NERC will continue to develop modifications to the CIP Reliability Standards when approving Version 5.[43] NERC is also developing a standard on Physical Security,[44] which will require owners or operators of the BPS, as appropriate, to identify facilities on the BPS that are critical to the reliable operation of the BPS. Additionally, owners or operators of those identified critical facilities will develop, validate, and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities.

Reliably integrating high levels of variable resources (wind, solar, and some forms of hydro) into the North American BPS will require significant changes to traditional methods used for system planning and operation. The amount of variable renewable generation is expected to grow considerably as policy and regulations on greenhouse gas emissions are being developed and implemented by federal authorities and individual states and provinces throughout North America. Power system planners must consider the impacts of variable generation in power system planning and design and develop the necessary practices and methods to maintain long-term BPS reliability. Operators will require new tools and practices, including potential enhancements to NERC Reliability Standards or guidelines to maintain BPS reliability.

NERC is continuing its focus on refining ICCs, including further analysis on the "Unknown" cause code. In the *State of Reliability 2013* report, transmission outages with an ICC of Unknown contributed to 19 percent of all TADS events. A recommendation was made to provide additional guidance to those entities reporting sustained outages with an ICC of Unknown.

The subject of TADS outages reported with initiating cause as Unknown was reviewed and discussed with the TADS Working Group (TADSWG). Results of statistical analyses on historical TADS event data (2008–2012) was presented by NERC staff and discussed at recent TADSWG meetings. The results indicated that:

- TADS events with ICCs of Lightning, Unknown, Contamination, and Foreign Interference tend to initiate Momentary Events.
- There is a statistically significant negative correlation between sustained events and TADS events with ICCs of Lightning, Unknown, Contamination and Foreign Interference.
- There is a statistically significant positive correlation between Sustained events and the following ICCs: Human Error, Failed AC Substation Equipment, Failed AC Circuit Equipment, Weather Excluding Lightning, Fire, Failed Protection System Equipment, Other, and Power System Condition.
- Approximately 40 percent of TADS event data are momentary events (an automatic outage less than one minute).

Further analysis has revealed that approximately 60 percent of TADS events with ICC Unknown are momentary events.

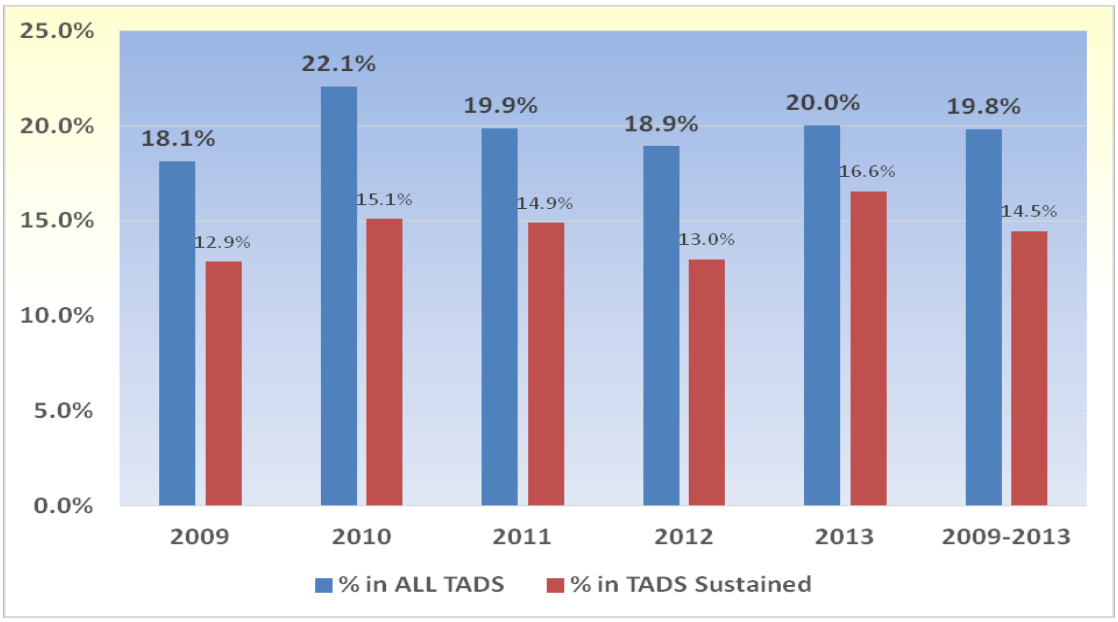

Figure 1.6: Percentage of Unknown Events in all TADS Events vs. in TADS Sustained Events

It is often not possible to confidently determine an ICC for momentary outages, so focus should be on sustained outage events with ICC of Unknown. It is possible that in certain cases, coding sustained outages as Unknown may be due to a lack of clarity on the part of reporting entities for coding events. The TADSWG continues to address questions from TADS reporting entities pertaining to TADS event coding. Specific outage scenarios are reviewed and clarifications to the TADS Data Reporting Manual are applied. These specific changes are reviewed during TADS training sessions, which are held annually with the TADS reporting entities. The TADSWG will continue to monitor the TADS outage data for the purpose of enhancing the cause coding process to minimize the number of sustained outages with ICC as Unknown. NERC will continue to identify and work with entities that report relatively high proportions of Unknown outages to resolve any outage coding issues.

Chapter 2 – Daily Performance Severity Risk Assessment

Overview

The PAS previously developed[45] Figure 2.1 to depict the metrics used to measure the major categories of risks to reliability.

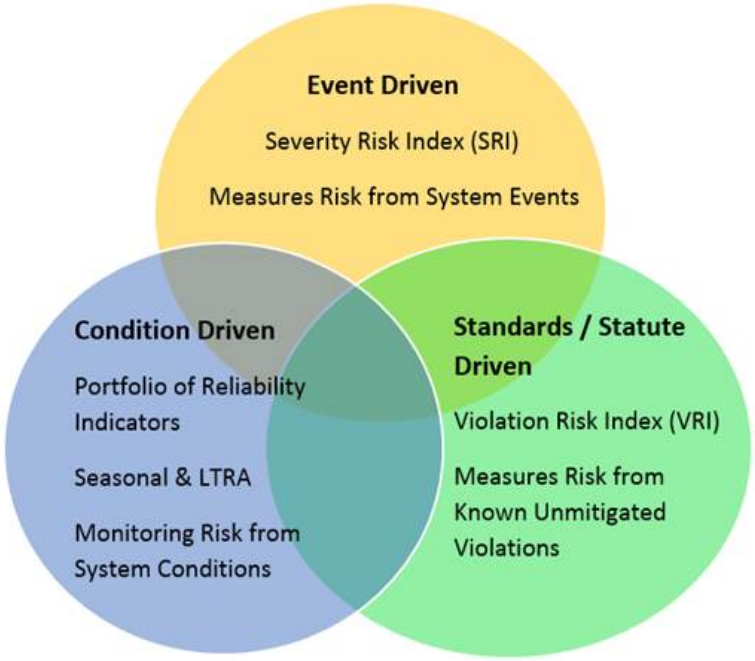

Figure 2.1: Conceptual Risk Model for Bulk Power System

The PAS also developed metrics designed to measure the performance of each of the categories of risk. While some of these metrics are still evolving, the use of the SRI[46] has proven to be a useful way of quantifying the daily performance of the BPS.

During 2013, the PAS undertook significant efforts to enhance the SRI, and it was recognized that the method of calculating the value relied on data that may not have aligned optimally with the index. As a result, revised data was developed, whereupon calculations were modified and results were tested. The SRI was calculated by using the historic method, labeled SRI_{OLD}, then compared against the revised method, labeled SRI_{bps}. These results were shared, along with the recommendation by the PAS to the OC and PC, who approved the revised calculation.

This year's analysis relies on this modified calculation, and all use of SRI_{OLD} has been discontinued in this year's *State of Reliability* report.

Key conclusions were:

- The performance on high-stress days was as good as that recorded in 2009 and 2010, which were the best years since data collection began.
- Contrary to prior years, load loss events were not the primary indicator of a high SRI day; in fact, three of the top-10 days for the year appeared to be driven by generation and transmission outage performance and did not significantly involve load loss (load loss severity was less than 1.0).

[45] Integrated Reliability Index Concepts, http://www.nerc.com/docs/pc/rmwg/Integrated_Reliability_Index_WhitePaper_DRAFT.pdf
[46] SRI Enhancement paper, http://www.nerc.com/comm/PC/Performance Analysis Subcommittee PAS 2013/SRI Enhancement Whitepaper.pdf

- There were several high-stress days resulting from extreme Weather events. In general, the SRI correctly correlated with those events, and the power system—while stressed—responded well.
- The majority of the top-10 most severe days in 2013 were initiated or exacerbated by Weather (seven of the 10 days).
- There were no high-stress days (SRI greater than 5.0) in 2013.
- For SRI values less than 5.0, 2013 had better average performance than all years except 2008, where its average value was very close to the 2008 average value.
- Generation outages contribute substantially to daily SRI_{bps} values.

NERC Assessment

Figure 2.2 captures the daily SRI_{bps} values from 2008 to 2013. The SRI is comprised of three key components: generation severity, transmission severity, and load-loss severity. For context throughout this report, each of these severity measures is calculated based on certain assumed and average values and does not rely on individual analyses that measured the specific impact of any given element's function. In particular, generation severity reflects the generation unavailability of a given unit with a plant capacity as a percentage of all available plant capacity. Transmission severity reflects the unscheduled availability of a particular TADS element for which the impact is calculated by a voltage-weighted value divided by the total inventory of TADS elements. Load-loss severity is calculated as an average customer usage at peak for the day the load-loss event occurred. The inset in Figure 2.2 highlights the highest stress days experienced in 2013 from the left side of the SRI curve.

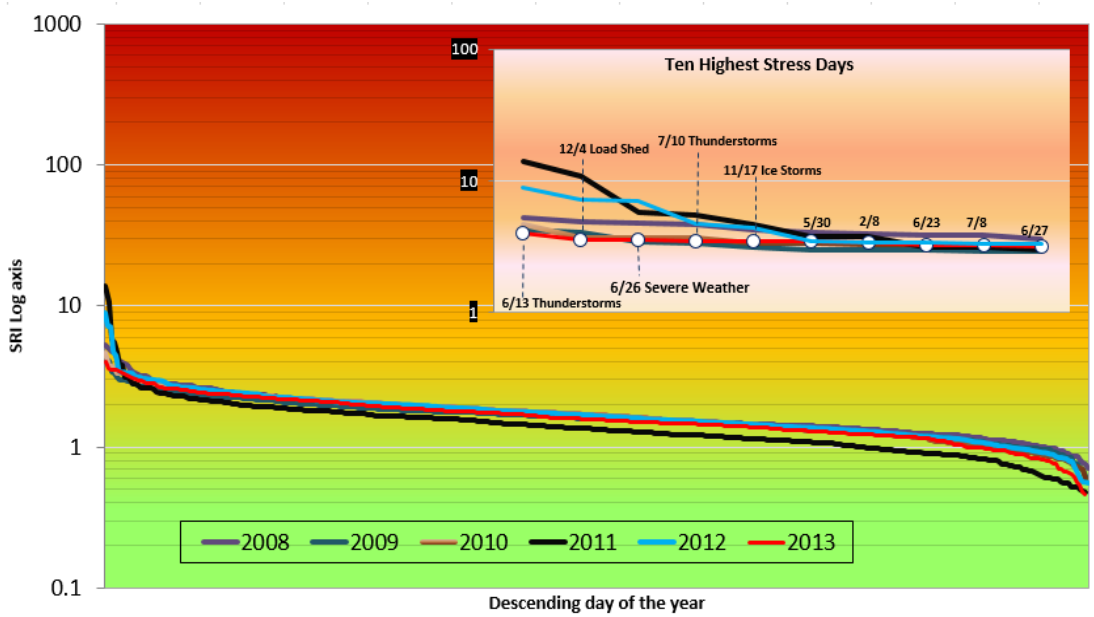

Figure 2.2: NERC Annual Daily Severity Risk Index Sorted Descending

As the year-to-year performance is evaluated in Figure 2.2, certain portions of the graph become relevant for specific analysis. First, the left side of the graph, where the system has been substantially stressed, should be considered in the context of the prior years' high-stress days. Next, the slope of the central part of the graph may reveal year-to-year changes in performance for the majority of the days of the year and demonstrate routine system resilience. Finally, the right portion of the curve may also provide useful information about how many days with lower SRIs occurred during any given year compared to another. The transition to SRI_{bps} allows the entire range of the curve to be used. Prior versions interpreting the right side of the curve may have been misleading, since load-loss calculations were not able to be performed for each calendar day of the year. As well, the left-hand

side of the graph, with the inclusion of distribution-related load-loss events, may have overstated the impact of the load-loss component that pertains to the BPS.

Table 2.1 provides a historical summary of the top-10 SRI_{bps} days. When comparing the values to those in previous state of reliability reports, consider that this summary is based on the updated SRI_{bps} methodology calculation.

Table 2.1: 2013 Top-Ten SRI Days

Date	NERC SRI and Components				Weather Influenced (Y/N)	Cause Description	Interconnection
		Components and Weighting					
	SRI_{bps}	Generation (10%)	Transmission (30%)	Load Loss (60%)			
6/13/2013	4.1	14.5	4.4	2.1	Y	Severe Thunderstorms	Eastern
12/4/2013	3.6	11.1	1.7	3.3	Y	Cold/Load Shed	Western
6/26/2013	3.6	16.8	4.9	0.7	Y	Severe Weather	Eastern and Western
7/10/2013	3.5	18.9	3.0	1.2	Y	Severe Thunderstorms	Eastern
11/17/2013	3.5	7.9	3.5	2.8	Y	Severe Ice & Snow Storm	Eastern
5/30/2013	3.5	18.9	4.7	0.3		Power System Condition, Fire	Western and Eastern
2/8/2013	3.4	9.9	0.2	3.9		Equipment Failure	Western
6/23/2013	3.3	8.9	3.5	2.2	Y	Weather	Western
7/8/2013	3.2	14.8	5.5	0.2	Y	Rainfall Leading to Flooding	Eastern
6/27/2013	3.2	13.2	3.8	1.2		Fault and Equipment Failure	Western and Eastern

In 2013 there were no days that the SRI_{bps} score exceeded 5.0, which is an indicator of a "noteworthy" day. A handful of days are identified on the inset. These include the five days in 2013 with the highest SRI_{bps} score, all of which have an SRI value less than 4.5. The year 2013 was comparable to 2009 and 2010, which were the best years recorded since this data began being collected.

Table 2.1 lists the 10 event dates with highest daily SRI values in 2013 and indicates the component contribution to the SRI_{bps}. The SRI_{bps} results were compared against Form OE-417 data to determine which ones were weather-related.[47] This comparison is shown on Table 2.2. Seven of the top-10 SRI days were weather-influenced, as compared to all of the top-10 SRI days in 2012.

Table 2.2: OE-417 Event Reports versus Load Loss Severity

Date Event Began	Date of Restoration	Area Affected	NERC Region	Event Type	Demand Loss (MW)	Number of Customers Affected	Customer Load Loss (mw) Associated with Significant SRI Day	Feed CAIDI	Restoration Promptness CAIDI Factor	Load Loss SRI	SRI Date

Figure 2.3 shows each day's SRI. Note that Figure 2.3 presents the historic top-10 days with an Event ID label that refers to column 1 of Table 2.3. A general normal range of performance can be established from historic data. Days that were extreme can be detected by their deviation from that normal level. During 2013, there do not appear to be as many extreme days as have occurred in prior years.

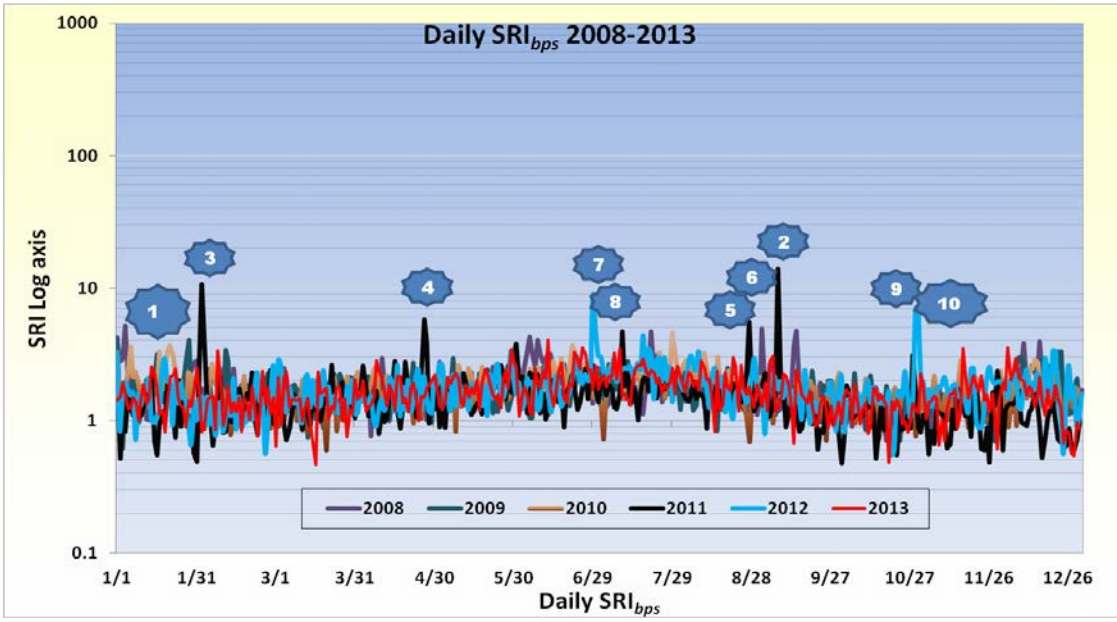

Figure 2.3: NERC Daily SRI (2008–2013)

Table 2.3: Top-10 SRI$_{bps}$ Days (2008-2013)

Event ID	Date	Event Ranking	SRI bps	Description
1	1/4/2008	8	5.30	Winter Storm
2	9/1/2008	9	4.90	Hurricane Ike
3	2/2/2011	2	10.80	Cold Weather Event
4	4/27/2011	6	5.80	Tornadoes, Severe Storm
5	8/28/2011	7	5.60	Hurricane Irene
6	9/8/2011	1	14.00	Southwest Blackout
7	6/29/2012	3	8.90	Thunderstorm Derecho
8	6/30/2012	10	4.70	Thunderstorm Derecho
9	10/29/2012	5	7.00	Hurricane Sandy
10	10/30/2012	4	7.20	Hurricane Sandy

Figure 2.4 shows annual cumulative performance of the BPS. If a step change occurs on the graph, it represents a stress day as measured by the SRI.

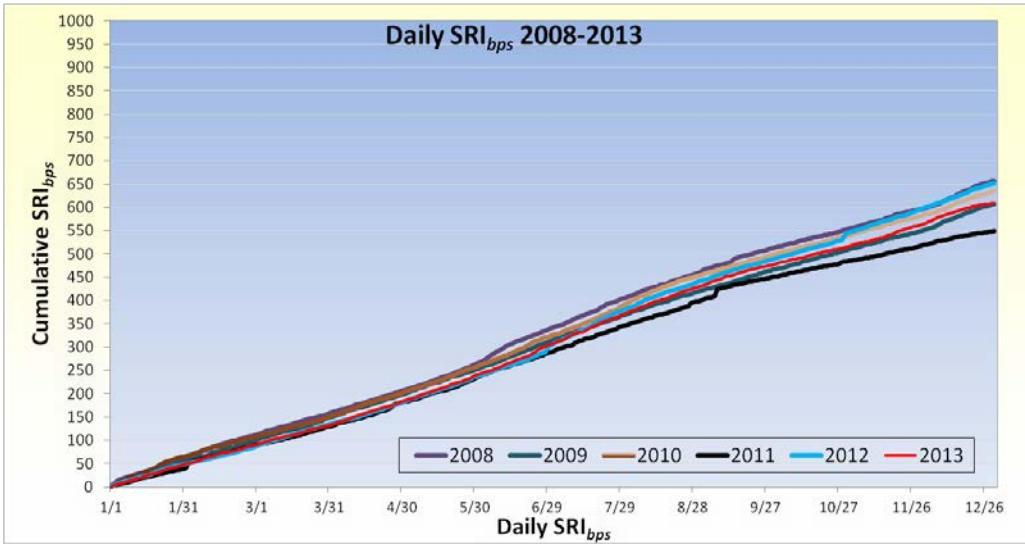

Figure 2.4: NERC Cumulative SRI (2008–2013)

Figure 2.5 breaks down the 2013 cumulative performance by BPS segment. The largest components are generation, transmission, and load loss, in that order. In Figure 2.4, the load-loss component shows day-to-day loss events but does not demonstrate any significant step changes, which was substantiated by the OE-417 data that was reviewed.

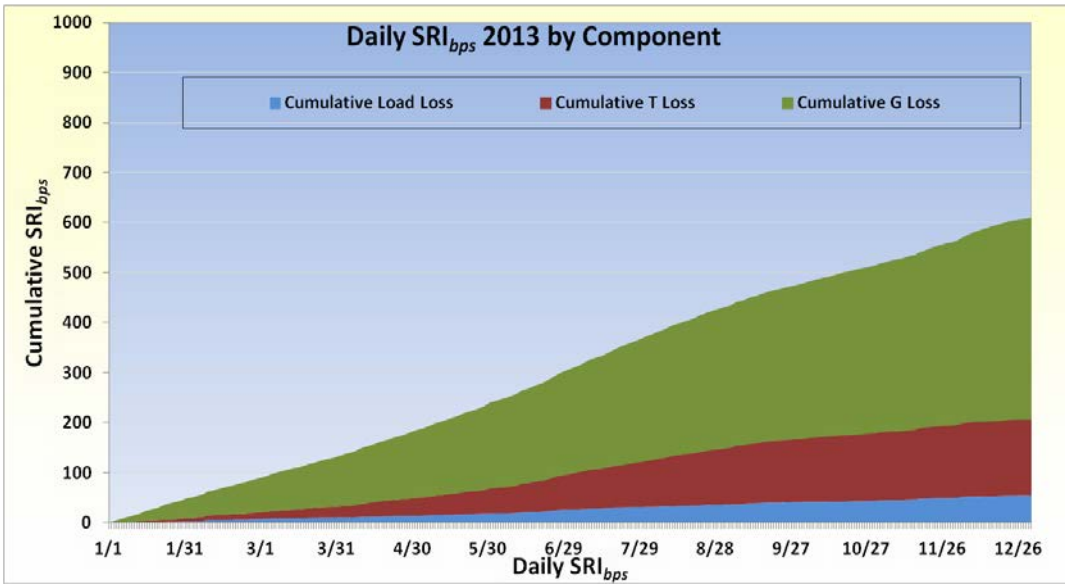

Figure 2.5: NERC Cumulative SRI by Component for 2013

Overall, 2013 had a lower SRI_{bps} score than 2008 and 2011 and was similar to 2009 and 2010. Also, the new calculation of SRI_{bps} shows that fewer stress days occurred in 2013 and that weather continues to contribute majorly to stress days. Additionally, it appears that with the modified method of calculating SRI_{bps}, generation severity plays a substantial role in the daily summary values as measured by SRI_{bps}. Future state of reliability reports will contain information assembled and analyzed from GADS, which is likely to bring greater understanding to these facilities and their role assessing the reliability of the BPS.

Chapter 3 – Risk Issue Identification and Transmission Severity Analysis

Overview

NERC uses disturbance event and equipment availability datasets to identify significant risk clusters to support making risk-informed decisions, prioritizing issues, and aligning resources to address those issues. The risk concentration areas enable NERC to identify priority projects that provide coordinated and effective solutions to identified risks to the reliability of the BPS. This chapter presents a conceptual framework using statistical analysis of transmission outage data to identify the top risks to the BPS. This transmission outage data is based on the data collected using the ICC identification provided by the NERC TADSWG. This framework and these risk analysis methods can be applied using other reliability datasets to further investigate risk concentration areas.

Based on the 2009–2013 automatic transmission outage data, the two significant risk clusters identified in this chapter are:

1. Protection system misoperations
2. AC substation equipment failure

In the *State of Reliability 2013* report, Misoperations (as an augmented ICC) were found to have the largest positive and statistically significant correlation with 2012 automatic transmission outage severity. This year's analysis shows that ac substation equipment failures now have the largest positive and statistically significant correlation with 2012–2013 automatic transmission outage severity. In addition, while these two ICCs remain the most statistically significant correlation with 2013 automatic transmission outage severity, the expected transmission severity associated with each of these ICCs has decreased from 2012's findings.

Failed AC Substation Equipment as an ICC was found statistically significant and positively correlated with 2009–2013 automatic transmission outage severity. Events initiated by Failed AC Substation Equipment are the largest contributor to the 2009–2013 transmission severity, excluding weather-related and unknown events. Chapter 5 contains a discussion of event analysis that shows that circuit breaker failures were reported as the most often failed equipment inside ac substations. A deeper investigation into the root causes of circuit breaker failures that contribute to disturbance events continues to be a high priority.

NERC is in the process of revising a number of Reliability Standards involving protection systems.[48] In addition, NERC has documented lessons learned from Generator Owners (GOs) and Transmission Owners (TOs) that achieve high protection system performance. In 2014, NERC staff is coordinating with the North American Transmission Forum to find ways to reduce protection system misoperations and develop ways to minimize the impact of misoperations.

Study Method

Defining BPS Impact from Transmission Risk

As described in Chapter 2, the SRI was developed to quantitatively compare events. The SRI is the calculation of a daily index that includes a component related to transmission system outages. The TADS outage data is used to populate the transmission outage impact component of the SRI. Since transmission outages are a significant contributor to the SRI, this chapter focuses on categorizing the individual transmission events based on TADS outage ICCs. A complete description of this methodology is contained in Appendix A.

[48] http://www.nerc.com/pa/Stand/Pages/Standards-Under-Development.aspx

Determining Initiating Causes and Probability

TADS events are categorized by ICCs. The ICCs facilitate the study of cause-effect relationships between each event's ICC and the severity of the event. As shown in Figure 3.1, for single-mode outage TADS events, the outage ICC is selected for the event's ICC. For common or dependent-mode TADS events, logical rules were applied to determine the initiating outage. The ICC is used to determine the event's ICC.

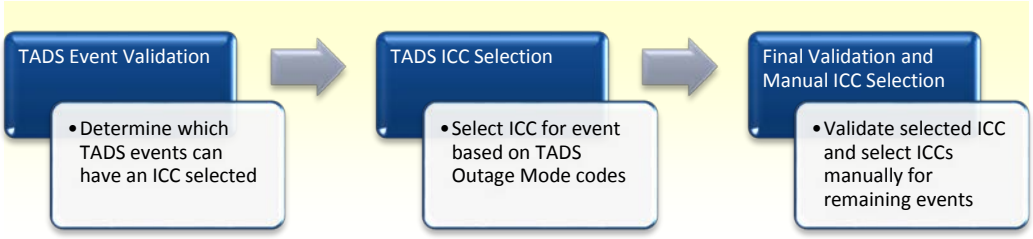

Figure 3.1 TADS Event Initiating Cause Code Selection Procedure

For TADS events initiated by a common cause, the probability[49] of observing the initiation of an event during a given hour is estimated using the corresponding historical event occurrences reported in TADS. Namely, the probability of the occurrence of the event is the total number of a given type of event observed during the historical data period divided by the total number of hours in the same period. Therefore, the sum of the estimated probabilities for all events is equal to the estimated probability of any event during a given hour. With the development of the transmission severity measure and TADS event ICCs, it is possible to statistically analyze the most recent five years of TADS data (2009–2013). The analysis shows which ICCs result in the highest transmission severity and finds significant changes in transmission severity by ICC over time.

Determining Relative Risk

Studies were performed to determine the correlation between each ICC and transmission severity, and whether a statistically significant confidence level could be established. This process is demonstrated in Figure 3.2. Then, sample distributions were studied to determine any statistically significant pair-wise differences in expected transmission severity between ICCs, including a time trend analysis where applicable. Finally, the relative risk was calculated for each ICC group. A description of this methodology is provided in Appendix A.

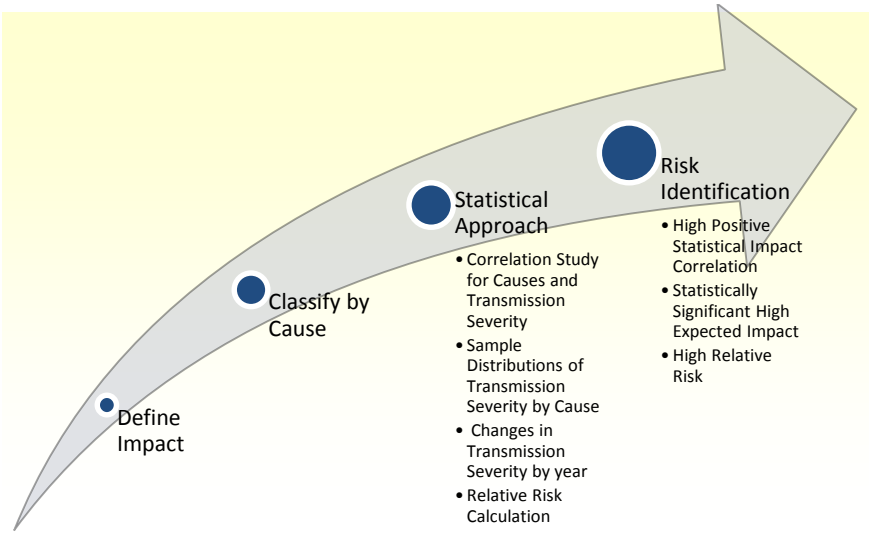

Figure 3.2: Risk Identification Method

[49] Probability is estimated using event occurrence frequency of each ICC type without taking into account the event duration.

Risk Identification Findings

2009–2013 Combined Study

TOs provide transmission performance information using the NERC TADS process. The data used in these studies includes momentary and sustained automatic outages of ac transmission circuits (overhead and underground) that operate at voltages greater than or equal to 200 kV.

Table 3.1 lists a total count of TADS events by ICC for 2009–2013. The three largest groups of events correspond to the following ICCs: Lightning, Unknown, and Weather Excluding Lightning. The next four groups of events are initiated by Human Error, Failed AC Circuit Equipment, Failed AC Substation Equipment, and Failed Protection System Equipment.

Table 3.1: TADS Outage Events by ICC (2009–2013)

Initiating Cause Code	2009	2010	2011	2012	2013	2009–2013
Lightning	789	741	822	852	814	**4018**
Unknown	673	821	782	710	712	**3698**
Weather Excluding Lightning	534	673	539	446	434	**2626**
Human Error	291	305	291	307	280	**1474**
Failed AC Circuit Equipment	257	277	306	261	248	**1349**
Failed AC Substation Equipment	266	238	289	248	192	**1233**
Failed Protection System Equipment	229	234	234	226	188	**1111**
Foreign Interference	199	173	170	170	181	**893**
Contamination	96	145	132	160	152	**685**
Power System Condition	112	74	121	77	109	**493**
Fire	92	84	63	106	130	**475**
Other	107	84	91	104	64	**450**
Vegetation	29	27	44	43	36	**179**
Vandalism, Terrorism, or Malicious Acts	4	6	5	10	9	**34**
Environmental	5	11	5	4	8	**33**
Failed AC/DC Terminal Equipment	1	2	0	0	0	**3**
All TADS Events	**3705**	**3917**	**3934**	**3753**	**3557**	**18866**
All with ICC Assigned	**3684**	**3895**	**3894**	**3724**	**3557**	**18754**

Almost all ICC groups have a sample size sufficient to be used for statistical analysis. However, four ICCs (Vegetation; Vandalism, Terrorism, or Malicious Acts; Environmental, and Failed AC/DC Terminal Equipment) have an insufficient sample size and are grouped together in this report and labeled “Combined Smaller ICC groups” for statistical analysis. They are then compared as a group to other ICC groups and studied for annual changes in transmission severity.

Figure 3.3 shows the correlation between calculated transmission severity and each ICC. A red bar in Figure 3.3 corresponds to an ICC that has a statistically significant positive correlation with transmission severity; a green bar corresponds to an ICC that has a statistically significant negative correlation; and a blue bar corresponds to an ICC that is not statistically significant. A statistically significant positive correlation of ICC with transmission outage severity would indicate a higher likelihood that an event with this ICC will result in a higher transmission outage severity. A statistically significant negative correlation indicates the contrary; in this case, a lower transmission outage severity would be likely. If a correlation is not statistically significant, this implies that a positive or negative correlation was very likely observed by mere chance, and there is, in fact, no linear relationship between ICC and the transmission outage severity. The events with this ICC have the expected transmission severity similar to all other events from the database.

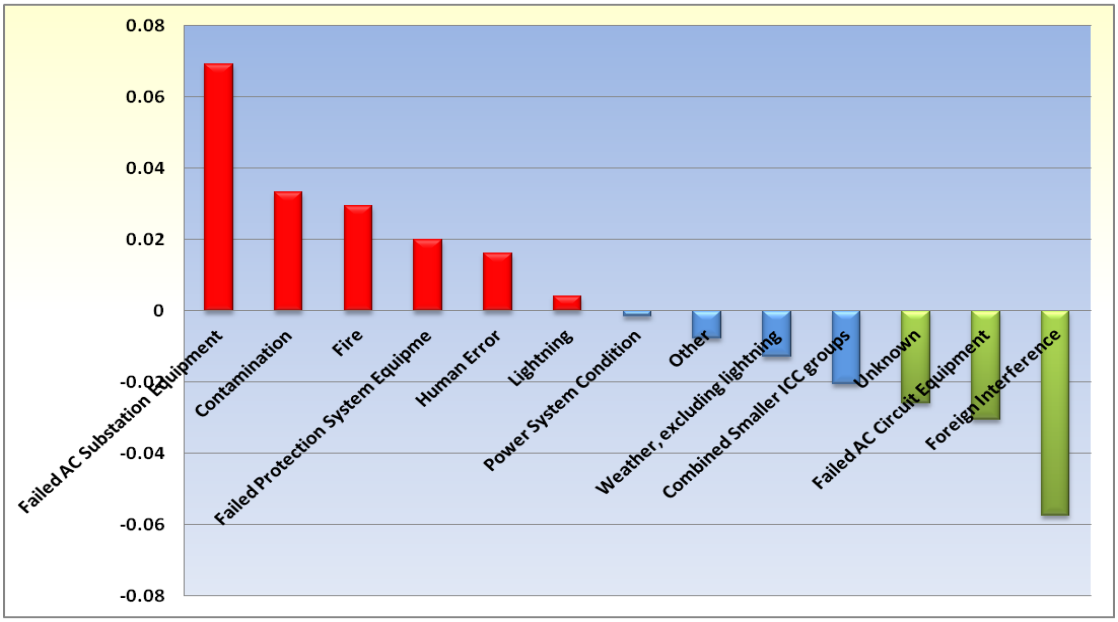

Figure 3.3: Correlation between ICC and TS of TADS Events (2009–2013)

Failed AC Substation Equipment is found to have the largest and most statistically significant positive correlation with 2009–2013 automatic transmission outage severity. In other words, 2009–2013 TADS events initiated by this cause tended to result in higher transmission severity than all other TADS events that occurred from 2009 to 2013.

Table 3.2 provides the transmission risk of each ICC as the product of the probability of the ICC event and its calculated transmission severity. The risk is then expressed as a percentage for each ICC relative to the other ICCs. As shown in Table 3.2, events related to weather represent the largest percentage of transmission severity. These are provided in two ICC groups in TADS: Lightning, and Weather Excluding Lightning. TADS events with an ICC of Lightning result in the greatest combined transmission severity for all TADS events. These Lightning events are typically momentary, single-mode outages and restore quickly, so therefore are not a significant impact to overall system reliability. Weather Excluding Lightning was found not to have a statistically significant correlation with transmission severity.

Table 3.2: Evaluation of ICC Relative Risk (2009–2013)

Group of TADS Events	Probability that an Event from a Group Starts during a Gven Hour	Expected Impact (Expected Transmission Severity of an Event)	Risk Associated with a Group Per Hour	Relative Risk by Group (%)
Lightning	0.092	0.164	0.015	21.3
Unknown	0.084	0.158	0.013	18.8
Weather Excluding Lightning	0.060	0.160	0.010	13.6
Human Error	0.034	0.169	0.006	8.0
Failed AC Substation Equipment	0.028	0.191	0.005	7.6
Failed AC Circuit Equipment	0.031	0.152	0.005	6.6
Failed Protection System	0.025	0.172	0.004	6.2
Contamination	0.016	0.182	0.003	4.0
Foreign Interference	0.020	0.136	0.003	3.9
Fire	0.011	0.183	0.002	2.8
Power System Condition	0.011	0.163	0.002	2.6
Other	0.010	0.158	0.002	2.3
Combined Smaller ICC groups	0.006	0.144	0.001	1.2
All TADS Events	**0.430**	**0.165**	**0.071**	**100.0**
All with ICC Assigned	**0.428**	**0.164**	**0.070**	**98.8**

Among non-weather-related ICCs (excluding Unknown), Human Error and Failed AC Substation Equipment are the two largest contributors to transmission severity. These two are tracked through closely related adequate level of reliability (ALR) metrics. As shown in Figure 3.3, TADS events initiated by either of these two causes have statistically significant greater expected severity than TADS non-weather ICC events. This is because a single substation element (equipment) failure may lead to multiple line outages on lines emanating from the same substation bus or end point. Therefore, the ac substation equipment failure would have the potential to substantially impact multiple locations. Further investigation into the Human Error ICC has led to a revision of the ICC data summary in the *State of Reliability 2013* report. Starting in 2012, more granular code data is available, and the ICC data summaries were modified, or augmented, as described in the following section of this chapter.

Finally, a series of statistical tests determined that both the average transmission severity of an event and the total transmission severity of TADS events in 2013 were statistically significantly smaller than in any other year from 2009 to 2012. Details of the statistical analysis of annual changes for the entire database as well as by ICC are described in Appendix A.

2012–2013 Study with Augmented Event Types

TADS event type reporting was modified in 2012 to further distinguish normal clearing events from abnormal clearing events. Components of the Human Error ICC are subdivided by type codes, which first became available in 2012. For the purpose of the report, two specific components related to protection system misoperation have

been removed from the Human Error ICC and added to the ICC for Failed Protection System Equipment. This augmented ICC is labeled "Misoperation." To introduce the additional data into this study where this level of detail is not available for prior years, TADS events with protection system misoperations—event types 61 dependability[50] (failure to operate) and 62 security[51] (unintended operation)—are used to modify (or augment) ICCs as shown in Table 3.3. The new Misoperation ICC is analogous to protection system misoperations, which are comprised of Failed Protection System Equipment (FPSE) and Human Error (HE) with event type 61 or 62 (HE and Type 61/62). Aggregate totals of 2012–2013 TADS events by augmented ICC are provided in Table 3.3. Events initiated by Misoperations comprise 8.2 percent of all TADS events and represent the fourth-largest group of events (after weather-related and Unknown ICCs.) Chapter 3's transmission analysis covers the most recent five-year period. After three more years of data collection, the augmented ICC data collection method will have a full five years of data and will become the method used for studying the TADS event data.

Table 3.3: TADS Outage Events by Augmented ICC (2012–2013)

Initiating Cause Code	2012	2013	2012–2013
Lightning	852	813	1665
Unknown	710	712	1422

[50] Event Type 61 Dependability (failure to operate): one or more automatic outages with delayed fault clearing due to failure of a single protection system (primary or secondary backup) under either of these conditions:

- Failure to initiate the isolation of a faulted power system Element as designed, or within its designed operating time, or
- In the absence of a fault, failure to operate as intended within its designed operating time.

[51] Event Type 62 Security (unintended operation): one or more automatic outages caused by improper operation (e.g., overtrip) of a protection system resulting in isolating one or more TADS elements it is not intended to isolate, either during a fault or in the absence of a fault.

Figure 3.4 shows the correlation between calculated transmission severity and each ICC in the same format as Figure 3.3. Using this augmented ICC data, Failed AC Substation Equipment and Misoperations had the largest and most statistically significant positive correlation with 2012–2013 ATO severity. In other words, TADS events initiated by these two causes tended to have higher transmission severity than other TADS events that occurred in 2012 and 2013. Power System Condition is the only other ICC with a statistically significant correlation to transmission severity, but the correlation is much smaller than Failed AC Substation Equipment and Misoperations. Therefore, the remaining discussion won't focus on TADS data from 2012 and 2013.

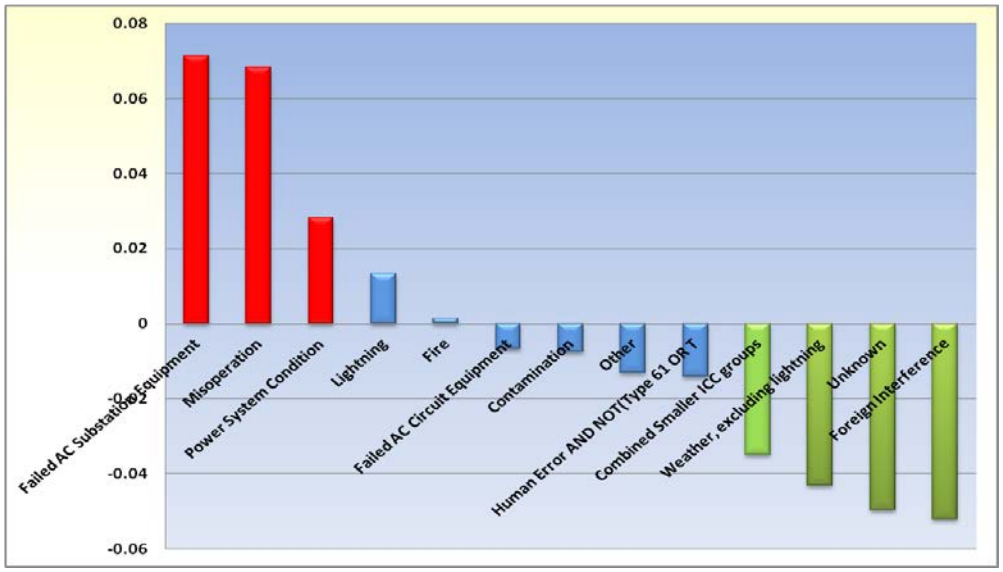

Figure 3.4: Correlation between Augmented ICC and TS of TADS Events (2012–2013)

Relative risk of the 2012–2013 TADS events by augmented ICC is listed in Table 3.4. The probability that an event from a given group initiated during a given hour is estimated from the frequency of the events of each type without taking into account the event duration. Excluding weather-related and Unknown events, events initiated by Misoperations and by Failed AC Substation Equipment had the largest shares in the total transmission severity and contributed 9.4 and 7.1 percent, respectively, to transmission severity relative risk.

Table 3.4: Relative Risk by Augmented ICC (2012–2013)

Group of TADS Events	Probability that an Event from a Group Starts during a Given Hour	Expected Impact (Expected Transmission Severity of an Event)	Risk Associated with a Group Per Hour	Relative Risk by Group (%)
Lightning	0.095	0.155	0.015	**23.1**
Unknown	0.081	0.143	0.012	**18.2**
Weather Excluding Lightning	0.050	0.143	0.007	**11.2**

Other	0.010	0.145	0.001	**2.2**
Combined Smaller ICC groups	**0.006**	**0.126**	**0.001**	**1.2**
All TADS Events	**0.417**	**0.153**	**0.064**	**100.0**
All with ICC Assigned	**0.415**	**0.152**	**0.063**	**99.1**

Focusing the statistical analysis of the 2012–2013 TADS augmented ICC data on the transmission severity and initiating causes of TADS events, and aligning that information with misoperations, yields the following results and observations:

- After excluding weather-related and Unknown ICCs, Misoperations and Failed AC Substation Equipment are the two largest contributors to the transmission severity risk.
- TADS events initiated by either of these ICCs have greater severity than all other TADS events.
- Among other ICCs, only Power System Condition[52] has a statistically significant positive correlation with transmission severity, but events initiated by this cause are infrequent and together contribute only 2.8 percent to the total transmission severity of the 2012–2013 TADS.

Common/Dependent Mode Event ICC Study (2009–2013)

TADS data also provides information to classify outages as single-mode or common or dependent mode (CDM) events that should be evaluated separately from single-mode events. CDM events result in multiple transmission element outages. It is important to monitor and understand CDM events due to their potential risk to system reliability.

Table 3.5 lists CDM events by ICC in the 2009–2013 database and their percentages with respect to all TADS events with a given ICC. Similar to all TADS events, Lightning initiated the largest number of CDM events. CDM events initiated by Failed AC Substation Equipment comprise the second largest group, followed by Weather Excluding Lightning and Human Error. Overall, 3,227 CDM events were defined, representing 17.1 percent of all TADS events from 2009 to 2013. Out of these, 3,136 are assigned to one of the 17 ICCs.

Table 3.5: CDM Events and Hourly Event Probability by ICC (2009–2013)

Initiating Cause Code	ALL TADS Events	CDM Events	CDM as % of ALL	Event Probability/Hour
Reliability Metrics	**5167**	**1249**	**24.2**	**0.0285**

All with ICC Assigned	**18754**	**3136**	**16.7**	**0.0716**

[52] Defined as "Automatic Outages caused by power system conditions such as instability, overload trip, out-of-step, abnormal voltage, abnormal frequency, or unique system configurations (e.g., an abnormal terminal configuration due to existing condition with one breaker already out of service)."

Almost all ICC groups of CDM events for five years have a sufficient sample size to be used in a statistical analysis, but the sample size is not enough to track statistically significant year-over-year changes in transmission severity. Four ICCs (Vegetation; Vandalism, Terrorism, or Malicious Acts; Environmental, Failed AC/DC Terminal Equipment) must be combined to comprise a new group, Combined Smaller ICC Groups, that can be statistically compared to every other group.

Figure 3.5 shows the correlation between calculated transmission severity and each ICC in the same format as Figure 3.3.

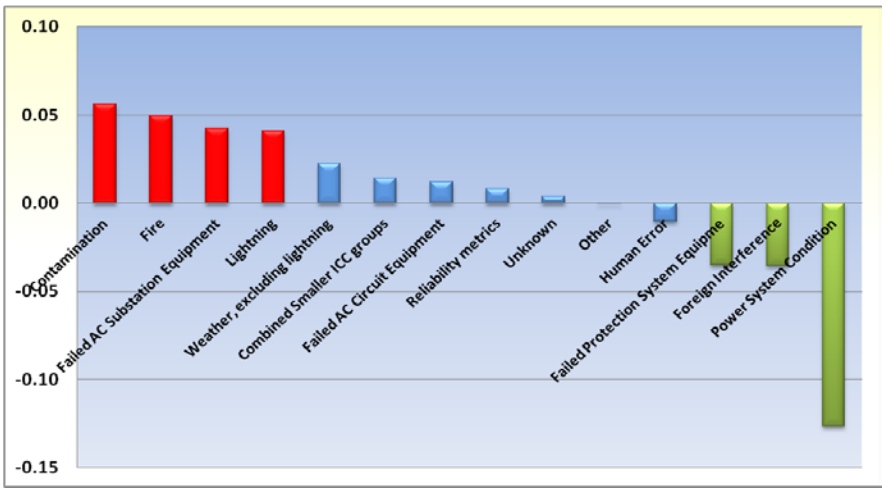

Figure 3.5: Correlation between ICC and TS of TADS CDM Events (2009–2013)

CDM events are a subset of the previously evaluated TADS events. Table 3.6 provides a breakdown of relative risk of CDM events by ICC.

Table 3.6: Evaluation of CDM Event ICC Contribution to Transmission Severity (2009–2013)

Group of TADS Events	Probability that an Event from a Group Starts during a Given Hour	Expected Impact (Expected Transmission severity of an event)	Risk Associated with a Group Per Hour	Relative Risk by Group (%)
CDM Lightning	0.013	0.258	0.003	4.6
CDM Failed AC Substation Equipment	0.010	0.261	0.003	3.7

CDM Combined Smaller ICC groups	0.001	0.257	0.000	0.3
All TADS Events	**0.430**	**0.165**	**0.071**	**100.0**
All CDM Events	**0.074**	**0.244**	**0.018**	**25.4**
All with ICC assigned	**0.072**	**0.241**	**0.017**	**24.4**

Analysis of the TADS CDM events indicated that events with ICCs of Failed AC Substation Equipment and Human Error are the two largest contributors to transmission severity with the exception of weather-related events. CDM events initiated by Failed AC Substation Equipment have statistically greater expected severity than other CDM events; however, the difference in transmission severity of CDM events initiated by Human Error and all other CDM events is not statistically significant. In other words, CDM events initiated by Human Error on average have the same transmission severity as all the other CDM events that occurred between 2009 and 2013.

Summary of Analysis

Figure 3.6 represents an analysis of the risk profile of the 2009–2013 TADS events combined study. The horizontal axis is the magnitude of the correlation of a given ICC with transmission severity. The vertical axis represents the expected transmission severity of an event when it occurs. The color of the marker indicates if there is a correlation of transmission severity with the given ICC (either positive - Red, negative - Green, or no significant correlation- Blue). The size of the marker indicates the probability of an event initiating in any hour with a given ICC. Failed AC Substation Equipment shows a statistically significant positive correlation of transmission severity and a higher relative transmission risk based on the probability of a failure initiating in any hour and the expected transmission severity when it occurs. Human error and failed protection system equipment both show a statistically significant positive correlation of transmission severity but individually show a moderately higher relative transmission risk. Fire, while showing a positive correlation of transmission severity, has a low relative transmission risk.

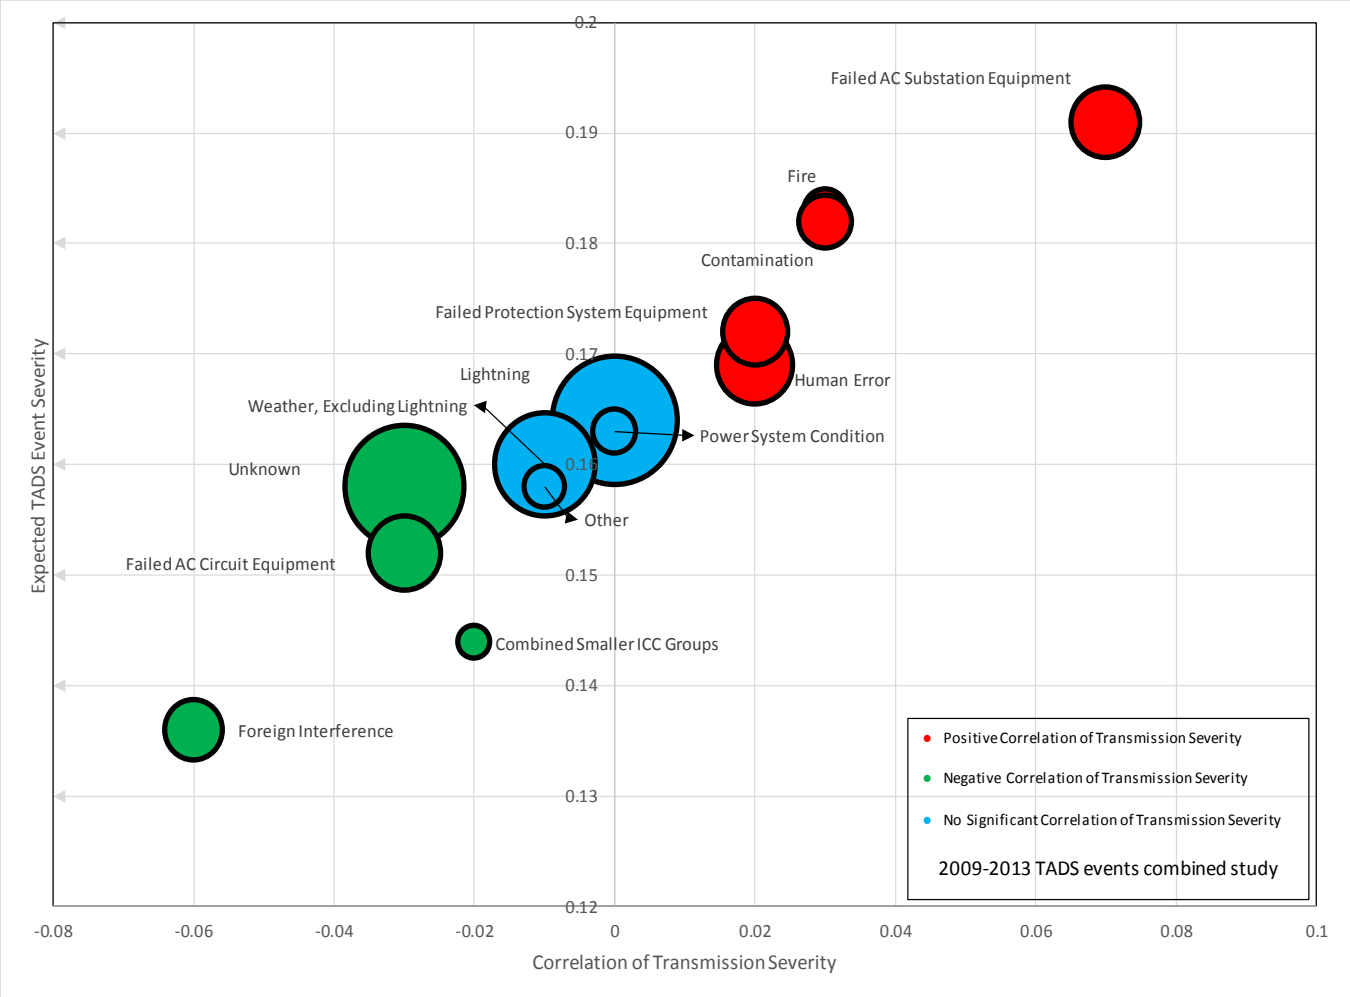

Figure 3.6: Risk Profile of the 2009–2013 TADS Events Combined Study

Figure 3.7 represents an analysis of the risk profile of the 2012–2013 study with augmented event types (augmented to further distinguish normal clearing events from abnormal clearing events). The parameters for the chart remain the same as in Figure 3.6. With the introduction of the Misoperation ICC (which combines Failed Protection System Equipment and Human Error associated with Misoperations), Failed AC Substation Equipment and Misoperations both show a statistically significant positive correlation with transmission severity and show a higher relative transmission risk. Power System Condition, while showing a positive correlation of transmission severity, has a lower relative transmission risk, based on the probability of this TADS event initiating in any hour and its expected transmission severity. On the other end of the risk spectrum, Lightning shows a high relative transmission risk but has no significant correlation with transmission severity.

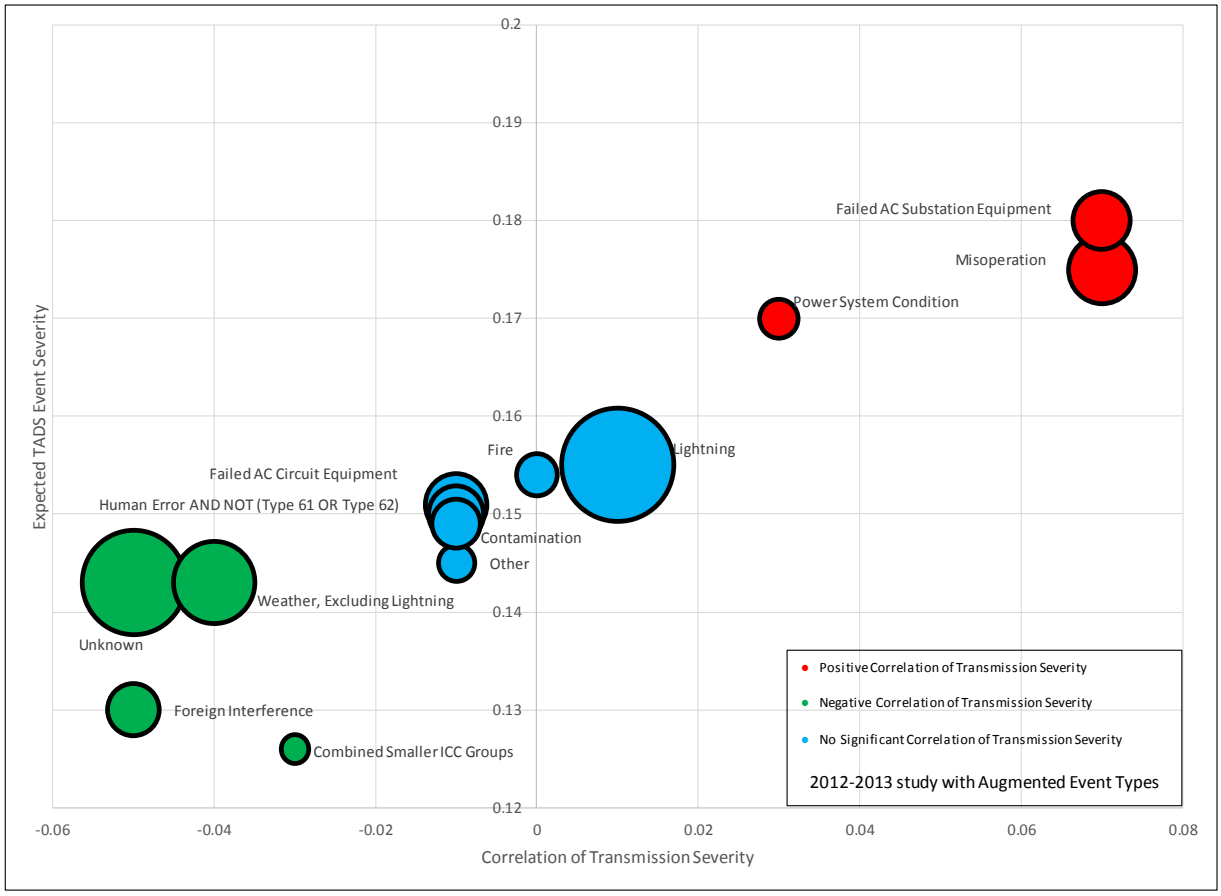

Figure 3.7: Risk Profile of the 2012–2013 TADS Events by Augmented ICC

Figure 3.8 represents an analysis of the risk profile of the 2009–2013 Common/Dependent Mode Event ICC Study. The parameters for the chart remain the same as in Figure 3.6 and Figure 3.7. Failed AC Substation Equipment and Lightning both show a statistically significant positive correlation with transmission severity and show a higher relative transmission risk. On the other end of the risk spectrum, Weather Excluding Lightning shows a high relative transmission risk but has no significant correlation with transmission severity.

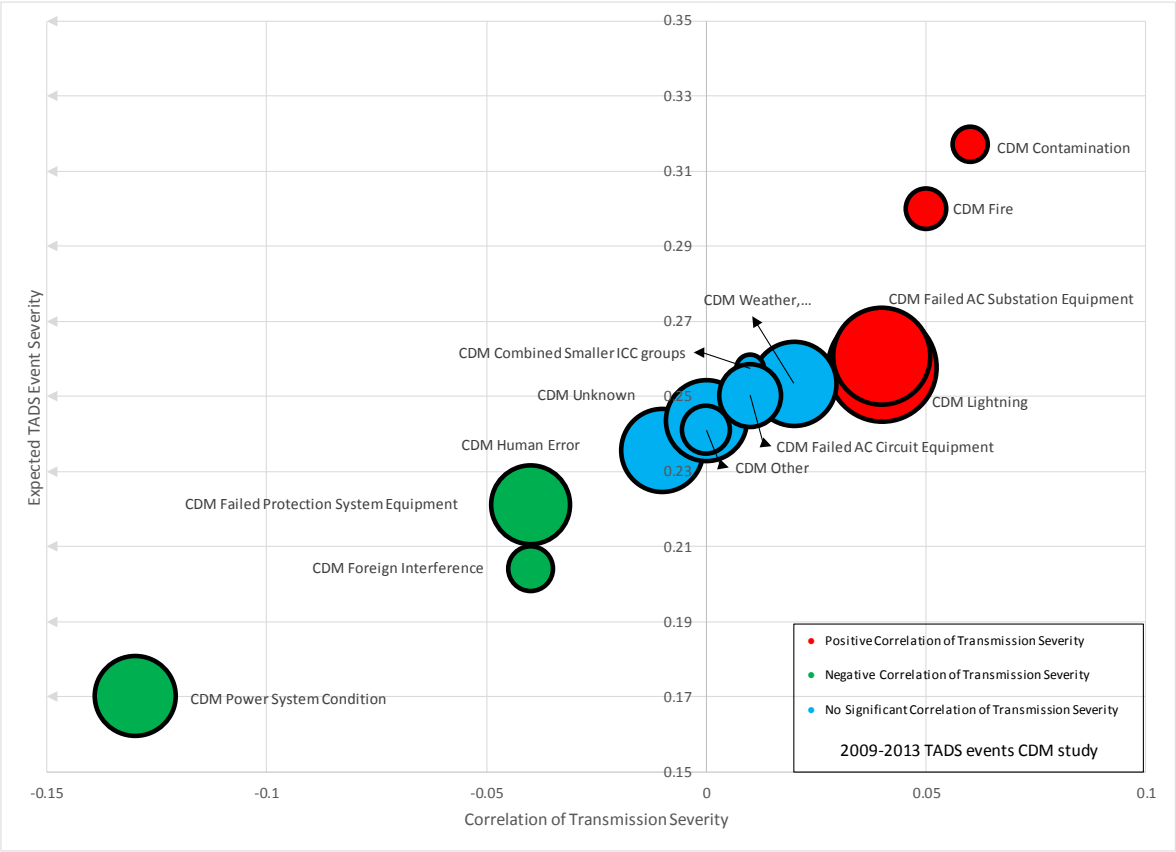

Figure 3.8: Risk Profile of the 2009–2013 Common/Dependent Mode Event ICC Study

Focusing the statistical analysis of the 2012–2013 TADS data on the transmission severity and initiating causes of TADS events and aligning that information with misoperations yields the following results and observations:

- After excluding weather-related and Unknown ICCs, Misoperations and Failed AC Substation Equipment are the two largest contributors to transmission severity risk.
- TADS events initiated by either of these ICCs have statistically significant greater expected severity than all other TADS events.
- Among other ICCs, only Power System Condition has a statistically significant positive correlation with transmission severity, but events initiated by this cause are less frequent and together contribute only 2.8 percent to the total transmission severity of the 2012–2013 TADS.
- Statistical tests resulted in the conclusion that both the average transmission severity of the events initiated by Misoperations and their total transmission severity significantly decreased in 2013 versus 2012.
- Based on the five-year statistical analysis, the average and total transmission severity and the relative transmission risk of Failed AC Substation Equipment significantly decreased in 2013, compared with 2011 and 2012.

Chapter 4 – Reliability Indicator Trends

Reliability Indicator Trends – Summary

NERC reliability indicators are intended to tie the actual performance of the BES to the set of specified objectives and outcomes for the NERC reliability objectives to measure whether an adequate level of reliability exists. Based on the events that occurred in 2013 and the metrics data analyzed, the system shows a continuing trend toward maintaining reliability. In other words, the system experienced a wide range of operating conditions and the BES operated as planned and designed.

One of the stated purposes for the new ALR definition is for the NERC PAS to assess BES reliability and identify gaps in data collection. In 2013, the PAS focused on aligning the existing ALR reliability indicators with the new ALR definition.[53] Table 4.1 shows the mapping of the 16 metrics monitored in 2013 to the seven reliability performance objectives of the new ALR definition. With the revised ALR definition that was approved in 2012, the existing metric naming convention no longer maps well to the objectives in the ALR definition. Therefore, the PAS is recommending a new naming convention for the existing 16 metrics, shown in parentheses below.

Table 4.1 Adequate Level of Reliability Metrics

Reliability Performance Objectives	System Stability	System Frequency	System Voltage	Manage Contingencies	Coordinate Restoration	Transmission Adequacy	Resource Adequacy
ALR Metrics (New ID)	ALR1-4 (M-2) ALR1-12 (M-4) ALR4-1 (M-9)	ALR1-12 (M-4) ALR2-4 (M-6)	ALR1-5 (M-3)	ALR1-4 (M-2) ALR2-3 (M-5) ALR2-4 (M-6) ALR2-5 (M-7) ALR3-5 (M-8) ALR6-2 (M-11)	ALR1-4 (M-2) ALR2-3 (M-5) ALR6-2 (M-11)	ALR1-4 (M-2) ALR3-5 (M-8) ALR6-1 (M-10) ALR6-11 (M-12) ALR6-12 (M-13) ALR6-13 (M-14) ALR6-14 (M-15) ALR6-15 (M-16)	ALR1-3 (M-1) ALR6-2 (M-11)

These metrics exist within a reliability framework. The existing 16 performance metrics align with the performance objectives for the design, planning, and operation of the BES. These metrics contribute to the reliability performance objectives, which will lead to a more resilient and reliable BES. There is at least one existing performance metric associated with each of the performance objectives listed in the table.

The definition of ALR speaks to the state of the BES in which the performance objectives are met. It is therefore intuitive that one could not base such an assessment of reliability on one metric only; rather, it is necessary to look at the entire set of metrics to evaluate that the ALR state has been attained. Any comparisons of individual metrics alone or between regions should therefore be evaluated with care.

Another metric reporting principle is to retain anonymity of individual reporting organizations. Thus, details are presented in this report at a NERC level and a regional level and do not compromise anonymity of individual reporting organizations.

Process Overview

Building upon previous metric reviews, the results of the approved performance metrics continue to be assessed. Each metric is designed to provide a measure of one or more performance objectives.

[53] http://www.nerc.com/FilingsOrders/us/NERC%20Filings%20to%20FERC%20DL/Informational_Filing_Definition_Adequate_Level_Reliability_20130510.pdf

Due to varying data availability, each of the performance metrics does not address the same time period (some metrics have just been established or modified, while others represent data collected over many years). At this time, the number of metrics is expected to remain relatively stable; however, the PAS annually reviews them. Working with industry subject matter experts, the RAS may recommend changes to metrics, or new metrics, as gaps are identified in reliability data. In 2013, such a review was performed that resulted in the retirement of two existing metrics and the modification of several others. Specific changes to metrics that were approved in 2013 and early 2014 will be described in greater detail further in this section.

Table 4.2 provides an overview of the ALR metric trends through 2013. Although a number of performance categories have been assessed, some do not yet have sufficient data to derive conclusions from the metric results. Assessment of these metrics should continue as additional data becomes available to determine if the metric is a good indicator of the performance objective it is meant to measure.

This chapter provides a discussion of the ALR metric trend ratings and activity on certain metrics where some changes have been implemented and which are associated to some key findings and conclusions. The full set of metrics and their descriptions, along with the results and trending, are on the NERC public website.[54]

ALR1-4 (M-2) BPS Transmission-Related Events Resulting in Loss of Load

Background

This metric measures BPS transmission-related events resulting in the loss of load, excluding weather-related outages. Planners and operators can use this metric to validate their design and operating criteria by identifying the number of instances when loss of load occurs. For the purposes of this metric and to be consistent with the revised metric approved by the OC and PC in March 2014, an "event" is an unplanned disturbance that produces an abnormal system condition due to equipment failures or system operational actions (either intentional or unintentional) that result in the loss of firm system demands. The metric analysis uses the subset of data provided by entities as specified in EOP-004-2. The reporting criteria for such events beginning with data for 2013 are outlined below:[55]

1. Loss of firm load for 15 minutes or more:

   a. 300 MW or more for entities with previous year's demand of 3,000 MW or more.

   b. 200 MW or more for all other entities.

2. BES Emergency requiring manual firm load shedding of 100 MW or more.

3. BES Emergency resulting in automatic firm load shedding of 100 MW or more (via automatic undervoltage or underfrequency load shedding schemes, or SPS/RAS).

[54] Assessments & Trends: Reliability Indicator, http://www.nerc.com/pa/RAPA/Pages/ReliabilityIndicators.aspx
[55] http://www.nerc.com/pa/rrm/ea/EA Program Document Library/Final_ERO_EA_Process_V2.1.pdf

4. Transmission loss event with an unexpected loss within an entity's area, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing) resulting in a firm load loss of 50 MW or more.

This metric was reviewed in 2013, and changes were made to make the criteria more consistent with the approved changes to EOP-004-2 reporting criteria that pertain to transmission-related events that result in loss of load. The criteria presented above were approved for implementation in the first quarter of 2014. Changes in the annual measurement between 2012 and 2013 therefore reflect the addition of the new criteria applied to the 2013 data.

Assessment

Figure 4.1 shows that the number of BPS transmission-related events resulting in loss of firm load from 2002 to 2011 is relatively constant. The year 2012 was better in terms of transmission-related load loss events, with only two events having resulted in total load loss of 1,055 MW. There were fewer events in 2013 than prior years, with the exception of 2007 and 2012. On average, eight to 10 events were experienced per year. The top-three years in terms of load loss are 2003, 2008, and 2011, as shown in Figure 4.2. In 2003 and 2011, one event accounted for over two-thirds of the total load loss, while in 2008, a single event accounted for over one-third of the total load loss. In 2013, there was a lower-than-average level of load lost in megawatt-hours with total load loss less than all previous years studied except for 2012.

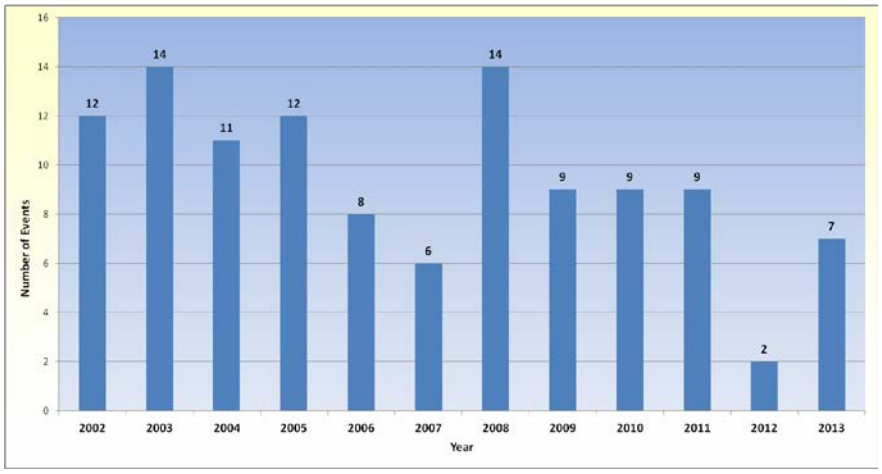

Figure 4.1: ALR1-4 BPS Transmission-Related Events Resulting in Load Loss (2002–2013)

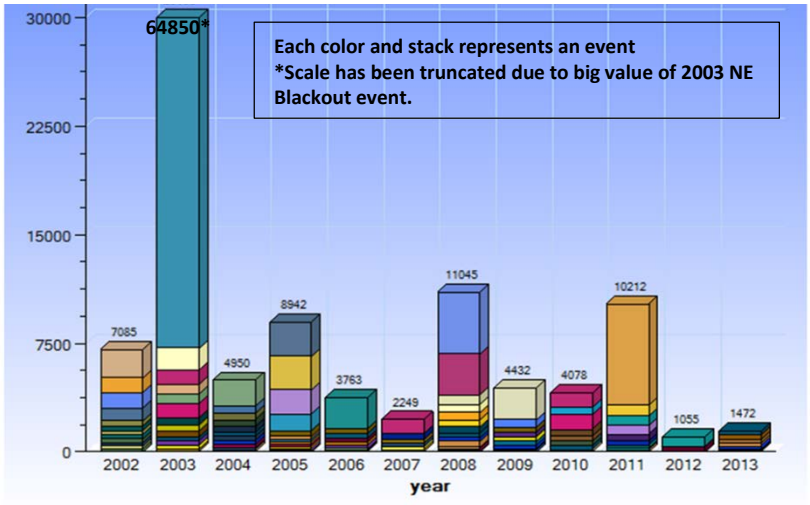

Figure 4.2: ALR1-4 BPS Transmission-Related Events Resulting in Load Loss (2002–2013)

Figure 4.3 is a new addition to this metric; it shows total megawatt loss values and duration of events resulting in firm load loss of 50 MW or greater. So, this figure shows that in addition to the seven events reported under the previous criteria, there are an additional seven events that were associated with the new criteria indicate events with load loss less than 100 MW and greater than or equal to 50 MW which is a new addition to the ALR1-4 Metric. So, while Figure 4.1 and 4.2 show 2013 transmission-related load-loss events based on the historical metric language, Figure 4.3 provides magnitude and duration of megawatt load loss for transmission-related load-loss events in 2013. It includes the new criteria in the metric to capture transmission-loss events with an unexpected loss in an entity's area of three or more BES elements (contrary to design) caused by a common disturbance (excluding successful automatic reclosing) that results in a firm load loss of 50 MW or more. Further analysis and continued assessment of the trends over time will continue in future years.

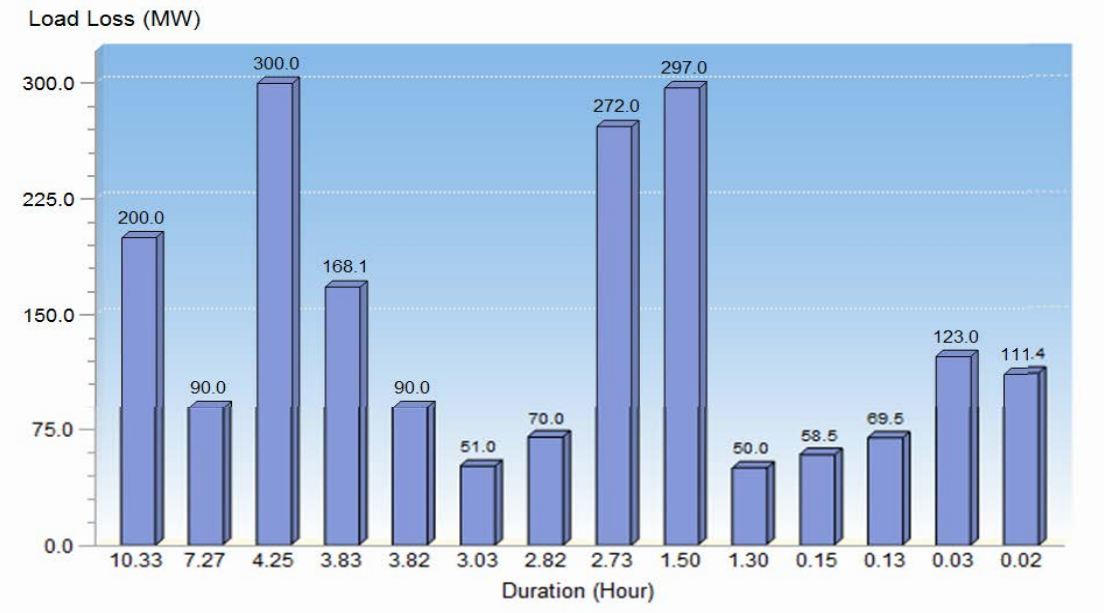

Figure 4.3: ALR1-4: 2013 Events with Load Loss ≥ 50 MW

Special Considerations

The collected data does not indicate whether load loss during an event occurred as designed or not as designed. Going forward, NERC will continue to refine data collection for this metric to allow grouping the data into categories such as separating load loss as designed versus unexpected firm load loss. NERC should support differentiating between load loss as a direct consequence of an outage and load loss as a result of operator-controlled action to mitigate an IROL/SOL exceedance.

ALR1-12 Metric Interconnection Frequency Response

Background

This metric is used to track and monitor interconnection frequency response. Frequency response is a measure of an interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load. It is a critical component to the reliable operation of the BPS, particularly during disturbances. The metric measures the average frequency response for all events where frequency deviates more than the interconnection's defined threshold, as shown in Table 4.3.

The following are frequency response calculations of the Eastern Interconnection, Western Interconnection, ERCOT Interconnection, and Québec Interconnection. The frequency response should not be compared within interconnections, because their BPS characteristics differ significantly in terms of number of facilities, miles of line, operating principles, and simple physical, geographic, and climatic conditions.

Table 4.3: Frequency Event Triggers

Interconnection	ΔFrequency (mHz)	MW Loss Threshold	Rolling Windows (seconds)
Eastern	36 or Point C below 59.960 Hz and delta Hz more than 30 mHz within 15 second time window	800	15
Western	70	700	15
ERCOT	90 or Point C below 59.900 Hz or above 60.100 Hz	450	15
Québec	350	450	15

Figure 4.4 shows the criteria for calculating average values A and B used to report frequency response. The event starts at time t±0. Value A is the average from t-16 to t-2 seconds, and Value B is the average from t+20 to t+52 seconds. The difference of value A and B is the change in frequency[56] used for calculating frequency response. The monthly frequency event candidate lists are posted on the NERC Resources Subcommittee[57] website. These lists are vetted by the NERC Frequency Working Group and the final list is published on a quarterly basis. The data is used to support the frequency response standard BAL-003 – Frequency Response and Bias. The frequency event data collection process is described in the BAL-003 Frequency Response Standard Supporting Document.[58]

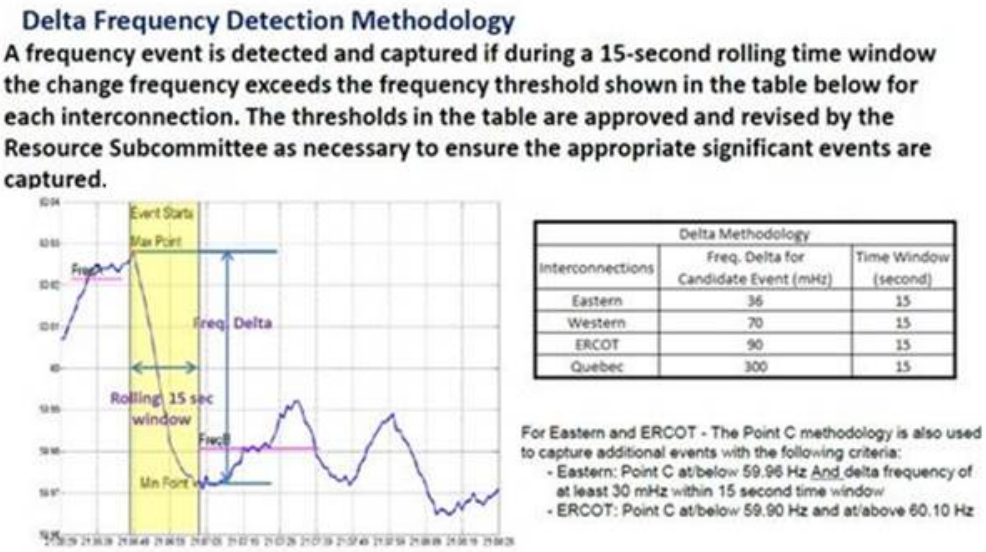

Figure 4.4: Criteria for Calculating Value A and Value B

The actual megawatt loss for the frequency event is determined jointly by NERC and Regional Entity situation awareness staff to develop the monthly frequency event candidate list. Both the change in frequency and the megawatt loss determine whether the event qualifies for further consideration for use in the ALR 1-12 metric or for the measurement of BA performance under Standard BAL-003 – Frequency Response and Bias by the NERC Frequency Working Group. If the event qualifies, then the actual megawatt loss is converted to a beta value (MW/.1 Hz) for use in Figure 4.4 above. The final monthly datasets of approved frequency events[59] are then used to analyze the interconnection frequency response performance.

[56] ALR1-12 Frequency Response Data Collections Process, Slide 18 of Presentation 1, 10/26-27/2011 http://www.nerc.com/docs/oc/rs/RS_Presentation_October_2011.pdf

[58] BAL-003-1 Frequency Response & Frequency Bias Setting Standard, 07/18/2011, http://www.nerc.com/FilingsOrders/us/FERCOrdersRules/NOPR_Proposal for BAL-003-1.pdf

[59] Starting in 2014, all frequency events selected for use in BAL-003 shall be also used for the ALR 1-12 frequency performance metric.

Table 4.4 shows the number of frequency events per year for each interconnection from 2009 through 2013. The increase in the number of events for the Eastern Interconnection in 2013 is because of the new threshold, which is 36 mHz, or Point C below 59.960 Hz and delta Hz more than 30 mHz within a 15-second time window.

Table 4.4: Yearly Number of Frequency Events

Interconnection	2009	2010	2011	2012	2013
Western	25	29	25	12	28
Eastern	44	49	65	28	71
ERCOT	51	67	65	63	52
Québec	-	-	20	28	37

Care is taken to select events that impact the frequency beyond the expected dead-band settings for that interconnection. Beta megawatt projections for events that are just slightly larger than the interconnection megawatt cutoff threshold can potentially result in outliers. The resulting frequency response for these smaller events may be quite minimal if generator governors have dead-bands set higher than the expected value. Another factor that can impact the projected beta megawatt value is the 32 second average value chosen for point B. If the frequency response is not sustained for the duration of the 32 second average, the resulting frequency response will be lower and consequently result in a lower beta megawatt value. Lack of sustained frequency response is evident in the Eastern Interconnection and is referred to as the "Lazy L" in frequency/time charts.

Assessment

NERC annually applies statistical tests to interconnection frequency response datasets,[60] and additional analyses on time of year, load levels, and other attributes were conducted in 2013. Frequency response is the ratio of the megawatts lost when generation is tripped and the difference in frequency before and after the event. A large value of frequency response is considered better than a small value.

Frequency Response Trending

From 2009 through 2013, the historical frequency response shows the following trends:

- The Eastern Interconnection has shown steady frequency response performance. A decreasing but not statistically significant time trend for frequency response was observed (there is a high probability the negative slope of the trend line occurred by pure chance). In 2013 the frequency response had the smallest average value observed over the five years studied; moreover, there was a statistically significant decrease of frequency response compared with 2011, which had the best frequency response performance over the same time period.
- The ERCOT Interconnection has had a statistically significant frequency response increase with the average monthly growth of 3.3 MW/0.1Hz; one of the contributing factors was the continued increase in wind generation in ERCOT that typically operates at maximum output. Without margin in the up direction, the interconnection only benefits by curtailing wind generators during high-frequency excursions from these generators. When low-frequency excursions occur, the wind generators cannot provide additional output to increase interconnection frequency.
- The Québec Interconnection (only for 2011–2013) has shown steady frequency response performance; and
- The Western Interconnection has shown steady frequency response performance.

[60] Datasets described in the Frequency Response Initiative Report, October 2012, http://www.nerc.com/docs/pc/FRI_Report_10-30-12_Master_w-appendices.pdf

Figure 4.5 uses a time-trend regression line to show year-to-year time trends by interconnection. The study methods and statistical results are summarized in Chapter 4 and Appendix B.

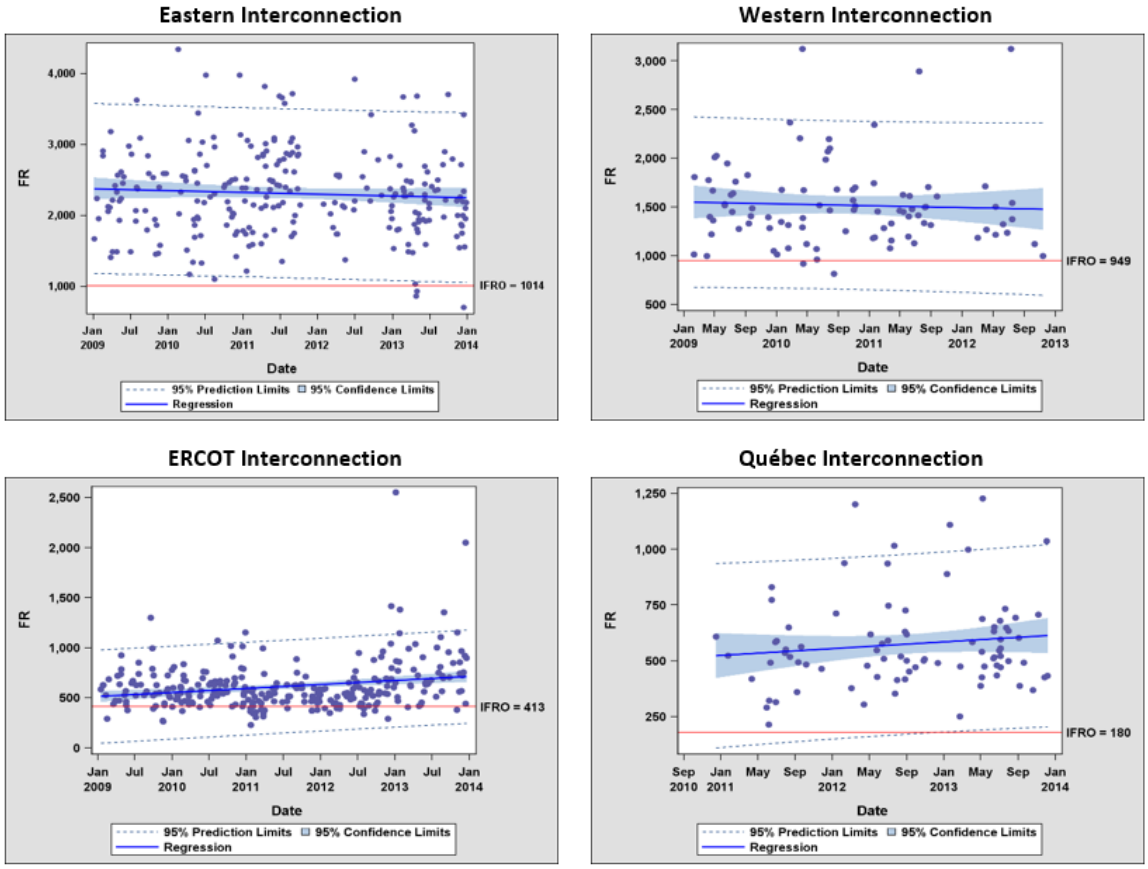

Figure 4.5 Interconnection Frequency Response Trend (2009–2013)

Relation to Interconnection Frequency Response Obligations

The expected frequency response for each interconnection was compared to its respective IFROs from the 2013 Frequency Response Annual Analysis. In all cases, the statistically expected frequency response for each interconnection has been higher than the recommended absolute values of IFRO.[61]

However, the historical frequency responses show (details in Appendix B):

- The Eastern Interconnection has had three events (1.2 percent of all Eastern Interconnection events) with the frequency response value below the absolute IFRO, all of which occurred in 2013;
- The ERCOT Interconnection has had 34 events (11.4 percent of all ERCOT events) with the frequency response value below the absolute IFRO, none of which occurred in 2013;
- The Québec Interconnection has had no events with the frequency response value below the absolute IFRO; and
- The Western Interconnection has had three events (2.5 percent of all Western Interconnection events) with the frequency response value below the absolute IFRO, none of which occurred in 2013.

[61] Current recommended IFRO values are presented in the Frequency Response Annual Analysis, December 2013, Annual Analysis, http://www.nerc.com/FilingsOrders/us/NERC Filings to FER DL/FR Annual Report 12-27-13 Final.pdf

Several factors contributed to the frequency response performance in ERCOT during the years the frequency response did not meet the recommended IFRO (2011 and 2012).

- ERCOT has a small hydro fleet that suffered significantly due to the extreme drought of 2011. There was some relief in 2012, but not in the geographical area of these hydro facilities. Additionally, the owners of the facilities have changed the facilities' operation. Prior to the ERCOT nodal market implementation in December 2010, many of these facilities were operated as frequency responsive reserves. They were on-line in synchronous condenser mode and ramped to full output in about 20 seconds anytime frequency dropped to 59.900 Hz or below, providing 50 to 240 MW of primary frequency response (during the first 20 seconds of a disturbance). Since early 2011, this service has been discontinued. The drought along the Colorado River that provides water to most of the hydro plants in Texas has not improved much. As of March 18, 2014, the watershed area for this river remains in extreme drought or severe drought conditions and has not recovered since 2011.

ERCOT's frequency response performance improved in 2013 for the following reasons:

- Natural gas prices have risen above coal and lignite prices, and solid fuel plants are again dispatched ahead of combined-cycle plants. However, the effort that began in September 2012 by the Texas Reliability Entity (TRE) has proven to be the major contributor to improved frequency response performance in ERCOT. The TRE has followed up with mitigation plans developed by generators of all fuel types to improve their frequency response. As these generators completed these efforts in 2013, the grid frequency response improved.
- FERC approved BAL-001-TRE-1 earlier this year, and the implementation phase began on April 1, 2014. This regional standard will help maintain the frequency response performance of generators in ERCOT and will standardize the dead-band settings of these generators. It is not yet known how much improvement in frequency response will result from this standard since many of the generators have already implemented the required settings. Some improvement in the RMS1 of frequency may be observed as more generators implement the lower governor dead-band settings.

Statistical significance tests have been applied to interconnection frequency response datasets, and additional analysis on time of year, load levels, and other attributes were also conducted. The overall observations and test results are summarized below:

- The Eastern Interconnection frequency response was stable from 2009 through 2013.[62]
- The ERCOT Interconnection frequency response grew from 2009 through 2013.[63]
- The Québec Interconnection[64] frequency response was stable from 2011 through 2013.[65]

[62] The correlation between time variable and frequency response is negative and this is equivalent to the fact that the slope is negative and the trend line is decreasing function. However, the correlation is not statistically significant. This leads to the failure to reject the null hypothesis of zero correlation. So even though the decreasing trend for frequency response in time was observed, there is a high probability that the negative correlation and the negative slope occurred by chance.

[63] The correlation between time variable and frequency response is positive, and this is equivalent to the fact that the slope is positive and the trend line is increasing function with the average monthly growth of 3.3 MW/Hz*0.1; moreover, the correlation is statistically significant ($p<0.0001$). This leads to the rejection of the null hypothesis of zero correlation. So, the observed increasing trend for frequency response is very unlikely occurred by chance.

[64] Only 2011–2013 data is available for Québec Interconnection.

[65] The correlation between time variable and frequency response is positive and this is equivalent to the fact that the slope is positive and the trend line is increasing function. However, the correlation is not statistically significant. This leads to the failure to reject the null hypothesis of zero correlation. So even though the increasing trend for frequency response in time was observed, there is a high probability that the positive correlation and the positive slope occurred by chance.

- The Western Interconnection frequency response was stable from 2009 through 2013.[66]

Special Considerations – Explanatory Variables

As recommended in the *2012 State of Reliability* report,[67] specific attributes have been further studied in order to understand their influence on the severity of frequency deviation events. For each interconnection, a set of six attributes was selected to be studied as explanatory variables for the interconnection frequency response. First, the correlation analysis was carried out to find statistically significant[68] contributors to frequency response; then, the explanatory variables were used as regressors in the multiple regression model that describes the interconnection frequency response. The model selection methods help identify important contributors and remove insignificant or highly correlated regressors to avoid redundancy. The following six specific attributes are included in the studies and tested for the frequency response data of each interconnection. The details of this analysis can be found in Appendix B.

- Summer
- Winter
- High Pre-Disturbance Frequency
- On-peak Hours
- Time
- Interconnection Load Level

For the Eastern Interconnection, only two variables (load level and high pre-disturbance frequency) have a statistically significant correlation with frequency response. The load level has the largest impact on frequency response, followed by the indicator of high pre-disturbance frequency. Interconnection load is positively correlated with frequency response, and high pre-disturbance frequency is negatively correlated with frequency response. There are a number of potential reasons why frequency response can improve as interconnection load level increases. Additional generators will typically be online at higher load periods. This can potentially increase the overall headroom of the generation that is online. It can also increase overall governor participation. In general, the Eastern Interconnection average frequency response of 2,308 MW/0.1 Hz provides a safe margin above the first step of underfrequency load shedding (59.7 Hz) for the single-event criteria loss of 4,500 MW.

For the ERCOT Interconnection, two variables (high pre-disturbance frequency and time) have a statistically significant correlation with frequency response. The indicator of high pre-disturbance frequency has the largest impact on frequency response, followed by time. High pre-disturbance frequency is negatively correlated with frequency response, while time is positively correlated with frequency response. Statistically significant positive correlation with time implies a frequency response improvement with time.

For the Québec Interconnection, three variables (load level, winter, and on-peak hours) have a statistically significant correlation with frequency response. Interconnection load has the biggest impact on frequency response, followed by the indicators of winter and on-peak hours. All these variables are positively correlated with frequency response.

For the Western Interconnection, only one variable (high pre-disturbance frequency) has a statistically significant negative correlation with frequency response.

---

[66] The correlation between time variable and frequency response is negative and this is equivalent to the fact that the slope is negative and the trend line is decreasing function. However, the correlation is not statistically significant. This leads to the failure to reject the null hypothesis of zero correlation. So even though the decreasing trend for frequency response in time was observed, there is a high probability that the negative correlation and the negative slope occurred by chance.

[67] 2012 State of Reliability Report, May 2012, http://www.nerc.com/files/2012_SOR.pdf

[68] At significance level of 0.1.

In summary, a high pre-disturbance frequency and interconnection load level are the two factors that significantly affect frequency response—the high pre-disturbance frequency results in a longer time for the frequency to fall below the governor dead-band setting and degrades frequency response.

ALR3-5 (M-8) Interconnection Reliability Operating Limit Exceedances

Background

The *State of Reliability 2013* report reviewed the Interconnection Reliability Operating Limit/System Operating Limit (IROL/SOL) Exceedances metric. In the past, this metric has been used to determine the number of times an IROL was exceeded in the Eastern Interconnection and the number of times an SOL was exceeded in the Western and ERCOT Interconnections. Since the metric was first introduced, all regions now recognize IROLs and are anticipated to be able to report on IROL exceedances in 2014. Therefore, metric ALR 3-5 (M8) was modified to remove the SOL reporting language in late 2013.

This metric measures the number of times that a defined IROL was exceeded and the duration of these exceedances. Exceeding an IROL could lead to widespread outages if prompt operator control actions are not taken to return the system to within normal operating limits. In addition, exceeding the limits may not directly lead to an outage but may put the system at unacceptable risk if the operating limits are exceeded beyond T_v.[69] To monitor how quickly an IROL is returned to within normal limits, the data is grouped into four time segments, as shown in Table 4.5.

Table 4.5: Exceedance Duration Segment

Time Range	IROL/SOL Duration
Time Range 1	10 secs < Duration ≤ 10 mins
Time Range 2	10 mins < Duration ≤ 20 mins
Time Range 3	20 mins < Duration ≤ 30 mins
Time Range 4	Duration > 30 mins

[69] T_v is the maximum time that an Interconnection Reliability Operating Limit can be violated before the risk to the interconnection or other Reliability Coordinator Area(s) becomes greater than acceptable. Each Interconnection Reliability Operating Limit's T_v shall be less than or equal to 30 minutes.

Eastern Interconnection

Figure 4.6 shows the number of IROL exceedances by quarter and time range of exceedance for the Eastern Interconnection for 2011–2013. The second quarter shows the most exceedances for the Eastern Interconnection in all years due to planned transmission outages resulting in congestion and higher flows on the remaining paths.

It is notable that most of the exceedances occur in Time Range 1 and 2, and that for the three years included in the analysis, the number of exceedances decreased in both of those time ranges. However, in 2013, there were also exceedances that had durations that put them into Time Range 3 and Time Range 4, meaning that the duration of these three exceedances were greater than 20 minutes; two of them were greater than 30 minutes.

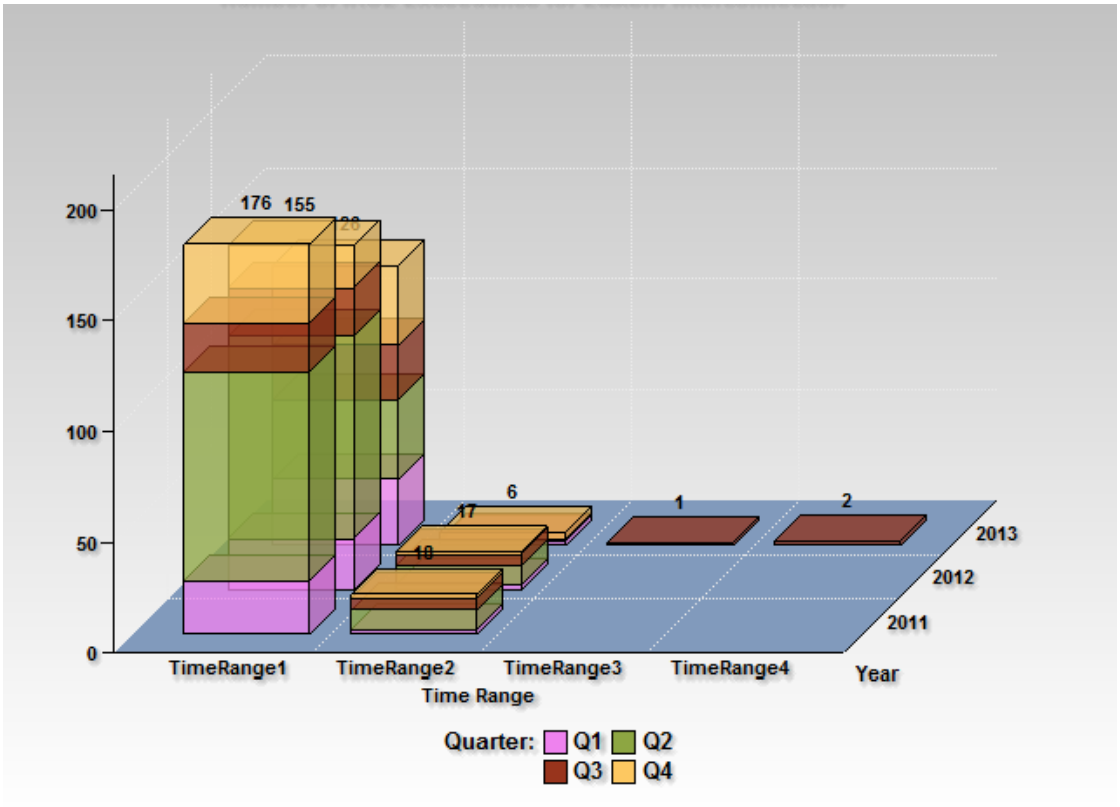

Figure 4.6: Eastern Interconnection IROL Exceedances

Western Interconnection

WECC is making changes in 2014 to the way its limits are calculated to allow the calculation of IROL limits and will therefore be able to report on IROL exceedances going forward. Figure 4.7 shows the number of SOL exceedances separated by quarter and segment type for the Western Interconnection from 2011 through 2013.

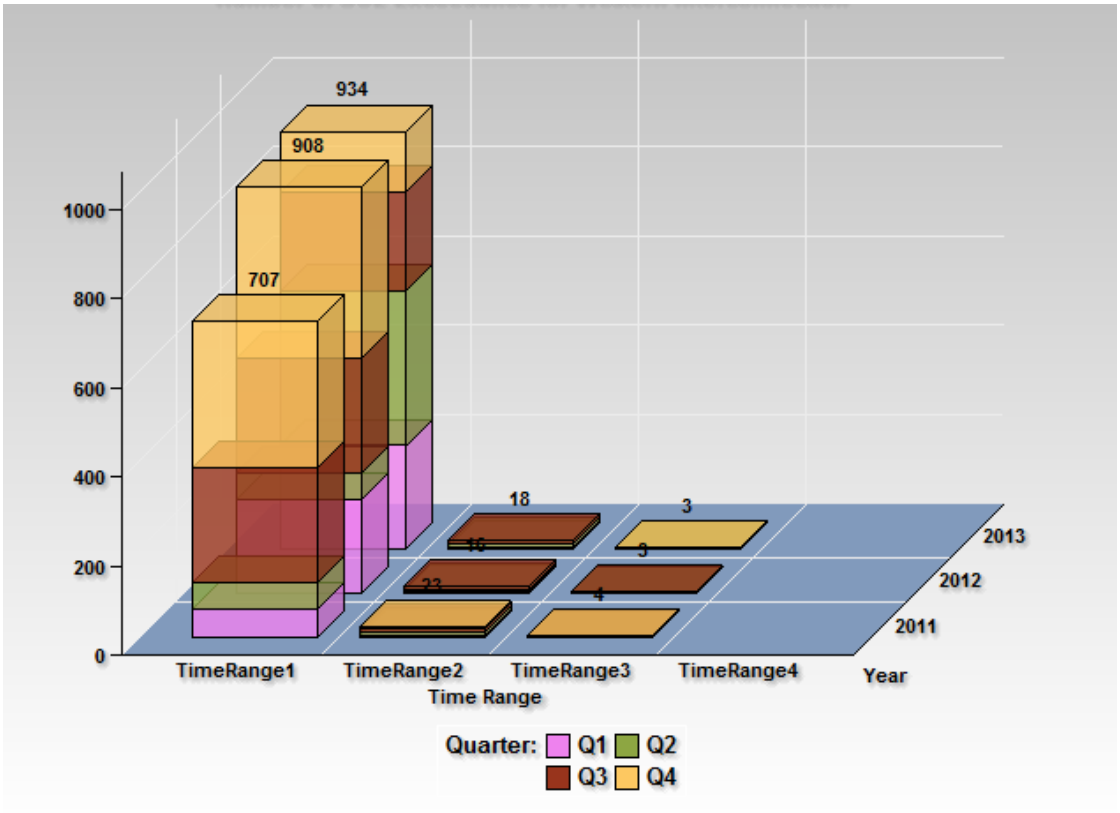

Figure 4.7: Western Interconnection ALR3-5 SOL Exceedances

ERCOT Interconnection

Figure 4.8 shows that the number of IROL exceedances was greatly reduced from 2011 through 2013. Some contributions to the improved performance are smoother transitions in limit values due to the implementation of real-time analysis tools, and more available transmission. The completion of a major transmission expansion project resulted in a major drop in exceedances between the fourth quarter of 2012 and the first quarter of 2013. The result is that the IROL that contributed to most of the exceedances has been mitigated, so exceedances are not expected to occur going forward.

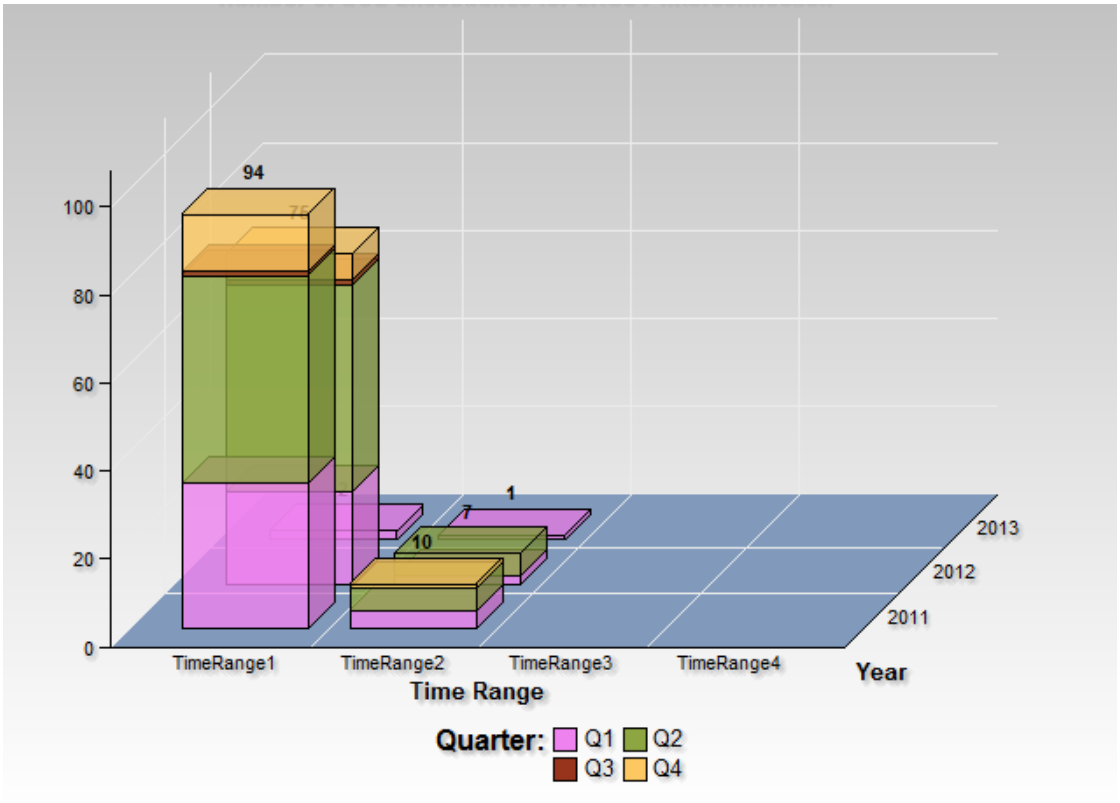

Figure 4.8: ERCOT Interconnection ALR3-5 SOL Exceedances

Québec Interconnection

To maintain the anonymity of the reporting entity, information regarding the assessment of Québec Interconnection is not disclosed, despite the data's being available.

ALR4-1 (M-9) Protection System Misoperations

Background

Protection system misoperations were identified as an area that requires further analysis in the *State of Reliability 2013* report. The improvements to the data collection process that the Protection System Misoperations Task Force (PSMTF) and System Protection Control Subcommittee (SPCS) proposed in 2013 have been implemented and should improve the accuracy of future misoperation reporting. Based on the recommendation by the PSMTF and SPCS, the respective protection system subcommittees within each Regional Entity began analyzing misoperations on an annual basis in early 2014. The *State of Reliability 2013* report also recommended that additional analysis be performed to determine how often misoperations are involved with reportable system

disturbances and whether the misoperation was causal to the event or exacerbated the seriousness of the disturbance.

Assessment

Figure 4.9 shows the misoperation rate by Region. The misoperation rate reflects the ratio of misoperations to total operations for the entire BES, 100 kV and above. This ratio provides a stable way to trend the rate of misoperations as compared to a misoperation count alone, where weather and other factors can influence the count. Total protection system operations was first requested with the fourth quarter 2012 misoperation data. Having the total number of operations for the reporting periods in 2013 allows for a consistent way to normalize and trend protection system misoperations over time.

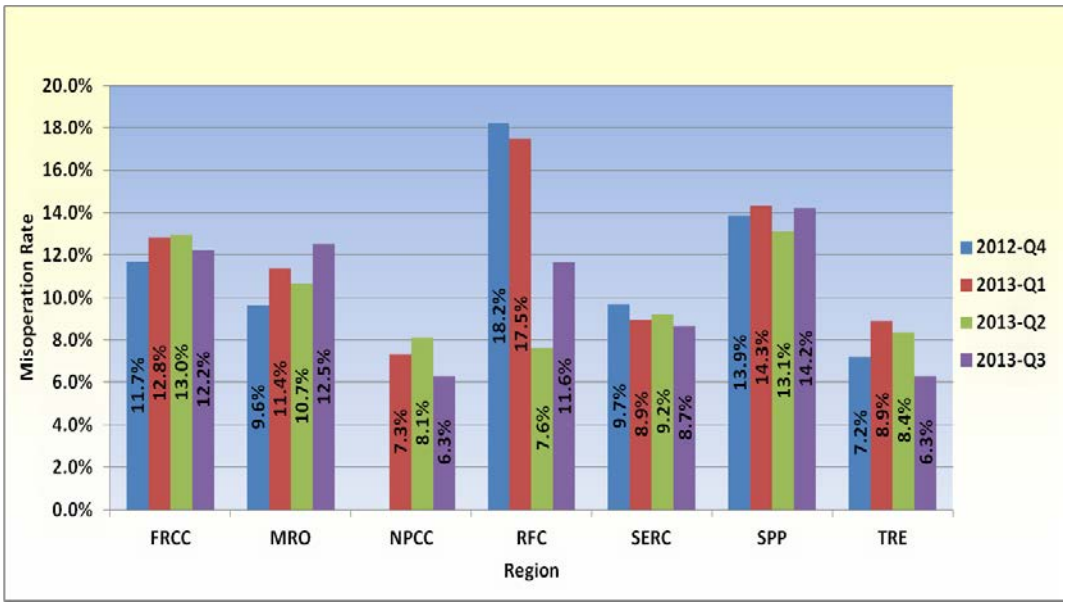

Figure 4.9: ALR4-1 Misoperation Rate by Region

Figure 4.10 shows misoperations on a monthly basis from April 1, 2011, to September 30, 2013. Overall, the trend is periodic, with peaks in the spring and summer months of all three years.

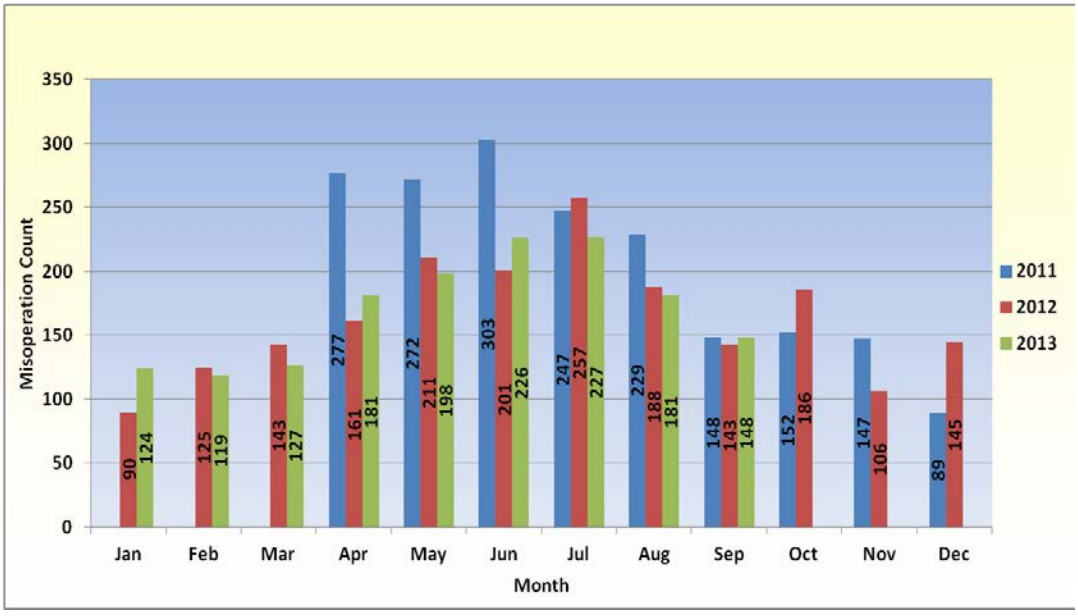

Figure 4.10: NERC Misoperations by Month (2Q2011–4Q2013)

Figure 4.11 illustrates the top-three cause codes being assigned to misoperations by the TOs: incorrect setting, logic, or design error; relay failures/malfunctions; and communication failure. These three cause codes have consistently accounted for 65 percent of all misoperations since data collection started in 2011.

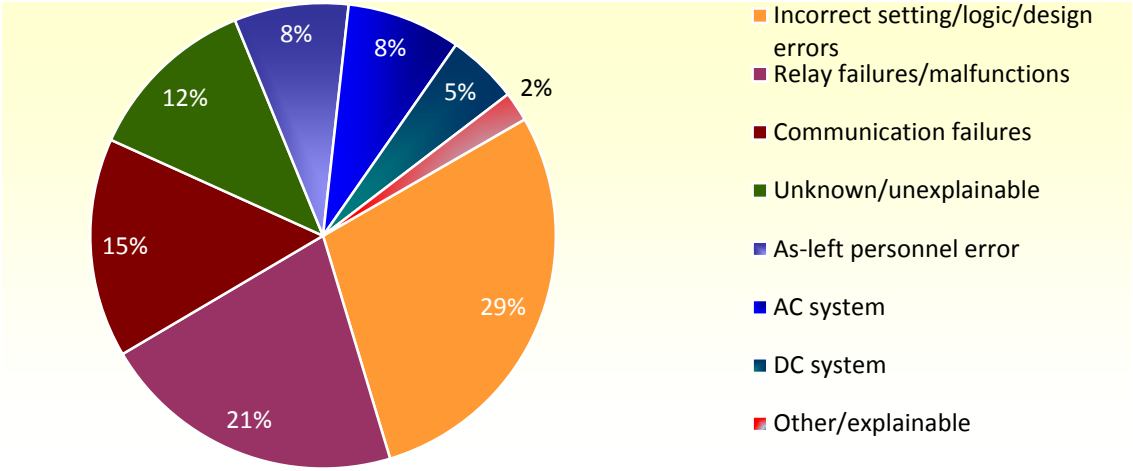

Figure 4.11: NERC Misoperations by Cause Code from 2011Q2 to 2013Q3[70]

In 2013, 71 transmission-related system disturbances resulted in a NERC Event Analysis reported event. Of those 71 events, 47 events (about 66 percent), had associated misoperations. Of these 47 events, 38 events (about 81 percent), experienced misoperations that were contributory to and/or exacerbated the severity of the event. In several cases, multiple misoperations occurred during a single disturbance. Cause coding has not yet been completed for all 2013 events, but it is estimated that there were 60–75 misoperations associated with these 38 reportable events. Therefore, out of approximately 2,000 total misoperations in 2013, approximately 3.0 to 3.5 percent were causal to or exacerbated the severity of reportable system disturbances.

NERC is in the process of revising a number of Reliability Standards involving protection system misoperations.[71] To increase awareness and transparency, NERC will continue to conduct industry webinars[72] on protection systems and document success stories on how GOs and TOs are achieving high levels of protection system performance. The quarterly protection system misoperation trending by NERC and the Regional Entities can be viewed on NERC's website.[73]

As identified in the 2013 PSMTF final report, there are several areas where misoperation reduction is possible for entities. First, relay applications requiring coordination of functionally different relay elements should be avoided. Secondly, misoperations due to setting errors can potentially be reduced. Techniques that could be used to reduce the application of incorrect settings include peer reviews, increased training, more extensive fault studies, standard templates for setting standard schemes using complex relays, and periodic reviews of existing settings when there is a change in system topography. Finally, firmware updates may affect relay protection settings, logic, communications, and general information stored and reported by the relay. Entities should be aware of what version of firmware they have on their microprocessor-based relays. Entities should also monitor if the relay vendor has issued updated relay firmware.

[70] Cause-coded Misoperation data for 2013 4Q is not available at this point.
[71] http://www.nerc.com/pa/Stand/Pages/Project2010-05_Protection_System_Misoperations.aspx
[72] http://www.nerc.com/files/misoperations_webinar_master_deck_final.pdf
[73] http://www.nerc.com/pa/RAPA/ri/Pages/ProtectionSystemMisoperations.aspx

Special Considerations

In the annual review of metrics, the PAS made a minor modification to ALR4-1 (M-9) to remove the interim method for calculation of the total number of operations. Previously, automatic operations were only available through TADS data, which only includes operations at 200 kV and above. This change was approved in December 2013.

NERC undertook an effort to collect data on total protection system operations to create a more useful metric for monitoring protection system misoperation performance. This data collection began with the reporting of fourth quarter 2012 misoperation data. Having the total number of operations for the reporting periods in 2013 facilitates a way to normalize and trend protection system misoperations over time.

ALR6-2 (M-11) Energy Emergency Alerts

Background

This metric was enhanced in 2013 by expanding the data collection to include counts and duration of all EEA events of all levels and unserved energy data for all EEA Level 3 occurrences that result in load shedding. This metric will account for the number and duration of Energy Emergency Alerts that are issued. All EEA Level 1, Level 2, and Level 3 occurrences can then be tracked to see whether there are any changes in frequency, duration, and load shed magnitudes of EEA occurrences over time.

As historical data is gathered on EEAs, trends provide a relative indication of performance measured at a BA or interconnection level. By definition, when an EEA Level 3 Alert is issued, firm-load interruptions are imminent or in progress. An EEA Level 3 indicates an issue with the real-time adequacy of the electric supply system. It may be due to a lack of fuel or dependence on transmission for imports into a constrained area, not simply a lack of available generation resources. The contributing factors for EEA Level 3 events need to be considered.

Reporting the duration and unserved energy of load shed events aids in determining the likelihood and duration of a load shed event following the issuance of an EEA Level 3. EEA Level 3 events are currently reported, collected, and maintained in NERC's Reliability Coordinator Information System (RCIS), as defined in NERC Standard EOP-002.[74]

Assessment

Table 4.6 shows the number of EEA Level 3 events from 2006 to 2013 at the Regional Entity level. Interactive quarterly trending is available at the Reliability Indicator's page.[75] In 2013 there were seven EEA Level 3 Alerts issued, with only one resulting in a loss-of-load event. Seven EEA Level 3 events were declared in 2013, which is significantly lower than the number that occurred in prior years.

Table 4.6: Energy Emergency Alert 3

Number of Events	Year							
	2006	2007	2008	2009	2010	2011	2012	2013
NERC	7	23	12	41	11	23	16	7
FRCC	0	0	0	0	0	0	0	1
MRO	0	0	0	0	0	0	0	0
NPCC	0	0	1	1	0	0	0	0
RF	0	3	1	0	2	0	1	0
SERC	4	14	2	3	4	2	7	0
SPP	1	5	3	35	4	15	6	2
TRE	0	0	0	0	0	1	1	0
WECC	2	1	5	2	1	5	1	4

[74] The latest version of EOP-002 is available at: http://www.nerc.com/files/EOP-002-3_1.pdf

[75] The EEA3 interactive presentation is available on the NERC website at: http://www.nerc.com/pa/RAPA/ri/Pages/EEA2andEEA3.aspx

The one EEA Level 3 event that resulted in load shed involved the interruption of 200 MW of load for two hours, or unserved energy of 400 MWh. This event was due to a number of factors that culminated with the failure of transmission system equipment that reduced the ability to serve all the load in the affected area.

The other six reported EEA Level 3 Alerts did not result in any loss-of-load events. These EEA Level 3 events fell into two categories. One category pertained to significant unplanned outages of resource supply due to generator trip or equipment failure, either the unplanned loss of one or more generation resources, or the unplanned loss of a major transmission facility that supplied generation into an area. These included quickly evolving events in which the entity had to use its reserves to serve its load and had to prepare for load shed to meet the next possible contingency. The other category consists of events in which transmission limitations in the form of Transmission Loading Relief (TLR)[76] events were in place and were affecting entities that rely upon import transactions to serve their load. These events did not involve sudden loss of generation or equipment failures; rather, they occur as loading increases over a period of time and the affected TOP responds by requesting various levels of TLR relief. The entities in this category used the EEA Level 3 to protect their firm transactions to avoid having to reduce load, and they called upon reserve sharing provisions to restore reserves.

In 2013, NERC began assessing the EEA Level 1 and Level 2 events as a part of this metric. Table 4.7 shows the number of EEA events at each of the levels and displays all the EEA alerts reported in 2013 by region (except for TRE). It is intuitive that more events occurred at Level 1 and Level 2, as those represent situations in which capacity emergencies are developing.

Table 4.7: EEA Level by Region

Region	EEA1	EEA2	EEA3	Total
FRCC	2	3	1	6
MRO	11	0	0	11
NPCC	5	11	0	16
RF	5	11	0	16
SERC	2	3	0	5
SPP	2	0	2	4
WECC	20	9	4	33
Grand Total	**47**	**37**	**7**	**91**

Figure 4.12 displays the cumulative amount of time at each EEA alert level. Since this data for all the alerts was only collected for 2013, there is not sufficient history to trend the data, which will continue to be gathered and analyzed going forward.

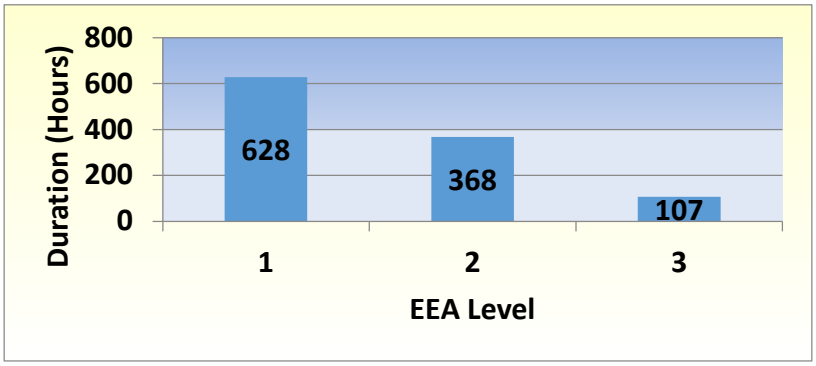

Figure 4.12: Duration (Hours) by EEA Level

Chapter 5 – Event Analysis

Background

The industry's voluntary event analysis program is providing valuable information for the ERO and industry to use to address potential threats or vulnerabilities to the reliability of the BPS. Since its initial implementation in October of 2010, the process has resulted in the collection of 399 qualified events being reported to the ERO and yielded more than 77 lessons learned, including 14 published in 2013.[77] NERC and the Regions assess every event to identify and share with industry the possible threats to reliability. This year the NERC Cause Code Assignment Process (CCAP) provided greater ability for historical trending and predictive analysis. Industry has actively participated in the assignment of cause codes as events, providing greater transparency on how NERC trends events; it also provides a great venue for active collaboration and sharing. This active collaboration is a testament to how much effort and resources are being expended in this area by the industry, as well as how important it is for the ERO and industry to truly understand the different contributors to events. The OC's Event Analysis Subcommittee (EAS) has been essential in the maturation of this process and has facilitated the active disseminations of many of the products that have been delivered to date. This chapter highlights some of the significant products that have been produced from this active collaboration.

Bulk Power System Awareness

The process for understanding the potential threats or vulnerabilities to the reliability of the BPS starts with understanding events and occurrences in the context in which they occur. NERC's Bulk Power System Awareness (BPSA) group and the eight Regional Entities monitor BPS conditions, significant events, and emerging threats for the 15 Reliability Coordinator regions in North America to understand the conditions and situations that could impact the BPS's reliable operation. This group also supports the development and publication of alerts and awareness products and facilitates information sharing among industry, the Regions, and the government during crisis situations and major system disturbances.

The first step in NERC's Event Analysis Program is to monitor and be aware of BPS events above a certain threshold of impact or risk. The group partners with Regional Entity staffs to monitor conditions on the BPS and allow the ERO to conduct in-depth, critical self-analysis of these events to identify trends and provide experience-based insight to prevent repeat occurrences. NERC's BPSA, in close coordination with the Regional Entities, shares the needed information with NERC and Regional Entity Event Analysis staff.

Overview and Accomplishments of the ERO BPSA Group

By The Numbers – Bulk Power System Awareness

- 480 new Event Analysis database entries initiated
- 250 daily reports published
- 46 special reports published during major system disturbances
- Received and processed:
  - 316 OE-417 reports
  - 42 EOP-004 system disturbance reports
  - 7 EOP-002 reports
  - 1,990 Intelligent Alarms notifications
  - 2,582 FNet notifications
  - 4,562 WECCnet messages
  - 1,709 Reliability Coordinator Information System messages
  - 156 Space Weather Predictive Center notifications
  - 149 Department of Homeland Security notifications
- 1 advisory (Level 1) alert issued
- 4 advisory (Level 1) alerts published, assisting ES-ISAC

[77] The link to the NERC Lessons Learned page: http://www.nerc.com/pa/rrm/ea/Pages/Lessons-Learned.aspx

As recognizable from the data above, many occurrences, notifications, and alarms occur frequently, with little or no real impact on the system at large. Being aware of the daily occurrences aids in the understanding of the size and complexity of the system. Registered entities continue to inform and collaborate with the ERO well beyond what is required in an effort to make sure all stay abreast of the state of the grid. Only a small subset of the occurrences of which the BPSA group is made aware rise to the level of a reportable event. When a registered entity experiences an event, the registered entity will recommend an initial category for the event, as outlined in the figure below. The categories listed in the Categorization of Events section do not cover all possible events.

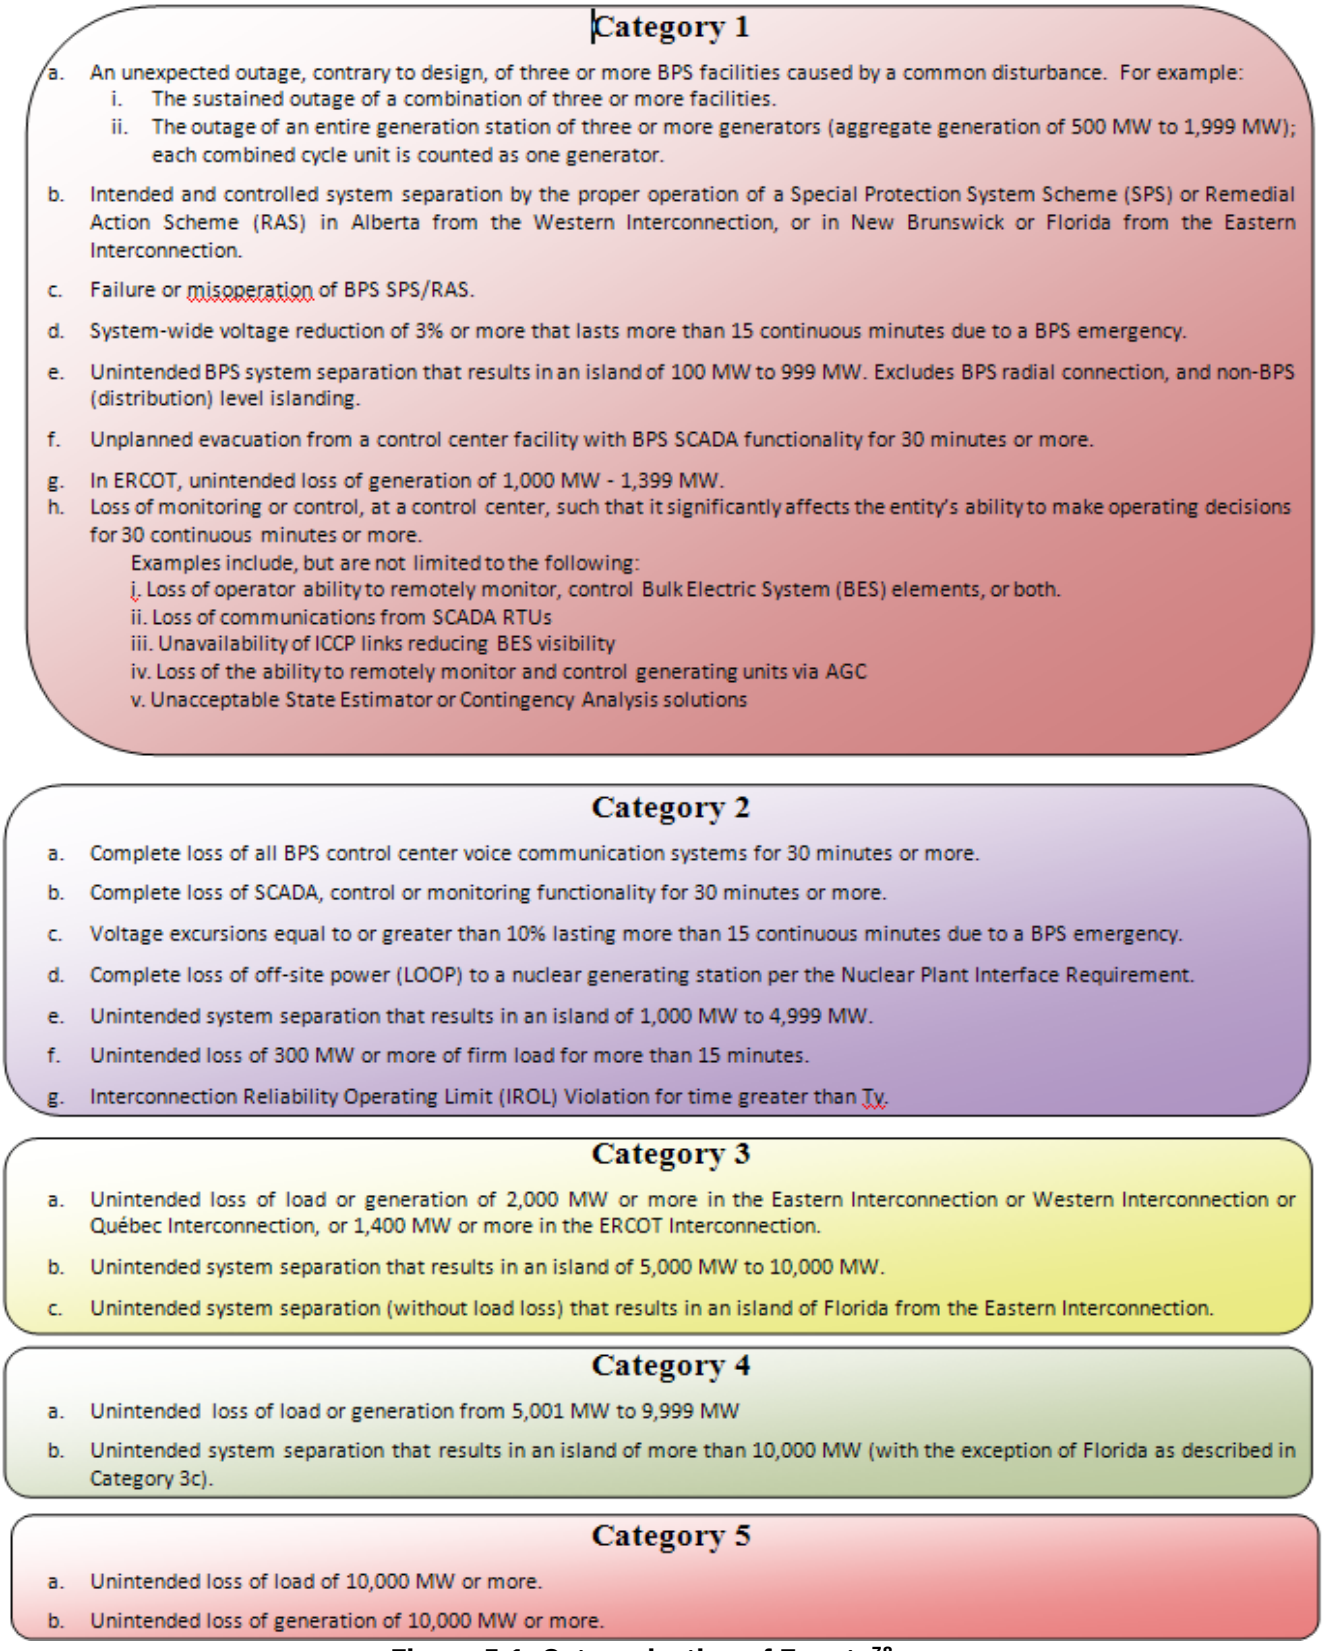

Figure 5.1. Categorization of Events[78]

[78] Qualifying events are assigned to one of five categories based on the impact to the reliability of the BPS. The event categories are intended to allow the registered entity and Regional Entity to objectively identify event thresholds. For a more thorough review of the process see: http://www.nerc.com/pa/rrm/ea/EA Program Document Library/Final_ERO_EA_Process_V2.1.pdf

In 2013, the NERC CCAP provided valuable information to the industry, including greater ability for historical trending and predictive analysis. The active participation by industry has greatly enhanced the accuracy in the assignment of cause codes as events are analyzed and trended, providing greater transparency on how NERC and the Regional Entities trend events. The process provides an ideal venue for active collaboration and sharing. See Table 5.1 for a consolidated chart of the reportable events since the program's inception and for 2013.

Table 5.1: Event Analysis Event Summary. The events by category since the initial implementation in 2010 and the event count for 2013

Event Category	Count (Total)	Count (2013)	Comments
CAT 1	267	102	
CAT 2	114	33	30 - EMS events (2b) (2013) 2 - LOOP events (2d) (2013) 1 – Loss of >300MW firm load for >15 minutes(2f)
CAT 3	14	6	
CAT 4	3	0	SW Winter Weather (2011) SW Blackout (2011) Derecho (2012)

Total CAT 1-5 Events	**399**	**141**	
Non-Qualified Occurrences reported	**1715**	**342**	

The plotting of the number events over time allows one to see if there is any sort of trending that is moving outside of the normal event count averages and is one indicator of the consistent reliability of the grid through a variety of external and environmental conditions (Figure 5.2).

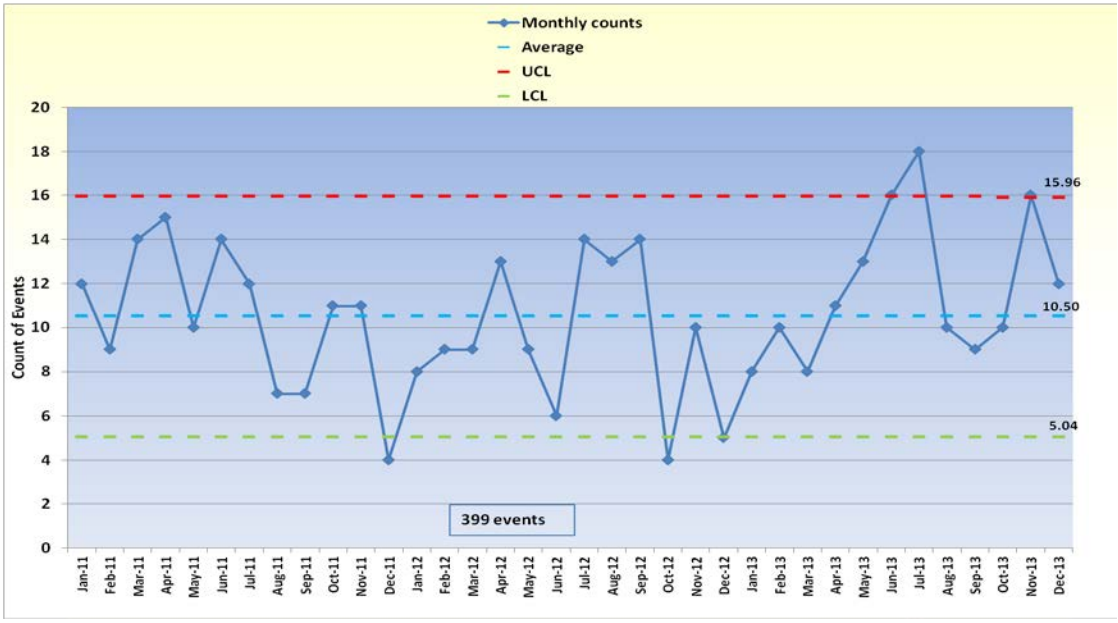

Figure 5.2: Trending of the Number Events over Time[79]

[79] Count of events by month with three-month average for control limit calculation. Surpassing the upper control limit in July of 2013 was largely due to environmental conditions, in this case, flooding and forest fires.

The above trending graph is of the 399 qualified events through 2013. The quality of the event reports is vital for the success of the NERC Event Analysis Program. The quality, detailed analysis, and investigations that entities performed have led to quality reports.[80] Good quality event analysis reports allow for more accurate cause coding of events and has led to better trending. Better trending leads to timely identification of issues being communicated back to the industry.

Through the Event Analysis Program, NERC assesses every event report to identify and then share with industry the apparent threats to reliability that may be emerging. The NERC CCAP manual[81] was updated in February 2013. Cause coding has allowed for easier trending for all event causes. While the root cause of every event can not necessarily be determined, many of the contributing causes or failed defenses can be determined, analyzed, and trended to provide valuable information to the industry. Figure 5.3 shows the overall trends for the contributing causes of events.

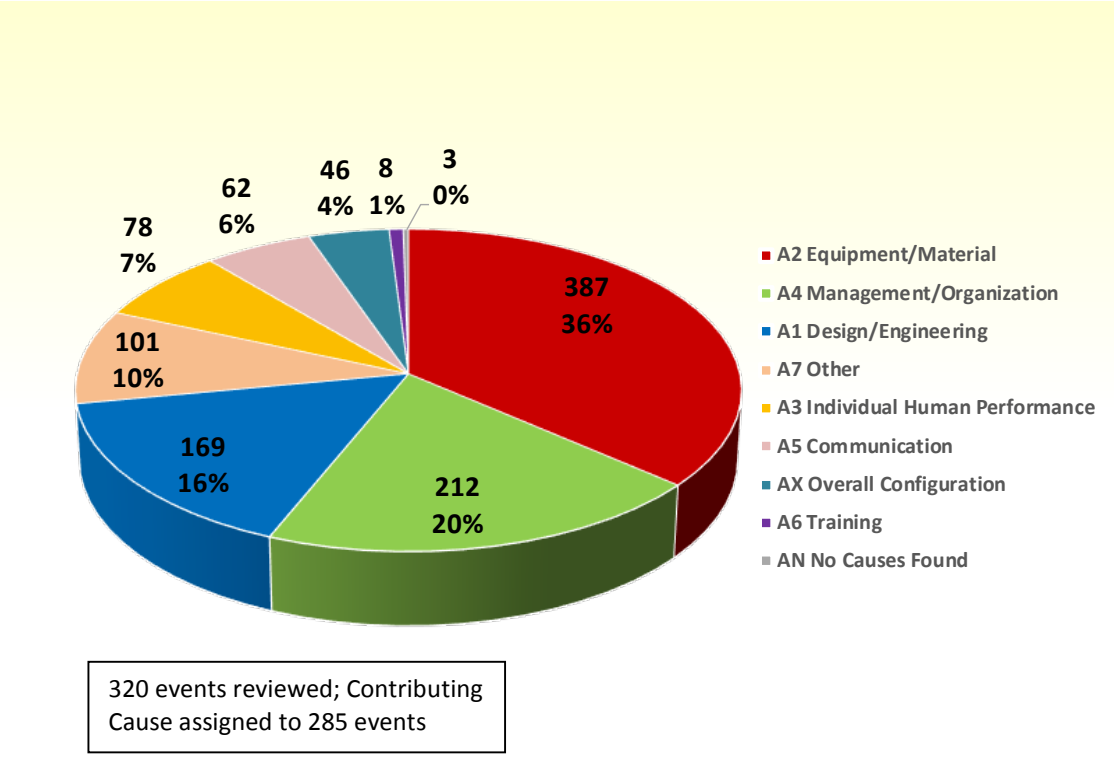

Figure 5.3: The Percentage of Contributing Causes by Major Category

Identification of these large areas of concern allow NERC and industry to prioritize and search for actionable threats to reliability. For example, from the chart above, one can see the large amount of equipment that is damaged or fails that is linked to the causes of events. With the systematic approach to trending all of the event data, the different types of failed or damaged equipment can be parsed from the aggregate data. In this case, circuit breaker failures were found to be the single-largest contributor to events (see Figure 5.4). This is often the failure mode of an event—what one sees as the apparent cause. Note that when possible, the distinction is made between equipment that fails due to damage (both human caused and nature caused), end of life, or other related attributes that result in the equipment or material not functioning as desired. For the purpose of the following

[80] http://www.nerc.com/pa/rrm/ea/EA Program Document Library/NERC-Report-Quality.pdf

[81] http://www.nerc.com/pa/rrm/ea/EA%20Program%20Document%20Library/NERC_Cause_Code_Assignment_Process_March_2014_rev20140324%20SLS.pdf

analysis, failed equipment relates to all of the aforementioned attributes, unless a specific failure mechanism is mentioned.

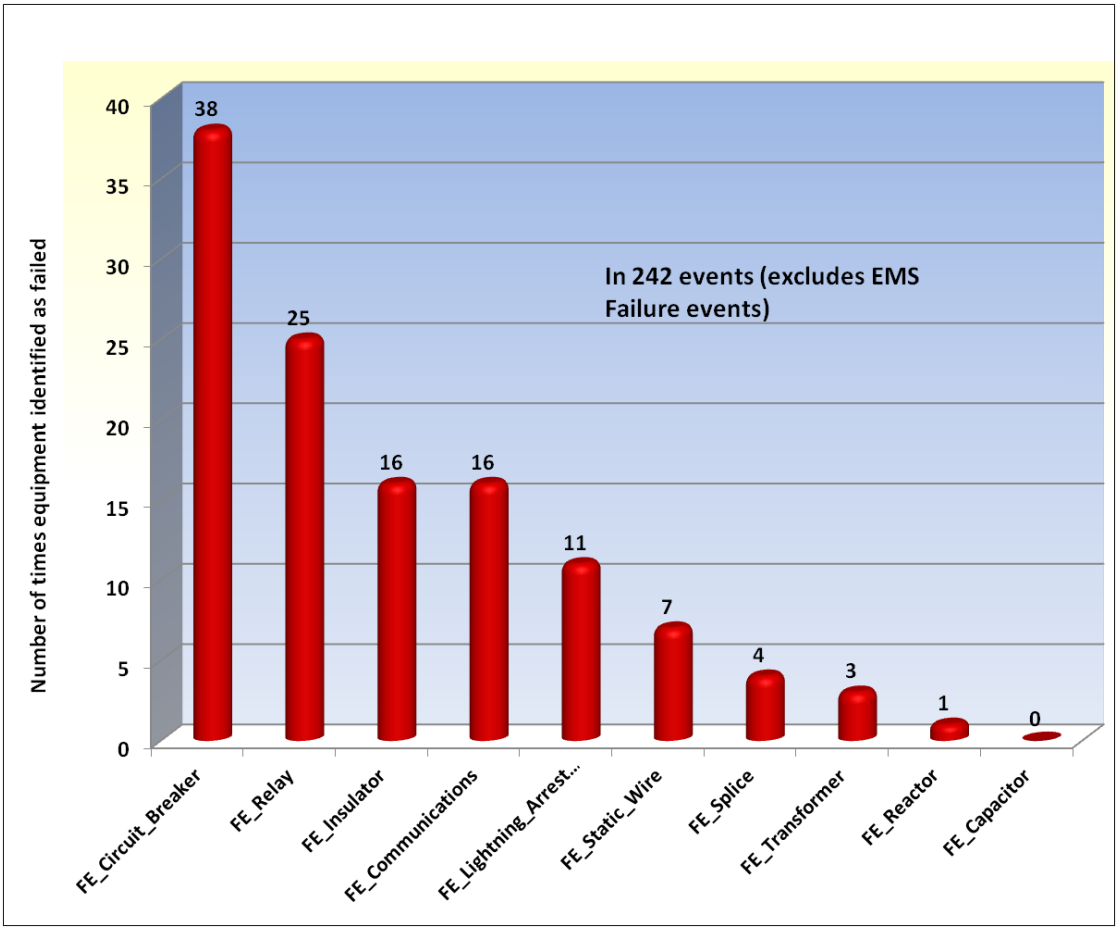

Figure 5.4: Failed Equipment Identified during Review of Event Reports

Further analysis of circuit breakers suggested a trend for a specific type of circuit breaker in many of the observed and reported events. NERC was then able to develop a case history. An example of the benefits of industry and NERC analyzing events is a recently identified trend related to the failure mode of a specific type of 345 kV breaker.

Figure 5.5 shows a timeline during which a trend was identified for a specific type of 345 kV SF_6 puffer-type circuit breaker failure.

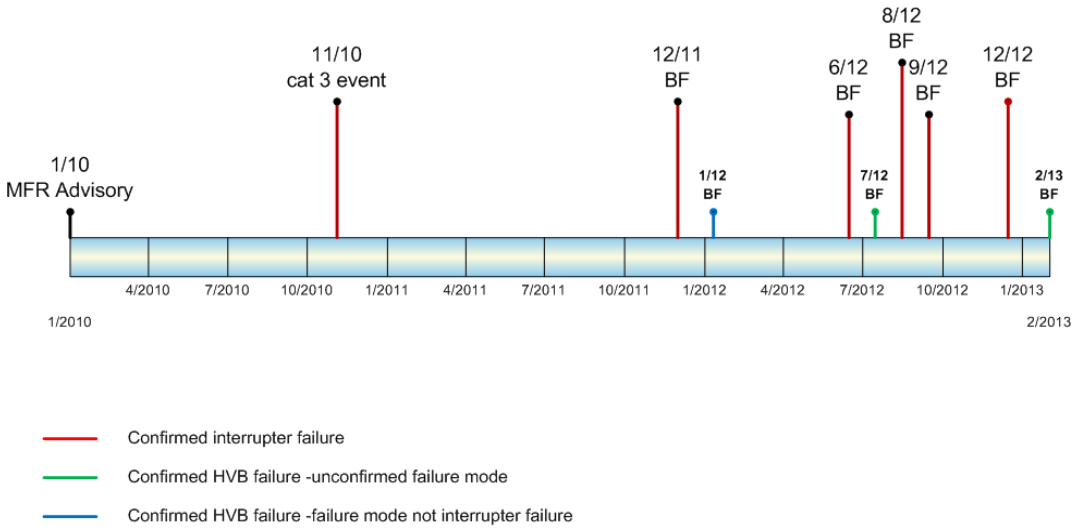

Figure 5.5. Timeline for Identification of a Trend in 345-kV SF_6 Puffer-Type Circuit Breaker Failures

These analyses resulted in NERC's issuing a Level 1 Advisory Alert regarding identification of a trend in 345 kV SF_6 puffer-type circuit breaker failures and the potential risk it posed to the reliability of the BPS. The purpose of the alert was to ensure that industry was aware of the recent failures and previously published maintenance advisories, so appropriate action could be taken by entities that utilize this particular equipment.

While the alert was advisory in nature and did not require specific action to be taken, this was a reliability risk suited for close collaboration with the North American Generator Forum and North American Transmission Forum, as well as certain trade associations with members that may have this particular 345 kV equipment. This advisory provided an excellent opportunity for NERC to work directly with the forums and trades to determine the extent of the condition and address the potential risk to the BPS.

NERC continues to conduct cause analysis training with staff from the Regions and registered entities. As of December 2013, personnel from all eight Regions and 668 persons from 145 different registered entities have received cause analysis training—more than 5,400 hours of training.

A similar identification of trends can be observed in the large contribution of "less than adequate" or "needs improvement" areas of management and organizational practices that contribute to events. Many of these threats can be identified and shared with the industry for awareness. For example, in Figure 5.6, the identification of some of the particular challenges to organization and management effectiveness are identified.

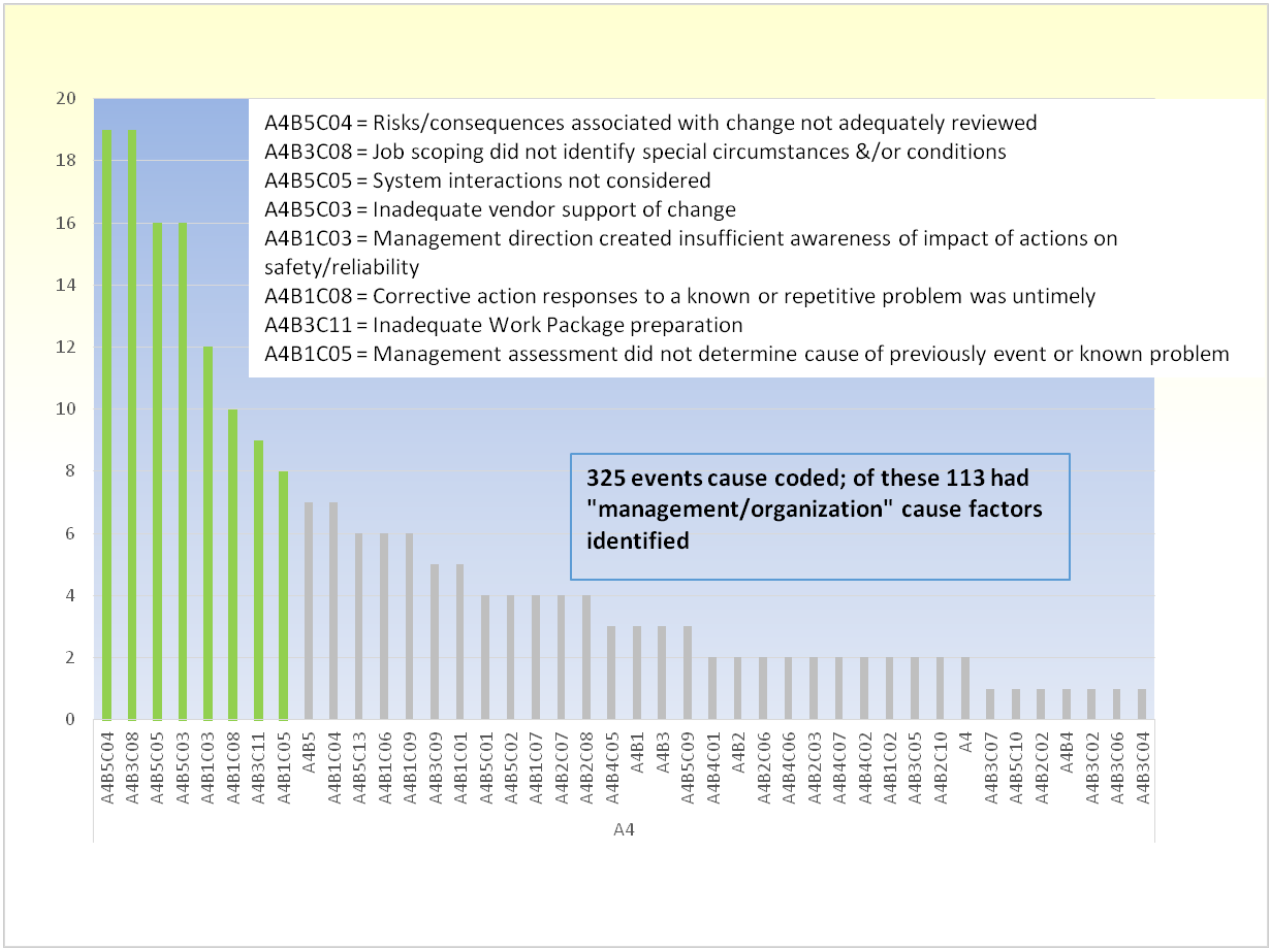

Figure 5.6: "Less than adequate" or "Needs improvement" Management/Organization Challenges that Contributed to an Event

Management of complex systems and organizations is a challenge in every industry, and the percentage of events with these contributing factors is collectively found in other industries.

Many of the most frequently identified contributing causes for events seen in Figure 5.6 were found present in the severe cold weather events. NERC, in close collaboration with the regional staff and the industry, published a report titled, *Assessment of Previous Severe Winter Weather Reports 1983-2011* to provide a review and comparison of previous winter weather events.[82] This review and a cold weather training package were provided to the industry to assist in their winter weather preparation.

Additionally, NERC conducted an industry-wide webinar in October 2013. Over 350 owners, users, and operators attended a webinar that provided the industry reports and training material in preparation for the upcoming winter weather forecasts and entity cold weather preparedness. During the webinar, the impacts from both the February 2011 Southwest Cold Weather Event and previous cold weather events were discussed. The webinar encouraged GOs and GOPs to focus on areas that were observed in past events, such as inspecting and maintaining

[82] These reports can be found at http://www.nerc.com/pa/rrm/ea/Pages/February-2011-Southwest-Cold-Weather-Event.aspx .

heat trace equipment and thermal insulation, erecting adequate wind breaks and enclosures, and taking measures to protect instrument lines and equipment prior to the onset of winter weather.

NERC also reviewed the *Assessment of Previous Severe Winter Weather Reports 1983-2011* during the webinar. This report provides a review and comparison of the previous winter events cited in the FERC and NERC staff Report.[83] This was to remind industry that generators experienced weather-related outages and rolling blackouts in previous events, and lessons learned from these events could have prevented outages in more recent winter events.

The OC-developed Reliability Guideline[84] was also reviewed. This guideline provides a general framework for developing an effective winter weather readiness program for generating units throughout North America. Although the NERC *Winter Reliability Assessment 2013-14* was expected to be published later in November, attendees were given a preview of the draft. NERC also covered the NOAA Winter Outlook, resource adequacy, and seasonal reliability issues were also covered during the webinar.

Attendees were also introduced to a Cold Weather Event Training Package[85] designed by NERC training staff to assist non-traditional cold weather registered entities properly prepare for cold weather events. The materials were designed to be a guide to training sessions. These materials have been created as a foundation for training and remain in PowerPoint format to allow for customization based on registered entity needs. The NERC Event Analysis Program continues to establish the appropriate balance of data reporting for analysis and use by the industry. NERC is investigating ways to sustain positive efforts and improve the process.

Individual Human Performance

Analysis of event reports to date has identified possible workforce capability and human performance challenges that pose threats to reliability. Workforce capability and human performance is a broad topic and can most simply be divided into management, team, and individual levels. The following paragraphs provide more details on the types of errors that were observed in BPS events since the inception of the NERC Event Analysis Program, specifically events that involved human error or less-than-adequate training.

Generally, individual error is classified using the mode of performance in which the individual was operating when the error was committed. The NERC CCAP uses a popular methodology developed by Jens Rasmussen[86] in which errors occur in one of three modes of human performance, depending on the nature of the task and the level of experience with the particular situation. When information is first perceived and interpreted in the processing system, that information is processed cognitively in either the skill-based, knowledge-based, or rule-based levels.

Additionally, when contributing causes are considered, over half of the event reports to date indicate some management or organizational challenges. In an effort to support industry with these challenges, NERC held its second annual Human Performance conference in Atlanta, *Improving Human Performance on the Grid,* at the end of March 2013. The focus this year was not only on individual human performance, but the organizational and management challenges around human capital. The conference included industry and related professionals in the field, with over 200 attendees from all regions. The conference and associated workshops were very well received. NERC supported similar venues for industry in the spring in Edmonton, Canada, as well as in the fall in Salt Lake City. NERC provided industry support in this area to well over 250 registered entities across the eight Regions.

Monitoring and Situation Awareness (Real-Time Tools)

Energy Management Systems (EMSes), including SCADA, digital or analog communications, and real-time tools, are vital for maintaining situational awareness and making operating decisions at both the individual and the organizational level. EMS systems are extremely reliable and are highly redundant. However, an outage of the EMS reduces visibility into a portion of the BES and increases the potential risk to the reliability of the BPS. The NERC Event Analysis Program has received over 80 Category 2b event reports in which a complete loss of SCADA, monitoring, or control has lasted for more than 30 minutes. NERC's commitment to active collaboration and sharing has allowed more information about these events to be adequately reviewed and shared among NERC Regions and the affected entities.

The Events Analysis Subcommittee (EAS) developed an Energy Management System Task Force (EMSTF) to analyze the events and data that were being collected about EMS outages and challenges. Industry also recognized that many EMS outages were significantly less than the 2b categorization yet impacted the decision-making activities for which the EMS is used. The 1h event category was created to learn more about these type of events. This category allows the EMSTF to collect a greater number of the occurrences of EMS partial outages and share this information with the industry.

From the event analysis reports and the work of the EAS, NERC published four lessons learned specifically about EMS outages and worked to build and support an industry-led EMS task force to support the EAS, under the NERC OC. The hard work and active sharing of this task force has reduced some of the residual risk associated with the potential loss of situation awareness and monitoring capability associated with this type of event and will continue to provide valuable information to the industry.

With the support of the EMSTF, NERC hosted its first Monitoring and Situational Awareness Conference Focused on Improving Energy Management Systems (EMS) reliability in Denver, September 18–19, 2013. The conference was scheduled to coincide with the NERC OC/PC/CIPC meetings. The conference brought together more than 90 operations and EMS experts from more than 55 registered entities, and a variety of vendors and consultants. The entities that attended came from all of the Regions.

The first day of the conference focused on the analysis of EMS outages and response strategies for alleviating the risk involved when EMS functionality is degraded or completely lost. The feedback from participants has been extremely positive. Attendees liked the technical nature of the presentations and the takeaways they could use to improve the processes and procedures at their own companies. Attendees greatly appreciated the openness with which the EMS shared their issues and corrective actions. Also appreciated was the platform that NERC provided to transparently share the events and learn from them. Industry requested a second workshop for 2014.

SCADA and real-time reliability tools are vital for maintaining situational awareness and making operating decisions at both the individual and the organizational level. EMS systems are typically extremely reliable and redundant; however, an outage of the EMS system increases the risk to the reliability of the BPS. Industry has demonstrated appropriate responses to EMS outages, and the ERO can now more accurately assess the residual risk to the BPS from EMS outages.

The full conference presentations for the past Monitoring and Situation Awareness conference can be found at http://www.nerc.com/pa/rrm/Resources/Pages/Conferences-and-Workshops.aspx.

Summary

The Event Analysis Program continues to provide valuable information for the industry to use to address potential threats or vulnerabilities to the reliability of the BPS. This continued active collaboration remains a testament to how much effort and how many resources are being expended in this area by the industry, as well as how important it is for the ERO and industry to truly understand the different contributors to events. The continued cooperation and collaboration with the industry is the hallmark to this program's success.

The ability to identify specific pieces of equipment that are potential threats, as well as emerging trends that increase risk to the system, illustrates the value of the event analysis program. These outcomes, coupled with the ability to actively share the information through lessons learned, webinars, technical conferences, and related venues, remain critical to the sustainment of high reliability.

Chapter 6 – Spare Equipment Database Initiative (2014)

Background

In June 2010, NERC issued a report titled *High-Impact, Low-Frequency Event Risk to the North American Bulk Power System*.[87] In a postulated high-impact low-frequency (HILF) event, such as a coordinated physical or cyber attack or a severe geomagnetic disturbance (GMD), long-lead-time electric transmission system equipment may be damaged. This could adversely impact system reliability.

Following a HILF event, increased intercompany coordination will help maximize the use of available spares in restoring the grid, thereby increasing the resiliency of the system. This chapter discusses a framework to facilitate that coordination.

Purpose

The purpose of the Spare Equipment Database Working Group (SEDWG) is to recommend a uniform approach to collecting information on long-lead-time electric transmission system equipment and develop a process for utilities to request assistance from other utilities.[88] Data collection is contained in the Spare Equipment Database (SED). The intent of the database is not to replace or supersede other existing transformer-sharing agreements. Rather, the intent is to facilitate timely communication of available equipment following a HILF event.

Spare Equipment Database

SEDWG reviewed various types of long-lead-time equipment, where "long lead time" is defined as six months or more. Following the review, it was determined that the initial focus should be large power transformers and generator step-up (GSU) transformers. In addition to long lead times, large power transformers also require substantial capital to secure. For these reasons, owners typically maintain an appropriate limited number of spares in the event of a failure. It may be beneficial in the future to expand SED to include other types of long-lead-time equipment.

2013 and 2014 Activities

In 2013, the primary focus of SEDWG was to increase participation. To that end, SEDWG worked with NERC to host a webinar to explain the program to registered entities and to solicit new participants. In addition, presentations were made at a variety of industry forums, including the NERC PC, MRO and RF regional meetings, and the American Public Power Association. The SEDWG also initiated development of a metric. In 2014, SEDWG will continue to increase SED awareness and participation and will complete the development and proposal for the metric.

Confidentiality of SED Process

Confidentiality has been and continues to be an important aspect of the SED. Participating organizations voluntarily identify and report spare equipment that meets predefined criteria in the database. The data collected provides essential information to enable automated queries of available equipment. In addition, equipment owner information is required to facilitate communication following a HILF event.

To maintain confidentiality of the information, SED utilizes a double-blind approach to preserve the anonymity of the registered SED participants, the requestor and the owner of the equipment.

---

[87] *High Impact, Low Frequency Event Risk to the North American Bulk Power System*, June 2010, http://www.nerc.com/pa/ci/resources/documents/hilf_report.pdf

[88] This task force will support the Electricity Sub-sector Coordinating Council's Critical Infrastructure Protection Roadmap, work plan items: 1) G - Critical Spares, and 2) P- GMD – Restore the Bulk Power System.

To initiate the search, the requestor completes an online form in SED and the program conducts a search. Upon completion, the requestor and NERC administrator are notified of the success of the search. From there, the SED program initiates a double-blind search-response procedure. SED generates messages to each unnamed TO identified by the search without disclosing what equipment is needed, how many pieces of equipment are requested, or the name of the requestor.

Owners who wish to proceed with discussing a sale/lease/exchange can use the double-blind search process to respond to the unnamed requestor to open an active discussion. Any decision to provide additional information is the responsibility of the owners. The NERC SED administrator is informed of all communications conducted via the SED link. The requestor and owner may then work toward a settlement acceptable to both parties.

A complete description of the SED search process and a special report on the SED can be found on NERC's website.[89]

Appendix A – Statistical Analysis for Chapter 3

Study Method

Defining BPS Impact from Transmission Risk

To define the impact, or severity, of each TADS event, the SRI quantitatively compares events. The TADS outage data is used to populate the statistical analysis study. For this analysis, the transmission outage impact component of the SRI quantifies BPS impacts. Since transmission outages are a significant contributor to the overall SRI, this chapter focuses on categorizing the individual TADS events based on TADS outage ICCs.

The SRI presented in Chapter 2 consists of several weighted risk impact components: generation, transmission, and load loss.[90] The transmission outage impact component of the SRI is defined as $w_T \times N_T$ where w_T is a weighting factor of 30 percent and N_T is the severity impact of a given day's transmission outages on the BPS based on TADS outages.

In this appendix and in Chapter 3, Equation A.1 is used to calculate the transmission severity component of a TADS event. The severity of a transmission outage is calculated based on its assumed contribution of power flow through transmission circuits. The average power flow MVA values, or equivalent MVA values used in Equation A.1, are shown in Table A.1. These equivalent MVA values are also applied to the denominator of the transmission severity equation to normalize the function. The TADS event severity is then analyzed by ICC to investigate relative information between the ICCs instead of being added to generation and load-loss components to calculate a daily SRI as used in Chapter 2.

For normalization, the total number of transmission circuits from the same year as the event is multiplied by each voltage class's equivalent MVA rating. For example, if an outage occurred in 2009, the normalization would use the total number of transmission circuits in 2009. This allows comparison of TADS events across years while taking into account the changing number of circuits within the BPS.

$$Transmission\ Severity_{Trans} = \frac{\sum_{Voltage\ Class}(MVA_{avg} \times AC\ Circuits\ Outages)}{\sum_{Voltage\ Class}(MVA_{avg} \times Total\ AC\ Circuits)}$$

Equation A.1

Table A.1: Transmission Severity Equivalent MVA Values

Voltage Class	Equivalent MVA Value
200–299 kV	700
300–399 kV	1300
400–599 kV	2000
600–799 kV	3000

[90] http://www.nerc.com/docs/pc/rmwg/pas/index_team/sri_equation_refinement_may6_2011.pdf, pp. 2-3.

Determining Initiating Causes and Probability

TADS events are categorized by ICCs.[91] These ICCs facilitate the study of cause-effect relationships between each event's ICC and event severity. The procedure illustrated in Figure A.1 is used to determine a TADS event's ICC. The procedure that defines ICCs for a TADS event allows ICC assignment to a majority of transmission outage events recorded in TADS. There are 18,754 events with ICCs assigned, comprising 99.4 percent of the total number of TADS events for the years 2008–2013. These events reflect 98.8 percent of the total calculated transmission severity of the database. Table A.2 provides the corresponding available event data by year.

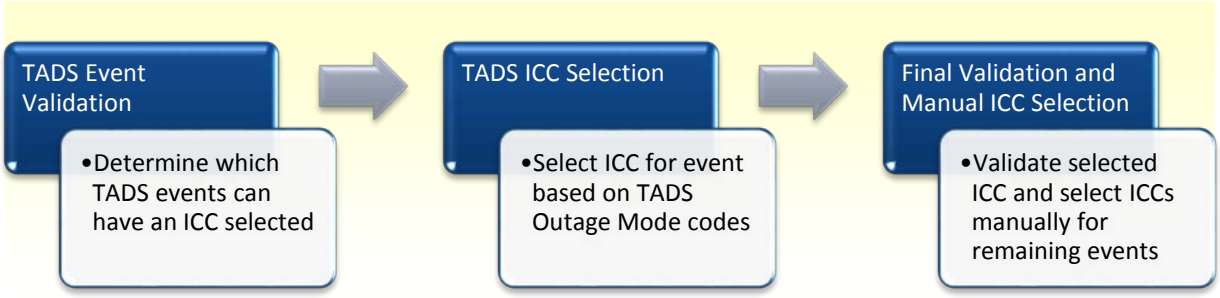

Figure A.1 TADS Event Initiating Cause Code Selection Procedure

Table A.2: TADS Outage Events Summary (2009–2013)

Summary	2009	2010	2011	2012	2013	2009-2013
Number of TADS events	3,705	3,917	3,934	3,753	3,557	18,866
Number of events with ICC assigned	3,684	3,895	3,894	3,724	3,557	18,754
Percentage of events with ICC assigned	99.4%	99.4%	99.0%	99.2%	100.0%	99.4%
Transmission severity all TADS events	643.8	675.8	665.7	612.4	506.0	3,103.7
Transmission severity of events with ICC assigned	636.8	667.5	654.6	602.1	506.0	3,066.9
Percentage of Transmission severity of events with ICC assigned	98.9%	98.8%	98.3%	98.3%	100.0%	98.8%

For TADS events initiated by a common cause, the probability[92] of observing that the event initiates during a given hour is estimated using the corresponding event occurrences reported in TADS. Namely, the probability of the occurrence of the event is the total number of a given type of event during the study period divided by the total number of hours in the same period. Therefore, the sum of the estimated probabilities for all events is equal to the estimated probability of any event during a given hour. With the development of the transmission severity measure and TADS event ICCs, it is possible to statistically analyze the most recent five years of TADS data (2009–2013). The analysis shows which ICCs result in the highest transmission severity and finds statistically significant changes in transmission severity by ICC over time.

[91] For detailed definitions of TADS cause codes, please refer to: http://www.nerc.com/pa/RAPA/tads/Transmission Availability Data System Working Group/TADS Definitions (Appendix 7).pdf, January 14, 2013, pp. 19-20.

[92] Probability is estimated using event occurrence frequency of each ICC type without taking into account the event duration.

Determining Relative Risk

Each study followed a similar approach, as shown in Figure A.2. Each study was performed to determine the correlation between each ICC and transmission severity, and whether a statistically significant confidence level was 95 percent or higher. Then, sample distributions were studied to determine any statistically significant pair-wise differences in expected transmission severity between ICCs, including a time trend analysis where applicable. Finally, the relative risk was calculated for each ICC group.

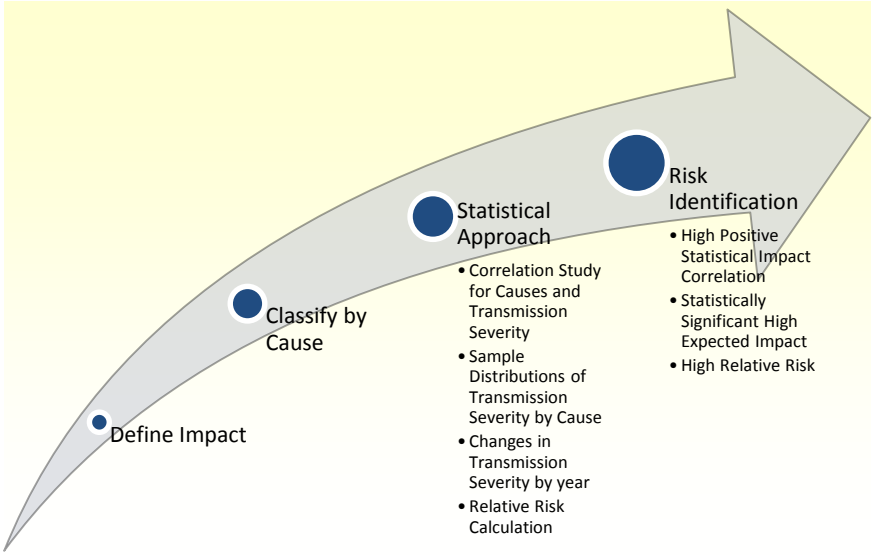

Figure A.2: Risk Identification Method

To study the relationship between ICCs and the transmission severity of TADS events, NERC investigated the statistical significance of the correlation between transmission severity and the indicator function[93] of a given ICC.[94] The test is able to determine a statistically significant positive or negative correlation between ICC and transmission severity.

Distributions of transmission severity for the entire dataset were examined separately for events with a given ICC. A series of t-tests[95] were performed to compare the expected transmission severity of a given ICC with the expected severity of the rest of the events at significance level of 0.05. Then, the Fisher's Least Square[96] difference method was applied to determine statistically significant[97] differences in the expected transmission severity for all pairs of ICCs.

Where applicable, a time trend analysis was performed. Statistically significant differences in the expected transmission severity for each ICC group were analyzed for each year of data. This showed if the average transmission severity for a given ICC group had changed over time.

[93] The indicator function of a given ICC assigns value 1 to an event with this ICC and value 0 to the rest of the events.

[94] For each ICC, a null statistical hypothesis on zero correlation at significance level 0.05 was tested. If the test resulted in rejection of the hypothesis, it is concluded that a statistically significant positive or negative correlation between an ICC and transmission severity exists; the failure to reject the null hypothesis indicates no significant correlation between ICC and transmission severity.

[95] For t-test, see D. C. Montgomery and G. C. Runger, Applied Statistics and Probability for Engineers. Fifth Edition. 2011. John Wiley & Sons. Pp. 361-369.

[96] For Fisher's Least Significance Difference (LSD) method or test, see D. C. Montgomery and G. C. Runger, Applied Statistics and Probability for Engineers. Fifth Edition. 2011. John Wiley & Sons. Pp. 524-526.

[97] At significance level of 0.05.

Finally, relative risk was calculated for each ICC group. The impact of an outage event was defined as the expected transmission severity associated with a particular ICC group. The probability that an event from a given group initiates during a given hour is estimated from the frequency of the events of each type without taking into account the event duration. The risk per hour of a given ICC was calculated as the product of the probability per hour and the expected severity (impact) of an event from this group. The relative risk was then defined as the percentage of the risk associated with each ICC out of the total (combined for all ICC events) risk per hour.

Table A.3 lists annual counts and hourly event probability of TADS events by ICC.[98] The three ICCs with the largest number of events are weather (with and without lightning), Unknown, and a group defined as Reliability Metrics (composed of ICCs of Human Error, Failed AC Circuit Equipment, Failed AC Substation Equipment, and Failed Protection System Equipment). The four ICCs grouped as Reliability Metrics are related to ALR6-12, ALR6-14, ALR6-13 and ALR6-11 and are combined in one section of the table. Metrics are provided for each of the ICCs in the group, as well as for the group as a whole.

Almost all TADS ICC groups have sufficient data available to be used in a statistical analysis. Only four ICCs (Vegetation; Vandalism, Terrorism, or Malicious Acts; Environmental; and Failed AC/DC Terminal Equipment) do not have enough observations. These are combined into a new group, named "Combined Smaller ICC Groups," that can be statistically compared to every other group and also studied with respect to annual changes of transmission severity.

Table A.3: TADS Events and Hourly Event Probability by ICC

Initiating Cause Code	2009	2010	2011	2012	2013	2009–2013	Event Probability/Hour
Reliability Metrics	**1043**	**1054**	**1120**	**1042**	**908**	**5167**	**0.1179**
Human Error	291	305	291	307	280	1474	**0.0336**

All with ICC assigned	**3684**	**3895**	**3894**	**3724**	**3557**	**18754**	**0.4279**

[98] For detailed definitions of TADS cause codes, please refer to: http://www.nerc.com/pa/RAPA/tads/Transmission Availability Data System Working Grou/TADS Definitions (Appendix 7).pdf, January 14, 2013, pp. 19-20.

Correlation between ICC and Transmission Severity

Figure A.3 shows the correlations between calculated transmission severity and the given ICC. To study a relationship between ICC and transmission severity of TADS events, the statistical significance of the correlation between transmission severity and the indicator function[99] of a given ICC was investigated.[100] A statistically significant positive or negative correlation between ICC and transmission severity could be determined by the test. A statistically significant positive correlation of ICC to transmission outage severity would indicate a greater likelihood that an event with this ICC would result in a higher transmission outage severity. A stark negative correlation would indicate the contrary; in this case, a lower transmission outage severity would be likely. If no significant correlation is found, it indicates the absence of a linear relationship between ICC and the transmission outage severity, and that the events with this ICC have an expected transmission severity similar to all other events from the database.

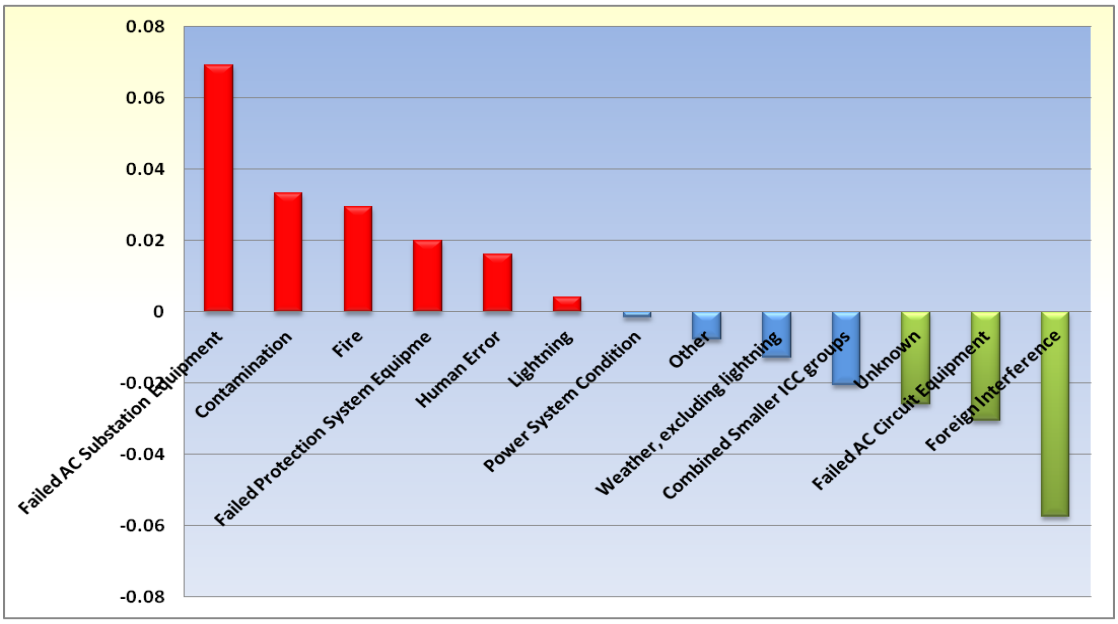

Figure A.3: Correlation between Augmented ICC and TS of TADS Events (2012–2013)

There were three key outcomes of all the tests. To begin, Failed AC Substation Equipment, Contamination, Fire, Reliability Metrics, Human Error, and Failed Protection System Equipment have statistically significant positive correlation with transmission severity. The expected severity of events with each of these ICCs is greater than the expected severity compared to other ICC events. Secondly, Foreign Interference, Failed AC Circuit Equipment, Smaller ICC Groups Combined, Unknown, and Weather Excluding Lightning have a statistically significant negative correlation with transmission severity. The expected severity of events initiated by these causes is smaller than the expected transmission severity of the remaining dataset. Finally, for each of the remaining groups (Power System Condition, Lighting, Other), the difference between transmission severity for the group and for its complement is not statistically significant.

Distribution of Transmission Severity by ICC

Next, the distribution of transmission severity for the entire dataset was studied separately for events with a given ICC. The transmission severity of the 2009–2013 dataset has a sample mean of 0.165 and the sample standard deviation of 0.108. The sample statistics for transmission severity by ICC are listed in Table A.4.

[99] The indicator function of a given ICC assigns value 1 to an event with this ICC and value 0 to the rest of the events.

[100] For each ICC, a null statistical hypothesis on zero correlation at significance level 0.05 was tested. If the test resulted in rejection of the hypothesis, it is concluded that a statistically significant positive or negative correlation between an ICC and transmission severity exists; the failure to reject the null hypothesis indicates no significant correlation between ICC and transmission severity.

The groups of events initiated by Failed AC Substation Equipment, Fire, and Failed Protection System Equipment not only have statistically[101] greater expected severity than the rest of the events, but the variance of transmission severity (and its standard deviation) for each of these groups is also statistically greater than the variance for the other events. The greater variance is an additional risk factor since it indicates more frequent occurrences of events with high transmission severity.

Table A.4 provides a column that indicates which other ICCs are statistically smaller than a given ICC referenced by the table's column 1 index. For example, transmission severity for Human Error (#5) is significantly smaller than for Failed AC Substation Equipment (#1), while Fire (#2) is not statistically significantly smaller than Failed AC Substation Equipment.

Table A.4: Distribution of Transmission Severity by ICC (2009–2013)

#	Initiating Cause Code	Average TS of Events with the ICC	Is Expected TS Statistically Significantly Bigger than for the Rest of the Events with ICC Assigned?	ICC with Statistically Significantly Smaller TS	Standard Deviation of TS
1	Failed AC Substation Equipment	0.191	Yes	3,4,5,6,7,8,9,10,11,12,13	0.135
2	Fire	0.183	Yes	5,6,7,8,9,10,11,12,13	0.131
3	Contamination	0.182	Yes	5,6,7,8,9,10,11,12,13	0.107
4	Failed Protection System Equipment	0.172	Yes	8,9,10,11,12,13	0.123
5	Human Error	0.169	Yes	8,10,11,12,13	0.102
6	Lightning	0.164	No	10,11,12,13	0.095
	All TADS events	**0.165**	**N/A**	**N/A**	**0.108**
	All with ICC assigned	**0.164**	**N/A**	**N/A**	**0.106**
7	Power System Condition	0.163	No	12,13	0.185
8	Weather Excluding Lightning	0.160	No	11,12,13	0.095
9	Other	0.158	No	13	0.216
1	Unknown	0.158	No	11,12,13	0.078
1	Failed AC Circuit Equipment	0.152	No	13	0.086
1	Combined Smaller ICC groups	0.144	No	none	0.132
1	Foreign Interference	0.136	No	none	0.065

[101] At significance level 0.05

Average Transmission Severity by ICC: Annual Changes

Year-over-year changes in calculated transmission severity by ICC were reviewed next. Figure A.4 shows changes in the average severity for each ICC and for the 2009–2013 dataset. The groups of ICC events are listed from left to right by descending average transmission severity for the five-year data. The largest average transmission severity over the five-year period was observed for events initiated by Failed AC Substation Equipment; the single-highest annual average transmission severity is observed for 2010 events initiated by Fire. NERC's investigation revealed that two wildfires[102] initiated the most severe events in this category.

It should be noted that for all ICC groups except Power System Condition, Combined Smaller ICC Groups, and Foreign Interference, the 2013 average transmission severity reduced compared with 2012; and for all groups except Power System Condition, it stayed below the five-year average transmission severity of the group.

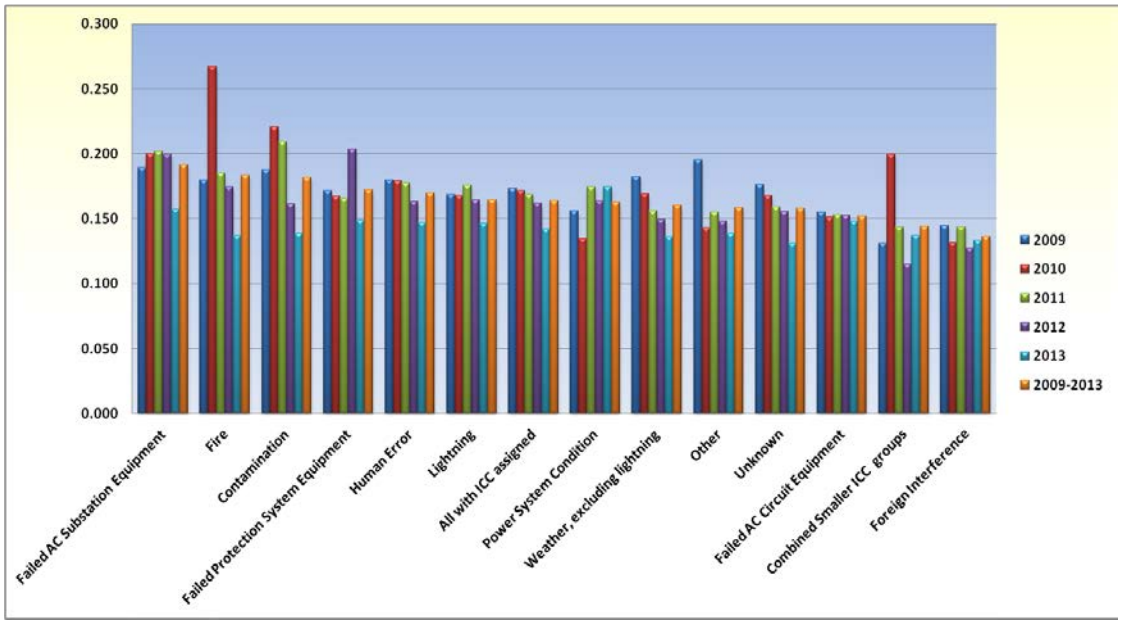

Figure A.4: Average Transmission Severity of TADS Events by ICC (2009–2013)

The following series of graphs shows changes in the average transmission severity by year for four groups of ICCs. For each group, the graph is accompanid by a list of statistically significant[103] changes (decreases and increases).

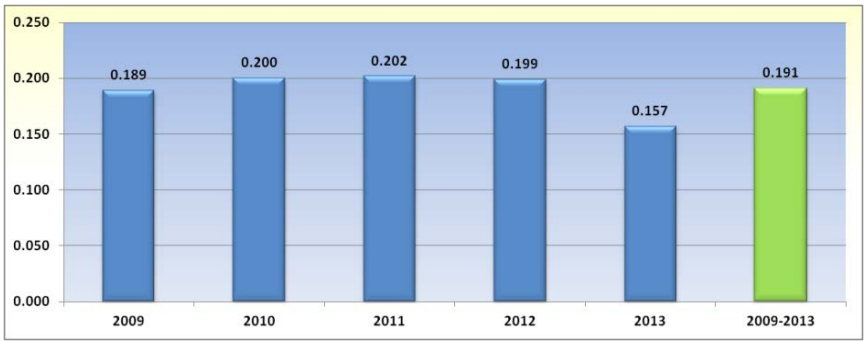

Figure A.5: Average Transmission Severity of Events Initiated by Failed AC Substation Equipment (2009–2013)

- Statistically significant year-over-year increases
  - none
- Statistically significant year-over-year decreases
  - 2009 vs. 2013
  - 2010 vs. 2013
  - 2011 vs. 2013
  - 2012 vs. 2013

[102] Québec wildfires June 22-23, 2010, and Sequoia National Forest fire in California, July 29-30, 2010

[103] This summary only lists changes that are statistically significant at the 0.05 level.

  - 2011 vs. 2012
  - 2011 vs. 2013
  - 2012 vs. 2013

Total (Combined) Transmission Severity by ICC: Annual Changes

Total annual transmission severity associated with each ICC by year (the sum of the transmission severity of all events from the group) is listed in Table A.5.

Table A.5: Annual Transmission Severity by ICC (2009–2013)

Group of TADS events	2009	2010	2011	2012	2013
Reliability Metrics	**181.7**	**183.2**	**195.4**	**185.1**	**136.1**
Human Error	52.3	54.7	51.5	50.0	41.2
Failed AC Circuit Equipment	39.8	41.8	46.8	39.7	36.8
Failed AC Substation Equipment	50.4	47.6	58.3	49.3	30.2
Failed Protection System Equipment	39.3	39.1	38.7	46.0	28.0
Lightning	132.7	124.4	144.5	139.8	119.1
Unknown	118.4	137.9	124.2	110.2	93.4
Weather Excluding Lightning	97.2	113.6	83.9	66.6	59.3
Foreign Interference	28.8	22.7	24.4	21.6	24.1
Contamination	18.0	32.0	27.6	25.8	21.0
Power System Condition	17.4	10.0	21.1	12.6	19.0
Fire	16.5	22.4	11.7	18.5	17.8
Other	20.9	12.0	14.1	15.4	8.9
Combined Smaller ICC Groups	**5.1**	**9.2**	**7.8**	**6.5**	**7.3**
All TADS Events	**643.8**	**675.8**	**665.7**	**612.4**	**506.0**
All with ICC Assigned	**636.8**	**667.5**	**654.6**	**602.1**	**506.0**

Figure A.10 shows changes in the total transmission severity of TADS events by year.

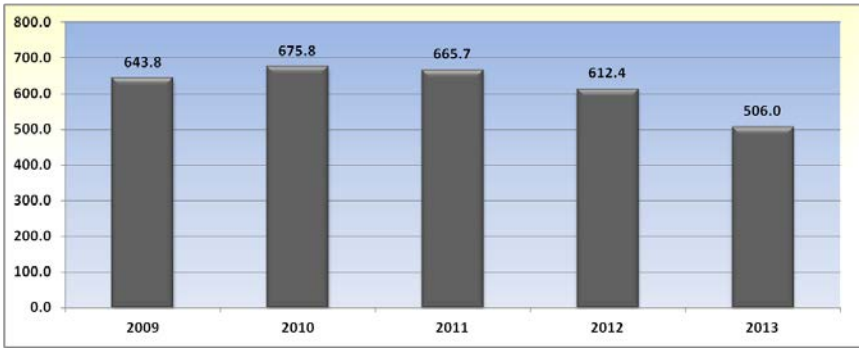

Figure A.10: Total Transmission Severity of TADS Events (2009–2013)

- Statistically significant year-over-year increases
  - none
- Statistically significant year-over-year decreases
  - 2010 vs. 2012
  - 2010 vs. 2013
  - 2011 vs. 2012
  - 2011 vs. 2013
  - 2012 vs. 2013

In particular, changes in the total transmission severity of events with a common ICC related to one of the ALR metrics are shown in Figure A.11.

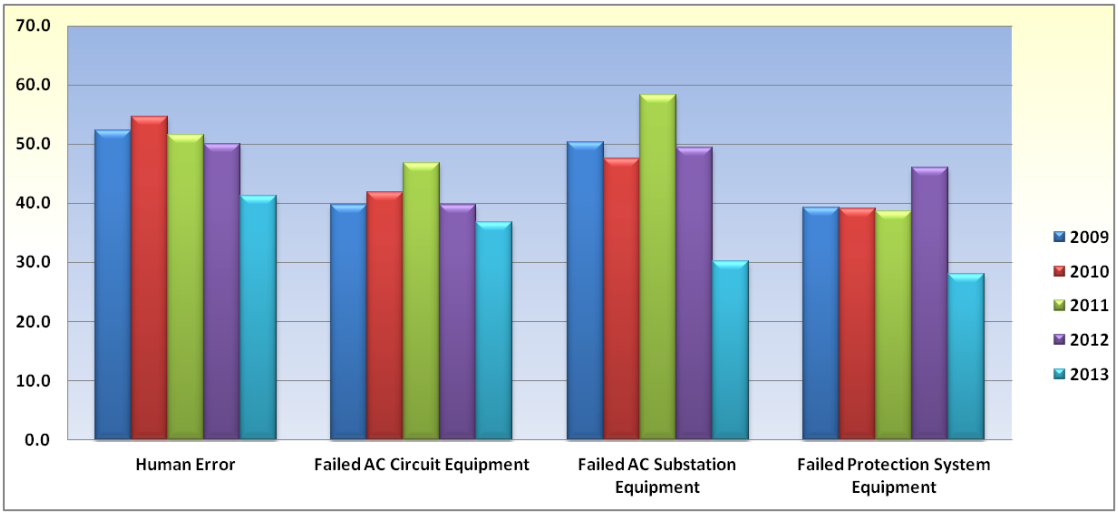

Figure A.11: Total Transmission Severity by Year

There were several statistically significant increases and decreases over time for ICCs related to Adequate Level of Reliability (ALR) metrics, as summarized below. For the annual total transmission severity of TADS events initiated by Human Error, there were:

- no statistically significant increases;
- statistically significant year-over-year decreases:
  - 2009 vs. 2013
  - 2010 vs. 2012
  - 2010 vs. 2013
  - 2011 vs. 2013

For the annual total transmission severity of TADS events initiated by Failed AC Circuit Equipment, there were:

- no statistically significant changes

For the annual total transmission severity of TADS events initiated by Failed AC Substation Equipment, there were:

- no statistically significant increases;
- statistically significant year-over-year decreases:
  - 2009 vs. 2013
  - 2010 vs. 2013
  - 2011 vs. 2013
  - 2012 vs. 2013

For the annual total transmission severity of TADS events initiated by Failed Protection System Equipment, there were:

- statistically significant year-over-year increases:
  - 2009 vs. 2012

- 2011 vs. 2012

- statistically significant year-over-year decreases:
  - 2012 vs. 2013.

Thus, all groups of TADS events from Reliability Metrics had a reduction in their total transmission severity in 2013 as compared with any other year from 2009 to 2012; moreover, many of these reductions were statistically significant.

Transmission Severity Risk and Relative Risk of TADS Events by ICC

The risk of each ICC group can be defined as the total transmission severity associated with this group; its relative risk is equal to the percentage of the group transmission severity in the 2009–2013 database. Equivalently, the risk of a given ICC per hour can be defined as the product of the probability that an event with this ICC initiates during an hour and the expected severity (impact) of an event from this group. For any ICC group, the relative risk per hour is the same as the relative risk for five years (or any other time period). Figure A.12 shows year-over-year changes in the relative risk of TADS events by ICC.

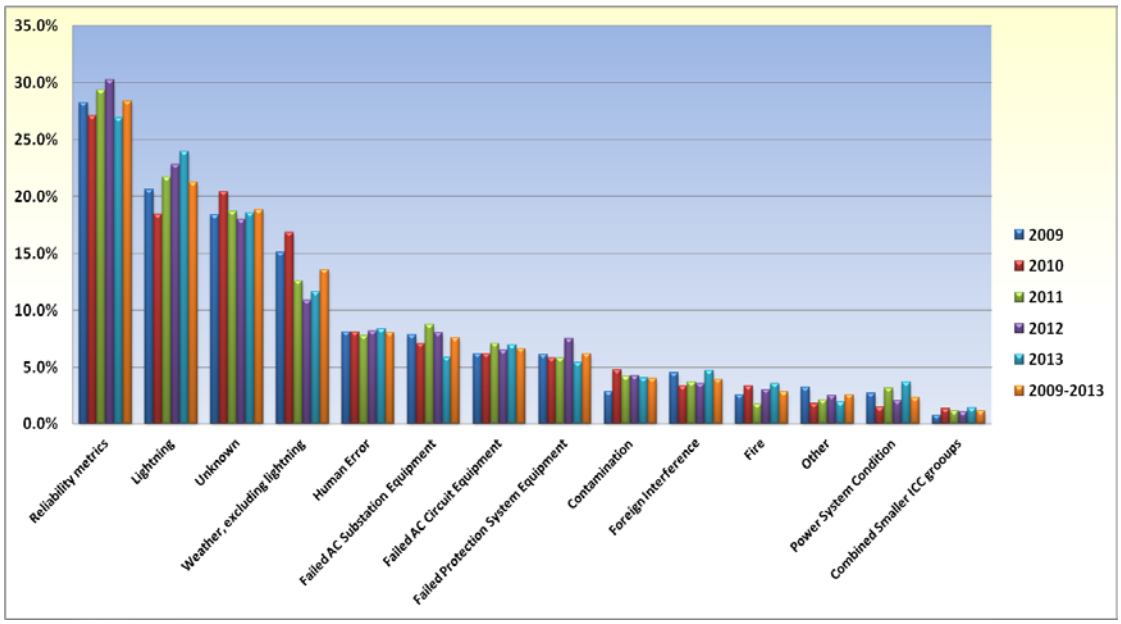

Figure A.12: Relative Transmission Severity Risk by ICC and Year

2012–2013 Study with Augmented Event Types

TOs provided transmission performance information using the NERC TADS process. The data used in these studies includes momentary and sustained automatic outages of ac transmission circuits (overhead and underground) that operate at voltages greater than or equal to 200 kV.

TADS event-type reporting was modified in 2012 to further distinguish normal clearing events from abnormal clearing events. To introduce the additional data into this study where this level of detail is not available for prior years, TADS events with protection system misoperations—event types 61 dependability[104] (failure to operate)

[104] Event Type 61 Dependability (failure to operate): one or more automatic outages with delayed fault clearing due to failure of a single protection system (primary or secondary backup) under either of these conditions:
- Failure to initiate the isolation of a faulted power system Element as designed, or within its designed operating time, or
- In the absence of a fault, failure to operate as intended within its designed operating time.

and 62 security[105] (unintended operation)—are included with ICCs as shown in Table A.6. The new ICCs developed are analogous to protection system misoperations, which are comprised of Failed Protection System Equipment (FPSE) and Human Error with event type 61 or 62 (HE and Type 61/62). Aggregate totals of 2012–2013 TADS events by augmented ICC are provided in Table A.6. Events initiated by Misoperations comprise 8.2 percent of all events and represent the fourth-largest group of events (after weather-related and Unknown ICCs.)

Table A.6: TADS Outage Events by Augmented ICC (2012-2013)

Initiating Cause Code	2012	2013	2012-2013
Lightning	852	813	1665
Unknown	710	712	1422
Weather Excluding Lightning	446	433	879
Misoperation: FPSE OR (HE AND Type 61/62)	321	281	602
Failed AC Circuit Equipment	261	248	509
Failed AC Substation Equipment	248	191	439
Human Error AND NOT(Type 61 OR Type 62)	212	191	403
Foreign Interference	170	181	351
Contamination	160	151	311
Fire	106	130	236
Power System Condition	77	109	186
Other	104	64	168
Vegetation	43	36	79
Vandalism, Terrorism, or Malicious Acts	10	9	19
Environmental	4	8	12
All with ICC assigned	**3724**	**3557**	**7281**
In TADS	**3753**	**3557**	**7310**

Human Error ICCs with event type 61 or 62 correspond to two misoperation causes:[106] incorrect setting/logic/design error or as-left personnel error. These ICCs also include Human Error events that occur during maintenance and testing activities that would not traditionally be classified as a misoperation. Historically, Human Error events during maintenance and testing that results in protection system activation have contributed to large disturbance events. Therefore, these events were included to capture this risk. After reclassifying 184 events that were initially identified as Human Performance but were reclassified as Misoperations, Human Error now accounts for 5.5 percent of all 2012–2013 TADS events.

[105] Event Type 62 Security (unintended operation): one or more automatic outages caused by improper operation (e.g., overtrip) of a protection system resulting in isolating one or more TADS elements it is not intended to isolate, either during a fault or in the absence of a fault.

[106] http://www.nerc.com/comm/PC/Performance%20Analysis%20Subcommittee%20PAS%20DL/Protection_System_Misoperation_Reporting_Template_Final.xlsx, January 16, 2013.

Figure A.13 shows the correlation between calculated transmission severity and each ICC. A red bar in Figure A.13 corresponds to an ICC that has a statistically significant positive correlation with transmission severity, a green bar corresponds to an ICC that has a statistically significant negative correlation, and a blue bar corresponds to an ICC that has a correlation that is not statistically significant. A statistically significant positive correlation of an ICC with a transmission outage severity would indicate a higher likelihood that an event with that ICC will result in a higher transmission outage severity. A statistically significant negative correlation indicates the contrary; in this case, a lower transmission outage severity would be likely. If a correlation is not statistically significant, this implies that a positive or negative correlation was very likely observed by a mere chance, and there is, in fact, no relationship between ICC and the transmission outage severity. The events with this ICC have an expected transmission severity similar to all other events from the database.

Failed AC Substation Equipment and Misoperations had the largest and most statistically significant positive correlation with 2012–2013 automatic transmission outage severity. In other words, TADS events initiated by these two causes tended to have higher transmission severity than other TADS events that occurred in 2012 and 2013.

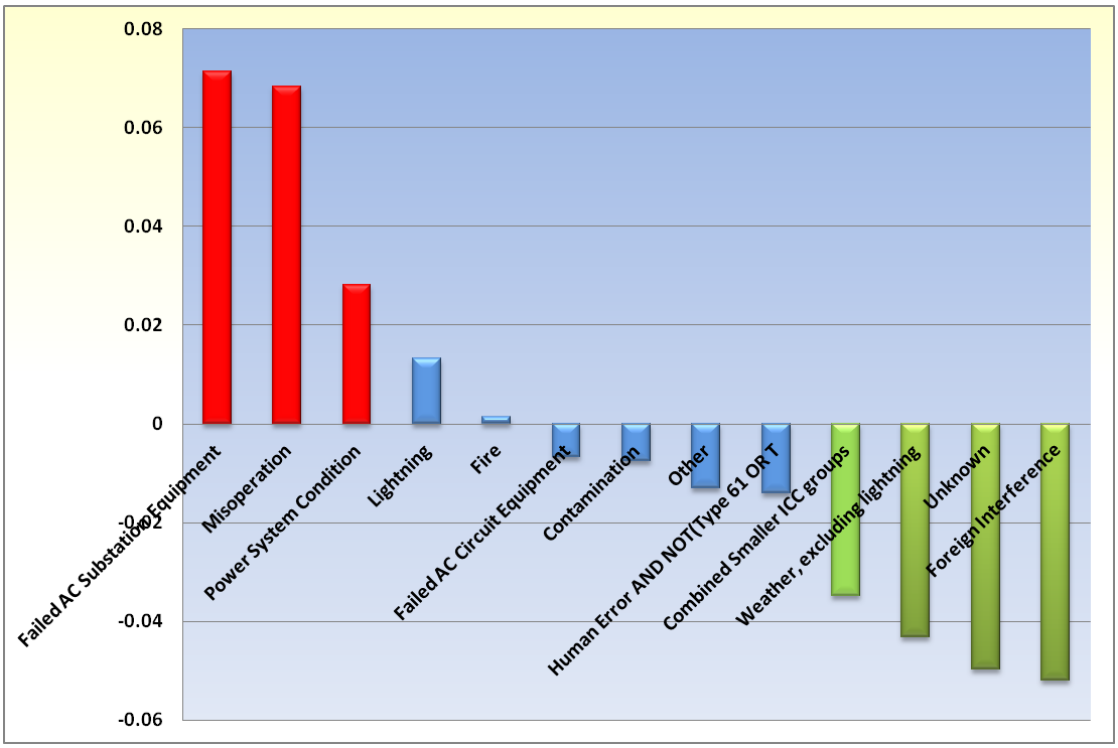

Figure A.13: Correlation between Augmented ICC and TS of TADS Events (2012–2013)

Relative risk of the 2012–2013 TADS events by augmented ICC is listed in Table A.7. The probability that an event from a given group initiated during a given hour is estimated from the frequency of the events of each type without taking into account the event duration. Excluding weather-related and Unknown events, events initiated by Misoperations and by Failed AC Substation Equipment had the largest shares in the total transmission severity and contributed 9.4 and 7.1 percent, respectively, to transmission severity relative risk.

Table A.7: Relative Risk by Augmented ICC (2012–2013)

Group of TADS events	Probability that an Event from a Group Starts during a Given Hour	Expected Impact (Expected Transmission Severity of an Event)	Risk Associated with a Group Per Hour	Relative Risk by Group (%)
Lightning	0.095	0.155	0.015	**23.1**
Unknown	0.081	0.143	0.012	**18.2**
Weather Excluding Lightning	0.050	0.143	0.007	**11.2**
Misoperation	0.034	0.175	0.006	**9.4**
Failed AC Substation Equipment	0.025	0.180	0.005	**7.1**
Failed AC Circuit Equipment	0.029	0.151	0.004	**6.9**
Human Error AND NOT(Type 61 OR Type 62)	0.023	0.150	0.003	**5.4**
Contamination	0.018	0.149	0.003	**4.2**
Foreign Interference	0.020	0.130	0.003	**4.1**
Fire	0.013	0.154	0.002	**3.2**
Power System Condition	0.011	0.170	0.002	**2.8**
Other	0.010	0.145	0.001	**2.2**
Combined Smaller ICC groups	**0.006**	**0.126**	**0.001**	**1.2**
All TADS events	**0.417**	**0.153**	**0.064**	**100.0**
All with ICC assigned	**0.415**	**0.152**	**0.063**	**99.1**

Since additional outage detail is available for two years, annual changes in transmission severity of the events initiated by Misoperations can now be studied. The analysis is provided in Table A.8. Statistical tests led to the conclusion that both the average transmission severity of these events and their total transmission severity statistically significantly decreased in 2013 versus 2012.

Table A.8: Relative Risk by Augmented ICC (2012–2013)

TADS events initiated by Misoperations	2012	2013
Average TS of an event	0.198	0.149
Total TS of the group	63.6	41.8

CDM Events: Definitions and Breakdown by ICC

As part of the analysis, a breakdown of ICCs was performed for TADS events containing Common- or Dependent-Mode (CDM) outages. These TADS events have more transmission severity than TADS events with a Single-Mode outage. TADS events were separated into two types: Single-Mode events and CDM events. A Single-Mode event is defined as a TADS event with a single-element outage. A CDM TADS event is a TADS event in which all outages have one of the modes (other than Single Mode) in Table A.9.

Table A.9: Outage Mode Codes

Outage Mode Code	Automatic Outage Description
Single Mode	A single-element outage that occurs independently of another automatic outage
Dependent Mode Initiating	A single-element outage that initiates at least one subsequent element automatic outage
Dependent Mode	An automatic outage of an element that occurred as a result of an initiating outage, whether the initiating outage was an element outage or a non-element outage
Common Mode	One of at least two automatic outages with the same ICC where the outages are not consequences of each other and occur nearly simultaneously
Common Mode Initiating	A common-mode outage that initiates one or more subsequent automatic outages

Some TADS events were entered as a combination of Single-Mode outages and other outage modes. These events were manually examined to determine if the event was Single-Mode or CDM. For some events, it was not possible to determine whether the event was Single-Mode or CDM, nor was it possible to tell the ICC for the event. These events, approximately 0.4 percent of all TADS events, were removed from the study.

Table A.10 lists CDM events by ICC in the 2009–2013 database and their percentages with respect to all TADS events with a given ICC. Similar to all TADS events, Lightning initiated the largest number of CDM events. CDM events initiated by Failed AC Substation Equipment comprise the second largest group, followed by Weather Excluding Lightning, and Human Error. Overall, 3,227 CDM events were defined, representing 17.1 percent of all TADS events from 2009 to 2013. Out of these, 3,136 are assigned to one of the 17 ICCs.

Almost all ICC groups of CDM events for five years have a sufficient sample size to be used in a statistical analysis, but the sample size is not enough to track statistically significant year-over-year changes in transmission severity. Four ICCs (Vegetation; Vandalism, Terrorism, or Malicious Acts; Environmental, and Failed AC/DC Terminal Equipment) must be combined to comprise a new group, Combined Smaller ICC Groups, that can be statistically compared to every other group.

Table A.10: CDM Events and Hourly Event Probability by ICC (2009–2013)

Initiating Cause Code	ALL TADS events	CDM events	CDM as % of ALL	Event Probability/Hour
Reliability Metrics	**5167**	**1249**	**24.2**	**0.0285**
Failed AC Substation Equipment	1233	444	36.0	0.0101
Failed Protection System Equipment	1111	296	26.6	0.0068
Human Error	1474	324	22.0	0.0074
Failed AC Circuit Equipment	1349	185	13.7	0.0042
Lightning	4018	559	13.9	0.0128
Weather Excluding Lightning	2626	334	12.7	0.0076

All In TADS	**18866**	**3227**	**17.1**	**0.0736**
All with ICC assigned	**18754**	**3136**	**16.7**	**0.0716**

CDM Events: Correlation between ICC and Transmission Severity

To study a relationship between ICC and transmission severity of TADS events, the statistical significance of the correlation between transmission severity and the indicator function[107] of a given ICC was investigated.[108] A statistically significant positive or negative correlation between ICC and transmission severity could be determined by the test.

A red bar in Figure A.14 corresponds to an ICC that has a statistically significant positive correlation with transmission severity, a green bar corresponds to an ICC that has a statistically significant negative correlation, and a blue bar corresponds to an ICC is not statistically significant. A statistically significant positive correlation of initiating cause code with transmission outage severity would indicate a higher likelihood that an event with this ICC will result in a higher transmission outage severity. A statistically significant negative correlation indicates the contrary; in this case, a lower transmission outage severity would be likely. If a correlation is not statistically significant, this implies that a positive or negative correlation was very likely observed by a mere chance, and there is, in fact, no linear relationship between ICC and the transmission outage severity, and the events with this ICC have the expected transmission severity similar to all other events from the database.

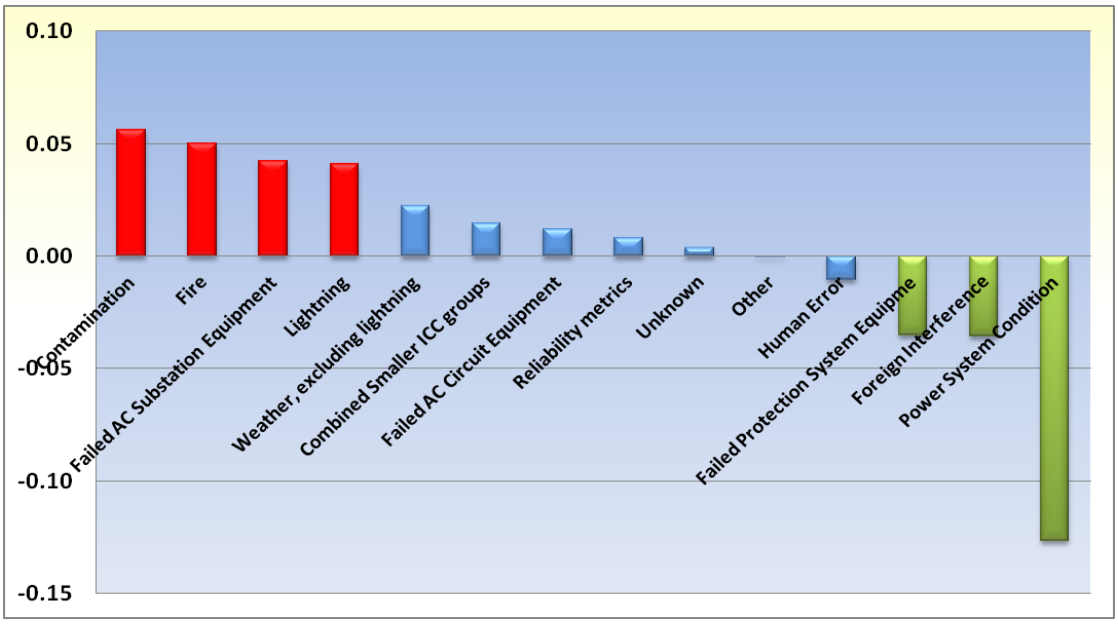

Figure A.14: Correlation between ICC and TS of TADS CDM Events (2009-2013)

Results of the correlation analysis are as follows:

- For the 2009–2013 CDM events, the Contamination ICC has the largest and most statistically significant positive correlation with transmission severity, followed by Fire and Failed AC Substation Equipment. Lightning also has a statistically significant positive correlation.
- Power System Condition, Foreign Interference, and Failed Protection System Equipment have a statistically significant negative correlation with transmission severity. CDM events initiated by either of these causes, on average, tend to have a smaller severity than events from the entire CDM dataset.

[107] The indicator function of a given ICC assigns value 1 to an event with this ICC and value 0 to the rest of the events.

[108] For each ICC, a null statistical hypothesis on zero correlation at significance level 0.05 was tested. If the test resulted in rejection of the hypothesis, it is concluded that a statistically significant positive or negative correlation between an ICC and transmission severity exists; the failure to reject the null hypothesis indicates no significant correlation between ICC and transmission severity.

CDM Events: Distribution of Transmission Severity by ICC

Next, the distribution of transmission severity for CDM events with a given ICC was studied. The transmission severity for CDM events has a sample mean of 0.244 and a sample standard deviation of 0.187. The sample statistics for transmission severity by ICC are listed in Table A.11. The CDM events initiated by Contamination have the largest average transmission severity of 0.317, followed by Fire and Failed AC Substation Equipment (with the expected transmission severity of 0.300, 0.261, respectively). The events initiated by Power System Condition have the smallest average severity of 0.170. Interestingly, the CDM events initiated by Contamination and Fire did not occur often, but upon occurrence resulted in significant transmission severity. Because CDM events typically have more outages per event than Single-Mode events, on average CDM events have higher transmission severity than TADS events.

Table A.11 provides a column that indicates which other ICCs are statistically smaller than a given ICC referenced by the table's column 1 index. For example, transmission severity for Unknown (#8) is statistically significantly smaller than Contamination (#1), while Fire (#2) is not statistically significantly smaller than Contamination.

Transmission Severity Risk and Relative Risk of CDM Events by ICC

If the transmission severity risk of each ICC group is simply the total transmission severity associated with the group, then its relative risk is equal to the percentage of the group transmission severity in the 2009–2013 dataset. Equivalently, the risk of a given ICC per hour can be defined as the product of the probability that an event with this ICC initiated during an hour and the expected severity, or impact, of an event from this group. Then, for any ICC group, the relative risk per hour is the same as the relative risk for five years or any other time period. Table A.11 lists relative risk by ICC with the ICC groups of CDM events in order from the largest relative risk to the smallest.

Table A.11: Evaluation of CDM Event ICC Contribution to Transmission Severity (2009–2013)

Group of TADS events	Probability that an Event from a Group Starts during a Given Hour	Expected Impact (Expected Transmission Severity of an Event)	Risk Associated with a Group Per Hour	Relative Risk by Group (%)
CDM Lightning	0.013	0.258	0.003	4.6
CDM Failed AC Substation Equipment	0.010	0.261	0.003	3.7
CDM Weather Excluding Lightning	0.008	0.253	0.002	2.7
CDM Human Error	0.007	0.236	0.002	2.5
CDM Unknown	0.007	0.244	0.002	2.4
CDM Failed Protection System Equipment	0.007	0.221	0.001	2.1
CDM Power System Condition	0.007	0.170	0.001	1.7
CDM Failed AC Circuit Equipment	0.004	0.250	0.001	1.5

Appendix B – Statistical Analysis for ALR1-12 Metric

Interconnection Frequency Response: Time Trends

Eastern Interconnection

The time trend analysis uses the Eastern Interconnection frequency response (FR) datasets for 2009–2013. In this section, relationships between frequency response and the explanatory variable T (time: year, month, day, hour, minute, second) are studied.

Even though a linear trend line for the scatter plot connecting T and FR shown in Figure 1.5 has a negative slope at -0.07139, the linear regression is not statistically significant[109] and, on average, the Eastern Interconnection frequency response[110] has been stable from 2009 through 2013.

ERCOT Interconnection

The time trend analysis uses the ERCOT frequency response datasets for 2009–2013. In this section, the relationship is investigated between frequency response and the explanatory variable T, when a frequency response event happened.

There is a positive correlation of 0.23 between T and FR; further, the statistical test on the significance of the correlation (and the equivalent test of the significance of a linear regression) results in a rejection of the null hypothesis about zero correlation (p-value of both tests below 0.0001). This proves that it was very unlikely that the observed positive correlation occurred simply by chance. Moreover, a linear trend line for the scatter plot connecting T and FR shown in Figure 1.5 has a statistically significant positive slope (0.0000013), the linear regression is statistically significant, and on average, the ERCOT Interconnection frequency response increased from 2009 through 2013 at the average rate of 3.3 MW/.1 Hz.

Québec Interconnection

The time trend analysis uses the Québec Interconnection frequency response datasets for 2011–2013. The frequency response values represent the observed values of the analysis (response) variable FR of the Québec Interconnection frequency response. In this section, the relationship is investigated between frequency response and the explanatory variable T, when a frequency response event happened.

There is a positive correlation of 0.13 between T and FR; however, the statistical test on the significance of the correlation (and the equivalent test of the significance of a linear regression) fails to reject the null hypothesis about zero correlation at a standard significance level (p-value of the both tests is 0.23). This result leads to the conclusion that with high probability the positive correlation could occur simply by chance. It implies that even though a linear trend line for the scatter plot connecting T and FR shown in Figure 1.5 has a positive slope (0.00000104), the linear regression is not statistically significant, and on average, the Québec Interconnection frequency response has been stable from 2011 through 2013.

Western Interconnection

The time trend analysis uses the Western Interconnection frequency response datasets from 2009 through 2013. The frequency response values represent the observed values of the analysis (response) variable FR, the Western Interconnection frequency response. In this section, the relationship is investigated between FR and the explanatory variable T, when a frequency response event happened.

---

[109] The linear regression in http://www.nerc.com/docs/standards/dt/Field_Trial_Analysis-final_20120910.pdf recommended by Howard Ilian is completely different from the linear regression in Appendix B which is used for time trend analysis.

[110] There is a positive correlation of 0.0017 between T and FR; however, the statistical test on significance of the correlation (and the equivalent test of the significance of a linear regression) fails to reject the null hypothesis about zero correlation at a standard significance level (p-value of the both tests is 0.98). This implies the increase in the expected frequency response since 2009 could just be chance.

There is a negative correlation of -0.05 between T and FR; however, the statistical test on the significance of the correlation (and the equivalent test of the significance of a linear regression) fails to reject the null hypothesis about zero correlation at a standard significance level (p value of the both tests is 0.60). This result leads to the conclusion that the negative correlation could have occurred simply by chance. It implies that even though a linear trend line for the scatter plot connecting T and FR shown in Figure 1.5 has a negative slope (-0.000000435), the linear regression is not statistically significant, and on average, the Western Interconnection frequency response has been stable from 2009 through 2013.

For the Western Interconnection, the data for the years 2009 through 2010 are not very reliable. The value of B was calculated within the first 10 seconds in 2009 and 2010. The other reason the frequency response is much higher for these years is because the capacity of the unit—rather than the net MW loss to the interconnection—was reported. In recent years, such as from 2011 through 2013, better tools have been put in place to detect frequency events and their underlying causes. There are also more systematic procedures to document and verify these events.

Interconnection Frequency Response: Year-to-Year Changes

Eastern Interconnection

The time trend analysis uses the Eastern Interconnection frequency response datasets from 2009 through 2013. The sample statistics by year are listed in Table B.1. The last column lists the number of frequency response events that fell below the absolute IFRO.[111]

Table B.1: Sample Statistics for Eastern Interconnection

Year	Number of Values	Mean of Frequency Response	Std. Dev. of Frequency Response	Minimum	Maximum	Number of Events with FR below the IFRO=1014
2009-2013	**257**	**2308.3**	**603.0**	**698.7**	**4335.9**	**3**
2009	44	2258.4	522.5	1404.8	3625.0	0
2010	49	2335.7	697.6	1102.5	4335.9	0
2011	65	2467.8	593.7	1210.0	3815.2	0
2012	28	2314.3	523.6	1374.0	3921.4	0
2013	71	2171.9	596.5	698.7	3696.3	3

Next, Fisher's Least Significant Difference test is used to analyze all pair-wise changes in frequency response. These tests result in the conclusion that there was a statistically significant decrease of frequency response in 2013 compared with 2011, and there were no other statistically significant changes in the expected frequency response by year for the Eastern Interconnection.

[111] http://www.nerc.com/FilingsOrders/us/NERC Filings to FER DL/FR Annual Report 12-27-13 Final.pdf

ERCOT Interconnection

The time trend analysis uses the ERCOT Interconnection frequency response datasets from 2009 through 2013. The sample statistics by year are listed in Table B.2. The last column lists the number of frequency response events that fell below the absolute IFRO.

Table B.2: Sample Statistics for ERCOT Interconnection

Year	Number of Values	Mean of Frequency Response	Std. Dev. of Frequency Response	Minimum	Maximum	Number of events with FR below the IFRO=413
2009-2013	**298**	**612.2**	**240.8**	**228.0**	**2552.8**	**34**
2009	51	595.2	185.0	263.5	1299.1	5
2010	67	609.7	164.8	367.6	1152.5	3
2011	65	509.6	131.3	228.0	993.0	15
2012	63	571.2	191.9	290.4	1417.9	9
2013	52	809.8	383.2	378.7	2552.8	2

Next, Fisher's Least Significant Difference test is applied to analyze all pair-wise changes in frequency response. These tests find four statistically significant improvements in the expected frequency response (between 2009 and 2013, between 2010 and 2013, between 2011 and 2013, and between 2012 and 2013).

Several factors contributed to the frequency response performance in the ERCOT Interconnection during the years in which the frequency response did not meet the recommended IFRO (2011 and 2012).

- ERCOT has a small hydro fleet that suffered significantly due to the extreme drought of 2011. There was some relief in 2012, but not in the geographical area of these hydro facilities. Additionally, the owners of the facilities have changed the facilities' operation. Prior to the ERCOT nodal market implementation in December 2010, many of these facilities were operated as frequency responsive reserves. They were on-line in synchronous condenser mode and ramped to full output in about 20 seconds anytime frequency dropped to 59.900 Hz or below, providing 50 to 240 MW of primary frequency response (during the first 20 seconds of a disturbance). Since early 2011, this service has been discontinued.
- There was a drop in natural gas prices and a change in dispatch. The price change caused many of the large coal generators to shut down, and frequency response from these generators had been excellent. The combined-cycle facilities that replaced these units had difficulty getting frequency response to work consistently and correctly. Since the fall of 2012, frequency response from combined-cycle facilities has improved, due to TRE's efforts to work with these generators to improve their performance.
- Another contributing factor was the continued increase in wind generation in ERCOT that typically operates at maximum output. Without margin in the up direction, the interconnection only benefits by curtailing wind generators during high-frequency excursions from these generators. When low-frequency excursions occur, the wind generators cannot provide additional output to increase interconnection frequency.

Québec Interconnection

The time trend analysis uses the Québec Interconnection frequency response datasets for the years 2011 through 2013. The sample statistics by year are listed in Table B.3. The last column lists the number of frequency response events that fell below the absolute IFRO.**Error! Bookmark not defined.**

Table B.3: Sample Statistics for Québec Interconnection

Year	Number of Values	Mean of Frequency Response	Std. Dev. of Frequency Response	Minimum	Maximum	Number of Events with FR below the IFRO=180
2011–2013	**85**	**575.3**	**202.9**	**214.7**	**1228.0**	**0**
2011	20	499.1	153.6	214.7	829.9	0
2012	28	592.7	212.4	305.9	1202.1	0
2013	37	603.3	213.3	250.9	1227.8	0

Next, Fisher's Least Significant Difference test is applied to analyze all pair-wise changes in frequency response. These tests result in the conclusion that there are no statistically significant changes in the expected frequency response by year for Québec Interconnection.

Western Interconnection

The time trend analysis uses the Western Interconnection frequency response datasets for 2009–2013. The sample statistics are listed by year in Table B.4. The last column lists the number of frequency response events that fell below the absolute IFRO.**Error! Bookmark not defined.**

Table B.4: Sample Statistics for Western Interconnection

Year	Number of Values	Mean of Frequency Response	Std. Dev. of Frequency Response	Minimum	Maximum	Number of Events with FR below the IFRO=949
2009–2013	**119**	**1514.0**	**422.9**	**816.7**	**3125.0**	**3**
2009	25	1513.6	295.7	1000.0	2027.0	0
2010	29	1572.2	512.3	816.7	3125.0	2
2011	25	1496.5	391.9	1078.6	2894.6	0
2012	12	1466.8	557.2	997.0	3123.5	0
2013	28	1491.2	404.3	821.9	2851.0	1

It is impossible to statistically analyze pair-wise annual changes in the Western Interconnection frequency response due to small sample sizes for each year.

Explanatory Variables for Frequency Response and Multiple Regression

Explanatory Variables

In the *2012 State of Reliability* report, Key Finding #2 proposed further work to see if specific indicators could be tied to severity of frequency deviation events. For each interconnection, the following set of six variables is included as explanatory variables (regressors) in the multiple regression models that describe the interconnection frequency response. These variables are not pair-wise uncorrelated, and some pairs are strongly correlated; however, all are included as candidates to avoid the loss of an important contributor to the frequency response variability. Model selection methods help ensure the removal of highly correlated regressors and run multicollinearity diagnostics (variance inflation diagnostic) for a multiple regression model selected.

Summer (Indicator Function) – Defined as 1 for frequency response events that occur from June through August and 0 otherwise.

Winter (Indicator Function) – Defined as 1 for frequency response events that occur from December through February and 0 otherwise.
High Pre-Disturbance Frequency (Indicator Function) – Defined as 1 for frequency response events with pre-disturbance frequency (point A)>60 Hz and 0 otherwise.
On-peak Hours (Indicator Function) – Defined as 1 for frequency response events that occurred during on-peak hours and 0 otherwise. On-peak hours are designated as follows: Monday to Saturday from 0700 to 2200 (Central Time) excluding six holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day.
Time – A moment in time (year, month, day, hour, minute, second) when a frequency response event happened. Time is measured in seconds elapsed between midnight of January 1, 1960 (the time origin for the date format in SAS), and the time of a corresponding frequency response event. This is used to determine trends over the study period.
Interconnection Load Level – Measured in megawatts. For the Eastern Interconnection, the data are unavailable for the 2013 events; thus, the multivariate statistical analysis for them involves 2009–2012 data only (186 observations for the Eastern Interconnection). For the ERCOT and Western Interconnections, the analysis covers the five-year data, and for the Québec Interconnection, the 2011–2013 data.

Table B.5 lists the ranks of statistically significant variables of interconnection frequency response for each interconnection. "Positive" indicates positive correlation, "negative" indicates negative correlation, and a dash indicates no statistically significant linear relation. If the initial pre-disturbance frequency is higher than 60 Hz, it is more likely that governor actions will be delayed because of the time it takes for the frequency to drop to the upper dead-band setting.

Table B.5: Observation Summary

Explanatory Valuable	Western	Eastern	ERCOT	Québec
Summer	-	-	-	-
Winter	-	-	-	2 (positive)
High Pre-disturbance	1 (negative)	2 (negative)	1 (negative)	-
On-peak hours	-	-	-	3 (positive)
Time	-	-	2 (positive)	-
Load Level	-	1 (positive)	-	1 (positive)

Eastern Interconnection: Correlation Analysis and Multivariate Model

Descriptive statistics for the six explanatory variables and the Eastern Interconnection frequency response are listed in Table B.6.

Table B.6: Descriptive Statistics

Variable	N	Mean	Std Dev	Minimum	Maximum
Time	186	-	-	1/1/2009	12/31/2012
Interconnection Load	186	343,170	63,792	217,666	541,565
On-Peak Hours	186	0.640	0.481	0	1
A>60	186	0.505	0.501	0	1
Winter	186	0.161	0.369	0	1
Summer	186	0	0	0	1
FR	186	2360	599	1103	4336

The correlation and a single regression analysis result in the hierarchy of the explanatory variables for the Eastern Interconnection frequency response shown in Table B.7. The value of a coefficient of determination R^2 indicates

the percentage in variability of frequency response that can be explained by variability of the corresponding explanatory variable. Out of the six parameters, interconnection load has the biggest impact on frequency response, followed by the indicator of high pre-disturbance frequency. Interconnection load is positively correlated with frequency response (they increase or decrease together, on average), while high pre-disturbance frequency is negatively correlated with frequency response. The events with A>60 Hz have smaller frequency response than the events with A≤60 Hz. The other four variables do not have a statistically significant[112] linear relationship with frequency response.

Table B.7: Correlation and Regression Analysis

Explanatory Variable	Correlation with FR	Statistically Significant (Yes/No)	Coefficient of Determination of Single Regression (If SS)
Interconnection Load	0.38	Yes	14.4%
A>60	-0.24	Yes	6.0%
On-Peak hours	0.11	No	N/A
Time	0.10	No	N/A
Winter	-0.09	No	N/A
Summer	0.06	No	N/A

Both step-wise selection and backward elimination algorithms[113] result in a multiple regression model that connects the Eastern Interconnection frequency response with the following significant[114] regressors: interconnection load and high pre-disturbance frequency (the other four variables are not selected or were eliminated). The models' coefficients are listed in Table B.8.

Table B.8: Coefficients of Multiple Model

Variable	DF	Parameter Estimate	Standard Error	t-value	p-value	Variance Inflation Value
Intercept	1	1272.19	218.21	5.83	<.0001	0
Interconnection Load	1	0.0036	0.00	5.86	<.0001	1.00067
A>60	1	-304.10	78.60	-3.87	0.0002	1.00067

The adjusted coefficient of multiple determination of the model is 20.0 percent; the model is statistically significant ($p<0.0001$). The random error has a zero mean and the sample deviation σ of 536 MW/.1 Hz. Variance inflation factors for the regressors do not exceed 1.0007, which confirms an acceptable level of multicollinearity that does not affect a general applicability of the model. Frequency responses in the Eastern Interconnection are higher due to the large number of disturbances in the dataset in which frequency changes were greater than the generator dead-bands. Also, in earlier studies, the gross output of the unit trip was reported, rather than the net generation[115] megawatt loss to the interconnection.

[112] At significance level 0.1

[113] For step-wise regression algorithm and Backward Elimination algorithm see D. C. Montgomery and G. C. Runger. Applied Statistics and Probability for Engineers. Fifth Edition. 2011. John Wiley & Sons. Pp. 499-501.

[114] Regressors in the final model have p-values not exceeding 0.1.

[115] There could be a coincident loss of load also.

ERCOT: Correlation Analysis and Multivariate Model

Descriptive statistics for the six explanatory variables and the ERCOT Interconnection frequency response are listed in Table B.9.

Table B.9: Descriptive Statistics

Variable	N	Mean	Std Dev	Minimum	Maximum
Winter	298	0.305	0.461	0	1
Summer	298	0.252	0.435	0	1
Date	298	-	-	1/1/2009	12/31/2013
A>60	298	0.440	0.497	0	1
On-Peak Hours	298	0.609	0.489	0	1
Interconnection Load	298	38,791	9,745	22,243	64,744
FR	298	612.16	240.75	228.04	2552.75

The correlation and a single regression analysis result in the hierarchy of the explanatory variables for the ERCOT Interconnection frequency response shown in Table B.10.

Table B.10: Correlation and Regression Analysis

Explanatory Variable	Correlation with FR	Statistically Significant (Yes/No)	Coefficient of Determination of Single Regression (If SS)
A>60	-0.31	Yes	9.4%
Time	0.23	Yes	5.3%
Winter	0.07	No	N/A
On-Peak Hours	0.07	No	N/A
Summer	0.04	No	N/A
Interconnection Load	0.02	No	N/A

Out of the six parameters, the indicator of high pre-disturbance frequency has the biggest impact on frequency response, followed by time. High pre-disturbance frequency is negatively correlated with frequency response (the events with A>60 Hz have smaller frequency response than the events with A≤60 Hz, and time is positively correlated with frequency response (on average, frequency response increases with time). The other four variables do not have a statistically significant[116] linear relationship with frequency response.

Finally, both step-wise selection algorithm and backward elimination algorithm result in a multiple regression model that connects the ERCOT Interconnection frequency response with high pre-disturbance frequency and time (the other four variables are not selected or were eliminated[117]) as regressors. The coefficients of the multiple models are listed in Table B.11.

Table B.11: Coefficients of Multiple Model

Variable	DF	Parameter Estimate	Standard Error	t-value	p-value	Variance Inflation Value
Intercept	1	-1377.45	484.53	-2.84	0.0048	0
Time	1	0.00000126	0.00000030	4.24	<.0001	1.00002
A>60	1	-147.89	26.15	-5.66	<.0001	1.00002

The adjusted coefficient of multiple determination of the model is 14.0 percent; the model is statistically significant ($p<0.0001$). The random error has a zero mean and the sample deviation σ of 224 MW/.1 Hz. Variance

[116] At significance level 0.1

[117] Regressors in the final model have p-values not exceeding 0.1.

inflation factors for the regressors do not exceed 1.00002, which confirms an acceptable level of multicollinearity that does not affect a general applicability of the model.

Québec: Correlation Analysis and Multivariate Model

Descriptive statistics for the six explanatory variables and the Québec Interconnection frequency response are in Table B.12.

Table B.12: Descriptive Statistics

Variable	N	Mean	Std Dev	Minimum	Maximum
Winter	85	0.188	0.393	0	1
Summer	85	0.541	0.501	0	1
A>60	85	0.471	0.502	0	1
Time	85	-	-	1/1/2011	12/31/2013
On-Peak Hours	85	0.647	0.481	0	1
Interconnection Load	85	21,635	4,593	14,330	35,140
FR	85	575.30	202.88	214.74	1228

The correlation and a single regression analysis result in the hierarchy of the explanatory variables for the Québec Interconnection frequency response shown in Table B.13.

Table B.13: Correlation and Regression Analysis

Explanatory Variable	Correlation with FR	Statistically Significant (Yes/No)	Coefficient of Determination of Single Regression (If SS)
Interconnection Load	0.28	Yes	7.6%
Winter	0.26	Yes	6.7%
On peak Hours	0.18	Yes	3.3%
Time	0.13	No	N/A
Summer	-0.10	No	N/A
A>60	-0.08	No	N/A

Out of the six parameters, interconnection load has the biggest impact on frequency response, followed by the indicators of winter and on-peak hours. Interconnection load, winter, and on-peak hours are positively and statistically significantly[118] correlated with frequency response (the winter events have higher frequency response than other events; the on-peak hour events have higher frequency response than the off-peak hour events; and, finally, the events with higher interconnection load have larger frequency response). The other three variables do not have a statistically significant linear relationship with frequency response.

Finally, both step-wise selection algorithm and backward elimination algorithm result in a single regression model that connects the Québec Interconnection frequency response with interconnection load (the other five variables are not selected or were eliminated[119]). The coefficients of the single model are in Table B.14.

Table B.14: Coefficients of Single Model

Variable	DF	Parameter Estimate	Standard Error	t-value	p-value	Variance Inflation Value
Intercept	1	312.1	103.06	3.03	0.0033	0.00
Interconnection Load	1	0.0122	0.00466	2.61	0.0107	1.00

[118] At significance level 0.1

[119] Regressors in the final model have p-values not exceeding 0.1.

The model's adjusted coefficient of determination is 6.5 percent; the model is statistically significant (p=0.01). The random error has a zero mean and the sample deviation σ of 196 MW/.1 Hz. Since the multiple models for the Québec Interconnection frequency response are reduced to a single model, no multicollinearity diagnostics are needed.

The main reason that winter events have a better frequency response is because winter is the peak usage season in the Québec Interconnection. More generator units are on-line; therefore, there is more inertia in the system, so it is more robust in responding to frequency changes in the winter.

Western Interconnection: Correlation Analysis and Multivariate Model

Descriptive statistics for the six explanatory variables and the Western Interconnection frequency response are listed in Table B.15.

Table B.15: Descriptive Statistics

Variable	N	Mean	Std Dev	Minimum	Maximum
Winter	119	0.218	0.415	0	1
Summer	119	0.378	0.487	0	1
Time	119	-	-	1/1/2009	12/31/2013
A>60	119	0.395	0.491	0	1
Interconnection Load	119	92553	17424	60188	143637
On-Peak Hours	119	0.597	0.493	0	1
FR	119	1514	422.9	816.7	3125.0

The correlation and a single regression analysis result in the hierarchy of the explanatory variables for the Western Interconnection frequency response shown in Table B.16.

Table B.16: Correlation and Regression Analysis

Explanatory Variable	Correlation with FR	Statistically Significant (Yes/No)	Coefficient of Determination of Single Regression (If SS)
A>60	-0.312	Yes	9.7%
Winter	-0.099	No	N/A
Interconnection Load	0.089	No	N/A
Summer	0.084	No	N/A
Time	-0.048	No	N/A
On-Peak Hours	0.024	No	N/A

Out of the six parameters, the indicator of high pre-disturbance frequency has the biggest impact on frequency response. The indicator is negatively and statistically significantly correlated with frequency response (the events with pre-disturbance frequency greater than 60 Hz have smaller frequency response on average). The other five variables are not statistically significantly[120] correlated with frequency response.

[120] At significance level 0.1

Finally, both step-wise selection algorithm and backward elimination algorithm result in a single regression model that connects the Western Interconnection frequency response with one regressor, the indicator of high pre-disturbance frequency (the other five variables are not selected or were eliminated[121]). The coefficients of the single model are listed in Table B.17.

Table B.17: Coefficients of Single Model

Variable	DF	Parameter Estimate	Standard Error	t-value	p-value	Variance Inflation Value
Intercept	1	1620.4	47.56	34.07	<.0001	0.00
A>60	1	-268.7	75.68	-3.55	0.0006	1.00

[121] Regressors in the final model have p-values not exceeding 0.1.

Appendix C – Statistical Summary of SRI$_{bps}$ Assessment

The PAS has investigated the SRI$_{bps}$ performance for 2008–2013 as well as a year-by-year comparison. From this analysis it concluded that 2011 performance was the best SRI$_{bps}$ on record, as measured by its mean and standard deviation, in spite of the relatively large standard deviation (whose outliers included the September 8, 2011 load shed event, in addition to the February 2, 2011 cold weather load loss event). It also determined that 2009 and 2013 were the next best performance years, followed by 2010, 2012, and 2008. These values are shown in Table C.1 below.

Table C.1: Descriptive Statistics of Annual SRI $_{bps}$

Year	N	SRI $_{bps}$	
		Mean	Std Dev
2008	366	1.801	0.674
2009	365	1.664	0.528
2010	365	1.742	0.611
2011	365	1.504	1.041
2012	366	1.785	0.813
2013	365	1.670	0.600

This ranking is further visible in Figure C.1 below. It can be observed that if outlier performance were taken as a larger input to ranking the year's results, 2011 and 2012 would be considered poorer performance years, while 2013 and 2009 would be rated as the best performance years.

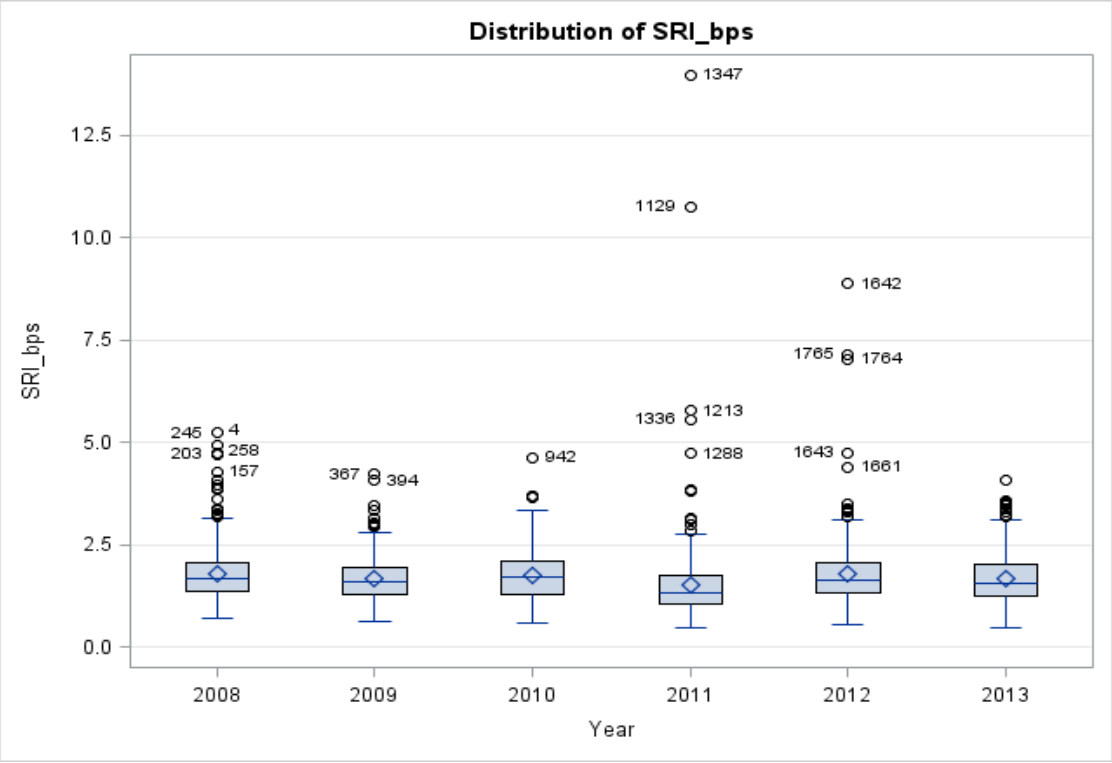

Figure C.1: Boxplot of Annual SRI$_{bps}$

Finally, the performance of each year compared to every other year is depicted in Table C.2 below; if no reference to statistical significance is made within the table, it is assumed to be statistically significant.[122]

Table C.2: Pair-wise Comparison of Annual SRI_{bps}

	Compared to Year					
Base Year	**2008**	**2009**	**2010**	**2011**	**2012**	**2013**
2008		2009 Better	2010 Better, but not Statistically Significant	2011 Better	2012 Better, but not Statistically Significant	2013 Better
2009			2009 Better, but not Statistically Significant	2011 Better	2009 Better	Approximately Equal
2010				2011 Better	2012 Better, but not Statistically Significant	2013 Better, but not Statistically Significant
2011					2011 Better	2011 Better
2012						2013 Better
2013						

The second analysis performed was an assessment of the distribution. Performance is most closely represented as a log-normal distribution; however, 2011 and 2012 do not fit that distribution.

Table C.3: SRI_{bps} Parameters for Fitted Log-normal Distribution

Parameter	Symbol	2008 Estimate	2009 Estimate	2010 Estimate	2011 Estimate	2012 Estimate	2013 Estimate	2008–2013 Estimate
Minimum p-value*	P	**0.205**	**>0.50**	**0.082**	**0.009**	**0.007**	**>0.250**	**0.001**
Fit to Log-normal		Good	Very good	Poor	Not fitted	Not fitted	Good	Not fitted
Threshold	Theta	0.389	0.059	-0.196			-0.491	
Scale	Zeta	0.247	0.422	0.613			0.734	
Shape	Sigma	0.440	0.319	0.312			0.273	
Mean		**1.799**	**1.664**	**1.743**			**1.670**	
Std Dev		**0.651**	**0.525**	**0.620**			**0.601**	

[122] At significance level 0.05.

In Figure C.2 below is the histogram for 2013 SRI_{bps}, which did conform to a log-normal distribution.

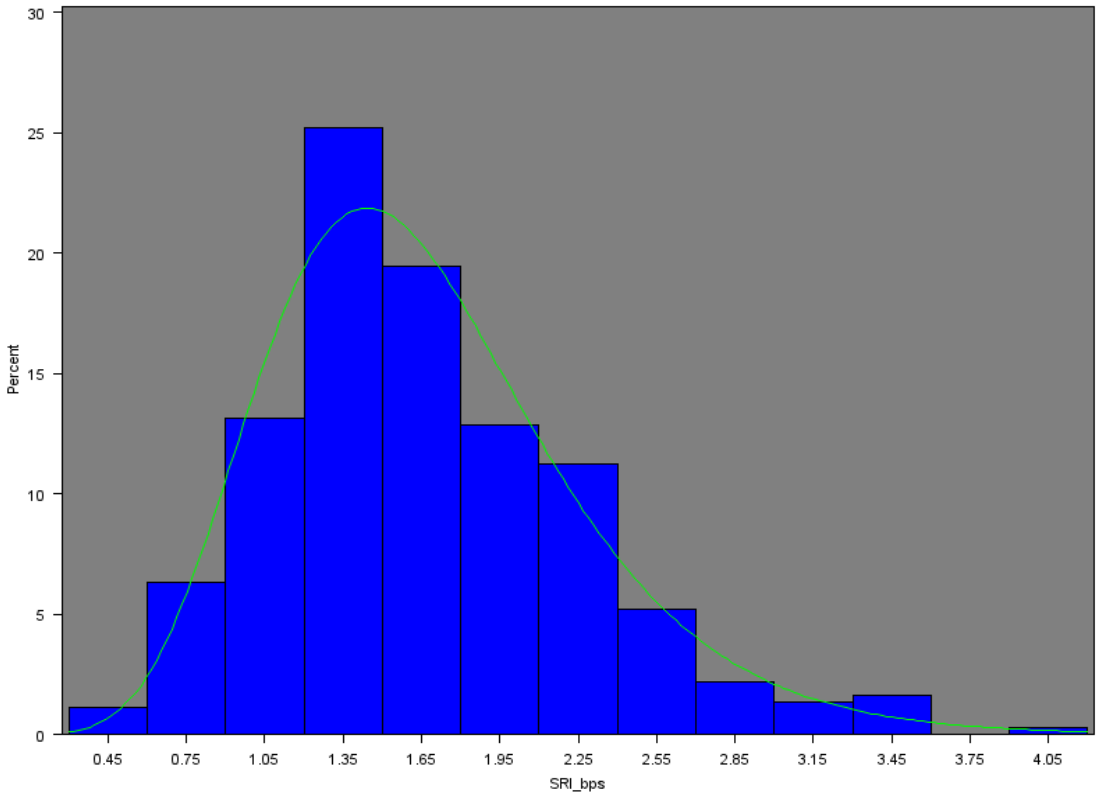

Figure C.2: Histogram for SRI_{bps} for 2013

In Figure C.3 below, the trend of performance is shown over the six-year history. It is notable that the trend of performance over this period is improving, which is very close to statistically significant;[123] statistical significance means that the changes observed are real changes and are not due to random variations in the data.

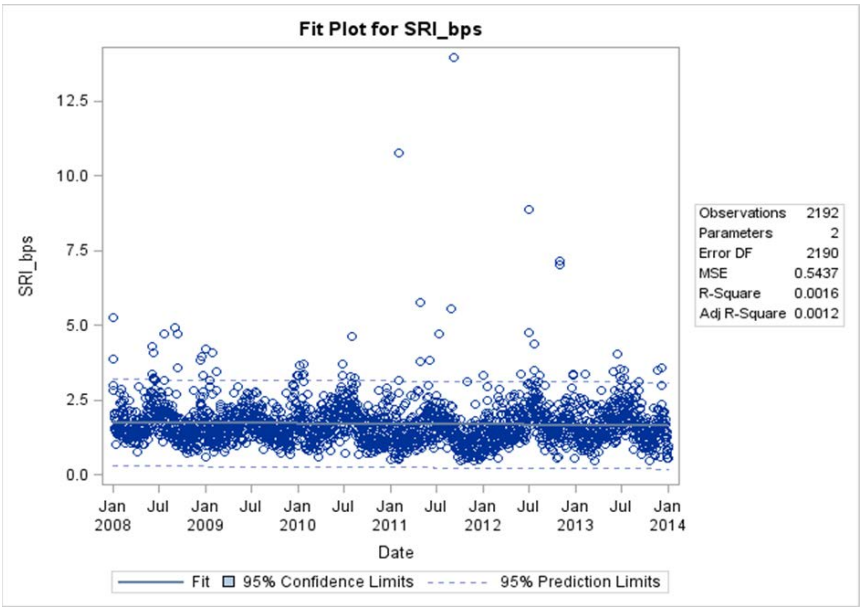

Figure C.3: Fit Plot for SRI_{bps} 2008–2013

[123] Significance of the linear regression describing the time trend is P=0.06.

Appendix D – Abbreviations Used in This Report

Acronym	Description
ALR	Adequate Level of Reliability
BES	Bulk Electric System
BPS	Bulk Power System
CDM	Common/Dependent Mode
EEA	Energy Emergency Alert
ERO	Electric Reliability Organization
ERCOT	Electric Reliability Council of Texas
FERC	Federal Energy Regulatory Commission
FRCC	Florida Reliability Coordinating Council
ICC	Initiating Cause Code
IROL	Interconnection Reliability Operating Limit
ISO	Independent System Operator
ISO-NE	ISO New England
KCMI	Key Compliance Monitoring Index
MRO	Midwest Reliability Organization
NERC	North American Electric Reliability Corporation
NPCC	Northeast Power Coordinating Council
NYISO	New York Independent Service Operator
PAS	Performance Analysis Subcommittee
PSMTF	Protection System Misoperation Task Force
RC	Reliability Coordinator
RE	Regional Entities
RF	ReliabilityFirst
RSG	Reserve-Sharing Group
SERC	SERC Reliability Corporation
SNL	Sandia National Laboratories
SOL	System Operating Limit
SPS	Special Protection Schemes
SPCS	System Protection and Control Subcommittee
SPP	Southwest Power Pool
SRI	Severity Risk Index
TADS	Transmission Availability Data System
TADSWG	Transmission Availability Data System Working Group
TO	Transmission Owner
TRE	Texas Reliability Entity
WECC	Western Electricity Coordinating Council

Contributions

Acknowledgements

NERC would like to express its appreciation to the many people who provided technical support and identified areas for improvement.

NERC Industry Groups

Table 1 lists the NERC industry group contributors.

Table 1: NERC Group Acknowledgements

Group	Officers
Planning Committee Reviewers	John Feit, Public Service Commission of Wisconsin David Jacobsen, Manitoba Hydro Dale Burmester, American Transmission Company, LLC
Performance Analysis Subcommittee	Chair: Melinda Montgomery, Entergy Vice Chair: Heide Caswell, PacifiCorp
Demand Response Availability Data System Working Group	Chair: Bob Collins, TRE Vice Chair: Mike Jaeger, ISO-NE
Events Analysis Subcommittee	Chair: Sam Holeman, Duke Energy Vice Chair: Hassan Hamdar, FRCC
Generation Availability Data System Working Group	Chair: Gary Brinkworth, TVA Vice Chair: Leeth DePriest, Southern Company
Transmission Availability Data System Working Group	Chair: Jake Langthorn, Oklahoma Gas and Electric Co. Vice Chair: Jeff Schaller, Hydro One Networks, Inc.
Resources Subcommittee	Chair: Don Badley, Northwest Power Pool Corp. Vice Chair: Gerald Beckerle, Ameren Services
Operating Reliability Subcommittee	Chair: Joel Wise, TVA Vice Chair: Eric Senkowicz, FRCC
Frequency Working Group	Chair: Sydney Niemeyer, NRG Energy
Operating Committee	Chair: Tom Bowe, PJM Interconnection, LLC Vice Chair: James D. Castle, Duke Energy
Planning Committee	Chair: Ben Crisp, SERC Reliability Corporation Vice Chair: Ben Crisp, SERC Reliability Corporation
Reliability Assessment Subcommittee	Chair: Vince Ordax, FRCC Vice Chair: Layne Brown, WECC
System Protection and Control Subcommittee	Chair: William J. Miller, Exelon Corporation Vice Chair: Philip B. Winston, Southern Company
Protection System Misoperations Task Force	Chair: John Seidel, Midwest Reliability Organization
Spare Equipment Database Working Group	Chair: Dale Burmester, American Transmission Company, LLC Vice Chair: Puesh Kumar, APPA
Compliance and Certification Committee	Chair: Terry Bilke, Midwest ISO, Inc. Vice Chair: Patricia E. Metro, National Rural Electric Cooperative Association

Regional Entity Staff

Table 2 provides a list of the Regional Entity staff that provided data and content review.

Table 2: Contributing Regional Entity Staff

Name	Regional Entity
Vince Ordax	FRCC
John Seidel	MRO
Phil Fedora	NPCC
Paul Kure	RF
John Johnson	SERC
Alan Wahlstrom and Deborah Currie	SPP
Bob Collins	TRE
Matthew Elkins	WECC

NERC Staff

Standards Authorization Request Form

When completed, email this form to:
Valerie.Agnew@nerc.net

For questions about this form or for assistance in completing the form, call Valerie Agnew at 404-446-2566.

NERC welcomes suggestions for improving the reliability of the Bulk-Power System through improved Reliability Standards. Please use this form to submit your proposal for a new NERC Reliability Standard or a revision to an existing standard.

Request to propose a new or a revision to a Reliability Standard			
Proposed Project Number and Name	Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems)		
Proposed Project Purpose:	Revise NERC Glossary of Terms definition: Special Protection System (SPS) Revise SPS-related Reliability Standards		
Date Submitted:	02/12/2014		
SAR Requester Information			
Name:	Al McMeekin		
Organization:	NERC		
Telephone:	404-446-9675	E-mail:	Al.McMeekin@nerc.net
SAR Type (Check as many as applicable)			
☒ New Standard ☒ Revision to existing Standard		☒ Withdrawal of existing Standard ☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
The existing NERC Glossary of Terms definition for a Special Protection System (SPS) or, as used in the Western Interconnection, a Remedial Action Scheme (RAS), lacks the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS or RAS across the eight NERC Regions, leading to inconsistent application of the related NERC Reliability Standards. In FERC Order No. 693 (dated March 16, 2007), the Commission identified three of the SPS-related ~~standards~~Reliability Standards (PRC-012-0, PRC-013-0, and PRC-014-0) as fill-in-the-blank standards because they are applicable to the Regional Reliability Organizations (RROs). Consequently, the Commission did not approve or remand them, rendering them neither mandatory nor enforceable. This project also addresses, in part, four recommendations related to identification and coordination of SPS from the joint FERC-NERC inquiry of the September 2011 Southwest Blackout Event. NOTE: Detailed information is included in the NERC Planning Committee report "Special Protection Systems (SPS) and Remedial Action Schemes (RAS): Assessment of Definition, Regional Practices, and Application of Related Standards" Revision 0.1 – April 2013.
Purpose or Goal (How does this request propose to address the problem described above?):
1) Establish a definition of an SPS or RAS that provides the specificity needed to consistently identify and classify protection schemes as SPS or RAS across all eight NERC Regions, thereby promoting the consistent application of the NERC Reliability Standards related to SPS. 2) Correct the applicability of the NERC Reliability Standards related to SPS/RAS by assigning responsibilities to the specific users, owners, and operators of the Bulk-Power System rather than the RROs. 3) Develop continent-wide standards to address all aspects of SPS/RAS, including but not limited to, the: • planning, coordination, and design of SPS/RAS, • review, assessment, and documentation of SPS/RAS, • operational considerations for monitoring, status notification, and response to failures, • analysis of SPS/RAS operations, and defining and reporting of SPS/RAS misoperations, • testing of SPS/RAS, and maintenance of any non-protection system components used ~~in SPS~~.

SAR Information
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
Successful implementation of a modified ~~SPS~~ definition ~~and~~for an SPS/RAS, with the revised SPS ~~standards~~/RAS-related Reliability Standards will improve Bulk-Power System reliability by providing continent-wide consistency in the identification and classification of SPS or RAS, and by promoting the consistent application of ~~NERC~~the related Reliability Standards ~~related to SPS~~.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The project will develop a revised definition of SPS or RAS, as well as ~~standards~~revise the NERC Reliability Standards that address the: • review of new or modified SPS/RAS, • annual assessments of SPS/RAS in transmission planning studies, • periodic comprehensive SPS/RAS assessments, • analysis and reporting of SPS/RAS misoperations, • maintenance, testing and operational aspects of SPS/RAS.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The SDT will revise the definition of SPS/RAS to provide the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS ~~or~~ /RAS across the eight NERC Regions. The SDT will revise or retire the six existing SPS ~~standards~~/RAS-related Reliability Standards: • PRC-012-0 Special Protection System Review Procedure • PRC-013-0 Special Protection System Database • PRC-014-0 Special Protection System Assessment • PRC-015-0 Special Protection System ~~data~~Data and Documentation • PRC-016-0.1 Special Protection System Misoperations • PRC-017-0 Special Protection System Maintenance and Testing

SAR Information
The SDT will correct the applicability in PRC-012-0, PRC-013-0, and PRC-014-0 by assigning the requirements to the specific users, owners, and operators of the ~~bulk power system~~Bulk Power System. The SDT will combine appropriate requirements from PRC-012-0, PRC-013-0, PRC-014-0, PRC-015-0, PRC-016-0.1, and PRC-~~015~~017-0 into ~~a~~one or more Reliability Standard~~-~~(s). The new standard(s) will provide specific requirements for: • review of new or modified SPS/RAS; • annual assessments of SPS/RAS in transmission planning studies; • periodic comprehensive SPS/RAS assessments; • design of SPS~~;~~/RAS; • operations and misoperations; • maintenance and testing of SPS/RAS; and • maintenance and testing of non-Protection System components used in SPS/RAS; and • coordination of SPS/RAS with other SPS/RAS, UFLS, UVLS, and Protection Systems. Due to the significant difference between Protection Systems and SPS, the subject of SPS misoperation is not addressed in the revision of Reliability Standard PRC-004. This SDT will develop a definition for SPS/RAS misoperation and revise PRC-016-0.1. The new Reliability Standard will provide specific requirements for the analysis of SPS operations and reporting of SPS misoperations. The SDT will address the complexity of maintaining and testing SPS, as well as the maintenance and testing of non-Protection System components used in SPS in a Reliability Standard. ~~-~~This SDT will coordinate with the PRC-005-4 SDT to prevent any overlaps or gaps in coverage. The SDT also will consider operational considerations for monitoring, status notification, and response to failures of SPS/RAS; and, if necessary, modify other related standards. The SDT will retire requirements that are administrative in nature that are not necessary for reliability of the Bulk-Power System, or that are superseded by other requirements; i.e., the new Reliability Standards will qualify as steady-state. No market interface impacts are anticipated.

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☐	~~Regional Reliability Organization~~	~~Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.~~
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.

Reliability Functions		
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles		
Applicable Reliability Principles (Check all that apply).		
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.	
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.	
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.	
☒	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.	
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.	
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.	
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.	
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.	
Does the proposed Standard comply with all of the following Market Interface Principles?		Enter (yes/no)
	1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
	2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes

Reliability and Market Interface Principles	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Related Standards	
Standard No.	Explanation
IRO-005-3.1a	The SDT may decide not to change this standard, but the SDT should keep the standard in mind since it contains potentially overlapping requirements.
PRC-001-1.1	The SDT may decide not to change this standard, but the SDT should keep the standard in mind since it contains potentially overlapping requirements.
PRC-005-2	The SDT may decide not to change this standard, or subsequently approved versions, but the SDT should keep the standard in mind to avoid any gaps or overlap between this standard and PRC-017-1.
PRC-010-1	The SDT may adjust the definition of Special Protection System to include centrally-controlled undervoltage-based load shedding or exclude UVLS Programs.
CIP-002, CIP-003, CIP-004, CIP-005, CIP-006 CIP-007, CIP-008, CIP-009, CIP-010 CIP-011, EOP-004, FAC-010, FAC-011, IRO-005, IRO-014, MOD-029, MOD-030, NUC-001, PRC-001, PRC-004-WECC, PRC-005, PRC-006, PRC-012, PRC-013, PRC-014,	The SDT will review all current standards that include the term SPS or RAS to ensure the modified term and definition are congruent.

Related Standards	
PRC-015, PRC-016, PRC-017, PRC-020, PRC-021, PRC-023, PRC-024, PRC-025, TOP-005, TPL-001, TPL-002, TPL-003, TPL-004; NERC Glossary of Terms: Special Protection System, Remedial Action Scheme; WECC Regional Term: Dependability-Based Misoperation, WECC Regional Term: Functionally Equivalent RAS, WECC Regional Term: Security-Based Misoperation	

Related SARs	
~~SAR ID~~Project	Explanation
Project 2008-02 – Undervoltage Load Shedding	The UVLSSDT is recommending that Project 2010-05.2 – Special Protection Systems adjust the definition of Special Protection System to include centrally-controlled undervoltage-based load shedding or exclude UVLS Programs.

NORTHEAST POWER COORDINATING COUNCIL
Reliability Coordinating Committee Minutes
February 26, 2014

Mr. Briggs called the meeting of the Reliability Coordinating Committee (RCC), held at the New York Times Square Residence Inn by the Marriott to order at 10:00 am.

Attendance

Officers of the Reliability Coordinating Committee

Alden Briggs, Chair	New Brunswick Power Corporation
Michael Schiavone, Co-Vice Chair	National Grid USA
Brian Evans-Mongeon, Co-Vice Chair	Utility Services, Inc.

Sector 1 - Transmission Owners

Central Hudson Gas & Electric Corp.	(proxy to James McCloskey)
Central Maine Power Company	David Conroy (Alternate)
Consolidated Edison Company of New York, Inc.	Mike Forte
Long Island Power Authority	(proxy to Anie Philip – via phone)
National Grid USA	Michael Schiavone
New Brunswick Power Corporation	(proxy to Alden Briggs)
New York Power Authority	(proxy to Randy Crissman)
New York State Electric & Gas Corp.	Ray Kinney
Northeast Utilities	Brad Bentley
Nova Scotia Power Incorporated	(via written proxy)
Rochester Gas & Electric Corporation	John Allen (Alternate - via phone)
The United Illuminating Company	Robert Pelligrini Jonathan Appelbaum (via phone)
Vermont Transco	(via written proxy)

Sector 2 – Reliability Coordinators

Hydro-Québec TransÉnergie	Pierre Paquet
Independent Electricity System Operator	Barbara Constantinescu
ISO-New England, Inc.	Mike Henderson
New Brunswick Power Corporation	Alden Briggs
New York Independent System Operator	Dana Walters (Alternate)

Sector 3 – Transmission Dependent Utilities, Distribution Companies and Load Serving Entities

Hydro-Québec Distribution	Stephane Dufrense (via phone)
New York Power Authority	(proxy to Randy Crissman)
Long Island Power Authority	Anie Philip (Alternate – via phone)
Northeast Utilities	Dwayne Basler

Sector 4 Generation Owners

Dominion Energy Marking, Inc.	Mike Garton (via phone)
Dynegy, Inc.	(via written proxy)
Entergy Nuclear Northeast	Tom Czerniewski (via phone)
Long Island Power Authority	(proxy to Anie Philip – via phone)
New York Power Authority	Randy Crissman
NextEra Energy Resources	(via written proxy)
Northeast Utilities	(proxy to Dwayne Basler)

Sector 5 – Marketers, Brokers, and Aggregators

Constellation Energy Commodities Group	(via written proxy)
HQ Energy Marketing Inc.	(via written proxy)
HQ Energy Services (US) Inc.	(via written proxy)
Long Island Power Authority	(proxy to Anie Philip – via phone)
New York Power Authority	(proxy to Randy Crissman)
PPL EnergyPlus, LLC	Elizabeth Davis (Alternate - via phone)
Utility Services	Brian Evans-Mongeon

Sector 6 – State and provincial Regulatory and/or Governmental Authorities

New York Power Authority	(proxy to Randy Crissman)
New York State Department of Public Service	Ed Schrom (Alternate)

Sector 7 – Sub-Regional Reliability Councils, Customers, other Regional Entities and Interested Entities

New York State Reliability Council, LLC	Roger Clayton (via phone)

NPCC Staff

Gerry Dunbar	Manager of Reliability Criteria Requirements
Phil Fedora	Assistant Vice President, Reliability Services
Brian Hogue	Information Systems & Security Management
Stanley Kopman	Assistant Vice President of Compliance Registration & Enforcement
Quoc Le	Manager, System Planning and Protection
Jennifer Mattiello	Vice President & Chief Operating Officer
John Mosier, Jr.	Assistant Vice President of System Operations
Scott Neid	Manager, Compliance Program Development
Andrey Oks (via phone)	Manager, Reliability Performance Criteria

Frantz Roc	Manager, Information Technologies
Paul Roman	Manager, Operations Planning
Ralph Rufrano	Manager, Event Analysis
Edward Schwerdt	President & Chief Executive Officer

Guests

Paul DiFilippo	Chair, Task Force on System Protection
Marc Dusseault	Chair, Task Force on Coordination of Planning
Gregory Goodrich	Chair, Task Force on Infrastructure Security & Technology
Dean Latulipe (via phone)	Chair, SS-38 Working Group
Jim McCloskey	Central Hudson Gas & Electric
John Norden	Chair, Task Force on Coordination of Operation
Isen Widjaja (via phone)	Chair, Load Modeling Working Group
Raey Yohannes (via phone)	Entergy Services, Inc.

Quorum Statement

Mr. Fedora indicated that a quorum had been achieved, by member attendance, proxy or alternate designation. He also noted having received the following written proxies:

Sector 1 – Transmission Owners
Paul Casey – Nova Scotia Power Incorporated
Paul Renaud – Vermont Electric Power Company, Inc.

Sector 4 – Generator Owners
Allen D. Schriver - NextEra Energy Resources
James Watson – Dynegy, Inc.

Sector 5 – Marketers, Brokers, and Aggregators
Glenn McCartney - Constellation Energy Commodities Group, Inc.
Yannick Vennes – HQ Energy Marketing Inc.
Louis Guilbault - HQ Energy Services (US) Inc.

Antitrust Guidelines for NPCC Meetings

Mr. Fedora reviewed the NPCC Antitrust Guidelines in the Agenda package, and suggested contacting NPCC Inc.'s Secretary, Andrianne S. Payson, at (212) 424-8218 for further information.

President & CEO Report

Mr. Schwerdt reported on the following items:

Bulk Electric System Definition
Following a 74% affirmative vote from the industry ballot body and a unanimous approval by the NERC Board of Trustees during their November 21, 2013 teleconference meeting, NERC filed the revised BES Definition with FERC on December 13, 2013 with a request for expedited action. Timely approval by FERC is necessary for an orderly implementation in the U.S. of the revised definition effective July 1, 2014.

In anticipation of that implementation, work on BES Exception Process ERO-wide IT tool has continued, addressing some technical issues identified during the end-to-end testing by NERC and Regional staffs. Guidelines for evaluating BES exception requests and guidelines for reviewing self-determined notifications have been developed to both enhance the efficiency of the processes and to support consistency between the Regional Entities. Reference documentation for stakeholder users is under development and currently out for industry comment. Last week's RSC meeting included a review of the current draft document. Finally, stakeholder training regarding the implementation of the definition and use of the BES tool is being scheduled, including a session in conjunction with the May 2014 NPCC Compliance and Standards Workshop being held in Cooperstown, New York.

ERO Enterprise 2014-2017 Strategic Plan
The NERC Board of Trustees at its February 6, 2014 meeting approved the ERO Enterprise Strategic Plan for 2014 through 2017 as it was modified based on discussions at the previous day's Member Representatives Committee meeting. The five Enterprise-wide Goals can be summarized as follows:

- ✓ Goal 1 – Develop clear, reasonable and sound mandatory standards that are practical to implement and cost effective
- ✓ Goal 2 – Implement risk-based registration, compliance and enforcement that holds industry accountable for violations
- ✓ Goal 3 – Support a culture of compliance that addresses reliability risks and leverages the industry's internal controls
- ✓ Goal 4 - Identify and prioritize risks and consistently analyze
- ✓ events and system performance
- ✓ Goal 5 – Operate a collaborative enterprise with improved efficiencies and cost effectiveness

2015 Business Plan and Budget
NERC and the eight Regional Entities are currently working on establishing shared business plan and budget assumptions to support the development of a more collaborative ERO Enterprise plan for the 2015 Business Cycle. NPCC will be providing an initial draft of its 2015 Business Plan and Budget to the NPCC Finance and Audit Committee in

mid-April, with a review by the full Board scheduled for their April 29, 2014 meeting. NERC is looking to post Draft 1 of its 2015 Business Plan and Budget, along with all of the Regional Entity BP&Bs by mid-May. A presentation to the RCC on the NPCC BP&B is scheduled for the June RCC meeting, with final NPCC Board approval expected in late June.

Chair Report

Meeting Agenda

Mr. Briggs said he had received no changes to the meeting Agenda as provided in the Agenda package.

The RCC then approved the Agenda.

Events Analysis "Lessons Learned" Template

Mr. Briggs refereed to the Events Analysis "Lessons Learned" Template provided in the Agenda package. He stated that comments received from the RCC review of the template have been incorporated.

Common Task Force Statement of Purpose

Mr. Briggs indicated that the Task Force Chairs have agreed to common wording for their respective Task Force's Statement of Purpose; the Task Forces will be presenting their revised Task Force Scopes for approval at the June 2014 RCC meeting.

Approved 2014-2015 RCC Work Plan

Mr. Briggs explained that at their January 29, 2014 meeting, the NPCC Board approved the 2014-2015 RCC Work Plan, adding the highlighted words "to the extent possible, are conducted in an efficient and cost-effective manner," as shown in the Agenda package.

Consent Agenda

The Reliability Coordinating Committee unanimously approved the following Consent Agenda items (all written proxies in favor, with three abstentions: Sector 5, Marketers, Brokers, and Aggregators - Glen McCartney, Constellation Energy Commodities Group, Inc., Louis Guilbault, HQ Energy Services (US) Inc., and Yannick Vennes, HQ Energy Marketing Inc.):

September11, 2013 Meeting Minutes

The Draft-For-Approval Minutes of the December 3, 2013 Reliability Coordinating Committee were approved, with corrections noted.

RCC Membership Changes

The following changes to RCC Membership were approved:

Sector 1, Transmission Owners

- ✓ Mr. James McCloskey of Central Hudson Gas & Electric Corporation succeeds Mr. Thomas C. Duffy, as the member.

Task Force Roster Changes

The following changes to Task Force and Working Group memberships were approved:

Task Force on Coordination of Operation

- ✓ Mr. Robert Reinmuller succeeds Mr. Paul Tremblay as a member, both of Hydro One, Inc.
- ✓ Mr. Tony O'Hara succeeds Mr. Alden Briggs as a member, both of New Brunswick Power Corporation.

CO-1 Control Performance Working Group

- ✓ Mr. David Devereaux to represent the Ontario Independent Electric System Operator as an alternate.
- ✓ Mr. Ed Rappold to represent ISO-New England as an alternate.

CO-2 Working Group on System Operator Training

- ✓ Ms. Diane Leferriere of HQ TransEnergie succeeds Mr. Stephen George of ISO New England, Inc. as Chair.
- ✓ Mr. Eduardo Sanchez to replace Mr. Stephen George as the ISO-New England, Inc. as member.
- ✓ Mr. Keith Harris of New York Independent System Operator to serve as Vice Chair.

CO-12 System Operator Training Working Group

- ✓ Mr. Michael Courchesne to replace Mr. Yan Beachamp as the CO-12 Chairman.
- ✓ Ms. Candida D'Costa to replace John Medal as the IESO alternate representative.

SS-38 Inter-Area Dynamic Analysis Working Group

- ✓ Mr. Emeka Ojukwu will represent New York Independent System Operator as a member. Mr. Tao has retired.

SS-38 Load Modeling Ad Hoc Working Group

- ✓ Mr. Daniele D'Aquila succeeds Mr. Tao as member.

Interim Review of Resource Adequacy

Approved as provided in the Agenda package. Mr. Bentley noted corrections to his transmittal letters.

2013 NPCC SPS List, BPS List, UVLS Program List, Major Projects List, and DCT Exclusions List

Approved as referenced in the Agenda package.

A-10 Implementation Plan Update

Approved as provided in the Agenda package.

Chicopee Alternative UFLS Plan

Approved as provided in the Agenda package.

Reliability Coordinating Committee Actions

NPCC 2013 Long Range Adequacy Overview

Mr. Fedora explained that this study evaluated, on a consistent basis, the long range adequacy of NPCC and neighboring Regions' plans to meet their Loss of Load Expectation (LOLE) planning criteria through a multi-area probabilistic assessment for the period from 2014 to 2018, based on the reported NERC 2013 Long Term Reliability Assessment data.

Mr. Dusseault added that the Task Force on Coordination of Planning discussed and approved the overview at their February 5, 2014, meeting, and requested RCC approval.

The RCC then approved the NPCC 2013 Long Range Adequacy Overview as provided in the Agenda (all written proxies in favor, with two abstentions: Sector 5, Marketers, Brokers, and Aggregators - Louis Guilbault, HQ Energy Services (US) Inc., and Yannick Vennes, HQ Energy Marketing Inc.).

Mr. Henderson indicated he would be contacting Mr. Fedora suggesting some editorial changes following the meeting.

2014 NPCC Summer Reliability Assessment

Mr. Roman presented the preliminary results of the "*2014 NPCC Summer Reliability Assessment*" provided in the Agenda package. He explained that the NPCC CO-12 Seasonal Assessment Working Group focused on the assessment of reliability within NPCC for the 2014 Summer Operating Period.

Mr. Fedora then provided the CP-8 Working Group's multi-area probabilistic reliability assessment regarding the estimated use of operating procedures designed to mitigate resource shortages for the same period. He also provided the RCC with the preliminary weather projection for the 2014 summer period.

In response to a question, Mr. Fedora indicated that the assessment also compares last year's actual experience with that estimated in the previous year's (2013) assessment.

The schedule for RCC review and Task Force approvals was discussed; public release of the assessment will be provided at a May 1, 2014 Media Event.

Status Reports

Mr. Briggs referred the RCC to the materials provided in the Agenda package; the RCC discussed the following Agenda items:

NPCC Regional Standards Committee (RSC) Report

Mr. Dunbar highlighted the materials described in the Agenda package; he indicated that the pace of NERC Standard development activity has been very aggressive this year, and that this high level of activity is expected to continue going forward in 2014. He then highlighted the following activities:

- ✓ approval of the NPCC Regional Standard Processes Manual;
- ✓ development of the continent wide Disturbance Monitoring Standard PRC-002-02, and the related Cost Effective Analysis Process; and,
- ✓ development of the continent-wide Cost Effective Analysis Process.

NPCC Reliability Directory Status Report

Mr. Dunbar referred the RCC to the materials provided in the Agenda package.

NPCC Compliance Committee

Mr. Kopman provided a brief summary of the materials provided in the Agenda package, and provided a highlight of aspects of the RAI Pilot Program. Mr. Schwerdt added that transitioning toward the uniform ERO-wide Self-Certification schedule described in the Agenda package will provide greater consistency and lessen the burden for those registered in more than one Region.

SS-38 Working Group Update

Mr. Widjaja stated that the SS-38 Load Modeling Working Group continues to make progress on the load modeling study effort, and reviewed the materials provided in the Agenda package.

Mr. Latulipe indicated that the SS-38 Working Group on Inter-Area Dynamic Analysis continues to make good progress on the UFLS Adequacy Assessment Study. He reported that the S-38 Working Group has mostly completed the work on identification of islands to be studied by performing coherent generation analysis including the use multiple methods of forming islands. Results of the work completed by each Area are being documented; during the first Quarter of 2014, all Areas are expected to complete the preliminary assessment of the NPCC UFLS program. Sensitivity analysis will be conducted during this summer.

TFCO/TFCP Phase 2 revision of Directory No. 1

Mr. Dunbar reported that the CP-11 /CO-7 Working Group have reviewed the revision of Directory No. 1 through a series of weekly WebEx meetings in 2013 and posted the draft of the Directory for Open Process review on December 11, 2013; the review concluded on January 25, 2014.

The CP-11/CO-7 Working Group has reconvened and will be considering any resultant revision of Directory No. 1 to address the comments received.

TFIST Cyber Update

Mr. Goodrich highlighted the following items provided in the Agenda package:

- ✓ an update on CIP Version 5;
- ✓ FERC Order 791; and,
- ✓ NERC Project: 2014-2 - CIP Version 5 Revisions Standard Drafting Team activities.

The RCC discussed substation relay communication with respect to the level of protection to be assigned under CIP-002-5.

TFSP Update

Mr. DiFilippo referred the RCC to the materials provided in the Agenda package regarding the SP-7 Working Group's review of Protection Systems Misoperations and the BPS Risk Reduction Implementation Status Report.

2013-2014 Task Force Work Plan Progress

The Chairs of the NPCC Task Forces provided a brief summary of their respective 2013-2014 Task Force Work Plan Progress reports provided in the Agenda package.

NPCC Reliability Assessment Program (NRAP) Highlights Report

Mr. Fedora indicated that the '*NPCC Reliability Assessment Program Highlights Report*' has been updated as of February 21, 2014 and is posted on the NPCC website.

NERC Agenda Items

Operating Committee (OC)

Mr. Mosier reviewed the following March 2014 NERC Operating Committee Agenda items:

- ✓ continued monitoring of the implementation of the Operating Reliability Coordination Agreement;
- ✓ review of the Geomagnetic Disturbance Planning Guide; and,
- ✓ the transition of NERCnet to the Eastern Interconnection Data Sharing Network.

Planning Committee (PC)

Mr. Fedora reviewed the following March 2014 NERC Planning Committee Agenda items:

- ✓ roundtable discussion of identified strategic Regional issues to help the Planning Committee prioritize its work activities moving forward;
- ✓ formation of the Essential Reliability Services Task Force;
- ✓ Integration of Variable Generation Task Force follow-up activities; and,
- ✓ approval of a revised metric for ALR1-4 – one that better reflects the loss of supply from BPS generation/transmission events rather than from distribution level events.

Critical Infrastructure Protection Committee (CIPC)

Mr. Hogue reported that there were no voting items on the March 2014 NERC Critical Infrastructure Committee Agenda; the previously identified Cyber Security issues will be discussed.

Informational Items

Mr. Briggs referred the RCC to the materials included in the Agenda package. The following Informational Items were discussed at the meeting:

Executive Order and Presidential Policy Directive 21/NIPP/NIST Update

Mr. Goodrich provided an update of the information provided in the Agenda package regarding the National Infrastructure Protection Plan and the 2014 NIST Framework for Improving Critical Infrastructure Cybersecurity. He explained that the Integrated Task Force will continue on information sharing, research and development with a focus on public and private sector partnership. The re-alignment within US Government agencies impacted Sector Specific that spawned updates to the Electric Sub-sector Coordinating Council.

Cyber-Physical Security Update

Mr. Goodrich provided an overview of the material provided in the Agenda package. He stated the GridEx II report is expected to be released soon, and described plans for GridEx III in 2015.

White House Quadrennial Energy Review

Mr. Goodrich referred the RCC to the materials in the Agenda package regarding the Presidential Memorandum that established a Quadrennial Energy Review.

Definition of the Bulk Electric System

Mr. Fedora described the recent activities related to the revised definition of the Bulk Electric System (BES). They included posting of guidance documents and other supporting materials on the NERC Bulk Electric System Definition, Notification, and Exception Process Project Web Page.

He also reminded the RCC of the BES related sessions scheduled for the Spring NPCC Compliance and Standards Workshop. A pre-Workshop training session is scheduled for explaining how to submit BES Self-Determined Notifications and BES Exception Requests through the BESNet application.

Events Analysis Program – Overview and Status

Mr. Rufrano provided a status and overview of the Events Analysis program provided in the Agenda package.

July 3rd Quebec Event

Mr. Paquet provided a brief overview of the July 3, 2013 Quebec event. He indicated that Quebec is in the process of providing the NPCC Task Forces detailed presentations of the event and Quebec's Action Plan to address the lessons learned. He stated that a Final Report summarizing the event and any corresponding NPCC Task Force recommendations are expected to be presented at the June 2014 RCC meeting.

Eastern Interconnection Frequency Response Activities

Mr. Briggs referred the RCC to the materials in the Agenda package.

Other Matters

Mr. Briggs noted the announced retirement of Ms. Constantinescu from the IESO and recognized her contributions. She responded that she was grateful to be provided the opportunity to work with the RCC over the years. The RCC wished her the very best in her future plans.

The RCC meeting was then adjourned.

Next RCC Meeting Date	Location
June 4, 2014	New York Times Square Residence Inn by the Marriott

Distribution of Approved Minutes

NPCC Full & General Member Representatives and Alternates
Members, NPCC Board of Directors
Members, NPCC Reliability Coordinating Committee
Members, NPCC Public Information Committee
Members, NPCC Compliance Committee
Members, NPCC Regional Standards Committee
Members, NPCC Task Force on Coordination of Operation
Members, NPCC Task Force on Coordination of Planning
Members, NPCC Task Force on Infrastructure Security and Technology
Members, NPCC Task Force on System Protection
Members, NPCC Task Force on System Studies
NPCC Officers
NPCC Staff
Andrew J. Fawbush, Esq.
Andrianne S. Payson, Esq.
and
Federal Energy Regulatory Commission – Mike Bardee, David O'Connor, Juan Villar

La Régie de L'Énergie – Daniel Soulier
Ontario Energy Board – Peter Fraser
United States Department of Energy – David Meyer
New Brunswick Department of Energy and Mines – David Sallows
Nova Scotia Utility & Review Board – S. Bruce Outhouse, Q.C.

Implementation Plan

Project 2007-11 Disturbance Monitoring

Requested Approvals

- PRC-002-2 Disturbance Monitoring and Reporting Requirements

Requested Retirements

- PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements
- PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting

Prerequisite Approvals

- None

Applicable Entities

- Planning Coordinator
- Reliability Coordinator
- Transmission Owner
- Generator Owner

Revisions to Defined Terms in the NERC Glossary

~~The standard drafting team proposes the following new definitions:~~	
~~Dynamic Disturbance Recording (DDR)~~	~~The recording of time sequenced data for dynamic power system characteristics such as power swings, frequency variations, and abnormal voltage problems.~~
~~Fault Recording (FR)~~	~~The recording of time sequenced waveform data for short circuits or failure of Elements resulting in abnormal voltage(s) and /or current(s).~~
~~Sequence of Events Recording (SOER)~~	~~The recording of time sequenced data for change in status of Elements, which may include protection and control devices.~~

Background

The Implementation Plan reflects consideration of the following:

1. This standard reflects the need for data, rather than equipment, with the understanding that the data is collected from Disturbance Monitoring Equipment distributed across the BES~~system~~.
2. A significant amount of s~~S~~equence of ~~E~~sevents ~~R~~recording (SER), f~~F~~ault r~~R~~ecording (FR), and d~~D~~ynamic d~~D~~isturbance r~~R~~ecording (DDR) equipment already exists on the BES. The monitoring~~location~~ requirements in this standard align with industry practices ~~for locating this equipment~~. Therefore, many existing recordings can~~-~~ satisfy the Requirements and Implementation Plan put forth.
3. Fault MVA data is readily available or calculable by the Transmission Owners for the BES buses ~~locations~~ they own. Therefore, six (6) months is adequate time for generating the list of BES bus locations following the methodology described in Attachment 1 (Requirement R1).
4. Responsible Entities have the relevant data and information pertaining to the BES Elements requiring DDR~~ynamic Disturbance Recording~~ and six (6) months is adequate time for working with any affected Entities and generating the list of BES Elements.
5. The nine (9) month time period for ~~R2, R7, and~~ R124 includes the six (6) month implementation for R1, and R56 ~~(refer to 3, and 4 preceding), and a three (3) month additional time period to make notifications.~~ The nine (9) months for R124 implementation is reasonable for the contents of that requirement. ~~All requirements pertaining to possible implementation of equipment are referenced to notification of the list of bus locations or Elements to account for any delays in the process of location and Element selection.~~
6. A total percentage (%) of BES buses ~~locations~~ and BES Elements established in Requirements R1 and R56 respectively, are used in the Implementation Plan since these lists are explicitly created and readily available. It is expected that many locations will become compliant with incremental changes to recording.
7. A graduated approach to implementation recognizes that progress will be made while attempting to minimize any potential significant impact to the Entities. ~~The timelines put forth allow for inertial delays in implementing new equipment or technologies (e.g. developing new standards and processes, testing and energization, and project management).~~
8. Implementation of disturbance monitoring following changes to the system are addressed ~~by referencing the Implementation Plan to the time of notification following reassessment. Changes to disturbance monitoring are only required for identified bus locations or Elements~~ following reassessment of the lists as per Requirement R1~~, Part 1.2~~ and Requirement R56~~, Part 6.2~~.

9. Implementing SOER, FR, and DDR may require scheduled outages for both Transmission Owners and Generator Owners. Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant. Meanwhile, Transmission Owners will have more Elements requiring SOER, FR, and DDR and may have to schedule outages across the system. The Implementation Plan takes this into account for scheduling outages.
10. An Entity owning only one (1) identified bus location, Element, or generating unit is allowed four (4) years for implementation to accommodate normal outage schedules.
11. The Implementation Plan accounts for any increase in requests to vendors for this technology or equipment that could impact implementation timelines for the respective Entities.

General Considerations

Each Transmission Owner and Generator Owner shall maintain the ability to provide Disturbance Monitoring data using current methods until the entity meets the requirements of PRC-002-2 in accordance with this Implementation plan. As required in PRC-018-1 Disturbance Monitoring Equipment Installed and Data Reporting, Requirement R1, Parts 1.1 and 1.2, it is expected that the Transmission Owner and Generator Owner will have those functionalities in regards to their current Disturbance Data.

Effective Date

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Standard(s) for Retirement

PRC-002-1 Midnight of the day immediately prior to the Effective Date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Each Transmission Owner, and Generator Owner shall maintain documentation to demonstrate compliance with PRC-018-1 until that entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2 and shall be applicable to an entity's Disturbance Monitoring and Reporting activities not yet transitioned to PRC-002-2. PRC-018-1 will be retired following full implementation of PRC-002-2 as noted below.

PRC-018-1 Midnight of the day immediately prior to six (6) years after the Effective Date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

~~**Implementation Plan for Definitions**~~

~~Entities shall use these definitions when implementing any requirement in this standard that references one of the definitions.~~

Implementation Plan for PRC-002-2 Requirements R1 and R5~~6~~:

Entities shall be 100% compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement~~s R2, R7, and~~ R1~~2~~4~~~~:

Entities shall be 100% compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) ~~-~~months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R5, R6~~8~~, R7~~9~~, R8~~10~~, R9~~11~~, R10~~12~~ and R11~~13~~:

Entities shall be at least 50% compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date.

Entities that own only one (1) identified BES bus , BES Element, or generating unit shall be fully compliant within six (6) years of the Effective Date.

~~Entities shall be compliant with the initial list of BES bus locations in Requirement R1 and list of Elements in Requirement R6 within the following:~~

- ~~Following governmental authority or as otherwise provided for in jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect,~~
  - ~~At least 25% compliant within two (2) years following notification of the list~~
  - ~~At least 50% compliant within three (3) years following notification of the list~~

- ~~100% compliant within four (4) years following notification of the list~~

- ~~**Note**: Entities that own only one (1) identified BES bus location, Element, or generating unit shall be 100% compliant within four (4) years following notification of the list.~~

- ~~Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is forty-eight (48) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction,~~

Entities shall be 100% compliant with a reassessed list from Requirement R1~~, Part 1.2~~ or R5~~6, Part 5~~6.2 within three (3) years following notification of the list.

Conforming Changes to Other Standards

Where conflicts between the continent-wide standard PRC-002-2 and a regional standard exist, entities should comply with PRC-002-2. Conflicts will be addressed in the regional standards development process.

- The following conflicts PRC-002-2 Requirement R3 stipulates data must be captured by fault recording to determine electrical quantities. PRC-002-NPCC-01 Requirement R3 stipulates the recording of those quantities.
- PRC-002-2 Requirement R5 stipulates the capture of dynamic disturbance recording data for HVDC. PRC-002-NPCC-01 does specify HVDC.

PRC-002-2 Requirement R8 recognizes dynamic disturbance recording that is not continuous. PRC-002-NPCC-01 addresses dynamic disturbance recorders installed after the standard was approved have to be continuous.

Implementation Plan Summary											
Requirement	Entity	Identify bus locations/ Elements	Notification	SOE	FR	DDR	Time Sync	5 Year Assessment	Other	Percent Compliant	Following compliance instructions noted for each requirement above:
R1	TO	X	X	X	X			X		100	Six (6) months
R2	TO		X							100	Nine (9) months
R23	TO/GO			X						25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R34	TO/GO				X					25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R45	TO/GO				X					25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R56	RE (PC or RC)	X	X			X		X		100	Six (6) months
R7	RE (PC or RC)		X							100	Nine (9) months
R68	RE (PC or RC)TO					X				25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R79	TGO					X				25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R810	TO/GO					X				25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R911	TO/GO					X				25	Two (2) years

										100	Four (4) years
R102	TO/GO						X			25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R113	TO/GO								X	25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R124	TO/GO								X	100	Nine (9) months

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Project 2007-11 Disturbance Monitoring

VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-002-2 – Disturbance Monitoring and Reporting Requirements.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines.

The Disturbance Monitoring and Reporting Requirements Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria –VRFs

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC VRF Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed VRF	**Lower**
NERC VRF Discussion	R1 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R1 establishes the list of Sequence of Events Recordings and Fault Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for establishing a list of BES bus locations for Sequence of Events Recording and Fault Recording using the selection procedure in Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish the list of BES bus locations for Sequence of Events Recording and Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective which is to establish a list of BES bus locations for Sequence of Events Recording and Fault Recording and to review the list every 5 calendar years. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Lower VSL	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 80% but less than 100% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by 30 calendar days or less. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by 10 calendar days or less. ~~The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 80% but less than 100% of the required bus locations.~~ ~~OR~~ ~~The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by 30 calendar days or less.~~
Proposed Moderate VSL	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 70% but less than or equal to 80% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by greater than 30 calendar days and less than or equal to 60 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by greater than 10 calendar days but less than or equal to 20 calendar days.~~The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 70% but less than or equal to 80% of the required bus locations.~~ ~~OR~~ ~~The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 30 calendar days and less than or equal to 60 calendar days.~~

VRF and VSL Justifications – PRC-002-2, R1	
Proposed High VSL	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 60% but less than or equal to 70% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by greater than 60 calendar days and less than or equal to 90 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by greater than 20 calendar days but less than or equal to 30 calendar days.~~The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 60% but less than or equal to 70% of the required bus locations.~~ ~~OR~~ ~~The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 60 calendar days and less than or equal to 90 calendar days.~~
Proposed Severe VSL	The Transmission Owner identified the BES buses as directed by Requirement R1for less than or equal to 60% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1but was late by greater than 90 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying one or more other owners by greater than 30 calendar days. ~~The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for less than or equal to 60% of the required bus locations.~~ ~~OR~~ ~~The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 90 calendar days.~~

VRF and VSL Justifications – PRC-002-2, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

VRF and VSL Justifications – PRC-002-2, R1	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

	of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to notify the owners of the Elements selected for Dynamic Disturbance Recording in R6 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R7 contains only one objective which is to notify the owners of BES Elements selected for Dynamic Disturbance Recording selected in R6.
Proposed Lower VSL	The Responsible Entity as directed by Requirement R7 was late in notifying the owners by 10 calendar days or less.
Proposed Moderate VSL	The Responsible Entity as directed by Requirement R7 was late in notifying the owners by greater than 10 calendar days but less than or equal to 20 calendar days.
Proposed High VSL	The Responsible Entity as directed by Requirement R7 was late in notifying the owners by greater than 20 calendar days but less than or equal to 30 calendar days.
Proposed Severe VSL	The Responsible Entity as directed by Requirement R7 was late in notifying one or more owners by greater than 30 calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level	Guideline 2a: The VSL assignment is for R7 is not binary.

VRF and VSL Justifications — PRC-002-2, R7	
Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP

	~~OR~~ ~~The Transmission Owner or Generator Owner as directed by Requirement R13, Part 13.2 failed to provide less than or equal to 70% of the requested data.~~ ~~OR~~ ~~The Transmission Owner or Generator Owner as directed by Requirement R13, Parts 13.3 through 13.5 provided less than or equal to 70% in the proper data format.~~
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1~~3~~ is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VRF and VSL Justifications – PRC-002-2, R1~~3~~	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R1~~2~~4	
Proposed VRF	**Lower**
NERC VRF Discussion	R1~~2~~4 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to

VRF and VSL Justifications – PRC-002-2, R1~~2~~4	
	effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R1~~2~~4 provides criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to follow the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1~~2~~4 contains only one objective which is to establish criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 90 calendar days but less than 100 calendar days after discovery of the failure. ~~The Transmission Owner or Generator Owner as directed by Requirement R14 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 90 calendar days but less than 100 calendar days after discovery of the failure.~~
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100 calendar days but less than or equal to 110 calendar days after discovery of the failure. ~~The~~

VRF and VSL Justifications – PRC-002-2, R124	
	~~Transmission Owner or Generator Owner as directed by Requirement R14 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100 calendar days but less than or equal to 110 calendar days after discovery of the failure.~~
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110 calendar days but less than or equal to 120 calendar days after discovery of the failure. ~~The Transmission Owner or Generator Owner as directed by Requirement R14 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110 calendar days but less than or equal to 120 calendar days after discovery of the failure.~~
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120 calendar days after discovery of the failure. ~~The Transmission Owner or Generator Owner as directed by Requirement R14 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120 calendar days after discovery of the failure.~~
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level	Guideline 2a: The VSL assignment is for R124 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R1~~2~~4	
Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the SAR Drafting Team members were solicited February 26 – March 9, 2007.
2. The SAR was posted for a 30-day comment period March 22 – April 20, 2007.
3. Nominations for the Disturbance Monitoring Standard Drafting Team (~~SDT~~DMSDT) for Project 2007-11 Disturbance Monitoring were solicited June 12 – 25, 2007.
4. The project was placed into informal development the fall of 2010.
5. The project was placed into formal development January 2013.
6. Nominations for two additional ~~SDT~~DMSDT members were solicited April 12 – 25, 2013.
7. Three additional ~~SDT~~DMSDT members were added May 22, 2013.
8. Industry webinar was held May 22, 2013.
9. Industry technical conferences were held July 30 - 31, 2013 and August 6 - 7, 2013.
10. The draft standard was posted for a 45-day concurrent comment and ballot period November 1 – December 16, 2013.

Description of Current Draft

This is the second draft of the proposed standard and is being posted for stakeholder comments and additional ballot. This draft includes the modifications based on comments submitted by stakeholders

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with a 10-day Ballot	May 2014
Final Ballot	July 2014
BOT Adoption	August 2014

Effective Dates

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

~~See PRC-002-2~~

Implementation Plan.

Implementation Plan for PRC-002-2 Requirements R1 and R5:

Entities shall be 100% compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement R12:

Entities shall be 100% compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:

Entities shall be at least 50% compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date.

Entities that own only one (1) identified BES bus location, Element, or generating unit shall be fully compliant within six (6) years of the Effective Date.

- **Note**: Entities that own only one (1) identified BES bus, BES Element, or generating unit and are notified by an entity shall be 100% compliant within four (4) years following notification.

Entities shall be 100% compliant with a reassessed list from Requirement R1or R5 within three (3) years following notification of the list.

2.0	TBD	Effective Date	New

DRAFT

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms (Glossary) used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

DRAFT

When this standard has received ballot approval, the ~~text boxes~~Rationale Boxes will be moved to the ~~Application~~ Guidelines and technical Basis Section of the Standard.

A. Introduction

1. Title: Disturbance Monitoring and Reporting Requirements

2. Number: PRC-002-2

3. Purpose: To have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances.

~~3.~~4. Applicability:

Functional Entities:

4.1 The Responsible Entity is:

~~3.1.1~~4.1.1 Eastern Interconnection – Planning Coordinator

4.1.2 ~~–~~ERCOT – Planning Coordinator or Reliability Coordinator

4.1.3 Western Interconnection – Reliability Coordinator

4.2 Transmission Owner

4.3 Generator Owner

Rationale for Functional Entities:

The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which dynamic disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.

BES buses where sequence of events recording (SER) and fault recording (FR) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. The Transmission Owners and Generator Owners that own BES Elements on those BES buses will have the responsibility for ensuring that adequate data is available.

~~Rationale for Functional Entities:~~

~~The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which Dynamic Disturbance Recorder (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.~~

~~BES Buses where Fault Recorder (FR) and Sequence of Events Recorder (SOER) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available.~~

B. Requirements and Measures

R1. Each Transmission Owner shall identify BES buses for which sequence of events ~~recorder~~recording (SER) and fault ~~recorder~~recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify ~~within 90 calendar days~~ other owners~~, if any,~~ of BES Elements connected to those BES buses~~,~~ , if any, within 90 calendar days that those BES Elements may require SER data and/or FR data, and reevaluate the identified BES buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

DRAFT

M1. The Transmission Owner has a dated (electronic or ~~hardcopy~~hard copy) list of BES buses for which SER and FR data are required, identified in accordance with Attachment 1, ~~assessed~~and evidence that the bus identification has been reevaluated within the required interval. The Transmission Owner will also have dated (electronic or ~~hardcopy~~hard copy) evidence that it notified other owners in accordance with Requirement R1.

Rationale for R1:

Analysis and reconstruction of BES events requires SER and FR data from key BES buses. Requirement R1 directs a uniform methodology to identify these BES buses. Review of actual BES short circuit data received from the industry in response to the DMSDT's data request (June 5, 2013 through July 5, 2013) illuminated a strong correlation between the available short circuit MVA at a transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of transmission lines and other Elements connected to the bus, and (iii) the number and size of generating units connected to the bus. BES buses with a large short circuit MVA level are BES Elements that have a significant effect on system reliability and performance. Conversely, BES buses with very low short circuit MVA levels seldom cause large cascading system events, so SER and FR data from these BES Elements are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment. Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection.

For the purpose of PRC-002-2, there are a minimum number of BES buses for which SER and FR data are required, based on the short circuit level. With these concepts and the objective being sufficient recording coverage for event analysis, the DMSDT developed the procedure in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and system topology of Transmission Owners across all Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure sufficient distribution.

BES buses where SER and FR data are required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. SER and FR data will include generating resource contributions to an event. DDR data better shows generator response to disturbances.

Each Transmission Owner must reevaluate the list of BES buses every five calendar years to address system changes.

Since there may be multiple owners of equipment that comprise a BES bus, the notification required in R1 is necessary to ensure all owners are notified.

A 90 calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

~~Rationale for R1:~~

~~SER and FR data are not required from every location on the BES to conduct adequate analysis of a BES event; SER and FR from key locations on the BES will suffice. Requirement R1 directs a uniform methodology to select these locations.~~

~~Review of actual BES short circuit data received from the industry in response to the DMSDT's June 5, 2013 through July 5, 2013 data request illuminated a strong correlation between the available short circuit MVA at a transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of transmission lines and other Elements connected to the bus, and (iii) the number and size of generating units connected to the bus. Buses with a large short circuit MVA level Elements that have a significant effect on system reliability and performance. Conversely, buses with very low short circuit MVA level seldom cause large cascading system events, so FR and SER typically are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment. Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected locations. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection.~~

~~For the purpose of PRC-002-2, there are a minimum number of buses for which FR and SER are required based on the short circuit level, With these concepts and the objective being sufficient recording coverage for event analysis, the SDT developed a procedure included in Attachment 1, that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for FR and SER data regardless of variations in size and system strength of Transmission Owners across all the Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process.~~

~~BES buses where FR and SER data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. SER and FR data will reflect generating resource contributions to an event. DDR data better shows generator response to disturbances.~~

~~Each Transmission Owner must reevaluate the list of buses every five calendar years to address system changes such. Since there may be multiple owners of equipment that comprise a bus, the notification required in R1 is necessary to ensure all owners are notified.~~

~~To ensure effective and timely post event analysis, it is important to have continuity of SER and FR, with sufficient data from bus locations across the BES. Of the BES bus locations determined in Requirement R1, there may be locations where the Transmission Owner of the bus location does not own all the Elements. This requirement ensures that all necessary BES Elements at a selected bus location have SOER and FR data available by requiring the Transmission Owner of that bus location to notify the other owners of their respective BES Elements that they require SER and FR per this standard. A 90 calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.~~

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker they own connected directly to the BES buses identified ~~per~~in Requirement R1 and associated with the BES Elements at those BES buses identified ~~per~~in Requirement R1. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) of SER data for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device interconnections and configurations which can include a single design standard as representative for common installations; or (2) actual data recordings.

Rationale for R2:

The intent is to capture SER data (opening/closing) for the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, time stamped according to Requirement R10 to a common clock, provides the basis for assembling the detailed sequence of events timeline of a power system disturbance. Other status monitoring indications can be used for devices other than circuit breakers.

~~Rationale for R3:~~

~~The intent is to capture SER data (opening/closing) for the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, timestamped, as per Requirement R10 to a common clock, provides the basis for assembling the detailed sequence of events timeline of a power system disturbance.~~

R3. Each Transmission Owner and Generator Owner shall have the following FR data to determine the following electrical quantities ~~at~~for each of the BES Elements they own connected to the BES buses identified ~~per~~in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 Phase-to-neutral voltages for each phase of each specified ~~line or~~ BES bus.

3.2 Each phase current and the residual or neutral current for the following BES Elements:

3.2.1~~.~~ Transformers that have a low-side operating voltage of 100kV or above.

3.~~2.~~2.2 Transmission lines.

M3. ~~**M3.**~~ The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) of FR data is sufficient to determine electrical quantities as specified in Requirement R3. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations including a single design standard as a representation for common installations; or (2) actual data recordings or derivations.

~~Rationale for R4:~~

~~The required electrical quantities may either be directly measured or derived if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all phase-to-neutral voltages are required to be determinable for each BES Bus identified in Requirement R1. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high side or the low side of the transformer.~~

Rationale for R3:

The required electrical quantities may either be directly measured or derivable if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all phase-to-neutral voltages are required to be determinable for each BES bus identified in Requirement R1. BES bus voltage data is adequate for system disturbance analysis. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high-side or the low-side of the transformer.

R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 A single record or multiple records that include:

- ~~—~~ A pre-trigger record length of at least two cycles and a post-trigger record length of at least 30 cycles for the same trigger point~~.~~, or
- ~~—~~ At least two cycles of the pre-trigger data, the first three cycles of the ~~fault~~post-trigger data, and the final cycle of the fault as seen by the fault recorder.

4.2~~.~~ A minimum recording rate of 16 samples per cycle.

4.3~~.~~ Trigger settings for at least the following:

4.3.1. Neutral (residual) overcurrent.

4.3.2. Phase undervoltage or overcurrent.

M4. The Transmission Owner or Generator Owner has evidence (electronic or hardcopyhard copy) that FR data meets Requirement R5R4. Evidence may include, but is not limited to: (1) device specification (R4, Part 4.2) and configuration (R4, Parts 4.1 and 4.3), or (2) actual data recordings or derivations.

Rationale for R4:

Time-stamped pre- and post-trigger fault data aid in the analysis of power system operations and determination if operation were as designed. System faults generally persist for a short time period, approximately 1 to 50 cycles; thus, a 50 cycle post trigger minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 50 contiguous cycles post-trigger.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point-on-wave data for recreating accurate fault conditions.

Rationale for R4:

Time stamped pre- and post-trigger fault data aid in the analysis of power system operations and determination if operations were as designed. System faults generally persist for a short time period, thus, a 30 cycle post-trigger minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 contiguous cycles post-trigger.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point on wave data for recreating accurate fault conditions.

R5. Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall identify BES Elements for which dynamic disturbance recorderrecording (DDR) data is required, notify within 90 calendar days other owners, if any, of BES Elements connected to those BES buses, if any, within 90 calendar days, that those BES Elements may require DDR data, and reevaluate the identified buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

5.1. The BES Elements shall include the following:

5.1.1. Generating resource(s) with:

- **5.1.1.1.** Gross individual nameplate rating greater than or equal to 500 MVA., or
- **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA. 1000 MVA.

5.1.2. Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines:

- Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection, or
- Transfer Paths in the Western Interconnection Path Rating Catalog, or
- Voltage stability limited transfer paths or load serving area, or
- Interfaces between Balancing Authority Areas, or
- Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC)).

5.1.3. Each terminal of a high- voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.

5.1.4. One or more BES Elements associated with Interconnection Reliability Operating Limits. (IROLs).

5.1.5. Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program.

5.2. The BES Elements shall include a minimum of:

5.2.1 One BES Element.

5.2.2 One additional BES Element perfor each additional 3,000 MW of its historical peak system Demand.

DRAFT

M5. The Responsible Entity has a dated (electronic or ~~hardcopy~~hard copy) list of BES Elements for DDR data, identified in accordance with Requirement R5, assessed within the required interval, dated evidence (electronic or ~~hardcopy~~hard copy) of notification to each Transmission Owner or Generator Owner of Elements identified in Requirement R5. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

Rationale for R5:

DDR plays a crucial role in wide-area disturbance analysis, and the Responsible Entity needs to ensure that there are sufficient BES Elements identified for DDR data capture. Additionally, DDR is used for capturing the Bulk Electric System transient and post-transient response and for validating the system performance. The requirement for DDR data for identified BES Elements, for the purpose of this standard, is based upon industry experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis.

From its experience with changes to the Bulk Electric System that would affect DDR, the DMSDT decided that the five calendar year re-assessment of the list is a reasonable interval for this review.

The DDR data is to be captured for a BES Element, and with the exception of HVDC, is obtainable from one terminal of an Element. This pertains to “major transmission interfaces”.

For HVDC (Part 5.1.3), each Transmission Owner is only responsible for DDR data for the Elements that it owns.

Part 5.1.5 is intended to have DDR data for at least one BES Element in a portion of the BES with a voltage response for system events that has required the installation of a UVLS.

It is intended that a Responsible Entity will have DDR data for one BES Element and one additional BES Element for each 3,000 MW of its historical peak system Demand.

Communication of selected Elements is required to ensure that the owners of the respective Elements are aware of their responsibilities under this standard. The Responsible Entity is only required to share the list of required Elements that each Transmission Owner and Generator Owner owns.

DRAFT

~~Rationale for R5:~~

~~DDR plays a crucial role in wide area disturbance analysis, and the Responsible Entity needs to ensure that there are sufficient BES Elements identified for DDR data capture. Additionally, DDR is used for capturing the Bulk Electric System transient and post-transient response and for validating the system performance. The requirement for DDR for identified BES Elements, for the purpose of this standard, is based upon industry experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis.~~

~~From its experience with changes to the Bulk Electric System that would affect DDR, the SDT decided that the five calendar-year re-assessment of the list is a reasonable interval for this review.~~
~~The DDR data is to be captured for a BES Element, and with the exception of HVDC, is obtainable from one terminal of an Element.~~

~~For HVDC (Part 5.1.3), each Transmission Owner is only responsible for DDR data for the Elements that it owns.~~

~~Sub-Part 5.1.5 is intended to have DDR data for at least one BES Element in a portion of the BES with a voltage response for system events that has required the installation of a UVLS.~~

~~It is intended that a Responsible Entity will have DDR data for one BES Element, and one more BES Element for each 3,000 MW of its historical peak system Demand.~~

~~Communication of selected Elements is required to ensure that the owners of the respective Elements are aware of their responsibilities under this standard. The Responsible Entity is only required to share the list of required Elements that each Transmission Owner and Generator Owner owns.~~

R6. Each Transmission Owner shall have DDR data for each BES Element ~~they own~~it owns for which it received notification as ~~per~~identified in Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

6.1 One phase-to-neutral or positive sequence voltage.

6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.

6.3 Real Power and Reactive Power flows expressed on a three- phase basis corresponding to all circuits where current measurements are required.

6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

M6. The Transmission Owner has evidence (electronic or ~~hardcopy~~hard copy) of DDR data to determine electrical quantities as specified in Requirement R6. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.

Rationale for R6:

Dynamic disturbance recording is used for measurement of transient response to system disturbances, during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined (calculated, derived, etc.).

Because all of the buses within a location are at the same frequency one frequency measurement is adequate.

The data requirements for PRC-002-2 are based on a system configuration assuming all normally closed circuit breakers on a bus are closed.

~~Rationale for R6:~~

~~Dynamic Disturbance Recording is used for measurement of transient response to system disturbances, during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined - calculated, derived, etc.~~

~~Because all of the buses within a location are at the same frequencies one frequency measurement is adequate. The data requirements for PRC-002-2 are based on a system configuration assuming all normally-closed circuit breakers on a bus are closed.~~

R7. Each Generator Owner shall have DDR data for each BES Element ~~they own as per~~it owns and is notified according to Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step- up (GSU) transformer high-side or low-side voltage level.

7.2 The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

7.3 Real Power and Reactive Power flows expressed on a three- phase basis corresponding to all circuits where current measurements are required.

7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1.

M7. –The Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) of DDR data to determine electrical quantities as specified in Requirement ~~R9~~R7. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.

~~Rationale for R7:~~

~~A crucial part of wide-area disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high- or low-side of the generator step-up (GSU) transformer, measuring the specified electrical quantities, to adequately capture generator response. This standard defines the 'what' of DDR, not the 'how.' GOs may install this capability or, where the TO already has suitable DDR data, contract with the TO. However, the Generator Owner is still responsible for the provision of this data.~~

Rationale for R7:

A crucial part of wide-area disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high or low-side of the generator step up (GSU) transformer, measuring the specified electrical quantities, to adequately capture generator response. This standard defines the 'what' of DDR, not the 'how.' Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.

R8. Each Transmission Owner and Generator Owner ~~that is~~ responsible for DDR data ~~as per~~in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of

continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~-~~**8.1** Triggered record lengths of at least three minutes.

8.2~~.~~ At least one of the following three triggers:

- Off nominal frequency trigger set at:

	Low	High
o Eastern Interconnection	<59.75 Hz	>61.0 Hz
o Western Interconnection	<59.55 Hz	>61.0 Hz
o ERCOT Interconnection	<59.35 Hz	>61.0 Hz
o Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

o Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
o Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
o ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
o Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds.

~~no lower than 85% of normal operating voltage for a duration of 5 seconds~~

M8. Each Transmission Owner and Generator Owner has dated evidence (electronic or ~~hardcopy~~hard copy) of data recording and storage in accordance with Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings.

Rationale for R8:

Large scale system outages generally are an evolving sequence of events that occur over an extended period of time, making DDR essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data is available for the entire event.

Existing DDR data recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

~~Rationale for R8:~~

~~Large scale system outages generally are an evolving sequence of events that occur over an extended period of time, making DDR essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data are available for the entire Disturbance.~~

~~Existing DDR recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).~~

R9. Each Transmission Owner and Generator Owner in Requirement R5 shall have DDR data~~, for the Elements as per Requirement R5, which conform~~ that conforms to the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 Input sampling rate of at least 960 samples per second.

9.2 Output recording rate of electrical quantities of at least 30 times per second.

M9. The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) that DDR data meets Requirement R9. Evidence may include, but is not limited to: (1) device specification and configuration, or (2) actual data recordings (R9, Part 9.2).

Rationale for R9:

An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle, on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.

An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor the low frequency oscillations typically of interest during power system disturbances.

~~Rationale for R9:~~

~~An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle, on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.~~

~~An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor low frequency oscillations typically of interest during power system disturbances.~~

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER, FR and DDR data for the BES ~~bus~~ buses identified ~~per~~in Requirement R1 and BES Elements identified ~~per~~in Requirement R5 to within ± 2 milliseconds of Coordinated Universal Time (UTC), time stamped with or without a local time offset. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M10. The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy)~~hard copy) of time synchronization described in Requirement R10. Evidence may include, but is not limited to: (1) device specification and configuration, or (2) actual data recordings, or (3) station drawings.

~~Rationale for R10:~~

~~Time synchronization of disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.~~

~~Accuracy of ±2 milliseconds for time synchronization is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:~~

~~"Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…"~~

~~Also, from the U.S. Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:~~

~~"Establishing a precise and accurate sequence of outage related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time stamped, there was some variance from source to source in how the time stamping was done, and not all of the time stamps were synchronized…"~~

~~From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.~~

~~The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.~~

~~Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.~~

Rationale for R10:

Time synchronization of disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of ±2 milliseconds for time synchronization is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

"Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…"

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

"Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…"

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.

Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.

R11. Each Transmission Owner and Generator Owner shall provide all SER, FR, and DDR data for the BES ~~bus locations~~buses identified ~~per~~in Requirement R1 and BES Elements identified ~~per~~in Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1. The recorded data will be provided within 30 calendar days of a request.

11.2. The recorded data will be retrievable for the period of 10 calendar days preceding a request.

11.3. SER data will be provided in Comma Separated Value (.CSV) format following Attachment 2.

11.4. FR and DDR data will be provided in electronic C37.111, (C37.111-2013 or later) IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files.

11.5. Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).

M11. The Transmission Owner or Generator Owner has evidence (electronic or hardcopyhard copy) data was submitted upon request in accordance with Requirement R11. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records, (2) device specification and configuration, or (3) actual data recordings.

Rationale for R11:

Multiple entities and data recordings may be involved in wide-area disturbance analysis. Standardized file format and naming conventions improves timely analysis.

The DMSDT determined that providing the data within 30 calendar days is reasonable based on normal business operations workload.

For Part 11.2, the DMSDT intends for data to be available for 10 days preceding a request for that data. Requests are usually initiated the same or next day following an event for which data is requested. A 10 calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requester of data has to be aware of the Part 11.2 10 day retrievability. Realistic overwrite concerns may have to consider the recording capability implemented.

Part 11.4 specifies the IEEE C37.111-2013 COMTRADE format for the FR and DDR data. IEEE C37.111 is the Standard for Common Format for Transient Data Exchange, and it is well established in industry. It is necessary to specify a standard format as it will be incorporated with other submitted data to provide a detailed analysis of a power system disturbance. C37.111-2013 is a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.

R12. Each Transmission Owner and Generator Owner shall, within 90 calendar days of the discovery of a failure of the recording capability for the SER and, FR data at the BES buses identified per Requirement R1 or DDR data for the BES Elements identified per Requirement R5, shall, restore the recording capability or develop a timeline for restoration and a Corrective Action Plan (CAP), to be submitted) for submission to the Regional Entity, to restore the recording ability which includes a timeline for the restoration.: *[:[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M12. The Transmission Owner or Generator Owner has dated evidence (electronic or ~~hardcopy~~hard copy) that meets Requirement R12. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date the data recording was restored, or (3) dated CAP transmittals to the Regional Entity.

~~Rationale for R12:~~

~~Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90 calendar days to ensure that adequate data is available for event analysis. Therefore, it is required to return the data recording ability to service within 90 calendar days of a discovery of failure. If the Disturbance Monitoring Equipment (DME) cannot be returned to service within 90 calendar days (e.g. budget cycle, service crews, vendors, etc.), the Entity must report it to the Regional Entity along with a Corrective Action Plan for returning the equipment to service. The timeline required for the CAP depends on the entity and they type of data required. For example, DDR data from a generator may not be restored until the next outage cycle. A CAP is not necessary if the recording capability is restored within 90 day of the discovery of the failure.~~

Rationale for R12:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90 calendar days to ensure that adequate data is available for event analysis. Therefore, it is required to return the data recording capability to service within 90 calendar days of a discovery of failure. If the Disturbance Monitoring Equipment (DME) cannot be returned to service within 90 calendar days (e.g. budget cycle, service crews, vendors, etc.), the Entity must develop a Corrective Action Plan (CAP) for restoring the data recording capability. The timeline required for the CAP depends on the entity and the type of data required. For example, DDR data from a generator may not be restored until the next outage cycle.

~~Rationale for R11:~~

~~Multiple entities and data recordings may be involved in wide area disturbance analysis. Standardized file format and naming conventions improves timely analysis.~~

~~The SDT determined that providing the data within 30 calendar days is reasonable based on normal business operations workload. A 10 calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities how long the data will be available.~~

~~For Part 11.2, the SDT intends for data to be available for 10 days preceding a request for that data. Requests are usually initiated the same or next day following an event for which data is requested. A 10 calendar day time frame provides a practical limit on the amount of data required to be stored and lets the requesting entities how long the data will be available. The requester of data has to be aware of the Part 11.2 10 day retrievability.~~

~~Realistic overwrite concerns may have to consider the recording capability implemented.~~

~~Part 11.4 specifies the IEEE C37.111-2013 COMTRADE format for the FR and DDR data. IEEE C37.111 is the Standard for Common Format for Transient Data Exchange, and it is well established in the industry. It is necessary to specify a standard format as it will be incorporated with other submitted data to provide a detailed analysis of a power system disturbance. C37.111-2013 is a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.~~

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years.

The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity ~~(Planning Coordinator or Reliability Coordinator)~~ is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

Methodology for Selecting Buses for Capturing Sequence of Events ~~Recorder~~Recording (SER) and Fault ~~Recorder~~Recording (FR) Data

~~Locations Selection Methodology~~

(Requirement R1)

To identify monitored BES ~~bus locations~~buses for Sequence of Events ~~Recorder~~Recording (SER) and Fault ~~Recorder~~Recording (FR) data required by Requirement 1 ~~of PRC-002-2~~, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES buses that it owns.

For the purposes of this standard, a single BES bus ~~location~~ includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus ~~locations~~.

Step 2. Reduce the list to those BES buses that have a maximum available calculated three phase short circuit MVA of 1500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES buses ~~-~~on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer ~~bus locations~~buses, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 BES buses determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20%.

Step 6. Reduce the BES buses on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

- 1500 MVA or
- 20% of median MVA level determined in Step 5.

Step 7. If there are no BES buses on the list: the procedure is complete and no FR and SER data will be required. Proceed to Step 9.

If the list has 11 or fewer BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 9.

If the list has more than 11 BES buses: ~~FR~~SER and ~~SER~~FR data is required on at least the 10% of the BES buses, determined in Step 6, with the highest maximum

available calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. ~~FR~~SER and ~~SER~~FR data is required at additional BES buses on the list determined in Step 6. The aggregate of the number of BES buses determined in Step 7 and this Step will be at least 20% of the BES ~~bus~~buses determined in Step 6.

The additional BES buses are selected, at the Transmission Owner's discretion, to provide maximum wide-area coverage for ~~FR~~SER and ~~SER~~FR data, therefore the following types of BES buses are recommended:

- Electrically distant buses or electrically distant from other DME devices.
- Voltage sensitive areas.
- Cohesive load and generation zones.
- BES buses with a relatively high number of incident transmission circuits.
- BES buses with reactive power devices.
- Major Facilities interconnecting outside the Transmission Owner's area.

Step 9. The list of monitored ~~locations~~BES buses for ~~FR~~SER and ~~SER~~FR data for ~~PRC-002-2~~ Requirement R1 is the aggregate of the BES buses determined in Steps 7 and 8.

Guidelines and Technical Basis Section

Introduction

The emphasis of PRC-002-2 is not on how Disturbance Monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance Monitoring capability to ensure the completeness of BES data capture.

~~From a compliance perspective, questions have been raised by industry regarding how conformance to this standard would be judged during a natural disaster which most likely would cause abnormal system conditions for the capturing of data that PRC-002-02 addresses, and also cause the loss of Disturbance Monitoring capability. This is addressed by NERC in its Appendix 4B Sanction Guidelines of the North American Electric Reliability Corporation, Section 2 Basic Principles, Section 2.8 Extenuating Circumstances effective Dec. 20, 2012:~~

~~"In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate penalties."~~

The data requirements for PRC-002-2 are based on a system configuration assuming all normally~~-~~ closed circuit breakers on a bus are closed.

Guideline for Requirement R1:

Sequence of events and fault records for the analysis, reconstruction, and reporting of system disturbances is important. However, SER and FR data are not required at every ~~location~~BES bus on the BES to conduct adequate or thorough analysis of a disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual circuit sallow precise reconstruction of events of both localized and wide-area disturbances.

In addition, more quality information is always better than less when performing event analysis. However, 100% coverage of all elements is not practical or required for effective analysis of wide-area disturbance. Therefore, selectivity of required ~~locations~~BES buses to monitor is important for the following reasons:

1. Identify key ~~locations~~BES buses where crucial information is available when required.
2. Excessive overlap of coverage is avoided.
3. Avoid gaps in critical coverage.
4. Provide coverage of system elements that could propagate a disturbance.
5. Avoid mandates to cover system elements that are more likely to be a casualty of a disturbance rather than a cause.
6. Establish selection criteria to provide effective coverage in different regions of the continent.

~~Listed as follows, the~~The major characteristics available to determine the selection process are:

1. System voltage level;
2. The number of transmission lines into a substation or switchyard;
3. The number and size of connected generating units;
4. The available short circuit levels.

Although it is straightforward to establish ~~a~~ bright line criteria for the application of identified ~~locations~~BES buses, analysis was required to establish a sound technical basis to fulfill the required objectives~~, rather than using opinions, feelings, or anecdotal judgment based upon experience in one area~~.

To answer these questions and establish criteria for ~~location~~BES buses of SER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The ~~team~~MVA Team collected information from a wide variety of transmission systems throughout the continent to analyze transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SER and FR coverage, based solely upon simple, bright-line characteristics, such as the number of lines into a substation or switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective ~~Location Selection Procedure~~Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

~~The Location Selection Procedure~~The Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) data is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent.
2. It is likely to select buses near large generation centers.
3. It is likely to select buses where delayed clearing can cause electric system cascading outages.
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater system impact.

To perform the ~~simple~~ calculations of Attachment 1~~ of the standard~~, the following information below is required and the following steps (provided in summary form) are required for systems with more than 11 BES ~~bus locations~~buses with three~~-~~ phase short circuit levels above 1500 MVA.

1. Total number of BES buses in the transmission system under evaluation.
   a. Only tangible substation or switchyard buses are included.
   b. Pseudo buses created for analysis purposes in system models are excluded.
2. Determine the three~~-~~ phase short~~-~~ circuit MVA for each bus.
3. Exclude buses from the list with short circuit levels below 1500 MVA.
4. Determine the median short circuit for the top 11 buses on the list (position number 6).

5. Multiply median short circuit level by 20%.
6. Reduce the list of BES buses with short circuit levels higher than 20% of the median.
7. Apply SER and FR at buses with short circuit levels in the top 10% of the list (from 6).
8. Apply SER and FR at buses at an additional 10% of the list using engineering judgment, and allowing flexibility to factor in the following considerations.:
   - a. Electrically distant bus locationsBES buses or electrically distant from other DME devices
   - b. Voltage sensitive areas
   - c. Cohesive load and generation zones
   - d. Bus locationsBES buses with a relatively high number of incident transmission circuits
   - e. Bus locationsBES buses with reactive power devices
   - f. Major facilities interconnecting outside the Transmission Owners' area.

There is no requirement for SER and FR for generating units in this standard.For event analysis purposes, more valuable information is attained about generators and their response to system events pre- and post-contingency through DDR data versus SER or FR records. SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). For event analysis purposes, more valuable information is attained about generators and their response to system events pre- and post-contingency through DDR data versus SER or FR recordsAs a result, this standard only requires DDR data.

The reevaluation interval of five years was chosen based upon the experience. Five years is long enough to avoid unnecessary reevaluations, but long enough of the DMSDT to address changing system configurations. while creating balance in the frequency of reevaluations.

Guideline for Requirement R3R2:

Analyses of wide-area disturbances often begin by evaluation of SERs to help determine the initiating event(s) and follow the disturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR data, since generator loading can be essentially zero regardless of breaker position. SER ofdata for generator breaker operations provides little useful data of generator loading.

Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers atconnected to the Transmission Owner's bus location. .

Guideline for Requirement R3:

The BES buses for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The Elements connected to those bus locationsBES buses for which FR data is required include:

- ~~Transmission lines, including interconnection facilities with generating resources~~
- Transformers with a low-side operating voltage of 100kV or above
- Transmission lines

Only those Elements that are identified as BES as ~~per~~identified in the latest in effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100 kV are not included.

FR data must be determinable from each terminal of ~~an~~a BES Element connected to applicable BES buses.

Generator step~~-~~ up transformers (GSU) are excluded from the above based on the following:

- Current contribution from a generator in case of fault ~~in~~on the transmission system will be captured by FR data on the transmission system.
- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed.

The ~~SDT~~DMSDT, after ~~consultating~~consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data.

Recording of Electrical Quantities

For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such ~~FRs~~FR data it is possible to determine all fault types. FR data also ~~augment~~augments SERs in evaluating circuit breaker operation.

Current Recordings

The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a transmission system is generally well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120°, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_r$, is calculated as a sum of vectors of three phase currents:

$\mathbf{I}_r = 3 \bullet \mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$ ~~Equation 1~~

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's ~~law~~Law. Fault currents for one of the BES Elements connected to a particular BES bus ~~location~~

can be derived as a vectorial sum of fault currents recorded at the other BES Elements connected to that BES bus ~~location~~.

Voltage Recordings

Voltages are to be recorded at applicable BES buses. Note that the Requirement calls for the voltages to be determinable. There are two options for recording phase-to-neutral voltages at applicable ~~bus locations~~BES buses:

1. At terminals of each line. This option would apply to lines that have a full set of VTs/CVTs required for distance protections, which is quite common in practice.
2. At a particular BES bus, in which case all the BES Elements connected to that common BES bus are covered.

Guideline for Requirement R4:

This requirement directs the applicable entities having FR determined ~~per~~as identified in Requirement R1 that meets the following:

Requirement R4, Part 4.1 specifies the minimum amount of FR data. Pre- and post-~~-~~trigger fault data along with the SER breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection system operations after a fault to determine if ~~the~~a protection system operated as designed. Generally speaking, BES faults and the system response to them occur within a very short time period, approximately 1 to 30 cycles, thus a 30 cycle post-trigger record length captured adequate data. Multiple records allow for legacy microprocessor relays which when time synchronized to a common clock are capable of providing adequate fault data but not capable of providing fault data in a single record with ~~53~~30 cycle post trigger data.

Requirement R4, Part 4.2 specifies the minimum recording rate of FR data. A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for SER.

Requirement R4, Part 4.3 specifies the minimum triggers to ensure FR data is available. A trigger is a set point on an ~~Oscilloscope~~oscilloscope or ~~Fault Recording~~FR device. The trigger can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R4, Part 4.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R4, Part 4.3.2 specifies a phase undervoltage or overcurrent trigger for phase-to-phase faults.

Guideline for Requirement R5:

DDR data is used for wide-area disturbance monitoring to determine the system's electromechanical transient and post-transient response and validate system model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the system's dynamic response and ensuring sufficient coverage to determine system performance, DDR is required ~~at~~for key ~~locations~~BES Elements in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient DDR data capture for, at a minimum, one BES Element and then one additional BES Element per 3,000 MW of historic peak Demand. This DDR data is included to provide adequate system-~~-~~wide coverage across an

Interconnection. To clarify, if any of the key BES Elements requiring DDR monitoring are within the Responsible Entity's area, DDR data capability is required. If a Responsible Entity (PC or RC) does not meet the requirements of Part 5.1, additional coverage ~~should~~had to be specified.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a disturbance helps the analysis of large Disturbances. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The ~~team~~DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The ~~team~~DMSDT determined the following basic information about the generating units of interest (current ~~NA~~North America fleet, i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.
- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.
- The information in the spreadsheet does not provide information by which the plant location of each unit can be determined, i.e. the ~~team~~DMSDT could not use the information to determine which units were located together at a given generation site or facility.

DRAFT

From this information, the ~~team~~DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings "greater than or equal to 500 MVA~~.~~". The ~~500MVA~~500 MVA individual unit size threshold was selected because this number roughly accounts for 47% of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5% of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, Part 5.1.2 is included to capture larger units located at large generating plants which could pose a stability risk to the system if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1000 MVA. The ~~300MVA~~300 MVA threshold was chosen based on the ~~Team's~~DMSDT's judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. The incremental impact to the number of units requiring monitoring is expected to be relatively low. ~~Wording was added to cover combined cycle plants, in which the loss of one unit will lead to the loss of a companion unit within a very short period of time. Because of the loss of the entire combined cycle plant, 500MVA was chosen as the threshold.~~

Major transmission interfaces are explicitly defined based on the Interconnection since a common naming convention for these interfaces does not exist. However, this data may be calculated, rather than directly measured~~,~~ if the accurate quantity can be derived (e.g. either end of the Flowgate line could be monitored since the other end could be derived). In the Western Interconnection, these major transmission interfaces are defined by the Regional Entity. In the ERCOT and Quebec Interconnections, the Responsible Entity will be required to identify those interfaces that are deemed significant enough to require monitoring (i.e. are utilized for real-time limits such as System Operating Limits or "contingencies"). Only one BES Element associated with a major transmission interface needs DDR data capability.

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective ~~location~~BES Element to monitor for DDR such that action of the UVLS or voltage instability could be captured on the BES. For example, a major 500kV or 230kV substation on the EHV system close to the load pocket where the UVLS is deployed would likely be a valuable ~~location~~BES Element for DDR coverage and would aid in post-disturbance analysis of the load area's response to large system deviations (voltage, frequency, etc.). It is ~~not~~ intended to have DDR

data for ~~all areas affected by~~ "Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program."

Guideline for Requirement R6:

DDR data shows transient response to system disturbances after fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. For example, a breaker-and-a-half or double bus configuration has a North (or East) Bus and South (or West) Bus, ~~which~~ would require that both buses should have voltage recording~~,~~ because either can be taken out of service indefinitely with the targeted BES Element remaining in service. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either of the bus voltage sources to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

It must be emphasized that the data requirements for PRC-002-2 are based on a system configuration assuming all normally~~-~~ closed circuit breakers on a bus are closed.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current record is also acceptable.

For all circuits where current recording is required, real and reactive power will be recorded on a three~~-~~ phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R7:

All Guidelines specified for Requirement R6, ~~-~~apply to Requirement R7~~, too~~. Since either of the high or low~~-~~side windings of the generator step~~-~~ up (GSU) transformer may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As ~~it~~ was explained in the Guideline for R6, the BES is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Again it must be emphasized that the data requirements for PRC-002-2 are based on a system configuration assuming all normally~~-~~ closed circuit breakers on a bus are closed.

Guideline for Requirement R8:

Large scale system outages are generally an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the BES Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist ~~at~~for some ~~locations~~BES Elements that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R8, Part 8.2:

- Off nominal frequency triggers are used to capture high or low frequency excursions of significant size based on the Interconnection size and inertia.
- Rate- of- change of frequency triggers are used to capture major changes in system frequency which could be caused by large changes in generation or load, or possibly changes in system impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR) events. A sustained voltage of 85% is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R9:

DDR data contains the dynamic response of a power system to a disturbance and is used for analyzing complex power system events. This recording is typically used to capture short term and long- term disturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in ~~Fault Recorder~~FR data.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency in sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better the representation. In the abnormal conditions of interest (e.g. faults or other disturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine- generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement ~~R110:~~ ~~See rationale.~~R10: Time synchronization of disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of ±2 milliseconds for time synchronization is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

"Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…"

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

"Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…"

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.

Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.

Guideline for Requirement R11:

This requirement directs the applicable entities that upon requests from the Reliability Coordinator, Regional Entity or NERC to provide SER, FR data for BES buses determined in requirement R1 and DDR data for BES Elements determined per requirement R5. To facilitate the analysis of BES disturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R11, Part 11.1 specifies the maximum ~~timeframe~~time frame of 30 calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor.

Requirement R11, Part 11.2 specifies that the minimum time period of 10 calendar days ~~that~~for which the data will be retrievable preceding a request. With the equipment in use that has the

capability of ~~making a~~ recording data, having the data retrievable for the 10 calendar days preceding a request is realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days. To clarify the 10 calendar day time frame, an incident occurs on a Day 1. If a request for data is made on Day 6, then that data has to be provided to the requester within 30 calendar days. However, if a request for the data is made on Day 11, that is outside the 10 calendar days specified in the requirement, and an entity would not be out of compliance if it did not have the data.

Requirement R11, Part ~~1~~11.3 specifies a Comma Separated Value (.CSV) format ~~per~~according to Attachment 2 for the SER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power system disturbance.

Requirement R11, Part 11.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange it is well established in the industry. It is necessary to specify a standard format as it will be incorporated with other submitted data to provide a detailed analysis of a power system disturbance. C37.111-2013 is a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.

Requirement R11, Part ~~1~~11.5 specifies the IEEE C37.232 COMNAME format for the naming the data files of the SER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files first version was approved in 2007. From the August 14, 2003 blackout there was thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and because of that it became difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in ~~their~~its initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of ~~their~~its top ten recommendations.

Guideline for Requirement R12:

This requirement directs the respective owners of Transmission and ~~Generator~~generator equipment to be alert to the proper functioning of equipment used for SER, FR, and DDR data capabilities for the BES buses and BES Elements which had been established in Requirements R1 and R5 and are found to be out of service. The owners are to ~~-~~ return the capability to service within 90 calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a "reasonable" amount of capability out of service does not result in lack of sufficient data for coverage of the system. Furthermore, 90 calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to return the capability to service within 90 calendar days, the requirement further provides that, for such cases, the entity must ~~provide~~develop a timeline and a Corrective Action Plan (CAP) for submission to the Regional

Entity. These actions are considered to be appropriate to provide for robust and adequate data availability.

DRAFT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Standard Authorization Request (SAR) posted for comment on January 20, 2010.
2. Revised SAR with supporting draft standard language posted for informal comment on September 10, 2013.

Description of Current Draft

This posting provides a complete draft standard and supporting documentation for an additional 30-day informal comment period to elicit further feedback from industry.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Ballot	June 2014
Final Ballot	September 2014
BOT Adoption	November 2014

Effective Dates

The standard shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Completed revision, merging and updating PRC-010-0, PRC-020-1, PRC-021-1, and PRC-022-1.	

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Undervoltage Load Shedding Program (UVLS Program): An automatic load shedding program consisting of distributed relays and controls used to mitigate the risk of Cascading, voltage instability, voltage collapse, or uncontrolled separation resulting from undervoltage conditions. Centrally-controlled undervoltage-based load shedding is not included.

Rationale for Definition: As part of the development of PRC-010-1, the drafting team found it necessary to introduce the term Undervoltage Load Shedding Program (UVLS Program) to clearly establish PRC-010-1's applicability. The following discussion and characteristics were critical elements to the development of the proposed definition.

The definition for the term UVLS Program includes automatic load shedding programs that utilize only voltage inputs at locations where action is taken to shed load. Therefore, the failure of a single component is unlikely to affect the reliable performance of the program.

Centrally-controlled undervoltage-based load shedding is excluded, because the load shedding logic may utilize 1) voltage inputs from multiple locations; and/or 2) inputs other than voltages, such as generator reactive reserves, facility loadings, and equipment statuses. As such, its reliable performance could be affected by a single component failure, which is consistent with the nature of Special Protection Systems. Therefore, the drafting team has recommended that Project 2010-05.2 Protection System (Special Protection Systems) include centrally-controlled undervoltage-based load shedding in the definition of a Special Protection System.

The definition of UVLS Program is independent of whether the undervoltage load shedding relays are armed manually or automatically since the arming is done in anticipation of extreme conditions and not during the events when load shedding needs to occur.

In the current inventory of NERC Reliability Standards, there is one instance of the term undervoltage load shedding program in NUC-001-2.1. This standard is part of an open standard revision project, and the finalized definition of UVLS Program will be forwarded to that drafting team for consideration. Likewise, future projects containing standards that feature variations of the term (e.g., undervoltage load shedding system) will also be advised to consider the newly defined term.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Undervoltage Load Shedding**

2. **Number: PRC-010-1**

3. **Purpose:** To establish an integrated and coordinated approach to the design, evaluation, and reliable operation of Undervoltage Load Shedding Programs (UVLS Programs).

Rationale for Applicability: This standard is applicable to Planning Coordinators and Transmission Planners that have or are developing a UVLS Program, and to Distribution Providers and Transmission Owners responsible for the ownership, operation, or control of UVLS equipment as required by the UVLS Program established by the Transmission Planner or Planning Coordinator. These Distribution Providers and Transmission Owners are referred to as UVLS entities for the purpose of this standard.

The applicability includes both the Planning Coordinator and Transmission Planner because either may be responsible for designing and coordinating the program based on agreements, memorandums of understanding, or tariffs.

The phrase "Planning Coordinator or Transmission Planner" provides the flexibility for applicability to the entity that will perform the action. The expectation is not that both parties will perform the action, but rather that the Planning Coordinator and Transmission Planner will engage in discussion to determine the appropriate responsible entity.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Planning Coordinator

   4.1.2 Transmission Planner

   4.1.3 Undervoltage load shedding (UVLS) entities – Distribution Providers and Transmission Owners responsible for the ownership, operation, or control of UVLS equipment as required by the UVLS Program established by the Transmission Planner or Planning Coordinator.

5. Background:

UVLS Programs must work correctly to properly protect system reliability. Ensuring program effectiveness and coordination, and ensuring accurate and timely program implementation, assessment, and data will improve UVLS Program performance.

PRC-010-1 – Undervoltage Load Shedding is a consolidation and revision of the following Reliability Standards:

- PRC-010-0 – Assessment of the Design and Effectiveness of UVLS Program
- PRC-020-1 – Under-Voltage Load Shedding Program Database
- PRC-021-1 – Under-Voltage Load Shedding Program Data
- PRC-022-1 – Under-Voltage Load Shedding Program Performance

The UVLS Standard Drafting Team (or drafting team) developed the revised PRC-010-1 to meet the following objectives:

- Address the FERC directive in Order No. 693, Paragraph 1509 to modify PRC-010-0 to require an integrated approach to all protection systems.
- Replace the applicability to and involvement of the Regional Reliability Organization (RRO) in PRC-020-1 and PRC-021-1.
- Consolidate the UVLS-related standards into one comprehensive standard (similar to the construct of FERC-approved PRC-006-1– Automatic Underfrequency Load Shedding).
- Clearly identify and separate centrally-controlled undervoltage-based load shedding due to the reliability requirements needed for this type of load shedding as compared to other UVLS systems.
- Create a single, results-based standard that addresses current reliability issues associated with UVLS.

As noted above, the drafting team found it is necessary to establish a bright line with respect to the characteristics of centrally-controlled undervoltage-based load shedding in regard to its reliability requirement-related needs. Because the reliable performance of centrally-controlled undervoltage-based load shedding could be affected by a single component failure, the drafting team maintains that this type of load shedding is consistent with the nature of Special Protection Systems (SPSs) and should be covered by SPS-related Reliability Standards.

Therefore, PRC-010-1 introduces a new NERC Glossary term, UVLS Program, to clearly establish PRC-010-1's applicability to automatic load shedding programs consisting of distributed relays and controls used to mitigate the risk of Cascading, voltage instability, voltage collapse, or uncontrolled separation resulting from undervoltage conditions. It is noted that this term excludes centrally-controlled undervoltage-based load shedding.

Subsequently, since the current NERC Glossary definition of Special Protection System excludes UVLS, Project 2010-05.2 Protection Systems: Phase 2 (Special Protection Systems) will adjust the definition to exclude only UVLS Programs as defined above and therefore include centrally-controlled undervoltage-based load shedding.

Requirements of the revised Reliability Standard PRC-010-1 meet the following objectives:

- Demonstrate a UVLS Program's effectiveness prior to implementation, including the program's coordination with other protection systems and generator voltage ride-through capabilities.
- Adhere to UVLS Program specifications and implementation schedule.
- Perform periodic assessment and performance analysis of UVLS Programs and resolve identified deficiencies.
- Maintain and share UVLS Program data.

Also of note, Project 2009-03 Emergency Operations is retiring specific requirements and revising EOP-003-2 – Load Shedding Plans to eliminate identified redundancy between PRC-010-1 and EOP-003-2. In addition, the UVLS drafting team's intention is for PRC-004 to address appropriate types of UVLS Program Misoperations (as previously addressed by PRC-022-1); the introduction of this revision to PRC-004 is pending outcomes of PRC-004-3, which is currently in final stages of development under Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

B. Requirements and Measures

Rationale for R1: In Paragraph 1509 from Order No. 693, FERC directed NERC to require an integrated and coordinated approach to all protection systems. The drafting team agrees that a lack of coordination among protection systems is a key risk to reliability, and that each Planning Coordinator or Transmission Planner that develops a UVLS Program should demonstrate the program's viability and effectiveness prior to implementation. This demonstration should include studies and analyses used when developing the program that show implementation of the program resolves the identified undervoltage issues that led to its design. These studies and analyses should also show that the UVLS Program is integrated through coordination with generator voltage ride-through capabilities and other protection and control systems. Though presented as separate items, the drafting team recognizes that the studies that show coordination considerations and that the program addresses undervoltage issues may be interrelated and presented as one comprehensive analysis.

R1. Each Planning Coordinator or Transmission Planner that is developing a UVLS Program shall demonstrate its effectiveness prior to implementing the program. This demonstration shall include, but is not limited to, studies and analyses that show: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. The implementation of the UVLS Program resolves the identified undervoltage issues that led to the UVLS Program's design.

1.2. The UVLS Program is integrated through coordination with generator voltage ride-through capabilities and other protection and control systems, including, but not limited to, transmission line protection, auto-reclosing, SPSs, and other undervoltage-based load shedding programs.

M1. Acceptable evidence may include, but is not limited to, studies and analyses, date-stamped reports, or other documentation detailing the effectiveness of the UVLS Program.

Rationale for R2: UVLS entities must implement a UVLS Program according to the specifications and schedule provided by the Planning Coordinator or Transmission Planner. If UVLS entities do not implement the UVLS Program according to the specifications and schedule provided, the UVLS Program may not be effective and may not achieve its intended goal.

R2. Each UVLS entity shall adhere to the UVLS Program specifications and implementation schedule determined by its Planning Coordinator or Transmission Planner. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

M2. Acceptable evidence may include, but is not limited to, date-stamped documentation identifying the feeders armed with UVLS relays, the UVLS relay settings, and the associated Load summaries.

Rationale for R3: A periodic comprehensive assessment (detailed analysis) should be conducted to capture the accumulated effects of minor changes to the system that have occurred since the last assessment was completed, and should include an evaluation of each UVLS Program to ensure the continued integration through coordination. This comprehensive assessment supplements the TPL-001-4 annual assessment requirement to evaluate the impact of protection systems.

Based on the drafting team's knowledge and experience, and in keeping with time frames contained in similar requirements from other PRC Reliability Standards, 60 calendar months was determined to be the maximum amount of time allowable between assessments. The drafting team asserts that there will be circumstances other than a periodic assessment, such as material changes to system topology or operating conditions, that could affect the performance of a UVLS Program and trigger assessments prior to the end of the 60-calendar month period. If so, the 60-calendar month time frame would reset after each assessment.

R3. Each Planning Coordinator or Transmission Planner shall perform a comprehensive assessment to evaluate the effectiveness of each existing UVLS Program in its area at least once every 60 calendar months or sooner if material changes are made to system topology or operating conditions. The assessment shall include, but is not limited to, studies and analyses that evaluate whether: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. The UVLS Program resolves the identified undervoltage issues for which the UVLS Program is designed.

3.2. The UVLS Program is integrated through coordination with generator voltage ride-through capabilities and other protection and control systems, including, but not limited to, transmission line protection, auto-reclosing, SPSs, and other UVLS programs.

M3. Acceptable evidence may include, but is not limited to, date-stamped reports or other documentation detailing the assessment of the UVLS Program.

Rationale for R4: A UVLS Program not functioning as expected during a voltage excursion event for which the UVLS Program was designed to operate presents a critical risk to system reliability. Therefore, a timely assessment to evaluate whether the UVLS Program resolved the undervoltage issues associated with the applicable event is essential. The 12 calendar months (from the date of the event) provides adequate time to coordinate with other Planning Coordinators and Transmission Planners, Transmission Operators, and UVLS entities, simulate pre- and post-event conditions, and complete the performance assessment.

R4. Each Planning Coordinator or Transmission Planner shall, within 12 calendar months of an event that resulted in a voltage excursion for which the program was designed to operate, perform an assessment to evaluate whether the UVLS Program resolved the undervoltage issues associated with the event. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M4. Acceptable evidence may include, but is not limited to, date-stamped event data, event analysis reports, or other documentation detailing the assessment of the UVLS Program.

Rationale for R5: If program deficiencies are identified during any assessment of a UVLS Program, a CAP must be developed to address the deficiencies. Based on the drafting team's knowledge and experience with UVLS studies, three calendar months was determined to provide a judicious balance between the reliability need to address deficiencies expeditiously and time needed to consider potential solutions, coordinate resources, and develop a CAP.

R5. Each Planning Coordinator or Transmission Planner that identifies deficiencies in its UVLS Program during an assessment shall develop a Corrective Action Plan (CAP) to address the deficiencies within three calendar months of identification. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M5. Acceptable evidence must include a CAP that addresses identified deficiencies and may also include date-stamped reports or other documentation supporting the CAP.

Rationale for R6: Having accurate and current data is required for the Planning Coordinator to perform undervoltage studies and for use in event analyses. Requirement R6 supports this reliability need by requiring the UVLS entity to provide UVLS Program data in accordance with specified parameters.

R6. Each UVLS entity shall provide data to its Planning Coordinator according to the format and schedule specified by the Planning Coordinator to support maintenance of each UVLS Program database. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M6. Acceptable evidence may include, but is not limited to, date-stamped emails, letters, or other documentation demonstrating data was provided to the Planning Coordinator as specified.

Rationale for R7: Having accurate and current data is required for the Planning Coordinator to perform studies and for use in event analyses. Requirement R7 supports this reliability need by requiring the Planning Coordinator to update its UVLS Program database at least once each calendar year.

R7. Each Planning Coordinator that has a UVLS Program in its area shall update a database containing data necessary to model its UVLS Program for use in event analyses and assessments of the UVLS Program at least once each calendar year. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M7. Acceptable evidence may include, but is not limited to, date-stamped spreadsheets, database reports, or other documentation demonstrating a UVLS Program database was updated.

Rationale for R8: Requirement R8 supports the integrated and coordinated approach to UVLS programs directed by Paragraph 1509 of Order No. 693 by requiring that UVLS Program data be shared with neighboring Planning Coordinators and Transmission Planners within a reasonable time frame of a request.

R8. Each Planning Coordinator that has a UVLS Program in its area shall provide its UVLS Program database to other Planning Coordinators and Transmission Planners within its Interconnection within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M8. Acceptable evidence may include, but is not limited to, date-stamped emails, letters, or other documentation demonstrating that the UVLS Program database was provided as requested within 30 calendar days.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The applicable entity shall keep data or evidence to show compliance with Requirements R1, R2, R3, R5, R6, R7, and R8 since the last audit.
- The applicable entity shall keep data or evidence to show compliance with Requirement R4 for six calendar years.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Long-term Planning	High	N/A	N/A	N/A	The applicable entity that developed the UVLS Program failed to demonstrate the program's effectiveness prior to implementation in accordance with Requirement R1, including the items specified in Parts 1.1 and 1.2.
R2	Long-term Planning	High	N/A	N/A	The applicable entity failed to adhere to the UVLS Program specifications in accordance with Requirement R2. OR The applicable entity failed to adhere to the UVLS Program implementation schedule in accordance with Requirement R2.	The applicable entity failed to adhere to the UVLS Program specifications and implementation schedule in accordance with Requirement R2.

R3	Long-term Planning	Medium	N/A	N/A	N/A	The applicable entity failed to perform an assessment at least once during the 60 calendar months in accordance with Requirement R3, including the items specified in Parts 3.1 and 3.2.
R4	Operations Planning	Medium	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 12 calendar months but less than or equal to 13 calendar months after an applicable event.	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 13 calendar months but less than or equal to 14 calendar months after an applicable event.	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 14 calendar months but less than or equal to 15 calendar months after an applicable event.	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 15 months after an applicable event. OR The applicable entity failed to perform an assessment in accordance with Requirement R4.

R5	Operations Planning	Medium	The applicable entity developed a CAP in accordance with Requirement R5, but was late by less than or equal to 15 calendar days.	The applicable entity developed a CAP in accordance with Requirement R5, but was late by more than 15 calendar days but less than or equal to 30 calendar days.	The applicable entity developed a CAP in accordance with Requirement R5, but was late by more than 30 calendar days but less than or equal to 45 calendar days.	The applicable entity developed a CAP in accordance with Requirement R5, but was late by more than 45 calendar days. OR The responsible entity failed to develop a CAP in accordance with Requirement R5.
R6	Operations Planning	Lower	The applicable entity provided data in accordance with Requirement R6, but was late by less than or equal to 30 calendar days per the specified schedule. OR The applicable entity provided data in accordance with Requirement R6, but the data was not according to the specified format.	The applicable entity provided data in accordance with Requirement R6, but was late by more than 30 calendar days but less than or equal to 60 calendar days per the specified schedule.	The applicable entity provided data in accordance with Requirement R6, but was late by more than 60 calendar days but less than or equal to 90 calendar days per the specified schedule.	The applicable entity provided data in accordance with Requirement R6, but was late by more than 90 calendar days per the specified schedule. OR The applicable entity failed to provide data in accordance with Requirement R6.

R7	Operations Planning	Lower	The applicable entity updated the database in accordance with Requirement R7, but was late by less than or equal to 30 calendar days.	The applicable entity updated the database in accordance with Requirement R7, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The applicable entity updated the database in accordance with Requirement R7, but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The applicable entity updated the database in accordance with Requirement R7, but was late by more than 90 calendar days. OR The applicable entity failed to update the database in accordance with Requirement R7.
R8	Operations Planning	Lower	The applicable entity provided its UVLS Program database in accordance with Requirement R8, but was late by less than or equal to 15 calendar days.	The applicable entity provided its UVLS Program database in accordance with Requirement R8, but was late by more than 15 calendar days but less than or equal to 30 calendar days.	The applicable entity provided its UVLS Program database in accordance with Requirement R8, but was late by more than 30 calendar days but less than or equal to 45 calendar days.	The applicable entity provided its UVLS Program database in accordance with Requirement R8, but was late by more than 60 calendar days. OR The applicable entity failed to provide its UVLS Program database in accordance with Requirement R8.

Guidelines and Technical Basis

Introduction

PRC-010-1 is a single, comprehensive standard that addresses the same reliability principles outlined in its legacy standards, PRC-010-0, PRC-020-1, PRC-021-1, and PRC-022-1. The standard also addresses a FERC directive from Order No. 693, Paragraph 1509. This paragraph directs NERC to develop a modification to PRC-010-0 that requires an integrated and coordinated approach to all protection systems, including generators and transmission lines, generators' low voltage ride through capabilities, and UFLS and UVLS programs.

Since FERC-approved PRC-006-1 – Automatic Underfrequency Load Shedding was developed under a similar construct of combining existing standards and addressing a FERC Order No. 693 directive, the drafting team looked to this standard as a guide. With the understanding that UVLS and UFLS programs have fundamental differences, the drafting team adopted PRC-006-1's industry-vetted reliability principles and language as applicable to UVLS Programs.

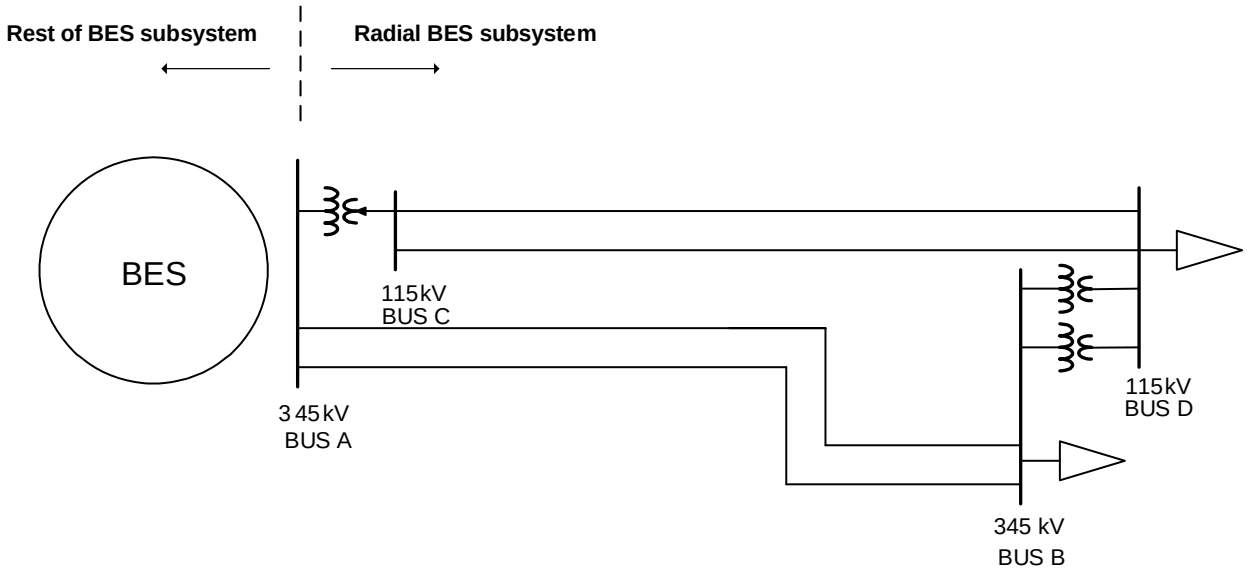
The drafting team's established purpose for PRC-010-1 is to clearly define the responsibilities of applicable entities to pursue an integrated and coordinated approach to the design, evaluation, and reliable operation of UVLS Programs. Since the need for and design of UVLS Programs is unique to each system preservation footprint, the intent of the standard is to provide a framework of reliability requirements for such programs to which each individual entity can apply its program's specific considerations and characteristics. The drafting team emphasizes that PRC-010-1 does not require a mandatory UVLS Program, nor does this standard address the need to have a UVLS Program. PRC-010-1 applies only after an entity has determined the need for a UVLS Program as a result of its own planning studies.

The drafting team provides the following discussion to support the approach to the standard. The information is meant to enhance the understanding of the reliability needs and deliverable expectations of each requirement, supported as necessary by technical principles and industry experience.

Guidelines for UVLS Program Definition

To ensure that the UVLS Program standard's applicability is to only those undervoltage-based load shedding programs whose performance has an impact on system reliability, a UVLS Program must mitigate risk of one more of the following: Cascading, voltage instability, wide area voltage collapse, or uncontrolled separation. An example of a program that would not fall under this category is undervoltage-based load shedding installed to mitigate damage to equipment or local loads that are directly affected by the low voltage event.

Below is an example of a radial Bulk Electric System (BES) subsystem for which a UVLS system could be used as a solution to mitigate various issues following the loss of the 345 kV double circuit line between bus A and bus B (TPL category C Contingency). If the consequence of this Contingency is limited to undervoltage conditions, loss of load, or overloading of facilities within the contained area formed by buses A to D, a UVLS system (at buses B and D) used to mitigate this case would not fall under the definition of a UVLS Program. However, if this same UVLS system would be used to mitigate Adverse Reliability Impact outside this contained area, it would be classified as a wide-area undervoltage problem and would fall under the definition of UVLS Program.



High Level Requirement Overview

Requirement	Entity	Demonstrate Program Effectiveness	Adhere to Program Specifications and Schedule	Program Assessment (Periodic or Performance)	CAP to Address Program Deficiencies	Update and/or Share Program Data
R1	PC or TP	X				
R2	UVLS entity		X			
R3	PC or TP	X		X		
R4	PC or TP	X		X		
R5	PC or TP				X	
R6	UVLS entity					X
R7	PC					X
R8	PC					X

Guidelines for Requirement R1:

A UVLS Program may be developed and implemented to either serve as a safety net system protection measure against unforeseen extreme Contingencies or to achieve specific system performance for known transmission Contingencies for which dropping of load is allowed under TPL Reliability Standards. Regardless of the purpose, it is important that the UVLS Program being implemented is effective in terms that it mitigates the risk of Cascading, voltage instability, wide-area voltage collapse, or uncontrolled separation resulting from undervoltage conditions. Consideration should be given to voltage set points and time delays, rate of voltage decay or recovery, power flow levels, etc. when designing a UVLS Program.

For the UVLS Program to be effective in achieving its goal, it is also necessary that the UVLS Program is coordinated with generator voltage ride-through capabilities and other protection and control systems that may have an impact on the performance of UVLS Program. Some of these protection and control systems may include, but are not limited to, transmission line protection, SPSs, other undervoltage-based load shedding programs, auto-reclosing, and controls of shunt capacitors, reactors, and SVSs.

For example, if the purpose of a UVLS Program is to mitigate fault-induced delayed voltage recovery (FIDVR) events in a large load center that also includes local generation, it is important that such a UVLS Program is coordinated with local generators' voltage ride-through capabilities. Generators in the vicinity of a load center are critical to providing dynamic voltage support to the system during FIDVR events. To maximize the benefit of online generation, the best practice may be to shed load prior to generation trip. However, occasionally, it may be best to let generation

trip prior to load shed. Therefore, the impact of generation tripping should be considered while designing a UVLS Program.

Another example that can be highlighted is the coordination of a UVLS Program with automatic shunt reactor tripping devices if there are any on the system. Most likely, any shunt reactors on the system will trip off automatically after some time delay during low voltage conditions. In such cases, shunt reactors should be tripped before the load is shed to preserve the system. This may require coordination of time delays associated with the UVLS Program with shunt reactor tripping devices.

Examples given above demonstrate that, for a UVLS Program to be effective, proper consideration should be given to coordination of a UVLS Program with generator ride-through capabilities and other protection and control systems.

Guidelines for Requirement R2:

Once a Planning Coordinator or Transmission Planner has identified a need for a UVLS Program, the Planning Coordinator or Transmission Planner will develop a program that includes specifications and an implementation schedule, which are then provided to UVLS entities. Specifications may include voltage set points, time delays, amount of load to be shed, the location at which load needs to be shed, etc. If UVLS entities do not implement the UVLS Program according to the specifications and schedule provided, the UVLS Program may not be effective and may not achieve its intended goal.

Guidelines for Requirement R3:

In addition to the initial studies required to develop a UVLS Program, periodic comprehensive assessments (detailed analyses) are required to ensure its continued effectiveness. This assessment should be completed at least once every 60 calendar months to capture the accumulated effects of minor changes to the system that have occurred since the last assessment was completed. There may also be material changes to system topology or operating conditions that would necessitate this same comprehensive assessment at any point in time. Regardless of the trigger, the assessment should include an evaluation of each UVLS Program to ensure the continued integration through coordination.

This comprehensive assessment supplements the TPL-001-4 annual assessment requirement to evaluate the impact of protection systems. The 60-month period is the same time frame used in TPL-001-4 and in PRC-006-1.

The material change terminology is also used in the TPL-001-4 standard. The industry concluded that the term material change is not transportable on a continent wide basis. Requirement R2, Part 6.2 of TPL-001-4 specifies that documentation to support the technical rationale for determining material changes shall be included. Similar documentation should also support a UVLS Program assessment that is a result of a material change.

As specified in Requirement R3, a comprehensive assessment must be performed at least once every 60 calendar months. If a comprehensive assessment necessitated by a material change is

conducted within the 60-month window, the 60-month time period would restart upon completion of this assessment.

Guidelines for Requirement R4:

The goal of the assessment required in Requirement R4 is to evaluate whether the UVLS Program resolved the undervoltage issues for an event that occurred on the system. It is expected that the assessment should include event data analysis, such as the relevant sequence of events leading to the undervoltage conditions (e.g., Contingencies, operation of protection systems, and SPSs) and field measurements useful to analyzing the behavior of the system. A comprehensive description of the UVLS Program operation should be presented, including conditions of the trigger (e.g., voltage levels, time delays) and amount of load shed for each affected substation. Simulations of the event shall be performed to evaluate the level of performance of the program for the event of interest and to identify deficiencies to be included in a CAP per Requirement R5.

The studies and analyses showing the effectiveness of the UVLS Program can be similar to what is required in Requirements R1 and R3, but should include a clear link between the demonstration of effectiveness (in studies using simulations) and the analysis of the event (with measurements and event data) that actually occurred. For example, differences between the expected and actual system behavior for the event of interest should be discussed and modeling assumptions should be evaluated. Important discrepancies between the simulations and the actual event should be investigated.

Considering the importance of an event that involves the operation of a UVLS Program, the 12-calendar month period provides adequate time to analyze the event and perform an assessment while identifying deficiencies within a reasonable time. This time period is also required in PRC-006-1.

Guidelines for Requirement R5:

Requirement 5 promotes the prudent correction of an identified problem during assessment evaluations of each UVLS Program. An assessment of an active UVLS Program is triggered:

- After material changes are made to system topology or operating conditions. Since every UVLS is unique, the Planning Coordinator or Transmission Planner will decide the degree to which the change in topology or operating condition becomes a material change sufficient to trigger an assessment of the existing UVLS Program.

- Within 12 calendar months of an event that resulted in a voltage excursion for which the program was designed to operate.

- At least once every 60 months. The default time frame of 60 months or less between assessments has the intention to assure that the cumulative changes to the network and operating condition affecting the UVLS Program are evaluated.

The 60-calendar month time frame would reset after each assessment.

A CAP is a list of actions and an associated timetable for implementation to remedy a specific problem. It is a proven tool for resolving operational problems. The responsible entity is required to implement and complete a CAP to accomplish the purpose of this requirement, which is to prevent future deficiencies in the UVLS Program, thereby minimizing risk to the system. The responsible entity is also required to complete the CAP, document the plan implementation, and retain the appropriate evidence to demonstrate implementation and completion.

Deferrals or other relevant changes to the CAP need to be documented so that the record includes not only what was planned, but what was implemented. Depending on the planning and documentation format used by the responsible entity, evidence of a successful CAP execution could consist of signed-off work orders, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, paid invoices, photographs, walk-through reports, or other evidence. Documentation of a CAP provides an auditable progress and completion confirmation for the identified UVLS Program deficiency.

CAP examples:

CAP Example 1 - Corrective actions for a quick triggering problem; preemptive actions for similar installations:

Fault records showed that a group of UVLS relays did trigger at the right undervoltage level but with shorter delays that expected. On-site inspections were completed in three weeks, confirming that the delay time programmed on the relays was 60 cycles instead of 90 cycles. A plan was scheduled for the next eight weeks to correct to a 90-cycle time delay setting of those UVLS relays identified to have shorter time delay settings.

Applicability to other UVLS relays: Based on our risk assessment, we scheduled to verify and adjust all remaining UVLS relays time delay settings within a one-year period.

CAP Example 2 - Corrective actions for a firmware problem; preemptive actions for similar installations:

Fault records were provided to the manufacturer on 6/4/2014. On 6/11/2014, the manufacturer responded that the misoperation of the UVLS relay was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 6/12/2014.

> Applicability to other UVLS relays: Based on our risk assessment, we plan to install firmware version 3 at all of our installations that are determined to be version 2. Proposed completion date is 12/31/2014.
>
> The firmware replacements were completed on 12/4/2014.

Based on industry experience and operational coordination timeframes, the drafting team believes that within three calendar months from the date the problem was identified is a reasonable time frame for development of a CAP, including time to consider alternative solutions and coordination of resources. The "within three calendar months" time frame is solely to develop a CAP and it does not include the time needed for its implementation.

Determining the cause of the deficiency is essential in developing an effective CAP to avoid future re-occurrence of the same problem. A CAP can be revised if additional causes are found.

Guidelines for Requirements R6–R8

An accurate UVLS Program database is necessary for the Planning Coordinator or Transmission Planner to perform system reliability assessment studies and event analysis studies. Without accurate data, there is a possibility that annual reliability assessment studies that are performed by the Planning Coordinator can lead to erroneous results and therefore impact reliability. Also, without the accurate data, it is very difficult for the Planning Coordinator or Transmission Planner to match a UVLS event and determine the root cause of the problem.

To support a UVLS Program database, it is necessary for each UVLS entity to provide accurate data to its Planning Coordinator. Each UVLS entity will provide the data according to the specified format and schedule provided by the Planning Coordinator. This is required in order for the Planning Coordinator to maintain and support a comprehensive UVLS Program database. By having a comprehensive database, the Planning Coordinator can embark on a reliability assessment or event analysis/benchmarking studies, identify the issues with the UVLS Program, and develop remedial action plans.

Items to be included in the UVLS database are as follows:

- Owner and operator of the UVLS Program
- Size and location of customer load, or percent of connected load, to be interrupted
- Corresponding voltage set points and overall scheme clearing times
- Time delay from initiation to trip signal
- Breaker operating times
- Any other schemes that are part of or impact the UVLS Programs, such as related generation protection, islanding schemes, automatic load restoration schemes, UFLS, and SPSs.

Additionally, the UVLS Program database should be updated annually (once every calendar year) by the Planning Coordinator. The intent here is for UVLS entities to review the data annually and provide changes to the Planning Coordinators so that Planning Coordinators can keep the databases current and accurate for performing event analysis and other assessments.

Finally, a Planning Coordinator is required to provide information to other Planning Coordinators and Transmission Planners within its Interconnection within 30 calendar days of a request. The 30 calendar days was selected as an acceptable time frame as it is considered to be reasonable and well-accepted by the industry. Also, this requirement of sharing the database with other Planning Coordinators and Transmission Planners supports the directive provide by FERC that requires an integrated and coordinated approach to UVLS programs (Paragraph 1509 of FERC Order No. 693).

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Project 2008-02 Undervoltage Load Shedding (PRC-010-1)

VRF and VSL Justifications

This document provides the Undervoltage Load Shedding Standard Drafting Team's (drafting team's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-010-1 – Undervoltage Load Shedding.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The drafting team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or, a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures; place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or, a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or

restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to requirements of reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the drafting team considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The drafting team believes that Guideline 4 is reflective of the intent of VRFs in the first instance and, therefore, concentrated its approach on the reliability impact of the requirements.

PRC-010-1 – Undervoltage Load Shedding is a revision of PRC-010-0 – Assessment of the Design and Effectiveness of UVLS Program, with the stated purpose: *To establish an integrated and coordinated approach to the design, evaluation, and reliable operation of Undervoltage Load Shedding Programs.* FERC Order No. 693 requested that PRC-010-0 be modified to require that an integrated and coordinated approach be included in all protection systems on the Bulk Power System, including generators and transmission lines, generators' low voltage ride-through capabilities, and underfrequency loading shedding (UFLS) and undervoltage load shedding (UVLS) programs. PRC-010-1 addresses this directive in addition to consolidating and revising PRC-010-0 with the three (3) other existing UVLS standards: PRC-020-1 – Under-Voltage Load Shedding Program Database, PRC-021-1 – Under-Voltage Load Shedding Program Data, and PRC-022-1 – Under-Voltage Load Shedding Program Performance.

PRC-010-1 has eight (8) requirements that incorporate and enhance the intent of the requirements of PRC-010-0, PRC-020-1, PRC-021-1, and PRC-022-1. The revised standard requires that entities developing an Undervoltage Load Shedding Program demonstrate the program's effectiveness prior to implementation. Applicable entities are then required to adhere to the Undervoltage Load Shedding Program specifications and implementation schedule. The standard also requires an assessment of the program at least once every 60 months (or sooner if needed) and an assessment to evaluate program performance within 12 months of an applicable event. If program deficiencies are identified as a result of any of these assessments, entities are required to develop a Corrective Action Plan within three (3) months. In addition, there are requirements to update, provide data for, and share an Undervoltage Load Shedding database containing information necessary to model the program for use in event analyses and assessments.

The requirements of PRC-010-1 do not map, one-to-one, with the requirements of the legacy standards. The new requirements comingle various reliability attributes of the legacy standards with new reliability objectives, thus a requirement-to-requirement comparison of VRFs is not possible. In developing the new

VRFs for the requirements of PRC-010-1, the drafting team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of FERC-approved PRC-006-1 – Automatic Underfrequency Load Shedding influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as the drafting team used PRC-006-1 as a model with respect to PRC-010-1's language and construct.

NERC Criteria - Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance, and may have only one, two, or three VSLs.

VSLs should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance. The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications – PRC-010-1, R1	
Proposed VRF	High
NERC VRF Discussion	This is a planning requirement that meets the NERC criterion for a High VRF. Failure to ensure the effectiveness of an Undervoltage Load Shedding Program could, under anticipated Emergency, abnormal, or restorative conditions, directly contribute to Bulk Electric System instability, separation, or Cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** N/A
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard:** The requirement has Parts that all support the reliability objective so only one VRF was assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement is similar to EOP-003-2, Requirements R3 and R7, which have approved VRFs of High.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** This is a planning requirement that meets the NERC criterion for a High VRF. Failure to ensure the effectiveness of an Undervoltage Load Shedding Program as specified in Requirement R1 could, under anticipated Emergency, abnormal, or restorative conditions, directly contribute to Bulk Electric System instability, separation, or Cascading failures.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of High is consistent throughout the requirement.
Proposed Lower VSL	N/A
Proposed Moderate VSL	N/A
Proposed High VSL	N/A
Proposed Severe VSL	The applicable entity that developed the UVLS Program failed to demonstrate the program's effectiveness prior to implementation in accordance with Requirement R1, including the items specified in Parts 1.1 and 1.2.
NERC VSL Guidelines Discussion	Meets NERC's VSL Guidelines—there is a binary aspect for failure; the VSL addresses the degrees of compliance with respect to equal importance of the two Parts.

VRF and VSL Justifications – PRC-010-1, R1	
FERC VSL G1 Discussion	**Guideline 1- Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance:** This is a new requirement; therefore, there is no prior level of compliance.
FERC VSL G2 Discussion	**Guideline 2- Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a- The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent:** The proposed VSL for this binary requirement is consistent with the guideline in that it is classified as a severe VSL. **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement:** The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4	**Guideline 4- Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations:** The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1, R2	
Proposed VRF	High
NERC VRF Discussion	This is a planning requirement that meets the NERC criterion for a High VRF. Failure to adhere to the Undervoltage Load Shedding Program specifications and implementation schedule could, under anticipated Emergency, abnormal, or restorative conditions, directly contribute to Bulk Electric System instability, separation, or Cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** N/A
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard:** The requirement has no Parts so only one VRF was assigned.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement is consistent with PRC-006-1, Requirement R9 and EOP-003-2, Requirement R5, which have approved VRFs of High.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** This is a planning requirement that meets the NERC criterion for a High VRF. Failure to adhere to the Undervoltage Load Shedding Program specifications and implementation schedule could, under anticipated Emergency, abnormal, or restorative conditions, directly contribute to Bulk Electric System instability, separation, or Cascading failures.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of High is consistent throughout the requirement.
Proposed Lower VSL	N/A
Proposed Moderate VSL	N/A
Proposed High VSL	The applicable entity failed to adhere to the UVLS Program specifications in accordance with Requirement R2. OR The responsible entity failed to adhere to the UVLS Program implementation schedule in accordance with Requirement R2.
Proposed Severe VSL	The applicable entity failed to adhere to the UVLS Program specifications and implementation schedule in accordance with Requirement R2.
NERC VSL Guidelines Discussion	Meets NERC's VSL Guidelines—the VSLs cover aspects of the requirement that are equal in importance.

VRF and VSL Justifications – PRC-010-1, R2	
FERC VSL G1 Discussion	**Guideline 1- Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance:** This is a new requirement; therefore, there is no prior level of compliance.
FERC VSL G2 Discussion	**Guideline 2- Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a- The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent:** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement:** The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4	**Guideline 4- Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations:** The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1, R3	
Proposed VRF	Medium
NERC VRF Discussion	This is a planning requirement that meets NERC's criterion for a Medium VRF. Failure to perform a comprehensive assessment to evaluate the effectiveness of each existing Undervoltage Load Shedding Program in its area at least once every 60 calendar months or sooner if material changes are made to system topology or operating conditions, could, under anticipated Emergency, abnormal, or restorative conditions, directly and adversely affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** N/A
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard:** The requirement has Parts that all support the reliability objective so only one VRF was assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement is consistent with PRC-010-0, Requirement R1, which has an approved VRF of Medium.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** This is a planning requirement that meets NERC's criterion for a Medium VRF. Failure to perform a comprehensive assessment to evaluate the effectiveness of each existing Undervoltage Load Shedding Program in its area at least once every 60 calendar months or sooner if material changes are made to system topology or operating conditions, could, under anticipated Emergency, abnormal, or restorative conditions, directly and adversely affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of Medium is consistent throughout the requirement.

VRF and VSL Justifications – PRC-010-1, R3	
Proposed Lower VSL	N/A
Proposed Moderate VSL	N/A
Proposed High VSL	N/A
Proposed Severe VSL	The applicable entity failed to perform an assessment at least once during the 60 calendar months in accordance with Requirement R3, including the items specified in Parts 3.1 and 3.2.
NERC VSL Guidelines Discussion	Meets NERC's VSL Guidelines—there is a binary aspect for failure; the VSLs address the degrees of compliance with respect to equal importance of the two Parts.
FERC VSL G1 Discussion	**Guideline 1- Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance:** The VSL is consistent in nature with the current VSL associated with the existing requirement being replaced (PRC-010-0, Requirement R1) and therefore does not lower the current level of compliance.
FERC VSL G2 Discussion	**Guideline 2- Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a- The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent:** The proposed VSL for this binary requirement is consistent with the guideline in that it is classified as a severe VSL. **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement:** The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4	**Guideline 4- Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations:** The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1, R4	
Proposed VRF	Medium
NERC VRF Discussion	This requirement meets NERC's criterion for a Medium VRF. Failure to perform an assessment to evaluate whether the Undervoltage Load Shedding Program resolved the undervoltage issues associated with a qualifying event in a timely manner could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** N/A
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard:** The requirement has no Parts so only one VRF was assigned.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement is similar to PRC-022-1, Requirement 1 and PRC-006-1, Requirement R11, which have approved VRFs of Medium.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** This requirement meets NERC's criterion for a Medium VRF. Failure to perform an assessment to evaluate whether the Undervoltage Load Shedding Program resolved the undervoltage issues associated with a qualifying event in a timely manner could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of Medium is consistent throughout the requirement.
Proposed Lower VSL	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 12 calendar months but less than or equal to 13 calendar months after an applicable event.
Proposed Moderate VSL	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 13 calendar months but less than or equal to 14 calendar months after an applicable event.

VRF and VSL Justifications – PRC-010-1, R4	
Proposed High VSL	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 14 calendar months but less than or equal to 15 calendar months after an applicable event.
Proposed Severe VSL	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 15 months after an applicable event. OR The applicable entity failed to perform an assessment in accordance with Requirement R4.
NERC VSL Guidelines Discussion	Meets NERC's VSL Guidelines—there is an incremental aspect to the VSL for tardiness and a binary aspect for failure.
FERC VSL G1 Discussion	**Guideline 1- Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance:** The VSLs' associated requirement is different in construct from the existing requirement being replaced (PRC-022-1, Requirement R1) and, therefore, the VSLs cannot be compared. The VSLs for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Discussion	**Guideline 2- Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a- The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent:** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement:** The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4	**Guideline 4- Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations:** The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1, R5	
Proposed VRF	Medium
NERC VRF Discussion	This requirement meets NERC's criterion for a Medium VRF. Failure to develop a Corrective Action Plan to address the deficiencies identified as a result of an Undervoltage Load Shedding Program assessment in a timely manner could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** N/A
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard:** The requirement has no Parts so only one VRF was assigned.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement is similar to PRC-006-1, Requirement R12, which has an approve VRF of Medium.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** This requirement meets NERC's criterion for a Medium VRF. Failure to develop a Corrective Action Plan to address the deficiencies identified as a result of an Undervoltage Load Shedding Program assessment in a timely manner could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of Medium is consistent throughout the requirement.
Proposed Lower VSL	The applicable entity developed a CAP in accordance with Requirement R5, but was late by less than or equal to 15 calendar days.
Proposed Moderate VSL	The applicable entity developed a CAP in accordance with Requirement R5, but was late by more than 15 calendar days but less than or equal to 30 calendar days.

VRF and VSL Justifications – PRC-010-1, R5	
Proposed High VSL	The applicable entity developed a CAP in accordance with Requirement R5, but was late by more than 30 calendar days but less than or equal to 45 calendar days.
Proposed Severe VSL	The applicable entity developed a CAP in accordance with Requirement R5, but was late by more than 45 calendar days. OR The applicable entity failed to develop a CAP in accordance with Requirement R5.
NERC VSL Guidelines Discussion	Meets NERC's VSL Guidelines—there is an incremental aspect to the VSL for tardiness and a binary aspect for failure.
FERC VSL G1 Discussion	**Guideline 1- Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance:** The VSLs' associated requirement is different in construct from the existing requirement being replaced (PRC-022-1, Requirement R1.5) and, therefore, the VSLs cannot be compared. The VSLs for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Discussion	**Guideline 2- Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a- The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent:** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement:** The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4	**Guideline 4- Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations:** The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1, R6	
Proposed VRF	Lower
NERC VRF Discussion	This is an administrative planning requirement that meets NERC's criterion for a Lower VRF. Failure to provide data according to the specified format and schedule to support maintenance of each Undervoltage Load Shedding Program database would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** N/A
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard:** The requirement has no Parts so only one VRF was assigned.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement is consistent with PRC-006-1, Requirement R8, which has an approved VRF of Lower.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** This is an administrative planning requirement that meets NERC's criterion for a Lower VRF. Failure to provide data according to the specified format and schedule to support maintenance of each Undervoltage Load Shedding Program database would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of Lower is consistent throughout the requirement.

VRF and VSL Justifications – PRC-010-1, R6	
Proposed Lower VSL	The applicable entity provided data in accordance with Requirement R6, but was late by less than or equal to 30 calendar days per the specified schedule. OR The applicable entity provided data in accordance with Requirement R6, but the data was not according to the specified format.
Proposed Moderate VSL	The applicable entity provided data in accordance with Requirement R6, but was late by more than 30 calendar days but less than or equal to 60 calendar days per the specified schedule.
Proposed High VSL	The applicable entity provided data in accordance with Requirement R6, but was late by more than 60 calendar days but less than or equal to 90 calendar days per the specified schedule.
Proposed Severe VSL	The applicable entity provided data in accordance with Requirement R6, but was late by more than 90 calendar days per the specified schedule. OR The applicable entity failed to provide data in accordance with Requirement R6.
NERC VSL Guidelines Discussion	Meets NERC's VSL Guidelines—the VSLs cover aspects of the requirement that are not equal in importance; there is an incremental aspect to the VSL for tardiness and a binary aspect for failure.
FERC VSL G1 Discussion	**Guideline 1- Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance:** The VSLs' associated requirement is different in construct from the existing requirement being replaced (PRC-021-1, Requirement R1) and, therefore, the VSLs cannot be compared. The VSLs for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Discussion	**Guideline 2- Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a- The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent:** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-010-1, R6	
FERC VSL G3	**Guideline 3- Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement:** The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4	**Guideline 4- Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations:** The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1, R7	
Proposed VRF	Lower
NERC VRF Discussion	This is an administrative planning requirement that meets NERC's criterion for a Lower VRF. Failure to update an Undervoltage Load Shedding Program database would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** N/A
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard:** The requirement has no Parts so only one VRF was assigned.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement is consistent with PRC-006-1, Requirement R6, which has an approved VRF of Lower.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** This is an administrative planning requirement that meets NERC's criterion for a Lower VRF. Failure to update an Undervoltage Load Shedding Program database would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of Lower is consistent throughout the requirement.
Proposed Lower VSL	The applicable entity updated the database in accordance with Requirement R7, but was late by less than or equal to 30 calendar days.
Proposed Moderate VSL	The applicable entity updated the database in accordance with Requirement R7, but was late by more than 30 calendar days but less than or equal to 60 calendar days.
Proposed High VSL	The applicable entity updated the database in accordance with Requirement R7, but was late by more than 60 calendar days but less than or equal to 90 calendar days.

VRF and VSL Justifications – PRC-010-1, R7	
Proposed Severe VSL	The applicable entity updated the database in accordance with Requirement R7, but was late by more than 90 calendar days. OR The applicable entity failed to update the database in accordance with Requirement R7.
NERC VSL Guidelines Discussion	Meets NERC's VSL Guidelines— there is an incremental aspect to the VSL for tardiness and a binary aspect for failure.
FERC VSL G1 Discussion	**Guideline 1- Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance:** The existing requirement being replaced (PRC-020-1, Requirement R1) is applicable to the Regional Reliability Organization and has no associated VSLs. Therefore, there is no prior level of compliance.
FERC VSL G2 Discussion	**Guideline 2- Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a- The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent:** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement:** The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4	**Guideline 4- Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations:** The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1, R8	
Proposed VRF	Lower
NERC VRF Discussion	This is an administrative planning requirement that meets NERC's criterion for a Lower VRF. Failure to provide an Undervoltage Load Shedding Program database within a timely manner of a request would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** N/A
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard:** The requirement has no Parts so only one VRF was assigned.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement is consistent with PRC-006-1, Requirement R7, which has an approved VRF of Lower.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** This is an administrative planning requirement that meets NERC's criterion for a Lower VRF. Failure to provide an Undervoltage Load Shedding Program database within a timely manner of a request would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of Lower is consistent throughout the requirement.
Proposed Lower VSL	The applicable entity provided its UVLS Program database in accordance with Requirement R8, but was late by less than or equal to 15 calendar days.
Proposed Moderate VSL	The applicable entity provided its UVLS Program database in accordance with Requirement R8, but was late by more than 15 calendar days but less than or equal to 30 calendar days.

VRF and VSL Justifications – PRC-010-1, R8	
Proposed High VSL	The applicable entity provided its UVLS Program database in accordance with Requirement R8, but was late by more than 30 calendar days but less than or equal to 45 calendar days.
Proposed Severe VSL	The applicable entity provided its UVLS Program database in accordance with Requirement R8, but was late by more than 60 calendar days. OR The applicable entity failed to provide its UVLS Program database in accordance with Requirement R8.
NERC VSL Guidelines Discussion	Meets NERC's VSL Guidelines—there is an incremental aspect to the VSL for tardiness and a binary aspect for failure.
FERC VSL G1 Discussion	**Guideline 1- Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance:** The existing requirement being replaced (PRC-020-1, Requirement R2) is applicable to the Regional Reliability Organization and has no associated VSLs. Therefore, there is no prior level of compliance.
FERC VSL G2 Discussion	**Guideline 2- Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a- The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent:** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement:** The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4	**Guideline 4- Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations:** The VSL is based on a single violation and not cumulative violations.

Reliability Standard Audit Worksheet[1]

PRC-004-3 – Protection System Misoperation Identification and Correction

This section to be completed by the Compliance Enforcement Authority.

Audit ID:	Audit ID if available; or REG-NCRnnnnn-YYYYMMDD
Registered Entity:	Registered name of entity being audited
NCR Number:	NCRnnnnn
Compliance Enforcement Authority:	Region or NERC performing audit
Compliance Assessment Date(s):[2]	Month DD, YYYY, to Month DD, YYYY
Compliance Monitoring Method:	Audit
Names of Auditors:	Supplied by CEA

Applicability of Requirements *[RSAW developer to insert correct applicability]*

	BA	DP	GO	GOP	IA	LSE	PA	PSE	RC	RP	RSG	TO	TOP	TP	TSP
R1		X	X									X			
R2		X	X									X			
R3		X	X									X			
R4		X	X									X			
R5		X	X									X			
R6		X	X									X			

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

Facilities

4.2.1 Protection Systems for BES Elements, with the following exclusions:

4.2.1.1 Non-protective functions that are embedded within a Protection System.

4.2.1.2 Protective functions intended to operate as a control function during switching.[3]

4.2.1.3 Special Protection Systems (SPS).

4.2.1.4 Remedial Action Schemes (RAS).

4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Subject Matter Experts

Identify Subject Matter Expert(s) responsible for this Reliability Standard. -(Insert additional rows if necessary)

Registered Entity Response (Required):

SME Name	Title	Organization	Requirement(s)

[3] For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.

DRAFT

R1 Supporting Evidence and Documentation

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation ~~when:~~under the following circumstances:

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

~~**M1.**~~ **M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested:[i]

Provide the following evidence, or other evidence to demonstrate compliance. Please contact your CEA with any questions regarding requested evidence.
A list of BES interrupting device operations within the audit period meeting the criteria of Requirement R1 Parts 1.1 through 1.3.
Of these BES interrupting device operations, evidence such as in Measure M1 identifying whether its Protection System component(s) caused a Misoperation (or not).

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to PRC-004-3, R1

This section to be completed by the Compliance Enforcement Authority

	Select, all or a sample thereof, BES interrupting device operations from the list of such operations outlined in the Evidence Requested section above.
	~~For BES interrupting device operations, as selected by auditor, verify that such operations met the criteria outlined in Requirement R1 Parts 1.1 through 1.3. If criteria is not met, then no identification necessary and no further audit testing is required.~~
	~~If Requirement R1 Parts 1.1 through 1.3 criteria is met for~~For selected BES interrupting device operations, verify the entity identified whether or not its Protection System component(s) caused a Misoperation within 120 calendar days of the BES interrupting device operation.

Note to Auditor: Auditors should use their professional judgment in selecting BES interrupting device operations for testing. Sources of such operations could include entity lists or auditor's knowledge of events occurring on the entity's system. In order to determine if entity identified whether there was a Misoperation (in accordance with Requirement R1) the auditor should seek evidence, such as that provided in Measure M1, associated with analyses of those BES interrupting device operations meeting Requirement R1, Parts 1.1 through 1.3.

If the BES interrupting device operation does not meet the criteria, then no identification is necessary and no further audit testing is required.

Auditor ~~should~~may identify instances where an entity identified a Misoperation of its Protection System component(s), but did not determine the cause(s) of the Misoperation (within the 120 calendar day period of R1) for verification of compliance with Requirement R4.

Auditor ~~-~~Notes:~~-~~

R2 Supporting Evidence and Documentation

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, ~~notify the other owner(s) of the Protection System of the operation when:~~ provide notification as described in 2.1 and 2.2:

~~2~~**2.1** For a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other ~~entity~~owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2.Acceptable evidence for Requirement R2, including Parts 2.1, ~~2.2,~~ and 2.~~3~~2 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested:[i]

Provide the following evidence, or other evidence to demonstrate compliance. Please contact your CEA with any questions regarding requested evidence.
A list of BES interrupting device operations within the audit period meeting the criteria of ~~Requirement R2~~Part 2.1, Parts 2.1.1 through 2.1.3.
For Requirement R2 Part 2.2, a list of BES interrupting device operations within the audit period that operated as backup protection for a condition on another entity's Element.
Of these BES interrupting device operations, evidence such as in Measure M2 of entity notifying other owner(s) of the Composite Protection System.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to PRC-004-3, R2
This section to be completed by the Compliance Enforcement Authority

	Select, all or a sample thereof, BES interrupting device operations meeting Requirement R2, Parts 2.1 ~~through~~and 2.~~3~~2.
	~~For BES interrupting device operations, as selected by auditor, verify that such operations met the criteria outlined in Requirement R2 Parts 2.1 through 2.3 for notifying other owner(s) of the Protection System of the operation. If criteria is not met, then no notification is necessary and no further audit testing is required.~~
	For selected BES interrupting device operations requiring notifying other owner(s), verify entity notified the other owners of the operation within 120 days of the operation.

Note to Auditor: Auditors should use their professional judgment in selecting BES interrupting device operations for testing. Sources of such operations could include entity lists or auditor's knowledge of events occurring on the entity's system. In order to determine if entity notified other owners of the Composite Protection System (in accordance with Requirement R2) auditor should seek evidence, as provided in Measure M2 associated with selected operations.

See Application Guidelines under section Requirement R2 for notification requirements for vertically integrated utilities.

Auditor ~~-~~Notes:~~-~~

R3 Supporting Evidence and Documentation

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, ~~shall~~ identify whether its Protection System component(s) caused a Misoperation.

~~**M3.**~~ **M3.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested:[i]

Provide the following evidence, or other evidence to demonstrate compliance. Please contact your CEA with any questions regarding requested evidence.
List of notifications received by entity within the audit period pursuant to Requirement R2.
Of these notifications, evidence such as in Measure M3 of the entity identifying whether its Protection System component(s) caused a Misoperation (or not).

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to PRC-004-3, R3

This section to be completed by the Compliance Enforcement Authority

	Select, all or a sample thereof, notifications received by entity pursuant to Requirement R2.~~–~~
	For notifications received by entity, as selected by auditor, verify entity identified, within the timeframes established in Requirement R3, whether its Protection System component(s) caused a Misoperation ~~within the timeframes established in Requirement R3.~~.

Note to Auditor: Auditors should use their professional judgment in selecting notifications for audit testing. Sources of such notifications could include entity lists, auditor's knowledge of events occurring on the entity's system, or inquiries of neighboring entities. In order to determine if entity identified whether its Protection System component(s) caused a Misoperation, the auditor should seek evidence, as provided in Measure M3, associated with selected notifications.

Auditor ~~should~~may identify instances where an entity identified a Misoperation of its Protection System component(s) (in accordance with Requirement R3), but did not determine the cause(s) of the Misoperation for verification of compliance with Requirement R4.

Auditor ~~-~~Notes:~~-~~

R4 Supporting Evidence and Documentation

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation:-

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

~~**M4.**~~ **M4.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested:[i]

Provide the following evidence, or other evidence to demonstrate compliance. Please contact your CEA with any questions regarding requested evidence.
List of identified Misoperations ~~where a cause has not been identified by entity within the parameters of~~ pursuant to Requirement R1 or R3, within the audit period, where the cause of the Misoperation was not revealed.
Of the Misoperation list, documented cause(s) of the Misoperation pursuant to Requirement R4.
Of the Misoperation list, declarations where no cause was identified.
Evidence such as in Measure M4.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to PRC-004-3, R4
This section to be completed by the Compliance Enforcement Authority

	Select, all or a sample of, identified Misoperations where a cause has not been identified by the entity.-
	For each identified Misoperation without a cause selected, verify entity performed (or is performing) investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified ~~at the frequency prescribed in Requirement R4.~~ .
	For completed investigative actions, verify that entity has either determined a cause or has a declaration that no cause was identified.

Note to Auditor: Auditors should use their professional judgment in selecting Misoperations for audit testing. Sources of such Misoperations could include entity lists or knowledge gained by the auditor via their review of Requirements R1 or R3. In order to determine if entity performed the investigative action(s) established in Requirement R4, the auditor should seek evidence, as provided in Measure M4, associated with selected Misoperations.

~~An~~The following is an example of~~,~~ what is meant by "once every two full calendar quarters after the Misoperation was first identified~~" is a~~:" A Misoperation ~~where~~(with no cause ~~is~~) initially identified on February ~~1~~10 (Quarter One) must be investigated (per Requirement R4) by ~~the end of~~ September 30 (Quarter three) of the same year ~~the Misoperation is first identified.~~ . Quarters two and three are the full quarters counted.

Auditor ~~-~~Notes:~~-~~

R5 Supporting Evidence and Documentation

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation:

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): ~~a dated~~ CAP and evaluation, or ~~a dated~~ declaration.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested:[i]

Provide the following evidence, or other evidence to demonstrate compliance. Please contact your CEA with any questions regarding requested evidence.
~~Evidence~~Within the audit period, evidence such as in Measure M5 for Misoperations with an identified cause.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to PRC-004-3, R5

This section to be completed by the Compliance Enforcement Authority

	Select, all or a sample thereof, identified Misoperations with a cause.
	For identified Misoperations with a cause, as selected by the auditor, verify entity developed a CAP and evaluation, or a declaration as described in Requirement R5.
	Verify CAP and evaluation, or declaration, was developed within 60 calendar days of the first identified cause.
	Verify CAP contains actions and a timetable to resolve the cause(s) of the identified Misoperation and verify entity evaluated the CAP's applicability ~~of the cause~~ to the entity's other Protection Systems and locations; or that the declaration contains why no corrective action will be taken according to Requirement R5.

Note to Auditor: Auditors should use their professional judgment in selecting Misoperations with an identified cause for audit testing. Sources of such Misoperations for audit testing should be obtained from information learned by, or provided to, the auditor from testing of Misoperations for Requirements R1, R3, or R4.

Auditor Notes:

R6 Supporting Evidence and Documentation

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to, the following dated documentation (electronic or hard copy format): dated records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested:[i]

Provide the following evidence, or other evidence to demonstrate compliance. Please contact your CEA with any questions regarding requested evidence.
From the CAPs developed in Requirement R5, evidence such as in Measure M6 demonstrating implementation of each CAP.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to PRC-004-3, R6

This section to be completed by the Compliance Enforcement Authority

	Select, all or a sample thereof, CAPs for correcting the cause(s) of an identified Misoperation.
	For CAPs selected, verify implementation and that CAP was updated in accordance with Requirement R6.

Note to Auditor: Auditors should use their professional judgment in selecting CAPs for audit testing. Sources of CAPs for audit testing should be obtained from information learned by, or provided to, the auditor in Requirement R5.~~–~~

In checking for implementation, auditors should verify evidence (such as described in Measure M6) that the actions or activities prescribed by the CAP were actually performed by the entity.

Items, such as work management records, supporting the implementation of actions and timetables to implement the CAP are alternatives to a written document.

Auditor ~~-~~Notes:~~-~~

DRAFT

Additional Information:

Reliability Standard

The RSAW developer should provide the following information without hyperlinks. Update the information below as appropriate.

The full text of PRC-004-3 may be found on the NERC website (www.nerc.com) under "Program Areas & Departments", "Reliability Standards."

In addition to the Reliability Standard, there is an applicable Implementation Plan available on the NERC website.

In addition to the Reliability Standard, there is background information available on the NERC website.

Capitalized terms in the Reliability Standard refer to terms in the *Glossary of Terms used in NERC Reliability Standards*, which may be found on the NERC website.

Sampling Methodology [If developer deems reference applicable]

Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria, or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

Regulatory Language – [Developer to ensure RSAW has been provided to NERC Legal for links to appropriate Regulatory Language – See example below]

E.g. FERC Order No. 742 paragraph 34: "Based on NERC's……."

E.g. FERC Order No. 742 Paragraph 55, Commission Determination: "We affirm NERC's……."

Selected Glossary Terms [If developer deems applicable]

The following Glossary terms are provided for convenience only. Please refer to the NERC web site for the current enforceable terms.

Revision History

Version	Date	Reviewers	Revision Description
1	2/14/2014	NERC Compliance	New Document
2	5/30/2014	NERC Compliance	Revised based on revisions to Reliability Standard and comments received during formal comment period.

[i] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

DRAFT

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction
- Definitions of "Composite Protection System" and "Misoperation"

Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

- None

Revisions to Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definition:

Composite Protection System:

The total complement of ~~the~~ Protection System(s) that function collectively to protect an Element~~, such as any primary, secondary, local backup, and communication-assisted relay systems.~~. Backup protection provided ~~by~~to a remote Protection System is excluded.

The standard drafting team proposes the following revised definition:

Misoperation:

The failure of a Composite Protection System to operate as intended~~.~~ for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition ~~for which it is designed, such as a power swing, undervoltage,~~

~~overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as~~if the ~~performance of~~duration of its operating time resulted in the operation of at least one other Element's Composite Protection System ~~is correct~~.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition ~~for which it is designed. Delayed clearing~~if the duration of ~~a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition ~~for which it is designed~~, such as a power swing, undervoltage, overexcitation, or loss of excitation~~. Delayed clearing~~ if the duration of ~~a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition ~~for which it is not designed. A~~. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.

General Considerations

The implementation period allows adequate time for applicable entities to develop or modify its procedures and processes for reviewing Protection System operations. ~~The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information.~~ The development and implementation of a Corrective Action Plan remains within the scope of PRC-004; therefore, little additional time and resources should be needed to account for the increased detail in the required performance identified in the proposed PRC-004-3 Reliability Standard. The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements. Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.
- Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Effective Dates of New or Revised Standards and Definitions

~~Except in the Western Interconnection, the~~ The standard, the revised definition of "Misoperation" and ~~definitions~~the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. ~~Except in the Western Interconnection, where~~Where approval by an applicable governmental authority is not required, the standard, the revised definition of "Misoperation" and ~~definitions~~the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

~~In the Western Interconnection, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

~~Implementation Plan for PRC-004-3, All Requirements~~

~~Each Transmission Owner, Generator Owner, and Distribution Provider applicable to this standard shall be 100% compliant upon the effective date of the standard.~~

~~The extended implementation for the Western Interconnection is provided to allow an opportunity to make the necessary changes to the PRC-004-WECC-1 Regional Reliability Standard. An overlap in performance between the regional and proposed continent-wide standard was identified during the development of the proposed PRC-004-3 Reliability Standard.~~

~~**Implementation Plan for definitions**~~

~~The revised definition of Misoperation and the new definition of Composite Protection System shall be implemented concurrently with the standard upon the effective dates noted above. Note that the Western Interconnection has an extended implementation.~~

Retirement of Existing Standards

~~Except in the Western Interconnection, the~~The existing standards, PRC-003-1 and PRC-004-2.1a, shall be retired at midnight of the day immediately prior to the ~~effective date~~Effective Date of PRC-004-3.~~ In the Western Interconnection, the existing standards PRC-003-1 and PRC-004-2.1a shall be retired at midnight of the day immediately prior to the effective date of PRC-004-3 for the Western Interconnection.~~

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Mapping Document

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the standard drafting team is recommending revisions to the standard, those changes are identified in the "~~Proposed Replacement~~Translation to PRC-004-3 or Other Action" column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Regional Reliability Organization	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed standard properly assigns responsibility to the registered entity functions that are responsible for Protection System Misoperation identification and correction. The Transmission Owner, Generator Owner, and Distribution Provider, by function, are Protection System asset owners and are in the best position be aware of and apply resources to review Protection System operations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:		The Requirements in the proposed PRC-004-3 standard by their results-based standard (RBS) construction requires performance that is implicit of having procedures for the analysis of Protection System operations (R1, R2, R3, and R4) and mitigation of identified Misoperations (R5 and R6). The proposed requirements also ~~direct~~directs focus to areas most important to reliability. For example, Requirement R1 requires the applicable entity to initiate a review upon a Bulk Electric System (BES) interrupting device operation and identify any Misoperation. Requirement R2 requires the applicable entity to notify all other owners that share a Misoperation identification responsibility of the Composite Protection System when it determines (or is unsure) its Protection System ~~components~~component(s) did not cause the BES interrupting device operation or it cannot rule out a Misoperation. Requirement R3 requires the notified entity to identify any Misoperation of its Protection System component(s) similar to Requirement

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		R1. Requirement R4 directs the applicable entity to continue its investigative work to determine the cause(s) of an identified Misoperation, if not determined in R1 or R3, until the cause(s) is determined or the entity ~~concludes~~declares that it is unable to determine the cause. Requirements R5 and R6 for developing and implementing a Corrective Action Plan (CAP) are also implicit of having a documented procedure. The implicit performance required by Requirements R1 through R6 necessitate that an entity have procedures to accomplish the objectives of the proposed standard. Requiring the applicable entities to have procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to	**4.2.** Facilities: **4.2.1** Protection Systems for BES Elements~~.~~, with the following exclusions:	The previous PRC-003-1, Requirement R1.1 required the Regional Reliability Organization (RRO) to identify the Protection Systems to be reviewed and analyzed for Misoperation.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
their potential impact on BES reliability).	**4.2.1.1** Non-protective functions that are embedded within a Protection System ~~are excluded.~~ . **4.2.1.2** Protective functions intended to operate as a control function during switching ~~are excluded.~~. **4.2.1.3** Special Protection Systems (SPS). **4.2.1.4** Remedial Action Schemes (RAS). **4.2.2** Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	The applicable Facilities have been clarified in the proposed PRC-004-3 to include Protection Systems for BES Elements. Additional language is provided for clarity that non-protective functions ~~are not applicable~~ and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service~~). The~~ as opposed to providing anti-motoring protection) are not applicable. The standard's Applicability is further clarified to include underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements to be more precise. Protection Systems associated with Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded and will be addressed in phase two of this project and have been excluded in the Applicability.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that	The applicable entities will be required to identify whether a Misoperation occurred for each BES interrupting device operation which meet criteria 1.1

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
for Misoperations (due to their potential impact on BES reliability).	operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation ~~when~~under the following circumstances: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and **1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.	through 1.3. Requirement R1 is most clearly the direct carryover from the PRC-003-1 Reliability Standard which involves the "owner" of the Protection System. The previous standard was silent on the responsibilities of other Protection System owners and had no provision for ensuring that other owners had a responsibility to be involved in the review and analysis.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R2.** ~~Each~~ Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, ~~notify the other owner(s) of the Protection System of the operation when:~~provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances: **2.1.1** The BES interrupting device owner shares the Composite Protection	Requirement R2 ~~now~~ asserts a responsibility on the initiating entity (i.e., BES interrupting device owner) to notify other owners of the Composite Protection System when the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and a Misoperation occurred (or cannot be ruled out) in accordance with ~~criteria~~Part 2.1, including sub-parts 2.1.1 through 2.1.3.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	System ownership with any other entity; and **2.1.2** The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** ~~**2.3**~~ The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation. **2.2** For a BES interrupting device operation by a Protection System	(Part 2.2) Since Requirement R1 initiates the reliability activity upon the operation of a BES interrupting device, Requirement R1 does not address the case of a Protection System failure where a remote BES interrupting device operates. The second Part 2.2 of Requirement R2 is a provision to require notification to the other owners when a remote BES interrupting device owner in performing Requirement R1 determines that it's Protection System

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.	operated as backup for another BES interrupting device which has most likely failed to operate. Part 2.2 requires the other owner for which backup protection was provided to be notified, thus initiating the reliability activity to identify a possible Misoperation under Requirement R3 for the other owner.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, ~~shall~~ identify whether its Protection System component(s) caused a Misoperation.	Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component(s) owners during its review ~~with~~within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 days) to review an operation, the receiving entity will always have

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		a minimum and reasonable time (60 days) to conduct its review.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified.	Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the cause(s) of a Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when ~~a~~the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it ~~has taken reasonable action and~~ could not determine the cause.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1.2. Data reporting requirements (periodicity and format) for Misoperations.	None.	NERC Rules of Procedure, Section 1600 Request for Information or Data will replace the reporting obligations of applicable entities. As such, Regional reporting will end and continent-wide single reporting to the Electric Reliability Organization (ERO) will be required. The ERO will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. Metrics will be shared with each Region. The removal of the data collection from the standard does not result in a reduction of reliability.
R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation:	The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those at other locations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	• Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.	Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity may document this as well~~.~~ and not make a change. In cases where the entity, in its judgment, determines that a CAP is not practical for improving BES reliability, the entity must explain in a declaration its conclusions why no further action will be taken.
(Continued) **R1.3.** Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.	None.	The proposed PRC-004-3 now requires the applicable entities (GO, DP, and TO) to individually address Misoperations of its Protection ~~System~~Systems for BES Elements without regard to the Region or Regions in which it owns Protection Systems for BES Elements. The proposed PRC-004-3 Reliability Standard ~~and~~, revised definition of "Misoperation," and new definition of "Composite Protection System" provide sufficient clarity to entities; therefore, there is no reliability benefit to obtain the Regional Entity's (formerly Regional Reliability Organization or RRO) approval. Each applicable entity will be measured on its performance with the proposed PRC-004-3 requirements.
R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no need to have a specific requirement for dictating the updating of such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
and generation Protection System Misoperations.		update procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.	None.	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no longer a need to distribute such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to distribute procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Transmission Owner **4.2.** Distribution Provider that owns a transmission Protection System **4.3.** Generator Owner	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider **4.2.** Facilities: **4.2.1** Protection Systems for BES Elements~~.~~, with the following exclusions: **4.2.1.1** Non-protective functions that are embedded within a Protection System ~~are excluded.~~ . **4.2.1.2** Protective functions intended to operate as a control function during switching ~~are excluded.~~. **4.2.1.3** Special Protection Systems (SPS).	The same applicable entities will transition to the new PRC-004-3 standard. The clause about the Distribution Provider "*that owns a transmission Protection System*" has been removed because it was ambiguous. This clause is replaced by "*Protection Systems for BES Elements*" found in Section 4.2, Facilities and applies to all the applicable entities. Having the Applicability section address Facilities specifically removes the ambiguity of what a "*transmission Protection System*" includes. The proposed PRC-004-3 standard is specific that it includes those Protection Systems for BES Elements, including UFLS that is intended to trip one or more BES Elements. Additional language is provided for clarity that non-protective functions ~~are not applicable~~ and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service~~).~~) are not applicable. Protection Systems associated with Special Protection Systems (SPS) and Remedial Action

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	4.2.1.4 Remedial Action Schemes (RAS). **4.2.2** Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	Schemes (RAS) are addressed in phase two of this project~~.~~ and have been excluded in the Applicability.
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation ~~when~~under the following circumstances: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and	The ~~already~~currently approved standard PRC-004-2.1a, Requirements R1 and R2 include three levels of performance which is analyze (Protection System operations), develop (CAP), and implement (CAP). The proposed standard, which includes the same three applicable entities (DP, GO, and TO), divides the three levels of performance into six discrete Requirements. Requirement R1 provides the "analyze" portion, requiring the initiating BES interrupting device owner to review its Protection System for each BES interrupting device operation that meets the three criteria (i.e., 1.1 thorough 1.3). The "analyze" portion is further clarified in the proposed Requirement R2 by ensuring that any other owners of the Composite Protection System are

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R2. The Generator Owner shall analyze its generator and generator interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. **R2.** ~~Each~~ Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, ~~notify the other owner(s) of the Protection System of the operation when:~~provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:	notified when the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and a Misoperation occurred (or cannot be ruled out) in accordance with criteria 2.1 through 2.3. Requirement R3 provides the necessary performance for the notified Protection System owner to review its component(s) for Misoperation. Last, Requirement R4 requires the applicable entity to conduct investigative actions until ~~is~~it determines the cause(s) or declares that it has been unable to determine the cause(s). Requirement R5 addresses the "develop" a Corrective Action Plan (CAP)" portion, and Requirement R6 addresses the "implement" portion of the CAP.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and **2.1.2** The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.	

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided. **R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, ~~shall~~ identify whether its Protection System component(s) caused a Misoperation. **R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a

Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.		Requirement is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.
6. Draft 4 of PRC-004-3 was posted for a 45-day additional comment period from January 17 – March 11, 2014 and an additional ballot in the last ten days of the comment period from February 2 – March 11, 2014 under the new Standards Process Manual (Effective: June 26, 2013).

Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft 45 of PRC-004-3 – Protection System Misoperation Identification and Correction for a 45-day additional comment period and additional ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).

Anticipated Actions	Anticipated Date
Additional 45-day Formal Comment Period with Parallel Ballot	~~January~~May 2014
10-day Final Ballot	~~March~~July 2014
BOT Approval	~~May~~August 2014

Effective Dates

~~Except in the Western Interconnection, the~~ The standard, the revised definition of "Misoperation" and ~~definitions~~the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. ~~Except in the Western Interconnection, where~~Where approval by

an applicable governmental authority is not required, the standard, the revised definition of "Misoperation" and ~~definitions~~the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

~~In the Western Interconnection, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC's	

		Order is effective as of September 26, 2011)	
2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2

2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	
2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
~~1~~3	TBD	~~Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)~~Adopted by Board of Trustees	~~New~~Revision under Project 2010-05.1

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms used in NERC Reliability Standards* ("NERC Glossary") are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the ~~glossary~~NERC Glossary.

Composite Protection System:

The total complement of ~~the~~ Protection System(s) that function collectively to protect an Element~~, such as any primary, secondary, local backup, and communication-assisted relay systems.~~. Backup protection provided ~~by~~to a remote Protection System is ~~excluded~~included.

Misoperation:

The failure of a Composite Protection System to operate as intended~~.~~ for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition ~~for which it is designed. Delayed clearing~~if the duration of ~~a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition ~~for which it is designed~~, such as a power swing, undervoltage, overexcitation, or loss of excitation~~. Delayed clearing~~, if the duration of ~~a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition ~~for which it is not designed. A.~~ A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

When this standard has received ballot approval, the ~~text~~rationale boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Misoperation Identification and Correction**

2. **Number:** PRC-004-3

3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   4.2. Facilities:

   4.2.1 Protection Systems for BES Elements~~. Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.[1]~~, with the following exclusions:

   4.2.1.1 Non-protective functions that are embedded within a Protection System.

   4.2.1.2 Protective functions intended to operate as a control function during switching.[2]

   4.2.1.3 Special Protection Systems (SPS).

   4.2.1.4 Remedial Action Schemes (RAS).

   4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Rationale for Applicability: Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are ~~not included~~excluded in this standard because they are planned to be handled in the second phase of this project.

[1] ~~For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.~~

[2] For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.

5. Background:

A key ~~element~~factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needs more specificity and clarity. The terms "specified time" and "abnormal condition" are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

The SAR for this project also includes clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information ("data request"). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for

compliance with the standard and data request are intended to be independent of each other.

The proposed requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

6. Effective Dates: ~~See Implementation Plan~~

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation ~~when~~under the following circumstances: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

~~**M1.**~~ **M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R1: This requirement ensures that entities review those Protection System operations meeting the ~~criteria~~circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner ~~has~~is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, ~~notify the other owner(s) of the Protection System of the operation when:~~provide notification as described in 2.1 and 2.2. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

~~2~~**2.1** For a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other ~~entity~~owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1~~, 2.2,~~ and 2.~~3~~2 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

Rationale for R2: ~~This requirement~~Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System ~~when the criteria in all three Parts (2.1, 2.2, and 2.3) are met~~. The phrase "owner(s) that share Misoperation identification responsibility" allows entities to notify the specific others that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which that backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that ~~the three conditions~~when Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, ~~shall~~ identify whether its Protection System component(s) caused a Misoperation. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R3: When an entity receives notification of a Protection System operation by the BES interrupting device owner, the Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R4: If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations~~,~~; or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): ~~a dated~~ CAP and evaluation, or ~~a dated~~ declaration.

Rationale for R5: A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc. In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the ~~close of the Misoperation in lieu~~absence of a CAP ~~and for future reference~~.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]*

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to~~,~~ the following dated documentation (electronic or hard copy format): ~~dated~~ records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

Rationale for R6: ~~The~~Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP tivities provides measurable progress and confirmation of completion.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for 12 calendar months.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5 for 12 calendar months following ~~completion~~development of each CAP, development of each evaluation, and development of each declaration.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Periodic Data Submittal

1.4. Additional Compliance Information

D. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Assessment, Operations Planning	Medium	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Assessment, Operations Planning	Medium	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Operations Planning, Long-Term Planning	Medium	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR (See next page)

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	(Continued)		The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
R6	Operations Planning, Long-Term Planning	Medium	The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.

Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter[3] from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

> "Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. …Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization."

The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance[4]; July 2011.

> "…a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 "Transmission Protective Relay System Performance Measuring Methodology[5]." Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a ~~Fault~~fault or non-~~Fault~~fault condition.

[3] http://www.nerc.com/pa/Stand/Project%20201005%20Protection%20System%20Misoperations%20DL/20110209130708-Cauley%20letter.pdf
[4] http://www.nerc.com/files/2011_RARPR_FINAL.pdf
[5] "Transmission Protective Relay System Performance Measuring Methodology," Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society, 1999.

For reference, a "Protection System" is defined in the *Glossary of Terms used in NERC Reliability Standards* ("NERC Glossary") as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

> **Composite Protection System –** *The total complement of ~~the~~ Protection System(s) that function collectively to protect ~~a~~an Element~~, such as any primary, secondary, local backup, and communication-assisted relay systems.~~. Backup protection provided ~~by~~to a remote Protection System is ~~excluded~~included.*

The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the ~~entity must consider the entire Protection System associated with the BES interrupting device that operated. Additionally, the definition accounts for those Protection Systems with multiple levels of protection (e.g., redundant systems), such that if one component fails, but the overall intended performance of the composite protection is met – it would not be identified as a Misoperation under the definition~~overall performance of an Element's total complement of protection should be considered while evaluating an operation.

Composite Protection System – Line Example

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Transformer Example

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Generator Example

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Breaker Failure Example

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker's Composite Protection System. Considering breaker failure protection to be part of another Element's Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the "Slow Trip" criteria of the Misoperation definition.

Misoperation – *The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:*

1. **Failure to Trip – During Fault** *– A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
2. ***Failure to Trip – Other Than Fault*** *– A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
3. ***Slow Trip – During Fault*** *– A Composite Protection System operation that is slower than required for a Fault condition ~~for which it is designed. Delayed clearing~~if the duration of ~~a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one other Element's Composite Protection System.*
4. ***Slow Trip – Other Than Fault*** *– A Composite Protection System operation that is slower than required for a non-Fault condition ~~for which it is designed~~, such as a power swing, undervoltage, overexcitation, or loss of excitation~~. Delayed clearing~~, if the duration of ~~a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one other Element's Composite Protection System.*
5. ***Unnecessary Trip – During Fault*** *– An unnecessary Composite Protection System operation for a Fault condition on another Element.*

6. ***Unnecessary Trip – Other Than Fault*** *– An unnecessary Composite Protection System operation for a non-Fault condition ~~for which it is not designed. A~~. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.*

The Misoperation definition is based on the principle that an Element's total complement of protection is intended to operate dependably and securely.

Failure to automatically reclose after a ~~Fault~~fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.

A breaker failure operation does not, in itself, constitute a Misoperation.

A remote backup operation resulting from a "Failure to Trip" or a "Slow Trip" does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended. The definition includes six categories which provide further differentiation ~~and examples~~ of what ~~is~~constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

Failure to Trip – During Fault

This category of Misoperation typically results in the ~~Fault~~fault condition being cleared by remote backup Protection System operation.

> **Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer ~~Fault~~fault is a Misoperation.
>
> **Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer ~~Fault~~fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated ~~to clear the Fault~~.
>
> **Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.
>
> **Example 1d:** A failure of an overall differential relay to operate is not a "Failure to Trip – During Fault" Misoperation as long as another component such as a generator differential relay operated.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – During Fault" category applies to the operation.

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The "Failure to Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Example 2a: A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

Example 2b: A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as ~~another component of~~ the generator's Composite Protection System operated as intended ~~(e.g.,~~ isolating the generator~~).~~ from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – Other Than Fault" category applies to the operation.

Slow Trip – During Fault

This category of Misoperation typically results in remote backup Protection System operation before the ~~Fault~~fault is cleared.

Example 3: A failure of a line's Composite Protection System to operate as quickly as intended for a line ~~Fault is a Misoperation~~fault is a Misoperation. The current differential element of a multiple function relay failed to operate for a line fault. The same relay's time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

Installing high-speed protection may be a part of a utility's standard practice without having the need for high-speed protection to prevent voltage or dynamic instability or to maintain relay coordination. For this case, a "Slow Trip – During Fault" of the high-speed protection is not a Misoperation because it would not negatively impact the dynamic BES performance, unless the Composite Protection System operation is slower than previously identified as being necessary to prevent voltage or dynamic instability. The Composite Protection System must also coordinate with other Protection Systems to prevent the trip (e.g., an over-trip) of additional Protection Systems.

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System ~~operated slower than the objective of the owner(s).~~ It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

The phrase "resulted in the operation of any other Composite Protection System" refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the "Unnecessary Trip – During Fault" category to determine if an "unnecessary trip" applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

Slow Trip – Other Than Fault

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System ~~operated slower than the objective of the owner(s).~~. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

> **Example 4:** A failure of a generator's Composite Protection System to operate as quickly as intended for an overexcitation condition is a Misoperation. ~~This category of Misoperation could result in equipment damage.~~

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Unnecessary Trip – During Fault

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the ~~Fault~~fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the ~~Faulted~~faulted Element to clear the ~~Fault~~fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

> **Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line ~~Fault~~fault is a Misoperation. The ~~Fault~~fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

Unnecessary Trip – Other Than Fault

Unnecessary trips for non-~~Fault~~fault conditions include but are not limited to, power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

> **Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.
>
> **Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

Example 6c: An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

Example 6d: Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-~~Fault~~fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

Example ~~6d~~6e: A BES interrupting device operation that occurs at the remote end of a line during a non-~~Fault~~fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation.

The "on-site" activities at one location that initiates a trip to another location are included in this exemption; however, once the maintenance, testing, inspection, construction, or commissioning is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip," category of Misoperation at the remote terminal.

Special Cases

Protection System operations for these cases would not be a Misoperation.

Example 7a: A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements, are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

Example 7b: The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for ~~Faults~~faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer ~~Fault~~fault operated as intended and would not be a Misoperation.

~~The above~~Below are examples ~~only, and do not constitute an all-inclusive list~~ of conditions that would ~~not~~ be a Misoperation.

Example7c: A 230 kV shunt capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization. The operation trips only the capacitor bank breaker that was closed to energize the bank. Since closing the breaker put the capacitor bank into service, this is a Misoperation.

Example 7d: A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush following a maintenance outage. Only the high-side breaker opens since the low-side breaker had not yet been closed. Since closing the breaker put the transformer bank into service, this is a Misoperation.

Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

Control Functions

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

Example 8a: The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.

Example 8b: The reverse power relay enables a permissive trip and the generator operator trips the unit.

~~In the example above, the~~

The standard is not applicable~~; however~~ to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay ~~as a part of the generator Protection System~~ when ~~intended to provide generator anti-~~ it operates for conditions not associated with the controlled shutdown sequence, such as a motoring ~~protection. For example, reverse power relays are typically installed as~~condition caused by a trip of the ~~primary protection for a generating unit to guard against motoring. Though, operators often take advantage of this functionality and use the Protection System's reverse power protective function as a normal procedure to shutdown a generating unit~~prime mover.

The following is another example of a condition to which this standard is not applicable:

> **Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, ~~says~~reads: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

Requirement R1

This requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified ~~that~~ its Protection System component(s) as causing the BES interrupting device operation.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

> **Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case, BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, Requirement R2, Part 2.2 requires the entity that had the BES interrupting device operation to notify the other owner(s) to review its portion of Composite Protection System for Misoperation.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation until the entity determines otherwise. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether or not a Misoperation of its Protection System component(s) occurred.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under requirement R1. This is consistent with NERC SPCS guidance.

Repeated Misoperations which occur during the same 24 hour period do not need a separate identification under requirement R1. This is consistent with NERC PSMTF guidance.

When Elements are isolated from the BES and undergoing maintenance, they are not subject to the standard, provided they do not result in the operation of any interrupting devices that are part of the BES.

Requirement R2

~~For~~ Requirement R2 ~~(i.e.,~~ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership~~),~~, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a

Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

> **Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking ~~or (~~DCB) relaying on 03/03/2014 at 15:43 UTC during an external fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.
>
> **Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, was required to notify the Generator Owner of the operation. The Generator Owner investigated to determine if its Protection System components caused the Misoperation. In this example, the Generator Owner's Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the GO and TO functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the

Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the latter half of the 120 calendar days allotted to the BES interrupting device owner.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, ~~the entity~~ is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

> **Example R4a**: A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following

calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, ~~or~~ requesting ~~a necessary~~an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.[6]

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

> **Example R4b**: A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.
>
> **Example R4c:** A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan ~~or (~~CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must create the CAP or make a declaration why additional actions are beyond the entity's

[6] NERC System Protection and Control Subcommittee. Misoperations Report. April 1, 2013: http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf, Figure 15: NERC Wide Misoperations by Cause Code, pg. 22 of 40.

control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation; in these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAPs to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The time periods within Requirement R1, R3 and ~~Requirement~~ R5 are distinct and separate. If a cause of a Misoperation is identified quickly, the time period in Requirement R1 or R3 ends and the 60 calendar day period to develop the CAP becomes applicable. The ultimate goal is to keep all time periods as short as possible, including the correction of the cause(s) of the Misoperation. See Requirement R6 for CAP implementation. Where there are multiple Protection System owners involved in a Misoperation, each owner whose Protection System component(s) contributed to the Misoperation is subject to Requirement R5.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP ~~must include~~and an evaluation of other Protection Systems including other locations ~~to~~must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of the CAPs in examples R5a through R5d, please see examples R6a through R6d.

> **Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

Example R5b: Actions: Remove the relay from service. Replace capacitor~~.~~ in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

Example R5c: Actions: Remove the relay from service. Replace capacitor~~.~~ in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.

A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

Example R5d: Actions: Provide the manufacturer ~~Fault~~fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

Example R5e: The cause of the Misoperation was due to a non-registered entity communications provider problem.

Example R5f: The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following ~~in an example~~are examples of ~~a declaration~~declarations made why corrective actions would not improve BES reliability.

Example R5g: The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

Example R5h: As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase fault. The protection scheme utilized for both protection groups is a ~~POTT.~~permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

Example R6a: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. ~~The~~A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

Example R6b: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. ~~The~~A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.

CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay~~;~~ and preemptive actions for similar installations (See also, Example R5c).

Example R6c: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. ~~The~~A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due resource rescheduling from a scheduled 02/01/15 completion to ~~03~~04/01/2015~~. Following the timetable change, capacitor~~ completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem~~;~~ and preemptive actions for similar installations. (See also, Example R5d).

Example R6d: Actions: ~~Fault~~fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

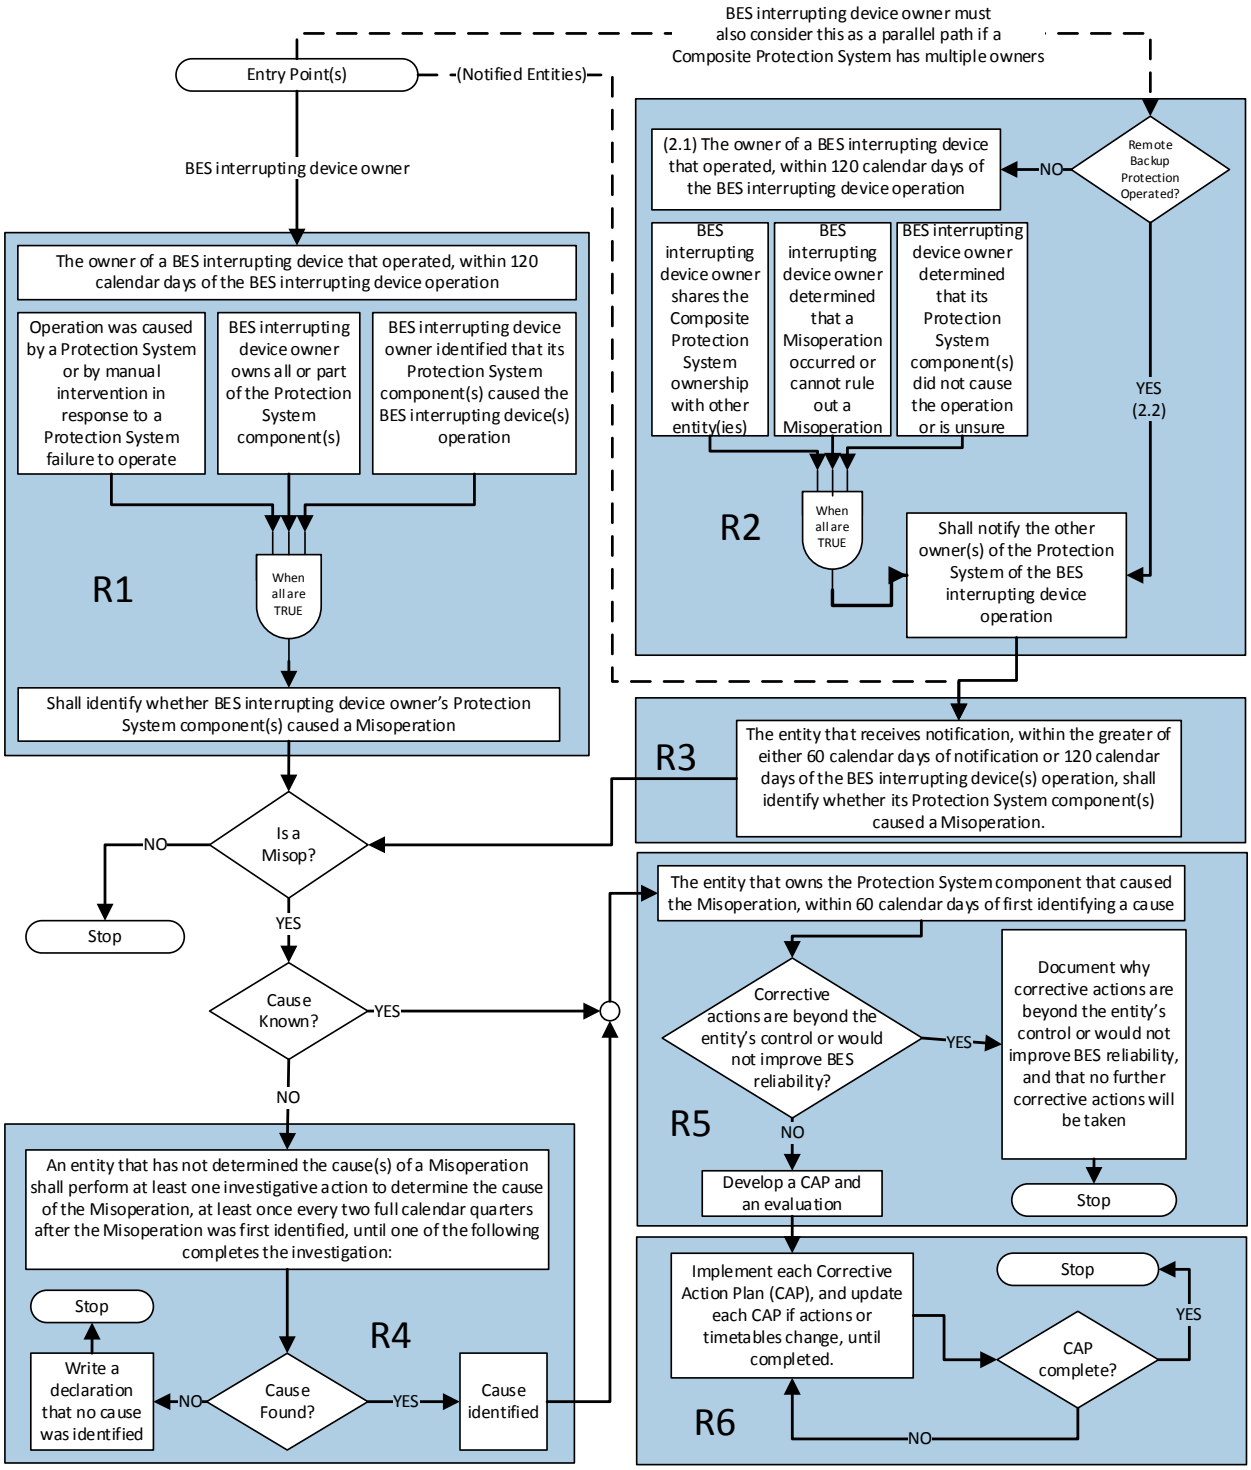
Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all of the ~~documented~~ actions ~~to resolve~~identified within the ~~specific problem (i.e., Misoperation) are~~CAP have been completed ~~which may include those actions~~

~~resulting from the entity's evaluation of other locations, if not addressed through a separate CAP.~~.

Process Flow Chart: Below is a graphical representation ~~of the expected process created by the standard, including~~demonstrating the relationships between requirements:



NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction

Project 2010-05.1 – Protection System (Misoperations)

Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 — Protection System Misoperations.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to

reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF Discussion

The following discussion addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. " The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another ~~entity~~owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete ~~requirement~~Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the

entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth ~~requirement~~Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity's control or would not improve BES reliability, ~~the entity~~it must ~~make~~explain this in a declaration why ~~and that~~ no further corrective actions will be taken.

In the last ~~of the requirements,~~ Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the ~~requirements~~Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new ~~requirements~~Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives, thus a ~~requirement~~Requirement-to-~~requirement~~Requirement comparison of VRFs is not possible. In developing the new VRFs for the ~~requirements~~Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations~~,~~ (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation~~,~~ (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation~~,~~ (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance~~, R1~~ (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Composite Protection System operations reviewed for proper operation by ~~their~~an owner~~(s)~~ is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection ~~System~~Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard:

VRF and VSL Justifications – PRC-004-3, R1	
	~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which both have a VRF of High. This ~~proposed~~ Requirement R1, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. ~~The proposed~~A VRF of Medium ~~is~~does not inadvertently ~~lowering~~lower the ~~identified~~current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because ~~the proposed~~this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. The VRF assignment also comports with the currently effective standards PRC-016-0.1 and PRC-022-1.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs:

VRF and VSL Justifications – PRC-004-3, R1	
	Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R1			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. ~~The proposed~~This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The ~~proposed~~ VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: ~~The proposed~~This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R1	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	~~The proposed~~This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with ~~the requirement.~~this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify ~~a joint~~the other owner(s) of a Composite Protection System when the initiating owner determined its Protection System components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of ~~jointly~~Composite Protection Systems owned ~~equipment or operations~~by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report:

VRF and VSL Justifications – PRC-004-3, R2	
	This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of the Composite Protection System ~~components~~component(s) when it determines that (or is unsure whether)its ~~components~~component(s) did not cause a Misoperation or when it is unable to rule out a Misoperation of the ~~jointly owned~~ Composite Protection System~~.~~ owned by others. This ensures that all ~~parties~~owners review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: ~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which ~~as~~both have a VRF of High. ~~The~~This requirement and VRF of Medium is consistent with Reliability Standards FAC-008-3 – Facility Ratings, R7 ("…shall provide Facility Ratings (for its solely and jointly owned Facilities~~…") and …"~~), MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 ("…shall provide appropriate equipment characteristics and system data~~…") which both~~…"), and IRO-015-1 – NAME, R1.1 ("…shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.") which all have a VRF of Medium.

VRF and VSL Justifications – PRC-004-3, R2	
	Other ~~protection systems~~Protection Systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 ("…shall provide documentation…"), PRC-016-0.1 – Special Protection System Misoperations, R3 ("…that owns an SPS shall provide documentation of the misoperation analyses…"), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 ("…SPS shall provide documentation of the program…) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of ~~jointly~~Composite Protection Systems owned ~~equipment or operations~~by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:

VRF and VSL Justifications – PRC-004-3, R2			
	This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as ~~joint ownership~~Composite Protection Systems that are owned by multiple entities is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: ~~The proposed~~This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	~~The proposed~~This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with ~~the requirement.~~this Requirement.

VRF and VSL Justifications – PRC-004-3, R2	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of ~~a joint~~another Composite Protection System owner to review its ~~components~~component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate ~~for Misoperation upon notification~~ could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection ~~System~~Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: ~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which ~~as~~both have a VRF of High. This ~~proposed~~ Requirement ~~R1,~~ R3, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. ~~The proposed~~A VRF of Medium ~~is~~does not inadvertently ~~lowering~~lower the ~~identified~~current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because ~~the proposed~~this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure of ~~a joint~~another Composite Protection System owner to review its ~~components~~component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate ~~for Misoperation upon notification~~ could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R3			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO & TO) for the notified Protection System owner. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. ~~The proposed~~A VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. ~~The proposed~~This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: ~~The proposed~~This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	~~The proposed~~This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with ~~the requirement.~~this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation (if not determined in Requirements R1 or R3) could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An Unidentified ~~causes~~cause(s) of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: ~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R4	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which ~~as~~have a VRF of High. This ~~proposed~~ Requirement R4, to perform at least one "investigative action" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. ~~The proposed~~A VRF of Medium is not inadvertently lowering the ~~identified~~current VRF of High in the former ~~Requirement~~PRC-004-2.1a, Requirements R1 or R3, because ~~the proposed~~this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

VRF and VSL Justifications – PRC-004-3, R4			
	Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

VRF and VSL Justifications – PRC-004-3, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. ~~The proposed~~This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. ~~The proposed~~This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: ~~The proposed~~This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: ~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have ~~varying VSLs.~~ ~~The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The former Requirement for the CAP was limited to a High VSL; however, the proposed Requirement R5 is now expanded to the Severe VSL. The lesser VSLs are based on tardiness and are practical and reasonable for the amount of time allotted for completion.~~a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 ("…shall take corrective actions to avoid future Misoperations"), PRC-022-1, R1.5 ("For any Misoperation, a Corrective Action Plan…"), FAC-003, R5 ("…Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management") all three of which have a VRF of Medium.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An unresolved cause of a Misoperation could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.

VRF and VSL Justifications – PRC-004-3, R5			
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

Introduction to GMD Studies

A Planner's summary roadmap for TPL007-1 GMD planning studies

DRAFT

Prepared by L. Marti

Hydro One Networks, Toronto, Ontario, Canada

Last revision May 2014

Introduction to GMD studies

NERC Draft Standard TPL007-1 requires that applicable entities such as transmission planners and generator owners carry out studies and establish mitigating measures (if any) to meet the reliability performance criteria established by the Geomagnetic Disturbance (GMD) benchmark event. The draft standard and its associated white papers provide references to resources that a planning engineer can use as guidance to carry out GMD assessment studies. This document provides an introduction and single-source information summary to familiarize the planning engineer with the salient steps needed to carry out a GMD assessment.

Organization

This document is organized to answer the following questions:

- What is a GMD event and how does it interact with the interconnected power system
- What is the TPL007-1 GMD benchmark event
- What are the steps required to carry out the studies needed to meet TPL007-1 requirements
- What are the data required for these studies

This guide does not replace the modelling and application guides produced by NERC's Geomagnetic Disturbance Task Force [1-2], but rather provides a "lighter" guide focused on the requirements of TPL007-1. The reader is directed to these guides for a more in-depth treatment of various elements of the subject matter as needed.

Space weather and the power system

A geomagnetic disturbance (GMD) event is a consequence of the interaction of the cloud of charged particles produced by the Sun's Coronal Mass Ejections (CME) and the Earth's magnetic field. Unlike terrestrial weather, which is local, CMEs that cross the earth's path are global events.

The Sun undergoes an 11-year cycle, where the polarities of its north and south poles reverse (see Fig. 1). Most solar storms and CMEs occur during a 4-6 year period referred to as "solar maximum" (see Fig. 2). However, the largest historical solar storms have not occurred at the peak of the "solar maximum." Although the probability of a solar storm occurrence is greater during the peak of the solar cycle, severe solar storms and CMEs can occur at any time in the cycle.

DRAFT

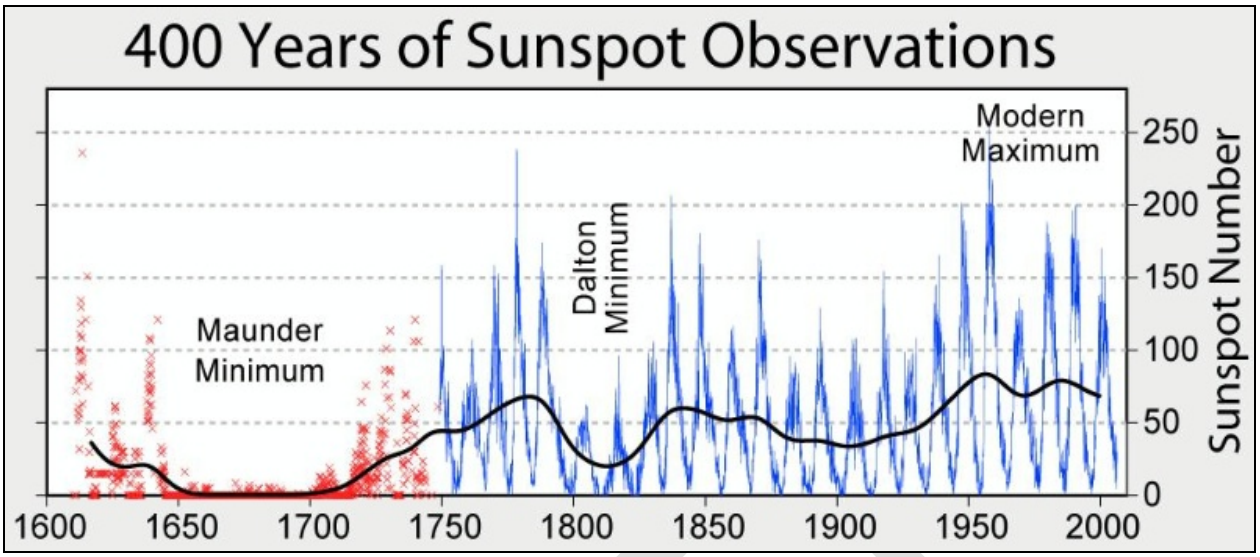

Fig. 1: Solar sunspot cycle

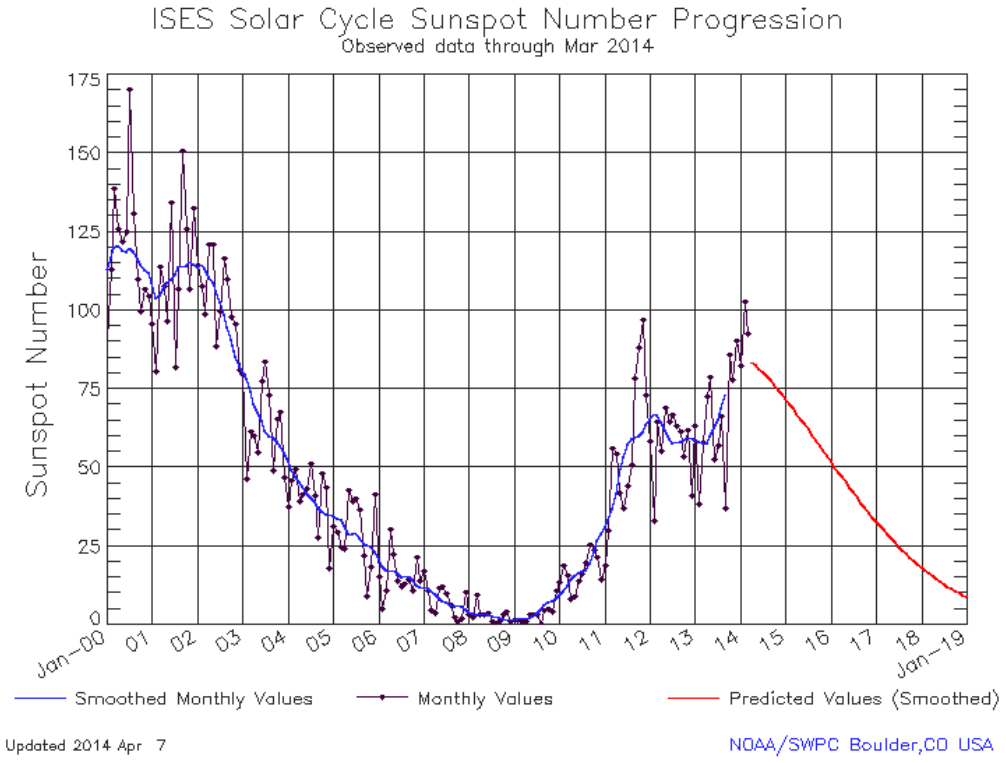

Fig. 2: Solar Sunspot Number Progression through October 2011

Geomagnetic disturbances occur on Earth one to four days after a flare or other eruption on the Sun.takes place. A CME, which is a cloud of solar material and magnetic fields that ejects from the Sun

and moves at a rate of about one to five million miles-per-hour, is usually associated with a large flare (see Fig. 3). If CMEs are Earth-directed, they interact with the Earth's magnetosphere and,

- Increase in the magnitude electroject currents as well as its width. From a power engineer's point of view, the electrojects (auroral/north and boreal/south) can be viewed as a large conductor about 100 km above the earth's surface carrying currents that can exceed 1,000,000 A.
- The interaction of the CME with the electroject causes slow fluctuations in the electrojet currents which in turn translate into changes in the magnetic field at ground level.

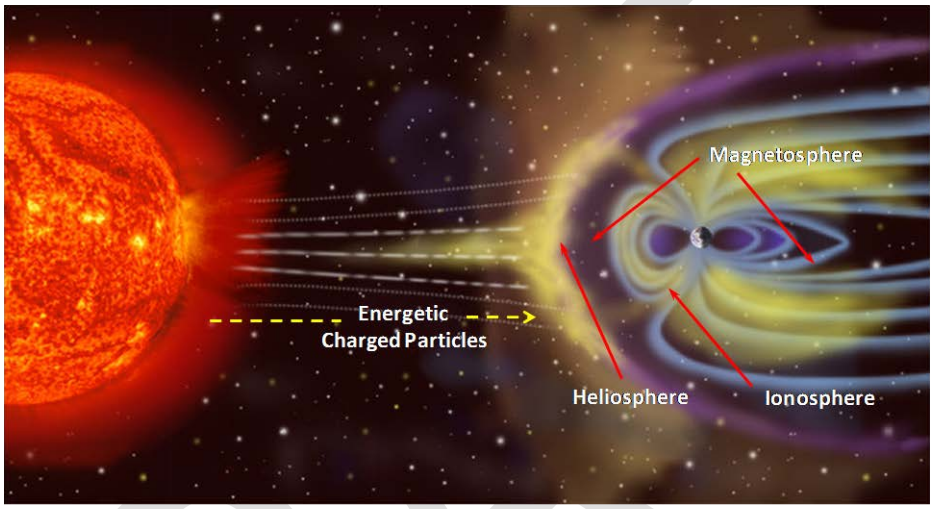

Fig. 3: Coronal Mass Ejection

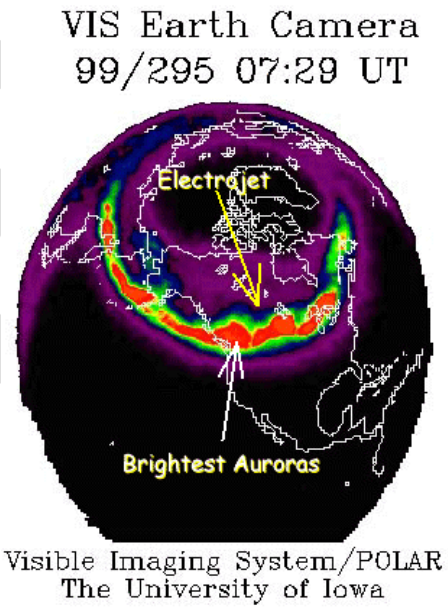

Fig. 4: Auroral electrojet.

Interaction of Geomagnetic Disturbances with the power system

A CME interacts with the earth's magnetic field and increases the magnitude and size of the electroject. The electroject can be visualized as a conductor 100 km above the earth carrying slow-varying currents (10 microHertz to 100 milliHertz). The electroject is magnetically coupled with transmission lines at ground level (see Fig. 5). The stronger the magnetic coupling between two conductors, the larger their coupling factor. The earth resistivity determines the coupling factor (high resistivity means large coupling factor) After the coupling factor is taken into consideration, the earth is assumed to be a zero resistance return path.

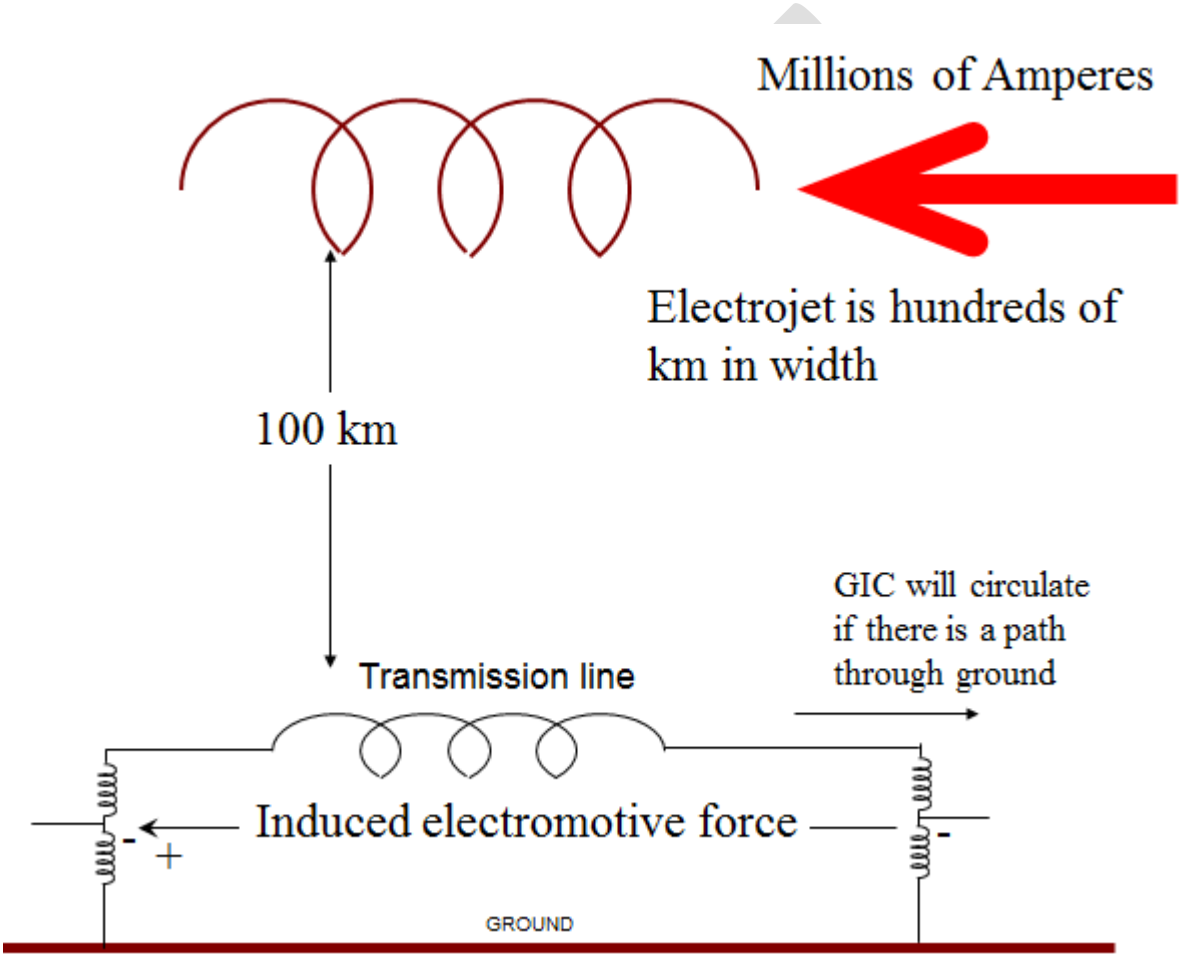

Fig. 5: Magnetic coupling between the electroject and HV transmission circuits.

Magnetic coupling induces a longitudinal voltage on transmission circuits. If there is a closed path through ground, this induced voltage will cause the circulation of Geomagnetically Induced Currents (GIC).

The notion of "coupling factor" is strictly a power engineering concept. The TPL007-1 standard uses the space science terminology of "earth model" effects, which account for earth structure and resistivity to depths of hundreds of km and determines how strongly the electrojet and transmission

circuits are coupled. The longitudinal induced voltage is referred to as the induced geoelectric field. In an HV and EHV transmission network, wye-grounded transformers provide a path to ground so that so that GIC can flow through the loop formed by lines, transformer windings station grounding system and earth return (see Fig. 6). In principle, a transformer with a zig-zag connection can also provide a path to ground for GIC. However, this type of connection is not normally used for voltages above 200 kV, which is the applicability voltage level of TPL007-1. HV-connected (as opposed to tertiary-connected) shunt reactors can also provide a path for GIC.

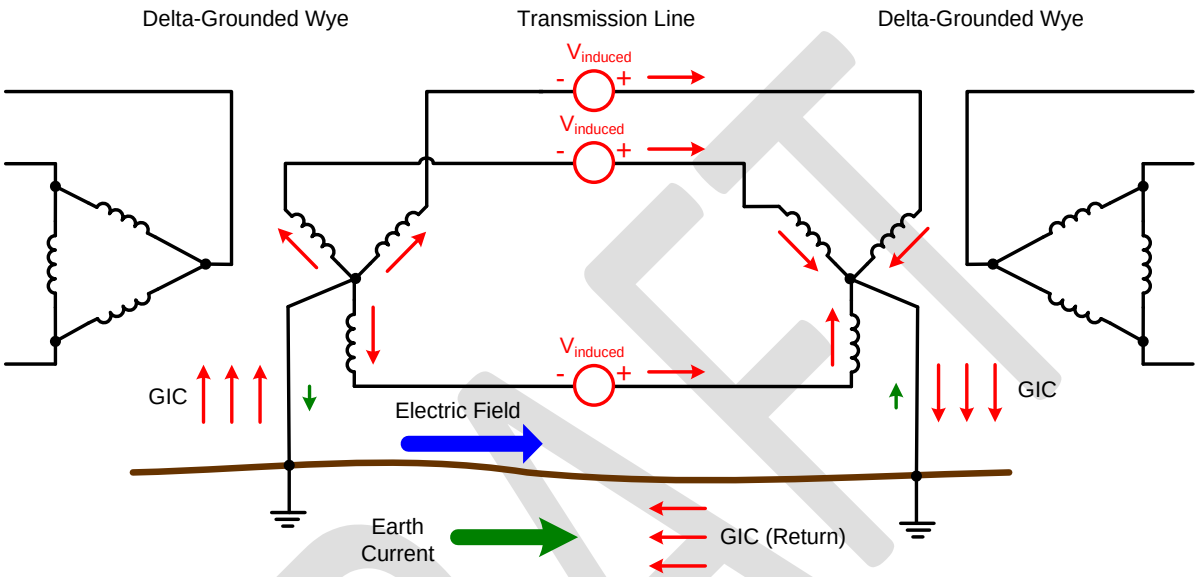

Fig. 6: GIC flow in the power system.

When GIC flows through a transformer winding there is a nearly constant flux offset (from a 60 Hz frame of reference) which causes asymmetrical or half-cycle saturation. Half cycle saturation causes persistent large magnetizing currents similar to inrush currents during transformer energization. These magnetizing currents are rich in even and odd harmonics. The 60 Hz component of these large magnetizing currents are seen by the system as transformer reactive power absorption.

Another effect of half-cycle saturation is hot spot heating of the transformer windings, which causes undue ageing of paper-oil insulation. Additionally, there is hot spot heating of the tank and other structural parts, which causes gassing, which in turn can result in dielectric breakdown.

Harmonics caused by half-cycle saturation can interfere with the operation of protective relaying. Shunt capacitor banks are harmonic sinks and experience harmonic overcurrents. This means that the shunt capacitor banks can either fail or trip on protection, depending on the protection scheme.

DRAFT

Effects of GIC in the power system

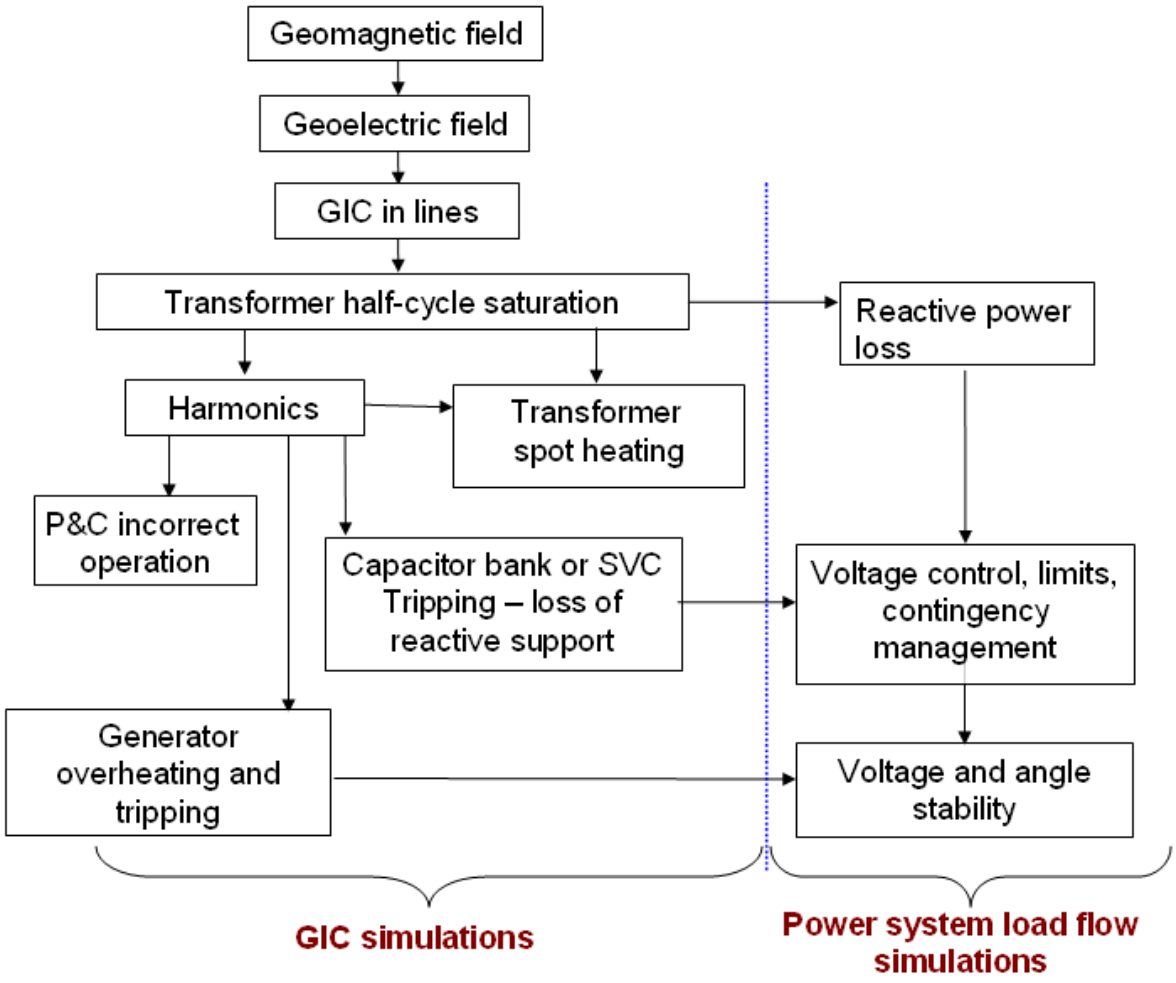

Fig. 7: Effects of GIC on the power system.

To summarize: GIC flow through the windings of HV and EHV transformer has the following consequences:

- Half-cycle saturation takes place. Half-cycle saturation causes
    - Even and odd current harmonics, which may
        - cause incorrect P&C operation;
        - exceed harmonic current ratings of shunt capacitor banks;
        - cause generator overheating due to negative sequence-like currents caused by even harmonics

- Additional transformer var absorption, which in turn can
  - reduce var reserves in the system;
  - violation of voltage and thermal limits;
  - contribute to voltage and angle instability.
- Transformer winding and structural part hot spot heating, which can lead to
  - Undue ageing of paper-oil insulation
  - Gassing that can lead to dielectric failure.

Benchmark GMD Event Description

The TPL007-1 GMD benchmark event is composed of the following elements: (1) a reference peak geoelectric field amplitude E_{peak} in V/km derived from statistical analysis of historical magnetometer data; (2) scaling factor α to account for local geomagnetic latitude; (3) scaling factor β to account for local earth resistivity; and (4) a reference geomagnetic field time series or waveshape to facilitate transformer thermal impact studies.

The statistical analysis predicts a peak geoelectric field amplitude of approximately 5.2 V/km. TPL007-1 selected a conservative 8V/km after accounting for some 20% margin as shown in equation (1) below.

$$E_{peak} = 8 \times \alpha \times \beta \ \text{(V/km)} \qquad (1)$$

Tables for scaling factor are provided in the Appendix of TPL007-1. A planner is permitted to use a technically-justified factor β on the basis of availability of more accurate earth models within the service territory.

The reference geomagnetic field time series is used to calculate GIC(t) in every applicable transformer in the network in order to carry out thermal vulnerability assessments.

DRAFT

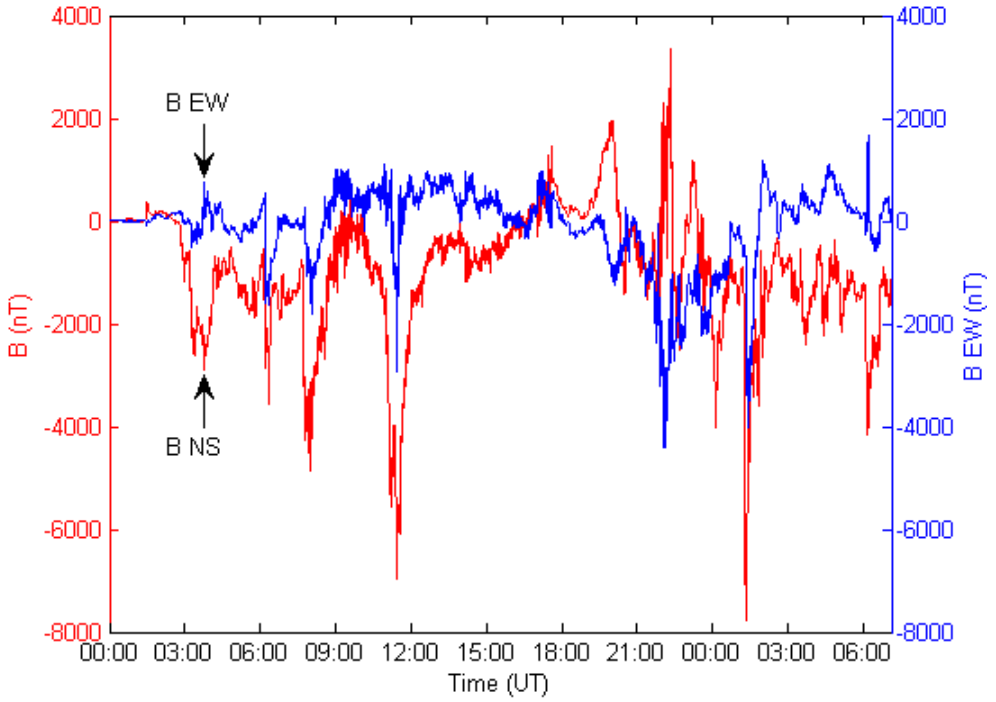

Fig. 8: Benchmark geomagnetic field waveshape. Red Bn (Northward), Blue Be (Eastward).

Studies required in a GMD assessment

The GMD assessment studies required in TPL007-1 generally follow the following sequence (see Fig. 9)

- GIC Study
  - Calculate GIC flow in every applicable transformer of the system using a peak geoelectric field of E_{peak}, as determined by the GMD benchmark event
  - Calculate var absorption in every applicable transformer of the system
- Load flow Study
  - Evaluate the performance of the system taking into consideration transformer var absorption calculated in the GIC Study.
- Thermal assessment study
  - Calculate GIC(t) for every applicable transformer in the system using the results of the GIC Study and the GMD benchmark reference geomagnetic field waveshape.
  - Determine if GIC(t) exceeds the allowable hot spot thermal limits of every applicable transformer in the system.

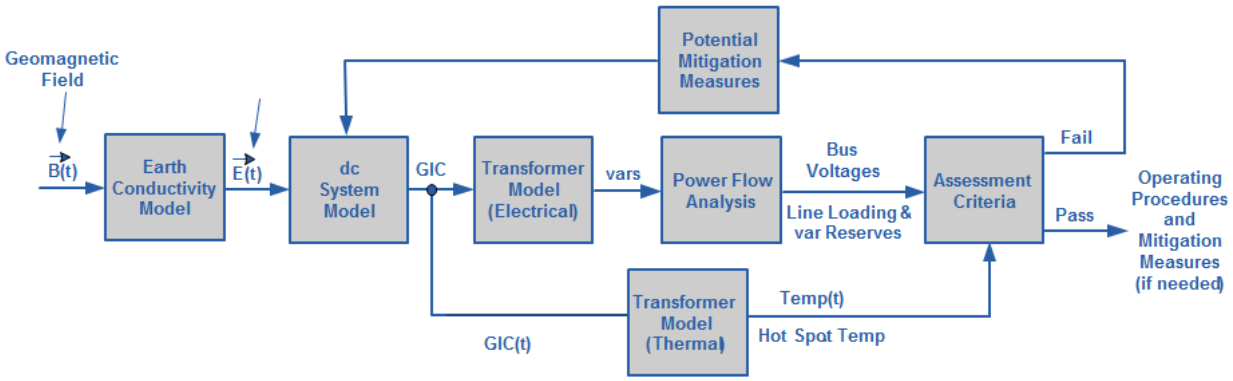

Fig. 9: GMD studies

1. **GIC study.** The purpose is to calculate the distribution of GIC in the network assuming a peak geoelectric field defined by E_{peak} in the GMD benchmark event (see equation (1)).
    a. GIC System model: Transmission lines are represented as a resistance in series with a voltage source. The magnitude of the voltage source depends on (a) line length and its orientation with respect to the direction of the geoelectric field; (b) Peak amplitude of the geoelectric field, which is defined by the benchmark GMD event. Transformers are represented as resistances. The effective grounding of a station is also modelled as a resistance.
    b. Transformer model: This is a curve that relates effective GIC in a transformer to reactive power absorption in the transformer (see Fig. 10).

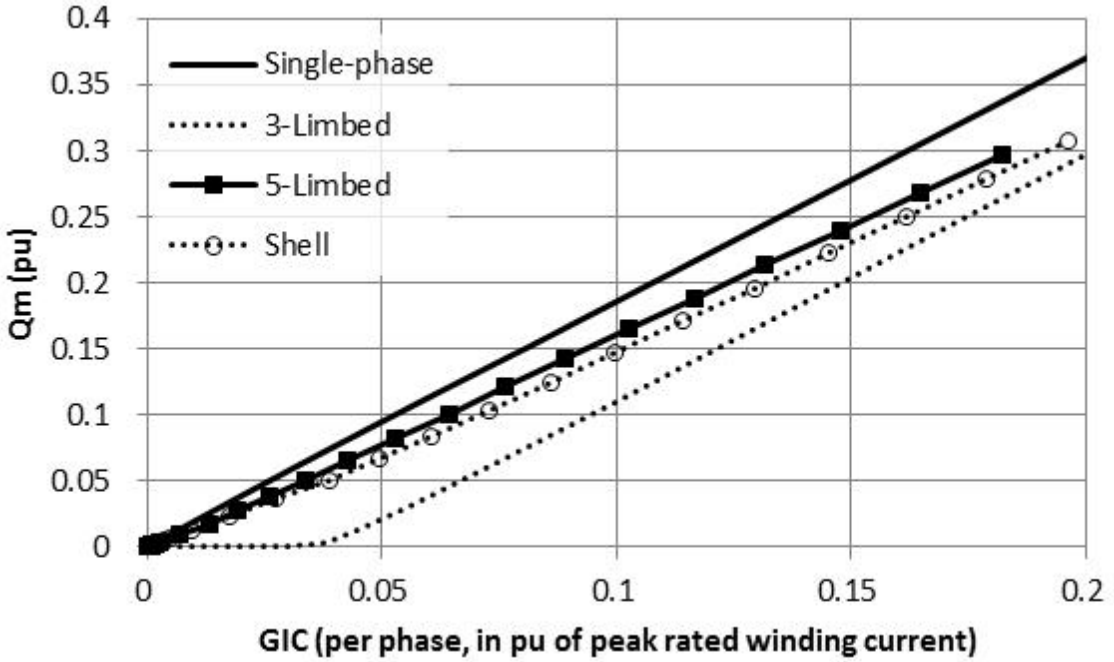

Fig. 10: Example of of GIC and var loss curves

DRAFT

c. Data sources:
    i. Station GPS coordinates. This determines the relative orientation of the transmission circuits and the geoelectric field.
    ii. Earth model or β factor from the GMD benchmark event. This determines the magnitude of the dc voltage sources in series with the transmission lines.
    iii. Transmission line dc resistance
    iv. Transformer winding dc resistance from test sheet, not from load flow model.
    v. Station grounding equivalent resistance, including the effect of shield wires.
    vi. Peak amplitude of the geoelectric field defined by the benchmark GMD event. This peak amplitude depends on geographical latitude (α factor) and local deep earth resistivity (β factor).
d. Results. The GIC study produces the following results for a given geoelectric field orientation, or the maximum GIC for the worst possible geoelectric field orientation:
    i. Distribution of GIC in every transformer in the system
    ii. 60 Hz reactive power absorption in every transformer.

2. **Load flow study.** The purpose of this study is to evaluate the effect to the ac network of transformer reactive power absorption computed by the GIC Study.
    a. System model:
        i. Standard ac base case load flow model to reflect the network operating conditions expected at the time a severe GMD event. For example, the load flow model may be modified to account for safe posture operational procedures that could be triggered on the basis of GMD coarse forecast (time window of 1 to 3 days).
        ii. Transformer reactive power absorption computed by the GIC Study is represented in the load flow model in the form of a constant var sink/source.
    b. Data sources
        i. Transformer reactive power absorption calculated with the GIC study
    c. Results:
        i. Load flow reflecting results with the reactive power absorption at the transformers reflected.
        ii. Identification of limit violations and situations of voltage instability

3. **Thermal assessment study**. The purpose is to assess if a transformer will withstand the benchmark GMD event.
    a. Transformer thermal model. This model relates GIC as a function of time (GIC(t)) to hot spot heating. Since transformer hot spot heating due to half-cycle saturation depends on magnitude and duration of GIC, the GMD benchmark provides a reference geoelectric field as a function of time from which GIC(t) can be calculated.
    b. Data sources:
        i. Transformer thermal model in the form of transformer capability curves provided by transformer manufacturers

DRAFT

ii. Generic or measured thermal transfer functions
    1. Manufacturer-provided
    2. From the NERC GMD Task Force reports.
iii. Peak GIC seen by a transformer as calculated in the GIC study.

c. Results:
    i. Hot spot temperature as a function of time for the GMD benchmark event. If temperatures exceed IEEE Std. 57.91 permissible emergency overloading hot spot limits the transformer may age unduly or eventually fail due to gassing.

Mitigating measures and corrective actions.

If load flow studies identify limit violations, a corrective plan must be put in place. If the plan involves changes in the system configuration, GIC, load flow and thermal assessment studies must be carried out to assess the effectiveness of the corrective plan.

If thermal assessment studies identify unacceptable hot spot limit violations, a corrective plan must be put in place. If the plan involves changes in the system configuration, GIC, load flow and thermal assessment studies must be carried out to assess the effectiveness and potentially unintended consequences of the corrective plan.

Calculation of GIC(t)

The calculation of GIC(t) required to perform a transformer thermal assessment is a new requirement for power engineers. The process to make this calculation from the time series of the GMD reference event is described in [3] and the general technical considerations are further discussed in [1]. A simplified step-by-step guide is presented here for completeness.

The GMD benchmark event specifies a reference geomagnetic field time series in the form of a comma-delimited ASCII file.

B_EW(t) and B_NS(t) are the components of geomagnetic field in the Eastward and Northward directions, respectively. The geomagnetic field is normalized to a 60° geomagnetic latitude (α=1.0).

E_EW(t) and E_NS(t) are the components of the geoelectric field in the Eastward and Northward directions, respectively. The geoelectric field is calculated using the reference earth model (β=1.0). Emag is the vectorial magnitude of the geoelectric field.

DRAFT

Process to calculate GIC(t)

1. Using the GIC Study software, calculate GIC_E in steady-state for the transformer under consideration assuming a uniform Eastward geoelectric field E_E = 1 V/km, GIC_E , and a zero Northward geoelectric field.
2. Using the GIC Study software, calculate GIC_N in steady-state for the transformer under consideration assuming a uniform Northward geoelectric field E_N = 1 V/km, GIC_E , and a zero Eastward geoelectric field.
3. Calculate GIC(t) using the formula

$$GIC(t) = \alpha \times \beta \times \left\{ GIC_E \cdot E_EW(t) + GIC_N \cdot E_NS(t) \right\}$$

If a technically justifiable earth model is known, use software to calculate the geoelectric field from the geomagnetic field using B_EW(t) and B_NS(t) as input to obtain $E_N(t)$ and $E_E(t)$. Calculate GIC(t) with the formula

$$GIC(t) = \alpha \times \left| E(t) \right| \times \left\{ GIC_E \cdot \sin(\theta(t)) + GIC_N \cdot \cos(\theta(t)) \right\}$$

where

$$\left| E(t) \right| = \sqrt{E_N^2(t) + E_E^2(t)}$$

$$\theta(t) = \tan^{-1}\left(\frac{E_E(t)}{E_N(t)} \right)$$

DRAFT

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

BES Cyber Asset (BCA): A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. ~~(~~A Transient Cyber Asset is not a BES Cyber Asset. ~~if, for 30 consecutive calendar days or less, it is directly connected to a network within an ESP, a Cyber Asset within an ESP, or to a BES Cyber Asset, and it is used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.)~~

Protected Cyber Assets (PCA): One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP. A Transient Cyber Asset is not a Protected Cyber Asset. ~~if, for 30 consecutive calendar days or less, it is connected either to a Cyber Asset within the ESP or to the network within the ESP, and it is used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.~~

Removable Media: Portable media, connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. A Cyber Asset is not Removable Media.

Transient Cyber Asset: A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-~~5~~6

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

6. Background:

Standard CIP-003-~~5~~ exists as part of a suite of CIP Standards related to cyber security, which ~~. CIP-002-5.1~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~ This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement~~ ~~**, in a manner that identifies, assesses, and corrects deficiencies, . . .**~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes,

but ~~they~~ it must address the applicable requirements. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

Annual review and approval of the cyber security policy ensures that the policy is kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);
- **1.7** Configuration change management and vulnerability assessments (CIP-010);
- **1.8** Information protection (CIP-011); and
- **1.9** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to ~~its~~ low impact BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements by CIP Senior Manager approval of the policies specified in Part 2.1.

The language in Requirement R2, Part 2.~~3~~ 4 "~~. . . for~~ external routable protocol ~~connections~~ paths" and "Dial-up Connectivity~~. . .~~" was included to acknowledge the support given in FERC Order No. 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.~~3~~ 4 uses the phrase "external routable protocol ~~connections~~paths" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems. The Standard Drafting Team (SDT) intent in using the phrase "external routable protocol paths" is to focus only on the paths to the low impact BES Cyber Systems and not the paths to other networks (e.g., corporate paths).

The additions to Requirement R2, in particular the processes required under Parts 2.2-2.6, address FERC Order No. 791 paragraphs 106-110, which require the standard to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for low impact assets. The SDT pulled language and concepts from CIP-004, CIP-005, CIP-006, and CIP-008 in order to add objective criteria to each of the previous policy topic areas in CIP-003, Requirement R2.

In FERC Order No. 791 paragraphs 111-112, FERC upheld that creating and maintaining an inventory of low impact assets for audit purposes would be unduly burdensome, so the inventory statements remain unchanged.

R2. Each Responsible Entity for its assets ~~identified in CIP-002-5, Requirement R1, Part R1.3~~containing low impact BES Cyber Systems~~),~~ shall perform each of the applicable requirement parts in *CIP-003-6 Table R2 – Low Impact Assets* ~~implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months:~~. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

~~Cyber security awareness;~~

~~Physical security controls;~~

~~Electronic access controls for external routable protocol connections and Dial-up Connectivity; and~~

~~Incident response to a Cyber Security Incident.~~

Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.

M2. Evidence must include each of the applicable documented policies and processes that collectively include each of the applicable requirement parts in *CIP-003-6 Table R2 – Low Impact Assets* and any additional evidence to demonstrate implementation as described in the Measures column of the table~~. If any asset locations have been identified per R2 of this Standard, then the following bulleted evidence may be included~~.

~~Examples of evidence may include, but are not limited to, one or more documented cyber security policies and evidence of processes, procedures, or plans that demonstrate the implementation of the required topics; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.~~

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	Low Impact BES Cyber Systems	Review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the topics in CIP-003-6, Requirement R2, Parts 2.2 – 2.6.	An example of evidence may include, but is not limited to, one or more documented cyber security policies that address each of the areas in Requirement R2, Parts 2.2 – 2.6 and includes evidence of review and CIP Senior Manager approval at least every 15 calendar months.
2.2	Low Impact BES Cyber Systems	Implement one or more documented processes that include operational or procedural control(s) to restrict physical access.	An example of evidence may include, but is not limited to, documentation of the operational or procedural control(s).
2.3	Low Impact BES Cyber Systems at Control Centers	Implement one or more documented processes that collectively include the following: 2.3.1. Escorted access of visitors; and 2.3.2. For Control Centers with external routable protocol paths, monitoring physical access point(s).	Examples of evidence may include, but are not limited to: • For 2.3.1, documentation of visitor escort procedure(s) at Control Centers. • For 2.3.2, documentation describing how the Responsible Entity monitors physical access points into Control Centers that have

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
			external routable protocol paths.
2.4	Low Impact BES Cyber Systems	Implement one or more documented processes that collectively include the following: 2.4.1. All external routable protocol paths, if any, must be through one or more identified access point(s). 2.4.2. For each identified access point, if any, require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default. 2.4.3. Authentication when establishing Dial-up Connectivity, per Cyber Asset capability.	Examples of evidence may include, but are not limited to: • For 2.4.1, documentation of external routable protocol paths through identified access points. • For 2.4.2, a representative sample of a list of restrictions (e.g., firewall rules, access control lists, data diode, etc.) that demonstrates that only permitted access is allowed and that each access rule has a reason documented individually or by group. • For 2.4.3, documentation of authentication controls applied to dial-up access connections.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	Low Impact BES Cyber Systems	Implement one or more Cyber Security Incident response plan(s) that collectively include the following: 2.5.1. Identification, classification, and response to Cyber Security Incidents. 2.5.2. Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident. 2.5.3. Notification of Reportable Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law. 2.5.4. The roles and responsibilities of Cyber Security Incident response groups or individuals. 2.5.5. Incident handling procedures for Cyber Security Incidents. 2.5.6. Testing of the plan(s) at least once per 36 calendar months, either through a paper drill, tabletop exercise, or a response to an actual Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to: • One or more documented cyber security incident response plans that include the requirement parts. • Dated evidence that shows the testing or execution of the plan(s) at least once per 36 calendar months, either through a paper drill, tabletop exercise, or a response to an actual Reportable Cyber Security Incident.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.6	Low Impact BES Cyber Systems	Implement a security awareness program that reinforces cyber security practices at least quarterly. Once every 15 calendar months, the program shall reinforce Parts 2.2, 2.3, 2.4, and 2.5 above.	An example of evidence may include, but is not limited to, one or more documents describing how the Responsible Entity is implementing its cyber security awareness program per 2.6.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager

may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-~~5~~6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address one of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 15 calendar months but did complete this review	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address two of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 16 calendar months but did complete this review	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address three of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 17 calendar months but did complete this review in less than or equal to 18	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address four or more of the nine topics required by R1. (R1) OR The Responsible Entity did not have any documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1. (R1) OR

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-~~5~~6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			in less than or equal to 16 calendar months of the previous review. (R1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 by the CIP Senior Manager or delegate according to Requirement R1 within 15 calendar months but did complete this approval in less than or equal to 16 calendar months of	in less than or equal to 17 calendar months of the previous review. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-6~~5~~, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-6~~5~~, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-6~~5~~, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate to its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

~~As with Requirement R1, the number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas required by CIP-003-5, Requirement R2. The Responsible Entity has flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-5, Requirement R2. The intent of the requirement is to outline a set of basic protections that all low impact BES Cyber Systems should receive without requiring a significant administrative and compliance overhead. The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems is not~~

~~necessary. The SDT also notes that in topic 2.3, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.~~

The intent of the requirement is to outline a set of protections designed for all low impact BES Cyber Systems. The SDT is balancing the fact that low impact BES Cyber Systems are indeed low impact to the BES, but they do meet the definition of having a 15-minute adverse impact so some protections are needed. The intent is that such protections are part of a program that covers the low impact BES Cyber Systems collectively either at a programmatic or site level, not an individual device or system level.

There are four main areas that must be covered by this security program: physical security, electronic access controls for all external routable protocol paths or Dial-up Connectivity, a security awareness program, and cyber security incident response plans.

The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems is not necessary.

2.1 - As with Requirement R1, the number of policies and the specific language used in them would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas in CIP-003-6, Requirement R2, Parts 2.2 through 2.6. The Responsible Entity has flexibility in the number and structure of its policies to meet its needs and organization. Examples include developing a single comprehensive cyber security policy covering these topics for all in-scope assets, several comprehensive cyber security policies based on asset type, or a single high-level umbrella policy with additional policy detail in lower level documents in its documentation hierarchy.

2.2 – The Responsible Entity must document and implement processes that include the physical security of the low impact BES Cyber Systems at a BES asset. The Responsible Entity has flexibility in the controls used and the granularity of those controls. The entity is to document its operational or physical controls that restrict access to the low impact BES Cyber Systems at the asset. Entities may utilize perimeter controls (fences with locked gates, guards, site access policies, etc.) and/or more granular areas of access control in areas where low impact BES Cyber Systems are located, such as control rooms or control houses. Lists of authorized users are not required.

2.3 – The Responsible Entity must document and implement processes that include the physical security of the low impact BES Cyber Systems at Control Centers. For Control Centers, the entity should further describe the process for handling escorted access of visitors. For Control Centers that have external routable connectivity, monitoring of physical access points is also required. Monitoring does not imply logging and maintaining logs, but monitoring that access has been

granted through an access point (door alarm, etc.). The monitoring does not need to be per low impact BES Cyber System but should be at the level as determined by the entity's controls.

2.4 – The Responsible Entity must have implemented processes that include the external routable protocol and Dialup connectivity paths to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected. The electronic access controls should address the risk of using the asset's external connectivity to gain access to the low impact BES Cyber Systems. The entity should be able to describe how its electronic access controls on the external connectivity paths protect the collection of low impact BES Cyber Systems at the site. The intent is to reduce the risk of aggregation of numerous low impact BES Cyber Systems at the site or across multiple sites through external connectivity.

Examples of sufficient access controls may include:

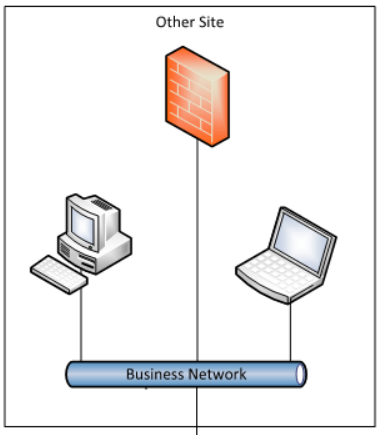
- All the external routable protocol connectivity paths to the asset pass through a firewall that denies all traffic by default with explicit inbound and outbound access permissions defined, or equivalent method by which both inbound and outbound connections are shielded from or to the world-wide-web (e.g. IP addresses, ports, services, and data diode) for scenarios representative of the Responsible Entity's sites having Low Impact BES Cyber Systems.
- Dialup Connectivity to a low impact BES Cyber System is set to dial out only (no auto-answer) to a preprogrammed number to deliver data. Incoming Dialup Connectivity is to a dialback modem, a modem that must be remotely controlled by the control center or control room, has some form of access control, or the low impact BES Cyber System has access control.

Some examples of situations that would lack sufficient access controls to meet the intent of this requirement include:

- An asset has dialup connectivity and a low impact BES Cyber System is reachable via an auto-answer modem that connects any caller to the Cyber Asset which has a default password. There is no access control in this instance.
- An asset has external routable connectivity due to a BES Cyber System within it having a 3G/4G wireless card on a public carrier which allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan.

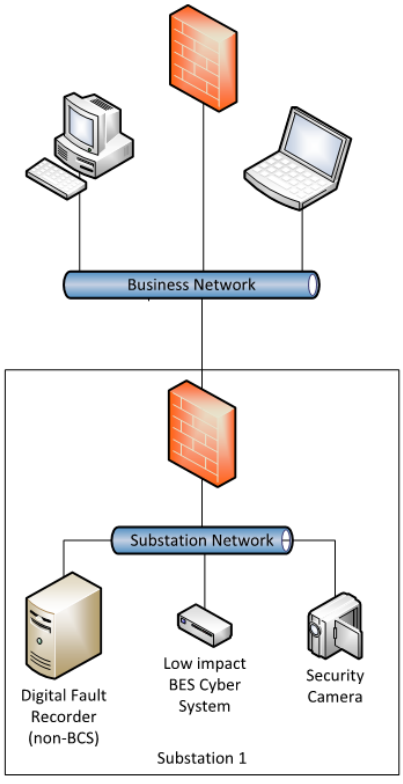
The SDT also notes that in topic 2.4, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

The following diagrams explain the SDT's rationale.



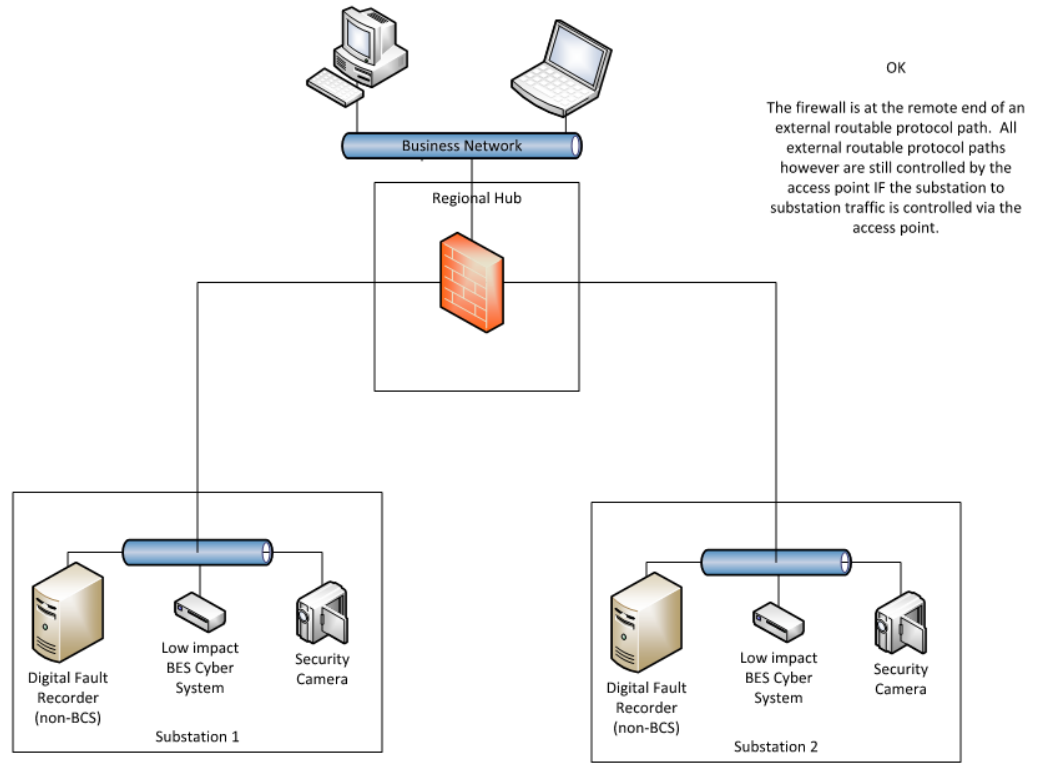
NOT OK

The BES Cyber System is behind an access point, however all external routable protocol paths to the BES Cyber System are not controlled by an access point if they originate on the business network.



OK

All the external traffic to the BES Cyber System is controlled by an access point.



2.5 - The entity should have a documented cyber security incident response plan that includes each of the topics listed. For assets that have limited or no connectivity, it is not the intent to increase their risk by increasing the level of connectivity in order to have real-time monitoring. The intent is if in the normal course of business suspicious activities are noted at an asset containing low impact BES Cyber Systems, there is a cyber security incident response plan that will guide the entity through responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident. The plan(s) must be tested once every 36 months. This is not an exercise per low impact BES Cyber Asset or per type of BES Cyber Asset but an exercise of each incident response plan the entity created to meet this requirement. An actual Reportable Cyber Security Incident counts as an exercise as well as other forms of tabletop exercises or paper drills. NERC-led exercises such as GridEx participation would also count as an exercise if the entity's response plan is followed.

For low impact BES Cyber Systems, the only portion of the definition of Cyber Security Incident that would apply is, "A malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of a BES Cyber System." The other portion of that definition is not to be used to require ESPs and PSPs for low impact BES Cyber Systems.

2.6 - The intent of the security awareness program is for entities to reinforce good cyber security practices with their personnel on at least a quarterly basis. The physical security, electronic access controls, and the cyber security incident response plan should be covered at least every 15 months. It is up to the entity as to the topics and how it schedules these topics. It should be sufficient for an entity to produce the awareness material that it delivered quarterly and the delivery method(s) (posters, emails, topics at staff meetings, etc.). The intent is that tracking of reception of the messages by personnel is not required.

Requirement R3:

The intent of CIP-003-6~~5~~, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that this CIP Senior Manager play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-6~~5~~, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-~~5.1~~6

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the BES from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-~~5.1~~6:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-004-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is six calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-004 ~~5.1~~ exists as part of a suite of CIP Standards related to cyber security, which ~~CIP-002-5~~ requires the initial identification and categorization of BES Cyber Systems ~~CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1~~ and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards.*~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement **in a manner that identifies, assesses, and corrects deficiencies, . . .~~**

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements~~

~~described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~ 6Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~5.1~~6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for

CIP-004-~~5.1~~6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ ~~a~~ one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets, including Transient Cyber Assets, and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

R3. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-~~5~~6. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-~~5~~ 6 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

R4. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R4 – Access Management Program. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-~~5.1~~6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-~~5.1~~6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-~~5.1~~6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-~~5.1~~6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

R5. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-~~5.1~~6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. Additionally, training should address the risk posed when connecting and using Transient Cyber Assets and Removable Media with BES Cyber Systems or within an Electronic Security Perimeter. As noted in FERC Order No. 791, Paragraph 135, Transient Cyber Assets and Removable Media have been the source of incidents where malware was introduced into electric generation industrial control systems in real-world situations. Training on their use is a key element in protecting BES Cyber Systems. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the

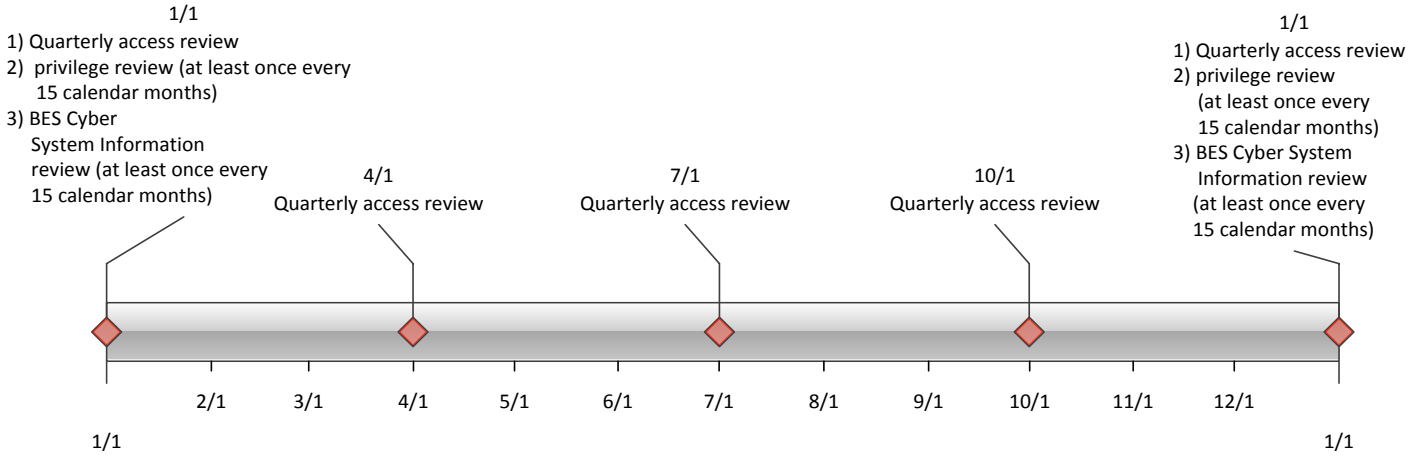
criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to



perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to

or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-006-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Physical Security of BES Cyber Systems

2. Number: CIP-006-~~5~~6

3. Purpose: To manage physical access to BES Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-006-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

6. Background:

Standard CIP-006-5 exists as part of a suite of CIP Standards related to cyber security, which ~~, CIP-002-5~~ requires the initial identification and categorization of BES Cyber Systems~~, CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies, . . .~~**

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of

300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Locally mounted hardware or devices at the Physical Security Perimeter –** Applies to the locally mounted hardware or devices (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) at a Physical Security Perimeter associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity, and that does not contain or store access control information or independently perform access

authentication. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for Requirement R1:

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement R1, Parts 1.1, 1.6~~7~~ and 1.7~~8~~ beyond what is already required for the PSP.

Regarding Requirement R1, Part 1.10, when cabling and other nonprogrammable components of a Control Center's communication network cannot be secured in a PSP, steps must be taken to ensure the integrity of the BES Cyber Systems. Exposed communication pathways outside of a PSP necessitate that physical or logical protections be installed to reduce the likelihood that man-in-the-middle attacks could compromise the integrity of their connected BES Cyber Assets or PCAs that are required to reside within PSPs. While it is anticipated that priority consideration will be given to physically securing the cabling and nonprogrammable communications components, the SDT understands that configurations arise when physical access restrictions are not ideal and Responsible Entities are able to reasonably defend their physically exposed communications components through specific additional logical protections.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented physical security plan(s) that collectively include all of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-~~5~~ 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	Medium Impact BES Cyber Systems without External Routable Connectivity Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Define operational or procedural controls to restrict physical access.	An example of evidence may include, but is not limited to, documentation that operational or procedural controls exist.

CIP-006-~~5~~ 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Utilize at least one physical access control to allow unescorted physical access into each applicable Physical Security Perimeter to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes each Physical Security Perimeter and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-~~5~~ 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Where technically feasible, utilize two or more different physical access controls (this does not require two completely independent physical access control systems) to collectively allow unescorted physical access into Physical Security Perimeters to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the Physical Security Perimeters and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-~~5~~ 6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Monitor for unauthorized access through a physical access point into a Physical Security Perimeter.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a Physical Security Perimeter.

CIP-006-~~5~~ 6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a Physical Security Perimeter and additional evidence that the alarm or alert was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.
1.6	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control System.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.

CIP-006-~~5~~ 6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.7	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Issue an alarm or alert in response to detected unauthorized physical access to a Physical Access Control System to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of the detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to Physical Access Control Systems and additional evidence that the alarm or alerts was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.

CIP-006-~~5~~ 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.8	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry.	An example of evidence may include, but is not limited to, language in the physical security plan that describes logging and recording of physical entry into each Physical Security Perimeter and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into Physical Security Perimeters that show the individual and the date and time of entry into Physical Security Perimeter.

CIP-006-~~5~~ 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.9	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days.	An example of evidence may include, but is not limited to, dated documentation such as logs of physical access into Physical Security Perimeters that show the date and time of entry into Physical Security Perimeter.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.10	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Restrict physical access to cabling and other nonprogrammable communication components used for connection between applicable Cyber Assets within the same Electronic Security Perimeter in those instances when such cabling and components are located outside of a Physical Security Perimeter. Where physical access restrictions to such cabling and components are not implemented, the Responsible Entity shall document and implement one or more of the following: • encryption of data that transits such cabling and components; or • monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection; or • an equally effective logical protection.	An example of evidence may include, but is not limited to, records of the Responsible Entity's implementation of the physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays) encryption, monitoring, or equally effective logical protections.

Rationale for Requirement R2:

To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented visitor control program(s) that include each of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-~~5~~ 6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each Physical Security Perimeter, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as visitor logs.

CIP-006-~~5~~6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require manual or automated logging of visitor entry into and exit from the Physical Security Perimeter that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain visitor logs for at least ninety calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least ninety calendar days.

Rationale for Requirement R3:

To ensure all Physical Access Control Systems and devices continue to function properly.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing program(s) that collectively include each of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-~~5~~ 6 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity Locally mounted hardware or devices at the Physical Security Perimeter associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Maintenance and testing of each Physical Access Control System and locally mounted hardware or devices at the Physical Security Perimeter at least once every 24 calendar months to ensure they function properly.	An example of evidence may include, but is not limited to, a maintenance and testing program that provides for testing each Physical Access Control System and locally mounted hardware or devices associated with each applicable Physical Security Perimeter at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus is shifted from the definition and management of a completely enclosed "six-wall" boundary, it is expected in many instances this will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Physical Security Perimeter.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Physical Security Perimeters, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, a sole perimeter's controls could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person they are observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.6~~7~~ and 1.7~~8~~ beyond what is already required for the PSP.

The new requirement part CIP-006-6, Requirement R1, Part 1.10 responds to the directive found in FERC Order No. 791, Paragraph 150. The requirement intends to protect cabling and nonprogrammable communication components that are within an ESP, but extend outside of a PSP. This protection, similar to the FERC Approved NERC Petition on the interpretation on CIP-006-3 from PacifiCorp, must be accomplished either by physically protecting the cabling and components that leave a PSP (such as by conduit or secured cable trays) or through data encryption, circuit monitoring, or equally effective logical protections. It is intended that the

physical protections reduce the possibility of tampering or allowing direct access to the nonprogrammable devices. Conduit, secured cable trays, and secured communication closets are examples of these types of protections. Alternatively, this protection may also be accomplished through the use of armored cabling or via the stainless steel or aluminum tube protecting the fiber inside an optical ground wire (OPGW) cable. In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP.

In addition to the cabling, the components in scope of this requirement part are those components outside of a PSP that could otherwise be considered a BES Cyber Asset or Protected Cyber Asset except that they do not meet the definition of Cyber Asset because they are nonprogrammable. Examples of these nonprogrammable components include, but are not limited to, unmanaged switches, hubs, patch panels, media converters, port savers, and couplers.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Physical Security Perimeter to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Physical Security Perimeter. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-~~5~~6

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-007-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-6, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until six calendar months after the effective date of Reliability Standard CIP-007-6.

6. Background:

Standard CIP-007 ~~-5~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5.1~~ requires the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ 2 and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on~~

~~*whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies,** . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is

specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~ 6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.

CIP-007-~~5~~ 6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or ~~removable~~ Removable ~~media~~Media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.

CIP-007-~~5~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-~~5~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-~~5~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

R3. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~ 6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).

CIP-007-~~5~~ 6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

R4. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~ 6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-~~5~~ 6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

PCA	Where technically feasible, either: • Limit the number of unsuccessful authentication attempts; or • Generate alerts after a threshold of unsuccessful authentication attempts.	Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

The protection of these ports can be accomplished in several ways including, but not limited to:

- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense are appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Stand alone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for

individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, ~~portable storage media policies,~~ Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code

cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

Entities should also have awareness of malware protection requirements for Transient Cyber Assets and Removable Media ("transient devices") in CIP-010-2. The protections required here in CIP-007-6, Requirement R3 complement but do not meet the additional obligations for transient devices.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible

Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of R~~r~~emovable M~~m~~edia in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor.

Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or “special” characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-009-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Recovery Plans for BES Cyber Systems

2. Number: CIP-009-~~5~~6

3. Purpose: To recover reliability functions performed by BES Cyber Systems by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-009-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-009 ~~-5~~ exists as part of a suite of CIP Standards related to cyber security, which ~~. CIP-002-5.1~~ require~~s~~ the initial identification and categorization of BES Cyber Systems ~~. CIP-003-5~~6, CIP-004-56, CIP-005-5, CIP-006-56, CIP-007-56, CIP-008-5, CIP-009-56, CIP-010-12, and CIP-011-1 2 and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies,** . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

R1. Each Responsible Entity shall have one or more documented recovery plan(s) that collectively include each of the applicable requirement parts in *CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications*.

CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).

CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover BES Cyber System functionality.

CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes to preserve data, per Cyber Asset capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	An example of evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

Rationale for Requirement R2:

The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.

Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ its documented recovery plan(s) to collectively include each of the applicable requirement parts in *CIP-009-~~5~~ 6 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-009-6 5 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-~~5~~ 6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: • By recovering from an actual incident; • With a paper drill or tabletop exercise; or • With an operational exercise.	An example of evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.

CIP-009-~~5~~ 6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test a representative sample of information used to recover BES Cyber System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover BES Cyber System functionality substitutes for this test.	An example of evidence may include, but is not limited to, operational logs or test results with criteria for testing the usability (e.g. sample tape load, browsing tape contents) and compatibility with current system configurations (e.g. manual or automated comparison checkpoints between backup media contents and current configuration).
2.3	High Impact BES Cyber Systems	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

Rationale for Requirement R3:

To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

R3. Each Responsible Entity shall maintain each of its recovery plan(s) in accordance with each of the applicable requirement parts in *CIP-009-~~5~~ 6 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the applicable requirement parts in *CIP-009-~~5~~ 6 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-~~5~~ 6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-009-~~5~~ 6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be

managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants' facilities.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially

know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

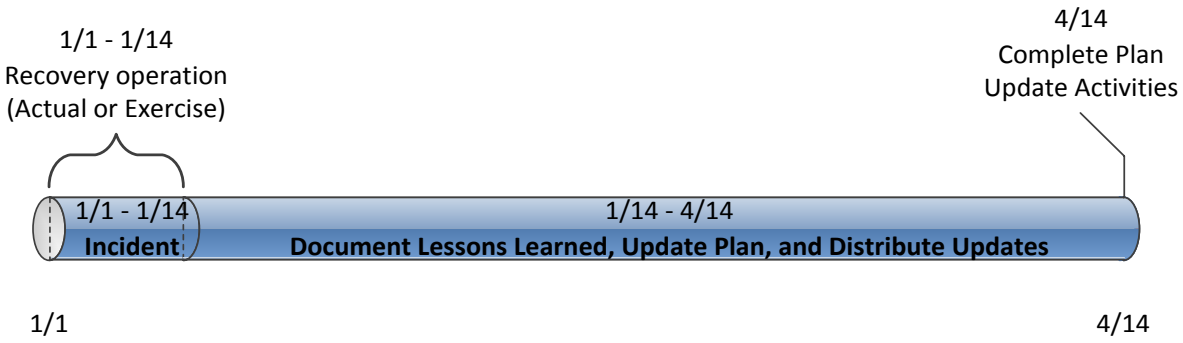

Figure 1: CIP-009-~~5~~ 6 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

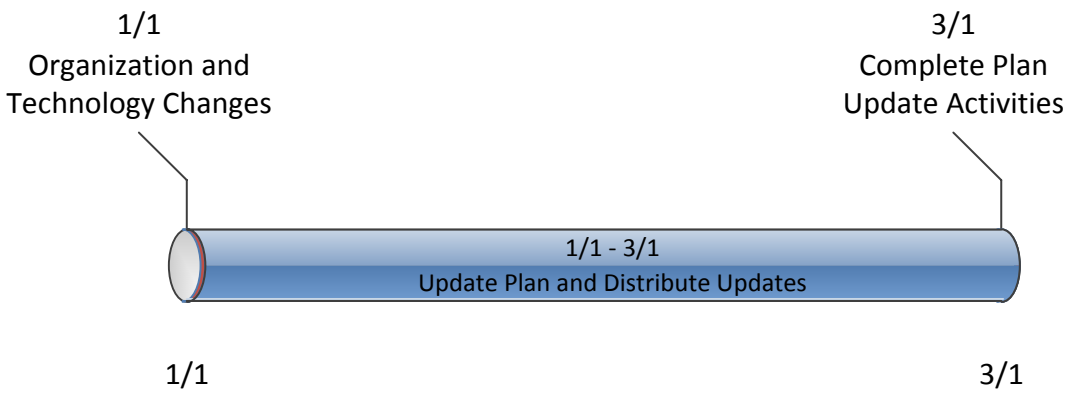

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-~~1~~2

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-010-~~1~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

6. Background:

Standard CIP-010 -1 exists as part of a suite of CIP Standards related to cyber security, which. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter. The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to

~~change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management

Part	Applicable Systems	Requirements	Measures
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ 2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

Rationale for R4:

Requirement R4 is to address FERC Order No. 791 Paragraphs 6 and 136, which require the standards to address security-related issues associated with tools specifically used for data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To that end, the requirement goals are as follows:

(1) Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and

(2) Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

The SDT has incorporated the concepts of other requirements from FERC-approved CIP-010-1 and CIP-007-5 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: This is a new requirement. All requirements related to Transient Devices and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. While the requirements are similar, they are not to the same rigor of those found in CIP-007 protecting the permanent assets identified by an entity. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances. Authorization shall include: 4.1.1. Users, individually or by group/role; 4.1.2. Locations, individually or by group/role; 4.1.3. Defined acceptable use; and 4.1.4. Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the authorized software for each Transient Cyber Asset, individually or by group; or • A record in an asset management system that identifies the authorized configuration for each Transient Cyber Asset individually or by group.
4.2	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets (per Cyber Asset capability).	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus hardening, policies, verification of method(s) employed by vendors, etc.).

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to detect malicious code on Removable Media prior to use on applicable systems.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus scanning techniques, verification of method(s) employed by vendors, etc.).
4.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
4.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Update signatures or patterns for those methods identified in Parts 4.2 and 4.3 that use signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.6	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, prior to use, for modifications that deviate from Part 4.1.4. For a modification that deviates from the state in Part 4.1.4, either: • Remediate by returning the Transient Cyber Asset to the state in Part 4.1.4; or • Update Part 4.1.4.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any remediation activities.
4.7	High Impact BES Cyber Systems and associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, within 35 calendar days prior to use, to ensure security patches are up-to-date. For security patches that are not up-to-date, take one of the following actions: • Apply the applicable patches; • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any mitigation activities.

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-~~5~~6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-~~5~~ 6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

This Requirement applies to any transient devices (i.e. Transient Cyber Assets and Removable Media) that will be connected temporarily to an applicable system. Examples of these devices include, but are not limited to:

- Hardware/software diagnostic test equipment
- Hardware/software packet sniffers
- Hardware/software used for BES Cyber System maintenance
- Hardware/software used for BES Cyber System configuration
- Hardware/software used to perform vulnerability assessments

Transient Cyber Assets can be in the form of a laptop, desktop, or tablet. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

This requirement does not cover hardware/software components that may support information system maintenance yet are a part of the system, for example the software implementing "ping," "ls," "ipconfig," or the hardware and software implementing the monitoring port of a switch.

Requirement Parts 4.1, 4.3, 4.6, and 4.7 refer to the term “prior to use” related to when specific actions must occur. For purposes of this standard, "use" is considered to be the interaction between transient devices and applicable systems. The interaction between transient devices and multiple applicable systems within the same ESP or PSP would be considered a single use. For example, a technician would need to have a laptop evaluated only once according to Part 4.6 when working in the same PSP. The technician would not need to have the evaluation performed each time it connects to a different Cyber Asset.

Requirement Part 4.1:

Requirement Part 4.1 requires the entity to document and implement its process to authorize the use of Transient Cyber Assets. This allows entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1. User(s), individually or by group/role, allowed to use Transient Cyber Assets. This is intended to provide assurance around who has physical proximity to the Transient Cyber Assets. These user(s) must have authorized electronic and unescorted physical access to the applicable system in accordance with CIP-004.
2. Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group/role of locations. Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e. high impact, medium impact, low impact). These impact areas have differing levels of protection under the CIP Requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. It may be reasonable to have separate Transient Cyber Assets for each impact level.
3. The intended or approved use of each Transient Cyber Asset. Activities not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals on the activities or uses that are not allowed (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).
4. The operating system, firmware, and intentionally installed software. All of this information may not be available or relevant to each Transient Cyber Asset. Having this information facilitates the review in Part 4.6. The use of the term “intentional” was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The Standard Drafting Team does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included.

CAUTION: Entities should exercise caution when using Transient Cyber Assets and ensure they do not have wireless or Bluetooth features enabled in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber

Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Requirement Parts 4.2, 4.3, 4.4, and 4.5:

Requirement Parts 4.2 and 4.3 address the protection against the introduction of malicious code by Transient Cyber Assets or Removable Media. For Transient Cyber Assets, the entity may either pre-authorize an inventory of Cyber Assets or authorize devices at the time of connection. Pre-authorized Transient Cyber Assets may have the malicious code prevention maintained on the device and do not require specific actions for each use.

It is the responsibility of the entity to ensure that the Transient Cyber Assets it owns and manages have methods deployed to deter, detect, or prevent malicious code. It is also the entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not own or manage, including vendor assets.

For Removable Media and Transient Cyber Assets authorized at the time of connection, the detection of malicious code must be addressed prior to use. This can be performed by scanning the Transient Cyber Assets or Removable Media in an environment outside of the Electronic Security Perimeter (ESP). Entities should use caution not to place kiosks or other scanning devices used to comply with this Requirement inside the ESP.

For Requirement R4, Part 4.4, if malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

Part 4.5 requires a process to update signatures or patterns, where applicable. This process is to be documented in the overarching program. As with CIP-007-6, Requirement R3, the process is to include testing and installing of updated signatures or patterns.

Requirement Parts 4.6 and 4.7:

Requirement R4, Part 4.6 requires the entity to evaluate Transient Cyber Assets to ensure that no unauthorized modifications have been made to the operating system, firmware, or software. This is a review of the current state against what is currently documented pursuant to Part 4.1.4. If there are differences, the modified code may be removed or the documentation updated to align to the authorized or current state.

Similarly, Requirement R4, Part 4.7 requires the entity to evaluate Transient Cyber Assets to ensure that patches are up-to-date. This is a review of the patches currently installed against what is currently documented. If there are missing patches, these should be tested and applied or a mitigation plan should be created to mitigate the vulnerabilities addressed by each uninstalled security patch. This should be performed prior to connecting the Transient Cyber Asset to an applicable system. For a device that the entity does not manage (i.e. vendor laptop), this can be performed immediately prior to connecting the Transient Cyber Asset to an applicable system. For an entity-managed device, the entity can evaluate and apply the patches monthly and not have to evaluate prior to each use.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-~~1~~2

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-~~1~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-011 ~~-1~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies, . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it~~-~~ believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-~~1~~ 2 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-~~1~~ 2 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~ 2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-~~1~~ 2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more methods to identify BES Cyber System Information and has identified deficiencies but did not assess or correct the deficiencies. (1.1)~~ ~~OR~~ ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more methods to identify BES Cyber System Information but did not identify,~~	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
					~~assess, or correct the deficiencies. (1.1)~~ ~~OR~~ ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more procedures for protection and secure handling BES Cyber System Information and has identified deficiencies but did not assess or correct the deficiencies. (1.2)~~ ~~OR~~ ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more procedures for protection and secure handling BES Cyber System Information~~	

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
					~~but did not identify, assess, or correct the deficiencies. (1.2)~~	
R2	**Operations Planning**	**Lower**	N/A	The Responsible Entity implemented one or more documented processes but did not include processes for reuse as to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.1)	The Responsible Entity implemented one or more documented processes but did not include disposal or media destruction processes to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.2)	The Responsible Entity has not documented or implemented any processes for applicable requirement parts in CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal. (R2)

F. Associated Documents

None.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the

analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset, Transient Cyber Asset, or Removable Media is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging.

Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Laura.Hussey@nerc.net
For questions about this form or for assistance in completing the form, call Laura Hussey at 404-446-2579.

NERC welcomes suggestions for improving the reliability of the Bulk-Power System through improved Reliability Standards. Please use this form to submit your proposal for a new NERC Reliability Standard or a revision to an existing standard.

Request to propose a new or a revision to a Reliability Standard			
Proposed Standard:	Project 2014-03 Revisions to the TOP/IRO Reliability Standards		
Date Submitted:	February 12, 2014		
SAR Requester Information			
Name:	David Souder		
Organization:	PJM		
Telephone:	610-666-4795	E-mail:	souder@pjm.com
SAR Type (Check as many as applicable)			
☒ New Standard ☒ Revision to existing Standard		☐ Withdrawal of existing Standard ☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards. On November 21, 2013, the Commission issued a NOPR in response to these petitions. The NOPR proposed to remand the proposed TOP and IRO Standards. In the NOPR, the Commission raises a concern that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently effective standards. On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR. This deferral would provide an opportunity for the industry, NERC, and FERC to work toward a common understanding and afford time to review the proposed TOP and IRO standards through the NERC standards development process to address the concerns set forth in the NOPR. That motion to defer action was granted by the Commission on January 14, 2014.
SAR Information
Purpose or Goal (How does this request propose to address the problem described above?):
The primary goal of this SAR is to allow the Standard Drafting Team (SDT) for Project 2014-03 Revisions to TOP/IRO Reliability Standards to address the concerns expressed in the NOPR while fulfilling the goals of the original projects: Project 2006-06 Reliability Coordination and Project 2007-03 Real-time Operations. In addition, the SDT should review the goals of Project 2009-02 Real-time Monitoring and Analysis Capabilities and consider whether to incorporate revisions to the TOP and/or IRO standards to address those goals in Project 2014-03.

SAR Information
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
Provide clear, unambiguous requirements and standards to allow Reliability Coordinators, Transmission Operators, and Balancing Authorities to operate the interconnected transmission system in a safe and reliable manner.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The SDT shall modify the TOP and IRO Reliability Standards to address the issues raised in the NOPR, while ensuring that the revisions continue to address directives previously assigned to the TOP and IRO standards under Projects 2007-03 and 2006-06. If it is decided to handle the goals of Project 2009-02 within Project 2014-03, then the directives assigned to Project 2009-02 will be addressed as well. In addition, the ~~suggestions~~ recommendations from the Independent Expert Review Project and the SW Outage Report will be reviewed, a directive dealing with monitoring responsibilities for the Reliability Coordinator will be resolved, and other IRO standards will be examined for consistency purposes.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The SDT shall: 1. Revise the TOP/IRO Reliability Standards to address concerns expressed in the NOPR a. ~~Use~~ Consider the inputs from technical conferences ~~to advise actions~~ 2. Consider the ~~comments and suggestions~~ recommendations in the Independent Expert Review Report and the SW Outage Report 3. Review the IRO Reliability Standards not included in the original Project 2006-06 for coordination with any changes made for this project (see list of related standards) 4. Preserve the intent of the reliability objectives in the current, approved standards so that no reliability gaps are created ~~4.~~5. Decide whether to handle the goals of Project 2009-02 within Project 2014-03; and if it does so decide, then also address the directives assigned to Project 2009-02. 6. Address the directives from Order 693 originally assigned to Projects 2006-06 and 2007-03.

SAR Information
~~5.~~7. Address the following directive from Order 693, paragraph 1855 ~~so that all monitoring responsibilities for the Reliability Coordinator are included in the IRO family of standards~~: "*Since a reliability coordinator is the highest level of authority overseeing the reliability of the Bulk-Power System, the Commission believes that it is important to include the reliability coordinator as an applicable entity to assure that adequate voltage and reactive resources are being maintained. As MISO points out, other Reliability Standards address responsibilities of reliability coordinators, but we agree with EEI that it is important to include reliability coordinators in VAR-001-1 as well. Reliability coordinators have responsibilities in the IRO and TOP Reliability Standards, but not the specific responsibilities for voltage levels and reactive resources addressed by VAR-001-1, which have a great impact on system reliability. For example, voltage levels and reactive resources are important factors to ensure that IROLs are valid and operating voltages are within limits, and that reliability coordinators should have responsibilities in VAR-001-1 to monitor that sufficient reactive resources are available for reliable system operations. Accordingly, the ERO should modify VAR-001-1 to include reliability coordinators as applicable entities and include a new requirement(s) that identifies the reliability coordinator's monitoring responsibilities*." 8. Modify the measures, Violation Risk Factors (VRF), and Violation Severity Levels (VSL) as necessary to address modified requirements. 9. Address the issue of outage coordination as pointed out by the Independent Experts Review Panel through the creation of a new standard. ~~6.~~10. Address the recommendations of the IRO Five Year Review Team (Project 2012-09) for the IRO standards revised in this project.

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.

Reliability Functions		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☒	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☒	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.

Reliability Functions	
☐ Market Operator	Interface point for reliability functions with commercial functions.
☒ Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.
Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to	Yes

Reliability and Market Interface Principles	
access commercially non-sensitive information that is required for compliance with reliability standards.

Standards Announcement

Project 2014-03 Revisions to TOP and IRO Standards

Formal Comment Period Now Open through July 2, 2014
Ballot Pools Forming Now through June 17, 2014

Upcoming:

Ballots and Non-Binding Polls: June 23 – July 2, 2014

Now Available

A 45-day formal comment period for the **TOP/IRO Reliability Standards** is open through **8 p.m. Eastern on Wednesday, July 2, 2014.** The join ballot pool windows are currently open through **8 p.m. Eastern on Tuesday, June 17, 2014.**

If you have questions please contact Ed Dobrowolski via email or by telephone at (609) 947-3673.

Background information for this project can be found on the project page.

Instructions for Commenting

Please use the electronic form to submit comments on the standards. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Instructions for Joining Ballot Pool

Two ballots pools are being formed for Project 2014-03 – one for the TOP and IRO Reliability Standards and one for the associated non-binding polls on this project. Registered Ballot Body members must join the ballot pools to be eligible to vote in the balloting and submittal of an opinion for the non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs). Registered Ballot Body members may join the ballot pools at the following page: Join Ballot Pool

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list servers for this project are:

Ballot: bp-2014-03 TOP/IRO_STDS_in@nerc.com
Non-Binding Poll: bp-2014-03 TOP/IRO_NB_in@nerc.com

Next Steps

Ballots for the standards and non-binding polls of the associated VRFs and VSLs will be conducted **June 23 – July 2, 2014.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

386	Project 2007-02	Project 2007-02 Operating Personnel Protocols: COM-003-1	Successive Ballot	3/27/2013	4/5/2013	Quorum: 78.39% Approval: 57.50%	No Consensus 4/4/13		The RSC did not reach a full consensus however the majority of respondents had indicated they will support the standard - see comment form for further details. Some believe the standard is not necessary and that existing whitepapers alleviate the need for it. In recognition of the NERC BOT's expectations that COM-003 will be approved by the industry and brought before them for approval, NPCC has voted affirmatively and will supply comments for the record outlining our concerns.
387	Project 2007-02	Project 2007-02 Operating Personnel Protocols: COM-003-1	Non-binding Poll	3/27/2013	4/5/2013	Quorum: 77.97% Approval: 54.28%

388	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-001-2	Initial Ballot	4/16/2013	4/25/2013	Quorum: 88.60% Approval: 66.98%	No Consensus 4/23/13		The majority of NPCC's Balancing Authorities have indicated support for the standard, however NPCC as the Regional Entity has concerns based on results of the field trials that were conducted. These field trials have indicated the potential for an increased number of SOL violations as well as potential for increased ACE due to large inadvertent flows with the proposed BAAL limits based on frequency triggers. To be respectful of the positions of the NPCC BAs who will have to implement this new methodology and the support expressed, NPCC as the Regional Entity will cast an Abstention
389	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-002-2	Initial Ballot	4/16/2013	4/25/2013	Quorum: 88.51% Approval: 42.75%	Oppose 4/23/13		There is a lack of technical justification for the 500 MW threshold within the standard-NPCC will submit suggested improvements
390	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-013-1	Initial Ballot	4/16/2013	4/25/2013	Quorum: 88.51% Approval: 23.84%	Oppose 4/23/13		Losses of large blocks of load are typically caused by coincident transmission contingencies. Excessive and uninformed adjustments made to generation in order to bring the ACE to zero may well lead to further transmission issues. NPCC will submit suggested improvements
391	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-001-2	Non-binding Poll	4/16/2013	4/25/2013	Quorum: % Approval: %

399	Project 2010-17	Project 2010-17 - Definition of Bulk Electric System (Phase 2)	Initial Ballot	7/3/2013	7/12/2013	Quorum: 85.53% Approval: 49.73%			
400	Project 2007-02	Project 2007-02 - Operating Personnel Communications Protocols - COM-003	Successive Ballot	7/10/2013	7/19/2013	Quorum: 76.32% Approval: 58.36%	No Consensus 7/19/13 [Due to the concerns expressed over the potential actions by the NERC BOT and FERC as well as the incremental improvement of the standard over the previous versions, NPCC as the Regional Entity will support the standard and submit comments.]		organizations support the standard as written however some members expressed concern that in order to measure compliance with R1 and R2, the standard will require all Reliability Directives to be investigated to determine if RC approved and documented communication protocols have been violated. Also it was identified that TO, BA communication protocols would have to approved by the RC potentially causing some legal issues if protocols aren't approved and casts question on the enforcement of those protocols. NPCC will be submitting some helpful comments should the standard pass and some non-substantive revision be performed prior to the "final" (previously named recirculation) ballot.
401	Project 2007-02	Project 2007-02 - Operating Personnel Communications Protocols - COM-003	Non-binding Poll	7/10/2013	7/19/2013	Quorum: 76.20% Approval: 55.37%

415	Project 2013-04	Project 2013-04 Voltage and Reactive Control - VAR-001-4, VAR-002-3	Ballot	8/23/2013	9/3/2013	Quorum: 81.89% Approval: 43.79%	Oppose 8/31/13		The standard, in the view of the group, has extensive issues including but not limited to, applicability issues, lacks clarity, missing measures, quality, and other substantive issues. NPCC will be submitting detailed comments to address these issues. The RSC does not believe it would be beneficial to support the standard at this point as the next step, if it fails the initial ballot, would still require an additional ballot prior to moving to recirculation due to the substantive changes that are needed for the next revision. NPCC will be submitting helpful comments to NERC and supporting the drafting team effort.

Information in a Regional Standard Authorization Request (RSAR)

The tables below identify information to be submitted in a Regional Standard Authorization Request to the NPCC Regional Standards Process Manager, NPCCstandard@npcc.org . The NPCC Regional Standards Process Manager shall be responsible for implementing and maintaining this form as needed to support the information requirements of the standards process.

Regional Standard Authorization Request Form

Title of Proposed Standard:
Request Date:

RSAR Requester Information

Name:	**RSAR Type (Check box for one of these selections.)**	
Company:	☐	New Standard
Telephone:	☐	Revision to Existing Standard
Fax:	☐	Withdrawal of Existing Standard
Email:	☐	Urgent Action

Purpose (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.**)**
Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation**.)**
Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.**)**

Reliability Functions

The Standard will Apply to the Following Functions (Check all applicable boxes.)		
☐	Reliability Coordinator	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
☐	Balancing Authority	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☐	Planning Authority	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.
☐	Transmission Service Provider	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.
☐	Transmission Owner	The entity that owns and maintains transmission facilities.
☐	Transmission	The entity responsible for the reliability of its "local" transmission system,

	Operator	and that operates or directs the operations of the transmission facilities.
☐	Transmission Planner	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.
☐	Resource Planner	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
☐	Generator Operator	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
☐	Generator Owner	Entity that owns and maintains generating units.
☐	Purchasing-Selling Entity	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
☐	Distribution Provider	Provides and operates the "wires" between the transmission system and the customer.
☐	Load-Serving Entity	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check all boxes that apply.)*	
☐	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
☐	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

☐	7. The security of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
Recognizing that reliability is an Common Attribute of a robust North American economy:
1. A reliability standard shall not give any market participant an unfair competitive advantage.Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

III. APPENDIX

A) RSAR FORM 19

I. EXECUTIVE SUMMARY

The purpose of the Northeast Power Coordinating Council, Inc. ("NPCC"), is to enhance the reliability of the international, interconnected bulk power system in Northeastern North America through the development of more stringent and specific regional reliability standards and compliance assessment and enforcement of continent-wide and regional reliability standards pursuant to the execution and implementation of a Regional Delegation Agreement with the Electric Reliability Organization ("ERO") and applicable Canadian Memoranda of Understanding that are backstopped by the Federal Energy Regulatory Commission ("FERC") and Canadian Provincial authorities. In the development and enforcement of Regional Reliability Standards, NPCC, to the extent possible, facilitates attainment of fair, effective, efficient, and competitive electric markets.

General Membership in NPCC is voluntary and is open to any person or entity, including any entity participating in the Registered Ballot Body of the ERO that has an interest in the reliable operation of the Northeastern North American bulk power system.

The NPCC Regional Reliability Standards Development Procedure describes the procedures, policies and practices implemented to ensure an "open, fair, and inclusive" process for the transparent initiation, development, implementation and revision of NPCC Regional Reliability Standards necessary for the reliable operation of the international and interconnected bulk power system in Northeast North America. These Standards will, in all cases, not be inconsistent with or less stringent than any requirements of the North American Electric Reliability Council/Electric Reliability Organization (NERC/ERO) Reliability Standards. The procedure will not unnecessarily delay the development of the proposed reliability standards. Each regional reliability standard shall enable or support one or more of the reliability principles, thereby ensuring that each standard serves a purpose in support of the reliability of the regional bulk power system. Each standard shall also be consistent with all of pertinent reliability principles and criteria, thereby ensuring that no standard undermines reliability through an unintended consequence.

II. REGIONAL RELIABILITY STANDARD DEVELOPMENT PROCEDURE

1. CHARACTERISTIC ATTRIBUTES

The NPCC Regional Reliability Standards Development Procedure is:

- **Open** — The NPCC Regional Reliability Standards Development Procedure provides any person the ability to participate in the development of a standard. Any entity that is directly and materially affected by the reliability of the NPCC's bulk power system has the ability to participate in the development and approval of reliability standards. There are no undue financial barriers to participation. Participation in the open comment process is not conditional upon membership in the ERO, NPCC or any organization, and participation is not unreasonably restricted on the basis of technical qualifications or other such requirements. NPCC utilizes a website to accomplish this. Online posting and review of standards and the real time sharing of comments uploaded to the website allow complete transparency.

- **Inclusive** — The NPCC Regional Reliability Standards Development Procedure provides any person with a direct and material interest the right to participate by expressing an opinion and its basis, have that position considered, and appealed through an established appeals process if adversely affected.

- **Balanced** — The NPCC Regional Reliability Standards Development Procedure has a balance of interests and all those entities that are directly and materially affected by the reliability of the NPCC's bulk power system are welcome to participate and shall not be dominated by any two interest categories and no single interest category shall be able to defeat a matter. This will be accomplished through the NPCC Bylaws defining eight sectors (categories) for voting.

- **Fair Due Process** — The NPCC Regional Reliability Standards Development Procedure provides for reasonable notice and opportunity for public comment. The procedure includes public notice of the intent to develop a standard, a 45 calendar day public comment period on the proposed standard request, or standard with due consideration of those public comments, and responses to those comments will be posted on the NPCC website. A final draft will be posted for a 30 calendar day pre-balloting period, and then a ballot of NPCC Members will be conducted. Upon approval by the NPCC Members, the NPCC Board then votes to approve submittal of the Regional Standard to NERC.

- **Transparent** — All actions material to the development of Regional Reliability Standards are transparent and information regarding the progress is posted on the NPCC website as well as through extensive email lists.

In as much as NPCC is one of several regional entities within the Eastern Interconnection of North America, there will be **no** *presumption of validity* by the ERO for any NPCC Regional Reliability Standard. In order to receive the approval of the ERO, the NPCC Reliability Standards Development Process must also achieve the following objectives:

- **No Adverse Impact on Reliability of the Interconnection** —An NPCC Regional Reliability Standard provides a level of bulk power system reliability that is necessary and adequate to protect public health, safety, welfare, and North American security and will not have an adverse impact on the reliability of the Interconnection or other Regions within the Interconnection.

- **Justifiable Difference** — An NPCC Regional Reliability Standard is based on justifiable differences between Regions, such as different electrical systems or facilities, sensitivity of load to disruptions, sensitivity of generation to disruptions, frequency and voltage sensitivity, system operating limit development and facilities ratings process, electrical system interactions, etc.

- **Uniformity**- NPCC Regional Reliability Standards shall provide for as much uniformity as possible with reliability standards across the interconnected bulk

power system of the North American continent. A NPCC Reliability Standard shall be more stringent than a continent-wide reliability standard, may include a regional variation that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the northeast's bulk power system, where the interpretation of the phrase "physical difference" will be consistent with FERC's Order, issued September 22, 2004, Granting Request For Clarification regarding Docket No. PL04-5-000, Policy Statement on Matters Related to Bulk Power System Reliability.

- **No Undue Adverse Impact on Commerce** — An NPCC Regional Reliability Standard will not cause any undue adverse impact on business activities that are not necessary for reliability of the Region and its interconnected Regions. All regional reliability standards shall be consistent with NERC's market principles.

Other Attributes of the NPCC Regional Reliability Standards Development Procedure include;

- **Maintenance of Regional Reliability Standards-**NPCC Regional Standards will be reviewed for possible revision at least every three years and follow the same process as a new standard. The old standard will remain in place until such time as the revised version has passed through the entire process, at which point the old standard will be retired in accordance with any applicable new implementation plan associated with the approved revised standard. The review process shall be conducted by soliciting comments from the stakeholders and through open posting on the NPCC website. If no changes are warranted, Regional Standards Committee (RSC) shall recommend to the NPCC Board that the standard be reaffirmed. If the review indicates a need to revise or withdraw a standard, a regional standard authorization request shall be prepared by the RSC and submitted in accordance with the standards development process contained in this procedure.

- **Maintenance of Regional Reliability Standards Development Procedure-** This NPCC Regional Reliability Standards Development Procedure will be reviewed for possible revision at least once every five years or more frequently if needed and subject to the same procedure as that of the development of a standard. All such revisions shall be subject to approval by the NPCC Board, NERC, FERC, and could be subject to approval, if required, by applicable authorities in Canada. The NPCC RSC has the authority to make non-substantive changes to this procedure and subsequently notify the NPCC Board for their concurrence at their next scheduled meeting.

- **Interpretation of Standards-** All persons who are directly and materially affected by the NPCC's bulk power system reliability shall be permitted to request an interpretation of a standard. The person requesting an interpretation will send an email request to the Regional Standards Process Manager (RSPM), as noted on the NPCC website, explaining the specific circumstances surrounding the request and what clarifications are required as applied to those circumstances. The request should indicate the material

impact to the requesting party or others caused by the lack of clarity or a possibly incorrect interpretation of the standard. The RSPM along with guidance from the RSC will forward the request to the originating Task Force which acted as the drafting team for that regional reliability standard. The Task Force will address, through a written response, the request for clarification as soon as practical, but not more than 45 business days from its receipt by the Task Force. This written interpretation will be posted along with the final approved and adopted standard and will stand until such time as the standard is revised through the normal RSAR process, at which time the standard will be modified to incorporate the clarifications provided by the interpretation.

2. ELEMENTS OF A RELIABILITY STANDARD

- **Elements of a Regional Reliability Standard**
  To ensure uniformity of regional reliability standards, a regional reliability standard shall consist of the elements identified in this section of the procedure. These elements are intended to apply a systematic discipline in the development and revision of standards. This discipline is necessary to achieving standards that are measurable, enforceable, and consistent.

  All mandatory requirements of a regional reliability standard shall be within the standard document. Supporting documents to aid in the implementation of a standard may be referenced by the standard but are not part of the standard itself.

  The most current version of the approved NERC Reliability Standard template and its associated elements as or if applicable, will be used at the time of the development of the NPCC Regional Reliability Standard to ensure all essential elements are contained therein to achieve consistency and uniformity and meet all statutory requirements. A sample of the elements contained in the standard appears in Table 1 below, however the latest ERO Board approved Standard template, that may be found on the NERC website, will supersede the list below at the time the regional standard is developed.

Table 1- Elements of a Regional Reliability Standard

Identification Number	A unique identification number assigned in accordance with an administrative classification system to facilitate tracking and reference. (i.e. "NPCC- BAL-002-0-Date" which refers to NPCC Regional Standard, referencing NERC BAL-002 Version 0, with NPCC Effective Date-final adoption by all Regional Authorities)
Title	A brief, descriptive phrase identifying the topic of the standard.
Applicability	Clear identification of the functional classes of entities responsible for complying with the standard, noting any specific additions or exceptions. The standard will be applicable to the Bulk Power System unless otherwise noted.
Effective Date	The effective date of the standard or, prior to approval of the

and Status	standard, the proposed effective date.
Purpose	The purpose of the standard. The purpose shall explicitly state what outcome will be achieved or is expected by this standard.
Requirement(s)	Explicitly stated technical, performance, and preparedness requirements. Each requirement identifies what entity is responsible and what action is to be performed or what outcome is to be achieved. Each statement in the requirements section shall be a statement for which compliance is mandatory.
Risk Factor(s)	The potential reliability significance of each requirement, designated as a High, Medium, or Lower Risk Factor in accordance with the criteria listed below: A High Risk Factor requirement (a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or (b) is a requirement in a planning timeframe that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. A Medium Risk Factor requirement (a) is a requirement that, if violated, could directly affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or (b) is a requirement in a planning timeframe that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

Measure(s)	Each requirement shall be addressed by one or more measures. Measures are used to assess performance and outcomes for the purpose of determining compliance with the requirements stated above. Each measure will identify to whom the measure applies and the expected level of performance or outcomes required demonstrating compliance. Each measure shall be tangible, practical, and as objective as is practical. It is important to realize that measures are proxies to assess required performance or outcomes. Achieving the measure should be a necessary and sufficient indicator that the requirement was met. Each measure shall clearly refer to the requirement(s) to which it applies.

Table 2 — Compliance Elements of a Regional Reliability Standard

Compliance Monitoring Process	Defines for each measure: • The specific data or information that is required to measure performance or outcomes. • The entity that is responsible for providing the data or information for measuring performance or outcomes. • The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes. • The entity that is responsible for evaluating data or information to assess performance or outcomes. • The time period in which performance or outcomes is measured, evaluated, and then reset. • Measurement data retention requirements and assignment of responsibility for data archiving. • Violation severity levels.

Supporting Information Elements

Interpretation	Any interpretation of regional reliability standard that is developed and approved in accordance with the "Interpretation of Standards" section of Appendix A of this procedure, to expound on the application of the standard for unusual or unique situations or to provide clarifications.
Implementation Plan	Each regional reliability standard shall have an associated implementation plan describing the effective date of the standard or effective dates if there is a phased implementation. The implementation plan may also describe the implementation of the standard in the compliance program and other considerations in the initial use of the standard, such as necessary tools, training, etc. The implementation plan must be posted for at least one public comment period and is approved as part of the ballot of the standard.

Supporting References	This section references related documents that support reasons for, or otherwise provide additional information related to the regional reliability standard. Examples include, but are not limited to: • Glossary of terms • Developmental history of the standard and prior versions • Notes pertaining to implementation or compliance • Standard references • Standard supplements • Procedures • Practices • Training references • Technical references • White papers • Internet links to related information

3. TERMS AND FUNCTIONS

- **Regional Standards Committee (RSC)**—An NPCC committee charged with management of the NPCC Standards Procedure under a sector based voting structure as described in the NPCC Bylaws. The NPCC RSC will consider requests for new or revised standards and be available for advisement to the NPCC Board on the standards.

  The RSC may not itself modify the standard without issuing a new notice to stakeholders regarding a vote of the modified standard. Any RSC action will only be activated in the event of a minor correction of a standard such as errata.

  The RSC is an open and balanced stakeholder committee inclusive of all stakeholder interests that provide for or are materially impacted by the reliability of the bulk power system.

  The RSC disposition regarding the regional standard authorization request, which will in all cases be within 60 calendar days of receipt of a completed standard request, shall include:

  - Accept the standard request as a candidate for development of a new standard, revision of an existing standard, or deletion of an existing standard. The RSC may, at its discretion, expand or narrow the scope of the standard request under consideration. The RSC shall prioritize the development of standards in relation to other proposed standards, as may be required based on the volume of requests and resources.

- Reject the standard request. If the RSC rejects a standard request, a written explanation for rejection will be delivered to the requester within 30 calendar days of the decision.
- Remand the standard request back to the requester for additional work. The standards process manager will make reasonable efforts to assist the requester in addressing the deficiencies identified by the RSC. The requester may then resubmit the modified standard request using the process above. The requester may choose to withdraw the standard request from further consideration prior to acceptance by the RSC.

The NPCC Standard Process responsibilities of the RSC will include:

- Review of NPCC Draft Standards for such factors as completeness, sufficient detail, rational result, and compatibility with existing standards; clarifying standard development issues not specified in this procedure. Under no circumstance will the RSC change the substance of a draft standard.
- Due consideration to the work of the drafting team as well as the comments of stakeholders and minority objections, in approving a proposed regional reliability standard to go to ballot.
- Approve standards for pre-ballot posting under a sector based voting structure as described later in the NPCC ~~Inc.~~ Bylaws or
- Remand the standard back to the Task Force acting as the drafting team for further work or recommend a change in those participating in the drafting team (i.e. a new drafting team).

- **Regional Standards Process Manager (RSPM) -** The Regional Reliability Standards Procedure shall be administered by a NPCC staff Regional Standards Process Manager. The RSPM is responsible for ensuring that the development and revision of standards is in accordance with this manual. The RSPM works to ensure the integrity of the process, format, consistency of quality, and completeness of the reliability standards. The RSPM facilitates all steps in the process.

- **Reliability Coordinating Committee (RCC)** —The RCC, will support the standards development process through the assignment of NPCC Task Forces. They will also provide a technical advisory role in the Regional Reliability Standards development procedure through recommendations.

- **Requester**— A Requester is any individual or an entity (organization, company, government authority, etc.) that submits a complete request for development, revision, or withdrawal of a standard. Any person or an entity that is directly and materially affected by an existing standard or the need for a new standard may submit a request for a new standard or revision to a standard. The Requester is assisted by the RSAR drafting team (if one is appointed by the RSC) to respond to comments and to decide if and when the RSAR is forwarded to the RSC with a request to draft a standard. The Requester is responsible for the RSAR, assisted by the RSAR drafting team and Regional Standards Process Manager, until such time the RSC authorizes

development of the standard. The Requester has the option at any time to allow the RSAR drafting team to assume full responsibility for the RSAR. The Requester may chose to participate in subsequent standard drafting efforts related to the RSAR.

- **Task Forces and Working Groups,**—The committees, task forces and working groups within NPCC , serve an active role in the standards process:
  - Identify the need for new or modified regional standards.
  - Initiate NPCC Standards actions by developing Regional Standard Authorization Requests (RSARs).
  - Develop comments (views and objections) to standards actions.
  - Participate in NPCC Standard drafting.
  - Provide technical oversight in response to changing industry conditions and ERO Requirements.
  - Conduct Field Tests as required

4. PROCEDURE DESCRIPTION

STEPS 1 AND 2: REQUEST TO DEVELOP A NEW REGIONAL STANDARD

Requests to develop a new Regional Reliability Standard shall be submitted to the RSPM by completing a **Regional Standard Authorization Request** (RSAR) ***(see Appendix A)***. The RSAR is a description of the new or revised standard in sufficient detail to clearly define the scope, purpose, and importance of the Regional Standard, impacted parties or other relevant information. A "needs" statement will provide the justification for the development of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard. The RSPM shall maintain the RSAR form and make it available electronically on the NPCC website.

Any person or entity ("Requester") directly or materially affected by an existing standard or the need for a new or revised standard may initiate a RSAR.

The Requester will submit the RSAR to the RSPM electronically and the RSPM will acknowledge receipt of the RSAR immediately, through electronic receipt. The RSAR, as a minimum, needs to contain the following information in order to be qualified for consideration. The NPCC RSPM will assist the Requester to ensure all the following information is submitted (on the RSAR) in a form appearing in Appendix A:

1. Proposed Title and Date of New RSAR
2. Requester's Name and Contact Information
3. Purpose of the Regional Standard
4. Description of Industry Need
5. Provide a Brief Description of the Standard
6. Identification of the Entities in the Functional Model as being responsible to adhere to the standard.
7. Necessary information to assist the drafting the team, to the extent feasible, to allow them to draft the standard.
8. A cross references to existing NPCC or NERC documents

The RSPM shall forward all properly completed RSARs to the RSC. The RSC shall meet at established intervals to review all pending RSARs. The frequency of this review process will depend on workload, but in no case shall a properly completed RSAR wait for RSC action more than 60 calendar days from the date of receipt. The RSC may take one of the following actions:

- Remand the RSAR back to the RSPM for additional work. In this case, the RSPM may request additional information or clarification for the RSAR from the Requester.
- Accept the RSAR as a candidate for a new or revised standard. In this case, the RSC will forward the RSAR to the RCC to assign a NPCC Task Force to provide technical support and analysis of comments for that RSAR, and assist the Requester and the RSPM in the remaining steps of the process. The RSPM shall post notification of intent to develop a standard on both NPCC and ERO websites within 30 calendar days of acceptance.
- Reject the RSAR. In this case, the RSC will provide a written explanation for rejection to the Requester within 30 calendar days of the rejection decision.

STEPS 3, 4, AND 5: RSC ACCEPTS RSAR AND RCC ASSIGNS TF TO DRAFT NEW OR REVISED STANDARD

A RSAR that is accepted by the RSC will be submitted to the RCC. Within 60 calendar days the RCC shall assign the development of the standard to a Task Force Drafting Team. The RSPM shall solicit and recommend a list of additional candidates for appointment to the team and shall submit the list to the RSC. This list shall include the Requester. The RSC may select other individuals to serve, with the Task Force to draft the Standard. This team shall consist of a small group of people who collectively have the necessary technical expertise and work process skills.

The RSPM shall assign NPCC staff personnel to assist in the drafting of the standard including compliance measure, process and elements. The drafting of measures and compliance administration aspects of the standard will be coordinated with the Compliance Program.

STEP 6: SOLICIT PUBLIC COMMENTS ON DRAFT STANDARD

Once a draft standard has been verified by the RSC to be within the scope and purpose of the RSAR, the RSPM will post the draft standard for the purpose of soliciting public comments. The posting of the draft standard will be linked to the RSAR for reference. In addition to the standard, an implementation plan shall be posted to provide additional details to the public and aid in their commenting and decision process. Comments on the draft standard will be accepted for a 45 calendar day period from the public notice of posting. Comments will be accepted on-line using the NPCC Open Process web-based application.

Final draft standards will be concurrently posted on the ERO website for comments.

STEPS 7, 8, AND 9: OPEN PROCESS POSTING AND ANALYSIS OF THE COMMENTS

The RSPM will assemble the comments on the new draft standard and distribute those comments to the Task Force acting as the standard drafting team. The Task Force shall give prompt consideration to the written views and comments of all participants. An effort to address all expressed comments shall be made, and each commenter shall be advised of the disposition of the comment and the reasons therefore, in addition to public posting of the responses.

The Task Force acting as the Standard Drafting Team shall take one of the following actions:

- Submit the draft standard for RCC endorsement as it stands, along with the comments received and responses to the comments. Based on the comments received, the Task Force acting as the standard drafting team may include revisions that are not substantive. A substantive change is one that directly and materially affects the application of the standard, including, for example: changing "shall" to "should," changing "should" to "shall"; adding, deleting, or revising requirements; or adding, deleting, or revising measures for which compliance is mandatory.
- Make substantive revisions to the draft standard and reposts it for further open review and comment.
- Task Force recommends Field Test if necessary to RSC.

Requester also may withdraw the request for a standard.

RCC submits proposed RRS to the RSC along with its recommendation based on comments, Task Force statements and any field test results.

STEPS 10 AND 11: RSC APPROVES OF THE NEW OR REVISED STANDARD FOR POSTING

If the RSC, acting with consideration of any recommendations by the RCC and utilizing the composite sector voting structure, as outlined in the NPCC, votes to post the draft standard for approval, the draft standard, all comments received, and the responses to those comments shall be posted electronically for the NPCC Members, by the RSPM and made public through the NPCC Website (www.npcc.org) for a 30 calendar day "pre-ballot review" and request for balloting. If the RSC decides more work is needed, the draft standard will be remanded back to the drafting Task Force. All actions of the RCC, Task Forces acting as drafting teams and the Regional Standards Committee will be recorded in regular minutes of the group(s) and posted on the NPCC website. Once the notice for a ballot has been issued, no substantive modifications may be made to the proposed standard unless the revisions are posted and a new notice of the vote is issued

STEPS 12, 13 AND 14: BALLOT OF STANDARD

Upon notification of a ballot, the Members of NPCC's registered ballot body will cast their vote consistent with the NPCC Bylaws. This ballot shall commence no sooner than 15 calendar days and no later than 30 calendar days following the notification of ballot. All members of the NPCC are eligible to participate in the voting on proposed, standard revisions or deletions of regional standards. The ballot period will typically begin immediately following the 30 calendar day pre-ballot posting and will last at least 10 business days.

The NPCC registered ballot body comprises all entities or individuals that qualify for one of the eight NPCC stakeholder sectors and are registered with NPCC as potential

ballot participants in the voting on standards. Each member of the NPCC registered ballot body is eligible to vote on standards.

In order for a NPCC Regional Standard to be approved;

- A quorum must be established by at least 50% of the NPCC Members of at least 60% of the Voting Sectors on the roster of Members maintained by NPCC.
- A two-thirds majority of the total weighted sector votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions, and non-responses. Weighted sector vote will be calculated as follows;
  - Affirmative votes cast in each sector will be divided by the sum of affirmative and negative votes cast, in that same sector, to determine the fractional affirmative vote for each sector. Abstentions and non-responses will not be counted for the purposes of determining the fractional affirmative vote for a sector.
  - The sum of the fractional affirmative votes from all sectors divided by the number of sectors voting will be used to determine if a two-thirds majority has been achieved. (A sector will be considered as "voting" if any member of the sector in the ballot pool casts either an affirmative or a negative vote.)
  - A standard will be approved if the sum of fractional affirmative votes from all sectors divided by the number of voting sectors is at least 2/3.

Ballots will be cast electronically and alternatives are as follows;

- Affirmative
- Affirmative with Comments
- Negative
- Negative with Comments
- Abstain

The RSPM shall post the final outcome of the ballot process. If the standard is rejected, it may be withdrawn by either the RCC or the original Requester, or the standard may be remanded by the RSC back to the Task Force acting as the drafting team to address the issues. All comments submitted during the process will be posted and archived for consideration when redrafting the standard upon review.

The standard, once approved by ballot, and a recommendation will be forwarded to the NPCC Board for final Regional approval. The Board may not make substantive modifications to the standard. If the Board does not approve the standard for transmittal to NERC it will be remanded back to the RSC.

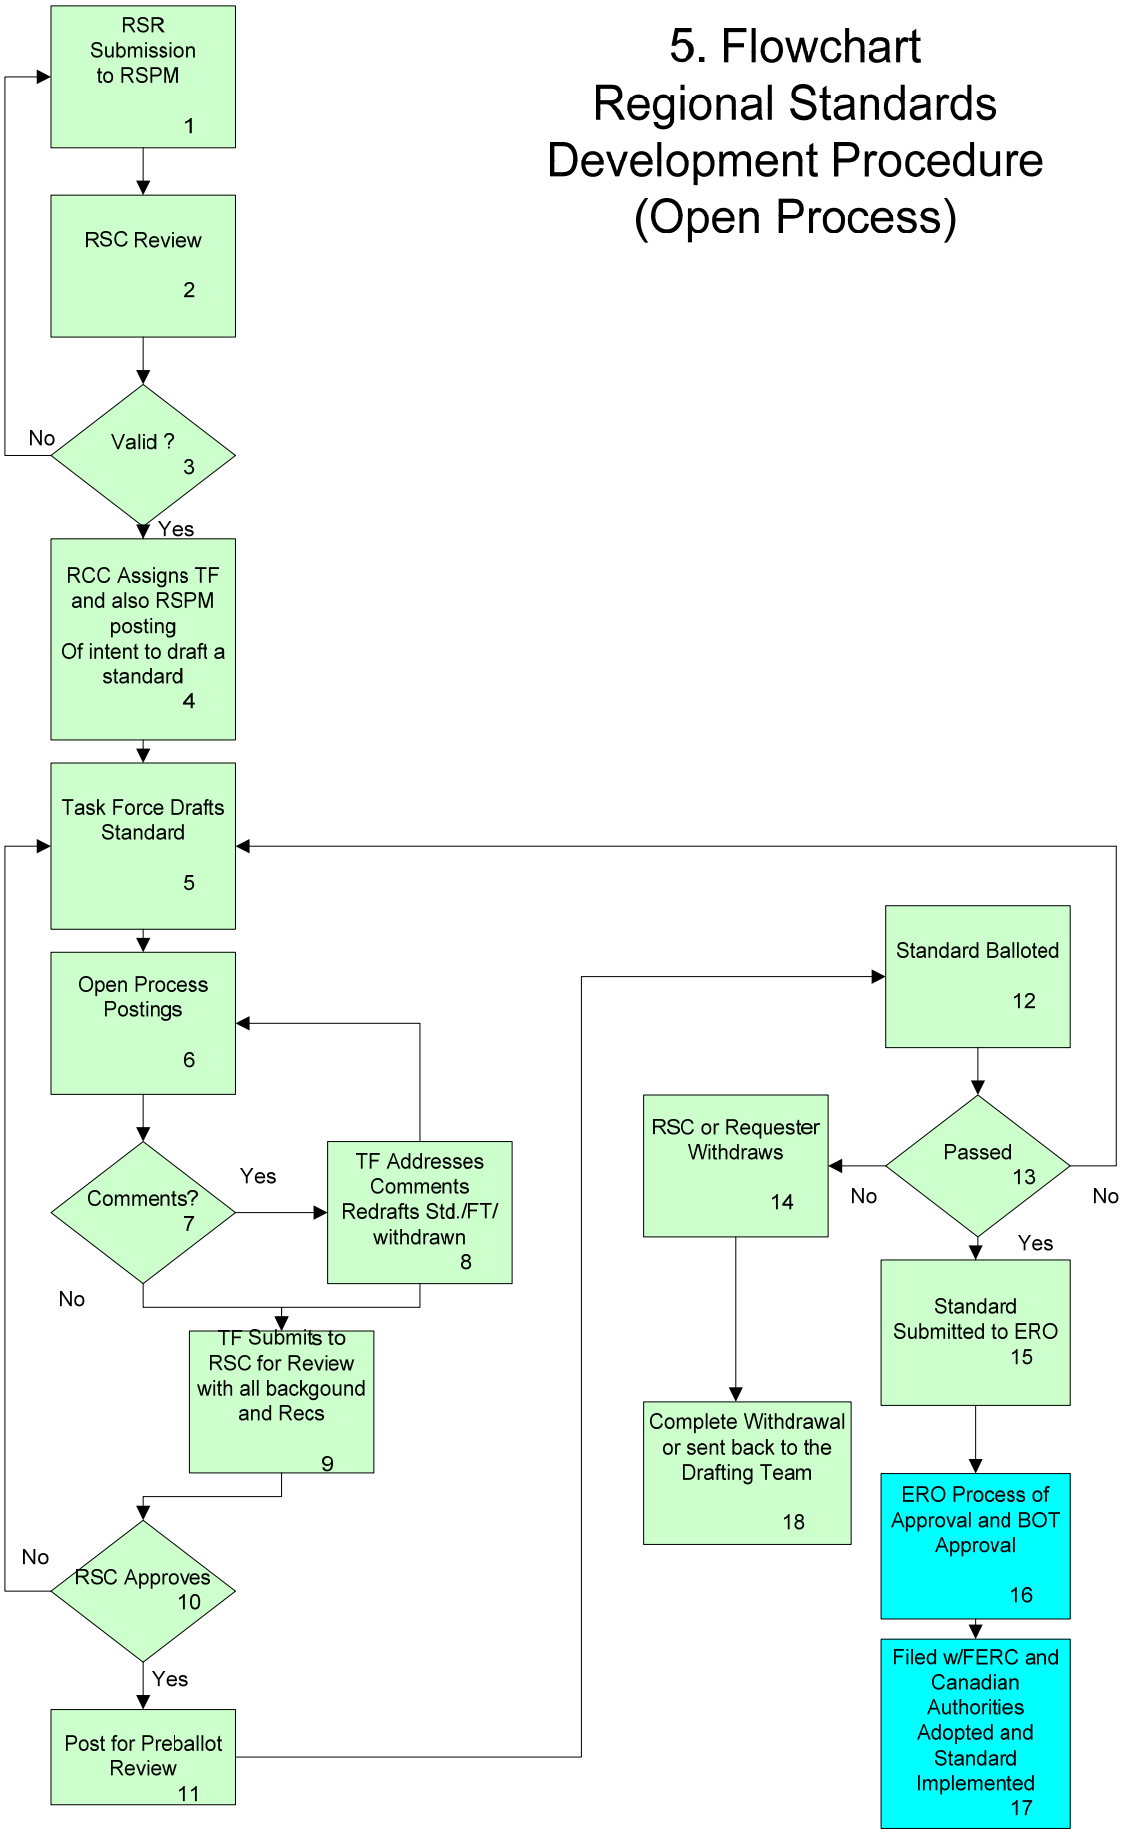
If the standard is approved, the standard will be submitted to the NERC/ERO Board of Trustees for approval.

STEPS 15, 16 AND 17: IMPLEMENTATION OF THE NPCC REGIONAL STANDARD
Upon approval within the NPCC , the standard will be submitted to the NERC/ERO for approval(s) and filing with FERC and applicable Canadian Governmental and/or Regulatory Authorities for adoption.

Once a reliability standard is adopted and made effective, all users, owners, planners, and operators of the Bulk Power System in the NPCC geographic area of the Northeast are required to comply with the standard. The NERC/ERO Board of Trustees has established a separate compliance program, also administered in the Northeast by NPCC , to measure compliance with the standards and administer sanctions as appropriate. After adoption of a NPCC Regional Standard, the standard will be forwarded to the compliance program for compliance monitoring and enforcement.

STEP 18: WITHDRAWAL OF STANDARD
Upon rejection of a proposed standard, the RCC or the requester may withdraw the standard completely or remand it back to the Task Force acting as the standard drafting team for further work.

5. Flowchart Regional Standards Development Procedure (Open Process)



6. ERO and Regulatory Process and Approvals

- **NERC/ERO Comment Period** —NERC/ERO shall publicly notice and request comment on the NPCC Regional Reliability Standard, allowing a minimum of 45 calendar days for comment on NERC's website and actively notify all adjoining Regions. Concurrent with this regional posting, final drafts will be forwarded to NERC for posting on the NERC website to ensure full industry awareness of the standard and expedite and coordinate all commenting. All comments will be responded to electronically through a posted response on the NPCC website or a link on the NERC website. NPCC shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the NPCC Regional Reliability Standard and request another posting for comment, or submit the NPCC Regional Reliability Standard along with a response to any objections received, for approval by NERC.

- **NERC/ERO Approval of NPCC Regional Reliability Standards** — Proposed regional reliability standards shall be subject to approval by the NERC/ERO who shall have a process to evaluate and recommend whether a proposed non-Interconnection-wide NPCC Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether NPCC has considered and addressed stakeholder objections. NPCC Board, having been notified of the results of the regional ballot concerning a NPCC Regional Reliability Standard, shall vote to submit the Standard to the NERC/ERO Board for approval as a NERC Reliability Standard. The NERC/ERO Board shall consider NPCC's request, the scope and implications of the Standard, the recommendation for action on the Standard, any unresolved stakeholder comments, and NPCC's consideration of comments and unresolved issues if any, in determining whether to approve the NPCC Regional Reliability Standard as a NERC Reliability Standard.

- **Regulatory Authority Approval** — An NPCC Regional Reliability Standard that has been approved by the NERC/ERO board shall be filed with FERC and applicable Canadian Governmental and/or Regulatory Authorities for approval and shall become effective and enforceable within the U.S., per Section 215 of the Federal Power Act, only when adopted by FERC, and within Canada, only when adopted by applicable Canadian Governmental and/or Regulatory Authorities. The regional reliability standard, once adopted will be made part of the body of NERC reliability standards and shall be mandatory and enforceable on all applicable bulk power system owners, operators, and users within the NPCC Region, regardless of membership status.

7. Appeals

- Persons who have directly and materially affected interests and who have been or will be adversely affected by any substantive or procedural action or inaction related to the development, approval, revision, reaffirmation, or withdrawal of a regional reliability standard shall have the right to appeal.

This appeals process applies only to the standards process as defined in this procedure.

The burden of proof to show adverse effect shall be on the appellant. Appeals shall be made within 30 calendar days of the date of the action purported to cause the adverse effect, except appeals for inaction, which may be made at any time. In all cases, the request for appeal must be made prior to the next step in the process.

The final decisions of any appeal shall be documented in writing and made public.

The appeals process provides two levels, with the goal of expeditiously resolving the issue to the satisfaction of the participants:

- Level 1 Appeal

Level 1 is the required first step in the appeals process. The appellant submits a complaint in writing to the RSPM that describes the substantive or procedural action or inaction associated with a reliability standard or the standards process. The appellant describes in the complaint the actual or potential adverse impact to the appellant. Assisted by any necessary staff and committee resources, the RSPM shall prepare a written response addressed to the appellant as soon as practical, but not more than 45 calendar days after receipt of the complaint. If the appellant accepts the response as a satisfactory resolution of the issue, both the complaint and response will be made a part of the public record associated with the standard and posted with the standard.

- Level 2 Appeal

If after the Level 1 Appeal the appellant remains unsatisfied with the resolution, as indicated by the appellant in writing to the regional standards process manager, the RSPM shall convene a Level 2 Appeals Panel. This panel shall consist of five members total appointed by the NPCC's board.

In all cases, Level 2 Appeals Panel members shall have no direct affiliation with the participants in the appeal.

The RSPM shall post the complaint and other relevant materials and provide at least 30 calendar days notice of the meeting of the Level 2 Appeals Panel. In addition to the appellant, any person that is directly and materially affected by the substantive or procedural action or inaction referenced in the complaint shall be heard by the panel. The panel shall not consider any expansion of the scope of the appeal that was not presented in the Level 1 Appeal. The panel may in its decision find for the appellant and remand the issue to the RSC with a statement of the issues and facts in regard to which fair and equitable action was not taken. The panel may find against the appellant with a specific statement of the facts that demonstrate fair and equitable treatment of the appellant and the appellant's objections. The panel may not, however, revise,

approve, disapprove, or adopt a reliability standard. The actions of the Level 2 Appeals Panel shall be publicly posted.

In addition to the foregoing, a procedural objection that has not been resolved may be submitted to the NPCC Board for consideration at the time the board decides whether to adopt a particular reliability standard. The objection must be in writing, signed by an officer of the objecting entity, and contain a concise statement of the relief requested and a clear demonstration of the facts that justify that relief. The objection must be filed no later than 30 calendar days after the announcement of the vote on the standard in question.

APPENDIX A

Information in a Regional Standard Authorization Request (RSAR)

The tables below identify information to be submitted in a Regional Standard Authorization Request to the NPCC Regional Standards Process Manager, NPCCstandard@npcc.org . The NPCC Regional Standards Process Manager shall be responsible for implementing and maintaining this form as needed to support the information requirements of the standards process.

Regional Standard Authorization Request Form

Title of Proposed Standard:
Request Date:

RSAR Requester Information

Name:	**RSAR Type (Check box for one of these selections.)**
Company:	☐ New Standard
Telephone:	☐ Revision to Existing Standard
Fax:	☐ Withdrawal of Existing Standard
Email:	☐ Urgent Action
Purpose (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability**.)**	
Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation**.)**	
Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others**.)**	

Reliability Functions

The Standard will Apply to the Following Functions (Check all applicable boxes.)

☐	Reliability Coordinator	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
☐	Balancing Authority	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☐	Planning Authority	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.
☐	Transmission Service Provider	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.
☐	Transmission Owner	The entity that owns and maintains transmission facilities.
☐	Transmission Operator	The entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission facilities.
☐	Transmission Planner	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.
☐	Resource Planner	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
☐	Generator Operator	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
☐	Generator Owner	Entity that owns and maintains generating units.
☐	Purchasing-Selling Entity	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
☐	Distribution Provider	Provides and operates the "wires" between the transmission system and the customer.
☐	Load-Serving Entity	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check all boxes that apply.)*	
☐	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
☐	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*	
Recognizing that reliability is an Common Attribute of a robust North American economy:	
1. A reliability standard shall not give any market participant an unfair competitive advantage.Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes	

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

HQT Comments	**page 60-65.**

CO7/CP11 Response to Comments Received in NPCC Open Process Posting of Directory #1 Design and Operation of the Bulk Power System.

CO7/CP11 would like to thank those who provided comments on the draft of Directory #1 posted from December 11th, 2011 through January 25th, 2014.

Responses to individual comments are provided below.

Comments from - IESO:

The IESO offers the following general and specific comments for the TFCO's consideration:

General Comments:

~~*Comment: 1*~~

We support the revision to move this Directory into a Phase II structure to present criteria requirements that are clear, measurable and consistent with the NERC ERO Rules of Procedure.

However, the proposed draft document does not provide any references to indicating the mapping of specific Sections in the existing Directory 1 into the Requirements in the Phase II version.

Also, the rationale for removing and adding certain requirements/content has not been provided. It will be very helpful to present a mapping table, and insert text boxes where material changes are made to provide the rationale.

CO7/CP11 Response:
3/26/2014

Thank you for the comment.

CO7/CP11 agrees with the comment to provide mapping to the existing version of Directory#1.

The intent of the CO7/CP11 effort was to clarify the criteria and not to modify the criteria. The criteria requirements as written represent a consensus position of the CO7/CP11 Working Group.

Accordingly CO7/CP11 believes that text boxes and rationale statements are outside the scope of the CO7/CP11 assignment and specific questions on elements of the requirements should be addressed through the NPCC Open Process.

Specific Comments:

~~*Comment: 2*~~

Requirement R1:

R1 requires that each equipment owner verify the information it submits, but there is no explicit requirement on these entities so to do.

Further, the draft does not state who the recipient is. Existing Directory 1 states: “Each Registered Entity within an NPCC Reliability Coordinator Area shall provide needed information to its Reliability Coordinator as required.” It

is not obvious why this has not been captured in the draft since it could create some uncertainty.
Is the intent to rely on other Standards/Criteria to make clear these obligations (e.g. FAC-008-3 R7 and R8)? Please clarify.

If that is not the intent we suggest inserting "to its Reliability Coordinator" after "submits" and explicitly introducing a requirement for equipment owners to submit information.

CO7/CP11 Response:
2/12/2014

Thank you for the comment.

Comment accepted.

CO7/CP11 considered your comment and made revisions to Requirement R1 to improve its clarity.

CO7/CP11 also notes that the recipient of the information is described in Requirement R2.

~~*Comment:* **3**~~

Section 1.3 – Objective

The third paragraph in this Section proposes that:

"Simulation of contingency events shall be applied on bulk power system elements and the resulting performance requirements shall be monitored on the bulk power system."

We find this proposed change to the contingency criteria represents a major erosion of the NPCC basic design and operation criteria.

Previous version of this Directory and its predecessor A1 Document, did not restrict contingencies to just the bulk power system elements. Contingencies

on non-bulk power system elements that could result in material adverse effects must also be considered.

Although it is not common for contingencies on the non-bulk power system to be restrictive, it can and does happen particularly under outage conditions. The proposed revision to Directory #1 does not provide any rationale for this change. We therefore urge the responsible Task Force or Work Group to consider the following proposed changes:

Existing: *"Simulation of contingency events shall be applied on bulk power system elements and the resulting performance requirements shall be monitored on the bulk power system"*

Proposed changes:

"Performance requirements following simulated contingencies shall be satisfied on bulk power system elements."

CO7/CP11 Response:
4/29/2014

Thank you for the comment.

Comment not accepted.

The text that restricts contingencies to bulk power system elements in the CO7/CP11 draft of Directory#1 reflects the consensus view of the working group.

Fault location was discussed at length by the working group without achieving a unanimous position. After consideration the consensus view of the CO7/CP11 working group was to not accept the proposed changes.

~~*Comment:* **4**~~

Section 1.6.1

Resource Planner is included in the Applicability Section but there are no requirements that apply to the Resource Planner. Please remove it from the Applicability Section, or insert it to the appropriate requirements (e.g., R4 and/or R5).

Same comment on the Balancing Authority.

Now that Section 5.3 has been revised to become Requirement R6 with the RC being held responsible for coordinating outages and de-ratings or resources, BAs no longer have the responsibility to meet any criteria in Directory 1.

Please review and revise the Applicability Section or Requirement R6 accordingly.

CO7/CP11 Response:
2/26/2014.

Thank you for the comment.

Comment accepted.

The Functional Entity 'Resource Planner' has been added to Requirement R4.

Regarding the similar concern stated for Balancing Authority:

The term 'Each Functional Entity' in some cases is intended to apply to the Balancing Authority and therefore the BA should remain on the list of Functional entities in Section 1.6.1 of the document.

~~*Comment: 5*~~

Section 1.3

Suggest to add "Transmission Operator" after "…each Reliability Coordinator" since TOP is also held responsible for a number of requirements that address operating reliability of the BPS.

CO7/CP11 Response:
4/04/2014.

Thank you for the comment.

CO7/CP11 reviewed this comment and it led the group to review the language in the Objective section more comprehensively. The group deleted language pertaining to Functional Entities since functional responsibility is already covered in other parts of the document. Additionally, the group agreed to delete language it considered redundant and introduce language proposed in a comment by HQT.

~~*Comment: **6***~~

Requirement R2:

Similar to our comment for R1, it is not obvious who are the intended recipients of the submitted information. Please clarify.

CO7/CP11 Response:
2/26/2014.

Thank you for the comment.

Comment accepted.

CO7/CP11 agrees and has modified Requirement R2 to provide additional clarity.

~~*Comment: **7***~~

CO7/CP11 Response:
2/12/2014.

Thank you for the comment.

Comment accepted.

CO7/CO7 agrees with the comment and has inserted the word ‘is’ within the Requirement replacing ‘shall be’.

Requirement R4:

The IESO proposes to replace “… *deficiencies shall be*…” with “…*deficiencies are*…”

CO7/CP11 Response:
2/19/2014.

Thank you for the comment.

Comment accepted.

CO7/CO7 agrees with the comment and will be replace ‘shall be’ with ‘is’ in Requirement R4.

~~*Comment:* **8**~~

Requirement R5:

We propose the following editorial change to R5:

R5. Each Planning Coordinator shall evaluate and report the resource adequacy of its Planning Coordinator Area portion of the bulk power system, and obtain Reliability Coordinating Committee (RCC) approval for its Review

of Resource Adequacy. Appendix D provides guidance for the Area Review of Resource Adequacy.

Alternatively, since Requirement R4 already establishes a requirement for the Planning Coordinator to evaluate the resource adequacy of …, R5 should not duplicate that requirement. As such, the text "evaluate and" could be removed from the above proposed change.

CO7/CP11 Response:
2/26/2014.

Thank you for the comment.

Comment accepted.

The word 'evaluate' will be struck from R5 since the obligation to evaluate is already addressed in R4.

~~*Comment:* **9**~~

Requirement R6:

Please see our comment under Applicability Section 1.6.1 regarding BA's responsibility.

CO7/CP11 Response:
2/26/2014.

Thank you for the comment.

Comment not accepted.

The term 'Each Functional Entity' in some cases is intended to include the BA and therefore the BA will remain on the list of Functional Entities in Section 1.6.1 of the document.

~~*Comment: **10***~~

Requirement R11:

This requirement holds both the TP and the PC for having procedures and implementing a system design that ensures equipment capabilities are adequate for fault current levels. It also holds the PC for coordinating the procedures with procedures with adjacent Planning Coordinator Areas but it does not require such coordination for the TP.

Suggest to review what's really require of the TP, and revise the requirement accordingly since the sentence as drafted implies the TP also needs to coordinate but with adjacent Planning Coordinator Areas not the adjacent TPs.

CO7/CP11 Response:
3/05/2014.

Thank you for the comment.

Comment accepted.

The Functional Entity 'Transmission Planner" added to Requirement R11.

~~*Comment: **11***~~

Requirement R14 and Table 3:

The original Directory 1 required us to operate the power system in a manner that ensured the contingencies in Table 3 can be withstood without causing a

significant adverse effect on other reliability co-ordinator areas or the loss of a major portion of the system.

The new Directory 1 require us to meet a set of performance requirements on the entire BPS for all of the contingencies in Table 3, which we believe is far more restrictive than originally intended by Directory 1. We suggest the following changes to the Directory to return to the original intent of the directory:

a) Requirement R14 should be changed to:

"*R14. Each Reliability Coordinator and Transmission Operator shall establish limits and operate so that the contingencies specified in Table 3 shall not have a significant adverse impact on other Reliability Coordinator Areas."*

b) The following performance requirement (or the equivalent) should be added to Table 3:

"*At the transfer levels permitted by contingencies 1 to 3, if contingencies 4 to 8 can be withstood without causing significant adverse effect on other reliability co-ordinator areas, then these performance requirements apply only to contingencies 1 to 3."*

CO7/CP11 Response:
4/09/2014.

Thank you for the comment.

Comment accepted.

The CO7/CP11 has re-structured Table 3 to capture the spirit of this comment. The working group believes the structure of Table 3 (i.e. linking specific contingencies to specific performance requirements) is more likely to result in a consistent application of requirements so it has chosen this manner to address your comment.

~~*Comment: **12***~~

Requirements R15 and R16:

These requirements hold the RCs responsible for operating to respect normal and emergency conditions, but not the TOP who is also responsible for establishing normal transfer capabilities and emergency transfer capabilities, and operating their portion of the bulk power system accordingly, as stipulated in R14.

There appears to be redundant requirements between R14 and R15/R16, and if the latter two requirements are to be retained, they need to be revised to include the role of the TOP for operating under these conditions (as so reflected in R17).

CO7/CP11 Response:
3/12/2014.

Thank you for the comment.

Comment accepted.

Applicability to the Functional Entity 'TOP' has been added to requirement R14 and R15 in order to maintain consistency with the applicability of requirement R13.

Additionally, CO7/CP11 considered potential redundancy between Requirements R13, r14 and R15 and agreed to remove the word 'operate' from R13 pending further revisions to R13.

~~*Comment:* ***13***~~

Requirement R17:

R17 states that immediately after the occurrence of a contingency (within Table 3), we must prepare the system for the next contingency.

However, it is not clear whether we must prepare the system for all of the contingencies in Table 3 or just a subset of those contingencies. The original directory required us to prepare the system to withstand contingencies 1 to 3 in Table 3, within 30 minutes, following a contingency and, therefore, we suggest R17 to be changed as follows:

"R17. Each Reliability Coordinator and Transmission Operator shall assess the status of the bulk power system immediately after the occurrence of any contingency and prepare for the next contingency within the requirements for emergency transfers in Table 3."

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment not accepted.

CO7/CP11 reviewed this comment and is satisfied that the requirement as written together with the content of Table #3 is satisfactory.

~~*Comment: **14***~~

Requirement R17.1:

The IESO proposes to replace …"*shedding of firm load shall be required*…" with "*shedding of firm load shall be deployed…"*

CO7/CP11 Response:
3/19/2014

Thank you for the comment.

Comment accepted.

'Required' will be replaced with 'deployed' in R16.1.

~~*Comment: **15***~~

Requirement R18:

This requirement holds the RC responsible for notifying the applicable Reliability Coordinators of forced outages of any facility as per the NPCC Transmission Facilities Notification List and of any other condition which may impact inter-Area reliability.

We suggest to add the TOP to this requirement since forced outages of a TOP area's facility and of the system condition in a TOP area may also impact inter-Area reliability.

Holding the RC alone responsible to the notification task delays the process, and can expose to reliability gap if a TOP is not held accountable for the notification task involving the facilities/conditions in its area.

CO7/CP11 Response:
3/19/2014

Thank you for the comment.

Comment not accepted.

CO7/CP11 considered this comment and noted that including the TOP as a functional entity applicable to the requirement would result in a preponderance of notifications to the RC and that the language of the requirement as written was sufficient.

~~*Comment:* **16**~~

Requirement R19:

This requirement holds the RC responsible for coordinating scheduled outages of facilities that are on the NPCC Transmission Facilities Notification List sufficiently in advance of the outage.

This responsible was assigned to the responsible entities which included the TOPs in the existing Directory #1. The switch of responsibility to the RC will relieve the TOPs from having to coordinate this task, which can leave a reliability gap.

We believe the RC has a high-level oversight role to ensure facility outage schedules are coordinated, but the act of coordination needs to be performed by the TOPs themselves. We suggest to add or replace RCs with TOPs for this requirement.

In addition, the IESO found "*sufficiently in advance*" is not specific enough. We suggest that the Task Force or Work Group specify what "sufficiently in advance" means.

CO7/CP11 Response:
3/19/2014

Thank you for the comment.

Comment not accepted.

CO7/CP11 has reviewed the comment and did not accept the comment to include the TOP as part of the functional applicability of R18 and to clarify 'sufficiently in advance' in the language of R18.

The group noted that Section 5.5 of the current Directory#1 holds the R.C. responsible for coordinating such outages and noted that the R.C. was the appropriate functional entity to provide such coordination.

The group also acknowledged that the comment to improve the term 'sufficiently in advance' was a valid concern.

However, CO7/CP11 noted that it had spent considerable time discussing this issue during its first review of the draft and could not improve on the term because of a variety of reasons which include different internal procedures and scheduling constraints.

The group considered removing the subject term completely from the requirement in order to address the comment, however CO7/CP11 agreed that term was useful in the context of the requirement as written.

~~*Comment:* **17**~~

Requirement R20:

This requirement holds the RC responsible for coordinating voltage control between TOP Areas. This responsible was assigned to the responsible entities which include the TOPs in the existing Directory #1. The switch of

responsibility to the RC will relieve the TOPs from having to coordinate this task, which can leave a reliability gap.

Further, the RC does not own or operate any TOP meters; this renders the RCs unable to meet Requirement R20.1.

Suggest to add or replace RCs with TOPs for this requirement.

Also, Appendix G stipulates that the TOPs are to following the voltage control and coordination procedures.

We suggest the drafting team (WG/TF) to review the role of TOP in coordination of voltage control and schedule.

CO7/CP11 Response:
3/19/2014

Thank you for the comment.

Comment not accepted.

CO7/CP11 has reviewed the comment and did not accept the comment to include the TOP as part of the functional applicability of R19.

The group noted that although the TOP has a role in voltage control in accordance with Appendix G, the RC is the appropriate functional entity to coordinate wide area voltage control and the language of the requirement as written was sufficient.

~~*Comment:* ***18***~~

Tables 1, 2 and 3:

The subtitle "*Compliance with Directory#1 shall be demonstrated for all requirements listed in the table below that are not required for compliance with the NERC Reliability Standards"* sends the message that NPCC does not require compliance with all requirements.

If the intention was to avoid duplication of sanctions from NERC and NPCC for the same violation, that should be clarified in a different place.

CO7/CP11 Response:
4/24/2014

Comment accepted.

CO7/CP11 agrees with the comment and has deleted the subject compliance statement from Tables #1 and #3 and further recommended that this statement be captured in the Compliance section of the document.

CO7/CP11 developed Tables#1 and#3 which organize requirements that are applicable to NPCC BPS elements and compliance with the performance requirements in the Tables shall be demonstrated for those elements.

Certain requirements presented in the Tables are duplicative with NERC requirements, however since the BES and BPS may comprise a different set of elements CO7/CP11 included all requirements that are applicable to the BPS.

Comments from – NYISO:

The New York Independent System Operator (NYISO) respectively submits comments on the subject draft Directory 1 revision which was posted on December 11, 2013 for review and comment.

The NYISO generally supports the posted version of Directory 1, and submits the following comments for consideration:

~~*Comment:* ***19***~~

The NYISO concurs with the following comment by the New York State Reliability Council (NYSRC):

"A new sentence has been added to the Resource Adequacy Criterion Requirement R4.1 in this Directory 1 draft as follows: "In the calculation of available resources, supply-side purchases from neighboring systems are limited to firm capacity backed purchases."

We understand that this sentence was taken from an earlier version of the Introduction of Appendix D – Guidelines for Area Review of Resource Adequacy.

The paragraph from which this sentence was taken describes types of supply and demand-side facilities that contribute to resource capacity. There is no indication as to why this particular type of supply-side measure was singled out for inclusion in R4.1 when many other important types of supply-side and demand-side components included in resource adequacy reviews were not also incorporated in the Resource Adequacy Criterion draft revision.

Notwithstanding this, the NYSRC maintains that the Guidelines for Area Review of Resource Adequacy – not the reliability criterion – continues to be the appropriate document for describing requirements for all load and capacity models and assumptions that are incorporated in Area resource adequacy assessments.

We recommend that Appendix D be restored to its 12/1/2009 version since it has not been demonstrated that the above referenced information is no longer required for preparing Area resource adequacy assessments.

CO7/CP11 Response:
2/19/2014

Thank you for the comment.

Comment accepted.

CO7/CP11 agrees with the comment and will transfer the language on supply side purchases that was moved to Requirement R4.1 back to Appendix D *Guidelines for Area Review of Resource Adequacy*.

~~*Comment:* **20**~~

The NYISO concurs with the following comment by the NYSRC:

Requirement R8 requires that credible combinations of certain specified system conditions that stress the system be modeled.

However, R8 does not specify the objective or use of this modeling requirement, e.g., whether it is intended by R8 that the system shall be designed to meet such combinations of system conditions.

CO7/CP11 Response:
3/5/2014.

Thank you for the comment.

Comment accepted.

CO7/CP11 agrees with the comment and has renamed R8 to R7.1 in order to link the objective of these studies to the planning obligations in Table 1.

~~*Comment: **21***~~

Requirement R6.1 states,

"*Perform a summer and winter reliability assessment every year*."

This does not provide enough clarity as to what NPCC Task Force or Working Group is responsible for the performance and review of this assessment.

Is each Reliability Coordinator individually responsible for this requirement? Is CO-12 responsible? Is CP-8 responsible?
This requirement should be revised to provide appropriate clarity both in terms of performance responsibility and review responsibility, and/or reference an appendix which would provide guidance.

CO7/CP11 Response:
3/12/2014.

Thank you for the comment.

Comment accepted.

Since Requirement R6.1 is a sub requirement of R6 the applicability of the parent requirement R6 also applies to R6.1.

In this case the functional entity responsible for R6.1 is the Reliability Coordinator.

Additionally CO7/CP11 has revised requirement R6.1 to improve its clarity.

~~*Comment:* **22**~~

In Appendix D, the title of 3.6 is misleading and inconsistent with the content. The title should be revised to "*Potential Reliability Impacts and Mitigation Mechanisms"*.

CO7/CP11 Response:
4/09/2014.

Thank you for the comment.

Comment accepted.

Appendix D *Guidelines for Area Review of Resource Adequacy* Section 3.6 and 3.7 language reordered.

Comments from – ISO-NE:

ISO New England has the following comments on the posted version of Directory 1, listed as DRAFT 14: December 11th, 2013:

~~*Comment: **23***~~

Page 3:

Delete the period after "Appendix A – Reserved for Future Use"

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

Period deleted after 'Appendix A-Reserved for Future Use".

~~*Comment: **24***~~

There appears to be inconsistent use of bolding when using the term "bulk power system". These comments attempted to catch each instance, but the entire document should be reviewed for consistency.

CO7/CP11 Response:
3/25/2014.
Thank you for the comment.

Comment accepted.

Entire document reviewed to insure the term “bulk power system’ is bolded consistently throughout.

~~*Comment :* ***25***~~

Page 5, Section 1.3:

4th paragraph, last line, “bulk” should be bold.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

“Bulk” bolded. (Page 5, Section 1.3, 4th paragraph, last line.)

~~*Comment :* ***26***~~

Page 5, Section 1.4:

The effective date will need to be updated once this document is finalized.

CO7/CP11 Response:
3/25/2014

Thank you for the comment.

Comment accepted.

The effective date of this document will remain as indicated in the Table of Contents as December 1, 2009 reflecting the date that Directory#1 initially became effective as balloted by the NPCC Full Members.

However, the 'Revision Review Record' on the title page along with the "Revision History" page will be updated to reflect the date that this version of the document becomes effective.

~~*Comment : 27*~~

Page 6, Section 1.6.2:

Delete "NPCC transmission" from the first line of the first paragraph. This should be redundant with "NPCC bulk power system elements" used in the next line and may cause users to ignore criteria on BPS facilities that they do not consider transmission.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

"NPCC transmission" has been deleted from the first line of the paragraph.

~~*Comment:* **28**~~

Page 7, title of Section 3:

Delete “More Stringent Criteria”. This is unnecessary.

CO7/CP11 Response:
2/12/2014.

Thank you for the comment.

Comment accepted.

Removed ‘More Stringent’ from title of 3.0

~~*Comment:* **29**~~

Page 8, last line of R7:

Delete “NPCC” from “NPCC bulk power system”. BPS is an NPCC defined term and adding NPCC adds unnecessary confusion.

CO7/CP11 Response:
3/5/2014.

Thank you for the comment.

Comment accepted.

Deleted “NPCC” from “NPCC bulk power system”

~~*Comment: **30***~~

Page 8, last two lines of R11:

….. state "*and coordinate these procedures with adjacent Planning Coordinator Areas"*. This language is overly burdensome. If there is a written procedure in the corner of a system that cannot possibly impact neighbors, this should be unnecessary. Suggest "*and coordinate these procedures with affected Planning Coordinator Areas"*.

CO7/CP11 Response:
3/5/2014.

Thank you for the comment.
Comment accepted.

Deleted "adjacent" and replaced it with "materially affected" in the last sentence of R11.

~~*Comment: **31***~~

Page 9, first line of R12.3:

Delete NPCC from before bulk power system, similar to our comment 5.

CO7/CP11 Response:
3/5/2014.

Thank you for the comment.
Comment accepted.

Deleted "NPCC" from "NPCC bulk power system"

~~*Comment : **32***~~

Page 9, R13.2:

Should be unnecessary as Directory 7 should require this.

CO7/CP11 Response:
3/12/2014.

Thank you for the comment.

CO7/CP11 agrees with the comment and has deleted the Requirement since it is redundant with NPCC Directory #7.

~~*Comment: **33***~~

Page 9, R14:

Last line states that system conditions are described in Table 3 and they are not present. Suggest deleting “and system conditions” from R14.

CO7/CP11 Response:
3/25/2014

Comment accepted.

Deleted the term ‘system conditions’.

~~*Comment :* **34**~~

Page 9, R16:

Last line, “emergency” should be bold.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

“Emergency” bolded in R16.

~~*Comment:* **35**~~

Page 9, R17:

Suggest adding “*specified in Table 3*” to the end of R17 so that it reads “…after the occurrence of any contingency and prepare for the next contingency specified in Table 3.” The current wording suggests that after the occurrence of the first contingency, the operator must posture the system to be ready for ANY next contingency, including ECs. Adding the suggested language limits the contingencies to those located in Table 3.

CO7/CP11 Response:
3/25/2014.

Comment accepted.

‘as specified in Table #3’ added to the language of R16.

~~*Comment: **36***~~

Table 1, Performance Requirement vi:

The evaluation of reclosing is limited to automatic. Should manual reclosing also be included here?

If so, the word "automatic" could be deleted or it could be modified to read "…with due regard to successful and unsuccessful automatic and manual reclosing, where automatic reclosing does not exist."

CO7/CP11 Response:
3/26/2014

Comment accepted.

CO7/CP11 agreed to delete the word 'automatic' when describing reclosing operations both in Table #1 Performance Requirement vi and Table#3 Performance Requirement vii.

~~*Comment: **37***~~

Table 2:

There is a note at the top that reads *"Compliance with Directory#1 shall be demonstrated for all requirements listed in the table below that are not required for compliance with the NERC Reliability Standards."*

This should be deleted. Unlike the design criteria specified in Table 1, there are no requirements listed in Table 2.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

Deleted the subject note in Table#2. (Table #2 provides assessment criteria and not performance requirements.)

~~*Comment: **38***~~

Table 2:

Fault description corresponding to item 4, the font appears to change size throughout the description.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

Font size adjusted.

~~*Comment:* **39**~~

Table 2, contingency 7:

Uses the term “Council”. Suggest replacing this with “NPCC” to avoid confusion.

CO7/CP11 Response:
3/25/2014.

Comment accepted.

The term ‘Council” has been replaced by ‘NPCC” in Table #2 contingency#7.

~~*Comment:* **40**~~

Table 3, in the column listed as “Normal Transfer Capability”:

Delete the periods from “i to xi.” They are inconsistent with the convention used throughout the tables.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

Periods after “i to xi” deleted in Table #3 in the column under ‘Normal Transfer Capability”.

~~*Comment:* ***41***~~

Table 3, performance requirement xi and the note underneath:

Bulk power system should be bold.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

"Bulk Power System" bolded in Table #3 performance requirement 'xi' and in the note at the bottom of Table#3.

~~*Comment:* ***42***~~

Table 3, performance requirement xi.

While members of CP-11 and CO-7 participated in the discussion of the wording of requirement, the subtlety of what is means is not understood by those who did not participate.

The language relies on the nuance introduced by the fact that the description is for an element that remains faulted and also provides no description on what is permissible if a fault has been removed.

Suggested wording: *"Normal transfer levels shall not require system adjustments before attempting manual reclosing of elements to maintain stability of the BPS unless specific instructions describing alternate actions are in effect."*

CO7/CP11 Response:
3/26/2014.

Comment accepted.

CO7/CP11 reviewed this comment and agreed to revise Table #3 Performance Requirement xi to further clarify the conditions under which manual reclosing is permissible.(removed the reference to faulted elements).

~~*Comment:* **43**~~

Table 3, performance requirement xii:

Suggest changes similar to those suggested in comment 21. Replace wording with:

> *"Emergency transfer levels may require system adjustments before attempting manual reclosing of elements to maintain stability of the bulk power system. "*

CO7/CP11 Response:
3/26/2014.

Comment accepted.

CO7/CP11 reviewed this comment and agreed to revise Table #3 Performance Requirement xii to further clarify the conditions under which manual reclosing is permissible.(removed the reference to faulted elements).

~~*Comment:* ***44***~~

While the Table of Contents lists Appendix A as “Reserved for Future Use”, there is no placeholder in the document itself. The document transitions right into Appendix B. It would be clearer if a page was inserted for Appendix A that that noted it was “Reserved for Future Use”.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.
Comment accepted.
A placeholder page will be added for Appendix A.

~~*Comment:* ***45***~~

Appendix B, Section 1.0, fifth line:

Uses the term “bulk power transmission system”. It is unclear if this is something different than the BPS. Suggest deleting the word “transmission” and making the remaining “bulk power system” bold.

CO7/CP11 Response:
4/04/2014.

Thank you for the comment.

Comment accepted. The word ‘transmission’ has been deleted and the remaining term ‘bulk power system’ has been bolded in Appendix b, Section 1.0, 5th line.

~~*Comment:* **46**~~

Appendix B, Section 1.0, sixth line:

Says that the periodic reviews encompass the BPS "*and the transmission interconnections to other Planning Coordinator Areas"*.

This indicates that this applies to interconnections to other Planning Coordinator Areas, even if they are none BPS. Suggest striking this language.

CO7/CP11 Response:
4/24/2014

Thank you for the comment.

Comment accepted.

Subject language deleted.

~~*Comment:* **47**~~

Appendix B, last paragraph of Section 4.0, first line:

Suggest capitalizing "coordinator".

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

'Coordinator" has been capitalized.

~~*Comment :* **48**~~

Appendix B, Section 5.0, part d:

States: "*Plots of angles versus time for significant machines, HVdc and SVC response, voltages at…*"

The use of the term SVC is too specific. It rules out other FACTS devices such as STATCOMs. Suggest using a more generic term so that all types of equipment of interest are included.

CO7/CP11 Response:
4/04/2014.

Thank you for the comment.

Comment accepted.

CO7/CP11 has revised the language in Appendix B, Section 5.0 part d to address the comment.

~~*Comment:* **49**~~
Appendix E, Section 3,

Should require that the exclusion is approved by the RCC.

As currently written Section 3 ends with finding the position of each Task Force with no step for final approval.

Additionally, Table 1, Performance Requirement vii states that the RCC must accept each request for exclusion. Adding a step for the RCC approval to Appendix E, Section 3 would address these concerns.

CO7/CP11 Response:
4/16/2014.

Thank you for the comment.

Comment accepted.

CO7/CP11 has revised Appendix E *Guidelines for Requesting Exclusions to Simultaneous Loss of Two Adjacent Transmission Circuits on a Multiple Circuit Tower* to include language that provides for RCC approval of such exclusions.

~~*Comment:* ***50***~~

Appendix G, Section 3.1.a:

Suggest deleting the period at the end after “between the reporting Reliability Coordinator and Adjacent Reliability Coordinators.”

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

Period deleted.

Comments from – National Grid):

Subject: Open Process Posting of NPCC Directory # 1 Design and Operation of the Bulk Power System.

~~*Comment:* ***51***~~

National Grid is very concerned with the change proposed in Directory 1 specific to footnote vii of Table 1.

The proposed change from the existing Directory 1 is to change the phrase *"...that involve a fault…*" to "*...that involve normal fault clearing...*"

While this seems a simple change, we are concerned that it could adversely impact protection system design as well as bulk power system stability.

The footnote is the new directory's method of addressing the issue of ensuring that stability is maintained whether fault clearing is maintained by system A protection group or system B protection group.

The present directory handles this in the introductory paragraphs of sections 5.4.1 and 5.5.1.

The footnote mechanism itself is not the issue of concern.

Rather, it is the action of the footnote to restrict application of the stability testing under either protection group clearing to only cases with normal fault clearing.

The result of the change is to eliminate the need to perform this step for the former fault "c." / now Event number 4 - a *"permanent phase to ground fault on any transmission circuit, transformer, or bus section with delayed fault clearing"*.

The concern that prompts a need and desire to ensure acceptable stability performance under fault clearing (either normal or delayed) by either

protection group is that the two NPCC required groups may not necessarily have the same speed of operation.

One might clear in "high speed" while the other may use a stepped distance design which would take longer.

The test of simulating fault clearing with either group and ensuring acceptable performance in each case confirms that the two protection groups provided are capable of performing the specified protective function and thus meet the NPCC Protection Criteria.

The proposal to limit such testing to only faults involving normal clearing may stem from a perception that delayed fault clearing implies a failure in one protection group already.

This is not correct.

Delayed fault clearing results from a mechanical failure which causes the breaker to not operate within its expected time. This situation is not a result of any system contingency. It is a condition which could occur quite some time prior to the system fault and persist undetected, only coming to light when the breaker is called upon to operate as a result of the fault.

And during that event one or the other protection group could suffer a failure.

NPCC criteria provide redundancy for the mechanical portion of the breaker (operating mechanism and contacts) through the breaker failure scheme, which is a separate protection group associated with the breaker. It is not part of the System A or System B protection group of an element.

But it is initiated by each of the protection groups which trip the breaker.

Thus, whether normal fault clearing or delayed fault clearing, there could be a difference in operating time due to differences between System A and System B protection groups.

Ensuring that protection groups will deliver their expected performance is important under all fault types - not just those involving normal clearing.

We believe that the footnote needs to retain the present text of "*for each of the contingencies that involve a fault, stability shall be maintained…*" in order to continue to protect NPCC bulk power system reliability.

CO7/CP11 Response:
5/20/2014

Thank you for the comment.

Comment accepted.

CO7/CP11 did not reach consensus on this issue.

Some CO7/CP11 Members agreed that the existing NPCC criteria requires the testing of certain faults with the slower of either protection system A or protection system B and that the proposed change would impact reliability by weakening the criteria.

Conversely other CO7/CP11Members contended that the change was necessary in order to properly clarify the criteria in order to avoid an overly conservative interpretation.

Ultimately, the TFCP directed that the criteria should remain as currently written and that notwithstanding the dissenting opinion the subject change to the criteria should be eliminated.

~~*Comment:* **52**~~

Table#1:

We believe appropriate limits should be specified in footnote iii. similar to footnote iv. E.g. Voltages and loadings shall be within applicable normal limits for pre-contingency conditions.

CO7/CP11 Response:
3/26/2014.

Comment accepted.

CO7/CP11 reviewed this comment and agreed to move the word ’applicable’ in front of the word ‘limits’ in Table 1 Performance Requirement iii and Table#3 Performance Requirement iv in order to improve clarity.

~~*Comment:* ***53***~~

Table#1:

Why is Event 3 (Loss of single pole of direct current facility) and Event 7 (Simultaneous permanent loss of both poles of a direct current bipolar facility) listed separately when both are functionally equivalent depending on the design of the dc facility?

This is an "or" not an "and". Wouldn't the requirements as stated require the owner of an HVdc bipolar facility to do unnecessary studies to demonstrate compliance?

CO7/CP11 Response:
3/25/2014

Thank you for the Comment.

Comment not accepted.

CP11/CO7 reviewed this comment and concluded that Contingency Event # 3 should remain in both Table#1 and Table #3 for the following reasons:

Regarding the Planning Table (Table#1) CP11/CO7 suggests maintaining the parallel structure with Table 3 including Contingency Event #3.

Additionally, it is understood that if a system has a bipolar dc facility and testing for Contingency Event #7 has been performed it is not necessary to perform the testing for Contingency Event #3(loss of a single pole).

Also, in Table#1 if a system has a mono-polar dc facility, Contingency Event #7 would not be applicable; however the loss of this mono-polar facility would be tested under Contingency Event #3 thereby justifying its presence in the table.

Finally, regarding the Operations Table (Table#3) all losses of a single element should be included to establish emergency transfer capability. Therefore, loss of a single pole DC current facility (bi-polar) was included with Contingency events #1 and #2 for emergency transfer capability.

~~*Comment:* **54**~~

Table#1:

The wording of Event 8.f. might negate itself (8… after the loss of the following…f. opening of any circuit breaker).

Taken together this says to simulate the loss of the opening of a circuit breaker, but that isn't what is meant.

Event 8.f. also contradicts itself when considering the fault type (opening of any breaker without a fault during a phase-to-ground fault).

Unless what is meant is a pullout of a remote breaker for a fault.

It is unlikely that an SPS would have been put in for that. It seems Event 8f would be better described in its own Event line - similar to Event 2.

CO7/CP11 Response:
3/26/2014

Comment accepted.

A new event line has been established in Table#1.

8f transferred to new contingency event #9….'the failure of a CB to operate when initiated by a SPS after opening of any C.B.'….

Fault Type: No Fault.

~~*Comment:* ***55***~~

Table#2:

Considering that most EHV and a good many HV circuit breakers have each pole in a separate tank (not to mention live-tank breakers), how is Event 5. (Loss of a circuit breaker due to a three-phase internal fault) relevant?

Does it not impose an undue burden for an unrealizable condition?

CO7/CP11 Response:
3/26/2014.

Thank you for the comment.

The word 'internal' has been deleted from Tables 1, 2 and 3 to eliminate ambiguity.

Furthermore CO7/CP11 notes that the intention is to address the zone of protection for the circuit breaker.

~~*Comment: **56***~~

The previous version of Directory 1 contained definition of terms in Appendix A. This proposed version has Appendix A reserved for future use. Where are the defined terms?

Have they all been incorporated into the NPCC Glossary?

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.
Comment accepted.

NPCC has established a Glossary of Terms to replace the A-7 document and the separate section within each Directory has been retired; all NPCC defined terms reside in the Glossary of Terms.

~~*Comment: **57***~~

Section 1.4:

States the Effective Date is December 1, 2009. This will need to change to reflect lead time for completion of open process and member acceptance voting.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

Comment accepted.

The effective date of this document will remain as indicated in the Table of Contents as December 1, 2009 reflecting the date that Directory#1 initially became effective as balloted by the NPCC Full Members.

However, the 'Revision Review Record' on the title page along with the "Revision History" page will be updated to reflect the date that this version of the document becomes effective.

Comments from – Dominion:

Comment#1:

~~*Comment:* ***58***~~

Section 1.6.2 (Applicability of NPCC Criteria):

Contains new "boiler plate" language in the second paragraph requested by the TFCO to addresses the applicability of the NPCC criteria. To be consistent with the NPCC Bylaws (Article IV, 4.2, (2)), Dominion suggest a modification to the last sentence as follows:

NPCC will not enforce compliance to the NPCC Directory requirements in this document on any entity that is not an NPCC Full Member.

CO7/CP11 Response:
4/04/2014.

Thank you for the comment.

Comment accepted. CO7/CP11 has incorporated the suggested language into the document.

Comments from – New York State Reliability Council (NYSRC):

The New York State Reliability Council (NYSRC) respectively submits comments on the subject draft Directory 1 revision which was posted on December 11, 2013 for review and comment.

The NYSRC generally supports the posted version of Directory 1, and submits the following comments for consideration:

General Comment:

~~*Comment:* **59**~~

Our review of the Directory 1 draft would have been made easier if a redline version had been made available along with a clean version. Changes were not only made in the reliability criteria section of the Directory, but also in its many appendices. Comparing this 50-page draft with the most recently posted December 1, 2009 version was very difficult without having a redline version

available. We strongly suggest that the next Directory 1 draft include a redline version.

CO7/CP11 Response:
3/26/2014.

Thank you for the comment.

Comment accepted.

CO7/CP11 notes that the draft of Directory#1 has undergone significant structural changes that would render a redlined to the current version unusable.

However, a red-line to the most recent posted draft of the document will be provided for subsequent postings.

Additionally, CO7/CP11 will also provide mapping to the existing version of Directory#1.

Specific Comments:

~~*Comment:* **60**~~

The NPCC Directory Development and Revision Manual indicates in its Introduction that each directory identifies NERC ERO Standards that are associated with the directory. This Directory 1 draft does not include such a list of associated NERC Standards.

We also note that other NPCC directories include a lead in sentence to the criteria, such as: “These criteria are in addition to, more stringent than, and more specific than NERC or any Regional reliability standard requirements.”

We suggest a similar sentence be included in Directory 1.

CO7/CP11 Response:
3/26/2014

Thank you for your comment.
Comment not accepted.

CO7/CP11 has reviewed this comment and determined that the list of ERO standards should no longer appear in the Directory for the following reasons:

- Regulatory approval and version control can lead to different versions of the ERO Standards in effect within US and Canadian provinces.
- BPS and BES represent different equipment.

CO7/CP11 recommends revising the subject section of the Directory Manual to eliminate the section on ERO standards and also recommends removing the subject list of ERO standards from all other Directories.

Additionally, CO7/CP11 recommends omitting the language surrounding the more stringent criteria and regional standards and also recommends removing this language from all other Directories since this language may no longer be accurate given that the NERC standards are evolving beyond the criteria.

~~*Comment:* ***61***~~

Directory 1 is clear in Section 1.6.2 that it applies to NPCC BPS elements that are defined by NPCC A-10 tests where the criterion is potential significant adverse impact outside of the Local Area.

NPCC's Glossary of Terms defines Local Area as, "An electrically confined or radial portion of the system. The geographic size and number of system elements contained will vary based on system characteristics. A local area may be relatively large geographically with relatively few buses in a sparse system, or be relatively small geographically with a relatively large number of buses in a densely networked system."

This definition is vague and ambiguous. It can lead to widely varied lists of

BPS elements with a range of economic impacts.

Also, A-10 is based upon Security performance and does not address Adequacy performance.

Please clarify with respect to Directory 1.

CO7/CP11 Response:
3/25/2014.

Thank you for the comment.

CO7/CP11 has reviewed your comment and found that the definition of local area is beyond the scope of the CO7/CP11 assignment which was to reformat the Directory#1 criteria into auditable requirements.

CP7/CP11 recommends that the appropriate forum for the review of this definition is a review of the NPCC A10 methodology and the NPCC Glossary of Terms.

Directory#1 Requirements R4 – R6 address resource adequacy which utilize system transfer security criteria.

~~*Comment Type: P.*~~ ~~***62***~~

A new sentence has been added to the Resource Adequacy Criterion Requirement R4.1 in this Directory 1 draft as follows: *"In the calculation of available resources, supply-side purchases from neighboring systems are limited to firm capacity backed purchases."*

We understand that this sentence was taken from an earlier version of the Introduction of Appendix D – Guidelines for Area Review of Resource Adequacy.

The paragraph from which this sentence was taken describes types of supply and demand-side facilities that contribute to resource capacity. There is no indication as to why this particular type of supply-side measure was singled out for inclusion in R4.1 when many other important types of supply-side and demand-side components included in resource adequacy reviews were not also incorporated in the Resource Adequacy Criterion draft revision.

Notwithstanding this, the NYSRC maintains that the Guidelines for Area Review of Resource Adequacy – not the reliability criterion – continues to be the appropriate document for describing requirements for all load and capacity models and assumptions that are incorporated in Area resource adequacy assessments.

We recommend that Appendix D be restored to its 12/1/2009 version since it has not been demonstrated that the above referenced information is no longer required for preparing Area resource adequacy assessments.

CO7/CP11 Response:
2/19/2014.

Thank you for the comment.

CO7/CP11 agrees with the comment and will transfer the language on supply side purchases that was moved to Requirement R4.1 back to Appendix D *Guidelines for Area Review of Resource Adequacy.*

~~*Comment: **63***~~

Requirement R8 requires that credible combinations of certain specified system conditions that stress the system be modeled. However, R8 does not specify the objective or use of this modeling requirement, e.g., whether it is intended by R8 that the system shall be designed to meet such combinations of system conditions.

CO7/CP11 Response:
3/5/2014.

Thank you for the comment.

Comment accepted.

CO7/CP11 agrees with the comment and has renamed R8 to R7.1 in order to link the objective of these studies to the planning obligations in Table 1.

~~*Comment: **64***~~

The following note appears in Tables 1-3: "*Compliance with Directory #1 shall be demonstrated for all requirements listed in the table below that are not required for compliance with the NERC Reliability Standards.*"

This note suggests that some requirements in these tables are NERC Standard requirements.

Without specifying which requirements in these tables are associated with NERC Standards, how can compliance with Directory 1 be demonstrated?

CO7/CP11 Response:
4/24/2014

Thank you for the comment.

CO7/CP11 agrees with the comment and has deleted the subject compliance statement from Tables #1 and #3 and further recommended that this statement be captured in the Compliance section of the document.

CO7/CP11 developed Tables#1 and#3 which organize requirements that are applicable to NPCC BPS elements and compliance with the performance requirements in the Tables shall be demonstrated for those elements.

Certain requirements presented in the Tables are duplicative with NERC requirements, however since the BES and BPS may comprise of different elements CO7/CP11 included all requirements that are applicable to the BPS.

~~*Comment:* **65**~~

Documented in the Final Meeting Minutes of the 10/17-18/2013 NPCC TFCO meeting, a bullet item on page 5 of the minute's states:

- *Station service supply (non-NPCC BPS) is viewed as loss of a transformer (NPCC BPS) so that by extension Directory #1 covers some non-NPCC BPS facilities that impact the NPCC BPS. The intention is to cover loss of the station service transformer consistently throughout NPCC.*

The latest Directory 1 draft, however, makes no reference to station service transformers or any other station service supply equipment.

If station service transformers are expected to be treated as NPCC BPS elements and, therefore, required to comply with NPCC Directory Criteria, this requirement should be clearly delineated.

Without delineation, treatment of station service supply for NPCC BPS facilities will (1) not be addressed in a consistent fashion, (2) create a potential reliability gap and (3) result in a potential compliance issue for industry entities.

CO7/CP11 Response:
3/26/2014.

Thank you for the comment.

CO7/CP11 has reviewed your comment and found that the delineation between BPS and non BPS facilities is beyond the scope of the CO7/CP11 assignment which was to reformat the Directory#1 criteria into auditable requirements.

CP7/CP11 recommends that the appropriate forum for BPS and non BPS facilities is a review of the NPCC A10 methodology and the NPCC Glossary of Terms.

Comments from – TFCO (via NPCC Staff):

Appendix F-Procedure for Operational Planning Coordination

~~*Comment :* ***66***~~

Appendix F Attachment A Line item#17 language revised

Comments from – HQT:

HQT respectfully submits comments on the Directory 1 revision that was posted on December 11, 2013.

HQT generally supports this version.

Many requirements are clearer and the table format contributes to even more clarity.

HQT is especially satisfied with the modification about flows adjustments after a first loss in Table 3 and with a clear statement in section 1.3 that contingencies are applied only to BPS elements.

However, HQT makes the following comments or suggestions:

~~*Comment: 77*~~

1.3 Objective:

We propose to add the following sentence at the end of 1st paragraph of the Objective: *"This aims to avoid instability, voltage collapse and widespread cascading outages".*

CO7/CP11 Response:
4/04/2014.

Thank you for the comment.

Comment accepted. CO7/CP11 has incorporated the suggested language into the Objective section.

~~*Comment: **78***~~

R1:

Information verification:

It may be very hard to demonstrate compliance with the requirement that information shall be verified annually. It is not clear what is meant by verification. We propose that NPCC establish a general methodology about how this verification should be done, distinguishing between existing and new data.

CO7/CP11 Response:
2/12/2014.

Thank you for the comment.

CO7/CP11 considered your comment and the issue of how to determine compliance to verification will be described in the Measures.

CO7/CP11 will seek guidance from its respective Task Forces on the development of the Measures.

~~*Comment:* ***79***~~

R4:

Responsibility:

In some places, the Resource Planner is involved for requirement R4 about the probability of loss of load expectation (LOLE). We propose to say "*Each Planning Coordinator, or each Resource Planner, shall…"*

CO7/CP11 Response:
2/12/2014.

Comment accepted.

Thank you for the comment.

CO7/CO7 agrees with the comment and has inserted Resource Planner in the applicability of Requirement R4.

~~*Comment:* ***80***~~

Table 1, event 2:

It may be helpful to specify what is really expected, maybe such as opening of one point for a line circuit connected to three points.

CO7/CP11 Response:
3/26/2014.

Thank you for the comment.

CO7/CP11 reviewed the circumstances associated with Table #1 Contingency Event #2 and feels the language as presented is satisfactory.

CO7/CP11 also noted that in certain cases judgement must be utilized when choosing how to apply this contingency.

~~*Comment:* **81**~~

Table 1 and 3:

Events 1 and 4 are slightly different than former D1. We propose to modify as following: *"Fault on any of the following*:"
For event 5, "loss of a circuit breaker" may cause confusion and we recommend the following: "*Internal breaker fault*", and "*phase to ground with normal fault clearing*". This is consistent with TPL-001-4 and let planners identify the elements that will be lost according to its single line diagram and protection scheme.

CO7/CP11 Response:
3/25/2014

Comment accepted.

CO7/CP11 agrees with the comment and has revised Table #1 and Table #3 accordingly.

~~*Comment Type:* **82**~~

Table 2, Extreme System Conditions:

Performance i. on pre-contingency conditions (specifying conditions not exceeded more than 25% of the time) should not apply to this part. Instead, conditions of either normal peak load or extreme peak load should apply, because the test wants to identify Extreme Conditions.

CO7/CP11 Response:
3/25/2014.

Comment accepted.

CO7/CP11 reviewed this comment and agreed to revise the Performance Assessments in Table#2, by deleting assessment i (a) from extreme weather assessment and deleting i (a) and i (b) from the fuel shortage assessment.

CO7/CP11 also spent considerable time discussing the wording of assessment i(a) and ultimately decided not to revise the language as currently written.

~~*Comment:* ***83***~~

General comments:

R13 – SPS:

There has been no consensus on CP11/CO7 to write criteria to identify type 1 SPS usage for the BPS. As a solution, R13 proposes a process to obtain approvals.

We agree that this is an improvement, but we will have to wait and see if experience proves in practice the efficiency of this solution.

With the change of BES definition at NERC, compliance of BPS to D1 through Interim or Comprehensive Transmission Review will no longer be sufficient for compliance with TPL at NERC.

In fact, TPL-001-4 includes some requirements that are more stringent than D1: 1) necessity to make sensitivity studies, 2) considering protection system outage in contingencies, 3) presenting both short and long term assessments, 4) making analyses for extreme contingencies at peak load or with two consecutive 3-phases fault contingencies without system adjustment in between.

Also, TPL applies to many more facilities, such as BES facilities not included in BPS. Members will need to be conscious of those differences.

CO7/CP11 Response:
3/12/2014.

Thank you for the comment.

CO7/CP11 has reviewed your comment and appreciates the additional information provided.

NPCC, Inc.

NORTHEAST POWER COORDINATING COUNCIL, INC.
1040 AVE OF THE AMERICAS, NEW YORK, NY 10018 TELEPHONE (212) 840-1070 FAX (212) 302-2782

May 22nd, 2014

Subject: Posting for Open Process Review of NPCC Directory#1 *Design and Operation of the BPS.*

NPCC Full Member Representatives and Alternates:

Please find attached clean and redlined versions of NPCC Directory#1 *Design and Operation of the Bulk Power System* which is now posted to receive your comments through the NPCC Process for Open Review.

On January 31st, 2013 the Task Force on Coordination of Planning (TFCP) and the Task Force on Coordination of Operation (TFCO) requested a collaborative review of the Phase 2 draft of Directory#1 by their respective working groups the CO7 and the CP11.

The combined CP11/CO7 Working Group completed an initial review of Directory#1 during which it reformatted the Directory#1 criteria into measurable requirements and posted a draft to the NPCC Open Process for 45 days concluding on January 25th, 2014.

NPCC received comments from eight of its Members and the Working Group reconvened to address comments, draft responses and revise the document as necessary.

Significant revisions to the draft based on the review of comments received include:

- Further revisions to the Objective section to clearly delineate where applicable performance requirements should be monitored.
- Revisions to the requirement language and performance attributes to improve clarity.
- Changes to the Directory format based on Working Group review and comment.
- Mapping of the reformatted criteria to the current in force version of Directory#1.
- Minor revisions to the Appendices.

However the CO7/CP11 Working Group was unable to reach consensus regarding a Member comment directed at a potential change to the criteria.

Specifically, the comment asserted that the existing NPCC criteria requires the testing of certain faults with the slower of either protection system A or protection system B and that the proposed change would impact reliability by weakening the criteria.

Conversely other Working Group Members contended that the change was necessary in order to properly clarify the criteria in order to avoid an overly conservative interpretation.

Ultimately, the TFCP directed that the criteria should remain as currently written and that notwithstanding the dissenting opinion the subject change to the criteria should be eliminated.

Subsequent to the CO7/CP11 review of comments the TFCO and the TFCP have reviewed the draft and have approved posting the document to the NPCC Open Process.

The NPCC Open Process may be accessed through the following link:

https://www.npcc.org/Standards/SitePages/NonStandardsList.aspx

Comments on Directory#1 will be received for forty five days through July 07, 2014.

Please contact me with any questions regarding the NPCC Open Process or the content of this document.

DRAFT 14:
Redlined to CO7/CP11 Review of Open Process Comments
Regional Reliability Reference Directory # 1
Design and Operation of the Bulk Power System

Task Force on Coordination of Planning Revision Review Record:

May 22nd, 2014

Note: Requirement R8 reordered as Requirement R7.1 on 3/5/2014, which reordered all subsequent requirements and sub requirements in the draft after R7.1.

Therefore, comments in the margin referencing requirements after R7.1 will no longer be aligned. (Reference is now (Requirement Rx -1).

Adopted by the Members of the Northeast Power Coordinating Council, Inc., on December 01, 2009 based on recommendation by the Reliability Coordinating Committee, in accordance with Section VIII of the NPCC Amended and Restated Bylaws dated July 24, 2007 as amended to date.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

1.0 Introduction

1.1 Title: Design and Operation of the Bulk Power System

1.2 Directory Number: 1

1.3 Objective:

The objective of this Directory is to provide a "design-based approach" to design and operate the **bulk power system** to a level of reliability that will not result in the loss or unintentional separation of a major portion of the system from any of the contingencies referenced in **R7** and **R14.** The intent of this approach is to avoid instability, voltage collapse and widespread cascading outages. Loss of small portions of a system (such as radial portions) may be tolerated provided these do not jeopardize the reliability of the remaining **bulk power system**.

Mapped to Section# 1.3 Objective.

CO7/CP11 revised language to improve clarity.

In NPCC the technique for achieving this level of reliability is to require that the **bulk power system** be designed and operated to meet the performance requirements for the representative **contingencies** as specified in this Directory. Simulations shall be used to assess and analyze these **contingencies. Contingency** events shall be applied on **bulk power system** elements and the resulting performance requirements shall be monitored on the **bulk power system.**

~~Simulation of contingency events shall be applied on **bulk power system** elements and the resulting performance requirements shall be monitored on the **bulk power system.**~~

~~It is the responsibility of each Reliability Coordinator to ascertain that their portion of the **bulk power system** is operated in conformance with these criteria. It is the responsibility of each Transmission Planner and Planning Coordinator to ascertain that their portion of the **bulk power system** is designed in conformance with these criteria. Loss of small portions of a system (such as radial portions) may be tolerated provided these do not jeopardize the reliability of the remaining **bulk power system.**~~

The characteristics of a reliable **bulk power system** include adequate **resources** and transmission to reliably meet projected customer electricity demand and energy requirements as prescribed in this document.

1.4 Effective Date: December 1, 2009

Mapped to Section#1.5 Background.

Background

This Directory was developed from the NPCC A-2 criteria document - *Basic Criteria for the Design and Operation of Interconnected Power Systems* (May 6, 2004

version). Guidelines and Procedures for consideration in the implementation of this Directory are provided in the Appendices.

1.6 Applicability

1.6.1 Functional Entities

Reliability Coordinators
Transmission Operators
Balancing Authorities
Planning Coordinators
Transmission Planners
Resource Planners
Generator Owners
Transmission Owners

Mapped to Section #1.6.1 Functional Entities.

CO7/CP11 updated to include GO's and TO's as responsible Functional Entities.

1.6.2 Applicability of NPCC Criteria:

New Section.

Added at the request of TFCO to clearly specify applicability of NPCC criteria.

Will be inserted in all NPCC Directories.

The requirements of an NPCC Directory apply only to those ~~NPCC transmission~~ facilities defined as NPCC **bulk power system** elements and identified through the performance based methodology of NPCC Document A-10, "*Classification of Bulk Power System Elements*," the list of which is maintained by the NPCC Task Force on System Studies and approved by the NPCC Reliability Coordinating Committee."

Requirements to abide by an NPCC Directory may also reside in external tariff requirements, bilateral contracts and other agreements between facility owners and/or operators and their assigned Reliability Coordinator, Planning Coordinator, Transmission Operator, Balancing Authority and/or Transmission Owner as applicable and may be enforceable through those external tariff requirements, bilateral contracts and other agreements. NPCC will not enforce compliance to the NPCC Directory requirements in this document on any entity that is not an NPCC Full Member.

Mapped to Section #2.

NPCC defined terms no longer contained in each Directory. All NPCC defined terms reside in the NPCC Glossary A-7.

2.0 Defined Terms:

Unless specifically noted in this document terms in bold typeface are defined in the NPCC Glossary of Terms.

3.0 NPCC Full Member~~, More Stringent~~ Criteria:

Information for Planning and Operational Assessments

R1 mapped to Section #5.1.3 CO7/CP11 revised to improve clarity. No change in intent of requirement

R1 Each Functional Entity that owns equipment shall ~~annually~~ submit verified ~~verify the~~ information representing the physical or control characteristics of its equipment for system modelling and reliability analysis of the ~~it submits for use in for~~ **bulk power system** ~~analysis. representing the physical or control characteristics of the equipment~~.

R2 mapped to Section #5.1.3 CO7/CP11 revised to improve clarity. No change in intent of requirement

R2 Each Planning Coordinator and Reliability Coordinator shall collect and ~~,~~ maintain information needed for system modelling and reliability analysis of the **bulk power system** as submitted in accordance with Requirement R1. ~~and submit information needed for system modelling and reliability analysis of the **bulk power system**.~~

R2.1 mapped to Section #5.1.3.

CO7/CP11 added R2.1 to clarify existing process.

R2.1 This information shall be submitted to NPCC upon request.

R3 Each Reliability Coordinator shall share and coordinate forecast system information and real-time information to enable and enhance the analysis and modeling of the interconnected **bulk power system** by security application software on energy management systems.

R3 mapped to Section #5.1.3 No change in intent of requirement.

Resource Adequacy

R4 Each Planning Coordinator or Resource Planner shall probabilistically evaluate resource adequacy of its Planning Coordinator **Area** portion of the **bulk power system** to demonstrate that the loss of **load** expectation (LOLE) of disconnecting **firm load** due to resource deficiencies ~~shall be~~are is, on average, no more than 0.1 days per year.

R4 and R4.1 mapped to Section # 5.2.

No change in intent of requirements.

R4.1 Make due allowances for demand uncertainty, scheduled outages and deratings, forced outages and deratings, assistance over interconnections with neighboring Planning Coordinator **Areas**, transmission transfer capabilities, and capacity and/or load relief from available operating procedures. ~~In the calculation of available **resources,** supply-side purchases from neighbouring systems are limited to firm capacity backed purchases~~

.

R5 Each Planning Coordinator shall ~~evaluate~~ report and obtain Reliability Coordinating Committee (RCC) approval for its Review of **Resource** Adequacy. Appendix D provides guidance for the Area Review of **Resource** Adequacy.

R5, R5.1, R5.2, and R5.3 moved from existing Appendix D Section#3--- proposed as new requirements.

R5.1 The Review of **Resource** Adequacy will be presented to the NPCC Task

Force on Coordination of Planning (TFCP). Comprehensive and Interim reviews shall be presented to the TFCP before the beginning of the first time period covered by the assessment.

R5.2 A Comprehensive Review of **Resource** Adequacy is required every three years and will cover a time period of five years. If changes in planned facilities or forecasted system conditions warrant, TFCP may require a Comprehensive Review of **Resource** Adequacy in less than 3 years.

R5.3 In subsequent years, each Planning Coordinator shall conduct an Annual Interim Review of **Resource** Adequacy that will cover, at a minimum, the remaining years studied in the Comprehensive Review of **Resource** Adequacy.

R6 Each Reliability Coordinator shall coordinate outages and deratings of **resources** to verify adequate **resources** will be available to meet the forecasted demand and **reserve** requirements. Appendix F provides guidance for Operational Planning Coordination.

R6 mapped to Section #5.3.

Proposed changes in requirement.

R6.1 A Summer and Winter Reliability Assessment will be presented to the NPCC Task Force on Coordination of Operation (TFCO) every year. ~~The Review of **Resource** Adequacy will be presented to the NPCC Task Force on Coordination of Planning (TFCP). Perform a summer and winter reliability assessment every year~~.

R6.1 moved from existing Appendix F Section#2.1--- proposed as new requirement.

Transmission Planning

R7 Each Transmission Planner and Planning Coordinator shall plan the system to meet the respective performance requirements for the **contingencies** as specified in ~~the system conditions, contingencies and performance requirements contained within~~ Table 1 in the design of its ~~NPCC~~ **bulk power system**.

R7 and R7.1 mapped to Section #5.4.

Table#1established to organize performance requirements, fault types and contingencies.

Performance requirements in Table#1 mapped to Sections# 5.4.1 and Section# 5.4.2.

R7.1 ~~Each Transmission Planner and Planning Coordinator shall model~~ Credible combinations of system conditions which stress the system shall be modelled including, load forecast, inter-Area and intra-Area transfers, transmission configuration, active and reactive resources, generation availability and other dispatch scenarios.

R8 Each Transmission Planner and Planning Coordinator shall assess the impact of the extreme **contingencies** listed in Table 2. Appendix C provides guidance for testing and analyzing extreme contingencies.

R8 mapped to Section#5.6.

Table#2 established to organize the performance assessments in Section#5.6.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

R9 Each Transmission Planner and Planning Coordinator shall assess the impact of extreme system conditions, one condition at a time, subject to contingencies as listed in the "Extreme System Conditions" category of Table 2.

R9 mapped to Section#5.7.

No change in intent of requirement.

R10 Each Transmission Planner and Planning Coordinator shall have procedures and implement a system design that ensures equipment capabilities are adequate for fault current levels with all transmission and generation facilities in service for all operating conditions which are not prohibited by a procedure and coordinate these procedures with ~~adjacent~~ materially affected Transmission Planner and Planning Coordinator Areas.

R10 mapped to Section#5.4.3.

No change in intent of requirement.

R11 Each Planning Coordinator shall conduct and obtain Reliability Coordinating Committee (RCC) approval for its Transmission Review. Appendix B provides guidance for Transmission Reviews.

R11 moved from Appendix B Section#1.

Proposed as new requirement.

R11.1 A Comprehensive Transmission Review is required at least once every five years or if major or pervasive system changes have occurred. If changes in the planned facilities or forecasted system conditions warrant, the Task Force on System Studies (TFSS) may require a Comprehensive Transmission Review in less than five years.

R11.2 The proposal for the type of annual Transmission Review shall be presented to TFSS by March of the year during which the review is conducted. Approval for the type of Transmission Review shall be obtained from the TFSS. The annual Transmission Review shall be presented to the TFSS by April of the following year.

R11.3 If the results of the Transmission Review indicate that the planned ~~NPCC~~ **bulk power system** will not be in conformance with NPCC Directory #1, the Transmission Review shall incorporate a corrective action plan to achieve conformance.

R11.1, R11.2 and R11.3 moved from Appendix B Section#4.

Proposed as new requirements.

Special Protection Systems

R12 Each Functional Entity that proposes a new or modified SPS shall consider the complexity of the scheme and the consequences of correct or incorrect operation as well as its benefits.

R12 and R12.1 mapped to Section#5.1.1.

No change in intent of requirement.

R12.1 Provide a rationale and justification to the TFCP including factors such as project delays, temporary construction configurations, unusual combinations of system conditions, equipment outages and infrequent contingencies.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

~~**R12.2** Obtain approvals in accordance with Directory#7.~~

Transmission Operation

R13 mapped to Section #5.1.2.

Table#3 established to organize performance requirements, fault types and contingencies.

Performance requirements in Table#3 mapped to Sections# 5.5, Section# 5.5.1. and 5.5.2.

R13 Each Reliability Coordinator and Transmission Operator shall establish **normal transfer capabilities** and **emergency transfer capabilities, for** ~~and operate~~ its portion of the **bulk power system** to meet the respective performance requirements ~~and system conditions~~ for the **contingencies** as specified in Table 3.

R14 mapped to Section #5.1.2.

No change in intent of requirement.

R14 Each Reliability Coordinator and **Transmission** Operator shall operate to **normal transfer capabilities** unless an **emergency,** in accordance with NPCC Directory# 2, is identified.

R15 mapped to Section #5.5.3.

No change in intent of requirement.

R15 Each Reliability Coordinator and Transmission Operator shall make system adjustments once an **emergency** has been identified, including the pre-**contingency** disconnection of **firm load,** to avoid exceeding **emergency transfer capabilities.**

R16 mapped to Section #5.5.3.

No change in intent of requirement.

R16 Each Reliability Coordinator and Transmission Operator shall assess the status of the **bulk power system** immediately after the occurrence of any **contingency** and prepare for the next **contingency as specified in Table 3**.

R16.1 mapped to Section #5.5.3.

No change in intent of requirement.

R16.1 Voltage reduction and shedding of firm load shall be ~~required~~ deployed to return the system to a secure state, if other system adjustments are not adequate. Voltage reduction need not be initiated and firm load need not be shed to observe a post contingency loading requirement until the **contingency** occurs, provided that adequate response time for this action is available.

R16.2 mapped to Section #5.5.3.

No change in intent of requirement.

R16.2 System adjustments shall be completed as quickly as possible following any **contingency,** ~~,~~ but ~~in all cases~~ within 30 minutes after the occurrence of any **contingency** specified in Table 3.

R17 mapped to Section #5.5.

No change in intent of requirement.

R17 Each Reliability Coordinator shall notify the applicable Reliability Coordinators of forced outages of any facility as per the NPCC Transmission Facilities Notification List and of any other condition which may impact inter-Area reliability.

R18 mapped to Section #5.5.

No change in intent of requirement.

R18 Each Reliability Coordinator shall coordinate scheduled outages of facilities that are on the NPCC Transmission Facilities Notification List sufficiently in advance of the outage to permit the affected Reliability Coordinators to maintain reliability. Appendix F provides guidance for Operational Planning Coordination.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

R18.1 moved from Appendix F Section#4.2.

Proposed as new requirement.

R18.1 Review and update its Facilities Notification List and submit the list to the NPCC Task Force on Coordination of Operation (TFCO) annually.

R19 moved from Appendix G Section#1.

Proposed as new requirement.

R19 Each Reliability Coordinator shall coordinate voltage control between Transmission Operator Areas. Appendix G provides guidance for Inter- Reliability Coordinator Area Voltage Control.

R19.1 moved from Appendix G Section#2.1.

Proposed as new requirement.

R19.1 Metering for **reactive power** resources and voltage controller status shall be consistent between adjacent Transmission Operators.

R19.1 moved from Appendix G Section#4.3.

Proposed as new requirement.

R19.2 Upon request from the TFCO, perform an Inter-Area Voltage Control Assessment.

4.0 Compliance:

Compliance with the requirements set forth in this Directory will be in accordance with the NPCC Criteria Compliance and Enforcement Program (CCEP).

Compliance with Directory#1 shall be demonstrated for all requirements that are not required for compliance with the NERC Reliability Standards and NPCC will not enforce duplicate sanctions for the same violation.

Prepared by: Task Force on Coordination of Planning
